- + Regulation is the fifth strongest factor affecting satisfaction.
- + The nature of the job is the last influencing factor on job satisfaction.

4. Discussion and Conclusion

Proposed some solutions to improve job satisfaction of lecturers at management level in some public universities in Hanoi:

Adjustment of promotion training policy

According to the above test results, the policy of training for advancement is the first factor that has the strongest influence on the working motivation of lecturers at management level; Therefore, public universities in Hanoi should develop some specific working groups for training them policies differently such as:

For policy training, universities need:

- + Strengthen communication techniques about training roadmaps, processes, procedures, rights, responsibilities and professional training programs, compulsory management skills training, but contents of these programs should be changed to practical training contents, specific and consistent to training target, instead of rambling and persuding quantity.

- + Diversify training methods on the basis of applying information technology in training such as, building an online training platform combined with face-to-face training or blended trainig at the university.

+ Develop some learning programs outside campus, attach to responsibilities and interests of each individual with the training costs paid by the school. The training content needs to solve the immediate problems and prepare for the long term for the development orientation of the school;

With the promotion policy, universities need:

+ Publicize the roadmap, promotion policy at each position; create a fair working promotion environment for all members (with superior evaluation criteria to encourage outstanding talented people);

+ Build a comprehensive human resource assessment software with updated general data by industry, digitize criteria, scales and make clear evaluation results monthly, quarterly, yearly and assess the whole working process.

+ Clarify rights and responsibilities for each position and conveying the opened and comfort spirit and attitude, and the culture of the university (the culture of resignation when not completing the task) to each individual whenever there are changes in positions, or rise and fall in position.

Improve the quality of the leadership team

According to the accreditation results, improving the quality of the leadership team is the second strongest factor affecting to work motivation of lecturers at management level, which requires the university to develop a toolkit, and form a basis project data for evaluating the quality of the present management lecturers and continuously develop the staff through the application of information technology to the management of the leadership team as well as develop the next leadership team, such as:

- Improve the professional quality and expertise of the leadership team through various channels such as creating a professional community; scientific and professional activities among faculties and institutes; establish a professional reference bookcase; invite expert speakers to the training school; establish expert tutoring groups with in-depth expertise.

- Build a process of assessing the credibility of positions with confidentiality of information to help senior leaders of the university make appropriate adjustments for all levels of personnel management.

Improve the working environment

According to the test results, improving working environment is the third strongest factor affecting to job satisfaction of lecturers at management level, which requires the universities to have plans to improve the working space, work types and facilities with suggestions such as: changing the arrangement of lecture hours and semesters so that the lecturers can actively arrange time, have time to spend with family and rest and regain energy; Encourage and reward individuals, groups, faculties and institutes with models of greening their workspace and harmonizing with the school's identity; support the development of faculties and institutes according to the characteristics of their department and faculty.

✚ Improve income, adjust salary and social welfare framework

According to the test results, income and salary is the fourth strongest factor affecting to job satisfaction of lecturers at management level in order of affecting levels to their satisfaction; therefore, the university should build policies to increase income, salary, social welfare. The university should pay salary according to lecturer's performance with the value of contribution of each position and associated with the reality of Vietnam's economic and social life at each time to offer different vertical and horizontal salaries, salary, bonus and allowance policies associated with each target group according to size of their faculties and institutes. Especially with the teaching staff at the management level, in the short term, the university should have a policy of rewarding the increment according to the results of scientific research, according to the survey evaluation scores from students, according to the trust of the community. subordinate career;

✚ Adjust general and specific regulations according to work groups

This is the fifth strongest factor affecting to job satisfaction of present lecturers at management level, which requires the universities to review their general regulations and regulations by departments, faculties and institutes. The universities should set up a group of regulations, review and revise the general and specific regulations that have been issued by the university within 3 years, because with the constant change in communication technology, skills, the way of working in this industry has changed a lot, especially when the Covid-19 pandemic occurs, the way of working, meeting and studying has been changed from face-to-face to online method; The university should internally communicate the general and private regulations to all employees who understand and share their personal views on those rules and regulations; Support present lecturers at management level so that they can create game rules to bring the universities' difficult rules and regulations into the minds of junior staff and lecturers to help present lecturers at management level feel secure about their work; Universities should develop policies that are specific to work groups, especially for faculties and institutes whose members are mostly females; Regularly re-evaluate the regulations according to the group, according to the arising work to make appropriate adjustments to that arising group or work; Forming thinking in the whole organization about the correct implementation of regulations is the driving force of the enterprise's development.

✚ New design job description and job reorder

According to the test results, job position is the sixth strongest factor affecting to job satisfaction of present lecturers at management level, which requires the universities to have a number of things to do right away such as: Quickly conduct research and put into operation the project "job position" to empower and assign clear and specific responsibilities to each incumbent lecturer at management level. Especially for management-level lecturers, the university needs to re-evaluate job descriptions, add assessment tools, thereby investing in an application software suitable to the management model, organization of faculties, institutes, and departments with fixed variables, changes according to each management position in the university; Re-evaluating current jobs, redesigning jobs, analyzing new arising operations in

the context of applying technological achievements to management, as well as impacts of the Covid-19 epidemic to make recommendations for new organizational models associated with changes of management position in the new development strategy of the university; thereby, comprehensively assess the risk levels in the short, medium and long term.

Abstract

Managing social evils prevention and control skills education activities for students in lower secondary schools in Hanoi capital has been conducted mainly by integrating content of social evils prevention and control skills education for lower secondary school students through teaching subjects, educational activities outside of class time, extracurricular activities and collective activities. The research results on the current situation of management and development of an educational model of social evils prevention and control skills and sustainable community development for students at lower secondary schools in Hanoi have shed light on the issues of theoretical topic and a practical basis for the author to develop management solutions to develop an educational model of skills in social evils prevention and control and sustainable community development for students in lower secondary schools in the current digital transformation context to prevent social evils in schools, contributing to comprehensive personality education for students.

Keywords: *Model management; Education on social evils prevention and combat skills; Hanoi capital lower secondary schools; Digital transformation context.*

1. Introduction

In the current period, we are living in the early years of the 21st century - the century of integration, Vietnamese society is affected both positively and negatively by the market mechanism. Improved social life leads to development evils such as addiction, violence, gambling, cheating...These evils are like a dangerous epidemic spreading throughout the school. According to education experts, the root cause is their lack of skills to live with life's difficulties such as parents' divorce, family breakdown, decline in schooling, etc. They have been drawn into the wrong path. pragmatic life, demanding, not brave enough to say "no to evil". The Ministry of Education and Training launched and implemented the emulation movement "Building friendly schools, active students" that created a new face in schools,

contributing to the cohesion of teachers, students and the community in the community. One of the current 5 very important contents of the emulation movement "Building friendly schools, active students" is education and life skills training for students. This is a practical content, associated with educational activities in schools and becomes more and more urgent for the younger generation, especially junior high school students, an age where psychophysiology has undergone many changes, lack of deep understanding of society, lack of life experience, hyperactive, easily manipulated...if not properly educated from the beginning. The education of social evils prevention and control skills in schools contributes to training and forming students to live more responsibly and to know how to choose appropriate behaviors, to cope with pressures and challenges in school life; promote social behavior, reduce crime rate. Up to now, the implementation of educational activities on social evils prevention and control skills and sustainable community development in high schools in general and especially in junior high schools of Hanoi capital in particular, not very often. The management of social evils prevention and control skills education activities for students in lower secondary schools has been carried out mainly by integrating the content of education on social evils prevention and control skills and sustainable community development for secondary school students through teaching subjects, through educational activities outside of class time, through extracurricular activities, group activities. However, in recent years, the activities of education on social evils prevention and control skills and sustainable community development for junior high school students have only stopped at the implementation according to documents of the Ministry of Education and Training, Hanoi Department of Education and Training and Divisions of Education and Training. The school has not actively developed a plan to carry out the task of educating students on social evils prevention and control skills and sustainable community development for junior high school students and diversifying forms of education on social evils prevention and control skills and sustainable community development for junior high school students. For the reasons mentioned above, the author has chosen to research the topic: "Management of an educational model of social evils prevention and control skills and sustainable community development for students at lower secondary schools in the Hanoi capital city in the current digital transformation context. The situation and the problems raised".

2. Methods

2.1. Group of theoretical research methods

- Researching the Law on Education, documents, directives and resolutions of the Party and the State on education in skills of preventing and fighting social evils for students of lower secondary schools.
- Studying documents of the Ministry of Education and Training, the Hanoi Department of Education and Training and the Education and Training Divisions of the districts related to the education of social evils prevention and control skills for students.
- Researching textbooks, scientific topics, books, newspapers and documents related to the education of social evils prevention skills for students in lower secondary schools.

2.2. Group of practical research methods

- Professional solution
- Survey method by questionnaire
- Interview method
- Methods of product research, activity and observation
- Method of summarizing experience

2.3. Group of methods of mathematical statistics

Using mathematical statistical methods to process the collected survey data. Using SPSS software to process the forms and analyze the results.

3. Results

3.1. Survey content and methods

Perception of administrators, teachers, staff, students about life skills education in general and skill education for social evils prevention and control and community development sustainability in particular; the need to educate students on social evils prevention and control skills and sustainable community development; Participating forces, factors and conditions affecting the education of social evils prevention and control skills and sustainable community development for students; Contents, methods and forms of organizing education on social evils prevention and control skills and sustainable community development for junior high school students in Hanoi capital.

** For educational forces inside and outside the school:*

Survey the level of awareness of the subjects about the education of social evils prevention and control skills and sustainable community development; The level of management and coordination of forces involved in the process of organizing and implementing educational content on social evils prevention and control skills and sustainable community development.

** With student:*

Survey of awareness on the importance of education on social evils prevention and control skills and sustainable community development; on the harms and dangers of social evils; understanding and applying social evils prevention and control skills and sustainable community development; the level of practice of social evils prevention and control skills and sustainable community development in schools; awareness of propaganda in the community to well implement the standards of society.

** Survey method*

- Observe activities by attending educational sessions on social evils prevention and control skills.

- Studying the management plan of education on social evils prevention and control skills of a number of administrators, homeroom teachers, subject teachers, and Youth Union officials in the school.

- Investigate by questionnaire, discussion, interview, exchange and live chat on contents related to the education of skills in preventing and combating social evils and

sustainable community development for students in schools, to the management board, teachers, staff, students, students' parents, and local officials and unions who are directly responsible for the prevention and control of social evils.

3.2. The current situation of management and development of an educational model of social evils prevention and control skills for students in junior high schools of Hanoi capital in the current context of digital transformation

3.2.1. The reality of managing educational programs on social evils prevention and fighting skills and sustainable community development for students in the classroom through subjects

According to Article 2 of the 2005 Education Law, the educational objective is to train Vietnamese people to develop comprehensively, to have morals, knowledge, health, aesthetics and professions, loyal to the ideal of national independence, ethnicity and socialism; forming and fostering the personality, quality and capacity of citizens, meeting the requirements of the cause of national construction and defense. However, the content and methods of education in schools today still attach great importance to teaching literacy, not paying enough attention to teaching how to be human, especially the education of life skills for students, including education. Prevention of social evils. In fact, when building a curriculum and teaching content in the classroom, teachers have to build three goals: providing knowledge, training skills, and forming attitudes. This is a principle requirement in teaching and education. Everyone must be deeply aware of this requirement. However, it can be said that because they have to run with time, have to convey a lot of content while time is limited, teachers tend to focus only on providing knowledge and pay little attention to training skills for students, especially skills to deal with society, cope with and integrate into life, skills to prevent and combat social evils. In the context of current integration, education on social evils prevention and control skills for students has received more attention. Education on social evils prevention and control skills for high school students has not yet been arranged as a separate subject in the system of subjects in high schools because the education on social evils prevention and control skills must be taught by the teacher, education anytime, anywhere when there are suitable conditions and opportunities. Therefore, education in social evils prevention and control skills must be carried out through each subject and in educational activities. Therefore, the opportunities to conduct education on social evils prevention and control skills are many and varied. The following organizational methods can be mentioned: Through teaching subjects; through elective topics; through educational activities outside of class time; through experiential activities. The close coordination of education on social evils prevention and control skills and sustainable community development with educational activities has been integrated into the educational program for many years, such as environmental protection education; drug, HIV/AIDS prevention; child sexual abuse prevention; adolescent reproductive health; cultural and behavioral education...creates many opportunities and conditions for the implementation of education on skills to prevent and combat social evils. In the lower secondary schools of the capital Hanoi in recent years have implemented the integration of school violence prevention and control education; prevention of drugs and social evils in the

curricula of subjects such as civics education, biology, literature, geography, fine arts...Considering propaganda and education as a fundamental task and must be done regularly and continuously.To find out the current status of the program, the content of educating students on social evils prevention and control skills and sustainable community development for students in the classroom through core subjects, the author conducted an investigation, Interviews with administrators (question 5 - Appendix 1), homeroom teachers, subject teachers (question 7 - Appendix 2) in the opinion poll. The survey results show that the school steering committees have paid attention to the management and education of social evils prevention and control skills and sustainable community development, but need to focus on better management at the stage of change. new teaching and education skills of social evils prevention and control and sustainable community development through subjects and management of the examination and assessment of educational activities on social evils prevention and control skills and development sustainable communities across subjects (very good and good level is 60%); manage the implementation of the education program on social evils prevention and control skills and sustainable community development through the subjects (very good and good 70%). And through the teacher's evaluation data for the direction and management of education on social evils prevention and control skills and sustainable community development for students in Hanoi capital's middle schools, the steering committee also showed its concern. to the educational activities of social evils prevention and fighting skills and sustainable community development for students of the schools today, but the very good and good levels are not highly appreciated (about over 70%), In which, innovation management, teaching, and education on social evils prevention and control skills and sustainable community development across subjects have 63.8% of the opinions rated very good and good, 36.2% Ratings are average and not good. This result shows that the Steering Committees of schools need to further strengthen the management of teaching innovation in general as well as innovating teaching and learning skills to prevent and combat social evils and develop sustainable communities for students. students through the subjects with high efficiency.

3.2.2. The current situation of managing educational programs on social evils prevention and control skills and sustainable community development for students through extracurricular activities

In the middle schools of Hanoi capital, extracurricular activities, collective activities, educational activities outside of class time, through elective topics, through experiential activities... have created favorable conditions. events for students to exchange, learn, and share experiences on social evils prevention and control skills and sustainable community development: propaganda about the dangers of social evils such as school violence Street; child sexual abuse, drugs, HIV/AIDS; illegal racing, dropping out of school, hanging out in bars; playing games for money... to help students seriously consider the dangers of social evils, and teachers, especially homeroom teachers, need to grasp and understand each individual's thoughts. students in the class, promptly correcting individual students. Schools also organize propaganda activities to raise awareness about crime and social evils

prevention, prostitution, human trafficking, and prevention and combat of sexual abuse against youth and students. activities such as: Research contest, Ring the Golden Bell contest, play scenes and skits, launch propaganda clubs or establish a red star team, and a youth shock team to strengthen inspection and development work. student violations to take educational measures. To find out the current status of the management and education of social evils prevention and control skills for students in secondary schools in Hanoi, the author conducted a survey by interviewing and student questionnaires. about the level of implementation of extracurricular activities programs that have been organized at schools in the education of social evils prevention and control skills (Question 8 – Appendix 3) and analysis of results. The obtained results show that educational activities outside of class time are mainly carried out in traditional forms such as activities under the flag, group activities (98.1%-80.8% at regular level); followed by talk about example, extracurricular activities by topic, contest to learn, criticize behavior, bad performance (72%-70.1%-64%-62.8%); He also listened to expert advice and invited the police to talk and introduce on a regular basis (52.9%-52.1%). The remaining forms of education such as painting propaganda propaganda; through educational situations and real life situations; state the regulations and requirements for the implementation of skills to prevent and combat social evils, and the awareness of the dangers of social evils is still at the level of non-conventional education (regularity is less than 50%), especially in that form through educational situations and real life situations; stating the regulations and requirements for the implementation of skills to prevent and combat social evils and awareness of the dangers of social evils, nearly 40% of students said that they have not been implemented.

3.2.3. The current situation of management of forces participating in education of skills in social evils prevention and control and sustainable community development for students of lower secondary schools in Hanoi capital

In recent years, the education of social evils prevention and control skills for students in secondary schools in Hanoi capital has had the contribution of educational forces inside and outside the school. And in order to better understand the current situation of management, assign specific tasks to the forces involved in the education of social evils prevention and control skills and sustainable community development, the development of a direction plan and regulations. How to determine the functions, tasks, and instructions for the implementation of education on social evils prevention and control skills and sustainable community development of the school board, the author used question number 8 (Appendix 2) in the opinion poll for teachers of schools and analyzing specific results, it can be seen that the establishment of a steering committee, defining functions and duties for each member of the steering committee, building The plan to guide the implementation and develop a regulation on coordination in education of skills in social evils prevention and control and sustainable community development in schools has not been given due attention, opinions are assessed at the level of good and normal are approximately equivalent, in which the content stipulates the functions and duties for each member of the

Steering Committee for education on skills in preventing and combating social evils, develop a regulation on coordination of forces in education of skills in social evils prevention and combat and sustainable community development at a good level even lower than the normal level (38.2 - 57.2); 32.2 - 53.9) and assessed the participation of forces in the education of social evils prevention and control skills at a good level of 48%. Thus, the above results show that the management, assignment of functions, tasks, and regulations on coordination between forces participating in education activities on skills in preventing and combating social evils and sustainable community development. for students who need to strengthen and push harder at schools.

3.2.4. The current situation of managing conditions for the implementation of skills education on social evils prevention and control and sustainable community development for junior high school students

Each educational activity in the school in general, and the education of skills in social evils prevention and control in particular, is conducted effectively in the school. In addition to planning, organizing, directing, inspecting, Assessing the implementation of the plan, the school's steering committee on social evils prevention and control skills also needs to pay attention to the conditions affecting the implementation of education on social evils prevention and control skills. opportunities for students such as: Management of training, retraining, professional improvement training on skills in preventing and combating social evils for teachers, management of facilities in general and teaching equipment in general. Separately, the funding is for educational activities on social evils prevention and control skills in schools. The author used question 6 (Appendix 1) in the questionnaire for administrators and question 9 (Appendix 2) in the poll for teachers about the level of management. Management of facilities in general and teaching equipment in particular, funding for educational activities on social evils prevention and control skills for junior high school students in Hanoi capital and analysis of the results shows that The opinions of administrators and teachers are relatively similar on the level of management of facilities, equipment, and funding to serve the education of social evils prevention and control skills for high school students. base of Hanoi capital. Specifically, the management and use of function rooms in service of the education of social evils prevention and control skills are at a very good and good level (80% of managers and 84.9% of teachers); management and use of equipment for education on social evils prevention and control skills (80% of administrators and 84.9 teachers); As for the content of funding investment for activities that are not at a good level, they are estimated to be approximately 30%. Thus, one of the weakest stages in the education of social evils prevention and control skills and sustainable community development, according to the Steering Committee and teachers, is the management and mobilization of funding sources for the activities. this move. For a long time this issue has not been really taken seriously, the funding sources for education on social evils prevention and control skills and sustainable community development are often extracted from a small part of the allocated budget.

3.2.5. Actual situation of factors affecting the management and education of social evils prevention and control skills and sustainable community development for students in junior high schools of Hanoi capital

To find out the current status of factors affecting the education of social evils prevention and control skills and sustainable community development for students, the author conducted a survey of 30 administrators, teachers and students. parents (Questions 7 - Appendix 1) for administrators; question number 10 (Appendix 2) for teachers; question number 3 (Appendix 4) for parents of students in the poll. The survey results show that there are many factors affecting the education of social evils prevention skills for students in schools: the attention of teachers and administrators (86.7%); school management (80%); actively training of students (76.7%); educational content and methods (73.3%); test and evaluate (66.7%). Based on the above data, we see that 86.7% of teachers and staff think that the attention of teachers and administrators is the most important. After all, the education of social evils prevention and control skills and sustainable community development for students in the school really needs the attention of the team of teachers and family members. school. It is also very important for each student to actively participate in training skills to prevent and combat social evils and develop sustainable communities. and suitable method of operation. If there is an appropriate method of educational organization and scientific management, objective factors and bad influences of the external environment have little chance of affecting them. Thus, the education of social evils prevention and control skills and sustainable community development for students depends on objective factors and subjective factors, they have a reciprocal relationship. School education is influenced by objective factors, of social management, but at the same time directly influenced by subjective factors such as teachers, students, educational content and methods, in which School management is an important link. To survey the actual status of students' awareness about education in social evils prevention and control skills and sustainable community development (perception of social evils through information sources, the author used Question 9 (Appendix 3) for students in the poll. The above results show that the evils that students are aware of from school are still more than from other information sources (55.5%), of which drug evils (75.1%); dropped out of school to hang out at Internet cafes (70.1%); child sexual abuse (67%); use of stimulants (64%); school violence (63%); violent gaming crime (61%). That shows that Hanoi capital's middle schools have organized education on skills in preventing and fighting social evils for students in recent years. However, it is necessary to implement more widely and pay more attention so that students can really see clearly the danger level of current widespread social evils so that they can have a sense of propaganda in their families. family and community (when the sources of information they do not receive are from the family or the local government). In order to understand students' awareness of the harmful effects of social evils, the author has conducted a survey on students' awareness of the harmful effects of social evils through question 10 (Appendix 3) for students. students in the poll. The survey results show that: The level of students' awareness of the harmful effects of social evils is very good and good is also low (41.9%). Most schools only propagate about the harmful effects of drug abuse (63.2%), while other

social evils are not well understood by students, there are perceived evils at a normal level and not good accounts for a high rate such as school violence (73.2%); spreading depraved cultural products (79.3%), extortion and theft (59.8%); child sexual abuse (54.7%), use of stimulants (54.8%).

3.2.6. General assessment of the current situation of management and development of an educational model of social evils prevention and control skills and sustainable community development for students in lower secondary schools of Hanoi capital in the current digital transformation context

Strengths

- Developed an education plan on social evils prevention and control skills and sustainable community development for students in Hanoi's lower secondary schools in the current digital transformation context, contributing to improving the quality of life. high quality education for all students.

- Conducted professional guidance to guide teachers to prepare relevant lessons, integrate and integrate educational content on social evils prevention and control skills for students and sustainable community development into subjects. during regular school hours.

- Officers of the Youth Union and Youth Team consciously develop plans to organize extracurricular activities in combination with professional groups, including the content of education on skills in preventing and combating social evils and sustainable community development for students.

- Homeroom teachers have paid attention and regularly cooperate with students' parents in educating skills to prevent and combat social evils and develop sustainable communities.

- The schools have organized the implementation of educational plans on skills in preventing and combating social evils and sustainable community development to all teachers and staff.

- The schools have examined and evaluated the education of skills in social evils prevention and control and sustainable community development.

- There is coordination and response of families, mass organizations and local authorities in educating students on social evils prevention and control skills and sustainable community development.

Drawbacks

- The school administrators put the content of the educational program on social evils prevention and control skills and sustainable community development for students, which is still formal, inappropriate, lack of creativity, the program of activities is still incomplete. The examination and assessment of education on social evils prevention and control skills and sustainable community development is still heavy on records and books without a clear evaluation criterion.

- Teachers' habit of focusing on theoretical knowledge will be a major obstacle when implementing education on social evils prevention and control skills - a type of education aimed at creating habits, attitudes, behaviors, properly deal with the evils of social life. The

teaching staff has not been properly trained, in accordance with the standards of education in skills to prevent and combat social evils and are not full-time. Administrators and teachers still face many difficulties and confusion during implementation. The selection of contents of education on social evils prevention and control skills is not appropriate, making the education of social evils prevention and control skills and sustainable community development still ineffective and unattractive. Students participate in understanding and preventing social evils.

- The coordination of mass organizations and forces inside and outside the school has not been effective, has not brought into full play the strength of forces educating skills in social evils prevention and control and community development. lasting.

- The form of organization of education on social evils prevention and control skills is very rich and diverse, but the conditions for activities are limited such as physical facilities, investment funds and support for activities from socialization sources.

Causes of strengths and weaknesses

a) Cause of strength

- On the side of the Hanoi Department of Education and Training, the Divisions of Education and Training have done well in the following areas:

- + Direct the lower secondary schools to carry out the education on skills of social evils prevention and control and sustainable community development closely, in a timely and planned manner.

- + Directing and scoring educational programs on social evils prevention and fighting skills and sustainable community development for students; through which the units learn, exchange, draw experience and replicate the operating model.

- On the school side:

- + There is the direction of the professional team, the organization of the Youth Union - the team to build an educational program on skills to prevent and combat social evils for students and to develop the community sustainably each semester and each competition period.

- + Directing the professional team and teaching staff to integrate and integrate the content of education skills in preventing and combating social evils and developing sustainable communities through classroom subjects.

- + Directing the educational forces in the school to coordinate in organizing educational activities outside of class time, extracurricular activities and collective activities on educating students on social evils prevention and control skills; propagate and coordinate with forces outside the school to participate.

- + Most of the students are self-conscious and actively participate in educational activities on social evils prevention and control skills and sustainable community development and gain understanding, awareness of harms and levels the danger of social evils; know some basic skills in social evils prevention and control and sustainable community development; Conscious in learning, training, self-cultivation, forming awareness, attitude and behavior in accordance with social standards.

b) Cause of the downside

- There is no general framework for education on skills in social evils prevention and control and sustainable community development for junior high school students.

- Sources of specific guidance documents on prevention and control of social evils and sustainable community development for junior high school students; Social evils prevention and control and sustainable community development for teachers are still limited. Teachers have not had the conditions to consult and research, so the content, methods and forms of organizing education on skills in preventing and fighting social evils and sustainable community development are still poor and not rich. not lively, still heavy on formality, not really attracting students to participate.

- The mobilization and coordination with forces outside the school is not regular; The power of local government organizations and mass organizations has not been brought into play, so the effectiveness is still limited.

- The examination and evaluation of administrators as well as functional agencies is not specific, there are no scoring criteria and the contents of emulation assessment in the education of students of each school have not been included. schools as well as for teachers. In management, education on social evils prevention and control skills and sustainable community development have not been widely propagated among teachers.

- A part of teachers and school staff are not fully aware of the importance and practical significance of education in social evils prevention and control skills and sustainable community development. Activities of the Youth Union and Youth Team in this work are not really comprehensive and effective.

- The level of culture, lifestyle and family education methods have great influence on children's personality. Faced with the need to survive, many students' parents have to struggle to make a living, outsourcing the teaching of their children to the school. The relationships in the family lack standards: parents divorce, family bankruptcy, family members fall into the phenomenon of smoking, drinking, gambling ...

4. Discussion and Conclusion

Through investigation and research on the actual situation of organizing skills education for social evils prevention and sustainable community development and management and education of skills in social evils prevention and control and sustainable community development for students in junior high schools in Hanoi, the author has some comments and discussions as follows:

- Before the development of the society in the integration period, in the face of the negative side of the market economy, the junior high schools of Hanoi capital have paid attention to building a safe and healthy educational environment, friendly, reduce all social evils spreading in school.

- In recent years, school administrators have launched and directed educational forces in the school such as professional groups, homeroom teachers, subject teachers, officials of the Youth Union - Teams, and Committees. On behalf of students' parents, they cooperate

in implementing educational activities on social evils prevention and control skills for students at the whole school. The organization of educational activities on social evils prevention and control skills and sustainable community development and management and education of social evils prevention and control skills and sustainable community development for students initially created a change in awareness for teachers, staff, students and parents. However, the coordination of participating forces is still not close, has not brought into full play the potential of the participating forces, the coordination with forces outside the school in the education of crime prevention skills is not regular, lack of synchronization.

- Schools have organized education on skills in preventing and combating social evils and sustainable community development through classroom subjects, through educational activities outside of class time, etc. Students had some basic and necessary skills, but the ability to apply them to practical situations is still limited, information technology, digital transformation, complex social evils, always stalking schools, ready to find ways to entice students to participate. The building of a cultural and healthy environment is not really effective.

- School administrators have developed specific plans for the education of skills in social evils prevention and control and sustainable community development. However, more positive solutions are still needed to organize and direct the education of social evils prevention and control skills and sustainable community development. The management and education of social evils prevention and control skills and sustainable community development also depend a lot on the actual conditions of each school.

- In the inspection and evaluation of managers, specific criteria and plans have not been established. The management of conditions for the implementation of education on social evils prevention and control skills and sustainable community development has been according to the established plan but has not been regularly, closely and additionally planned to operate effectively.

Some social evils have occurred due to many reasons, so schools need to seriously promote the education of skills in preventing and combating social evils and developing sustainable communities. Management measures need to be continuously supplemented, coordinated with departments and need to have measures to propagate and educate students widely and strongly in many forms on the mass media on ways to prevent and combat in order to reduce social evils, contributing to further improving the effectiveness of education.

The results of the study on the current situation of management and education of social evils prevention and control skills and sustainable community development for students in lower secondary schools in Hanoi have shed more light on issues of social evils, theory and practice is a very important practical basis for the author to build a system of management solutions for the model of skills education in social evils prevention and sustainable community development for students in lower secondary schools of Hanoi capital to effectively prevent social evils in schools, contribute to comprehensive personality education for junior high school students in the context of current digital transformation, integration and educational reform needs.

CONTENT AND POPULARIZATION OF BUDDHIST PERSPECTIVES ON SUSTAINABLE DEVELOPMENT THE MEKONG RIVER DELTA

Nguyen Thi Hao

haonguyen1841976@gmail.com

Le Ngoc Thong

thongleh@yahoo.com

National Economics University, Hanoi, Vietnam

Abstract

By unifying both qualitative and quantitative methods, the article has analyzed the content, necessity and factors affecting quality of the educational process, popularizing Buddhist views on sustainable development in the Mekong River Delta or Southwest (Vietnam). Thereby, affirming the value of the Buddhist point of view, assessing the process of disseminating that view in the Mekong River Delta or Southwest (Vietnam) and proposing a number of corresponding recommendations.

Keywords: *Sustainable development; Buddhism; Popular; Buddhist perspective on sustainable development*

1. Introduction

Based on the foundation of wisdom and liberation, Buddhism offers a convincing and highly effective solution of the laws for many problems of reality. Currently, the world is facing many difficulties and obstacles on the way of development, on the process of implementing sustainable development in both theory and practice. Should it be necessary to promote the Buddha's values and views on sustainable development? From there, find out social orientations to solve contemporary problems occurring nationwide and in the Mekong River Delta or Southwest. That, starting from the analysis of the content, necessity and factors affecting the quality of the educational process, popularize the Buddhist view on sustainable development in this area.

2. Method

2.1. Research questions

- The basis and content of the Buddhist perspective for sustainable development?
- What factors, trends and levels of influence of each factor affect the quality of the process of disseminating Buddhist views on sustainable development in today's society?
- When determining the position and role of each factor, how does it help to popularize and apply the Buddhist perspective on sustainable development?

2.2. Research model

Based on a number of related theories along with the opinions of a number of experts and delegates who are knowledgeable and interested in Buddhism and education, the article uses the following research model

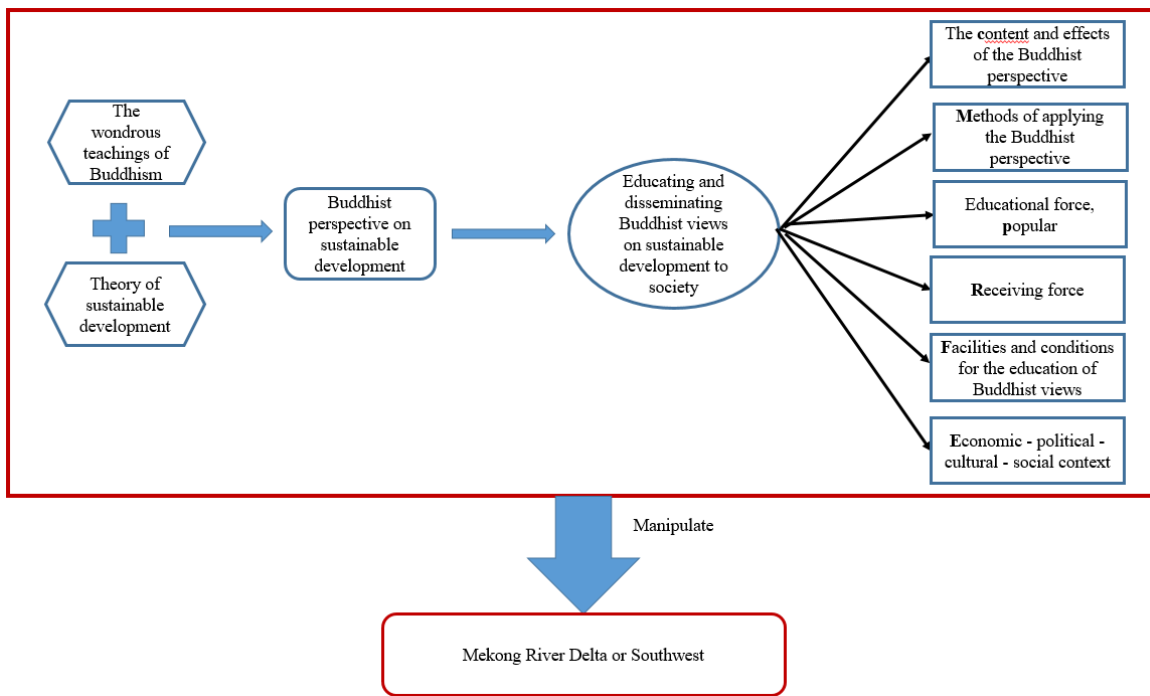

Figure 1. Research model

Source: self-build by authors

2.3. Qualitative research

Theoretical research on the nature and relationship between Buddhist teachings and sustainable development, on education, and invited to interview a number of experts and interested people who are knowledgeable about Buddhism, education, on expert society; Ask for people's opinions through sociology ballots.

2.4. Quantitative research - sources and methods of data collection

- Secondary data collected from books, journals, data from Internet sources or other mixed data...

- Primary data is formed through sociological research, collecting primary data for this topic, the article also chooses interview method to help obtain necessary information.

The questionnaire was designed to investigate the actual factors affecting the quality of the educational process, and to disseminate Buddhist views on sustainable development in the Mekong River Delta or Southwest.

The research sample was selected by convenient method in the Mekong River Delta or Southwest: province and Tien Giang university, city and Can Tho university, province and Tra Vinh university; period from October 2020 to August 2021, asking for opinions from Buddhists, people, and students. Sample size: 300.

Data processing steps: (i) checking and cleaning data; (ii) data analysis with the following methods: descriptive method, method of assessing the reliability of the scale, method of factor analysis, method of regression analysis of the influence of factors, ANOVA test method.

3. Results

3.1. Buddhist perspective on sustainable development - orientation of the sustainable development process

3.1.1. The term "sustainable development"

This term first appeared in 1980, with the content that the development of mankind should not only focus on economic development but also respect the indispensable needs of society and its impact on the ecological environment. By 1987, this concept was widely disseminated with more complete content: sustainable development is development that can meet the needs of the present without compromising, damage the ability of future generations to meet their own needs... Thus, sustainable development ensures effective economic development, fair society and the environment is protected, preserved and national security and defense. In which, human is the center, is the basic condition, with many management subjects, the pillar is the harmony of economy - society - environment in the conservation and rational use of nature.

Currently, in the context of the 4.0 scientific and technological revolution, creating breakthrough achievements, humanity has to face great challenges in many aspects:

Global climate change, degradation of land, water, air resources, poverty, epidemics... The result is three major crises in finance, energy and food. It is urgent for all of humanity to join hands for sustainable development in the direction of: a low-carbon society and green growth - a society that regenerates resources, in harmony with nature.

3.1.2. The basis for forming a Buddhist perspective on sustainable development

Buddhist teachings refer to the human being including both material and spiritual elements. The ultimate goal of life is liberation. The Buddhist worldview deals with two major problems: Earthly existence and its cessation. Buddhism does not separate personal interests and social interests. That principle is reflected in the five basic precepts: (i) not killing; (ii) not stealing; (iii) no adultery, no illegal sex; (iv) not lie or deceive others; (v) do not drink intoxicating or addictive substances.

In the Vyaggapajja Sutta, the Sangha says that sentient beings should practice developing both physically and mentally with four principles: perseverance, preservation of possessions, good friends, and life balance. An individual with a balanced life is the premise of democratic development in a reciprocal country, by staying in harmony with his body, speech and mind; equality in material resources, practice and achievements in practice and knowledge. The basic teachings of Buddhism towards a noble view of life: the Four Noble Truths.

3.1.3. Contents of Buddhist views on sustainable development.

The Buddhist perspective on sustainable development is clearly expressed in Buddhist economics²²⁰

The goal proposed by Buddhist economics is similar to the statement from the United Nations Brahimi Commission on the Millennium Development Goals: every individual has

²²⁰ The term "Buddhist economics" was first used by the British economist E. F. Schumacher in 1955 in his book "Small is Beautiful" published in 1966..

the right to respect for dignity, liberty, equality and basic living conditions, including freedom from hunger and violence, tolerance and solidarity. It is a strategy that emphasizes the balance between economy and ecology for sustainable development and cares about sustainability for future generations. The model is governed by Buddhist principles focusing on equality, social justice, and empowerment – based on the “righteous livelihood” foundation of the Eightfold Path.

Spiritual wealth is wealth that is not material; is the mental capacity or property acquired by practicing the Buddha Way, including seven treasures: faith talent, precepts, good talents, precious talents, literary talents, generosity, and wisdom. Distributing resources in the most reasonable and humane way; Use property properly with the motto "people must be able to use wealth to avoid being manipulated by wealth. Then the real wealth was the Dharma, faith, compassion, satisfaction, joy, humility, personal relationships, safety, health, wisdom. Therefore, people should develop the habit of saving like a bee sucking honey without harming the flower. That usage, consistent with the monk's "Luc Hoa Kinh Phap" emphasizes: benefit and harmony for all and is also in line with modern thinking about shared glory and enjoyment. At the same time, avoid getting rich wrongly with the spirit of Buddhism.

The Buddhist view of sustainable development encompasses two important concepts:

(i) “Wealth” is health, intelligence, personal relationships, competence, reliability, eloquence, prestige, success, history, character, and morality..

(ii) “Relation between material production” (with non-material aspects of life) is the relationship between people and people; between man and nature. Development must be directed towards man and all living things. Something that is left out of economic production will have dire consequences in the future. Economic activities are conservation, use and regeneration of resources, prevention of environmental pollution and destruction; production, limited growth, ethics in consumption and thrifty enjoyment; equitable distribution of income, harmonization of population and human resources; and avoid taking advantage, exploiting, depriving others of basic needs; increase personal lust...

From the spirit of morality, Buddhist economics solves 3 macro problems:

(i) What to produce? Create products towards spiritual as well as material development.

(ii) Produce for whom? Bringing benefits to sentient beings, satisfying basic human needs for food, clean water, housing, health, education, welfare, welfare, right to speak, right to participate... along with many other spiritual and material requirements.

(iii) How is it produced? By “cooperation” instead of “competition”; altruism “for the sake of all beings present” instead of selfishness; acts based on the Middle Way, the six Salvation and mindfulness achieved through meditation, benefiting all sentient beings and oneself; with a policy of non-violence.

Answering the above macro problems is the process of operating according to economic laws. In which, growth is the means, sustainable development is the end. From there, it reflects some orientations of Buddhism for sustainable development

* Limit insatiable economic growth, grow spiritual wealth and respect, protect the environment whose core value is contentment with a less materialistic life to share.

* Towards building a sustainable humanity, awakening, enlightenment, repentance and inner self-transformation of every human being suitable and oriented for national policy making.

* It is done starting with personal happiness, helping others and realizing the responsibility of contributing to the happiness of the majority.

The above values and contents need to be disseminated and applied in the sustainable development of the country or each locality. To do so, first of all, we need to carry out the process of educating and disseminating the Buddhist perspective on sustainable development to society.

3.2. Current status of education, popularizing Buddhist views on sustainable development in the Mekong River Delta or Southwest, Vietnam.

3.2.1. Actual research

Mekong River Delta or Southwest, Including 13 provinces and cities (see map)

Figure 2. Map of the Mekong River Delta or Southwest

Source: <https://60giayonline.com/ban-do-viet-nam.html>

3.2.2. Actual survey

The process of educating and disseminating Buddhist views on sustainable development is the process of educating and training people in all three aspects, intellectually, emotionally and physically according to the requirements of sustainable development. Participants include: subject; object; purpose; Content; method; vehicle; organizational form; external environment - economic environment - production, political, socio-cultural and internal conditions - pedagogical environment and facilities and equipment at the educational institution. The educational motto here is: promote wisdom and awareness

Facts about factors affecting the quality of the educational process, popularizing Buddhist views on sustainable development in the Mekong River Delta or Southwest.

Questionnaire with 31 observed variables of six factor groups. Number of votes issued 370, received 328. The number of votes to respond for analysis is 246.

Table 1. Characteristics of the survey sample

Characteristics		Sample size n = 250

Source: self-build by authors

Thus, after analyzing and evaluating the reliability of the scale, the observed variables belonging to the five scales (see Table 2) are continued for factor analysis. To evaluate whether the exploratory factor analysis method is really suitable for analysis in this case, by KMO and Bartlett's test.

Table 3. KMO test and Bartlett scale of factors affecting education quality, popularity

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.825
Bartlett's Test of Sphericity	Approx. Chi-Square	3986.937
	Df	465
	Sig.	.000

Table 4 below provides data on characteristic values analyzed from observed variables. In which, there are six factors with characteristic value greater than 1, the remaining 25 factors have characteristic value less than 1.

Also in this table, the total index of "Rotation Sums of Squared Loadings" is 64.689%. That said, the use of six factors representing 31 observed variables could explain 64.689% of the variability of the data. In the study, the total index of total squares of the rotation factor "Rotation Sums of Squared Loadings" reaching 50% is accepted.

Thus, the use of six factors to reflect the information provided from 31 observed variables.

Table 4. Eigenvalues analysis of 20 observed variables on the scale of factors affecting education quality, popularity

3.2.3. Comment on the results and problems raised from the actual research.

The above results should only be for reference, partly subjective because the respondents are not qualified to give an accurate opinion. In short, on the basis of acknowledging the Buddhist perspective on sustainable development has been included and oriented from the wonderful system of Buddhist teachings. Thereby, showing the role and significance of those views. Therefore, affirming the necessary necessity of the educational process, popularizing the Buddhist perspective on sustainable development. That popularization process is governed by

many factors, here agreeing with 31 factors divided into six groups of factors. In which, the influence with the dollar level gradually loosens with the order:

- 1) P3, P4, R3, R2, R1, C1, C3, E2 (Rotated Component Matrix $\alpha \geq .8$)
- 2) C4, P5, E1, M2, C4, C2, R5, F3, F2, M4, M1, M3, ... (Rotated Component Matrix $\alpha \geq .7$)
- 3) E3, F4, F5, E5 (Rotated Component Matrix $\alpha \geq .6$)

Accordingly, the educational factor has the strongest influence on the quality of education, popularizing the Buddhist perspective on sustainable development.

3.2.4. Issues and proposals in education to popularize Buddhist views on sustainable development in the Southwest region

First of all, the issue of life, employment and income is becoming a serious issue for the people of the Southwest region. Since then, it has led to a wave of migration from the Southwest region to the Southeast region, which has a great impact on promoting cultural values in social development. Therefore, it is urgent to ensure a stable life, employment and income for the people

Second, people's intellectual level is not high, the number of students studying at higher education levels is less, which has caused great obstacles to the development of the nation. It is one of the factors that degrade and destroy the values of national culture, regional culture, and Buddhist culture in social development. This shows the influence of Buddhist beliefs and practices in the spiritual life of people in the region. Of course, raising the intellectual level of the people in this area.

Third, the influence from the enemy's conspiracy and counter-measures by distorting the history of the formation of the land and peoples in the Mekong Delta. The incitement of the mentality of separatism, the division of the great national unity bloc in the Mekong Delta. That is no small obstacle in sustainable development in the spirit of culture. That, is imperative to ensure regional national security.

4. Conclusion

In the spirit of Buddhism, sustainable development must be oriented to make positive contributions to civilization and progress of people and society. That contributes to bringing peace and happiness to all species. Therefore, the core of sustainable development is: building consumer ethics, limited economic growth, balancing the many aspects of life between the present and the future. The important directional solution is to avoid any exploitation or misunderstanding towards humans or the natural world; At the same time, people need to actively solve problems in the spirit of Buddhist humanity.

FACTORS AFFECTING THE SATISFACTION OF STUDENTS WITH ONLINE SHOPPING SERVICES ON SHOPEE

Lu Thi Mai Oanh

maioanhxhh9@gmail.com

VNU - University of Education, Hanoi, Vietnam

Abstract

Based on a sample survey of 274 students from The University of Education conducted in May 2022, the article focuses on analyzing the factors affecting students' satisfaction with online shopping services on Shopee e-commerce site. The result shows that students of The University of Education have then using online shopping services on Shopee quite popularly, and the satisfaction level is also quite high. The article also shows that there are many factors affecting the satisfaction of surveyed students such as the ability to use online shopping websites (Std. Error 0.050, Sig. = 0.021); service quality (Std. Error = 0.033, Sig. = 0.000); price (Std. Error 0.053, Sig. = 0.002); trust (Std. Error 0.024, Sig. = 0.000); brand (Std. Error 0.033, Sig. = 0.000).

Keywords: *Satisfaction, online shopping service, Shopee e-commerce site*

1. Introduction

Hitherto many researchers have emphasized the shift from in-person shopping to online shopping for various reasons. Research by Nggai and Anandya (2020) mentions the reasons including (1) saving time and effort; (2) many promotions available; (3) convenience in payment and (4) more complete product improvements. One of The other interesting points is that users can visit multiple stores simultaneously to search for different products and compare the prices. Specifically, research by Holbrook and Hirschman (2012) in Sofiyudin (2015) emphasizes optimal value-oriented consumer behavior. Hanaysha and Mehmood (2016) assert that the perceived pleasure from shopping can the related to positive word of mouth, loyalty, emotional value and psychological satisfaction linked to the shopping experience. Customer satisfaction is the key to successfully expanding the customer network (Chow, 2015).

Especially, the development of information technology in the modern era has had a positive impact on many fields in general and business in particular. Specifically, the development of smartphones has changed the lives of people in general and students in particular when the emergence of many applications on these devices has contributed to changing user behavior in different ways, ranging from economic, society, lifestyle to the user's shopping behaviors (Ni and Hutagalung, 2021). In The context of the Covid 19 epidemic, online shopping has become popular and many companies have developed e-commerce-based applications on online technology platforms to attract customers by offering the convenience and free-of-charge use (Nisak and Yasa, 2021). Therefore, an increasing number of e-commerce sites are developing like Shopee - one of the online

shopping malls that comes with the whole-product concept and the convenience of online shopping and delivery. However, when a company enters the service sector, it must provide the best service to make customers feel satisfied (Pettit et al., 2019). Customer satisfaction is closely related to quality; Quality directly affects the performance of the product and Thus customer satisfaction. The student community of The University of Education, VNU is a dynamic, creative and responsive community with the Shopee e-commerce site, which can be considered as a miniature social model. With this article, the research team would like to find out and answer the following questions (1) How satisfied are students with shopping services on Shopee e-commerce site; (2) What factors affect the satisfaction of University of Education students with Shopee services?

2. Literature Review

Satisfaction is an expression which is expressed to the happy or not, compared between the expectation of a product and the actual product received. More specifically, according to Kotler and Keller (2006), customer satisfaction is an individual's feeling of enjoyment or disappointment when comparing the perceived performance or outcome of a product with one's own expectations. Research by Pham & Ahmad (2017) emphasizes that customer satisfaction has a relation to the customer's cumulative experience of a product or service. Thus, satisfaction herein is the customer's feeling good or disappointed with goods and services. At The same time, the level of customer satisfaction will reflect the success and efficiency of the company in implementing business activities and the satisfaction index can the expressed through product quality, service quality, product price, emotional factors and convenience (M. TantowiJauhari et al., 2019). However, so far, research on students' satisfaction is still very limited, especially through major online shopping platforms such as Shopee. Therefore, the content of the study on factors affecting students' satisfaction when using services on Shopee includes five aspects, which are web usability; service quality; price; trust and quality of information.

Web usability (WU)

Customer satisfaction is one of the important keys for online stores (Septiano & Sari, 2020). Research by Giao et al. [8] demonstrated the influence of web quality on customers' loyalty to e-commerce services. In a study by Annaraud & Therezina (2020), the quality of Shopee website is also emphasized to affect customer satisfaction through three aspects: usability, information quality and service interaction quality. However, the study by Mardatill et al (2017) again shows That The aspect of service quality such as ease of use, web design, responsiveness, personalization, assurance do not affect customer satisfaction. At The same time, the study of Sørnum et al., (2012) confirmed that website quality does not have a positive relationship with satisfaction. Therefore, this study, based on the results of other researchers, gives ten indicators to assess the effect of web usability on customer satisfaction such as ease of ordering, making payments, shipping, using and learning to use, operating, interacting, navigating with an attractive web interface.

H1: The ability to use features on Shopee e-commerce site affects customer satisfaction.

Service quality (SQ)

High competition in e-commerce requires businesses to improve service quality. Research by Rather & Camilleri (2019) mentions That service quality is an important component in shaping consumer awareness and positively influencing online shopping decisions on Shopee (Andrew, 2019). Service quality is understood as the comparison of the results between the consumer's expectation and the actual perception (Hamari & Koivisto, 2017). According to Hanitahaiza Hairuddin et al., (2019) there are three indicators of service quality: product advertising, effective shopping experience, and reliable product/service provision. Therefore, The service quality herein emphasizes on The flexible system application of Shopee for accessing shopping activities; no errors during use; Personal data is protected and financial data and transactions are secure.

H2. Service quality on Shopee affects customer satisfaction

Price (P)

Price is considered to the one of the most important criteria affecting consumers' expectations and choices (Mansori, 2012). Research by Rizki, Hidayat, & Devita (2019) also emphasizes that price has a positive impact on consumers' purchase decisions when buying online on Shopee. Specifically, the perceived price plays an important part compared to the actual price and affects the evaluation and choice of products of consumers (Dholakia, 2006). Therefore, online retailers need to offer attractive prices and different segments of price suitable for each type of item to attract users to decide to buy (Delafrooz et al., 2010). However, when shopping online, consumers are hardly able to observe and handle the item because the product is invisible and what is displayed is uncertainly perceived (Jiang & Rosenbloom, 2005) despite the benefit of easy comparison among online stores. Thus, consumer satisfaction has a special impact on price, which in many cases helps to create loyalty with The company, and makes consumers repetitively purchase as Their satisfaction is achieved (Usman & Ur, 2017). Therefore, the price on Shopee is assessed through three indicators - The listed product prices are lower than other e-commerce shopping sites; The price is consistent with product quality; and attractive price with promotions combined.

H3. Prices on Shopee affect customer satisfaction

Trust (T)

Trust is a central factor in forming lasting relationships (Singh & Sirdeshmukh, 2000). In which, customer expectations are expressed through the trust in service, thereby directly affecting customer satisfaction (Sirdeshmukh et al., 2002). At the same time, customer satisfaction can be created by customer trust (Ball, Coelho, & Machás, 2004). Therefore, customer trust is essential in determining customer loyalty (Lau & Lee, 1999). Research by Roziqy & Arifin (2018) also emphasizes that trust has a positive influence on consumers' purchase decisions when buying online on Shopee. Specifically, trust is expressed through five indicators simultaneously applied in This study: (1) belief that Shopee owners can be held accountable; (2) shopping on Shopee meets customers' own desires; (3) The customer personally believe in The seller's performance on Shopee; (4) goods on Shopee can meet The needs of buyers and (5) suppliers/sellers on Shopee can best serve consumers.

H4: Trust affects customer satisfaction with online shopping on Shopee

Brand (B)

Many studies highlight the degree to which consumers perceive a brand/service as the most important factor affecting their purchase decisions (Kumar and Jayasimha, 2019). Branding brings great value to businesses because it brings about a constant and reliable source of revenue and it is difficult for competitors to imitate (Smith & Milligan, 2002). More specifically, consumers may prefer top brands or services not because of better quality or value, but because of their self-image (Chang and Ko, 2014). That is why more and more e-commerce sites allow consumers to easily browse and compare between other commerce platforms therefore making a purchase. Research by Rizki, Hidayat, & Devita (2019) emphasizes That brand has a significant influence on customers' purchase decisions on Shopee. This is partly shown through four indicators mentioned in this study that are (1) brand name Shopee is easy to remember; (2) buy Shopee for The convenience of free shipping; (3) Shopee is the leading e-commerce site when shopping online and (4) Shopee is the brand recommended by others when customers want to shop online

H5: Brand affects customer satisfaction with online shopping on Shopee

3. Method

The survey was created on Google Forms with the links being sent to research subjects or respondents, namely students. Sample requirements are students who have used services on Shopee online shopping site and used technology. This type of research is conducted via online surveys and data is processed by SPSS statistical analysis. The survey was conducted on 274 students at The University of Education, VNU; In which, there are 89.8% female (n=246) and 10.2% male (n=28); freshman 95.3% (n=261); sophomore 4.7% (n=14). Data management involves data quality tests (validity and reliability), descriptive analysis, classical assumption tests (normality test, multicollinearity and variance test), multiple linear regression, and hypothesis testing. Data analysis in this study was carried out with the support of The SPSS Statistics 22.0 to analyze and demonstrate the factors affecting student satisfaction when using online shopping services on Shopee.

3. Results

3.1. Descriptive statistics

Customer satisfaction is one of the important keys for online stores (Septiano & Sari, 2020). This is partly shown through the research results when it is found that up to 96.4% of students choose to shop on Shopee, followed by Facebook 1.8%; Tiki 1.1% and other online channel 0.7%. Through the survey results, it can be seen that students are using a diversity of shopping and commerce channels, which shows that in society in general, diversity will be even greater. In addition, shopping on Shopee online site also partly explains the reasons for students' purchase behavior.

Table 1. Reasons for doing online shopping on Shopee among students

Reasons for choosing Shopee	Percentage	Frequency
Diversity of products and styles	39.1	107
Web usability	28.1	77
Reasonable price	24.1	66
Good service	3.3	9
Convenient delivery and return policy	1.5	4
Payment methods	1.5	4
Simple user interface	1.1	3
Consumer protection policy	0.7	2
Others	0.7	2

Research results show that the majority of students use shopping services on Shopee because of the diversity of products; high website usability; reasonable price and all other reasons such as good service quality, convenient delivery and return policy; simple user interface, consumer protection policy accounts for an insignificant percentage, approximately 3%.

3.2. Reliability analysis of measurement items

The results of reliability item analysis show that the reliability is 0.961 in the range from 0.8 to 1, which is good, and variables with corrected item - total correlation greater than 0.3 meet the requirements.

Table 2. Results of the reliability item analysis

Items	Scale Mean if Item Deleted	Scale Variation if Item Deleted	Corrected Item – Total Correlation	Cronbach's Alpha if Item Deleted
Cronbach's Alpha (REL) = 0.693				
WU1	95.80	237.089	.668	.959

WU3	96.28	234.453	.657	.959
WU4	96.14	236.247	.675	.959
WU5	95.96	237.515	.730	.959
WU6	96.15	234.577	.722	.959
WU7	96.14	234.674	.756	.959
WU8	96.19	233.893	.753	.959
SQ1	96.04	235.397	.764	.959
SQ2	96.92	234.474	.505	.962
SQ3	96.45	233.816	.678	.959

Items	Scale Mean if Item Deleted	Scale Variation if Item Deleted	Corrected Item – Total Correlation	Cronbach's Alpha if Item Deleted
SQ4	96.31	235.131	.715	.959
P1	96.02	236.465	.665	.959
P2	96.15	234.487	.727	.959
P3	95.95	235.048	.685	.959
T1	96.53	234.250	.644	.960
T2	96.28	233.593	.738	.959
T3	96.39	234.533	.730	.959
T4	96.32	234.323	.724	.959
T5	96.37	235.458	.704	.959
B1	96.27	237.407	.553	.960
B2	96.10	236.902	.642	.960
B3	96.00	237.788	.629	.960
B4	96.09	235.343	.737	.959

3.3. Exploratory Factor Analysis (EFA)

The factor analysis results show that the KMO index is $0.944 > 0.5$, which proves that the data used for factor analysis is completely appropriate. The result of Bartlett's test is 5854.295 with $\text{sig} = 0.000 < 0.05$, thus exploratory factor analysis (EFA) is appropriate (Source: extracted from SPSS, 2021). Five variables measuring student satisfaction are extracted into the same factor at Eigenvalues = 3,380 (>1) and the total variance extracted is 51,800%. Therefore, EFA results are suitable to be used for regression analysis in the next step.

Table 3. EFA analysis results for independent variables (Round: 1)

Measure	Factors				
	1	2	3	4	5
WU1	0,765				
WU2	0,739				
WU3	0,735				
WU4	0,717				
WU5	0,696				
WU6	0,503

T4				0,753	
T5				0,724	
B1					0,712
B2					0,629
B3					0,513
B4					0,735
Eigen - value	7.824	2.035	1.135	1.248	1.009
Extracted Variance (%)	33,621	44.621	46.753	52.340	56.735
a. Rotation converged in 6 iterations.					

Source: Survey results, 2022

All factor loading coefficients are greater than 0.5, and there is no case that any variable uploads both factors at the same time with the loading coefficients close to each other. Thus, the factors are guaranteed to have convergent and discriminant values in EFA analysis. In addition, there is no mixing of factors, which means that the question of one factor is not confused with the question of the other factor. Hence, after EFA analysis, these independent factors are kept unchanged, neither increased nor decreased by factors.

Table 4. Explained Total Variance

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	13.468	51.800	51.800	13.468	51.800	51.800
2	1.999	7.687	59.486			
3	1.627	6.258	65.744			
4	1.049	4.034	67.778			
5	1.032	2.954	69.366			

Extraction Method: Principal Component Analysis.

3.4. Regression Analysis

After conducting exploratory factor analysis, grouping variables into each factor, the study continued to conduct regression analysis. Regression analysis is used to predict a statistical model and predict the value of dependent variables. The purpose of regression analysis is to measure the impact of the factors that affect customer satisfaction. Specifically, regression analysis was performed with 5 independent variables: Web Usability (WU), Service Quality (SQ), Price (P), Trust (T), Brand (B). One-pass input method (Enter method) was used for regression analysis. The values of the factors used to run the regression are the mean values of The observed variables. The regression equation reflecting the influence of the factors in the model was built as follows: $SS = \beta_0 + \beta_1 * WU + \beta_2 * SQ + \beta_3 * P + \beta_4 * T + \beta_5 * B + e_i$ (β_i : Regression coefficients ($i > 0$); β_0 : Constant; e_i : error). Research model evaluation:

The analysis results show That The Adjusted R-Square = 0.509, meaning That independent variables in The model including Web Usability (WU), Service Quality (SQ), Price (P), Trust (T), Brand (B) contributes to 51.8% of The variation of The Student Satisfaction (SS) with shopping services on Shopee e-commerce site. The results of the regression model are shown in detail as follows:

Table 5. Output of Multiple Regression Analysis

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Theta		
Constant	0,288	0,205		1,233	0,000
WU	0,283	0,070	0,219	3,408	0,021
SQ	0,112	0,033	0,118	1,227	0,000
P	0,233	0,053	0,166	2,443	0,002
T	0,211	0,024	0,126	2,551	0,000
B	0,213	0,033	0,124	4,424	0,000

Source: Primary data analyzed through SPSS

As the result shows that all factors have Sig. value less than 0.05, showing a significant regression coefficient. In other words, these variables including Web Usability (WU), Service Quality (SQ), Price (P), Trust (T), Brand (B) are correlated with the satisfaction of customers when using services on Shopee. The standardized regression model of student satisfaction with shopping services on Shopee e-commerce site is built as follows:

$$SS = \beta_0 + 0.219 * WU + 0.118 * SQ + 0.166 * P + 0.126 * T + 0.124 * B$$

Overall, the results validated That There were 5 factors affecting students' satisfaction towards shopping online on Shopee, including: (1) Web usability (2) Service Quality, (3) Price, (4) Trust, (5) Brand. Regression analysis results not only show That all initial hypotheses H1, H2, H3, H4, H5 are accepted but also prove a strong influence on student satisfaction with e-shopping services on Shopee.

4. Discussion and Conclusion

4.1. Discussion

The e-commerce market has then constantly evolving and changing business models in recent years. In particular, e-commerce shopping sites like Shopee have changed its business model with manufacturers, distributors and customers using The Internet as a useful tool for communication. It can be seen that Shopee is an accessible APP on Android and IOS, enabling consumers to easily seek and buy the products they want not only at an affordable price, but also without distance and time limitations (Wijaya & Warnadi, 2019). Therefore, it is important that service providers on Shopee make optimal use of the features of The Internet and other product-related factors presented through the online platform in order to achieve customer satisfaction, thereby leading to a change in behaviors of purchase decision. More specifically, the study of student satisfaction with online shopping on Shopee emphasized the factors of web/app usability; service quality; price; trust and brand. Simultaneously, the five research hypotheses were all accepted and statistically significant.

Student satisfaction with Shopee web/app usability is demonstrated through the easiness in ordering and paying, using features as well as operating and interacting on the web/app with an attractive user interface.... This is important because consumers have more choices and better deals on different e-commerce websites (Devaraj et al., 2002). Therefore, from a consumer and business perspective, it is vital for e-commerce managers to understand this virtual distribution channel (Escobar-Rodríguez and Bonsón-Fernández, 2017). Specifically, e-commerce websites/apps in general and Shopee in particular need to provide a simple way for manufacturers or retailers to effectively distribute goods and reach potential consumers (Escobar -Rodríguez and Bonson-Fernandez, 2017).

In addition to the web/app usability, service quality is also one of the important factors to achieve student satisfaction. Service quality and satisfaction are two different concepts, but closely related in research on services (Parasuraman, ZeiBam, Therry, 1988). Many researchers also emphasize that service quality can be improved and lead to a positive experience of satisfaction (BouraTa, Psomas, Suárez-Barraza, & Jaca, 2019). Service quality is not only limited to delivery, but also related to after-service evaluation criteria such as easiness in shopping; no errors encountered during use; Personal data and transactions protected. Research by Eboli, Forciniti, & Mazzulla (2018) also mentions service quality includes reliability, responsiveness, capacity, access, communication, reputation and security.

Price is also a criterion leading to student satisfaction and purchase decision on Shopee. Consumers have more choices and better deals on different e-commerce websites (Devaraj et al., 2002) and so do students. Service prices in this study emphasize that the prices of products sold on Shopee are lower than other e-commerce sites and are consistent with product quality; as well as offering attractive prices with vouchers/promotions.

Besides, trust is also an important factor leading to high student satisfaction and thereby a long-term loyalty to products and services. In particular, trust is the fundamental precursor to the structural connections between buyer and agent. In any buyer-seller relationship, assessing a shopper's trust in a particular transaction is emphasized to have a

direct impact on post-purchase transaction (Kim et al. associates, 2009). This is also partly emphasized through specific criteria such as The trust in the Shopee shop owners' high responsibility; trust in The salesman's performance; The best service meeting The expectation and needs of students.

Finally, the research results show that student satisfaction with online shopping services on Shopee e-commerce site is also expressed through brands such as easy brand identification and brand recall; Free shipping; Top site for online shopping and recommended by people. Long-term brand experiences kept in the mind of consumers are likely to influence consumer satisfaction and loyalty (Mittal & Kamakura, 2001). More specifically, a positive brand experience plays an important role in developing sustainable and long-term brand loyalty (Mascarenhas, Kesavan, & Thernacchi, 2006).

4.2. Conclusion

The industrial revolution 4.0 has created a driving force for promoting people growth in the context of digital development and transformation in almost every field in general and in economy. Especially, the use of digital technology in the economic sphere of society has brought about major changes to the economic behavior pattern of the community itself. Digitization has made the market competition difficult to control in today's business world and has led to an indirect intersection between manufacturers and customers to conduct transactions, in which the e-commerce shopping site is a marketing system that shows the development potential of businesses. However, regardless of the form of business, it is always aimed at consumers and consumer satisfaction is considered the most important factor to bring success to a business. Research results show that student satisfaction with Shopee online shopping site is influenced by many statistically significant factors such as web usability; service quality; price; trust and brand. Therefore, online shopping portals need to actively focus on providing impactful consumer experiences and pleasing customers in general, and students in particular. Student satisfaction not only affects retention and engagement rate when shopping online; but also boosts buying decisions.

Abstract

This study aims to investigate the current situation vertical linkage between the exported Woodland wood Processing Company and the local forest plantation households in FSC certified timber production and marketing. The research results show that the economic efficiency from afforestation of households participating in linkage with the company is much higher than that of households not participating in the linkage. Linkage not only brings economic benefits but also helps households improve their knowledge of planting techniques and reduce production risks. In order to enhance the linkages, it is necessary to implement a number of solutions such as: continuing to expand the area of planted forests according to FSC standards by mobilizing households to participate in the linkage; building a close linkage mechanism through cooperation between the parties; enhance the role of state management of local governments in maintaining and developing the linkage model.

Key words: *Vertical linkages, Timber production, Wood processing company, FSC, Forest plantation households.*

1. Introduction

In situation of conservation of natural forests for environmental and social protection, the industrial forest plantation is required for not only the increase of forest area but also the demand of wood products for wood industry. As the mentions in report of FAO: “industrial plantations make up only about 5 percent of the total forest area but provide 35 percent of the world’s wood supply” (Fao, 2001). The demand of timber products is increasing. Besides the involvement of companies, many small-scale farm have evolved in industrial plantation of forest (C. Anyonge and James Roshetko, 2003). The farm timber producers have potentials in providing timber for wood materials market, especial in contractual market (corporate-smallholder partnerships).

Tuyen Quang is a mountainous province in the North of Vietnam. Tuyen Quang Province now has 448,681 ha of forest land, accounting for 76% of the total natural land

area. In which, by the end of 2019, the area of planted forest in the whole province is 201,954 ha (Department of Agriculture and Rural Development, 2019). With favorable conditions in terms of weather, climate and land, this is a land with great advantages to develop the forestry economy for the locality, contributing to the greening of barren hills and mountains, protecting the biological environment. and improving the farmer's life. In 2018, the proportion of the agriculture and forestry sector's contribution to the province's GDP growth reached 26% (Tuyen Quang Department of Statistics, 2018).

The linkage model of developing afforestation certified for sustainable forest management (FSC) between the exported Woodland processing company and forest planters is one of the typical forms of linkage in Tuyen Quang province. (Yen Do Hai, 2018). By the end of the first 6 months of 2020, the total area of planted forests achieving FSC certificates of the whole province is 25,336 ha (reaching 12.6% of the total area of planted production forests in the province). In which, the forest area reaching FSC of households is 10,251 ha. (Woodland Tuyen Quang Joint Stock Company, 2019). The linkage model is currently expected to be of great significance in enhancing the value of plantation timber, confirming the right direction of leaders and people on sustainable management and use. forest resources, contributing to local forestry economic development. However, up to now, the number of forest plantation households participating in the linkage is still limited. The linkage between the Woodland Joint Stock Company and the forest growers was formed mainly by the need for connection from the company.

This study was conducted to evaluate the overall status of the linkage between Woodland exported wood processing companies and forest growers, from which proposing solutions to strengthen and develop the linkage model of afforestation according to FSC standards in Tuyen Quang province in the coming time.

2. Method

The study uses a systematic and participatory approach to solve the research problem. Primary data sources were collected through surveys and questionnaires of 120 reforestation households, of which 80 households were affiliated with the Woodland company and 40 households were not affiliated. Descriptive and statistical methods, comparative and analysis methods are the main methods used in the research process. The cost-benefit analysis method is used to evaluate the economic efficiency of afforestation as an investment project over many years (Juan Torres, et al., 2016). This investment analysis is used to assess the profitability of the projects. Net present value (NPV) is the flow income and time based expenses converted to present. An economically viable investment project must have an NPV greater than 0 (Webber M, 2007). The formula for NPV calculation is as follows:

$$NPV = \sum_{t=0}^n \frac{Bt - Ct}{(1 + r)^t}$$

Inside:

t: time of the investment project; r: The author uses the interest rate on bank deposits in Viet Nam; Ct: annual cost for investment; Bt: The revenue is earned annually

3. Results

3.1 Overview of the linkage between the Woodland Wood Processing Company and the forest plantation households

** Tuyen Quang Woodland Joint Stock Company*

Tuyen Quang Woodland Joint Stock Company is a company specializing in manufacturing wooden building products and interior decoration for export. The raw materials for production processing that the company uses is the type of timber that is fully harvested from planted forests, of which the trees are mainly acacia trees with the age of 7-8 years or more and must have Forest Stewardship Council (FSC) certification. Forest certification according to the standards of a sustainable forest management council. The products produced by Woodland have been present in the US, Canada, Europe and Japan markets. The company is also one of the main suppliers of the world's largest furniture group IKEA in Viet Nam. With a factory capacity of over 680,000 m³ per year, each year the company needs a minimum logging area of 2,500 ha of plantation forest with a minimum 7-year cycle and must have FSC certification. Currently the company is the main purchasing unit of wood certified with FSC in Tuyen Quang province. This is also a decisive party in the formation and operation of the FSC certified afforestation model with households in the province.

** Characteristics of households participating in the linkage*

The study surveyed 80 households participating in afforestation under FSC standards with the company through Tien Huy Forestry Cooperative in Tien Bo commune, Yen Son district, Tuyen Quang province. All households are members of the cooperative. Households in the area are all those with long-term experience in afforestation, up to 78.7% of households rely on forest work, income from forests mainly contributes to 80% of the family's economy family.

Table 1. Basic information of households participating in the linkage

Criteria	Unit	Quantity
1. Number of households	household	80
2. Age	Year	45,62
3. Number of school year	Year	10,25
4. Experience in afforestation	Year	15,54
5. Average area	Ha	7,19
6. Forrst Planting density	tree/ha	2000

** Form of linkage between the Woodland Company and the local forest plantation households*

The model of linkage between the Woodland Company and the forest growers is depicted in Figure 1. Table 2 presents the rights and obligations that parties participating in the association enjoy and are responsible for implementing.

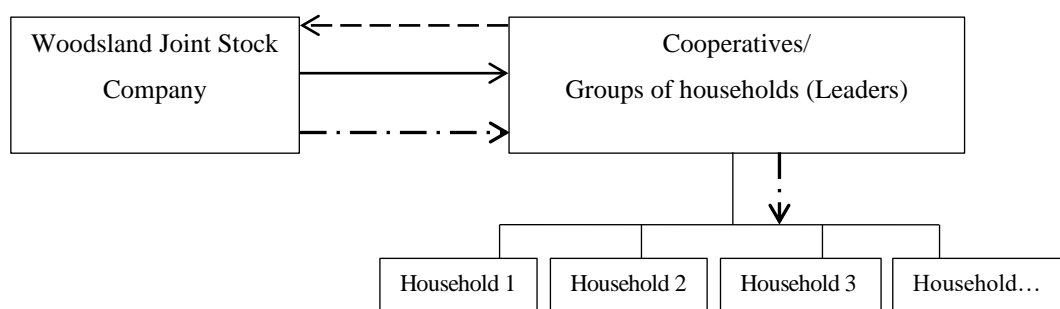

Figure 1. Linkage Model between Woodland Company and Forest Plantation Households

Notes: → Demand ← - Supply as order
 - . → Admin, financial and technical support

Table 2. The rights and obligations of company and famers

	Rights	Obligations
Forest plantation households	<ul style="list-style-type: none"> - To be supported for free with 100% fee of evaluating and achieving FSC certificate for forest plantation. - Oportunities to approach loans with less or free interest rates. - Improve the knowledge in technology, silvicultural training for forest establishment and maintenance. - Safety output market for timber harvest and increasing income 	<ul style="list-style-type: none"> - To comply tightly all technical requirements on afforestation according to FSC criterias to ensure certified timber materials - Lasting the cycle of trees (at least for 7 years) to obtain the large-diameter size of wood. - To give priority in selling timber to COC sawmills of the company or to the company directly
Cooperatives	<ul style="list-style-type: none"> - To be received FSC evaluation costs from the company and implement it to households. - To be trained and accessed new scientific and planting techniques following FSC standars. - To be updated reliable information regarding good seedlings to introduce with household growers. 	<ul style="list-style-type: none"> - to support househods in preparing forest documents for FSC evaluation - To help company to check and make a harvest plan annually. Being a bridge between company and households. - To assist households in havesting and guide them to sell timber for company's sawmills
Woodland Joint Stock Company	<ul style="list-style-type: none"> - Having the stable source of timber material inputs that meet the requirement of IKEA wooden products 	<ul style="list-style-type: none"> - To combine with cooperatives, training growers in developing and managing the forest following the requirement of FSC.

	Rights	Obligations
	- Being initiative management in timber material sources and reducing the imported inputs.	- To advise on organization and operation of household groups such as: meetings, monitoring forest development - To sponsor 100% for free the forest evaluation cost to achieve FSC certification. - To commit to purchase FSC certified timber when harvesting at a price higher about 10 – 18% at least than market price of non-certified wood at the time of transaction.

Source: Do Hai Yen, 2020

3.2. Results of linkage implementation between the Woodland Company and the forest plantation households

* The results of developing planted forest area achieved FSC certificate

By the end of 2019, Tuyen Quang Woodland Company has supported the total area of FSC certified forest in the province to reach 25,366 hectares, of which the forest area managed by forest companies is 15,115 hectares, accounting for 59.6 %; of households managing 10,251 ha, accounting for 40.4% (Chart 1).

Figure 2. Developing planted forest area achieved FSC certificate in Tuyen Quang Province

* Technical support situation by Woodland Company

In order to assist and train in the knowledge of the certification requirements; For FSC principles and criteria, Woodland has applied the training method “TOT - Training Of Trainers - to train trainers”. The company coordinates with provincial agricultural extension officers,

forestry sub-departments, training capacity building and agricultural extension methods, intensive forest technique in the direction of FSC for district and commune extension officers; heads of cooperatives, heads of household groups. These people will then be responsible for retraining the forest owners, making sure all forest owners are trained and knowledgeable about the FSC certification for sustainable forest management. In addition, at commune meetings, village meetings, forest production principles, effectiveness from afforestation according to FSC standards are always integrated and emphasized on households.

** Situation of household responsibilities when joining the Woodland company*

Through the survey, it was found that 100% of the households participating in the association ensured compliance with the requirements of FSC standards. The majority (97.4%) of the households maintain the minimum exploitation cycle of timber for 7 years. Percentage of households selling timber to the company after exploitation reached 92.5% (Table 3), there are still some households selling to the market or harvest and sell before the prescribed cycle. This situation mainly occurs in households that are new to the association, having doubts about the effectiveness of the model or the company's price commitment. Some households transfer or sell forest land or, for some reason, they need money or need land, so they harvest before the agreed period, accept to sell at a lower price than the price if sold to the company . However, this situation is not happening much.

Table 3. Situation of household responsibilities when joining the Woodland company

Contents	Rate (%)
Comply with the requirements of afforestation according to the Sustainable Forest Management Standard (FSC)	100
Maintain required minimum operating cycle of timber (7 years)	97,4
Percentage of households selling timber to the company	92,5

** Economic benefits from household afforestation when joining the Woodland company*

In order to create one cubic meter of FSC certified round timber, in addition to the cost of conventional afforestation, there must be additional costs related to the implementation of the FSC certification. Costs for the evaluation are approximately 28,000 USD (\approx 652,960,000 VND), including the cost of the first year evaluation 8,000 USD (\approx 186,560,000 VND) and the annual audit cost for the next 4 years 20,000 USD / 4 year (\approx 466.400.000 VND / 4 years). All these costs are currently being covered by Woodland Company and are not required to be reimbursed by households.

To clarify the effectiveness of afforestation according to FSC standards of the households participating in the association, the study evaluates and compares the results of planting business between 2 groups of households: group of households planting forests Normally and groups of households plant forests according to FSC standards. At the time of the survey, the difference in the selling price of FSC certified wood is 17% higher than that of ordinary timber without FSC. Production results of households planting forests according to FSC standards are shown in Table 4.

Table 4. Result of plantation production according to FSC standards of households in linkage with the Woodland Company

Criteria	Unit	Year 5	Year 6	Year 7	Year 8	Year 9	Year 10
1. Household of linkage							
Investment	VND	37.862.334,2	45.775.667,5	53.119.000,8	59.555.667,5	63.542.334,2	67.529.000,8

NPV	VND	12.816.673,6	31.674.226,5	47.120.155,2	52.907.322,3	53.092.725,0	52.809.865,4
IRR	%	13%	21%	22%	21%	18%	16%
BCR		1,42	1,92	2,34	2,34	2,33	2,31
2. Households of non linkage							
Investment	VND	33.465.000,0	41.378.333,3	48.721.666,7	55.158.333,3	59.145.000,0	63.131.666,7
revenue	VND	47.704.800,5	76.785.150,0	112.073.500,0	132.193.050,0	143.749.850,0	155.306.650,0
NPV	VND	4.952.885,0	16.245.923,2	30.010.483,0	34.004.001,6	34.165.420,7	34.004.036,4
IRR	%	7%	14%	19%	18%	16%	14%
BCR		1,18	1,53	1,89	1,95	1,94	1,93

The results of production and business of the group of afforestation households providing FSC and non-FSC certified timber show the difference in monetary benefits that the linkage model brings. Both groups of households mainly exploit planted forests from year 7 onwards. The cost of entering planted forests of the linked household group is higher than that of the non-linked group because it will take more labor to plant forests according to standard and standard methods than to plant forests according to traditional methods. system. Specifically, afforestation under FSC standards will increase the number of working days due to direct weeding and clearing of vegetation. The efficiency analysis indicators all show that the afforestation linkage model with FSC brings much higher economic efficiency, clearly shown through the NPV of the linked household is 1.57 times higher than the non-linked household. results at a 7-year cycle. Similarly, the FSC BCR is 2.34, while the average planting households are only 1.89. With the calculation results of these indicators, we have a basis to state that afforestation under the FSC certified linkage model is economically efficient, bringing in higher income from planted forests compared to other indicators. conventional forest planters.

The results of NPV and IRR calculation for two groups of households in Table 4 also show that, if we consider afforestation as an investment project with a normal cycle of 5 to 10 years and use the interest rate of deposits / year of the bank. Agriculture and Rural Development is 8.5%, the group of households planting forests under the FSC model should harvest in year 8 is most beneficial because of the highest NPV and BCR. Conventional households should harvest in year 9 is most effective.

3.3. Benefits of the linkage

One of the most obvious impacts on households after joining the FSC-standard afforestation model with Tuyen Quang Woodland Joint Stock Company is the application of science and technology to the practice of afforestation. . Through training courses and propaganda on forest planting standards and criteria according to FSC, people have the opportunity to expand their knowledge in planting, tending and protecting forests, and gradually abandoning the habit of afforestation. statistics; to initially get acquainted with modern farming methods, gradually integrate with the development trend of the general forestry industry in the world. Afforestation households according to FSC standards have fundamentally changed their old afforestation habits, which is to completely eliminate burning of vegetation when preparing land for afforestation, and do not throw away fertilizer and plant protection packages indiscriminately. .. These are factors at high risk to affect water resources and living environment.

In addition to the benefits of improving knowledge of afforestation, participating in afforestation according to FSC standards also helps households benefit from the timber selling price higher than the normal selling price of timber, thereby increasing income from the forest. grow. At the same time, thanks to the correct application of standards in the process of planting, tending and protecting forests, the productivity of planted forests according to FSC standards is also higher and reduces production risks such as the rate of dead trees, pests and diseases. harm.

There is not a big difference between the linked and non-linked households in assessing the quality of seedlings in the process of planting and developing forests. This is because in the linkage mechanism, the company does not have specific support for seedlings to be used for afforestation, in this part the cooperative will be the one to introduce and connect households to buy seedlings from Reputable seed production centers in the province or from research institutes of universities. On the other hand, over 80% of the surveyed households of both groups of households in the study area are households with long-term experience in afforestation, contributions from forests are also the main source of income for households. Therefore, all households are very interested in seed quality and have investment.

3.4. Households' evaluation on the company's linkage activities

The survey of households' evaluation about the company's linkage activities shows that the majority of households are very satisfied (42.5%) and satisfied (55%) about the correct implementation of what companies do. with households such as: regularly assigning staff to coordinate with cooperatives to support and train households in acquiring knowledge on afforestation according to FSC standards, hand-held communication is easy to understand (47.5% very much satisfied). Besides, the company also buys timber at a price higher than the market price as committed. Thanks to the role of the cooperative participation in the model, the household does not face any difficulties in procedures for joining the association.

However, 13.8% of respondents think the procedure is still complicated. However, these households mainly focus on those who have problems with Certificates of forest land use rights such as: households are using certificate to pledge for bank loans; or for some reason, they lose it and are in the process of apply for reissuance; or the forest land are in the process of transferring to someone else, meanwhile the requirement of joining the association is that the household must prove their forest land is 100% certified of use rights and no dispute. On the other hand, up to 21.3% of households also said that the procedure for exploiting and selling FSC certified timber is more complicated than for selling ordinary timber. Before exploitation, it is necessary to report 1 year in advance, follow the technical protection process, with the inspection of the cooperative, the representative of the wood

purchasing unit of the company's satellite factory COC. Meanwhile, if selling ordinary timber, households can sell the whole forest completely or log it straight to the place for sale without spending time on harvesting procedures.

3.5. Difficulties in the process of operating the linkage model between companies and households

All expenses related to the formation and operation of groups of households, guide households to plant, take care of and harvest according to FSC requirements; expenses for forest assessment and certification. These costs are currently being fully supported by Woodland Company and have not been included in the production cost structure of raw wood of households. According to the survey information from households, the price difference is not too large (from 15-20%) as at present between the timber with FSC certificate and the timber without FSC certificate, if the household has to remove all of it. With these expenses, households will not be willing to participate in the linkage model because it is unlikely that the economic benefits from planting forests with FSC will be more than those from traditional afforestation. Therefore, in the future if the above subsidies are no longer available, but the household has to invest, especially the costs related to certification, this association model is predicted to be difficult to form.

The difficulty in complying with the FSC requirements includes 10 principles and 56 criteria. Forest land of households with FSC certification is interspersed with land of households that do not or have not participated in the association, together with fragmentation and fragmentation of forest land, causing risks in compliance. requirements of the FSC. Besides, it is very difficult to change perceptions and habits of households that are accustomed to afforestation according to traditional methods. Most of the reforestation households live in rural areas, with limited resources and intensive farming skills. Households have engaged in afforestation for over 15 years, and over 45 years old. Therefore, it is very difficult to change a production habit. Results of interviews with communal officials, officials of the Board of Directors of the Cooperative and through in-depth interviews with staff in charge of developing raw material areas for Woodland

Company said that when implementing, mobilizing households to participate In the linkage model, they all face difficulties in convincing households and closely following households in the process of operating, planting and taking care of forests as required. Because the educational level of most households is still low. Farming habits and practices have been deeply imprinted and difficult to change.

In the process of operating the linkage model, there are risks related to the cooperative relationship between the company and the households, with the company being the more risky party. Currently, the linkage mechanism between the company and the household groups is through a support contract. However, the content of the contract only mentions that the company will support the full cost of certification, support in terms of forest planting and care techniques. The company only requires groups of households to give priority to selling timber after harvest to the company, not required. So in case the households do not comply with the conditions of the contract such as: selling timber voluntarily ahead of time or not selling to the company. In this case, it is difficult for the company to sue or apply any sanctions for groups of households. Interview with woodland company officials said: the company must now accept violations without handling, but in the future the company will never cooperate with those households again. If the number of breaches of the contract increases, the timber supply to the company will be affected.

3.6. Proposing some solutions

The forest plantation linkage model according to FSC standards is a model with many potentials in bringing about social and environmental effects. To complete and develop the model, some solutions are proposed as follows:

Firstly, it is currently in the period when technical assistance, funding support for forest certification is being paid by the woodland company. Department of Agriculture and Rural Development together with cooperatives and heads of branches and groups of FSC afforestation households should continue to review and mobilize households with forest land, especially those with forestry land. In the same plot, plot in the region participate in the association on the spirit of voluntary participation, voluntarily complying with the provisions of the afforestation according to FSC standards. Establish new afforestation groups, each with a minimum size of 100 ha. With this scale, afforestation households can access the State's policy of funding support for forest certification under Decision No. 38/2016 / QĐ-TTg. On the other hand, the more the certified forest expands, the greater the benefits to be gained by the household, while the smaller the cost of auditing to get FSC allocated per hectare (cost per audit). price is fixed regardless of the area). Therefore, does the development of the group's operating regulations provide the amount of funding to contribute to the Fund for the maintenance of forest certification at the next stage (when support for forest certification is provided by woodland JSC. in the end) is workable.

Secondly, to enhance the responsibility of each household in complying with FSC's requirements and principles. Need to enhance the role of cooperatives, associations, household groups that have joined the current linkage. Cooperative staff, group leaders and members are responsible for maintaining the household group in implementing standard planting

techniques, reproducing certified planted forests for the next cycle. Advocate, support and supervise new participating households to comply with requirements and principles. On the other hand, the company needs to combine the agricultural extension staff of the Department, the village and commune staff, the cooperative officer, the group leader, the branch to properly and clearly convey information about the opportunities and the necessity. and the benefits that can be gained from joining the linkage model to households. Since then, it increases the trust of households as well as the responsibility of participating in the association of households. Organize training classes, teach and share knowledge about FSC afforestation.

Thirdly, because the link between the growers and the processing company suffers from the effects of supply and demand in the market, fluctuations in the market can lead to contract non-compliance, especially from households. To overcome this situation, the company and groups of households represented by the cooperative need to negotiate and build a sustainable linkage mechanism through the linkage contract. The contract should ensure fairness of interests and obligations between the parties. In addition to maintaining and committing to well implement the terms of support, the company needs to add terms on product consumption when exploiting, price transparency, financial support ... The company also needs to exchange often. regularly working with cooperatives, heads of household groups to develop annual exploitation plans, maintain raw materials for production.

Finally, People's Committees at all levels and the Department of Agriculture and Rural Development should continue to direct the review of forest and forest land areas in their respective management areas, make plans for forestland allocation, and guide groups of households, The association procedures to apply for land use right certificates for households in accordance with the 2013 Land Law. Disseminate to households programs and policies of the Government and the province on development. forestry economy. Support legal procedures for households to easily participate in the association as well as participate in sustainable forest management and development programs and projects. Authenticate cooperation agreement between the company and groups of households. Participate in monitoring and take measures to handle the implementation of commitments by stakeholders.

4. Conclusion

The linkage model of afforestation according to FSC standards in Tuyen Quang has made important contributions to promoting afforestation in Tuyen Quang province. The model is said to bring benefits to planters in terms of economic efficiency, knowledge and techniques of planting and tending forests. The research results of two groups of households that participate in the association and do not participate in the association show that: the economic efficiency from planting forests according to FSC standards of the linked household group is higher than the group of households planting under the conventional method and not. join the link. Besides, it also brings many positive benefits to households such as: improving knowledge on planting techniques, higher selling price of timber and higher income from planted forests. However, the model also has many hidden risks that the biggest loser is the company. To improve and develop the model in the coming time, a number of main solutions are proposed: 1) Continue to advocate and expand the area of

planted forests according to FSC standards, and at the same time build a Fund to maintain the certification. only in household groups. 2) Enhance the role of groups of households and cooperatives in propagating and mobilizing participation and monitoring the implementation of FSC's requirements and principles. 3) Building the sustainable linkage mechanism through the linkage contract. 4) Enhance the role of state management of local governments in maintaining and developing the linkage model.

Acknowledgments

This study was funded by Tan Trao University, Tuyen Quang, Viet Nam under grant number: 2020.5.04. We are grateful to the staff of Woodland Joint Stock Company and forest plantation farmers who provided us with sources of information and interviews that were very valuable in the conduct of this research.

Abstract

This study aimed to analyze the current status in Son La province in terms of policy implementation focusing on maize. By utilizing qualitative research method, the study assessed the impacts of the policies those affecting to sustainable maize-based farming systems in Vietnam with a case study in Son La province. The results showed that, in recent years, maize is no longer known as the key crop and interest by both farmers and local authorities in Son La. This trend partly affected by the policies by the local strategy. An important finding showed that the policies for maize-based sustainable development have been integrated in certain agricultural policies at the central level. Nevertheless, only a few policies directly support maize production while some others are general. At the local level (Son La province), there is no specific policy for maize. Existing policies on maize in Vietnam in general and Son La, in particular, did not affect or put their impacts to promote sustainable maize production. In addition, five most prominent challenges were accentuated those need to be addressed in order to achieve the goal of sustainability in maize production as defined by the Vietnamese government.

Keywords: *Maize-based farming system, agriculture production, sustainable development, policy effect.*

1. Introduction

In Vietnam, maize is known as the primary material resource for livestock and poultry feed. It is one of the six main crops in the country (along with rice, coffee, orange, pomelo, and banana), being the second most important food crop after rice [21]. Maize has been grown in almost eight agro-ecological regions [17], concentrating in the northwest, northeast and central highlands (accounting for nearly 60% of the total maize area and production of the country) [7].

In the 1990s, maize production in Vietnam increased dramatically, especially during the time that the government strongly supported and promoted hybrid maize technology. Since then, more productive hybrid maize varieties have been widely adopted [9]. At present, 140 maize varieties are recognized and allowed for production in Vietnam. However, the expansion of maize areas has led to the deforestation, the soil erosion, and the land degradation, especially in the mountainous and highland regions. Additionally, the effects of climate change with intense rainfall that exacerbates the soil erosion on sloping lands. At the same time, droughts have come more frequent that also make the maize farming smallholders vulnerable [4]. This is the challenge for Vietnam if both aim to increase acreage and maize production, while to ensure environmental sustainability and economic household through appropriate agricultural and rural development policies.

Son La is one of the mountainous provinces in the northwest of Vietnam with the third largest natural area of the country. In Son La, about 80% of sloping cultivated land are reserved for maize, industrial plants, fruit trees and other annual crops. For many years, maize has been the major crop in the province, attracting farmers (especially the poor households) to cultivate in all districts and generating most income for local farming households [4]. The land in Son La is quite relevant for growing maize (about 60% of the agricultural land area) [13]. Moreover, more than 40% of cultivation land is distributed at a slope of over 15 degrees (among those, the area of over 25 degrees accounts for about 6%). In addition, about 14% of agricultural land is distributed at elevations above 1,000 m. Meanwhile, maize in Son La is predominantly cultivated on sloping land (about 70% of the maize cultivation area) [13]. This leads to the status that if there are no sustainable maize farming practices, the risk of erosion on maize cultivated land is very high.

In recent years, a number of researches on Vietnam's policies in agriculture have been conducted by domestic and international organizations. However, no research on policies of maize or maize-based production has been conducted. Therefore, this study, by a case study in Son La province provided the audience with practical analysis on maize production and update policies related to maize-based agriculture in Vietnam as well as the implementation status of these policies at the locality. Accordingly, relevant recommendations will be provided to limit the gaps or shortcomings of the policies and partly contribute to improve the management quality. The study focused on the most related policies promulgated by central and local agencies that directly and indirectly affect to maize-based agricultural farming in Son La province.

2. Method

The qualitative were utilized in this study with desk study, semi-structured interviews and focus group discussions. 10 interviews via emails and direct meetings were applied to leaders, managers, researchers. Meanwhile, the focus group discussions were applied to 20 local farmers and traders to understand how the policies have come into effects in practical.

The review began with studying policy reports, agricultural policies and related legal documents for overview of maize production and policy context. Then, it followed by some interviews and group discussion with local authorities, farmers and traders for understanding the practical situation of maize cultivation, consuming and markets. Comments and feedbacks from policy beneficiaries on existing policies were collected to understand the policy impacts to the local production and livelihood.

3. Results

3.1. Maize in Vietnam and Son La

3.1.1. Maize in Vietnam

In Vietnam, the maize farming area and production increased sharply between 1995 and 2015. The rapid increase in maize productivity was recorded due to the application of technical advances, using hybrid maize varieties into mass production (over 90% of the total

maize cultivated area in the whole country). But since 2015, the maize planted area and crop yield began a downward trend. In recent years, the domestic maize production could not meet the domestic demand resulting in the request to import maize from other countries. In 2010, the volume of imported maize was 1.77 million tons (equally to 38.49% of domestic production) [18]. However, by 2020, the volume of imported maize increased 6.8 times compared to the volume in 2010. It was 2.43 times higher than the domestic maize [19]. According to the national master plan, the area of maize production should maintain a stable figure at 1.44 million per ha by 2020; the average maize productivity of the country should be around 5.9 tons/ha; and the maize crop should reach 8.5 million tons. However, at present, the maize cultivated area has been just about 79% as the plan and the crop reached only about 82%. Thus, the plan on expanding area for maize production and crop yield to 2020 has not been achieved yet.

The area for maize cultivation decreased in most localities throughout the country due to some main reasons, among those, unstable selling prices of maize were the core factor encouraged farmers to reduced production. In addition, many midland and mountainous provinces in the north are changing the structure of plantation on sloping land from maize or low value crops to fruit trees or other crop which could bring the higher economic value. Furthermore, unusual weather conditions with heavy rains and droughts in some areas caused of damages on cultivation and production. As a result, some cultivation transformation trends have occurred among farmers' groups in provinces: farmers in Thanh Hoa, Dak Lak, Dong Nai, Son La shifted to grow other crops which may bring higher economic value, while those in Ha Tinh, Nghe An, Son La switched to grow corn for biomass to serve dairy farming, deer farming. Additionally, the famers in Dak Lak and Son La reduced their intercrop area of corn for long term trees.

3.1.2. Maize in Son La

In Son La, between 1995 and 2012, maize cultivation area increased dramatically. In 2012, the cultivated area reached 168.7 thousand hectares (accounting for 14.6% of the national cultivated corn area) and total maize production of 667.3 thousand tons. However, during the period of 2015 and 2019, the area of maize production declined from 159.9 thousand hectares (2015) to 121.5 thousand hectares (2019), decrease by 24,05%. In 2020, the maize area is 84.6 thousand ha (accounting for 8.9% of the whole country's maize area), a decrease of nearly 50% compared to 2012; maize production reached 362.2 thousand tons (accounting for 7.9% of the country's output), declined 45.7% compared to 2012 (Figure 2).

In terms of crop yields, during the period 2007 and 2019, maize crop yield was parallel with the cultivated area. In 2007, the province's maize production was 444 thousand tons, peaked to 667.3 thousand tons in 2012 (the area of maize cultivation reached the biggest figure so far). 80% of annual maize was purchased, preserved by local farmers and enterprises then they sold to the animal feed processing enterprises outside the province while the rests served for local needs. Since 2015, the area for maize farming was significantly decreased and the maize productivity was thoroughly declined. Up to

December 2019, maize crop yield in Son La was only 510.4 thousand tons. The average maize yield in Son La achieved only 4.20 tons/ha, much lower than the national average figure (4.77 tons/ha). However, maize productivity has improved significantly, partly due to the adoption of new varieties. Over the past 10 years, more than 50 varieties of hybrid maize have been grown in Son La province. If in 2015, the yield was only 3.71 tons/ha, this number in 2019 increased by 11.7% compared to the previous four years. Nevertheless, the average maize production in Son La achieved only 4.3 tons/ha (in 2020). It is much lower than the figure of the world (5.8 tons/ha) [1].

Figure 2. Maize cultivation area and production in Vietnam and Son La from 1995 to 2020

Sources: [2], [11], [12], [23], [24]

Since 2015, maize has been recorded as an ineffective crop in the province. The main cause is that maize have mainly been planted on sloping land where soils are frequently washed away and infertile. Cultivating maize in these areas depend on investments on new varieties, fertilizers and pesticide supplies to ensure productivity. At present, maize in Son La has been primarily cultivated on a household scale by traditional methods. After a long period of increasing productivity and farming areas, many sloping lands of maize monoculture have been exploited for many years without any measures to protect and improve the land, causing soil erosion and landslides, degenerate. The other cause comes from the unstable price and the difficulty in product marketing, leading to a fact that the income was lower than the cost for production. Additionally, the efficiency from maize cultivation is much lower than that from fruit crops [22].

Furthermore, the traditional maize farming methods in Son La cause a big amount of soil erosion, up to 64.06 tons/ha/year [8]. Besides, the agricultural land area where could not be actively irrigated (cultivation must depend on the rain) accounts for about 96% [13]. This leads to the hot weather, drought and stem borer disease affecting many areas and causing lost crops (especially in 2010, 2015, 2019). In addition, the selection and the constant change of varieties without official approval caused many serious consequences. Accordingly, the actual average yield of many cultivated maize varieties is much lower than expected, reaching only 25-50% of the potential yield [6].

Since 2015, the province’s authority has promulgated some policies with focus on the transition of crops on “inefficient sloping land” to plantation of highly qualified fruit trees. These policies stipulated the support for renovating mixed gardens and planting fruit trees which encouraged many farming households to change their cultivation methods by conducting the hybrid trials and grafting mangoes; planting pomelos, oranges and bananas alternately on the cultivated area. After learning from the successful models, most farming households changed to plant fruit trees, resulting in the increase of area of fruit tree plantation. Among cultivated crops on sloping land, the transition area of maize cultivation took the largest proportion. The area and structure of changed crops on upland maize is shown in *Figure 3*. Accordingly, by the end of 2018, the total area of maize cultivation changed to fruit tree plantation accounted for 23,578 ha (recorded as 92.8% of the transition area) [10].

3.2. Status of policies on maize production in Vietnam and Son La

In Vietnam, there is a well structure in agriculture management, policy enforcement and decision-making among agencies from central to local levels (*Figure 4*).

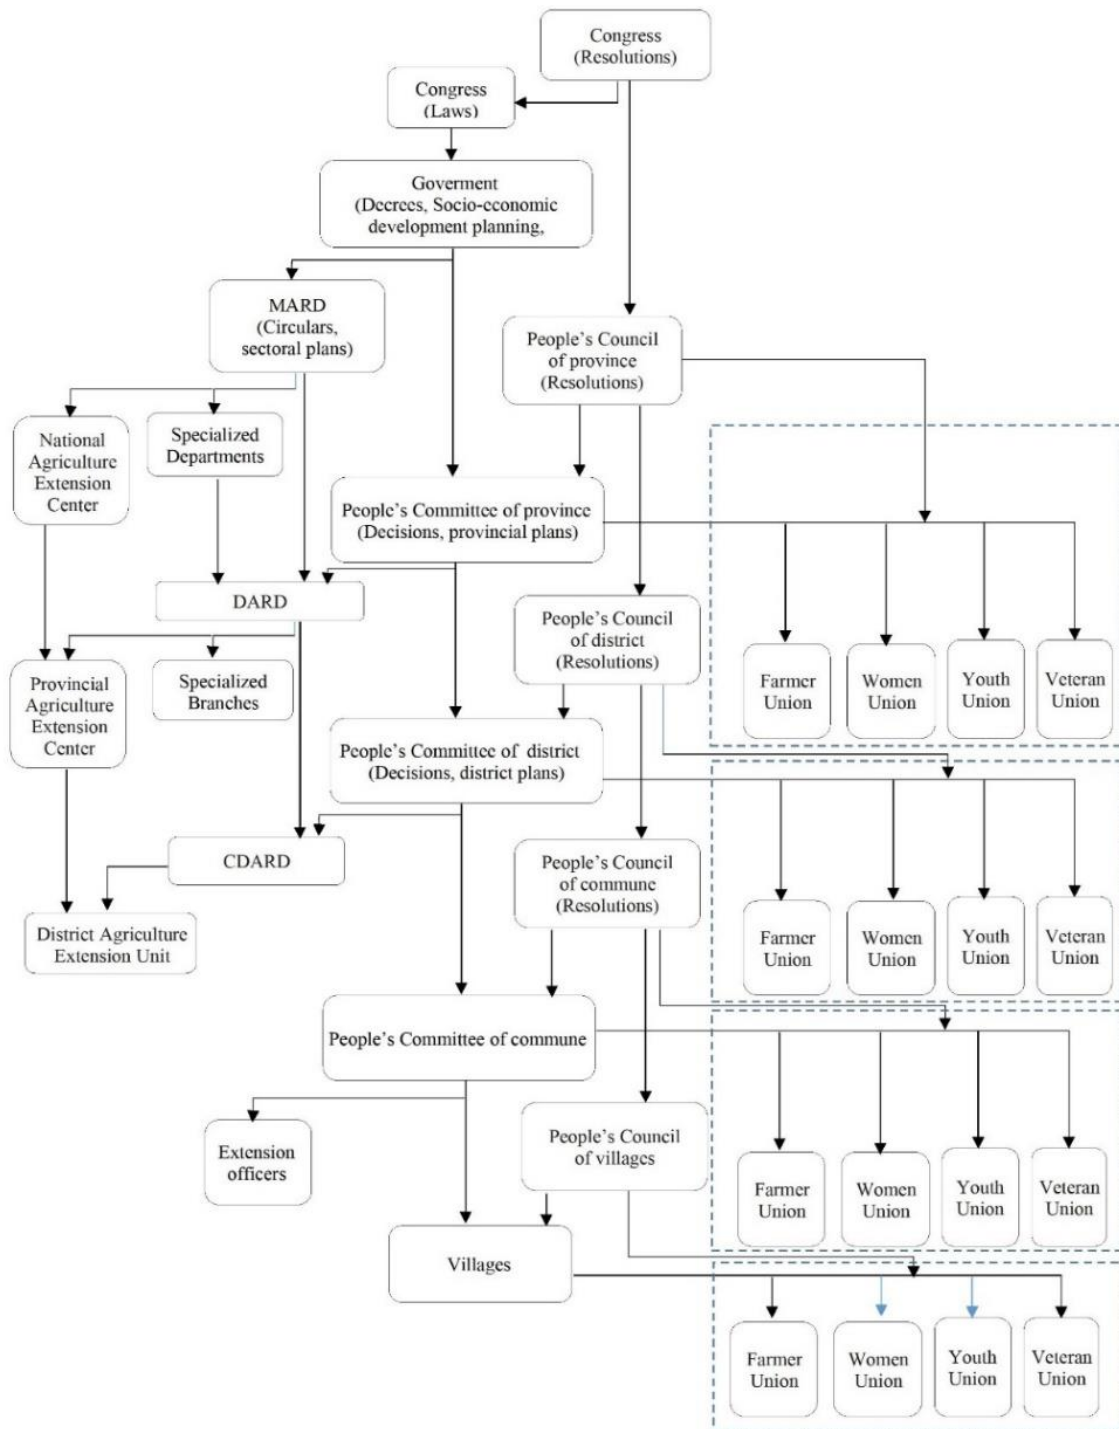

Figure 4. Organizational chart of policy management and enforcement agencies in agriculture in Vietnam

The organizational structure can be divided into three groups: (i) Group for direction (the Vietnamese Communist Party); (ii) Group for drafting, promulgating and state management (the National Assembly, the Government, ministries and ranking ministerial agencies, administrative agencies at provincial, district and commune levels); (iii) socio-political organizations (Women's Union, Farmer's Union, Youth Union, Veteran's Association). These agencies are responsible for drafting, promulgating and implementing policies related to agriculture.

3.2.1. Outstanding policies related to maize in Vietnam

Some plans and strategies in agriculture promulgated by the Government of Vietnam and the Ministry of Agriculture and Rural Development (MARD) consider maize as a mainstay crop. These policies point out the specific objectives and indicators of area, output and orientations to achieve those goals. Accordingly, maize should be developed in accordance with the value chain, and the technology application in maize production, preservation and processing. However, the existing policies to support maize development in Vietnam (including policies of land, credit, science and technology, extension, market) are utilized to all agricultural products, not only maize implication.

In 2007, MARD issued the Decision No. 20/2007/QD-BNN on approving the national strategy for post-harvesting of rice, maize, soybean and peanuts until 2020. Regarding maize, the goal by 2020, post-harvest losses are about 8-9%. Two years later, the Government issued the Resolution No. 63/NQ-CP on national food security. Accordingly, maize cultivation area was expected to reach 1.3 million hectares, with an output of 7.5 million tons. Specific tasks were set up to achieve the goal. Among those, food production areas (including maize) must be concentrated.

Especially, a remarkable national master plan issued by the Prime Minister in accordance with the Decision No.124/QD-TTg in 2012 clearly stated on maize production in the item 2b Part III. This document refers to expand the maize acreage by increasing the winter crop area in the Red River delta and increasing the maize acreage on single-rice crop areas in the northern midland and mountainous provinces and the Central Highlands. It also mentions the acreage of maize after 2020 at around 1.44 million ha in certain areas throughout the country. Moreover, it focuses on intensive cultivation of maize to ensure some 80% of raw materials for the animal feed processing industry. In the same year, the maize production is clearly mentioned in the Decision No. 824/QD-BNN-TT on approving the proposal for plantation to the year 2020 with the vision to 2030. Accordingly, after 2020, maize production area will be stable at 1.44 million hectares with the crop yield of 7.5 million tons, providing about 80% of raw materials for animal feed processing industry.

In 2013, MARD released an action program to implement the agricultural restructuring project in orientation of increasing added value and sustainable development under the Decision No. 1384/QD-BNN-KH. The program's mission to 2020 defined maize as one of the crops being encouraged to develop with large-scale production for animal feeding basing on the existing maize cultivation area and expanded area of the inefficient rice land. It also mentioned that maize cultivation would not apply actively irrigation because maize has been an imported product in large quantities. The action program referred to the solutions of applying genetic modify (GM) maize varieties; applying high technology and sustainable production processes towards good agricultural practices (GAP); saving water; increasing fertilizer efficiency; reducing pesticides and chemicals. All these applications aimed to reduce production costs and to increase the productivity, quality, food safety as well as to reduce agriculture emissions to protect the environment. At the same time, the policy showed an encouragement to promote training, agriculture extension and consultancy

services for farmers to improve skills of production, harvesting and preservation. This program gave its priority to the central agricultural extension projects for producing key products (including maize).

In 2016, MARD issued a separate strategy for maize development to 2025 with a vision to 2030 under the Decision No. 5448/QĐ-BNN-TT. Accordingly, three main objectives related to maize include: (i) Development of maize production based on the application of comprehensive technical packages to increase productivity, product quality and lower costs; to improve competitiveness, production efficiency and to protect cultivated land sustainably (ii) Development of maize production based on the production system which encouraged enterprises (especially the raising cattle and poultry enterprises) to cooperate with maize producers/cooperatives for purchasing fresh maize to dry to meet the breeding quality requirements; (iii) Encouragement of all economic sectors to mobilize resources to invest in maize production and product processing. The Government prioritized their investment in research, technology transfer, drying and preservation of maize. By 2020, the area of maize cultivation in the country reached 1,160-1,265 thousand hectares; the crop yield achieved 5.4 to 5.8 million tons, and the production value reached VND 28 million/ha/crop. The total maize area nationwide aims to reach 950-1,100 thousand hectares, with the crop yield of 4.8-5.5 million tons and a production value of 32 million VND/ha by 2025. By 2030, it refers to keep a stable area of maize cultivation in the whole country like the figure in 2025, but expects to increase the productivity to 0.52-0.53 tons/ha; to achieve around 5.0-5.7 million tons of the crop yield and about 35-40 million VND/ha of the production value.

Furthermore, to support the shifting from rice plantation to maize plantation, the Prime Minister issued the Decision No. 915/QĐ-TTg in 2016 which concentrates on providing producers fund for maize cultivation between 2016-2019. This Decision refers to certain areas in the mountainous provinces, northern midlands area, the northern central coast, the Central Highlands, Mekong delta and eastern South Vietnam. According to the regulation, farmers would be supported not more than 3 million VND per hectare for maize varieties when transiting of cultivation from rice to maize. However, this policy has not been implemented in Son La because it does not fit with the reality and the province's policies. The locality's direction is changing the crop structure on inefficient slope area (where farming maize, rice, etc.) to grow fruit trees those bring more economically benefits.

3.2.2. Policies to develop agriculture by Son La provincial authorities

At present, there is no direct policy for maize development as well as there is no supportive policy to maize production by Son La province (such as supports of seed, technologies, farming techniques, etc.). Only related policies on maize in some policies which directed the transition of crops on "inefficient sloping land" (mainly from maize cultivation land) to plantation of fruit trees. These policies include the Conclusion. No.121-TB/TU approved by the Standing Committee of Son La Provincial Communist Party in 2015 and the Resolution No.28/2017/NQ-HDND in 2017 stipulated the support for renovating mixed gardens and planting fruit trees. Since then, areas of maize cultivation fell down sharply. Especially, the Resolution No.28/2017/NQ-HDND in 2017 stipulated the support

for renovating mixed gardens and planting fruit trees which encouraged many farming households to change their cultivation methods.

In 2014, the People's Committee of Son La province issued the Decision No. 3528/QD-UBND on approving the project “Developing and improving the efficiency of commodity agricultural production of Son La province up to 2020”. Shortly thereafter, in 2015, the policy of planting trees on sloping land was approved by the Standing Committee of the Provincial Party Committee according to the Notice of Conclusion No. 121/TB-TU. Accordingly, fruit tree plantation on sloping land has been identified as a breakthrough step in developing agro-forestry economy, increasing economic efficiency, creating jobs and contributing to protecting the ecological environment, steadily reducing the area of food trees on sloping land.

In 2018, Son La People's Council issued the Resolution No. 76/2018/NQ-HDND on supporting the development of production, processing and consumption of safe agricultural products and foods in the province in 2018-2021. Accordingly, agricultural production households being members of cooperatives, cooperatives, unions of cooperatives and enterprises receive a lot of support when they have export agricultural products; register for a certificate of good agricultural production under VietGAP and Global G.A.P standards; building a product traceability system; building codes and bar codes; propagating and promoting products. For credit support, the support level is 35% of the loan interest rate at commercial banks and People's Credit Funds for production and business, not exceeding VND 500 million/project for construction investment. constructing traffic systems, electrical systems, in-field irrigation systems, warehouses for agricultural products, irrigation systems for the project or plan. Support one-time funding, but not more than VND 100 million/a cooperative to hire a certification organization eligible to be granted Global G.A.P certificate and similar standards.

3.3. Challenges to support maize sustainable production in Son La

Although maize is one of the main food crops for livestock and other purposes, the policy for the sustainable development of maize is rarely mentioned in major central and local policies. Policies on maize are often integrated into small components of development policies. However, during the implementation process, many policies still reveal limitations, or they are unsuitable with the specific case of Son La. Some challenges in the implementation of policies to support maize production in Son La might be faced with, including:

Firstly, there is a lack of policies to encourage linkages in agricultural production associated with high-tech application in processing and preserving maize.

In Son La, maize has been mainly produced and consumed at the household level. There have been no storage and processing facilities for maize products in the province. Meanwhile, the country's target states that 90% of maize commodities must be preserved in a modern warehouse system by the year of 2020 (the Decision No. 20/2007/QD-BNN). At present, the existing policies to encourage linkages in agricultural production associated with high-tech application in processing and preserving agricultural products according to raw

material areas do not mention on maize. Therefore, there should be a need to develop policies to support farmers, cooperatives, enterprises to accumulate agricultural land for large-scale production. In addition, it is necessary to review the existing policies and to take off policy barriers of land use, credit, and policy information access to attract domestic private and foreign enterprises to invest in hi-tech agriculture. Furthermore, the cooperation between farmers and enterprises will be further developed in the future. This relation comes not only from the needs of farmers and enterprises but also from the demands of the market. Therefore, local cooperatives and farmer organizations in the locality should be strongly supported. Besides, it is also in need to apply non-economic measures, community-based measures towards changing farmers' behavior, promoting a healthy linkage environment for stakeholders. At the same time, localities should have policies to encourage mobile processing of agricultural products associated with local raw material areas such as specific support policies of taxes, investment registration procedures, labors, etc.

Secondly, the credit policies for maize production have not really brought into full play.

The Vietnamese government has issued and implemented a series of preferential lending policies for agricultural development since 1999. In Son La, farmers who cultivate maize can easily access concessional loans when the Bank for Agriculture and Rural Development (Agribank) brings their services to all communes through their transaction team who base at the headquarters of the commune People's Committee. However, the research results showed that informal credit (granted by traders) is still the farmers' main choice despite much higher interest rates than the banks' offers. This is because the loan payment period (regulated by Agribank and the Bank for Social Policies) is not relevant to the reality (the farmers have not yet sold maize at the time). The effectiveness of micro-credit programs is still relatively low [3; 16]. More than 50% of maize farming households cannot access loans from banks [6].

The challenges that farmers and cooperatives in Son La are facing with including: the lack of production budget and the increasing input costs (especially the cost for seeds and fertilizers) [5]. Whereas the farmers are not interested in the supportive loans for buying materials for agricultural production due to some difficulties in obtaining financial invoices. Because, in order to complete the procedures for loans and interest rate support, the households must submit financial invoices ("red" invoices). Thus, they have to pay an additional value-added tax expense from 5% to 10% of the bought product value. In addition, many households have not been granted land use certificates yet. Therefore, they do not have enough legal documents to submit for loan mortgages. Furthermore, the short-term loans do not attract the households, is also the reason to make the policies become inediquate in the local practice.

The regulations on interest rate to support for buying machineries, equipments and supplies to serve the agricultural production under the Decision No.497/QD-TTg dated 17/04/2009 (and the amending and supplementing Decision No.2213/QD-TTg dated January 31/12/2009) has been only applied to the group who bought light trucks with a tonnage of less than 05 tons and a loan amount of over VND 200 million. This policy has

not been applied to other groups. The main reason of the policy's late implementation to all groups is due to the strict loan procedures and regulations, such as the requirement of submitting land use right certificates or mortgage assets and having a plan to use machines and supplies; a requirement of locally assembled machines with a rate from 40%, meanwhile, loans are small and short term. In fact, local farmers have mainly used Chinese-made or second-hand Japanese machines with low prices but have many features, which are suitable for their farming.

Some policies supporting the reduction of post-harvest losses for agricultural product have been recorded as slowly deployed in Son La such as the Decision No. 68/2013/QĐ-TTg dated November 14, 2013 by the Prime Minister. The main reason for this situation is the cumbersome loan procedure, resulting in the households' difficulty in loan access. According to this Decision, the machines bought by loans must be 100% brand new if the borrowers would like to have preferential interest rates. Additionally, the loan can only be disbursed at 70% of the machine price. Meanwhile, the households expect to have their own decision of purchasing the machines as they would like. This is the reason why the banks do not want to disburse loans due to their concerns that households may use the loan for the wrong purposes (for example, they may buy second hand machines instead of brand new ones as requirements).

Therefore, it is necessary to have policies to guide and encourage various credit types for farmer organizations to enhance their access to the capital sources such as establishing and operating village savings and loan association groups (VSLA). In addition, it is necessary to review, adjust and supplement credit policies to support agricultural production in the orientation of increasing the loan credit, reducing loan procedures, and expanding the credit line for farmers/cooperatives in accordance with the actual conditions of production and consumption of short and medium-term crop products. At the same time, it should be under consideration of researching and formulating policies to switch from post-investment support to pre-investment support and direct support.

Thirdly, it is a lack of policies to encourage scientific and technological researches in maize production, processing and preservation.

At present, maize in Son La has been still mainly produced on a small scale, with traditional farming methods with low yield and high production costs. Furthermore, maize is cultivated in areas with steep slopes that requests of investments in new varieties, fertilizers and pesticides to ensure the yield. Therefore, it is necessary to develop and promulgate specific policies and action programs to support researches as well as to identify appropriate technologies and techniques for each area and each type of crop in terms of maize cultivation, production and post-harvest preservation. Furthermore, supports for research and application of biotechnologies, high technologies for agricultural development should be included in the policies. At the same time, there should be a policy to encourage the participation of various stakeholders (such as policy makers, enterprises, farmers, technology experts, researchers and other partners) in implementing the policies and the programs. Meanwhile, the local authorities and management agencies could play as the connectors among those parties and would provide legal or service supports. In addition, it

is necessary to set up a system of legal documents specifying the Government's supports for spontaneous researches and initiatives by individuals and organizations, including the regulations on the direct supports from the state budget.

Additionally, farmers in Son La should be provided assistance to overcome difficulties in applying cultivation solutions in sloping land such as minimal land preparation, legume intercropping, grass plantation line band, and small-scale cultivation ladder. At the same time, it is necessary to research to understand the impact of these technical measures when widely applied by farmers. These research results will be the significant scientific base for designing appropriate mechanisms and policies to promote apply these practices across the whole region.

Fourthly, the agricultural extension activities for maize are still limited.

At present, there is no policy on agricultural extension methods (including attached budgets and manpower). Additionally, there is no guidance on the using structure of the extension budget in the direction of increasing funding for information dissemination, training, agricultural extension support in groups, and supports for replication. It is also a lack of specific regulations on cooperation between stakeholders in planning activity; linkages of the agricultural extension activities with other livelihood supports as well as monitoring and evaluating extension activities in one area. Furthermore, there are no clear distinction and specific priority orientation between "extension for livelihoods" (targeting the impoverished people and poor areas) and "extension of commodity production" (targeting more favorable areas) in agricultural extension programs. The impact of extension programs on maize yields is not clear [14; 16]. Agricultural subsidies (for seed variety) seem to be ineffective. Even maize farmers who received the subsidized seed variety had lower production compared to those who did not by [15].

The interviews with local leaders revealed that the capacity of agricultural extension staff in some localities has not met the working requirements due to their limited ability in communication or insufficient professional knowledge, resulting in low enthusiasm and responsibility among extension force. In addition, there is a shortage of policy measures to support capacity building, to develop job descriptions and work plans for commune extension staff as well as village extension collaborators.

Moreover, only a few of technical training programs on maize farming, processing and consuming have been introduced to the farmers. Those are mainly the introduction workshops provided by trading companies and trial groups to sell their varieties or fertilizers. Meanwhile, the extension activities mainly focus on industrial crops and fruit trees. Many varieties are purchased from traders or local shops without information of manufacturing units as well as no technical instruction. Whereas the agricultural extension centers are only allowed to check the variety profiles, not allowed to monitor and inspect the quality of the varieties supplied by the providers. In recent times, there has been a tendency to encourage the introduction of transgenic maize varieties for cultivation without assessing their impacts on the ecosystem and the environment, which bring the concerns by the regulators and maize growers.

Therefore, specific coordination regulations for stakeholders at provincial and district levels should be developed. This activity will support the locality in their policy planning process, integration of capital investments, monitoring and evaluation of the extension activities as well as production supports in the localities. Furthermore, the identification of extension needs at the provincial level should be integrated in the participatory socio-economic development planning process. At the same time, there should be a mechanism to use the commune's plans which are developed basing on the participatory method as a fundamental to integrate resources for agricultural extension and production support. These resources come from the national programs of 135, 30a, rural restructure and other projects such as agricultural vocational training. Moreover, it is necessary to apply the decentralized mechanism to communes, so that they can actively sign contracts in agricultural extension services basing on the needs of the local farmers.

Besides, it is necessary to introduce production models and methods of sustainable maize cultivation on sloping land (such as intercropping between maize and other crops) to ensure both improving soil nutrition, preventing soil erosion and generating better income for local farmers. This solution also aims to ensure maize production in combination with growing fruit trees and other crops to promote the sustainable production. At the same time, strictly control of maize varieties should be seriously under the consideration before cultivation. In addition, the communication method and messages should be changed to fit with the localities by various forms such as village meetings or village loudspeakers.

Fifthly, the market policies for maize are still relatively lackluster.

In recent times, Vietnam has participated in many bilateral and multilateral trade agreements. The international integration is both an opportunity and a challenge for Vietnam's agriculture, including maize production because many enterprises, cooperatives, farm owners and farmers have not been able to adapt in time to the requirements. The reduction of tariffs in the agreements creates significant challenges for maize production in Vietnam with the increasing competition between imported maize and domestic production maize when the tariff is only from 0 to 5% compared to 15-20% previously. At present, Vietnam has also abolished tariff quotas on imported maize since 2005 [20]. At the same time, the application of neomercantilism by countries to protect their agricultural markets as well as the application of food safety and quarantine control measures Vietnam's plants still have many gaps, that put great pressure on maize production/export.

In Son La, the policy implementation indicates that policies on the agricultural markets are also the weakest supportive policy group in the product supply chain, including maize. Almost all production households/enterprises do not receive the supports of information on markets. Though information is provided by various methods such as website or newsletter. However, the messages have not been covered with all related information of the agricultural market in general as well as the maize markets in particular. At macro level, market fluctuations have not been in-depth analyzed. Additionally, the information is not updated. Moreover, the budget for trade promotion programs and market information is insufficient. Therefore, it results in the impossibility of increasing resources for purchasing market information and training.

The interview results also showed that the product market information in Son La is facing with the lack of statutory policies in sharing and coordinating information resources. Most of the cooperatives and farmer households have been lacked of market information, resulting in low product competitiveness compared to trading enterprises. In many localities, many households have massively shifted to plantation of mangoes or other fruit trees without information of product output markets. The cooperatives, small and medium enterprises are not provided essential supports and guidance of finding and evaluating the potential markets for their products in the target markets. Moreover, they are also not provided the information of tariffs and tax incentives.

Additionally, many market policies promulgated by the central agencies, those have revealed certain shortcomings and limited effects when applied at the localities. Some macro-level policies have been in "suspended planning status" and could not apply into practice due to the lack of specific guidance to the localities or there is no instruction by the local authorities. For example, in 2018, after five years of implementation, the Government issued the Decree No. 98/2018/ND-CP with the aim to encourage the development of cooperation and linkages in the production and consumption of agricultural products replacing for the Decision No. 62/2013/QĐ-TTg. However, this decree has not had a circular or technical guidelines for implementation. Besides, the efficiency of sanctions and policy implementation also results in the low effectiveness of the sale contracts between cooperatives/farmer groups and enterprises. In addition, there is a shortage of policy measures to encourage the enterprises to sign direct contracts with farmers through the local cooperatives.

Therefore, it is necessary to study, develop and implement trade protection barriers (quota, voluntary export restrictions, export subsidies, technical standards) for imported maize to support domestic maize production. Accordingly, it is a need to focus on building appropriate import quotas and technical barriers for imported maize. Also, market information services for farmer organizations and cooperatives should be provided through programs of information and knowledge dissemination. Besides, there should be capacity building and assistance programs for farmer organizations, including 1) accessing market (negotiation, bargaining, signing contracts); 2) improving legal knowledge and legal aid; 3) building, developing and managing organizations; 4) supporting in technical assistance and training on production standards for farmers. Furthermore, a consideration of establishing a specialized organization in market and trade promotion for localities is strongly recommended. This unit will be responsible for conducting international trade promotion; working directly with enterprises and farmers' organizations to help them analyze domestic and international markets; guiding them how to find and assess the potential, target markets and providing information on tax, regulations, standards and other related requirements.

4. Conclusion

Maize is one of the main food crops for livestock and other purposes in Vietnam and Son La province in particular. The policies for maize are mainly integrated into certain development policies. Meanwhile, provincial and district agencies do not have their specific policies on maize production. Even the policies which refer to maize, have revealed their

shortcomings in the implementation at the localities. In addition, the policies have been also recorded as in low effectiveness. Furthermore, the policies to support the development of maize production such as policies on land use, credit, agricultural extension, science and technology, markets are all general provisions. There is still a lack of policies on sustainable maize farming. Compared with the national plan on maize production to 2025, with orientation to 2030, the farming area in 2020 reached about 79% and the output achieved 82% only. At present, maize farming area may be going to decrease due to the low price and economic benefits of maize. This might cause the failure of many major policies in implementation. Therefore, there should be well studies and adjustments in the orientation of the local realities to bring strategies and plans into practice,

In Son La, maize is no longer the main crop in the province, although the area of maize cultivation is still large. Over the last five years, maize acreage and maize production has decreased significantly due to the transition trend from planting maize to fruit trees and other crops on sloping land. There is no supportive policy on maize production by the province or district authorities including technical guidance or supports on varieties and farming techniques. The province is focusing on investment and development in fruit and organic agriculture programs through specific policies to support market promotion, development orientation, finance and credit policies and technical measures. Accordingly, in the period 2015-2020, the maize production area in Son La decreased sharply, from 159.9 thousand ha (2015) to 84.6 thousand ha (2020), a drop of about 47%.

This paper also analyzed five challenges to achieve sustainability in maize farming in Son La. Those include (i) the lack of policies to encourage linkages in production associated with high-tech application in maize processing and preserving; (ii) the low effectiveness of policies to support credit for maize production; (iii) the lack of policies to encourage scientific and technological researches in maize production, processing and preservation; (iv) the limitation of agricultural extension activities; (v) the lack of market policies for maize. Based on the analysis results, the article as well clarified certain problems need being addressed to ensure sustainable maize production.

DETERMINANTS OF RESIDENTIAL SATISFACTION WITH RURAL PUBLIC SERVICES: THE CASE OF NAM DINH, VIETNAM

Assoc. Prof. Dr. Dang Thi Le Xuan

xuandl@neu.edu.vn

Assoc. Prof. Dr. Le Huy Duc

duclh@neu.edu.vn

Faculty of Planning and Development, National Economics University, Hanoi, Vietnam

Abstract

The paper uses 3 forms of rural public services (clean water supply, environmental hygiene, and water resources) in Nam Dinh province, Vietnam as a case to analyze the effects of factors on the quality of rural public services and residential satisfaction with the quality of such services in the same area. From the data collected based on the 5-point Likert scale, the authors used Exploratory Factor Analysis (EFA), Confirmatory Factor Analysis (CFA), Structural Equation Modeling (SEM), and Multi-Group Analysis (MGA) to shed light on the influence of the factors. The research results reveal that the factors including reliability, responsiveness, competence, tangible physical facilities, and prices have positive influences not only on service quality but also on residential satisfaction with rural public services. The study also shows the level of residential satisfaction with such services. The research results are the basis for the recommendation of some policy changes in providing rural public services to scale up residential satisfaction with these services as well as improve the provision of public services targeting residents in the process of building a new model for rural areas.

Keywords: *Nam Dinh, public services, rural areas, rural public services, satisfaction, Vietnam.*

1. Introduction

Vietnam is a country where the majority of the households (almost 70 percent) live in rural areas. Rural areas are under the development strategy of the Vietnamese Government. In rural areas, rural public services play an important role in the socio-economic development of localities. With two groups of public services for life and public services for production, they are making positive contributions to promoting production development, sustainable poverty alleviation, improving quality of life, and ensuring social equity for rural people.

Currently, the living standard of rural people in Vietnam increasingly improving, along with the per capita income increases, leading to the rise in the demand for rural public services regarding quantity and quality. Besides state entities, private enterprises are also strongly involved in providing these services. Rural people have better access to rural public services. However, the question of the quality of these services and the satisfaction of rural

residents is still left unanswered. Therefore, we decided to choose the research topic: “Determinants of Residential Satisfaction with Rural Public Services: The Case of Nam Dinh, Vietnam”

The purpose of the article is to identify and evaluate the impact of factors on residential satisfaction with the current rural public services in Vietnam through a case study to propose potential appropriate recommendations for improving the quality of rural public services in Vietnam.

The article uses Nam Dinh province as a case study. Our research attempts to deal with issues by investigating three basic rural public services including rural clean water supply, environmental hygiene (waste collection and treatment), and water resources in Nam Dinh province.

2. Literature Review

2.1. Concept of public services and rural public services

Public services can be broadly understood as the ones that the State is in charge of, serving the basic and essential needs of the people, not for profit. Basically, public services are supposed to serve the necessary common interests of society. Accordingly, rural public services are regarded as the types of services provided by the State to meet the demand of rural areas.

The most basic public services that are often mentioned and have a great influence on the lives of rural people usually include education, health care, irrigation, environmental hygiene, transportation, clean water supply, and industrial and agricultural extension services... Then, these rural public services can be divided into two groups: services for agricultural production (e.g. industrial and agricultural extension services, veterinary medicine, plant protection, irrigation...) and services for residential livelihood (e.g. health, rural clean water supply, electricity...).

Rural service provision includes three key dimensions: Demand, Supply, and Governance with regulations to monitor service provision systems. The three dimensions may be illustrated as follows:

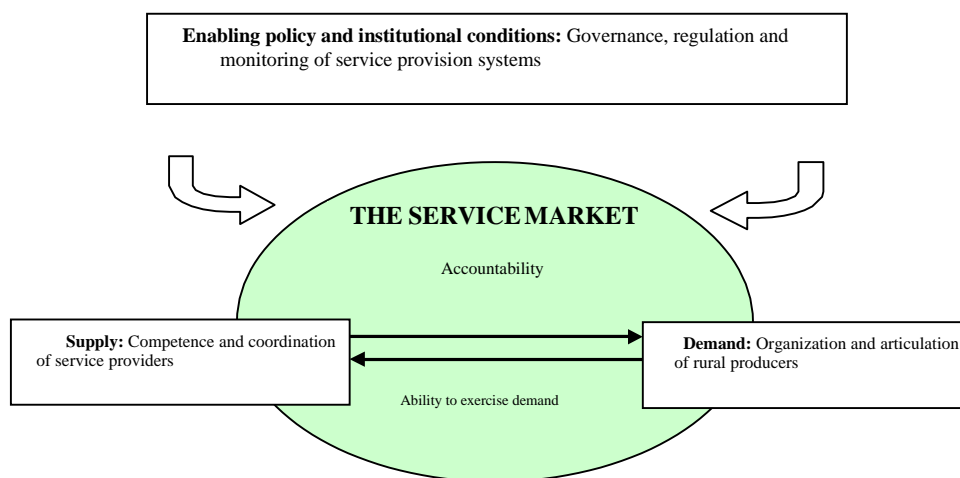

Figure 1. The three dimensions of rural service provision

Source: Jens Rydger et al (2008)

While the private sector is strongly involved in the provision of rural public services, the State still plays the role of the important actor. Therefore, from the administrative perspective, the management of rural public service provision in Vietnam is quite tight.

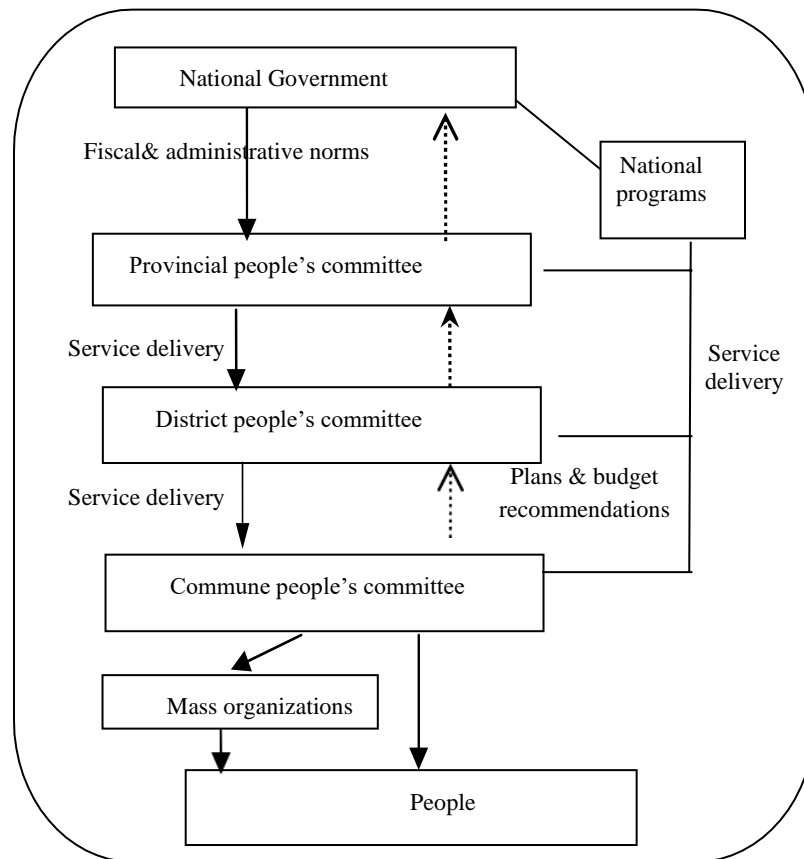

Figure 2. Administrative organization of rural service delivery in Vietnam

Source: Le Huu Anh et al (2011)

The role of rural public service:

Poverty alleviation and livelihood security: Poor and ethnic minority producers in remote areas have access to relevant services that allow them to make informed livelihood and production choices based on their specific livelihood situation and production capacities, and effectively contribute to the elimination of hunger and poverty.

Food security: Rural services enable farmers to meet domestic demands for food security through the production of staple food commodities.

Improving the quality of life: Rural public services are not only for production but also for life. Therefore, rural public services also satisfy the needs and contribute to improving the quality of life of rural people.

Sustainable development: Rural public services may protect the rural environment.

2.2. Satisfaction and service quality.

Understanding customer satisfaction could be considered the fundamental principle of this research work. The definition of customer satisfaction given by Philip

Kotler (Kotler et al. 2013) says that: Customer satisfaction depends on a product's perceived performance in delivering value relative to a buyer's expectations. If the product's performance falls short of the customer's expectations, the buyer is dissatisfied. If performance matches expectations, the buyer is satisfied. If performance exceeds expectations, the buyer is delighted.

Satisfaction could also be described as a process that starts with the formation of customers' expectations and ends with communication of the obtained experience. However, how a person assesses the conducted service is a very subjective thing. Philip Kotler also asserted that: "Customer satisfaction is closely linked to quality. Many companies have adopted total quality management (TQM) programs in recent years. Quality has a direct impact on product performance, and hence on customer satisfaction".

Quality is an elusive and indistinct construct. Often mistaken for imprecise adjectives like "goodness, or luxury, or shininess, or weight" (Crosby 1979), quality and its requirements are not easily articulated by the consumer. Service quality is a measure of how well the service level delivered matches customer expectations. Delivering quality service means conforming to customer expectations consistently (Lewis and Booms 1983).

Service quality is often assessed based on the feedback of service users (Parasuraman & et al., 1985; Cronin & Hult 2000; Vázquez, 2001...). Most of the studies evaluate service quality or customer satisfaction with the method based on the 5-point Likert scale. The major instrument designed in rating the level of customer satisfaction with services is the SERVQUAL scale that was developed by Parasuraman et al., which produced significant progress in the knowledge and measurement of assumed quality of service. It was further designed by Zacharias et al.18 and Yen et al. SERVQUAL has five (5) major areas of measurement such as tangibility, reliability, responsiveness, assurance, and empathy.

2.3. Current provision of some rural public services in Nam Dinh

2.3.1. Research field

Nam Dinh is a Northern province of Vietnam. It has an area of 1,668 km² and a population of 1.78 million (in 2020), of which the rural population accounts for about 70%. This is a plain province with relatively flat terrain and convenient transportation. GRDP per capita reached 45.8 million VND (2021) (equivalent to 1,982 USD).

2.3.2. Current status of providing some rural public services in Nam Dinh

Rural clean water supply

In Nam Dinh, the number of rural households using clean water from centralized water supply works is 337,660, reaching 64.46%. The remaining households use water from other small sources such as open wells, drilled wells, rainwater, or river water...

There are 53 centralized water supply works in the province (of which the private sector manages 28). The designed capacity scale is 177,429 m³/day, guaranteed to meet the demand for clean water of the people in the same area. The water quality of these structures is reflected as quite guaranteed. The current fee applied for clean water service ranges from 3,500 VND/m³ to 8,200 VND/m³. This price is basically in line with the affordability of rural people.

Environmental hygiene

According to the statistics of Nam Dinh province, the amount of domestic waste generated in rural areas is about 660 tons/day. The total amount of waste collected is about 580 tons/day (accounting for 88%). Daily-life garbage is collected 3 times/week with the fee not exceeding 8,000 VND/person/month. There are 177/204 communes having domestic waste treatment facilities in rural areas, including 105 incinerators and 77 landfills. However, the incinerators mainly have a small capacity and do not satisfy environmental standards.

Water resources

According to the Law on Irrigation, the irrigation system consists of a culvert system, pumping station, and water conduit and transfer system.

Currently, there are 609 pumping stations, 5,410 culverts, and 3,290 water transmission and transfer systems. Nam Dinh's free-of-charge irrigation system is widespread throughout the province and provides water for about 113,000 hectares of agricultural land, creating a water source for livestock, poultry, and aquaculture, being a resource supplying domestic water for about 1.8 million people and production facilities.

However, this system is quite old and rarely fixed. So, it is only suitable for small production but large production conditions which are increasingly common.

3. Method

The article applies the mixed method with specific methods are used such as desk research, in-depth interviews with experts, business owners, managers, the services providers, and residents, and a sociological quantitative survey

The research used both primary and secondary data provided by local authorities and agencies. Primary data were collected from 578 households in 2021.

In this study, the research team surveys customers' perceptions of the quality and satisfaction of rural public services, then using the following models in the following order: (1) Scale testing model with 3 techniques: Cronbach's Alpha test, exploratory factor analysis (EFA), confirmatory factor analysis (CFA). (2) *Structural equation modeling* (SEM) and multi-group analysis (MGA). Analysis techniques are performed on SPSS 20 and AMOS 20 software.

Research model

In this study, the research team surveyed customers' perceptions about the quality and satisfaction of rural public services based on a 5-point Likert scale. Then, the study performs the tests of the reliability of the scales, the influence of factors, and regression estimation on the relationship between such influencing factors on the level of customer satisfaction. This quantitative analysis, on the one hand, allows the discovery of the factors affecting the satisfaction of customers with rural public services in the area, and on the other hand, identification of the causes that are the basis for improving satisfaction in the future.

The study uses 5 criteria as influencing factors, including Reliability (TC); Responsiveness (DU); Tangibility (HH); Capacity (NL); Price (GIA). The factor 'service

quality” (CL) plays the role of a mediator between satisfaction and the first 5 factors. Satisfaction (HL) is the result of the overall effect and is a dependent variable.

The research model is designed as follows:

Figure 3. Research model on rural public services

The observed variables of each factor are coded and the content is interpreted in the following table:

Table 1. Coding of observed variables

Influence factors	Observed variables	Items	Hypothesis
Reliability (TC)	TC1	Information is conveyed correctly	H1 +
	TC2	Service providers always keep their commitments	
	TC3	The problem is fixed quickly without errors	
	TC4	Information about the service volume used is correct	
Responsiveness (DU)	DU1	Staff is ready to help customers with procedures	H2 +
	DU2	Transaction time is suitable and fast	
	DU3	Working hours are convenient for people	
	DU4	Time to deal with residential requests is always available	
Tangibility (HH)	HH1	The company has modern facilities	H3 +
	HH2	Enough capacity to serve the needs of the people	
	HH3	Transaction location is stable and convenient	
	HH4	Staff uniforms are neat and easily identifiable.	

Influence factors	Observed variables	Items	Hypothesis
Capacity (NL)	NL1	Qualified and experienced staff	H4 +
	NL2	Always respect customers and make them feel secure	
	NL3	Problems emerging in service provision are well addressed	
	NL4	The difficulties and desires of customers are always taken care of	
Price (GIA)	GIA1	The price is suitable for residential income	H5 +
	GIA2	The initial contribution cost is appropriate	
	GIA3	Reasonable repairing and maintenance costs	
	GIA4	The payment method is convenient and suitable	
Service quality (CL)	CL1	The quality of the products is guaranteed in line with the commitment	H6 +
	CL2	Highly satisfying the needs of production and residential life	
	CL3	Technical facilities and equipment are modern	
	CL4	Service attitude is proper	
Satisfaction (HL)	HL1	Customers are satisfied with the public service provided	Dependent variable
	HL2	Residential expectations of service quality are met	
	HL3	Continue to use rural public services	
	HL4	Recommend for neighbors and relatives to use the service	

Data

The data was collected through a survey by questionnaires for households that have been using the above-mentioned 3 types of services in 4 districts of Nam Dinh province: Yen Yen, Nam Truc, Giao Thuy, and Hai Hau. The research team distributed nearly 600 questionnaires, and 578 were collected. Each service has 186 responses. A total of 558 responses are valid. With each factor in the model, the questionnaire includes 28 questions corresponding to 28 observed variables, using a 5-level Likert scale. The scales are shown in table 1 above. The minimum required sample size is 140 (28 X 5) observations with 28 observed variables. The survey sample size has exceeded the sample size requirements.

4. Results

4.1. Descriptive statistics of the survey sample

SPSS 20 software was used to produce descriptive statistics. The results are presented in Table 2.

Table 2. Descriptive statistics of the survey sample

Types	Value			Frequency	Percent (%)	Valid Percent (%)	Cumulative Percent (%)
Environmental hygiene	Valid			0	372	66.7	66.7
				3	186	33.3	100
				Total	558	100	100
Water resources	Valid	0		372	66.7	66.7	66.7
		3		186	33.3	33.3	100
		Total		558	100	100	
Rural water supply	Valid			0	372	66.7	66.7
				3	186	33.3	100
				Total	558	100	100

Source: Analytical results using SPSS 20

4.2. Test of Cronbach's Alpha

The results of Cronbach's Alpha test for the scale are presented in Table 3 showing that Cronbach's Alpha of all items is higher than 0.6 and the total variable correlation coefficient > 0.3 . Thus, with the original 28 observed variables, after removing 5 observed variables (noted in Table 3), the remaining items meet the requirements for EFA analysis.

Table 3. Results of testing Cronbach's alpha coefficients of scales

Scales	Number of observed variables	Cronbach' Alpha	Note
Reliability (TC)	3	0.778	remove the observed variable TC2
Responsiveness (DU)	3	0.721	remove the observed variable DU2
Capacity (NL)	3	0.75	remove the observed variable NL1
tangibility (HH)	3	0.794	remove the observed variable HH4
Price (GIA)	3	0.766	remove the observed variable GIA1
Service quality (CL)	4	0.765	-----
satisfaction (HL)	4	0.821	-----

Source: Analytical results using SPSS 20

4.3. Exploratory factor analysis (EFA)

Using EFA analysis on SPSS 20 software, after removing some observed variables with loading factor < 0.5 , variables have converged in 7 groups and satisfied the test requirement (Table 4). The results show that all scales have KMO coefficient > 0.5 ; Total

variance extracted > 50%, Eigen Value coefficients > 1. Therefore, it can be seen that the factors are consistent with the research data. As a result, 7 factors were extracted including 23 observed variables used for the subsequent analysis of CFA.

Table 4. Test results of scale EFA coefficients

Scales	KMO	Sig	Total variance extracted (Extraction Sums of Squared Loadings)	Eigen Value
Independent variables	0.693	0.000	0.6809	1.247
Service quality	0.70	0.000	0.5809	2.348
Satisfaction	0.755	0.000	0.6531	2.612

Source: Analytical results using SPSS 20

4.4. Confirmatory factor analysis (CFA)

CFA analysis on AMOS 20 software produces normalized CFA results shown in Figure 4.

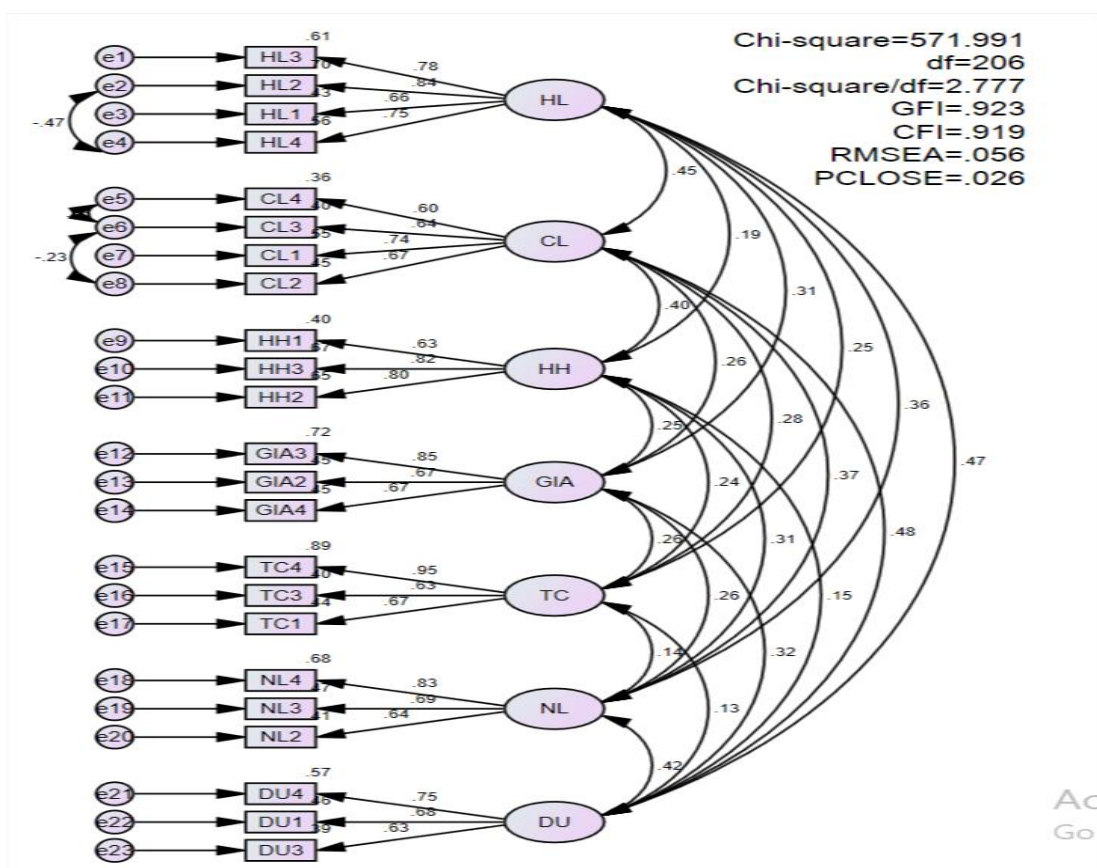

Figure 4. Normalized CFA analysis results

Performing the model's fit test, it shows that the model has 206 degrees of freedom; Chi Square value = 571,991 with P-value = 0; GFI = 0.923 > 0.9; CFI = 0.919 > 0.9; RMSEA = 0.056 < 0.06; Chi-Square = 2,777 < 3; Thus, according to Hu & Bentler (1999), the analysis results show that the data are consistent with the proposed model.

The research team continues to test reliability, convergent validity, and discriminant validity. The data in Table 5 shows that the reliability of CR is > 0.7 ; The total values of variance extracted VEA $> 50\%$. Thus, it can be concluded that the components in the scale are reliable and convergent.

Analysis of the correlation coefficient between the factors corresponding to the diagram in Figure 1 shows that the maximum value is 0.47, which is quite small compared to the threshold of 0.85, so the factors satisfy the condition of discriminant value.

Table 5. Results of the tests of reliability and convergence of functional quality scale

Scales	CR	AVE (%)
Reliability (TC)	0.764	0.522
Responsiveness (DU)	0.842	0.573
Capacity (NL)	0.761	0.512
Tangibility (HH) (HH)	0.797	0.571
Price (GIA)	0.777	0.541
Service quality (CL)	0.800	0.580
Satisfaction (HL)	0.759	0.508

Source: Analytical results using AMOS 20

4.5. Structural equation modeling (SEM)

SEM model was used to test the model and research hypotheses. The model estimation results show that there are two concepts: (1) Service quality and (2) Residential satisfaction, in which, satisfaction depends on the quality of the service. The normalized SEM results are shown in Fig. 5.

Figure 5. Standardized SEM model results

The SEM model has 211 degrees of freedom, with the following indicators to ensure the validity: Chi-Square/df = 2.975 < 3; GFI = 0.915 > 0.9; CFI = 0.908 > 0.9; RMSEA = 0.06). The main parameter estimation results show that the estimated coefficients are statistically significant and greater than 0. Thus, the hypothesis about the impact of quality factors on satisfaction is supported. Besides, the estimated coefficients of the variables are all statistically significant, except only one variable, GIA, which has no significant impact on Quality with $P=0.73 > 0.05$.

The results are shown in Table 6.

Table 6. Test of causality in SEM (unstandardized)

Relationship	Unstandardized Estimated results				Standardized (Estimate)
	Estimate	S.E.	C.R.	P	
CL<--- TC	.107	.030	3.609	***	.174
CL<--- DU	.298	.050	5.957	***	.405
CL<--- NL	.096	.042	2.261	.024	.133
CL<--- HH	.304	.069	4.420	***	.255
CL<--- GIA	.014	.041	.345	.730	.018
HL<--- CL	.632	.079	8.018	***	.513

Source: Analytical results using AMOS 20

From the last column of Table 6, with the standardized estimation results, the following remarks can be made:

The factors of Reliability, Responsiveness, Capacity, Tangibility, and Price all have a positive impact on the quality of rural public services. The factor ‘Responsiveness’ has the strongest impact, followed by the Tangible, the Reliability, the Capability, and finally, the Price.

The factor ‘Quality’ has a positive impact with a fairly large weight on residential satisfaction. This is sound

In addition, the Squared Multiple Correlations coefficient table shows that the factor ‘Quality’ only explains a little more than 30% of the variation of the factor ‘Satisfaction’, while the remaining 5 factors contribute more than 44% to the change of the Quality factor

4.6. Testing the research hypotheses

From the above estimation and analysis results, the following conclusions can be made about the research hypotheses:

H1 is supported: Estimation coefficient = 0.107, $p = 0.000$ shows that an increase in reliability in service delivery will improve service quality, thereby improving residential satisfaction.

H2 is supported: Estimation coefficient = 0.298, $p = 0.000$ shows that increasing responsiveness in service delivery will improve service quality, thereby improving residential satisfaction.

H3 is supported: Estimation coefficient = 0.096, $p = 0.024$ shows that increasing the service capacity of staff in service delivery will increase service quality, thereby improving residential satisfaction.

H4 is supported: Estimation coefficient = 0.304, $p = 0.000$ shows that increasing equipment for service delivery will increase service quality, thereby improving residential satisfaction.

H5 is supported: Estimation coefficient = 0.014, $P = 0.73 > 0.05$: Do not support the hypothesis H5 that an increase in service delivery prices will increase service quality and thereby increase residential satisfaction.

H6 is supported: Estimation coefficient = 0.632, $P = 0.000$, there is enough empirical evidence to say that increasing service quality will increase people's satisfaction with rural public services.

4.7. Multi-group analysis with SEM model

To test whether residential perceptions differ on the impact of factors on service quality and satisfaction towards the 3 products and services provided, it is necessary to use the multi-group analysis method. To perform this test, the study has estimated two types of models: Mutable and Invariant. With the support of AMOS 20 software, two models have been estimated as shown below.

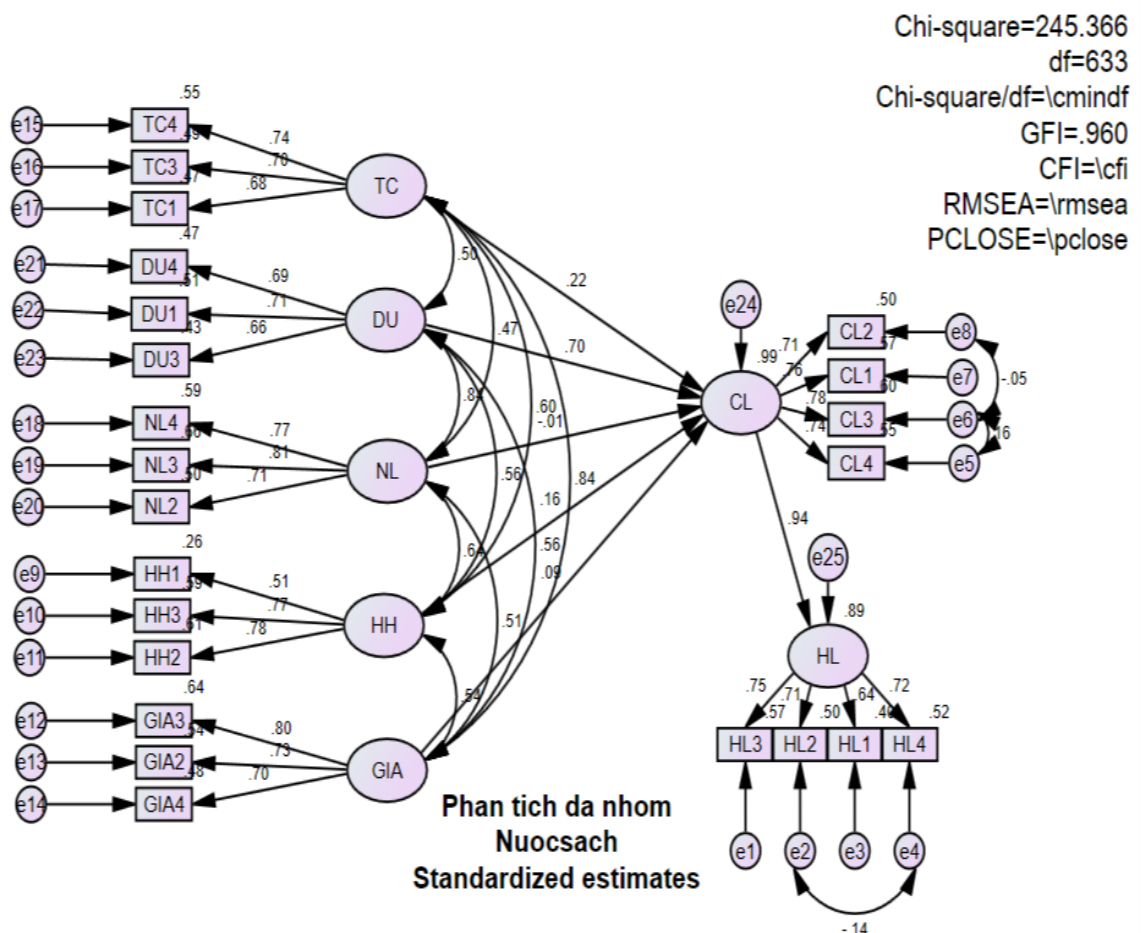

Figure 6. Mutable model

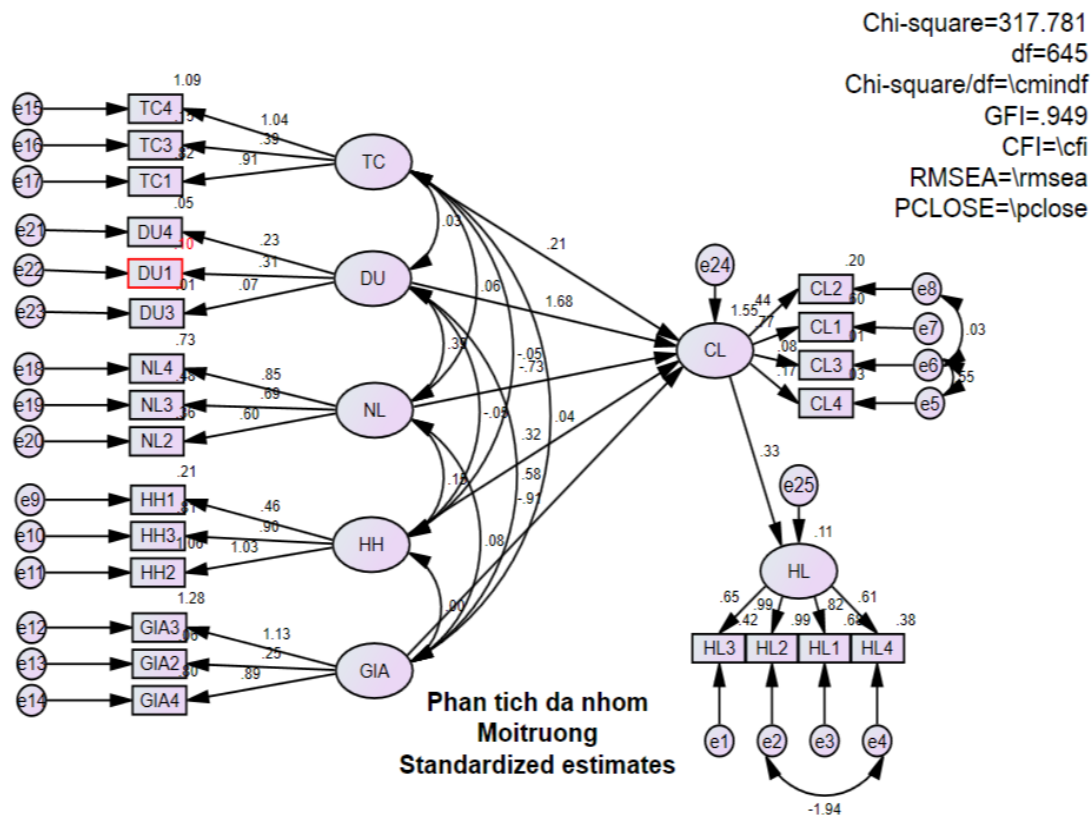

Figure 7. Invariant model

The indexes of the Chi-Square value and degrees of freedom of the two models are presented in Table 7, and the P-value is calculated. With a very small P-value (approximately zero), we support the assumption that there is a difference in residential perception about the relationship between factors for the services being studied.

Table 7. The value of the multi-group structure model

Mode	Chi-Square	df
Mutable model	1795.393	633
Invariant model	1891.984	645
Difference	96.591	12
P-Value	2.58372E-15	

Due to the difference in the evaluation of the 3 services mentioned above, the comparison will use the Mutable model. Using the mutable model (Figure 6), the authors have arranged the relevant indicators in Table 8 for the three fields of *Rural clean water supply*, *environmental hygiene*, and *water resources*. Table 8 shows that there is not much difference between the two fields of *environmental hygiene* and *water resources*. However, the field of *Rural clean water supply* is very different from the other two fields. Specifically, in the 5 factors considered, there are 4 factors affecting the service quality having statistically

significant impacts and only the tangible factor's impact is statistically insignificant. Moreover, the estimated coefficients all have values greater than 0, satisfying the assumptions of the research model. In general, in the field of clean water supply, the impact of factors on service quality and satisfaction is greater for the other two areas. In particular, the explanatory level of the factors to the dependent variable in the field of clean water supply is also superior to that of the other two fields, respectively 93.2% for the 'Quality' variable and 71.8 for the 'Satisfaction' variable.

Table 8. Comparison of differences in evaluation of public services

Sector	Relationship	Indicators			
		Estimate Unstandardized	P-Value	Estimate Standardized	Squared Multiple Correlations
<i>environmental hygiene</i>	CL<--- TC	.154	.038	.230	CL: 18.5 %
	CL<--- DU	.201	.025	.269	HL: 5.7 %

5. Conclusion and Recommendation

5.1. Conclusion

Based on survey data, the article has carried out a quantitative study on the factors affecting service quality and residential satisfaction with rural public services in Nam Dinh province. Such results lead to the following conclusions:

CFA analysis shows that the models are suitable for survey data. The scales all ensure convergence value, unidirectionality, reliability, extracted variance, and discriminant value. The SEM analysis shows that the selected research model is quite suitable for the survey data.

The study has identified factors that positively affect service quality and residential satisfaction, in which the strongest impact is the factor 'Responsiveness' followed by the impact of the tangibility and Reliability. The impact of quality on satisfaction is also significant. Besides the commonly used factors, the study has tried to add the 'price' to the research model. However, the influence of this factor is statistically insignificant.

Analysis of multi-group in the SEM model has also shown that there are differences in residential perception of the impact of factors on quality and residential satisfaction with rural public services. Research results in the field of clean water supply are the most convergent. That partly shows that people have more interest in clean water services than in the other two areas.

The research model only examines 3 services that do not necessarily represent all forms of rural public services. It is also the room for the authors to continue to further explore in the future.

5.2. Recommendations

Along with the program of building a new model for the countryside being strongly implemented in rural areas of Vietnam, rural public services have also been expanded in both scale and type of services. Recently, the provision of rural public services has tended to shift sharply from the role of the State to the private sector, creating increasingly fierce competition. Therefore, improving the quality of rural services is an urgent need, a vital factor for suppliers to improve residential satisfaction. Drawing on the findings, the authors propose the following recommendations to improve the quality and satisfaction of rural public services:

-Further enhancing the responsiveness of service providers to the people. Specifically, staff should always be ready to help people with procedures related to service registration; fast transaction time; flexible working hours to create more convenience in daily life and agricultural production activities.

-Increasing investment; modernizing facilities and equipment to meet people's needs; working style is becoming more and more professional.

-Improve people's trust in the service individual providers. This is reflected in the timely and accurate communication of information related to products and services. Suppliers need to ensure commitments on quality and price; publicity and accuracy of the volume of services used to ensure fairness for beneficiaries of rural public services.

-Through the survey of people, the service capacity of the 3 research services is still not reliable, and there is a significant difference. In the coming time, service providers need to further improve their professional qualifications, capable of quickly solving problems emerging in the supply process; respect residential opinions and pay more attention to people's difficulties as well as reasonable wishes.

-The research results also show that the impact of the price factor on satisfaction is not statistically significant. This shows that the price of rural services is not currently a serious concern of the people. Therefore, to improve service quality, service providers can negotiate at a more favorable price, to ensure the balance between the quality of services provided and the reasonable interests of investors.

SOLUTIONS ON DEVELOPING MARINE ECONOMY IN QUANG BINH PROVINCE IN THE CURRENT PERIOD - VIEWING FROM THE PERSPECTIVE OF ECONOMIC PHILOSOPHY

Dr. Nguyen Van Duy

nguyenvanduydhqb@gmail.com

Faculty of Laws, Quang Binh University, Quang Binh, Vietnam

MA. Nguyen Thi Hong Tham

hongtham.spk2a@gmail.com

Faculty of Foreign Languages, Quang Binh University, Quang Binh, Vietnam

Abstract

On the basis of an overview of the basic theoretical issues of the marine economy, the researchers focus on surveying and assessing the current state of the marine economy in Quang Binh province. Basing on the economic philosophy point of view, the research objective, the authors analyze and evaluate the current situation, and offer solutions to develop the marine economy in Quang Binh today in a practical and meaningful way. All the explanations of the issue are seen from the perspective of economic philosophy of the researchers. Research on the panorama of marine economic activities such as: marine economic activities, the basic factors affecting the development of the marine economy, the impact of globalization and internationalization on the development of the marine economy in Vietnam. Then, reflecting specifically the development of marine economy in Quang Binh, the locality has many comparative advantages in marine economy.

Keywords: *Quang Binh province, perspective of economic philosophy, solutions on marine economic development*

1. Introduction

The world is entering a new stage of development, with the trend that is increasingly affirming the great importance of seas and oceans. The scarcity of raw materials and energy leads to frequent and intense market competition, territorial disputes and national conflicts. "Reaching out to seas, exploiting the oceans" [4, p.12] has become a strategic action slogan of the whole world.

Vietnam, blessed with nature, is a country with a large area of seas and islands in the East Sea with 3260 km of coastline and more than 3000 islands and rocks. It is estimated that Vietnam's scale of the sea and coastal economy has the average of about 47 - 48% of the country's GDP. The strategy for sustainable development of Vietnam's marine economy to 2030, with a vision to 2045 affirms: "It's obligatory to become a country which is strong in the sea, enriching from the sea, on the basis of promoting all potentials from the sea, developing comprehensively marine industries with a rich and modern structure, creating a fast, sustainable and highly efficient development with a long-term vision" [4, p. 5]. This is a complete strategic orientation, as well as a clear direction for the current development of Vietnam's marine economy.

Quang Binh is a province in the North Central Coast with a marine exclusive economic zone covering an area of more than 20,000 square kilometers, with a coastline of 116.04 kilometers and five small coastal islands with a total area of 185 hectares. This is a place with a particularly important position in the strategy of socio-economic development, security and defense for the whole North Central region and is the gateway to the sea on the East-West corridor connecting the Trans-Asia route from Northeast Thailand via National Highway 12A with international shipping through Hon La seaport. Quang Binh marine economy plays an important role in the socio-economic development of the province with a strategy of comprehensive development of industries from the marine economy, including: marine minerals, fishing and farming, marine tourism and entertainment, research and education...

However, in the context that the whole world is strongly moving to the sea in the 21st century, the scale of marine economic development in Quang Binh province today is not commensurate with the potential and the values that the sea brings. In the face of the above actual situation, based on the economic philosophy point of view, the aims of the research, analyzing, and evaluating the current situation, and offering solutions of developing the marine economy in Quang Binh is very practical and meaningful today. On the basis of an overview of the basic theoretical issues of the marine economy, focusing on surveying and assessing the current state of the marine economy in Quang Binh province, some viewpoints and solutions are proposed to develop the marine economy of Quang Binh in the period of economic integration. All the explanations of the problem are seen from the perspective of economic philosophy of the researchers.

2. Method

Research object is Quang Binh marine economy, strategy for comprehensive development of industries from marine economy, including: marine minerals, fishing and farming, marine tourism and entertainment, research and education.

Research tools ensure scientific principles. Thoroughly researching theoretical perspectives associated with practice, viewed from the perspective of economic philosophy to serve the construction of Vietnam today.

Collecting and analyzing data from specific research methods are: comparative research method, specific historical synthesis, field survey and systematic method.

Methods of researching documents and texts; observation method; methods of processing data collected by mathematical statistics. Observational and interview methods are used to detect research problems.

3. Results

3.1. Marine economy, the role and factors affecting marine economic development in Quang Binh province

The important role of the marine and ocean economy for the current and future economic and social development is increasingly clearly demonstrated by the extremely rich and diverse marine resources that are satisfying the increasing demand of the society.

From the perspective of economic philosophy in the narrow sense, marine economy is all economic activities at sea, including: maritime economy (sea transportation and seaport services); seafood (fishing and aquaculture); offshore oil and gas exploitation; marine tourism; salt making; searching - rescuing services and island economy. Marine economy in a broad sense means all economic activities taking place at sea and economic activities directly related to marine exploitation in the coastal mainland. To be suitable for the purposes and research subjects, the researchers present the marine economy in three main fields: Fishing, aquaculture and seafood processing; Maritime economy; Sea travel.

Referring to the role and factors affecting the economic development of the oceans and seas, the strategists all agreed that: Oceans and seas are humanity's last reserve of food and fuel resources in the 21st century, especially when the world is facing a crisis of lack of natural resources on land as follows:

The first is the marine economy in transportation development. Developing sea transport which connects the most countries and has the lowest transport costs but can accommodate the largest volume of traffic. It is the development of shipping that has promoted the trade of nations to become efficient.

Secondly, it is the marine economy in the development of the oil and gas industry. Today's oil and gas industry has become one of Vietnam's spearhead industries, the country's leading export industry (more than 3 billion USD annually), associated with the marine economy. Almost all of Vietnam's oil and gas reserves are located in the continental shelf. On the area of the continental shelf with a water depth of up to 200m, reserves of about 550 million tons of oil and 610 billion m³ of gas have been discovered. Potential reserves are estimated at 0.9 - 1.2 billion m³ of oil and 2,100 - 2,800 billion m³ of gas.

Thirdly, it is the marine economy in mineral exploitation. Many minerals have large reserves such as bauxite, iron ore, rare earth, apatite, ilmenite placer...with a total reserve of about 10 million tons. The accompanying minerals are zircon, monacid with high economic value. This is a fairly large source of raw materials that can serve the TiO₂ powder production industry.

Fourthly, it is the marine economy in the development of the processing industry. The sea provides more and more variety of raw materials for the processing industry such as: fish, shrimps, crabs, oysters, squids, seaweeds, pearls... in the form of wild fishing and farming. According to the Directorate of Fisheries, the value of fishery production in 2020 increased by 6.25% compared to 2019. The total output of all kinds reached about 8.15 million tons, up 4.9% over the previous year. Thus, the development of aquaculture and fishing plays an increasingly important role in the economic development of the country in general and the processing industry in particular.

The fifth is marine economy with national defense and security. The characteristics of topography and tides make Vietnam's seas dominate and influence in a very tight way, which is vital for national and regional security and defense. Vietnam's seas and islands are located in the East Sea, in the region with the very dynamic economic development of the Asia-Pacific.

It can be said that the marine economy plays an increasingly important role in the national economy, the marine economy has become a driving force for the development of industry and other economic sectors because the sea is the gateway to exchange with the world. world, creating favorable conditions for the import and export of goods at low cost. Then, clearly analyzing the conditions and potentials of natural - social conditions for the development of marine economy in Quang Binh province. Listing completely on the local marine economic development policies, focusing on developing the strong industries, the economic achievements achieved as well as specifying the outstanding obstacles from which locals provide basic and feasible solutions to promote the potential of the marine economy and to improve the economic efficiency in marine economic activities in Quang Binh. The province is determined to bring sea and inland waterways "effectively exploiting existing ports. Calling for investment in building Hon La port, upgrading Gianh Port and some other ports serving international and domestic shipping routes. Strengthening the socialization of dredging and clearing river channels"[3, p. 35].

3.2. Main solutions to develop marine economy in Quang Binh province today

To implement marine economic development, it is necessary to: promote basic survey of coastal areas and planning; mobilize investment capital sources; expand international and regional cooperation with other localities; develop science and technology human resource; strengthen the State management apparatus; promote the combination of economy and defense, which can be divided into the following solutions:

3.2.1. Solutions on implementing effective management of marine economic development in Quang Binh province today

That is implementing effective management. Quang Binh is striving to be one of the leading provinces in developing the marine economy of the North Central Coast in the future. It is especially important to improve the effectiveness of the competent authorities in managing and directing the province's marine economic development. Competent agencies related to marine economic development planning must properly perform their functions and tasks, specifically:

Firstly, the Department of Agriculture and Rural Development is a specialized agency performing the state management function on: agriculture; forestry; salt - making; fishery; irrigation and rural development. Therefore, it is especially important that the Department take measures in different periods to prevent and control floods and storms; safety of agricultural products, forest products, aquatic products and salt during the production process until they are put on the market.

Secondly, Quang Binh Department of Fisheries performs the function of State management of fisheries in the province, including: aquaculture, exploitation and processing of aquatic products, and protection and development of aquatic resources inland and at sea; The Department needs to come up with strategies, development plans, long-term, five-year and annual plans, programs and projects on fishery activities in the province in accordance with the total plan for socio-economic development. The Department needs to guide, inspect and organize the implementation of regulations on decentralization of management of

fishing vessels, fishing ports, fishing wharfs, shorelines, storm shelters of fishing vessels and registration of fishing vessels. Actively inspect and guide the production, harvesting, preservation and processing of salt in localities of the province.

Thirdly, Quang Binh Department of Tourism undertakes the state management of tourism in general and sea tourism in particular. The Department needs to take measures to protect, embellish, exploit and rationally use marine resources effectively. Moreover, strengthen the development of marine tourism promotion programs to promote Quang Binh tourism widely throughout the country as well as internationally.

Fourthly, state agencies involved in marine economic fields must associate the process of marine economic development with the process of urban development planning, industry and product development planning. Developing a marine economic strategy should clearly show the key investment direction. Competent agencies must consider the role of science - technology development and high-quality human resource training as the main orientation for the development of all fields of marine economy, gradually bringing the marine economy to enhance their potential and strengths.

3.2.2. Solutions on implementing policies to support marine economic development in Quang Binh province today

In recent times, the marine economy of Quang Binh province has achieved remarkable achievements. However, there is still no marine strategy and specific development programs to fully promote the potential of Quang Binh marine resources. Therefore, in the process of developing the marine economy, it is necessary to have supportive policies to create momentum for the favorable development of the marine economy as follows:

Firstly, Quang Binh needs to strongly develop the marine economy in order that this strength becomes a spearhead economy of the locality, especially improving the capacity of offshore fishing in close association with investment in fishery infrastructure such as ports, shipyards, and establishing seafood processing factories.

The second is promoting administrative reform and give incentives to fishermen. Leaders of departments should offer many preferential policies for fishermen to borrow money to expand production, support them to build new fishing ships, replace engines, buy crew insurance, and hull insurance.

Thirdly, ensuring safety and security for marine economic activities is also one of the policies to support the development of Quang Binh's marine economy. The Provincial Sub-department of Irrigation and Flood - Storm Control needs to strictly adhere to the motto "Prevent actively, respond promptly, and overcome quickly and effectively". Safety for fishermen and means of transportation at sea during the rainy and stormy season needs to be done right from the fishermen community. It is necessary to consciously learn how to avoid natural disasters, well comply with maritime safety requirements, follow the instructions and directions of flood and storm prevention agencies, and reduce damage caused by natural disasters.

The fourth is attaching importance to marine science and technology development and human resource training to serve marine economic sectors. The province must soon develop mechanisms and policies of attracting overseas Vietnamese experts and highly qualified foreign experts to Quang Binh to participate in research, teaching, consulting, and assuming management positions of marine science and technology research.

3.2.3. Solutions on focusing on regional development and regional connection to develop marine economy in Quang Binh province today

In economic development thought, it is very vital to connect with each other to develop. If economic activities are carried out according to the locality, everyone can do it on their own, and the economic management follows administrative boundaries, it is very difficult to develop. Quang Binh province should not develop massively and sporadically, but it must share and focus on its main development direction in its role with the entire North Central region.

Firstly, the advantage of Quang Binh province's marine economy is in the field of fishing, aquaculture and seafood processing, therefore, connecting with neighboring provinces is an important factor to help this field develop its strengths. Connecting in fishing, in sharing farming experiences and seafood processing methods will help provincial leaders as well as businesses to be active in source raw materials, reduce costs, create stability for product output, but also contribute to increase product value, create a closed process from production, processing to product consumption.

Secondly, the potential for sea tourism is great, therefore, Quang Binh must know how to choose outstanding tourism topics to connect. Promote more tourism products for the tourism industry, contribute to rationally and effectively exploit tourism's potential.

Thirdly, Quang Binh Port needs to connect with ports of neighboring provinces such as Vung Ang Port, Cuu Lo Port, Chan May Port, etc... in engineering geological investigation, geodynamics and archaeological geology of sea areas and terraces. continent; apply adaptive solutions to minimize the impact of climate change and sea level rise on the operation of seaports; control the pollution of the environment around the port... Quang Binh port system is in the port planning of the whole region, sharing experiences in this new field of marine economy to interact with each other and develop together.

3.2.4. Solutions for state-owned enterprises to develop marine economy in Quang Binh province today

Firstly, businesses need to set out specific mechanisms and policies for themselves. In order to have a new development direction, which is suitable to actual conditions, state-owned enterprises should not be tied to the old mechanism, must create conditions for cooperation, external relations, association and cooperate development models. It is necessary to build for themselves an appropriate organizational, management and production structure.

Secondly, it is necessary to actively review and adjust long-term and medium-term strategies and develop specific production and business plans each year to ensure a healthy,

efficient and sustainable financial balance; Investing in science and technology application and training high-quality human resources will contribute to overcoming the limitations of mechanisms, policies and efficiency of production and business activities.

Thirdly, improve the quality and efficiency of production and business activities: This is an extremely important issue for businesses. In the process of participating in production and business activities, especially in the fields of marine economy, improving the quality and efficiency of production and business activities must be a top priority.

3.2.5. Solutions for private enterprises to develop marine economy in Quang Binh province today

Firstly, strengthen the application of new science and technology: Innovation in production and business is very necessary for private enterprises. Participating in marine economic activities, private enterprises must always find new production methods and regularly innovate techniques. Only in this way can large-scale production be created, even connection between production fields and industries.

Secondly, human resource development: The marine economy is a dynamically developing economic sector, therefore, the quality and quantity of human resources involved in this field must always be improved. From managers and leaders to workers directly involved in production and business, they need to be regularly trained and retrained to meet new demands.

Thirdly, attract investment capital: The marine economic sector, due to its scale and nature, requires businesses to have a large capital source to be able to sustain. The capital source of enterprises themselves is only a part of the capital to maintain business operations. With action programs, specific production and business plans, as well as activities to promote and introduce businesses that call for and attract investment capital from outside. With strong capital, the programs and plans of the enterprise can operate effectively. The level of investment attraction also shows the production and business capacity of the enterprise.

4. Discussion and Conclusion

Quang Binh province focuses on developing the marine economy in five key areas in order of priority: fishery economy; sea tourism; the port system development, port services and shipping; development of economic zones, industrial parks and coastal urban areas; development of the industry of building and repairing ships, boats and floating vehicles.

From now to 2030, Quang Binh will develop the marine economy in the direction of multi-industry and multi-field in which, aquaculture and fishing are basic, accounting for the largest proportion of the total value created by the marine economy. Gradually form economic zones concentrated in coastal areas associated with Hon La seaport, and develop marine economy with sea tourism; well solve social problems in coastal areas; The province strives to, by 2030, bring the proportion of GDP of the sea to over 30%; raising the living standards of people in the coastal area to double the current level, bringing the income of each person in the coastal areas in the province to USD 2500/year.

Quang Binh marine economy actively attracts many economic sectors and forces to participate in marine economic development. For the area of communes and wards adjacent

to the sea, the province will fully promote its advantages in terms of geographical location, traffic, investment attraction, labor and economic development, people's livelihood, creating dynamic development of the whole region; Strive for the per capita income of this region to be 1.2 - 1.4 times higher than the per capita income of the whole province and coastal strip of the country by 2025, and 1.4 - 1.6 times higher by 2030, gradually narrowing the gap between rich and poor. Quang Binh builds and operates non-tariff zones in association with investment and effective exploitation of Hon La port along with existing national highways and border gates to form an important gateway to the East Sea of Southern Laos, Northeast Thailand and Mekong sub-regions. Thus, from now to 2030, Quang Binh will continue to build and invest in economic zones, complete approved functional zones and expand economic sectors. At the same time, invest in building a new modern urban area with financial, banking, securities, postal and telecommunications services up to international standards, ensure the province's development trend of marine economy is in line with international standards, with the general trend of the country.

Discussing the results is that it is necessary to step up the investigation, survey, research, establishment and management of a database and information system on marine resources and marine environment to provide timely scientific arguments serving planning and making policies and laws for the general and unified state management of seas and islands. For the coastal provinces, such an outcome will help to conserve and sustainably develop marine ecosystems, protected areas and nature reserves that have been recognized internationally and nationally. Arrange space for development of seas, coasts and islands which is suitable to ecological conditions of each region. Control pollution sources from land discharged into the sea, prevent pollution from marine activities and transboundary pollution in scope. Actively prevent and combat marine disasters and respond to negative impacts of climate change. It is necessary to develop specific mechanisms and policies to attract, train, employ and develop human resources for marine economic development in which it is necessary to focus on investing in training key and spearhead marine economic sectors. Strengthen international cooperation, open the door for foreign investors in training marine personnel to acquire advanced training technology and modern training equipment.

In summary, the marine economy plays a very important role in socio-economic development as well as in enhancing the position of a country, especially in the period of industrialization, modernization and international economic integration of Vietnam today. Quang Binh has a lot of opportunities to develop the marine economy. However, due to obstacles in awareness, management, material and technical facilities, etc... the exploitation of resources from the sea is not commensurate with the position and role of the marine economy as well as the favorable opportunities brought by objective and subjective conditions. In this research, solutions on marine economic development in Quang Binh province in the current period - from the perspective of economic philosophy, the researchers have contributed to clarifying the theoretical and practical basis of marine economic development; at the same time, making survey and evaluating reality, thereby confirming the achievements and pointing out the difficulties and limitations in developing the marine economy in Quang Binh province. More important is to propose some solutions to develop Quang Binh's marine economy in the current period.

Abstract

The study focuses on analyzing and evaluating the influence of product/service quality on the intention to experience tourism according to OCOP standards in Vietnam. Two main data sources are used:

Secondary data include documents, newspapers, laws, ... about the OCOP program in Vietnam from 2018-to 2020, and primary data collected from the survey which is based on decision No. 1048 / QD-Ttg 2019. Research results found that product quality has a positive impact on the intention to experience OCOP tourism products. From the research results, the authors will make suggestions and recommendations for points that need to be amended and supplemented for the current OCOP tourism products to encourage customers to use the product in the future.

Keywords: *The quality of OCOP tourism product, Intention to travel, Vietnam*

1. Introduction

During the past 60 years, the tourism industry has always been in focus, in each period, governments have determined the position of tourism in the socio-economic development strategy of the country by the revolutionary requirements. Currently, overcoming many difficulties, and challenges, the tourism industry has been making significant contributions to the country's socio-economic development, preserving and promoting the values of national cultural heritage.

Recently, Vietnam has begun to develop rural tourism. The development of this form of tourism has contributed to providing employment opportunities for the local community, facilitating the development of the local economy through the sales of tourism products and services, contributing to the development of the local economy, and enhancing a local and national

image. Especially, [TP1] with the integration and the development of society, rural tourism has become more attractive to tourists. This is also one of the goals of the OCOP program.

In Vietnam, the OCOP program was absorbed in 2006 with the implementation of the project "One commune, one product" by localities and started implemented strongly from 2013 onwards with the pioneer province of Quang Ninh. The program has contributed to restructuring agricultural production, handicrafts, improving production value, and developing own brands of many localities. As yet, the OCOP program has been widely deployed in 63 provinces and cities across the country.

This paper is structured as follows. **In section 1**, we give a general introduction to the state of tourism in Vietnam in general and about OCOP tourism products in particular. **Section 2**, provides an overview of the study. **Section 3**, the research model and hypotheses. **In section 4**, we provide methodological aspects. **Section 5**, Presents and analyzes some of the results. **In section 6**, we make the conclusion

2. Literature Review

There is much research and approaches on the relationship between product (service) quality and customer purchase intention (use) in the world.

Chapin (1974) examines the Activity Pattern Model of tourism which has 2 factors: trends and opportunities to promote action influence the choice of tourism products/programs. There are two sub-variables in the element of opportunity (promoting action): availability and quality (location, program, and service). The model has initially demonstrated the impact of tourist destination product/service quality as a motivating factor for customers to participate in the travel experience.

Sultan & Simpson (2002) mention that since European passengers found the service quality of US airlines to be less than that of their international carriers, substantial efforts may be needed by US carriers to improve the service they offer to attract Europeans. This has obvious implications for airline alliances, such as the Star alliance between Air Canada, Varig, SAS, Lufthansa, Thai Airlines, and United Airlines. It remains unclear, however, whether US carriers see these alliances as a way of improving their service quality, or whether they are merely seeking to circumvent international laws governing their ability to reach what appear to be attractive markets. In the long term, the success of an alliance may be jeopardized if partners are perceived not to offer the same level of service.

Another research by Tsiotsou, R., (2005) refers to quality levels and their relation to involvement, satisfaction, and purchase intention, marketing bulletin. The main objective of the study was to investigate the effect of perceived product quality on product involvement, consumers' overall satisfaction, and purchase intentions. This investigation confirmed previous findings on the critical role of perceived product quality on consumer behavior and led to the identification of the effects that different levels of perceived quality have on involvement, overall satisfaction, and purchase intentions. Besides, Tsiotsou, R., (2006) also mentioned that perceived quality had a direct and an indirect effect (through overall satisfaction) on purchase intentions, overall satisfaction had a direct effect on purchase intentions and involvement had an indirect effect on purchase intentions through overall satisfaction and perceived quality. The results of

the study provide several theoretical and practical implications. There are contradicted findings on the influence of perceived quality on purchase intentions. In some studies, perceived quality has been found to have a positive direct effect on purchase intentions (Carman, 1990; Boulding et al., 1993; Parasuraman et al., 1996), whereas others report only an indirect effect through satisfaction (Cronin and Taylor, 1992; Sweeney et al., 1999).

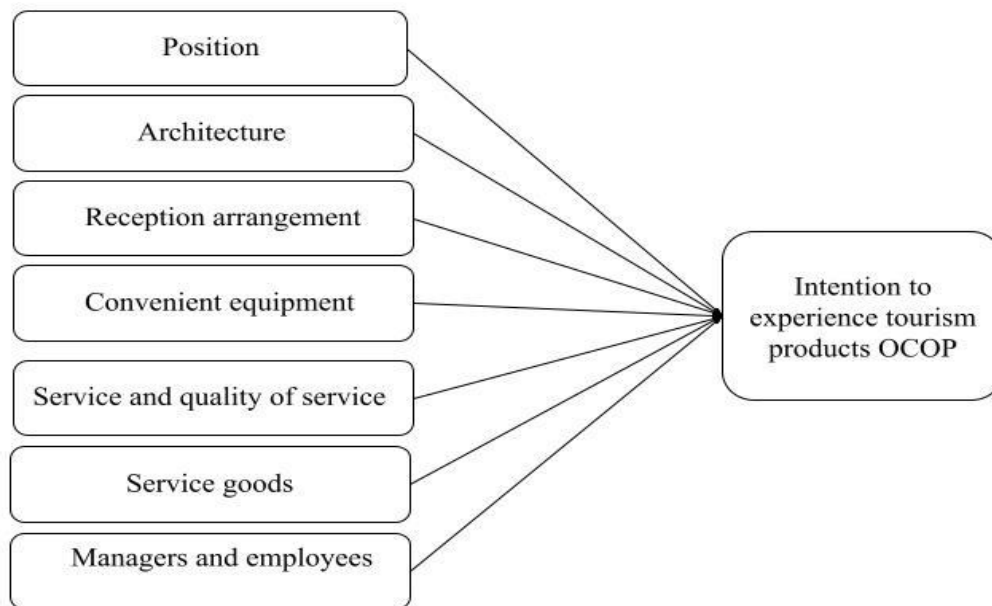

In 2013, authors Tariq, M., Nawaz, and coworkers made important discoveries. The research paper has shown that a certain influential buying motive for multinational brand cosmetics is quality, and this is the only reason that attracts more than half of their users.

Model

The research model includes:

Independent variables are components of product quality according to OCOP standards: (1) Position; (2) Architecture; (3) Reception arrangement; (4) Convenient equipment; (5) Service and quality of service; (6) Service goods; (7) Managers and employees.

The dependent variable in the model is “OCOP tourism experience intention”, in which product quality components directly affect the intention to experience tourism according to OCOP standards.

Source: Authors' estimations

Research hypotheses include:

H1: “Position” has a positive impact on the “Intention to experience tourism products OCOP” of customers.

H2: “Architecture” has a positive impact on the “Intention to experience tourism products OCOP” of customers.

H3: “Reception arrangement” has a positive impact on the “Intention to experience tourism products OCOP” of customers.

H4: “Convenient equipment” has a positive impact on the “Intention to experience tourism products OCOP” of customers.

H5: “Service and quality of service” has a positive impact on the “Intention to experience tourism products OCOP” of customers.

H6: “Service goods” have a positive impact on customers’ “Intention to experience tourism products OCOP” of customers.

H7: “Managers and employees” have a positive impact on the “Intention to experience tourism products OCOP” of customers.

2. Method

Participants: Customers who have knowledge about OCOP and have never experienced tourism products according to OCOP standards

Qualitative research methods: Conduct direct phone interviews with 20 customers in the research group. Through this method, the research team can evaluate which factors are appropriate, which factors need to be adjusted and removed from the model; At the same time, the research team checked the appropriateness of the research variables' scale and adjusted it to come up with an official scale for researching a large scale. The result of this research phase is that the research team comes up with research models and hypotheses that are suitable for the research topic, adjusted

Quantitative research methods: Implemented through questionnaires sent/distributed to research subjects on a large scale to test the proposed research model and hypotheses. The results of this phase are the data, scientific evidence, and proving the proposed hypotheses and models.

Data collection

Secondary data collection

Data used in this study is collected from books, reports, websites, and especially studies on product quality, tourism product quality, consumer behavior, program OCOP process, and relevant theoretical knowledge.

Primary data collection

The questionnaire approached research subjects through social networks in the form of an online survey to ensure that all survey respondents had access to the Internet. The total number of responses was 235; and after a vote filtering procedure, the number of responses that were reliable and included in the analysis was 210 (89,36%).

Data analysis

Data was entered and processed, and statistical analysis was carried out through Microsoft Excel 2016, and SPSS 20 software. This study includes descriptive statistics, Cronbach's alpha reliability test, and factor analysis. explored EFA, Pearson correlation analysis, and ANOVA analysis of variance. Descriptive statistics were used to examine variables of interest, including demographic variables. Analyze Cronbach's Alpha coefficient to evaluate the reliability of the scales and compare the correlation coefficient of

the total variable to eliminate inappropriate observed variables. Exploratory factor analysis (EFA) to test the scale value, and determine the correlation between variables in the data set. Pearson correlation analysis to test the close linear relationship between the independent variable and the dependent variable. The ANOVA method was used to find the differences according to individual characteristics.

3. Results

Table 1. Descriptive statistics of the sample

Factors	Variables	Mean	Standard Deviation
Position	VT1	3.99	.773
	VT2	3.66	.818
	VT3	3.82	.778
	VT4	4.35	.806

	QL3	3.71	.884

Source: Authors' estimations

With the value commentary in table 4.8, we can see that the minimum value is 3.66 and the maximum value is 4.35. This thing for the history of big part is the same to all variable of modeling that the authors put forward.

The standard deviation is the degree of variation of the variables around the mean value. The larger the standard deviation, the more different the respondents' opinions. With TTB1 the variable has the smallest standard deviation of 0.671 for the homogeneity seen in the customer's assessment, there is not a big difference. In contrast, with KT3 the variable with the largest standard deviation is 1,019 responding to different reviews from customers.

Table 2. Regression results with dependent variable “Intent to experience tourism according to OCOP standard”

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
Constant	-0.032	0.261		-1.121	0.903		
Position	0.218	0.048	0.221	4.513	0.000	0.867	1.154
Architecture	0.119	0.042	0.159	2.855	0.005	0.675	1.482
Reception arrangement	0.098	0.038	0.130	2.565	0.011	0.816	1.225
Equipment	0.165	0.044	0.199	3.765	0.000	0.745	1.343
Service and quality of service	0.229	0.047	0.260	4.845	0.000	0.724	1.382
Service Goods	0.091	0.041	0.128	2.203	0.029	0.619	1.615
Managers and employees	0.100	0.038	0.136	2.626	0.009	0.775	1.291

Source: Authors' estimations

From the regression results of the table, we can see that all 7 components of product quality have Sig coefficients less than 0.05. This Sig coefficient shows that the product quality factors in the model are consistent with the study and have an influence on intention. On the other hand, the Beta coefficients of the 7 factors are all more than 0, showing that they have a positive impact on the intention to experience tourism according to the OCOP standard. Which, the Beta coefficient of the variable “Service and quality of service” is the largest (by 0.229), so this is the factor that has the strongest influence on the intention to experience OCOP tourism.

Based on the results, we can write the regression equation as follows:

$$\text{Intention} = -0,032 + 0,218\text{Position} + 0,119\text{Architecture} + 0,098\text{Reception arrangement} + 0,165\text{Equipment} + 0,229\text{Service and quality of Service} + 0,091\text{Service Goods} + 0,100\text{Managers and employees}$$

From the table and the regression equation, it can be seen that all beta coefficients are greater than 0 showing that the independent variables are positively related to the dependent variable.

According to the results of the ranking table of the importance of the independent variables in the regression model, the variable "Service and quality of service" has the strongest impact on the dependent variable "Intention", determining tourism experience according to OCOP standards" is the weakest variable "Service Goods".

After testing the statistical hypotheses, we concluded that: All components of product quality have a positive impact on the intention to experience tourism according to OCOP standards of customers. At the same time, components of product quality have different levels of impact on tourists' intention to experience tourism according to OCOP standards.

4. Conclusion

The paper uses a model to develop hypotheses about the relationship between product quality and tourists' intention to experience tourism according to OCOP standards. In general, many previous studies are showing that product quality influences intention, consumption behavior, and choice of a tourist destination.

Through analyzing and testing variables according to the model, we found that the service factor and service quality have the greatest influence on the individual's intention to experience tourism according to OCOP standards, through which the trend of evaluating product quality can be seen.

The topic has contributed a small part to help the subjects in the OCOP tourism business group better understand the product quality requirements of tourists, from which some businesses have had many solutions to perfect their products according to OCOP standards, thereby supporting and creating jobs for people.

TRANSFORMING LIVELIHOODS OF PHU XUYEN DISTRICT RESIDENTS (HANOI CITY) IN PROCESS OF BUILDING NEW RURAL AREAS

MA. Nguyen Thi Phuong

nguyenhaphuong110@gmail.com

Communist Review, Hanoi, Vietnam

Abstract

The writing studies the livelihood transformation of the Phu Xuyen District residents (Hanoi City) in the context that the building of new rural areas is based on the lively choice and job change, on the basis of effective calculation. The new-style rural building program has been conducted in Phu Xuyen district, Hanoi city in the context of stagnant local economic development, residents' deep attachment to agricultural production with low per capita income, and unsecured infrastructure. Therefore, they face several challenges, especially changes in production methods, land and environment, etc. By data collection methods combined with fieldwork, in-depth interviews with households in Phu Xuyen district have shown the difficulties in the process of building a new countryside. Accordingly, the problems arising in the process of the farmers' livelihood are under discussion when the process of building new rural areas carried out alongside the process of urbanizing the countryside is happening vigorously.

Key words: *livelihood transformation, livelihoods, new rural areas, Phu Xuyen District*

1. Introduction

According to the Vietnamese dictionary, livelihood can be understood as “a job to earn one’s living” (Linguistics, 2010). According to the researchers, livelihood “studies the material aspect of life in its social and cultural context. It studies how the links of production, distribution and consumption have taken part in the whole structure of social life and the vital role of the perfect whole that has created that living society” (Evens, 2001). The idea of livelihood introduced by Robert Chambers in the middle of 1980s of the 20th Century maintained that “livelihood includes energy, property, the way of getting access (the reserves, resources, the right to ownership, the right to use) and the necessary activities for life” (Chambers, 1983). After that, it was developed by Chambers, Conway and other researchers in early 1990s of the 20th Century (Robert Chambers & G. Conway, 1992). There are a lot of ways of getting access to livelihood and different definitions of livelihood; however, the above-said concept comprises a lot of elements that can make influences on the living activities of each individual or household. Fundamentally, the livelihood activities are decided by each individual or farm household by basing on their own abilities, at the same time they are under the impact of institutions, policies and social relations established by these individuals and households in the community. So, livelihood is understood as having assembled all the resources and capacities that human beings can afford, in combination with decisions and activities of their own in order to make their living as well

as reaching their targets and wishes. Livelihood of each individual or household is set up by three main pillars: property (resources) of livelihood, livelihood strategy and livelihood results. In the next studies of the World Commission of Environment and Development (WCED), Chambers & Conway came out with a relatively complete livelihood concept. According to them, livelihood includes capacities, property (the reserves, resources, requirements and access) and the needed activities to ensure the means of living. Livelihood is sustainable only when it can be able to cope with and to recover after the shocks, maintain or improve capacities and property and provide the opportunities of sustainable livelihood for the next generations. The sustainable livelihood is understood as being able to cope with and to recover after waves of crisis and shocks, to maintain and enhance the capacities and property and supply the opportunities of sustainable livelihood for the next generation and contribute to the real benefits of other livelihoods at the local level and at the short-term, long-term global level. In the context that society moves and develops constantly, transforming livelihood is an inevitability that can be seen through the process of a change of jobs, the people's judgement of the quality of life, the change of living level of households.

Samuel Popkin has selected the way of getting access to the economy so as to study the activities of the farmer individual with the presumption that individual is a man of rationality with self-interest. By basing himself on the concepts such as the individual choice and decision making, he had analyzed the economic behaviours of the farmer in the life of agricultural economy and in the village's everyday life activities. So, the farmer is always closely connected with farm household, just because the farmer has never existed separately; on the contrary, they have always operated in a capacity of a member of a farm household. According to Popkin, the Vietnamese peasant is a "rational peasant" (Popkin, 1979) who has always paid attention to the individual interests of their own family and making investment for their own through the short-term and long-term plans. They have always sought the reasonable choice in the context that urbanization is happening rapidly in the present-day rural areas. The present-day peasants know how to respond to the market and regard their farm work as an investment to obtain the economic effectiveness. (Schultz, 1964), reflected right in their thinking: "The peasants are now very sensitive and it is impossible to orientate them. They only do it when they find it beneficial to them" (An in-depth interview, male, 57 years old, a communal cadre).

Max Weber has divided the social actions into 4 categories in order to analyze the social movement (Hung, 2008), in which there is a change in the social-job structure. In which the rational action - tool is an activity to carry out the weighing up, calculation, choice of a tool, a means or a target in such a way as to have the highest effectiveness. It can be seen in any society, traditional or modern, that man always has the "calculation and choice of a job to be suitable to their abilities and standards and to the actual conditions of society (it means taking other people into account too) so as to obtain the highest productivity, quality, effectiveness and benefits. This is a wise, reasonable choice of action and also an element making an important influence on the change of the social-job structure in the current society" (Anh, 2016). Therefore, a study of a peasant's livelihood transformation from the rational perspective (the choice, transforming a job in a pragmatic way on the basis of effective

calculation) is a basis for explaining the choice by the peasants in the villages who have chosen this job, not other jobs so as to ensure the life of their own and of their families.

In this case study, Phu Xuyen District is the South Gate of Hanoi Capital City, with an important road system connecting the capital city with the provinces in the neighbourhood of the Capital City. The district also has a planning on developing the commodity agricultural production, the traditional handicraft villages with trade names, high value and natural ecological balance of Hanoi. The advantages of Phu Xuyen District are the agricultural production and the traditional handicrafts; however, the farm work and craft villages only stop at a small scale, with spontaneous, fragmented development without any concentrated planning and its development is yet to be on a par with potential. In recent years, beside the advocacies and policies concerning agricultural development, the farmers, countryside and residents of Phu Xuyen District have expressed their dynamism and activity in transforming their mode of livelihood and job choice that both ensure the household income and contribute to building the prosperous and civilized rural areas.

2. Method

By basing on the field work survey materials in 2019-2021, the figures from the reports on the economic-social development in recent years by Phu Xuyen District (Hanoi City), the writing has started to analyze the livelihood transformation of the Phu Xuyen district residents on the horizontal side of the economic structure; it means considering the transformation of the job such as agriculture, small handicraft industry, trade and services and other economic activities.

The writing has also used the ethnological field work method, in which there are some in-depth observations and interviews. At the time when the field work was taking place, the COVID-19 pandemic was developing complicatedly with the social distancing measures being taken then, thus making the researcher's movements, contacts and meetings with the local cadres and people more difficult. In each research area, the author of the writing tried to ensure the diversity in gender, age groups and social composition of the objects under interviews, with attention being paid to the opinions of the peasants, because they were the objects deeply influenced from the advocacies and policies being implemented in the localities, particularly the process of rural renewal and rural urbanization which were happening vigorously. The author conducted interviews and discussions with about 200 subjects in Chuyen My, Phuong Duc, Nam Trieu, and Van Tu communes. The target audience is quite diverse, including: commune leaders, village officials, farmers' associations, women's unions, farmer households, business households, and traditional households. The objects of the interviews were implemented in the way of "a rolling snow ball" with a view to creating a diversity in objects and interview contents until all the suitable information was available

3. Results

3.1. The traditional livelihood of Phu Xuyen district residents

a. In the agricultural area: According to the materials on the development history of Phu Xuyen District, the communes and villages here used to be built on the slope of high mounds, in the interior side of the dike, along the Nhue River, especially for the villages that

lay in the low land areas of Phu Xuyen District, all the houses' foundations had to be filled with more earth (earth was dugged from their ponds to raise their houses' foundations) so as to be able to avoid any floods. However, during the rainy season that fell annually in July and August, these houses were unable to avoid being submerged in water. During the flood season, all the villages looked afloat like the islands and the locals had to travel on their bamboo-made boats, or as the locals call it: *“they travel by hand in six months and on foot in six months”* (Dang Van Tu & Nguyen Ta Nhi, 2011). The peasants' life here relied all the year round on the fifth-month crop (or summer paddy crop) and on catching fish in the rice fields. The field work was entirely dependent on the tide of water. If the tide rose high, it was flooded, if very low, a drought happened or as the locals called it: *“the rice plants were burnt in summer crop, got rotten in spring crop”* (Dang Van Tu & Nguyen Ta Nhi, 2011).

Cultivation: Due to the characteristics of the low-lying land, cultivation is considered as the main livelihood of Phu Xuyen district residents. In the past years, all the rice plant varieties for production were mainly two crossed rice plant varieties called Khang Dan and Q5 which were put into large-scale cultivation. Apart from two main crops, the winter plants that includes the soya-bean plants, potato plants and vegetables are also cultivated to increase the farmers' income. In 2010, the value of agricultural production was put at VND 438.14 billion, a 14.8% reduction as compared to that in 2009. It was because of the diseases in animals and poultries. The prolonged rain spell in late October 2008 had caused inundation, thus causing a total loss of the winter rice crop and a number of areas under aquaculture. The value of agricultural-aquacultural production in 2010 stood at VND 517.45 billion, an average increase of 1.63% in the 2006-2010 period, and obtained 4.17% of the whole 2000-2010 period (People's Committee of Phu Xuyen District, 2019).

Livestock breeding: In the 2000-2010 period, the indicators of development in the herds of buffalos, cows, pigs, and flocks of poultries, water fowls had been maintained and increased in number, especially the hatching of breeds in the Phu Yen and Dai Xuyen communes; every year, about 18 million to 20 million breeds are provided for the market. The proportion of livestock breeding (including aquaculture) in the value structure of agricultural production reached 44.38%. In 2010, there were 64,022 pigs, the total live weight pork was put at 11,126.70 tons. The pig farming was shifted to the modern method and the commodity production was carried out in the concentrated areas. The total flock of poultries in 2010 was numbered in assorted 829,000 and the output of poultry meat was put at 2,267 tons. The district's livestock breeding sector has been developing in the direction of supermeat, supereggs and industrial production. The value of husbandry production in 2010 was obtained at VND 429.50 billion, accounting for 30.51% in the agricultural sector's structure (Que, 2011).

Table 1. Agricultural production value in the period 2000 - 2010 of Phu Xuyen district

Type	Export (heads)	Output (tons)
Total pig herd	64,022	11,126.70
Total poultry herd	829,000	2,267

Source: (Que, 2011)

Aquaculture: Phu Xuyen is an area having the great potential of aquaculture with the total land area of 3,600 hectares under aquaculture and fishery. The total area for aquaculture in the whole district in 2010 was 1,361 hectares. The increase of the areas under aquaculture is mainly due to the transformation of the low-lying areas into aquaculture and fishery in combination with rice planting or breeding of waterfowls. A number of communes had transformed the rice growing areas in the low-lying areas (the winter crop was inundated) into the farming mode of rice growing-fish breeding, waterfowls raising, bringing about high economic efficiency. However, the transformation of land from producing mainly the rice to the rice-fish production still had a spontaneous character, so it was yet to create the production areas of concentrated character.

b. The traditional handicraft industry: In the far-off days, Phu Xuyen District was regarded as the cradle of many age-old famous craft villages, creating jobs and improving the lives of the farmers during the post-harvest leisure time. Many products of these craft villages have their brands in the market. In the Phu Xuyen district area, 156 over 156 villages and groups of residents have got involved in doing the crafts with 78 craft villages having been maintained and developed; 39 villages have been recognized as the craft villages with the criteria for the city level, in which there are 9 villages doing the inlaid mother-of-pearl, 10 villages doing the *Té* grass weaving, 10 villages doing the carpentry, and 12 villages doing the garment and shoes production (People's Council, 2021). The whole district has got 22,100 craft households, accounting for 40% of the total households of the district with around 28,500 labourers. In 2008, Phu Xuyen District became a district of Hanoi City after the capital city had expanded its administrative border line. Many craft villages in Phu Xuyen District continued to have developed, transforming gradually to the direction of clusters and areas of craft villages, to have built their trade centres and formed the commercial enterprises right at these craft villages. From these craft villages, not only the lives of the residents here have been improved, but also the fine value of human life has been maintained and conserved.

c. Commerce and services: In the old days, Phu Xuyen District used to be a place where many towns had been concentrated, to be the trade centres, “with the landing busy with boats cruising in and out”, to exchange goods and trading activities. With its advantages of having the traditional crafts, the trade-services activities of the district have developed strongly both in quantity and quality and the commodity market has become ever more abundant and diverse. In the 10-year long period, the district had repaired and renovated 13 rural markets with a cost of VND 8.880 billion. Until 2020, the district had 17 rural markets, 1 supermarket and a system of utilities shops doing the general business in the residential areas (People's Committee of Phu Xuyen District, 2019).

3.2. Livelihood transformation of Phu Xuyen District residents in the process of building new rural areas

Right from 2010, Phu Xuyen District started implementing the Program of National Targets to build new rural areas. Based on the practical situation in the locality, Phu Xuyen District decided to take two breakthrough contents in building new rural areas, including:

Firstly, building and organizing the implementation of convention on new rural areas to replace the convention of cultural villages; *secondly*, carrying out the plan on agricultural mechanization. After more than 10 years, there is a change in the job structure, bringing along with the labour and job transformation of the local residents. The Phu Xuyen district residents have got their calculation in transforming their business mode in the direction of both maintaining and developing the traditional crafts and further developing the trade and services activities and participating in various new livelihood forms. Specifically:

a. In the agricultural area: A lot of scientific and technical progress and new models had been applied such as rice production with the application of the SRI improved intensive measures, or tray rice sowing and transplanting by machines. Until 2018, the land areas under transplanting with machines of the communes reached 1,719 hectares, accounting for 10% of the areas under transplanting of the whole district; basically, areas under rice plants had been harvested by harvesters; the current number of transplanters is put at 148, there are 2 automatic tray transplanters, 35 combined harvesters; the areas under high-quality rice plants is 2,656 hectares, equalling to 30% of the total land areas; there are some pilot models for new rice varieties such as CXT30, JO2, Đai Thom 8, Bắc Hương 9 that have yielded the first good results. Some concentrated production areas with high-quality rice have been formed in Hoang Long, Tri Trung, Phuong Duc and Hong Minh communes, the special areas under vegetables and fruits (Hong Thai, Khai Thai, Minh Tan and Quang Lang communes). Productivity, output and quality of products of various plants have been improved. The production values of the horticulture in 2018 was put at VND 695.4 billion, accounting for 46.5% of the production values of the agricultural sector, a 11.8% reduction in structure as compared to that in 2010. The economic structure had transformed in the positive direction (People's Committee of Phu Xuyen District, 2019). In 2020, the proportion of agriculture will account for 15%, the construction industry will account for 69.4%, and trade and services will account for 15.6% (District P. C., 2020).

Table 2. Value of Agricultural Production, 2018

Agricultural sector	Production value (billion VND)	Industry structure ratio (%)
Cultivation	695.4	46.5
Breeding	747.2	50
Seafood	395.5	3.5

Table3. Economic structure of Phu Xuyen district in 2020

Industry Production	Value (billion VND)	Economic structure ratio (%)
Agriculture	1,469.13 15	15
Industrial	6,831.73	69.4
Trade and service	1,539.16	15.6

Source: (District P. C., 2020)

Phu Xuyen District is one of the leading districts in Hanoi that have implemented the tray rice sowing and transplanting by machines. The district and communes and agricultural cooperatives have always paid attention to creating conditions and having a lot of mechanism and support policies to encourage and develop the model of tray rice sowing and transplanting by machines in the district areas, such as to support the funding to buy transplanters or to support more areas for transplanting by machines. In the Phu Xuyen district area there have appeared a number of typical models of tray rice sowing and transplanting by machines that have been visited and learned by the collective units and individuals inside and outside Hanoi City. Tray rice sowing and transplanting by machines have helped the peasants reduce their workforce, whereas rice seedlings have been rarely damaged by rats and insects. At the same time, it is possible to reduce the use of plant protection products, especially pesticide which is harmful to environment and biodiversity in the agricultural production areas and human health. Therefore, this measure has been unanimously supported by the peasants who are now active in production.

Livestock breeding and aquaculture have strongly shifted from the small, separate breeding mode to the form of livestock breeding farms with joint venture and linkage by applying the model of high-tech agricultural production. From the small, separate breeding mode, the Phu Xuyen district peasants have taken bold steps in shifting to the livestock breeding farms with the joint venture and linkage outsourcing breeding. At present, in the Phu Xuyen area there is a number of models that have applied high technologies to agricultural production with high economic efficiency and ensured food safety such as the model of growing asparagus in Hong Thai commune with the use of the irrigation water system, or growing in the membrane houses; the model of growing cantaloups in Minh Tan commune; a number of concentrated livestock breeding farms in Phuc Tien, Chau Can, Quang Lang, Tan Dan and Hong Thai communes where new imported breeds are used and the breeding is carried out according to the technology of close-knit breeding facilities with a temperature, humidity and lighting regulating system, with the automatic manger system ((People's Committee of Phu Xuyen District, 2019).

b. In the small-scale industries: The district continues to maintain and develop the production of traditional, small industries and import some new industries so as to step by step transform the reasonable labour structure according to the criteria of building new rural areas. Up to now, many products of the craft villages have got their own brands in the market such as Phu Yen leather shoes, Van Tu garments, Chuyen My inlaid mother-of-pearl, Tan Dan and Van Nha wooden goods or Dai Thang iron, hardwares which have been introduced and sold in the inner city of Hanoi, Ho Chi Minh City and many other localities nationwide. The rattan and grass woven products have been exported to the Western and Eastern European countries and they have been much sought after there; the annual export value increases by 15.5%. The household and craft villages economies have promoted their effectiveness, creating jobs and increasing the labourers' income, improving the people's living standards and maintaining firmly the stability in the grass-root establishments.

c. The appearance of new forms of livelihood: Large-scale trade and services are the two areas with the rapid development and average increase of 8.8% per year. The investment and business environment has been improved; the number of enterprises having registered for business is in the year-on-year increase; district has now got 595 enterprises in operation, an increase of 214 enterprises (People's Committee of Phu Xuyen District, 2019). The commodity market is diverse and abundant; the forms of services (such as telecommunications, banking, restaurants, hotels...) have seen relatively vigorous development, thus meeting the requirements and serving satisfactorily the people's life and production and business activities. Together with the repair and renovation of the rural markets, the local residents have also developed more of small business trades and expanded more supermarkets, the utilities shops system and general business in the residential areas. Initially, there has been formed a number of supermarkets and trade centres. In some craft villages, a number of households have shifted to supply the input materials to products when they have recognized the high profits brought about by the supply chain as compared to the direct production chain. As observed, in the villages of Chuyen My, Phu Tuc, Dai Thang and Tan Dan communes, the households with their houses upfronted to the road have opened their shops with adverts. Some households have acted as the clues to receive the materials to supply them to the craft-doing households. Some clue establishments have designed the products, looked for customers and then placed the orders for the households in the villages to produce them, thus ensuring the outlet of the handicrafts of the craft villages.

The impact of the Industrial Revolution 4.0 has opened up a lot of consumption channels. Nowadays, the craft villages have not only sold their products in their shops, but also sold them through the on-line trade channels, social net working sites and through the Internet. The modern peasants have known how to make full use of the advantages of information technology, meeting the requirements of contacts in work and in life. We conducted in-depth interviews with 4-5 fine art production facilities and they said that: the skilled artisans in Phu Xuyen District have also built the state-of-the-art electronic trade environment, had the on-line interactive with their customers so as to together take part in design and model of products, boosted the selling of goods on the Internet and accelerated the linkage in the production process (An in-depth interview, female, 40 years of age, owner of the production establishment). Some inlaid-mother-of-pearl, fine art wood work producing establishments such as Hoang Hiep wood work producing establishment, My Ha wooden goods, Dai Cat inlaid mother-of-pearl picture producing establishment, Bich Ngoc fine art products have built their own e-trade webpages in order to advertise their products. Some of these establishments have promoted their on-line trade through the social net working sites, or through the foundation of applying information technology.

d. The appearance of the forms of small trade and business: The conversion of agricultural land and the form of urban space have contributed to forming a number of new livelihood activities, such as lodging houses, trading in the items of household appliances, food and foodstuffs and providing other services within the villages and communes. As observed, in a number of villages there have appeared individuals and small private

organizations doing realty business and trading. The real estate trading market is not only hectic in the central areas such as Phu Minh market town or the areas adjacent to the inner city, but also these realty trading activities have become bustling in the villages of the district. Besides, a number of other services in service of urbanized life has also appeared such as services of entertainments, café, beer bars, gyms and so on. Some other spontaneous jobs of seasonal character like motorbike taxi, technological motorbike taxi, pawn service, fast food stalls, ceded café have also become popular.

4. Discussion and Conclusion

The livelihood transformation of the Phu Xuyen District residents in the process of building new rural areas has got both the positive and limited aspects.

Firstly, the livelihood transformation has made a contribution to improving the income of the farmer's household. Agricultural production has seen a lot of positive changes in productivity, quality, income value on farming unit. Fusing and exchanging the rice fields and granting the certificates of farming land use rights had been completed. Changing the plant and animal structure in the positive direction, forming the areas specialized in farming the high-quality rice plants, in growing the safe fruits and vegetables, in breeding animals, poultries and fisheries have helped increase the farmers' income. That technical progress is applied, the model of high-tech applying agricultural production and the mechanization of farm work are realized in production have helped the peasants reduce their toiling farm work, improve productivity and farming efficiency over one production hectare unit.

In the context of national modernization and building new rural areas, the peasants nationwide in general, in Phu Xuyen District in particular continue to play the central role of the economic and social development of the rural areas. In the economic integration and development of a modern agriculture, there have appeared the "groups of new peasants" in the rural society. They are the "owners of farms, the agricultural businessmen, the strata of agricultural labourers, the hired hands in agriculture or the people operating in the service areas in the rural areas. These are the children of the market, of the rural modernization and industrialization" (Thang, 2015). The tendency that the peasants produce commodities has been happening vigorously after the Renovation, until the State issued the Program on building new rural areas, the 2012 Law on Cooperatives, the 2013 Law on Land and many other policies and measures to give support to agriculture and this trend has developed more strongly.

Secondly, proactiveness and dynamism of the peasants of Phu Xuyen District have been markedly manifested, contributing to promoting their subject role in the process of building a prosperous and beautiful rural area. When the peasants are proactive in choosing jobs conforming to the new context with the help of the local authorities, their subject role in Phu Xuyen District has been raised. In a discussion with 15 people including district economic officials, representatives of farmers' associations, cooperatives and agribusinesses, most of the interviewees said that: a number of typical examples from the peasants' proactiveness in having cooperation and linkage in production such as the models of linkage of Phu Thang and Phu Hung Cooperatives with the enterprises in the area so as to serve the

people doing the tray rice sowing and transplanting by machines; the Hong Thai vegetable and fruit cooperative with Mr. Le Duc Trinh as director is the model of growing the asparagus with high technology for the first time in Phu Xuyen District; the model of growing the safe cress plants and raising the thorny turtles in Khai Thai commune; the models of growing the green asparagus in Hong Thai, of producing substrate for tray rice seedling in Dai Thang commune and so on (An in-depth interview, male, 50 years of age, a cadre of the economy section in the district). With the efforts of the local authorities and the peasants' proactiveness, the material and spiritual life of the households in Phu Xuyen District has become much better now. Average per capita income is VND 55 million per year (in 2020, it was VND 52 million per person). 100% of dilapidated houses have been eliminated; the rate of households which are able to use hygienic water now is 100% (in which 41.8% can be able to use clean water); the health stations in communes have now had doctors, thus ensuring the examinations and treatments for the local residents (People's Committee of Phu Xuyen District, 2019). Environment and rural landscape have been improved, so the cultural, art performances and sport events have developed vigorously. Through this, it can be seen that the rural peasants in the new era are considered as the ones who have now known how to renew, how to make rich from farming. They have expressed their subject role right in their choosing jobs and livelihood in a proactive and calculating manner. Especially, production mode and model of the peasants here are not merely the manual work, but they have "shifted to apply the scientific and technical achievements (mechanization, automation, high technologies), produced commodities in the direction of serving the market demands" (Chien, 2019). The new peasants have got the changes in quality from the small peasants to the market, industrialized peasants.

However, the transformation of jobs and production has caused environmental pollution in the craft villages and the plant growing and livestock breeding areas, badly impacting the peasants' health. Even though there are now a lot of modern machines and facilities, the state of dust, smoke and noise in the craft villages is still happening and there is yet to be any ways for thorough-going settlement. The impact from living waste and industrial waste is great. As observed, wastes from the craft villages have blackened the Nhue River, causing bad smell all the year round. In 2021, during a one-week field trip in Phu Xuyen district, we asked about people in craft villages, living near Nhue River, they said: "About 15 years now, sometimes I had seen the villagers fishing out floating fish and shrimps for their food, but right after that they had stomach ache, so from then on, nobody had the gut to catch fish there. Later, this black water had come in waves, thus having scarce living fish and shrimp" (An in-depth interview, male, 40 years of age, small trader). Apart from that, livelihood transformation is still one of the reasons that have increased social ills in the localities. It is clear that the process of urbanizing together with the change in the economic structure in the rural areas has made an impact on the change of jobs of the majority of peasants, from agriculture to non-agriculture. In many villages, particularly the villages having got vigorous speed of urbanization, the people's life is richer, but their life style has also changed faster with social ills happening in a more complicated manner such as gambling, drinking, smoking and injecting drugs, prostitute and social violence. Many

restaurants and karaoke shops have mushroomed with latent danger of causing social disorder and unsafety.

The livelihood transformation of the Phu Xuyen District residents has not only been directly impacted from the Program on Building New Rural Areas, but also it is necessary to place it in a linkage closely connecting it to the process of urbanization, industrialization and modernization. The process of building new rural areas with a series of policies to support in capital, techniques, machines and equipment has broken the single-rice crop system together with the form of small, separate livestock breeding and cultivation and self-sufficiency of the traditional agriculture and it has shifted to diversify the breeding and planting on a large scale with commercial and industrial character. The model of large-scale agricultural production in accordance with the mode of commodity production of the modern peasants has been developing strongly in the Phu Xuyen rural areas, thus changing fundamentally the economic status and role of the peasants, contributing to forming and setting up the new relationship networks in the countryside. The groups of new, rich and modern peasants who are the owners of agricultural production, small handicraft industry, services establishments in rural areas have appeared a lot.

According to the general planning on building the capital city of Hanoi to the year 2030, the vision to the year 2050, Phu Xuyen District is a suburban district, in the south of Hanoi City with the fundamental characteristics that it is the new urban development area with supporting industries, high-tech agriculture and services, a new growth pole at the Southgate of Hanoi City. In the future, there will be a lot of challenges for the managers so as to have policies and solutions for suitable adjustment in relation to the job and stability and development of the rural households in the context of fast urbanization of rural areas./.

Faculty of Social Sciences, Vietnam National University of Agriculture, Hanoi, Vietnam

Abstract

Nowadays, Vietnam has still been a backward agricultural country, the quality of the workforce is very poor, mainly untrained workers, and labor productivity is very low. Therefore, vocational training for the rural workforce must be identified as the breakthrough so that Vietnam can keep up with the requirements of the fourth industrial revolution, to meet the requirements to build modern agriculture and sustainable rural areas. By statistical method and document analysis, the article will focus on assessing the current situation of the workforce in rural areas, and vocational training for the rural workforce in order to recommend solutions to improve the quality of vocational training for the rural workforce toward sustainable rural construction and development.

Keywords: *Vocational training, rural workforce, vocational training for rural workforce*

1. Introduction

After more than 35 years under the leadership of the Party to carry out the comprehensive renovation of the country, Vietnam's agriculture has achieved many great accomplishments. However, those results have still not been proportional with the potential and advantages of Vietnam, especially in agricultural and rural development, there are still imbalances and large disparities between regions, the agricultural economy has changed slowly. One of the main reasons for this situation is that the majority of workers in rural areas have not received vocational training and low labor productivity. Acknowledge of this, the Party and State have issued many guidelines and policies to improve vocational training for rural workforce, considering it as the task of the entire political system and of the whole society in order to conduct industrialization and modernization of agriculture and rural areas. However, vocational training for rural workforce has also revealed many limitations such as demand forecasting for vocational training, job support and product consumption which have not been good; vocational training has not been linked with the use of workforce, so many workers after completing their studies do not follow the profession they have learned; the workers themselves have not been able to identify the profession they study and the ability to apply it to practice... leading to the fact that the quality of vocational training has not been

proportional with the expectations and investment of the State. Therefore, it is necessary to have an overall assessment of the status of vocational training for rural workforce and to have solutions to improve the quality of vocational training for rural workforce.

2. Method

The data on agriculture and rural areas used in this article are secondary data officially published on the General Statistics Office of Vietnam, the Ministry of Agriculture and Rural Development, the Ministry of Labour, Invalids and Social Affairs and the data, analysis and assessment related to labor, employment, and vocational training for rural workforce have been collected through published scientific works... On the basis of diversified data available, the authors have used statistical - comparative, analytical - synthesis, deductive - inductive, logical - historical methods... to analyze, assess, and clarify the research problem.

3. Results

3.1. Theoretical basis of vocational training for rural workforce

** Vocational training*

The concept of training is understood in many different ways, training is "making a person capable to meet certain standards" (*Hoang Phe, 2002*); "is the process of equipping workers with certain professional and professional knowledge so that they can undertake a certain job" (*Mai Quoc Chanh - Tran Xuan Cau, 2008*); "Training is a purposeful, organized process of activities to acquire knowledge, skills and techniques in theory and practice, creating competency to successfully perform a social activity (necessary profession) (*Luu Thi Duyen, 2014*). Vocational training (vocational coaching) "is a teaching and learning activity to equip learners with necessary professional knowledge, skills and attitudes to be able to find a job or create a self-employment job after completing the study course" (*National Assembly, 2006*). Thus, referring to vocational training is to teach practical skills, occupations or knowledge related to a specific field, so that learners can acquire and master knowledge, skills and occupations in a systematic way, which prepares that person to be able to perform a certain job.

** Rural workforce*

Rural workforce is all the productive labor activities that create material wealth of the workers in rural areas. Rural workers are those in agriculture, rural industry, rural services... (*Duong Ngoc Thanh - Nguyen Minh Hieu, 2014*). Due to the specificity, Vietnamese rural workforce has some characteristics such as being highly seasonal; rural workforce is abundant and diverse in age; poor qualification, very low industrial style; production is mainly based on experience and health; simple labor organization; rudimentary labor tools...

** Vocational training for rural workforce*

Vocational training for rural workforce is a purposeful and organized activity to teach knowledge, skills and techniques of a certain occupation to workers in rural areas, thereby creating competency for those workers to be able to successfully perform the trained job. Thus, "Vocational training for rural workforce is the combination of vocational training and

vocational learning, which is the process by which lecturers teach theoretical and practical knowledge so that rural workers will have a certain qualifications, skills, techniques, ingenuity, professional proficiency to meet the requirements of rural socio-economic development” (Nguyen Van Dai, 2012). The above concepts have stated very clearly about the operation method and the products created from vocational training activities for rural workers in terms of technical aspects, but have not mentioned the products in terms of the effectiveness of the vocational training activities for rural workforce. Therefore, the concept of vocational training for rural workforce should be understood as follows: Vocational training for rural workforce is a teaching and learning activity to equip rural workers with necessary professional knowledge, skills and attitudes for rural workers so that learners after graduation can practice (find a job or create their own jobs) in order to help rural workers improve their incomes and improve their quality of life in line with society development (Dinh Trung Thanh et al, 2021).

** Project "Vocational training for rural workforce until 2020"*

On November 27, 2009, the Prime Minister issued the Decision No. 1956/QDTTg, approving the Project "Vocational training for rural workforce until 2020". The objective of vocational training is to serve human resources for new rural construction and at the same time to serve human resources for restructuring agricultural production. Financial resources for vocational training in general and vocational training for rural workforce in particular in Vietnam include the sources from the state budget and non-state budget. State budget sources include 3 contents: regular funding, capital construction investment funding and national target program capital funding. Financial sources outside the state budget include: Tuition fees, enrollment fees, revenues from services, production and business activities, technology transfer consultancy, investment capital, sponsorship from organizations and individuals domestic and abroad.

3.2. Current status of rural workforce in Vietnam

Nowadays, Vietnam is still a country with an outdated economic structure, the quality of human resources is still very low, knowledge is still not the main driving force contributing to economic growth and labor productivity... Especially in rural areas, production and business farmers are still mainly based on experience, unskilled labor is common, so efficiency and productivity in agriculture are still much lower than many countries in the region and the world. According to statistics, by 2020, the workforce of the whole country will be 54.84 million people, a decrease of 924 thousand people compared to the previous year (equivalent to a decrease of 1.66% compared to 2019). The workforce consists of 53.6 million employed people and more than 1.2 million unemployed. Women (47.4%) account for a lower proportion than men (52.6%). Although there has been an increase in the proportion of the workforce in urban areas in recent years, up to now, still 66.9% of the workforce in our country is concentrated in rural areas (General Statistics Office, 2021).

Trained workers in Vietnam can be generalized in the following points:

Firstly, the proportion of trained workers in the total number of workers is very small. By 2020, Vietnam has about 13.2 million trained people, accounting for about 24.0% of the total workforce. Currently, there are more than 41.6 million people in the country (accounting for about 76.0% of the workforce) who have not been trained to reach a certain level of professional and technical expertise. Thus, our country's human resources are young and abundant, but the skill level and technical expertise are still too low (*General Statistics Office, 2021*).

Secondly, the proportion of trained workers also has large difference between economic regions, the region with the highest percentage of trained workers is the Red River Delta and the region with the lowest percentage of trained workers is the Mekong Delta (Table 1).

Table 1. Percentage of workers from 15 years and over who are working in the economy have been trained by economic region

Region	Year 2010	Year 2015	Year 2017	Year 2020
Nationwide	14.6	19.9	21.4	24.0
Red river delta	20.7	27.5	25.2	32.6
Northern Midlands and Mountains	13.3	17.0	17.1	20.5
North Central and Central Coast	12.7	19.4	20.6	22.7
Highlands	10.4	13.3	14.3	16.9
South East	19.5	25.3	21.1	29.5
Mekong Delta	7.9	11.4	12.1	14.9

Sources: (General Statistics Office, 2018) and (General Statistics Office, 2021)

From Table 1, it can be seen that the increase in the proportion of trained workers in Vietnam's economy has been very slow, from 14.6% in 2010 to 24.0% in 2020. The Red River Delta is the region with trained workers account for the highest proportion of 32.6% in the country, while the Mekong River Delta has the lowest percentage of trained workers at 14.9%, and the Highlands also has only the lowest percentage of trained workers which is 16.9%. Thus, it can be easily seen that the two key areas of agricultural production in our country have the lowest trained workers. This may be the main reason leading to the shortcomings and limitations in agricultural development in Vietnam in recent years.

Thirdly, the structure of professional and technical qualifications of trained workers in Vietnam also has many shortcomings, specifically, skilled workers only account for 5.3%, intermediate professional level is 3.7%, college degree is 2.7% and university degree or higher accounts for 9.3% (*General Statistics Office, 2018*). By 2020, the elementary level will only accounts for 4.7%, intermediate level accounts for 4.4%, college accounts for 3.8%, university or higher accounts for 11.1%. Thus, in general, trained workers in Vietnam are not only small in number at all levels, but also has an inadequacy in the structure of trained professional and technical qualifications, Primary and intermediate vocational training is still very small, which proves that the phenomenon of "excess teachers, shortage of workers" due to the mentality of "degree preferential" in the Vietnamese population which still persists.

Fourthly, there is still a big gap between urban and rural areas, between men and women... Although the general trend of trained workers has increased over the years, however, the increase in trained workers' faster growth mainly occurs in urban areas, while in rural areas the increase is very slow... (Table 2).

Table 2. Proportion of trained workers by gender and by urban and rural areas

Year	Total	By gender		By urban and rural areas	
		Men	Women	Urban	Rural
2005	12.5	14.3	10.6	27.2	7.6
2010	14.6	16.2	12.8	30.6	8.5
2015	19.9	22.4	17.3	36.3	12.6
2017	21.4	24.0	18.7	37.9	13.7
2020	24.0	26.9	20.9	39.7	16.3

Sources: General Statistics Office, 2018 and General Statistics Office, 2021

From the data in Table 2, it can be seen that the proportion of trained workers by gender is still different between men and women. In general, the percentage of trained female workers is always lower than that of male workers. This shows that cultural barriers for women in the education and training process still exist. However, the difference is not large, which shows that the supportive policies of the State and other institutions have come into effect, contributing to building a fair and equal society.

However, the ratio of trained workers between rural and urban areas, although has been shortened in recent years, still has a large difference, specifically, in 2005 the proportion of trained workers in urban areas is 27.2%, in rural areas is only 7.6%, in 2010 the proportion is 30.6% and 8.5% respectively and by 2020 the corresponding rate will be 39.7% and 16.3%. In particular, there is also a large difference in professional and technical qualifications between trained workers in rural and urban areas, specifically in urban areas: primary level is 6.1%, the intermediate level is 5.9%, college-level is 5.6%, university or higher is 22.1%, the corresponding rate in rural areas is 4.0%, 3.7%, 2.9% and 5.7% (*General Statistics Office, 2021*). Study of trained rural workers, we find that there are major gaps, specifically trained workers aged 15 years now working in the fields of agriculture, forestry and fisheries only account for a very small proportion, only 2.4% in 2010, 4.2% in 2015, 4.1% in 2016 and 4.2% in 2017 (*General Statistics Office, 2018*). By 2020, untrained agricultural, forestry and fishery workers will be 12.57 million people, accounting for 89.97% of the total number of agricultural, forestry, and fishery workers in working age (*General Statistics Office, 2021*).

Thus, although in Vietnam over the last few years, the number of trained workers has increased, but so far only 13.7% of rural workers have been trained. Especially in which only 4.2% (in 2017) and more than 10.0% (in 2020) of employees in the fields of agriculture, forestry and fishery have been trained, this is really a great challenge for Vietnam in the

process of international integration, major barriers in building a comprehensive agriculture and modern rural areas. In order to strongly transform the rural economic structure, improve the productivity and quality of agricultural products, build a sustainable agriculture, and develop comprehensively and sustainably, many measures must be taken, especially increase in the proportion of trained workers in rural areas, especially those in the fields of agriculture, forestry and fishery is the most important. To do so, we must continue to promote and improve the quality of vocational training for rural workers.

The reasons leading to low quality of rural workforce are: Firstly, the awareness of rural workers about improving their qualifications and skills is still low. Secondly, the ability to access information, especially information on science and technology of rural workers is still limited. Thirdly, vocational training has not yet closely followed the structure of rural workforce and has not been associated with the practical needs of localities and businesses. Fourthly, the vocational training system in rural areas has not been developed, and the qualifications of the vocational training teachers are still low...

3.4. Vocational training for rural workforce in Vietnam today

According to statistics, in the period from 2010 to 2015 in Vietnam, nearly 3.2 million rural workers received vocational training, reaching 70.8% (the target of the Project 1956 set out in this period was to train for 4.5 million people). In which, more than 2.1 million rural workers were supported for vocational learning under the Project's policies, reaching 90.4% of the plan. The number of female rural workers receiving training support reached more than 994 thousand people, accounting for 45.8% of the total number of people receiving vocational training support (*Ministry of Labor, 2016*).

In the period 2016 to 2019 in Vietnam, 4.9 million rural workers received vocational training, reaching 89% of the period plan. In which, the number of rural workers who were supported with primary-level vocational training, training for less than 3 months was 2.85 million people (of whom there were 850,000 agricultural learners and about 2 million non-agricultural learners); 450,000 ethnic minority people, 200,000 people from poor households, 60,000 people with disabilities, the remaining were other subjects. The proportion of rural workers having jobs after vocational training in the period 2016 - 2019 reached over 81%. There were more than 134,000 poor households who have participated in vocational training and have escaped from poverty, over 165,000 households who have participated in vocational training, had jobs and had incomes higher than the local average. Vocational training for rural workers in our country has been more focused on quality than quantity. The proportion of agricultural and non-agricultural vocational training has also changed with 70% of workers having learned non-agricultural occupation, and only 30% having learned agricultural occupation. In the 2020 plan, the whole country will conduct vocational training at primary level and other vocational training levels for 1.68 million people, in which training will be provided at primary level and under 3 months of training for about 1 million rural workers. The proportion of workers having jobs after training is over 80% (*Dinh Trung Thanh et al, 2021*).

The achievements of vocational training for rural workers bring many values, the number of trained rural workers increases, making an important contribution to the implementation of the criteria for building new rural and restructuring the agricultural industry towards modernization. Survey results on the benefits of vocational training for rural workers have shown that, 92.80% of the families who have been asked said that, thanks to vocational training, adults in the family have new jobs or skills to enter new jobs. Family income has increased, thereby improving living standards; 69.20% of the respondents said that they have new jobs in their localities, especially those in the service or non-agricultural sectors. Many households have organized the production of goods under contracts with enterprises, creating new value chains. Some households have cooperated with each other to create new production models; 93.70% of households have learned more professions, learned new techniques and new technologies, so they have enough money to buy motorbikes, refrigerators, computers, and repair or expand houses. Some families, thanks to learning techniques and technology, have changed professions such as from small business to computer repair, from farming to producing slicers and peelers. (*Pham Tat Dong, 2022*).

However, in recent years, vocational training for rural workers in Vietnam has also revealed some major shortcomings such as low quality of vocational training; the effectiveness of vocational training for rural workers is not uniform across regions of the country; the determination of the list of training occupations for rural workers, especially the list of agricultural occupations in some localities, is still scattered, not derived from agricultural production planning, new rural development planning; the initial investment in facilities and equipment for vocational training are still scattered and lacking in synchronicity; in many localities, the work of consulting on vocational training, profession choosing, surveying vocational training needs has not really come from the needs of learners but mainly by the movement; vocational training has not been linked with employment, so many workers after completing their studies do not follow the profession they have learned... (*Dinh Trung Thanh et al, 2021*). Thus, one of the solutions that must be taken to develop sustainable agriculture is to improve vocational training for rural workers so that farmers can master modern agriculture or occupation transfer responding to the trend of industrialization and modernization of agriculture and rural areas.

4. Discussion and Conclusion

4.1. Some solutions to improve the quality of vocational training for the rural workforce

To promote the achieved accomplishments, overcome shortcomings, limitations and promote vocational training for the rural workforce to meet the requirements of industrialization and modernization of the country, building comprehensive agriculture, it is necessary to implement some of the following solutions:

Firstly, the Party and State must identify vocational training for the rural workforce as one of the breakthrough solutions to accelerate the process of restructuring the agricultural industry and building new rural areas. Vocational training for the rural workforce is one of the breakthrough solutions to accelerate the process of agricultural restructuring and building new rural. To do so, it is necessary to strengthen communication

work, helping rural workers to timely grasp information about vocational training, and have the opportunity to choose and learn occupations that are suitable to their conditions, capacity, and development trend of high-tech agriculture. On the one hand, it is necessary to socialize vocational training and vocational training schools for rural workers; give priority to vocational training for farmers whose agricultural land has been acquired, shrunk, and converted. On the other hand, the State also needs to do a good job of managing and unifying the focal points of vocational training in the localities, avoiding overlap, waste, and loss.

Secondly, developing vocational training networks in rural areas. Establishing vocational training institutions, investment from infrastructure to material foundations, teaching and learning equipment. Expanding the training scale as well as developing the number of students, diversifying vocational training institutions with more professions, especially the market has demand. Establishing more vocational training schools in rural areas, especially in key areas of agricultural production. Upgrading vocational schools regularly, especially to ensure training quality, have practice rooms for students, to connect with production facilities for students to practice at the workshops and at the same time having contracts to supply workers after vocational training for factories to both create jobs for workers and attract workers to attend vocational training. Building some mobile vocational training institutions to meet the vocational training needs of workers in remote, mountainous areas, ensuring fairness, and equality and creating opportunities for everyone who wishes to participate in vocational training. It is necessary to encourage all economic sectors to invest in the vocational training system, especially the private sector. In the future, it is necessary to further encourage vocational training centers in rural areas to develop the number of technical workers and reduce the number of untrained workers. In addition to the economic sector, the State also encourages other sectors such as economic sectors with foreign investment capital... to participate in support.

Thirdly, improving the competency of vocational training and nurturing in rural areas. Vocational training centers and continuing education centers of the provinces in the region need to diversify types of training and nurturing for rural workers. The development of orientation and vocational training must be associated with the socio-economic development strategy, with the development needs of socio-economic industries of each locality, focusing on the development of projects and types of diverse vocational training, etc. especially, jobs have been created after they are trained. In order to improve the quality of vocational training for rural workforce, it is necessary to quickly improve the qualifications of vocational teachers, agricultural and technical officials, etc. Vocational training for rural workforce can only achieve actual efficiency when there is a close combination between vocational training centers, universities, colleges, research institutes, production facilities, enterprises and efforts of rural workers.

Fourthly, businesses and production units need to actively coordinate with vocational training institutions and provide vocational training to attract rural workers to participate in locally training. Local vocational training and job centers need to build the model of signing training contracts such as promoting forms of vocational training under

contracts with enterprises inside and outside the locality; signing contracts with enterprises for rural workers to transfer occupations from agriculture to non-agricultural industries...

Fifthly, learners need to actively search for information to choose profession which is suitable with the trends and requirements of the fourth industrial revolution. Learners need to be proactive and self-disciplined in the learning process to improve their qualifications, capacity, professional skills, foreign languages, and practice industrial style to actively adapt to the requirements of modern agriculture. High schools need to do well in orientation activities for students. Currently, many students and parents still have misconceptions about occupations, especially occupations associated with agriculture and rural areas. Vocational training programs in high schools at all levels in rural areas, agriculture need to help students direct more towards occupations that will develop in the rural areas while still ensuring excitement such as if they love animals, they can choose livestock farming on farms, if they like driving, they can learn to drive trucks at businesses in the field of agricultural production, serving agricultural tourism (Pham Tat Dong, 2022).

Sixthly, improve living standards in rural areas. With the principle of social existence, material life determines social consciousness and spiritual life, so in order to improve the quality of training for rural workforce, help this force feel secure to study and practice, stick with the training profession, they must have supportive policies to improve the immediate economic life for them and their families. When the life of rural people is improved, they will have conditions to pay attention to improving their qualifications and technical expertise.

4.2. Conclusion

Sustainable rural development, building modern agriculture in association with vocational training for rural workforce is considered the key to transforming rural economic structure, contributing to the successful implementation of industrialization, modernization of agriculture and rural areas. In fact, trained workers in rural areas of Vietnam is still too low, so vocational training, especially job creation for workers after vocational training in rural areas is still a difficult issue. The majority of rural workers, after receiving vocational training, still have difficulty in finding jobs, self-employment or have jobs but have low and unsustainable incomes. In addition, a large number of rural workers have been trained but have not met the needs of the labor market properly, leading to underemployment or even unemployment. Therefore, in order to perform well in vocational training for rural workforce to build sustainable agriculture, it needs coordination from many sides: the State, local vocational training institutions, especially universities, colleges and enterprises must promote their leading role in innovating program content and improving training quality to meet the needs of the labor market.

Based on the research results, in our opinion, (1) In order to build modern agriculture and sustainable rural development, many solutions must be comprehensively implemented in terms of economy, politics, society and culture; (2) vocational training for rural workforce is considered the most important solution to promote modern and sustainable agriculture and rural development; (3) it is necessary to solve the problem of training and using rural

workforce to avoid wasting time, effort and money of the State and the People; (4) there should be coordination of many subjects in the process of vocational training for rural workforce; (5) thoroughly solving the problem of sustainable output for agricultural products so that farmers can guarantee production.

Abstract

The Mekong Delta faces climate change, depletion of natural resources, environmental pollution, etc. These challenges have been, are, and will be serious threats to the sustainable development of the socio and economical of the Region, especially for agricultural production activities. Circular agriculture is an urgent trend to solve these problems, contributing to the prosperity and sustainable development of Vietnam's agriculture in general and agricultural production in the Mekong Delta. Building and developing circular agriculture will contribute to the rational use of natural resources, protect the environment, change the production-consumption structure, bring about high economic efficiency and ensure livelihoods for farmers in the Region. The article summarizes some expected benefits of circular agriculture and analyzes the shortcomings when developing this agricultural economic model in the Mekong Delta in recent years. From there, propose solutions to promote the development of circular agriculture in the Mekong Delta, contributing to the Region's green growth and development strategy.

Keywords: *Circular agriculture, Mekong Delta, Mekong Delta: opportunities and challenges.*

1. Introduction

Over the past 30 years, agricultural farming systems in the Mekong Delta have shifted towards high quality, safe and organic production. Accordingly, farmers gradually change their habits from using more fertilizers and pesticides to more sustainable production and better adapting to climate change. Some ways to highlight such as "3 decreases three increase", "1 must five decrease", and "1 must six decreases". In economic irrigation techniques, VietGAP and GlobalGAP standards also apply more and more. Plant structure is also adjusted to avoid drought - salinity intrusion. However, agricultural production in the Mekong Delta generally still focuses on productivity and output. However, it has not paid attention to taking advantage of wastes from the production process, causing destruction of resources (redundancy fertilizers, pesticides, feed, loss, waste in harvesting, post-harvest, and consumption) and environmental pollution. In a report by the Department of Natural Resources and Environment of Tra Vinh province, each year, pangasius farms in the Mekong Delta emit more than 10 billion cubic meters of wastewater containing about 51,336 tons of

nitrogen and 16,070 tons of phosphate- untreated phosphorus; Intensive shrimp production has generated about 4.4 billion cubic meters of wastewater, including 25,344 tons of nitrogen and 6,336 tons of phosphorus (Tra Vinh Department of Natural Resources and Environment, April 2021). More worrying is the increasing use of pyrethroids, organophosphates, and organochlorine pesticides in the Mekong Delta. Some of the banned pesticides still in use include Methyl parathion and Methamidophos (organophosphate compounds) of WHO categories Ia and Ib (extreme and hazardous), respectively, and Endosulfan (chlorinated organic compounds) class II (moderately dangerous) (Nguyen, Hang T. (VietinBankSC), March 2021).

Faced with this situation, the development of circular agriculture is considered an essential foundation to ensure prosperity and sustainable development for Vietnam's agriculture in general and the Mekong Delta's agricultural sector in particular. Circular agriculture creates many economic and welfare values, solves resource scarcity, protects the environment, and contributes to climate change response, ensuring sustainable livelihoods for people in the Mekong Delta.

2. Method

The article is based on the methodology of Marxism-Leninism and thoroughly grasps the views and policies of the Party and the laws of the State. The article also used secondary data from various published reports from the World Bank, Food and Agriculture Organization of the United Nations (FAO), The United Nations Industrial Development Organization (UNIDO), General Statistics Office of Vietnam, and Experts' opinions were published in leading newspapers of Vietnam and the world, published articles in reputable journals. Then, the author's opinion is given based on analysis from scientific documents to legal documents, documents of the Politburo of Vietnam combined with an analysis of the actual situation to clearly explain the challenges and prospects of developing circular agriculture in the Mekong Delta in the new context.

3. Results

3.1. The concept of circular economy and circular economy in agriculture

According to the Food and Agriculture Organization of the United Nations (FAO) and the World Bank, in the agricultural sector in the last five years, Vietnam has always been a deficit country in terms of inorganic fertilizers and pesticides deep, with an estimated cost of billions of dollars (World Bank Regional Agricultural Pollution Study Group, 2017, pp.26-27). Also, according to a World Bank report, in 2013, it was estimated that air pollution alone caused Vietnam to lose 5.18% of GDP, and water pollution will expect to cost Vietnam up to 3.5% of GDP (World Bank, 2019). That is not to mention soil pollution and land degradation. Furthermore, the impact of climate change, especially the Covid-19 pandemic, which is still complicated globally, has been seriously affecting agricultural production - one of the critical sectors in the socio-economic development of Vietnam.

Faced with the above problems, many countries worldwide, including Vietnam, the transitioned from a linear economy to a circular economy. This sustainable development trend has always been of interest to the international community over the past decades.

Research by Stahel and Ready (1976) has shown that: "a circular economy is an economy with a completely closed product cycle, prioritizing reuse, repair and remanufacturing of goods. The production of new goods will positively impact job creation, economic competition, saving of natural resources, and protection of the environment. The United Nations Industrial Development Organization (UNIDO) considers the circular economy "a way to create value and towards the ultimate goal of prosperity; it works by extending the product lifecycle, transferring the waste from the end of the supply chain back to the beginning... thereby, using resources more efficiently by using them again and again" (UNIDO), 2017). In Vietnam, "*circular economy is an economic model in which design, production, consumption, and service activities reduce the exploitation of raw materials and materials, prolong the product life cycle, and limit the quality of products emissions and minimize adverse impacts on the environment*" (National Assembly, 2020). With these approaches, the circular economy is the opposite concept of the linear economy, which is considered an appropriate development model for realizing the goals of sustainable development (SDGs) and adaptation to deal with climate change. The circular economy is associated with and supports the implementation of 10 out of 17 common sustainable development goals: SDG2, SDG6, SDG7, SDG8, SDG 9, SDG 12, SDG 13, SDG 14, SDG 15, and SDG 17. In particular, targets directly related to the agricultural sector are SDG2 - Hunger eradication; SDG12 - Responsible consumption and production; and SDG15 - Sustainable land use (Nguyen The Chinh & Nguyen Hoang Nam, October 2021).

In agriculture, the circular economy is the process of agricultural production following a closed cycle through scientific and technical advances, biotechnology, and physicochemical technology. Then the wastes and by-products of this process are the input of other production processes. As a result, agricultural production will exploit and use resources economically and efficiently, minimizing waste and loss of harvest, creating safe and high-quality products, and significantly minimizing and eliminating waste causing environmental pollution, protecting the ecosystem and human health (Nguyen Thi Mien, 2021). At the same time, it contributes to raising people's awareness about the reuse of by-products and waste products in production and environmental protection. Thus, when operating and developing a circular economy in agriculture (also known as circular agriculture), it will ensure three sustainable development goals, which are: (1) Responding to the depletion of natural resources input and production materials; (2) Overcoming environmental pollution in the output development; and (3) Harmoniously combine economic growth, social development with environmental protection.

3.2. Benefits of operating and developing circular agriculture in the Mekong Delta

The disadvantages that appear when traditional agricultural production is applied too long with minor or inefficient agricultural manipulations; include a change in the area of land used, an increase in the number of inorganic fertilizers; an increase in the number of chemical pesticides (insecticides and weeds); increase CO₂ emissions and increase fossil fuel use. Meanwhile, circular agriculture aims to connect farming and production activities in a predetermined way so that the combination best matches, forming cyclic circles in production activities. As a result, agricultural production minimizes emissions to the

environment towards zero emissions (Nguyen The Chinh & Nguyen Hoang Nam, 10/2021). Therefore, operating the circular economy in agriculture will solve the problem of coping with the depletion of input resources and environmental pollution in the output development. Specifically, the main benefits that the circular economy brings to agricultural production in the Mekong Delta are:

About ecology. Circular agriculture helps restore and increase soil fertility through increased use of natural and sustainable nutrients (organic fertilizer products recycled from agricultural by-products and agricultural waste); diversifies crop rotation by combining crops and livestock under a closed system. From there, reduce chemical pesticides and herbicides by using integrated pest control. In the report Agriculture Pollution Overview in Vietnam: Crop Industry, in the Mekong Delta, farmers overuse fertilizers and chemicals in crop production at 360-160-120 (kg NPK/ha)); this rate is relatively high compared to the Red River Delta at 100-60-90K (kg NPK/ha); On average, pesticides were to applied 5.3 times/crop. An estimated 1,790 tons of molluscicides, 210 tons of herbicides, 1,224 tons of pesticides, and 4,245 tons of fungicides are wasted each year from unnecessary use in rice production in the Mekong Delta (Research Team World Bank Regional Agricultural Pollution Study, 2017, p.26). Excessive fertilization or continued use of pesticides over the allowable threshold causes many harmful impacts on the ecological environment. It increases the cost of agricultural production and has high environmental costs.

About environment. Circular agriculture has the potential to regenerate investment in the atmosphere by restoring and maintaining soil fertility; reducing soil erosion and chemical pollution in agriculture; increase the efficiency of water use by utilizing the wastewater output of one acts as an input source for another after being treated, or by applying optimal closed irrigation and cover crop cultivation techniques; reduce forest degradation; without loss of biodiversity and other impacts on land use. Furthermore, with a closed production cycle, making full use of the by-products/waste of this stage as input materials for different locations, reducing almost 0% of harmful waste to the environment. More importantly, it is possible to minimize greenhouse gas emissions or switch from a source of greenhouse gas emissions to a neutral place, even absorbing emissions when forest degradation is reduced to 35% freshwater instead of 55% (Khuat Dang Long, 2016). It is of urgent value in the face of saline intrusion in the Mekong Delta.

Economic. Developing circular agriculture helps rationally use resources/input materials and minimize or no longer have costs in using chemical fertilizers and pesticides. In the Mekong Delta, it is estimated that about 140,000 tons of N-82,000 tons of P-66,000 tons of K are wasted in rice cultivation every year, equating to \$150 million wasted every year. When agricultural production follows the circular economy model, farming by-products and wastes are utilized for recycling into useful products to serve the industry or as raw materials for other industries. Other ancillary businesses, thereby generating additional income for producers. For example, shrimp shells and heads in aquaculture areas produce Chitosan (a substance that helps prolong the preservation time of vegetables and meat; additives used in the processing of some beverages), SSE with the potential to collect 4-5 billion USD/year. Furthermore, rice straw by-products in rice cultivation are used to grow

mushrooms, corresponding to the amount of straw from 01 ha of rice cultivation, 250-300 kg of fresh mushrooms are obtained, with the selling price of 01 kg of fresh mushrooms from 25,000 VND-27,000 VND estimated at 01 hectares of rice farmers can earn from 6-8 million dong. Alternatively, produce microbial fertilizer in livestock (using all agricultural by-products combined with probiotics as a biological buffer for livestock, which is then used to produce organic fertilizer) with about 100 tons of microbial organic fertilizer, worth 300 - 500 million VND (Nguyen Thi Mien, 2021).

3.3. Actual situation of operation and development of circular agriculture in the Mekong Delta region

3.3.1. About the operation and development of circular agriculture

Although "circular economy in agriculture" or "circular agriculture" is still relatively new in Vietnam, the manifestations of this economic model have been established since the 1980s through different production models, such as Garden - Pond - Barn (VAC); Garden - Pond - Stable - Biogas (VACB); Garden - Pond - Stables - Forest (VACR) in the mountainous provinces or Garden - Pond - Lake (VAH) in the central areas. Among the above models, the VACB model is evaluated as a solution that brings economic efficiencies and helps overcome irrational waste management, rational use of agricultural by-products, and returns soil fertility. The safe handling of animal waste, generating renewable energy to create a fuel source for daily life, combating environmental pollution, reducing emissions, and reducing the greenhouse effect causing climate change. In general, the VAC/VACB model in the Mekong Delta was initially small, with a small household size to contribute to food security, hunger eradication, and poverty alleviation. Currently, these models have developed in both quantity and scale with improved forms flexibly in many households, farms, cooperatives, businesses, and significant economic groups. For example, the 2013-2019 Low Carbon Agriculture Support Project of the Ministry of Agriculture and Rural Development, with the support of the Asian Development Bank. The project is deployed in 10 provinces, including Tien Giang, Ben Tre, and Soc Trang (Quoc Anh, 11/2020). Recently, in agricultural production in the Mekong Delta, many new production models under the circular economy have appeared, typically:

** Models of "fragrant rice - clean shrimp" and "fish - river - pond."* In this modified model, the waste after shrimp and fish farming is a source of fertilizer to produce fragrant rice. At the same time, it combines the use of green mushrooms to control pests in organic aromatic rice cultivation. Furthermore, when shrimp and fish farming areas are linked to processing plants, waste and by-products from shrimp and fish are utilized to increase the production value chain, minimizing adverse impacts on the environment and residential communities. Currently, Dong Thap province has Vinafood and Vinh Hoan Joint Stock Company, which focuses on extracting valuable nutrients such as Chitosan, Peptide, Omega-3 in shrimp heads, shrimp shells, fish heads, bones, fish fat investigated into commercial products of high economic value (Nguyen Hong Quan, Nguyen Minh Tu, Dang Kim Khoi, Thach Phuoc Hung & Nguyen Kieu Lan Phuong, January 2022).

* *The model of "growing rice - growing mushrooms - producing organic fertilizers - growing fruit trees."* The feature of this model is to make use of raw materials from rice straw by-products in rice cultivation to grow mushrooms, straw residues after harvesting mushrooms are used to fertilize crops (fruit trees, vegetables). On fruit trees, significant by-products such as overhanging branches, weak branches, and plant residues are used by people as organic fertilizer to re-fertilize the tree (commonly applied on dragon fruit trees) not only to save money. Buying fertilizers also help manage pests and diseases and protect the environment. One of the units that successfully implemented this model was Co May Company of Dong Thap province when it introduced a new product, mushrooms. Organic straw is grown in a closed house without using any chemicals. The value of straw is also enhanced when straw mushrooms are processed into nutritious powder, vegetarian fish sauce, dried mushrooms, and fresh mushrooms (Phan The Cong & Nguyen Ngoc Quynh, 2021).

* *Model "production of organic fertilizer from agricultural waste"*. The model is operated on the principle of using by-products from cultivation (straw, corn, beans), domestic waste, livestock waste (pig manure, chicken manure, bird droppings, quail, cow dung) through the composting process (addition of manure, phosphorus) decomposes as organic fertilizer to care for and improve degraded soil, lack of nutrients, return soil fertility, and cultivate vegetables organic and safe vegetables. In addition, manure from livestock is also used to raise earthworms, harvested as food for chickens, ducks, and fish. As a result, agricultural waste can be reused as fertilizer stably while taking advantage of available raw materials to meet clean production requirements and reduce emissions and greenhouse gas emissions.

Although there are many potentials, experience (from developing VAC models or recycling craft villages), and achieving remarkable results through initiatives to apply circular economy in agricultural production, circular agriculture in the Mekong Delta is considered in the early stages, facing challenges and many difficulties in operation and development. This is demonstrated through the following issues:

Firstly, awareness of circular agriculture development. In the Mekong Delta, several agricultural production models in the direction of circular agriculture have appeared since the early 2000s. Nevertheless, issues related to circular agriculture have not been fully addressed comprehensively. Therefore, the role, benefits, nature, content, and criteria for evaluating the achievement of circular agriculture are still unclear or even nonexistent. Leading to the perception of state management agencies, agricultural production subjects of this model is still vague and incomplete.

Secondly, disseminating and providing relevant information about circular agriculture to agricultural producers has not had extensive effects. The organization has not been synchronized, and there has been no close coordination from the government-related parties. Many farmer households still do not understand/do not know the principles and requirements in circular agricultural production. This is one reason for the limited awareness of circular agriculture among most Vietnamese agricultural producers, especially farmers in the Mekong Delta. Besides, consumers and consumer behavior significantly impact the entire production

process in agricultural production. Therefore, the consciousness and behavior of consumers play a decisive role in the sustainable development of the Industry. However, because green consumption and green agriculture are still relatively new, it is challenging to change production and consumption habits immediately. Some consumers are still not aware of the negative impact of their consumption behavior on the environment, so they still have reckless consumption behaviors that seriously affect the sustainable development of agriculture—for example, using plastic bags and disposable plastic products instead of switching to using materials and products that can be completely recycled and reused.

Third, agricultural production also abuses inorganic fertilizers and pesticides in cultivation. The increase in the production of farm products, especially in farming activities, leads to the excessive use of chemical fertilizers, pesticides, and other plant protection chemicals. According to the World Bank's Regional Agricultural Pollution Research Group (2017), rice production has consumed about 1.5 million tons of N-1.6 million tons of P; The recommended fertilizer rate for maize cultivation is around 50–100 kg N, while in the Mekong Delta farmers typically apply 180-146-77 (N-P-K) kg/ha. Of the pesticides used, almost 20% are classified by WHO as highly hazardous, with an estimated 69,238 kg and 43,574 liters of pesticides and 69,640 kilograms of chemical sachets released into the surrounding environment without proper handling (p.26-27).

Fourth, the capacity to recycle and reuse by-products and agricultural wastes is limited. The Mekong Delta region still lacks capable enterprises in recycling and reusing used products and materials. Most agricultural enterprises in the area are small and medium-sized, and capital constraints make it more challenging to invest in technological innovation. On the other hand, the collection, sub-classification, agricultural waste, and investment in recycling technology have not been paid attention to because of the small and odd production scale. In addition, many localities have not paid attention to waste management or technical training and guidance for production facilities. Therefore, only about 10% of crop by-products are used as local fuel, 5% as industrial fuel, and 3% as animal feed; more than 80% have not been used and are discharged directly into the environment or burned, causing environmental pollution (Phan The Cong & Nguyen Ngoc Quynh, 2021).

Fifth, evaluate, monitor, and control pesticides and fertilizers; monitor food hygiene and safety standards. This is one of the weak points of Vietnam's agricultural production. The management quality of the entire value chain is divided into three segments: agricultural inputs, agricultural products, and product distribution to the market. There are too many specialized agencies to assess and monitor each piece, but coordination and cooperation among these agencies are minimal. This, in turn, leads to the lack of a traceability system for environmentally friendly agricultural/circulating practices such as VietGAP and other voluntary standards. As a result, it limits the capacity of the authorities to monitor the number of agrochemicals used and the quality of food. At the same time, the treatment and announcement of items that pollute the environment and increase harmful emissions in agricultural practices have not been implemented synchronously and effectively (Nguyen Do Anh Tuan and Dang Kim Khoi, 2014).

Sixth, supporting capital, science and technology, and highly qualified human resources. Recently, the Government has focused on boosting capital for agricultural development investment in the Mekong Delta. However, there is still a lack of clear legal regulations (or just a list of priorities) on credit capital for investment in technology and equipment when operating circular agriculture (currently, the money is still short of more than 20% of the demand) (Nguyen Thi Tuyet Nga, 2021). In addition, many critical fields of science and technology for agricultural development (biotechnology, information technology, post-harvest technology, processing technology, and deep processing); and scientific areas of the digital era (IoT, Bigdata, AI, Blockchain, Robotics, Quantum Computing,...) have not been deployed and applied much in agricultural production in the Mekong Delta. This comes from insufficient investment capital, a lack of highly qualified human resources, and slow implementation. According to the Labor-Employment Survey data from the General Statistics Office, the Mekong Delta is one of the regions with the lowest percentage of trained workers compared to the whole country, accounting for 13.3%, while this rate for the entire country is 22%; the Northern Midlands and Mountains region is 18.3%; the Central Highlands region is 14.2% (GSO, 7/2020).

3.2.2. About the regulatory policy and legal framework

In recent years, in the face of increasingly severe impacts of climate change and prolonged effects of the Covid-19 pandemic, it has posed a requirement to open up a new direction in agricultural economic development in the lowlands by the Mekong River. They recognized the role and trend of circular agriculture in developing the farm industry, protecting natural resources, protecting the environment, and ensuring the country's sustainable socio-economic development. The Party and State soon issued many guidelines and policies to create a favorable environment for developing this economic model, such as Directive No. 36/CT-TW, dated June 25, on strengthening the protection environment in the period of industrialization and modernization of the country. The directive clearly states that it is necessary to “promulgate tax and credit policies to support the application of clean technologies” (Politburo, 1998). Furthermore, the Strategy for Socio-Economic Stability and Development up to 2000, adopted at the Seventh Party Congress, emphasized that "economic growth must be associated with environmental protection". It was followed by Resolution No. 26-NQ/TW, dated August 5, 2008, of the Central Committee on Agriculture, Farmers and Rural Affairs; Resolution No. 24/NQ-TW, dated June 3, 2013, of the Central Committee on proactively responding to climate change, strengthening natural resource management and environmental protection, continues to emphasize and demand demand "promote the transformation of the growth model associated with economic restructuring towards green growth and sustainable development".

On the basis of the Party's policy, the State has issued documents such as: Decision No. 432/QĐ-TTg, dated April 12, 2012 approving Vietnam's sustainable development strategy for the period 2011-2020; Decision No. 1393/QĐ-TTg, dated September 25, 2012 supporting the National Strategy on Green Growth, this is a strategy to promote the process of restructuring and perfecting economic institutions towards effective use over natural

resources, through three primary goals: “Greening” production - Reducing the intensity of greenhouse gas emissions per unit of GDP and increasing the rate of renewable energy use - Greening lifestyles and sustainable consumption steady; Decision No. 899/2013/QĐ-TTg, dated June 10, 2013 approving the agricultural restructuring project towards high added value and sustainable development, emphasizing three pillars: economy, society and environment in agrarian development; Decision No. 593/QĐ-TTg, dated April 6, 2016 promulgating the pilot Regulation on linking socio-economic development in the Mekong Delta in the 2016-2020 period; Resolution No. 120/NQ-CP dated November 17, 2017 on sustainable development of the Mekong Delta in response to climate change. Moreover, recently, Decision No. 287/QĐ-TTg, dated February 28, 2022, approved the Master Plan for the Mekong Delta from 2021 to 2030, with a vision for 2050. These documents are the primary basis of important legal and political values that represent the shift and promote the agricultural sector in Vietnam in general, including the Mekong Delta region, to develop towards a circular economy.

However, in terms of State management, it can be seen that the barrier to the development of circular agriculture in Vietnam in general and in the Mekong Delta, in particular, is the lack of mechanisms, policies, and specific guidelines for this economic model. Many National Strategies on green growth and sustainable agricultural development; Projects on agricultural economic development of the Region were promulgated quite early but not synchronously to promote the development of circular agriculture, and specific regulations and guidelines have not yet been the issue. These limitations summarize in the following contents:

First, there is no separate official regulation regulating circular agriculture. The operation and development of the circular economy in general and circular agriculture in Vietnam in recent years has been carried out based on the guidelines, policies, and strategies of the Party or from different provisions of the law major/decreed. The conditions in these documents are scattered and general, mainly stating the principle of ensuring sustainable development in the exploitation and use of natural resources and environmental protection directly and covering the nature and requirements of circular agriculture. There has been no standardization of the circular economy in general and no criteria to identify, evaluate and guide the implementation of this economic model in agricultural production. Therefore, policies, support, and encouragement of circular agriculture have not been able to promote synergy to build a stable legal corridor.

Second, the regulations governing agriculture have not yet been developed, and issued adequate guidelines on criteria, standards, and regulations related to the collection, transportation, and reuse of agricultural by-products and waste from agriculture; regulating the quantification of indicators in circular agriculture; stipulating conditions, assessing environmental impacts and controlling and managing systems on the environment in agricultural production according to the circular economy. In general, the monitoring according to the environmental impact assessment framework and the granting of ecological practice certificates to agricultural enterprises, especially small-scale enterprises, and households, has not been

effectively or synchronized for various reasons. Therefore, it creates confusion when implementing and applying circular agriculture to producers and management agencies.

Third, policies and regulations supporting the construction and protection of agricultural product brands from the circular agricultural model have not been paid attention to and focused on. However, in this regard, it should be noted that Vietnam has integrated and is a WTO member, so when implementing support policies for circular agriculture, it is necessary to study and consider carefully to avoid confusion and "devaluation" as before. At the same time, the implementation and implementation of agricultural insurance in Vietnam so far have not been effective - when this is one of the solutions to contribute to overcoming production losses due to the impacts of the pandemic climate change or diseases (such as the recent Covid-19 pandemic) to help farmers restore production and stabilize their lives soon.

4. Discussion and Conclusion

It is to overcome barriers and challenges in the coming time in developing circular agriculture in the Mekong Delta. Therefore, it is necessary to implement the following synchronous solutions:

**** About the regulatory policy and legal framework***

Firstly, define a vision of circular agriculture toward green agriculture. The Government's top priority for the Mekong Delta is to develop models/indicators for circular agriculture or an idea for circular agriculture and the longer-terms rather than green agriculture in the trend green growth position in the whole region. In this strategy, industry development goals need to integrate with environmental resource protection goals; Green agriculture - rural development goals need to be consistent with the development goals of other sectors. This requires the cohesion and participation of many stakeholders, who can share the vision and work together.

Second, build a management system to operate the circular agriculture strategy and clearly define the role of central and local policies. It is necessary to develop high-level and multi-sectoral, synchronized policy support to implement the region's green agricultural growth strategy, including circular agriculture, and set standards to protect human health, ecology, environmental certification, and resource access in the Mekong Delta. At the same time, it is necessary to review and re-evaluate the effectiveness of the management apparatus in implementing the agricultural development strategy in the Mekong Delta to have a new proposal that is more effective and more suitable to the actual situation. In particular, special attention to the role of the specialized focal agency to manage, guide, and provide timely support to agricultural producers under the circular economy model. It is advisable to pilot studies on the model of regional administrative agencies in the Mekong Delta to facilitate the management and administration in implementing the region's sustainable development strategy.

Third, the Government needs to be proactive and strengthen the direction of reviewing, amending, supplementing, and perfecting institutions, policies, and regulations related to the circular economy and circular agriculture. The more transparent procedures and legal rules will help businesses and people implement circular agriculture more systematically, synchronously, and effectively. This issue includes the following:

- Carefully research when formulating and planning the development of circular agriculture according to the characteristics of the region/region, with an appropriate roadmap-especially the issue of exploitation and use of natural resources and environmental protection for large-scale foreign-invested production.

- Issue appropriate preferential policies on land, tax, and credit to mobilize resources for investment in large-scale farms that meet regional/international standards and regulations on administrative procedures. In particular, focus on developing credit policies suitable to household production models and small and medium enterprises, creating conditions for them to expand their production scale. At the same time, it is advisable to enlist financial and technical support from the international community and the private sector.

- For land policy and law, it is necessary to continue studying land classification, master plan, plan on mixed land use on agricultural - forestry land, and the problem of "land accumulation" serving large-scale farms. Accordingly, it is necessary to study and consider amending and supplementing the regulations on filing deadlines in the Land Law; this content should do according to the roadmap; develop legal rules on ways to lease, transfer, and contribute capital with land use rights between households or between groups of farmers and enterprises to expand the scale of circular agricultural production. In addition, adjusting regulations for agricultural real estate in the Law on Real Estate Business, the Law on Land, the Law on Housing, and related documents are added.

Fourth, it is necessary to issue regulations that directly regulate the circular economy in general and circular agriculture. Because this is a specific economic model directly related to and affects many fields such as the environment, natural resources, and local/regional ecological conditions, this can do in the direction of promulgation. Decree regulating circular agriculture. When developing and promulgating regulations related to the development of circular agriculture that needs to be quantified, such as allowable carbon emissions, national standards, and rules on identification and assessment of circular agriculture, for actors involved in circular agricultural production, there should be specific and interdisciplinary environmental protection assessment indicators such as agricultural supporting industries and related services. It is necessary to continue researching and depending on each group of industries, products, raw materials, and agricultural production scale and interdisciplinary with other fields to issue legal regulations suitable.

Fifth, planning and zoning land use. The Government and subjective ministries need to study, review, and re-evaluate land-use zoning plans in the Region to suit each locality's natural, economic, and social conditions, especially climate change. In addition, it requires that the authorities of each province/city in the Region have high coordination, association, and consensus. Contributes to exploiting and promoting competitive advantages in producing agricultural products of each locality. Furthermore, it strengthens industry linkage, facilitates technology transfer, and applies science-technology to aagrariagricultureral, helping to exploit and use land resources more rationally and effectively.

**** Raise awareness about circular agriculture***

For agricultural production in the Mekong Delta to develop according to the circular economy model, ensuring sustainable green growth, many parties must obtain consensus. In the long run, only when producers/consumers realize that circular agriculture brings tangible benefits to themselves, their families, and society, will this production model develop sustainably stable. Therefore, it is necessary to create a communication strategy on circular agriculture, including the following contents: role, benefits, nature, scope, criteria, and implementation method. Accordingly, strong propagated through mass media and integrated into high school to university training programs. At the same time, it is necessary to approve the role of local authorities, agricultural enterprises, and social organizations such as Agricultural Cooperatives, Agricultural Extension Associations, Farmers' Associations, Vietnam Consumer Associations, organize field visits to typical circular agricultural models in the country/region to apply appropriately and effectively to the natural conditions of each part and area.

**** Some other solutions***

Firstly, to improve the effectiveness and efficiency of state management of the circular economy in general and circular agriculture in particular. Management and supervision should carry out throughout the agricultural production process, such from exploitation and use of resources; to carry out a quantitative assessment of the impact on the environment; equipment, and technology in the production process (collection, classification, and recycling of agricultural by-products-waste, quality control of agricultural output products). In addition, because it is related to and affects many different industries and fields, it is necessary to coordinate between the management agencies. Accordingly, depending on the different levels of involvement, to determine the specific tasks and implementation progress for each industry, each field, and the responsibilities of several agencies and organizations that play a crucial role in specialized management.

Second, in the management and supervision of capital sources to support the development of circular agriculture. The government should prioritize and have a monitoring mechanism to ensure capital investment efficiency and funding for scientific and technical research and development activities in circular agricultural production. Accordingly, it is necessary to summarize the efficiency and level of investment in the development of circular agriculture in the past time, from which to draw lessons to continue to supplement and improve to suit the actual conditions of agriculture in the area.

Third, proactively develop human resources with professional qualifications in circular economy in general and circular agriculture, in particular, to approach and learn from experiences from countries around the world. Although the governing body is the Ministry of Agriculture and Rural Development, the Ministry of Science and Technology will soon proactively coordinate with other ministries, branches, centers/institutes, and educational institutions to prioritize resources for planning work, focusing on training high-quality human resources, promoting and developing circular agricultural models, researching markets for the output of circular farm products. Besides promoting socialization

and encouraging enterprises to participate in human resource training for the circular economy transformation in agriculture, focus on training local technical staff to promptly support and guide farmers in operating circular agriculture.

Over the years, the Party and State have had many undertakings and policies and implemented many solutions to bring the potential and advantages, creating a driving force for socio-economic development in the Mekong Delta region. Decision No. 287/QĐ-TTg, dated February 28, 2022, of the Prime Minister, further affirms the importance of the Mekong Delta not only in ensuring national food security and as a critical economic region with a strategic position for the country's socio-economic development. However, the challenges of climate change, depletion of natural resources, and environmental pollution have been and will seriously threaten the agricultural economic development of the region. Therefore, the development of circular agriculture is the optimal solution for the farming sector in the Mekong Delta to develop and grow sustainably.

HALONG BAY: CURRENT STATUS OF TOURISM, POTENTIAL AND DEVELOPMENT OPPORTUNITIES

Dr. Tran Trung Vy

trantrungvy1971@gmail.com

Vice Principal, Ha Long University, Quang ninh, Vietnam

Abstract

The article introduces Ha Long Bay and its tourism on the basis of analyzing the current tourism status of Ha Long Bay; outline the potentials and conditions for development and propose solutions to effectively and sustainably exploit tourism in Ha Long Bay. The strength of tourism development in Ha Long Bay is the beauty of the natural landscape and outstanding global value. Halong Bay tourism needs budget support for financial support from domestic and foreign human resource training projects and provincial funding to promote human resource training.

Keywords: *Ha Long Bay; travel; Halong Bay tourism; actual situation.*

1. Introduction

Ha Long Bay is located in the northeast of Vietnam, 165 km from Hanoi, has an area of 553 km² with 1,969 islands, of which 90% are limestone islands with an area of 434 km² and contains 775 islands. The West borders Dau Go Island, Dau Be Island (south) and Cong Tay Island (east). In 1962, Ha Long Bay was recognized as a national monument by the Ministry of Culture and Information of Vietnam and classified as a special national monument in 2009. Ha Long was recognized by UNESCO as a world natural heritage in 1994 for the special and universal value of the landscape, and again in 2000 for the exceptional value of geology and geomorphology. In 2012, Ha Long Bay was voted as one of the New Seven Natural Wonders of the World [1]. Ha Long Bay is a national monument of special importance in the Prime Minister's Decision No. 1272/QĐ-TTg dated 12/8/2009. The plan for tourism development in Vietnam to 2020 with a vision to 2030, approved by the Prime Minister on January 22, 2013 has identified Ha Long Bay as a particularly important resource.

2. Method

Research question

- How does the current status of tourism in Ha Long Bay contribute to the socio-economic and environmental development of Quang Ninh province?
- Solutions for effective and sustainable exploitation of tourism in Ha Long Bay?

Research methods

The study site was conducted in Ha Long city, Quang Ninh province, where the main data on tourism resources and parts of Ha Long Bay were collected at Ha Long City People's Committee, Department of Planning and Investment. Investment, Department of Sports and Tourism. Analytical, synthetic and comparative methods were used in this study.

3. Results

3.1. Current status of tourism in Ha Long Bay and potentials and conditions for development

Along with the development of national tourism, Quang Ninh tourism focused on Ha Long Bay and achieved certain achievements. With outstanding tourism potential, as a natural heritage of aesthetic value as well as geology and geomorphology, Ha Long Bay can be the most attractive tourist attraction in the world [2]. In addition, the advantages of the terrain, landscape, climate, flora and fauna of Ha Long have created a value chain for Quang Ninh and are being exploited in the form of nature tourism along with Ha Long Bay with cultural tourism of sea islands. The increase in the amount of visitors in Ha Long Bay is considered the fastest in Vietnam in recent years. With various types of marine tourism on the island such as eco-tourism, boating, swimming, mountain climbing, traditional cultural festivals, sightseeing, overnight stay on the bay, and experiencing the life of fishermen... develop strong. However, in recent years, tourism in Ha Long Bay only gives visitors some knowledge about nature, mainly focusing on the landscapes on the bay, while the heritage area has many conditions and opportunities for tourists to discover and experience Ha Long island culture [3]. Tourists also want to meet and interact with local people with specific cultures to discover about the lifestyle; traditional and modern culture of the local community; enjoy the forms of introducing national culture, performing arts, folk music, folk dance and annual festivals in the buffer zone, heritage quarter such as Tien Cong festival (Ha Nam, Quang Yen/Yen Hung), Quan Lan festival, Ba temple festival with typical values.

With the policy of developing various types of tourism, improving the quality and professionalism of tourism services in the direction of upgrading the class, not following the quantity, the central area of Ha Long Bay will be prioritized for developing ecotourism, cultural tourism. Developing products and services in the direction of introducing, discovering and contributing to the preservation of heritage values. In the past, with the development of the tourism industry, cultural tourism activities in Ha Long area have achieved initial results. But effective cultural tourism activities are still very low compared to their inherent potential, do not create a strong attraction, make a sustainable and unworthy contribution to tourism economic development. Most tourist resorts and hotels currently do not have cultural tourism programs, cultural tourism maps and cultural tourism content [4]. In addition, there are issues that need to be resolved such as: the balance between ecological environment conservation and tourism development; tourism development must go hand in hand with the protection of environmental landscapes and heritage values, developing community-based tourism; understand and effectively exploit the natural conditions and advantages of Ha Long Bay, creating a new development in terms of quantity and quality of tourism services; continue to expand and develop new routes and tourist attractions; continue to upgrade the system of infrastructure, accommodation, tourism and entertainment services, create diverse tourism products to form high-quality tourist centers and centers; organize international cultural events and seminars.

Resolution No. 07-NQ/TU dated May 25, 2013 of the Quang Ninh Provincial Party Committee on tourism development in Quang Ninh province in the period of 2013-2020, with a vision to 2030 [5] has determined the true value of the Gulf. Ha Long Bay and its marine tourism resource system are the driving force to accomplish the overall goal: to strive to turn Quang Ninh into an international tourism center, a leading national tourist destination. Modern and synchronous tourism facilities; diversified, special, high-quality tourism products, strong brands, bold cultural identities of ethnic groups in the province, capable of competing with countries in the region and internationally; this is a spearhead economic sector, a driving force for rapid and sustainable socio-economic development, national defense and security. In order to promote the full potential of tourism in Ha Long Bay, effective solutions to exploit tourism resources in Ha Long Bay are always the top research and implementation priorities of state management agencies in Quang Nam. Ning. A. Assessment of the status quo Halong Bay tourism contributes to economic development - society and the environment of Quang Ninh province. The report proposes a plan to implement solutions for effective and sustainable exploitation of Ha Long Bay. Research results also help tourism businesses develop their business strategies to improve the quality of tourism services to satisfy customers. At the same time, there are solutions to improve products and strategies to expand the tourism market of Ha Long Bay.

Shipping Terms

Ha Long has favorable conditions to develop into a center of tourism, an industry, trade and transportation along the ASEAN-Vietnam-China economic corridor. Regional cooperation frameworks have been established. Specifically, the ASEAN-Vietnam-China corridor can create development opportunities for Ha Long. These efforts include:

Cooperation framework between Vietnam and China ("Two Corridors, One Economic Belt") in which the two corridors are Kunming - Lao Cai - Hanoi - Hai Phong - Quang Ninh and Nanning - Lang Son - Ha Noi. Noi - Hai Phong - Quang Ninh. The "Economic Belt of the Gulf of Tonkin" includes 10 coastal provinces of Vietnam from Quang Tri to Quang Ninh and Chinese territories including Beihai, Quinzhou, Fangchengang of Guangxi, Zhanjiang of Guangdong and Hainan Island. Economic cooperation framework "Nanning - Singapore Economic Corridor".

The China - ASEAN economic integration model stretches over 5,000 km from Nanning in China to Hanoi, Vien Chan (Laos), Phnom Penh (Cambodia), Bangkok (Thailand), Kuala Lumpur (Malaysia) and Singapore. It is envisioned that the cities in the corridor will be connected by rail, highway, waterway and air, forming a comprehensive development area with enhanced trade, investment and tourism [6]. In which transportation by car and ship has been exploited for tourism for a long time and brings outstanding efficiency. In recent years, the transport of tourists by helicopter and train has been welcomed by many tourists. Recently, the train departing from Gia Lam (Hanoi) to Ha Long (Quang Ninh) has been put into operation, initially tourists are very interested. This is a high-quality passenger train operated by Dongrim Railway Transport Co., Ltd. (Korea) with a total investment of over 1 million USD. This has opened up new opportunities for tourism in Quang Ninh to transport, attract tourists from Hanoi to Ha Long and vice versa.

On the information system, electricity and water

Currently, the electricity and water system in Ha Long is good and invested in repairing and upgrading. Stable power system, safe transmission line. The water supply system in the city as well as in the Ha Long Bay area is quite good with the assurance of clean water supply, safe sanitation, and reasonable water treatment and drainage. Good information network to ensure good information needs of tourists. Besides, other infrastructure such as toll stations, coastal medical emergency stations, and banks are also quite developed... to best serve tourists.

Facilities of the property

Only in the past 10 years, a series of hotels, guest houses, motels of all economic sectors, agencies, organizations and individuals have been born. Occupying a large number of small hotels, these small accommodation establishments cater to the needs of tourists especially during high season. However, the increase in mid- and large-sized hotels inevitably leads to excess capacity during the low season. Some hotels are rated as high-class hotels such as Ha Long I, II, III and Ha Long, with occupancy rates above 80%. Besides, some other big hotels such as: Ha Long Hotel, Bach Dang Hotel, Cong Doan Hotel, Vuon Dao Hotel are also hotels with similar occupancy. In recent years, the total number of hotels and rooms of international standard is increasing. Ha Long has 857 accommodation establishments with 12,300 rooms. There are 77 standard hotels from 1 to 5 stars with more than 5,000 rooms [7]. The number of accommodation establishments has increased rapidly, especially 1 to 5 star hotels, mainly located in Bai Chay and some in Hon Gai on Le Thanh Tong street. This is one of the advantages of tourism development of the city in general and the Ha Long Bay area in particular to meet the needs of tourists.

Food establishments

Dining facilities in Ha Long city are diverse. Most hotels, guest houses serve food, in addition there are restaurants, eateries and bars of all economic sectors serving tourists and locals throughout the day. Catering services from famous restaurants, sea specialties, European and Asian restaurants, high-class eateries located mainly in Bai Chay area and large hotels are very developed. European and Asian restaurants are relatively large in scale, mainly in 3-5 star hotel standards, meeting international quality standards. Medium and large specialty seafood restaurants on Bai Chay and the main streets of Ha Long city such as Le Thanh Tong, Tran Hung Dao are important culinary addresses. Especially interesting is the chain of floating restaurants, the rafts, where visitors can both admire and enjoy the seafood flavor of Ha Long Bay. In addition, food service in Ha Long is also growing by many restaurants, drinks and refreshments serving day and night. Especially "snail supermarket", attracting visitors in the evening.

Recreational and sports facilities

Currently, in Ha Long city as well as in the Bay area, there are many entertainment facilities and sports facilities built to serve the needs of tourists as well as of local people.

Most are located in Bai Chay area with many well-invested facilities including bars, discos, casinos, parks (Sun World Ha Long Parks / royal lotus park) located on the beach, Tuan Chau tourist area, Night market, sports area such as water engine, paragliding...

Travel agent

Ha Long Bay has long been known as one of the attractive tourist destinations with vibrant tourist activities. Contributing a large part to promoting Ha Long Bay tourism domestically and internationally are tour operators and travel agents that are currently operating very effectively. Currently, there are about 30 tour operators located in Ha Long, including many major travel agencies.

Resources

Ha Long is endowed with natural resources. These range from non-growable minerals such as coal, limestone and clay, to other resources such as land, sea and coast, freshwater and forests, and coastal properties (shipbuilding, trade, etc.). international and logistics).

Topographic

Quang Ninh is a mountainous coastal province with more than 80% of the mountainous land area. The terrain is relatively complex with mountainous areas, midlands and coastal plains, coastal areas and islands. The sea and islands of Quang Ninh province, especially the Ha Long Bay area are unique terrain with 1969 large limestone islands, Karst terrain worn by thousands of appearances and in the center of the cave is interesting, occupying more than two-thirds of the island. The islands stretching along the coast for more than 250 km are divided into several layers. There are many large islands such as Cai Bau, Ban Sen. And two districts are Van Don and Co To. The seabed is not flat, the average depth is 20m. There are deep creeks and coral reefs. The topography of Ha Long Bay area is Karst terrain which is abrasive water. It is a complete evolution of Karst over 20 million years due to the simultaneous integration of factors such as very thick limestone, hot and humid climate, and too slow growth. Ha Long Bay has many forms of Karst Phong Tung, Phong Linh styles.

- Karst Phong Tung: consists of a cluster of limestone often with adjacent pyramids with a height of 100m, the highest peak is about 200m.

- Phong Linh terrain: Characterized by dividing peaks forming towers with steep walls. Most towers are from 50-100m. The ratio between height and width is about 6m.

The limestone field is a large basin that grows in relatively flat karst areas. Limestone quarries are formed by different methods such as: loss of underground river valleys, underground caves; Due to erosion, the limestone topography is higher than the surrounding area. Ha Long Karst School is often flooded.

- Underground Karst landscape: Diverse cave system in Ha Long Bay, divided into 3 main groups: First, ancient cave relics, typical of Sung Sot cave, Tam Cung cave, Caste castle, Thien cave Palace, Dau Go cave, Thien Long cave. The second group is a typical Karst cave, which is Trinh Nu, Bo Nau, Tien Ong, Hang Trong... The third group is a functional frog system, typical of three caves in Ba Ham lake and Ba Hang cave. Karst in

Ha Long Bay has global significance and is the foundation for geomorphology. The geological environment is also the foundation for other values of Ha Long Bay such as biodiversity, archaeological culture and others. This is one of the potential tourism resources of Ha Long Bay.

Ecosystem

Ha Long Bay is considered a diverse ecosystem with ecosystems such as mangrove ecosystems, coral reef ecosystems, tropical forest ecosystems and ecosystems. Besides the green vegetation covering the mountain peaks, cliffs and caves on the island are many rare animals. In fact, the islands here have a wide variety of plants, including rare, endemic and beautiful species. Along with the diversity and abundance of species with many shapes and sizes, adapting to the living environment. The total number of plant species present on Ha Long Island has not been determined. However, this diverse flora can be identified to include: mangroves; sand shore; vegetation on the mountain slopes; vegetal cliffs; tree on the top of the mountain; cave and rock crevasse plant.

Besides, Ha Long Bay has many animals including about 1,000 species of marine fish, including 730 species; 140 species of zooplankton; nearly 500 benthic species; 326 species of zooplankton; 130 species of bivalve molluscs; more than 230 species of coral and some rare primates and many endemic plant species. Currently, the ecosystem in Ha Long Bay is quite intact, the vegetation has almost no signs of burning or cutting.

Research results show that Ha Long Bay has many tropical ecosystems such as mangrove ecosystems, coral reef ecosystems, sea grass ecosystems, tropical forest ecosystems and especially... specific. With very stable climate conditions, extremely complex topography, the coasts of many large estuaries are extremely favorable natural conditions for ecological development.

Coral ecosystem

In the waters of Ha Long Bay, coral is scattered in many places but concentrated in large numbers in the east and south of the continent. Ha Long Bay has about 163 coral species, belonging to 44 genera and 12 families, usually concentrated at a depth of 5-10m. The average reef layer is 30%, but there are 70-80% of the area, such as Cong Do, Union, etc. Ha Long Bay coral reef is a beautiful sight, coral forming corals, corals, lacquered corals... with many colors of white, blue, red, red... Simultaneous corals This is where many fish species such as 107 species, seaweed, algae, zooplankton, phytoplankton...

Mangrove Ecosystems

This is an attractive landscape of the intertidal zone of Ha Long Bay. This ecosystem is mainly located in Tuan Chau, Cua Luc, Ba Che and scattered along the coast. Besides, there are many kinds of plants such as: black tiger, parrot, fish sauce, crab... There are countless species of plants and animals such as migratory birds, semi-migratory birds (37 species), benthic animals with 81 species. species; 90 species of fish belonging to 55 families. Only benthic animals in mangrove forests account for 61.2%

of the total species in the intertidal zone with many species of high economic value such as oysters, clams, shrimp, crustaceans.

Tropical forest ecosystem

This ecosystem is rich in species such as cloves, incense, candles, scallops, scallops... mainly on the islands. It is also home to a number of rare wildlife species such as deer, weasel, squirrel, especially white gibbon and red monkey and many others.

Ecosystem

In addition to these basic ecosystems, Ha Long Bay also has a small ecosystem of pine trees growing in the East Sea. This is the habitat and development of many species of plants and animals such as sea grass, algae, fish, shrimp ... Besides going abroad is the habitat of shrimp, fish, squid, abalone, and seafood with the annual output is up to thousands of tons.

With such a rich ecosystem, Ha Long Bay was decided by the Prime Minister on Decision No. 5/2001 dated June 1, 2001 [12] to establish Bai Tu Long National Park in order to preserve the biodiversity value of Ha Long Bay area.

Population and people

There are a large number of people living in the world heritage site of Ha Long Bay, mainly in the fishing villages of Cua Van, Vong Va, Cau Tau and Ba Hang. boats, rafts and live on fishing, aquaculture. This is the home of 21 ethnic groups, each with its own cultural characteristics, customs and habits. This is also the main factor that creates the culture of Ha Long region and is an abundant human resource in tourism exploitation.

Historical and cultural sites and fine arts

Ha Long Bay has a particularly important position for commercial, cultural and military exchanges. Bach Dang River, Van Don is the place to mark the glorious military victory of the Tran Dynasty in the war against the Mongols (III) in 1288. Ha Long is also considered a center of cultural exchange between Vietnam and other countries. other countries such as China, Japan, Siam, Southeast Asia under the Ly - Tran - Le feudalism. This evidence is that Van Don port was established under King Ly Anh Tong (1149). Many artifacts found here include millions of pieces of porcelain originating from Vietnam, China, and Japan up to 0.60m thick. Most of them are pieces dating from the Ly to Le dynasties. Ancient house ruins are also found along the coast. These are old houses lined with cobblestones in the bay. Around the house there are many bronze jars in the Chinese dynasties from Tang to Thanh and Vietnam since the Ly Dynasty to the Nguyen Dynasty. There are also many other ports and commercial ports discovered such as Cong Dong, Cong Yen, Ngoc Vung, Quan Lan, Cai Bau... Accompanying evidence is the mark of a flourishing religious architecture. Buildings were built and embellished to meet the spiritual needs of merchants as well as locals, including temples and Catholic churches [13]

Ha Long culture has existed for thousands of years, and has long been known as a typical culture of prehistoric people living along the coast and islands. Along with the existence and development of traditional cultural values, Ha Long Bay has been built over time with valuable historical and architectural relics such as Van Don commercial port under

King Ly Anh. Tong (12th century), is a place of trade, exchange and commerce. in goods, cultural exchange... lasted from the Ly to Tran dynasties. There are also many other historical sites such as Quan Lan on Quan Lan island in Vam Thu archipelago (Cam Pha town), Cua Ong temple. Notable in the Ha Long Bay area is the historic Bach Dang Beach, marking three major battles on the Bach Dang River under the command of Ngo Quyen (983) Le Hoan (1981), Tran Hung Dao (1988).

Ha Long Bay is known as one of the cradles of ancient Vietnamese people, which has existed for more than 4,000 years, Ha Long Bay has become a huge archaeological geological treasure with thousands of archaeological discoveries. So far, about 40 archaeological sites about Ha Long culture have been established on the islands and on the coast of Ha Long Bay. Archaeological evidence shows that Ha Long Bay has undergone great geological formation of soil, geological structure. Ha Long Bay has experienced three successive cultures: Soi Nhu culture, Cai Beo culture, and Ha Long culture.

Ha Long Bay is a land that has existed a rich culture, rich in tradition. Buddhist festivals, local festivals and tourist festivals are held every year. The highlight of the festivals in Ha Long Bay is the reenactment of the activities of the fishermen on the Bay, the Fisherman's Village, the Boat Club...

Sea and Coast, Marine Fisheries, the marine area of Ha Long Bay is home to many species of sea snakes and other Ha Long seafood including 950 species of fish, 500 types of molluscs and 400 species of crustaceans. This includes many seafood species of high economic value such as mackerel, grouper, shrimp, squid, pearls, abalone and oysters. Coral reefs in the bay are also rich with 117 species belonging to 40 families and 12 groups. The waters off Ha Long Bay are one of the four main fishing grounds in Vietnam. In addition to aquatic resources in the sea, Ha Long also has more than 50 km of coastline. This is a resource that has been exploited for port development such as Cai Lan deep-water port, coal port, tourist port and some other auxiliary ports allowing the shipbuilding industry in Ha Long to develop.

3.2. Business opportunities

In the master plan for tourism development of Ha Long Bay to 2030, Quang Ninh Provincial People's Committee has set a target of welcoming 10.8 million visitors by 2020. Ha Long Bay not only brings beautiful and romantic landscape value. but also make visitors not boring, monotonous. Therefore, the development of tourism in Ha Long Bay must depend on the needs, preferences and affordability of different tourist market channels. Ha Long Bay needs to enrich the types of sea tourism, island tourism, sport tourism, adventure tourism, cultural festivals, craft village tourism, archeology, cruise ships... For many years, tourism activities in Ha Long Bay were only popular as a form of mass tourism, which means that visitors to Ha Long Bay are basically just sightseeing, swimming, visiting fishing villages... Currently Some types of tourism attract many domestic and foreign tourists to explore Ha Long Bay:

Sightseeing tour [14] is a popular type of tourism in Ha Long Bay. Participants in this type of tourism have the opportunity to enjoy the scenery, visit caves and entertainment, swim at islands in the bay such as Ti Top beach...

Canoeing (Kayaking)

This is a kind of romantic travel. A large boat will take visitors and small boats to the wide sea so that you can explore your own adventures and discover new things on the Bay.

Cultural tourism

This is a type of tourism for tourists to enjoy culture, have more time to visit, learn or research archaeological sites, material culture and immaterial objects in Ha Long Bay.

Ha Long Bay Ecotourism

World natural heritage Ha Long Bay is full of tropical natural conditions, diverse terrain, rich ecosystems and special cultural values. These are great potentials for ecotourism development. This is a type of environmental tourism in unspoiled natural spots to enjoy nature, thereby encouraging environmental protection in that area. Currently, ecotourism is just a spontaneous activity, as tourists organize themselves in wilderness areas or in places with national parks. Ha Long Bay has put into operation a number of eco-tours at a number of attractions such as: Me Cung cave (history of cave formation, limestone deposits), islands - Cong Do lake, Ba Ham Mountain lake. Bai Tho - Long Tien Pagoda - Tran Quoc Nghia Temple or Ngoc Vung, Quan Lan (history, culture). However, the exploitation of ecotourism in these places is still limited, not fully realized. Nowadays, ecotourism has especially become a popular form of tourism, especially to nature reserves and indigenous cultural values. The development of ecotourism in Ha Long Bay is the most appropriate way to help minimize current gaps and change the way we operate, towards sustainable tourism.

Community tourism

In Vietnam today, the model of community-based tourism is not new. Ha Long Bay with potential strengths in the landscape; outstanding geomorphological values, biodiversity values, historical and cultural values... are favorable conditions for the development of community tourism. In addition to its outstanding global values, the natural heritage of Ha Long Bay is one of the cradles of the ancient Vietnamese. This is a culture with its own characteristics. Currently, the value of this culture continues to be maintained and developed along with the existence of fishing communities living on the bay in fishing villages such as Ba Hang, Hoa Cuong, Bo Nau, Cua Van, Vung Vieng... Most of them still live by fishing nets and still retain many customs and characteristics of the sea inhabitants. Therefore, the development of the model of community-based tourism in Ha Long Bay not only introduces visitors to cultural values, but also serves as a means to educate about the preservation and promotion of traditional culture.

3.3. The problems in tourism management in Ha Long Bay, the study has proposed the following solutions

- Status of discharge into the Bay. In the immediate future, it is necessary to make a plan to quickly move polluting enterprises out of Ha Long Bay area. Invest in renovating

and building waste treatment facilities to ensure proper treatment of waste before discharging into the Bay. Early research and promulgation of specific environmental policies, regulations on penalties and compensation for cases of environmental resource depletion at sea, coastal areas, caves and islands. Strictly manage the environmental protection of ships in the Gulf, as well as foreign ships according to special policies and regulations on environmental protection associated with material responsibility. Apply sanctions for violations of environmental protection [15].

- Research and establish a system of marine and island nature conservation zones in an appropriate and appropriate manner to protect and develop specific ecosystems and ecosystems of sea, coast and islands. The first is to build and preserve Bai Tu Long National Park with strict regulations on environmental protection. Diversify products, develop unique and attractive forms of tourism. For each tourism business, product diversification is one of the most important solutions to attract tourists and create its own brand identity. Recently, Ha Long Bay has implemented a number of forms of tourism such as sightseeing, boat tourism, eco-tourism in Ha Long Bay, tourist areas, etc. However, tourism products are still not lacking in products. particular tourism with high competitiveness in the region and internationally. Therefore, the mission for businesses is to invest in research, construction and deployment to serve new, more attractive and richer forms of tourism such as adventure tourism, mountaineering tourism, diving tourism...

- Improve service quality

Ensure all forms of tourism, cultural activities, sports and entertainment. In addition, in order to continue to upgrade technical infrastructure, amusement parks, means of transport, standard hotel systems, businesses need to upgrade and increase the number of restaurants, the tourism quality ensures to meet the needs of visitors. In addition, businesses are especially interested in improving the morale and attitude of their employees, sending staff directly to the delegation to have ideas to help tourists more and more. more professional.

- Promote tourism promotion

Each business has a different business strategy, a different program to promote and promote tourism, but the main purpose is to attract tourists and guide them to use their services. To promote effectively, businesses need to build a rich promotion program with many attractive programs, advertise on many media such as newspapers, internet, radio, television...

4. Discussion and Conclusion

The strength of tourism development in Ha Long Bay is the beauty of the natural landscape and outstanding global value. Besides the advantages, the exploitation of tourism resources in Ha Long Bay also has certain limitations. In order to further promote the value of Ha Long Bay, worthy of the title it has been awarded, first of all, good management and conservation must be done. A close interaction can be seen between the conservation and promotion of cultural heritage and the preservation and promotion of heritage with the development of tourism. This relationship needs to be fully evaluated and considered in order to build an orientation to effectively exploit heritage values for tourism development and

develop appropriate policies for tourism. In addition, a long-term vision strategy is required; prioritize high-quality eco-tourism products associated with conservation activities. It is important that community-based, business-based participation activities, mobilizing many resources and common interests, must be carried out in accordance with the guiding principles of the state and the people. In order to have an active participation and role of businesses and communities in the exploitation of heritage for management and conservation, stronger and more uniform regulatory mechanisms are needed to link and bind the exploitation of services and travel of organizations and individuals in Ha Long Bay with the conservation of heritage.

Halong Bay tourism needs budget support for financial support from domestic and foreign human resource training projects and provincial funding to promote human resource training. Ha Long Bay Management Board is the agency that directly manages the Bay, manages tourism activities and conserves resources in Ha Long Bay. Long unified direct management of a focal point. In order to exploit this tourism potential, the Ha Long Bay Management Board has and needs to issue, amend and supplement a number of solutions on mechanisms, policies and cooperation in investment and development of tourism specific to Ha Long Bay. Long.

Tourism enterprise is an important economic activity institution contributing to the development of tourism in the locality. For tourism businesses to exploit natural resources in Ha Long Bay, it is always necessary to have proposals and solutions for effective exploitation in accordance with the law on enterprises and tourism business.

In order to improve tourism quality and attract tourists to Quang Ninh, Quang Ninh province needs to identify four main tasks set out for the management, conservation and promotion of the value of Ha Long Bay. That is positioning the development of Ha Long Bay in the importance of national and world tourism development; building tourism brand and investment target so that Ha Long Bay becomes a top destination; effective exploitation associated with environmental protection and embellishment of Ha Long Bay; raising awareness about nature protection and environmental protection for local people.

Abstract

Currently, Vietnam is accelerating the industrialization and modernization of rural areas, especially the policy of building new-style rural areas. Successful new-style rural construction requires the mobilization of all social resources. The farmer plays the role of the subject of this process. Promoting the role of farmers in building new-style rural is an important task, a decisive factor for the success of this process, and a responsibility of the whole political system. The article focuses on analyzing the role of farmers in building a new-style rural, the problems posed in promoting this role today and proposing solutions to promote the role of farmers in building a new-style rural in the future.

Keywords: *Farmers; New-style rural construction; Role*

1. Introduction

To carry out the policy of industrialization and modernization of the country requires us to develop the economic structure comprehensively from the agriculture industry to services. At the same time, it is also necessary to develop a balance and harmony between urban and rural areas. Vietnam is an agricultural country, so in the development orientation of the Party and State, we always focus on agricultural development. However, the development of agriculture and rural areas has not been commensurate with the attention and investment of the Party and State. In response to this request, on August 5, 2008, the Central Committee of the Communist Party of Vietnam issued Resolution No. 26-NQ/TW on agriculture, farmers, and rural areas. To concretize this Resolution, the Government has developed a national target program on new-style rural construction. The Government developed and implemented this master program on a rural scale nationwide on socio-economic development, politics, and national security. In the new-style rural construction program, people are both the subject and the object. Therefore, promoting the role of farmers is a decisive factor for the success of this policy.

The research objective of the article is to clarify the roles of farmers in building new-style rural areas in Vietnam, the problems raised in the process of promoting the roles of farmers, and propose solutions to develop them. Promote the role of farmers in building new-style rural in the coming time.

2. Method

The article uses the method of secondary document analysis. We analyze the Party's resolutions research works on the role of farmers in building new-style rural. In addition, the article also uses some data from reports of state agency's reports of the Provincial Governance and Public Administration Performance Index (Papi).

3. Result

3.1. *The roles of farmers in the process of building new-style rural in Vietnam*

Approaching the role of farmers in new-style rural construction today has many different conceptions. The general notion that farmers have the role of subjects in the process of building new-style rural has been affirmed by the Communist Party of Vietnam: "*In the close relationship between agriculture, farmers and In rural areas, farmers are the subjects of the development process*" (Central Committee of the Communist Party of Vietnam, 2008). This is a cross-cutting approach when it comes to the role of farmers in new-style rural construction, "*As the subject of the new-style rural construction process as well as the agricultural and rural development process, farmers and rural residents have a significant role*" (Nguyen Trong Binh, 2020). Within the framework of the article, we clarify the subjective roles of farmers in building new-style rural from the perspective of their participation in building new-style rural. The subject's role of farmers is shown in the following aspects:

Firstly, being a participant in planning and implementing new-style rural

The first role of farmers is to participate in the planning and implementation of the specific content of the new-style rural development program. Farmers can participate in implementing all contents of new-style rural construction from planning, socio-economic infrastructure, implementing socio-economic development programs to building a new-style rural development system. Political system and maintain social order and security. Together with the State, they will be active actors in implementing new-style rural construction content. With the participation of farmers, it will help policies and programs to build new-style rural areas get closer to farmers and receive their consent. Only when this role is promoted can the rural construction policy achieve the set goals. Promoting this role also demonstrates the spirit of "taking farmers to serve farmers". This role of participation is demonstrated through two primary contents: "people discuss" and "people do". "People discuss" is expressed through the participation of farmers in contributing ideas on new-style rural planning, infrastructure system planning, health education development planning, contributing to building a political system. "People do" is expressed through the fact that farmers will directly participate in organizing and implementing new-style rural construction content. They will work with the Government to implement the contents of the new-style rural, such as the implementation of master plans and plans in new-style rural construction in general and each specific content in particular.

Secondly, being a participant in contributing resources to new-style rural construction.

Farmers not only participate in the implementation of programs and plans when the State deploys them, but they also contribute great resources to this process. Promoting the contribution

of farmers is a manifestation of the idea of “*taking the resources of farmers to unleash the potential of farmers*”. Farmers can contribute many different resources to the new-style rural construction program. They can contribute through the workday. At the same time, they can also contribute finance, land, machinery, equipment, etc., to the Government. The farmers’ resources are extensive; the problem for the Government is how to release these resources. If this role is guaranteed, it will contribute to diversifying resources for policy implementation. This also shows the current thinking of promoting the socialization of the Party and State. In fact, in building a new-style rural area in the past time, it is shown that in the early stages, state resources are the primary source, but over time, the State begins to mobilize more social resources. The State only lays the foundation and premise for the first stage of new-style rural construction; then, farmers must be the real subject of this process. This, on the one hand, is due to the “limited” resources of the State, but on the other hand, from the policy of promoting the autonomy and sense of responsibility of farmers for this process. Farmers are the actors and beneficiaries in new-style rural construction, so they are responsible for participating in this process.

Thirdly, being a participant in monitoring and evaluating new-style rural construction content implementation.

Besides “people discussing”, “people are doing”, the role of farmers is also expressed through “people checking”. Farmers will be the subjects participating in supervising the implementation of new-style rural construction programs and projects. Implementing new-style rural construction can be difficult to avoid errors, inadequacies, and even negative ones. Therefore, the participation of farmers in supervision is an essential basis for the implementation of new-style rural construction to ensure compliance with the guidelines of the Party, policies, and laws of the State and following the needs and aspirations of the State. Farmers’ expectations. Promoting the role of farmers in supervision will contribute to building their trust in the Party and State. In addition, the people are also an important subject to evaluate the effectiveness and efficiency of the new-style rural construction policy. The effectiveness of the new-style rural policy must be shown through the development of agriculture and rural areas, the socio-economic development of farmers, and the satisfaction of farmers. Therefore, to accurately evaluate the results of this policy implementation requires the participation of farmers. This is also a modern policy assessment method used in rural assessment today - Participatory Rural Appraisal (PRA).

3.2. Some problems arise in the process of promoting the role of farmers in new-style rural construction

As subjects, farmers play an essential role in building new-style rural. The practice of building new-style rural areas in the localities in recent years has shown that the role of farmers is gradually being promoted. Their participation in new-style rural construction is an essential factor determining the success of this policy. However, in the process of promoting the role of farmers, there are still many issues that need to be resolved, such as:

Firstly, the problems posed to the State in promoting the role of farmers.

Currently, in building a new-style rural, the authorities in some places are not aware of the importance of farmers. Some cadres and civil servants still consider farmers as the

object of implementing the policy of new-style rural construction but are not aware of the role of farmers. *“A part of cadres, party members, civil servants, and public employees has not been exemplary, has not respected the people’s opinions and recommendations, and has promptly dealt with legitimate rights and interests. The people’s right to mastery is sometimes violated; still manifest formal democracy, separating democracy from the rule of law”* (Communist Party of Vietnam, 2021, p. 89). This incomplete and inaccurate awareness has led to not paying attention to promoting the role of farmers.

In the process of building a new-style rural, some places have had good models to promote the role of farmers, such as the model of “Farmers’ Club” in Dong Thap, the model of “model new-style rural hamlet, model garden”,... However, in many places, the authorities have not yet built scientific models and solutions to promote the role of farmers. The failure to develop many suitable and attractive solutions has not brought into play the fundamental role of farmers, *“not fully promoting the autonomy and self-management rights of people in each hamlet, hamlet, and hamlet in the process of building new-style rural”* (Nguyen Trong Binh, 2020). In some places, the Government has not created favorable conditions for farmers to participate in the new-style rural construction process. However, it mainly focuses on several stages and activities, *“The participation of the people from the Proposing essential works for life, production, etc., the management and administration are still very weak, in many places people can hardly participate but can only mobilize when they need to contribute, so many works are not urgent needs of the people, so after construction, they are not effectively put into use and quickly degraded”* (Ho Anh Dao, 2018).

In many places today, the publicity and transparency of information so that people can participate in state management activities in general and participation in new-style rural construction, in particular, are still minimal.

Table 1. Level of publicity and transparency in decision-making in local government

Provinces and municipalities under the command of the central government	2018	2019	2020
Ha Noi	5.09	5.06	5.24
Ho Chi Minh city	5.23	4.45	5.38
Ha Giang	5.35	4.35	5.44
Lai Chau	5.23	4.97	5.03
Quang Ngai	4.82	4.30	4.92
Binh Thuan	4.64	4.34	5.07
Dak Nong	5.53	4.92	4.95
Gia Lai	5.20	4.85	5.07
Tay Ninh	4.79	4.52	5.06
Tra Vinh	4.65	4.06	4.70

Source: CECODES, VFF-CRT, RTA & UNDP, 2019, 2020, 2021.

From Table 1, it can be seen that the level of publicity and transparency of information of local authorities is shallow (the average score of localities ranges from 4-5.5/10 points). The specific contents of publicity and transparency such as access to information, publicizing the list of poor households, publicizing budget revenues and expenditures at commune/ward level, publicizing land use plans, and compensation price brackets are all shallow. The fact that the commune-level Government has not focused on publicity and transparency of information will cause many difficulties for people when participating in building a new-style rural - participating in building a new-style rural.

Secondly, the problems faced by farmers in performing their roles.

Many farmers are still not fully and accurately aware of their role in building new-style rural, *“The perception of the subject role of the peasantry and the peasantry is not profound and comprehensive. This is a big obstacle for thinking and action, in promoting farmers' ownership in building new-style rural”* (Ho Ngoc Hy, 2021). They also do not fully understand their rights in the process of new-style rural construction, *“The IPSARD survey in 2019 showed that only 68.1% of households said that they have the right to participate in planning, local new-style rural plans, and projects; only 55% of households said that they have the right to participate in the selection of works and projects; 66.9% of households said that they have the right to supervise the implementation of new-style rural projects”* (According to Anh Cao, 2020).

In some places, farmers still have the idea that rural construction is the responsibility of the Government. When the Government and socio-political organizations launch movements and programs, farmers will participate. Meanwhile, the active participation of farmers is not high. There are even places where the Government creates conditions, but farmers are still afraid to participate. In addition, the necessary conditions to promote farmers' roles are not guaranteed. *“Farmers still operate spontaneously, with limited legal knowledge and qualifications, so the content of participation is not diverse, and the level of participation is low. People, especially those in backward areas, far from urban centers, lack communication facilities. They have difficulty expressing their opinions and aspirations and are afraid to contact state agencies”* (Do Van Quan, Nguyen Tien Doan, 2016). The reality is the process of building a new-style rural in the coming time shows that not all farmers have all the necessary conditions to participate in new-style rural construction, *“the majority of farmers in our country are still the poorest class in society, and the gap between rich and poor is increasing. A part of farming households has no savings,... More than 90% of the country's poor households live in rural, remote, and isolated areas, lacking opportunities to develop production and business, lack of knowledge of commodity production and markets”* (Luong Quoc Doan, 2021).

Table 2. Structure of people’s contributed capital in total mobilized capital in new-style rural construction

Period	Total mobilized capital (Billions dong)	Specific sources of funds	Amount (Billions dong)	Ratio (%)
2011-2015	851.380	State budget	266.785	31,3
		Credit	434.950	51,1
		Enterprise	42.198	5,0

Source: Central Steering Committee for National Target Programs for the period 2016-2020, 2020

According to Table 2, people’s participation in contributing resources for new-style rural construction is minimal. Especially in the 2016-2019 period, the proportion of people’s mobilized capital increased compared to the 2011-2015 period, but the proportion of people’s contribution to the total capital structure decreased (from 12.62% to 6.2%). This also partly reflects the difficulties in resources of the people.

4. Discussion and Conclusion

4.1. Discussion

In order to promote the role of farmers in new-style rural construction in the coming time, we recommend the following solutions:

Firstly, raising awareness of officials, civil servants and farmers about the role of farmers in building new-style rural.

Cognition is a determining factor in an individual’s behavior. Only when they have the correct perception can they make the right choices and take the initiative to do the work. If officials and civil servants have the right and sufficient awareness, they will actively attract and create conditions for farmers to participate. If farmers have complete and accurate awareness, they will actively participate in building new-style rural. Objects to raise awareness here include cadres, civil servants, and farmers. The content of propaganda to raise awareness for cadres and civil servants is the benefit of people’s participation in this process, the responsibility of cadres and civil servants in taking the initiative and creating conditions for people to participate. Governments at all levels need to propagate to cadres and civil servants to see the role and importance of farmers in building new-style rural, avoiding the thought of “lack of trust” with farmers.

Meanwhile, the content of propaganda for farmers is the benefits that building a new-style rural brings to farmers - the content farmers enjoy, the need to participate in the construction of a new-style rural area, the responsibility of the farmers. Each person's responsibility for new-style rural construction. When participating in new-style rural construction, farmers are most interested in the benefits they receive, so the Government needs to guide and explain the direct and indirect benefits, the immediate and long term if they participate. In order to raise awareness, it is necessary to promote propaganda and dissemination to cadres and civil servants as well as to farmers. Harmoniously combine the Party's people's movements, the Government's people's movements, and the mass mobilizations.

Secondly, promote publicity and transparency of information for farmers.

In order for “people to discuss”, “people to do”, and “people to check”, we must first make sure that “people know”. This requires commune-level authorities to strengthen the transparency of information for farmers. Farmers can only truly and effectively participate when fully informed and fully understood about programs and policies. Therefore, the commune authorities need to provide them with information promptly. This publicity and transparency can be done by posting it at the headquarters of the People's Committee, the headquarters of the hamlets and hamlets. Besides, actively publicizing directly to farmers through meetings, dialogues, or receiving citizens. Besides, with the development of the industrial revolution 4.0, it is necessary to promote the application of information technology in public transparency for farmers. This should be done through the Portal, using social networks like Facebook, Zalo, etc., to inform farmers. The Government must ensure that information is disclosed quickly and accurately.

Thirdly, select participation forms and models suitable to the characteristics and conditions of each subject.

For farmers to promote their actual role, the Government needs to have measures to attract them to participate in association with the characteristics of each locality and object. The Government needs to analyze the socio-economic conditions, psychological characteristics, and ability to participate in each farmer to have attractive measures suitable to their ability and conditions. For experienced and qualified farmers, focus on attracting them to contribute ideas for programs and plans to build new-style rural areas. Mobilize those with economic conditions to participate in financial contributions, land donation, and equipment support. The farmers who do not have economic conditions are encouraged to contribute their efforts to participate in the implementation of new-style rural construction programs. The Government needs to exploit the resources associated with the conditions of each farmer in order for the mobilization and attraction to be effective.

If promoting the role of farmers is limited to slogans, the formal movement will not be effective. To promote the fundamental role of farmers, the Party, Government, and socio-political organizations need to build scientific and specific models and solutions. The practice has proven that only through specific models can the mobilization of people be effective. The models are both a mechanism to ensure the participation of farmers, on the other hand, create spillovers and promote the initiative of farmers. Therefore, in the coming time, it is necessary

to perfect and replicate existing models such as the “4 houses” linkage model (Farmer - Entrepreneur - Scientist - State) the model “One commune, one product”, “Products”, the “Farmer’s Club” model, etc. At the same time, many new models should be built, especially those that need to be associated with each specific object, such as the “Women and construction model new-style rural”, model “Veterans with new-style rural”, model “Youth union with new-style rural”,...

Fourthly, improve proactiveness and ensure conditions for farmers to play their role.

To promote the role of farmers, the key point still lies with farmers. The roles only really come into play when farmers have the conditions and ability to participate. Therefore, in the coming time, the Government needs to improve the accessibility and participation of farmers. The Government needs to step up propaganda, dissemination, and publicity of information so that farmers have sufficient understanding to participate. The Government must make them know the policies, laws, programs, and plans and entirely and thoroughly understand these contents. Raising people’s knowledge is an essential condition for farmers to participate effectively.

On the other hand, it is necessary to have policies to take care of the complex life of farmers so that they can participate. In addition, the Government needs to promote the self-discipline and initiative of the people in building a new-style rural. Each farmer himself must also actively participate in new-style rural construction, considering this both a right and a responsibility for himself, the Government, and society.

4.2. Conclusion

The article’s research results have shown that farmers have an essential role in implementing the new-style rural construction program in Vietnam. Farmers participate in all steps and activities in the new-style rural construction program. However, promoting the role of farmers in this process is not easy. Practice shows that ensuring farmers’ roles in new-style rural construction faces many difficulties from the people themselves and state agencies. Promoting the role of farmers requires the Government to develop solutions and scientific models. At the same time, each farmer must actively participate in this process. Finding a “common voice” is a fundamental factor in promoting the fundamental role of farmers, thereby successfully realizing the objectives of the new-style rural construction policy.

Abstract

Sa Dec city is the center of economy, finance, education and culture, and tourism in the south of Dong Thap province. In 2020, the People's Committee of Dong Thap province built and put into operation the project "Sa Dec Culture and Tourism Village" in Dong Thap province. The project is divided into 2 phases: from 2020 - 2025 and 2026 - 2030, with the aims to exploit the development potential of Sa Dec Flower Village to serve tourism, contribute to socio-economic development, and improve the lives of local people. The article describes an overview of theoretical research on sustainable tourism business and enters into the study of sustainable tourism business at Sa Dec Cultural and Tourism Village. From there, solutions for sustainable tourism business development are suggested.

Keywords: *Tourism, sustainable business, Culture tourism village, Sa Dec.*

1. Introduction

Deeply renovating and implementing sustainable development of the tourism industry is of great significance to accelerating economic development, creating jobs for local people, helping to adjust the economic structure strategy, promoting exchanges and cooperation at home and abroad. Sustainable tourism development is a close combination of environment, society, and economy, without harming the existing natural environment of the locality.

Dong Thap province has been exploiting the potential of developing the model of Sa Dec Culture and Tourism Village in the direction of sustainable tourism business. The tourism industry is characterized by broad linkages, which can play an essential role in promoting the development of related industries. Therefore, researching sustainable tourism business in Sa Dec Cultural and Tourism Village is one of the effective measures to contribute to fostering socio-economic development and improving the lives of Sa Dec people in general and Dong Thap province.

2. Method

The research employed paper-research for collecting, analyzing data; and then some suggestions were concluded.

3. Results

3.1. The concept of sustainable development, sustainable tourism business and operating principles

3.1.1. Sustainable development and sustainable tourism business

“Sustainable development” was first defined in the 1980s in Brundtland’s report. The tourism industry also inherits the concept of sustainable development, but so far, there is no unified concept of this definition; it continues to be widely discussed and researched. In particular, the growing concern for the environment, resources, and social justice in the 1980s gave rise to the concept of sustainable development, which is defined as development that meets the present needs without including the ability of future generations to meet their own needs, by the “Brundtland Report.”

Based on this report, the United Nations World Tourism Organization (UNWTO) has defined sustainable tourism as “development that meets the needs of tourists and existing host regions while protecting and enhance opportunities for the future.” It is expected to lead to the management of all resources so that economic, social, and aesthetic needs can be met while maintaining cultural integrity, essential ecological processes, biodiversity, and life support systems. In other words, sustainable tourism should be defined through a participatory approach, involving industry, tourists, and the host community or region to determine sustainability values and indicators.

According to Landrum and Edwards, a sustainable business enterprise means “operating for the benefit of all present and future stakeholders in a way that ensures the health and long-term viability of the business and its economic, social and environmental systems.” Businesses that focus solely on reducing their environmental impact are referred to as “green businesses.” Sustainable tourism business will focus on all three aspects of sustainability, often referred to as “three key points”. They are closely related to each other, and their interdependence needs to be understood. However, implementing environmental initiatives can be the first step towards sustainability following Kernel’s four-step model for sustainability in tourism businesses.

The first steps are mainly concerned with the development of environmental cleanup procedures and environmental management practices. The next and final steps challenge organizations to go further and include social and ethical aspects and integration in the community. Similarly, Dunphy, Griffiths, and Benn’s sustainability stage model identify different steps organizations can take to achieve sustainability. The final stage is called the “Sustainability Group”. The sustainability ideology is adopted with a fundamental commitment to enabling the planet’s ecological capacity and contributing to social practices and human satisfaction.

3.1.2. Principles of sustainable tourism business development

For a long time, people have always considered tourism development an economic activity and only focused on pursuing its economic benefits, but relatively overlooked the impact of tourism on the environment. Tourism resources and tourism environment quality are the foundation for the existence and development of tourism; the severe damage caused by tourism to the environment, especially the natural environment, hinders the sustainable

development of tourism and entails related negatives. To achieve sustainable tourism business development, it must ensure three primary contents: Sustainable environment, sustainable society, and sustainable economy. It is necessary to identify the principles of sustainable tourism development, taking as a guideline for further activities, helping tourism develop sustainably in the future. Here are ten basic principles:

- Principle 1: Exploiting and using resources is sustainable; the conservation and sustainable use of natural, cultural, and social resources are essential. These will make the tourism business grow in the long run.

- Principle 2: Reduce over-consumption of resources and reduce waste are reducing over-consumption of resources such as water and energy and reducing waste into the environment. These will avoid recovery costs and contribute to the quality of tourism services.

- Principle 3: Maintaining diversity includes natural, social, and cultural ones. Maintaining and enhancing the diversity of nature, culture, and society is essential for long-term sustainable tourism development and the tourism business's survival support.

- Principle 4: Tourism development must be in the overall socio-economic development planning, integrating tourism development into the national and local socio-economic development strategic planning framework. In other words, conducting an environmental impact assessment will increase the long-term viability of the tourism industry.

- Principle 5: It is related to the local community. The participation of the local community in tourism activities will not only benefit the local community and the environment but also improve the quality of tourism service.

- Principle 6: Tourism development must support local economic development. A tourism industry that supports local economic activities and takes into account environmental value and cost. Data is essential to help solve outstanding problems and benefit attractions, the tourism industry, and customers.

- Principle 7: Collecting the opinions of the public and relevant stakeholders is essential. Exchanges and discussions between the tourism industry and the local community, different organizations, and related agencies are necessary to resolve potential conflicts of interest.

- Principle 8: human resource training focuses on human resource training, including integrating sustainable tourism development into work practice and recruiting local workers in all areas will increase tourism products.

- Principle 9: Responsible tourism marketing, providing tourists with adequate and responsible information promotes visitors' respect for the natural environment, culture, and society in the destination and will increase visitor satisfaction.

- Principle 10: research is the final principle. Continuing to research and monitor tourism activities through effective use and analysis of data is essential.

3.2. Sustainable tourism business development in Sa Dec cultural and tourism village

3.2.1. General overview of Sa Dec Culture and Tourism Village

Sa Dec is one of three cities in Dong Thap province, Vietnam. With Cao Lanh city and Hong Ngu city, it forms three economic centers of Dong Thap province. Sa Dec city is the center of economy, finance, education and culture, and tourism in the south of Dong Thap province. The ancient land of Sa Dec has the Khmer name of Phsar Dek; there are two

ways to understand it. The first is that Phsar Dek is the name of a goddess; the second one is from Phsar Dek, meaning Iron Market. Historically, this is the oldest city in Dong Thap province, with an age of over 300 years at the same time as Saigon.

For Sa Dec's smokeless industry to develop more deeply and sustainably in the coming periods, implementing more in-depth plans is essential. Implementing the project "Sa Dec Culture and Tourism Village" (one of 10 tourist villages selected for pilot nationwide) between 2019 and 2025 and the orientation in 2030 is one of the critical planning projects essential to be promoted by Dong Thap province in Sa Dec city. With an orientation to 2025 and a vision to 2030, the Sa Dec Cultural Tourism Village project is built with its distinctive local imprint on an area of about 510 hectares, the core area of Tan Quy Dong ward, which will spread to neighboring regions.

Sa Dec Culture and Tourism Village will be built to promote cultural values and traditional crafts. It helps to create valuable tourism resources to serve the needs of artistic research and sightseeing tours of tourists, bring economic benefits and protect natural resources, improve the living environment in the flower village area, and improve the community's quality of life. It also creates opportunities for cultural exchanges between localities at home and abroad.

The four core elements to build Sa Dec cultural and tourism village are the state, local people, investors, and scientists. Accordingly, the culture and tourism village will be planned into specific areas such as The cultural village operator's area; local OCOP product display area; the sample house of flower varieties; culinary experience area of folk dishes from flour and fish sauce; traditional festival area; resort bungalow; spa area, beauty care services from flowers; hydroponic flower garden; processing area for flower oil; parking lot...

In terms of organizational structure, there will be a tourism village management board including Management board, supervisory board, secretary board, operation board, finance board, and marketing board, and at the same time develop a set of rules for private treatment in the cultural village.

The project's primary purpose is to create highlights, promote traditional values of the locality and craft villages, create tours to stimulate Dong Thap tourism development. These activities improve income and living standards for people, increase the value of agricultural products from tourism, develop cultural values and local craft villages in locals with environmental protection, and improve the quality of community life. The total cost of this project is estimated at nearly 600 billion VND.

3.2.2. The benefits of sustainable tourism business development at Sa Dec Culture and Tourism Village

Achieving sustainable development of the tourism industry is a great driver to promote the transformation of development modes and promote the development of the economy. In addition, the usual benefits are raising income - living standard for people, increasing the value of agricultural products from tourism, developing local cultural values and craft villages associated with environmental protection, and improving the quality of community life, etc. Sustainable tourism business at Sa Dec Cultural Tourism Village also brings the following distinct benefits:

Reduce investment costs

The most significant benefit of sustainable tourism business activities at Sa Dec Cultural Tourism Village is reducing input costs for businesses. Cost reduction is the main driving force behind the introduction of the environmental initiative. Specifically, rising water, energy, and waste treatment prices have led many tourism businesses at Sa Dec Culture and Tourism Village to look for alternatives. Operational measures are recycling systems, use of recycled materials, installation of water-saving appliances, low-energy light bulbs, energy conservation measures such as solar insulation. These initiatives focus exclusively on the environmental aspect of sustainable tourism businesses at Sa Dec Culture Tourism Village.

It can be seen that, compared with other industries, the sustainable tourism business in Sa Dec Cultural and Tourism Village has the advantage of consuming fewer resources and low environmental costs. Accelerating the development of the tourism industry can transform the traditional model based on resource consumption. It aims to promote economic growth to a new model of low energy consumption and high productivity, achieving a harmonious unity between natural, cultural resources and the sustainable development of the ecological environment. Strongly developing sustainable tourism at Sa Dec Cultural and Tourism Village can lead and promote the rapid growth of related service industries and trade in services, transforming the business model-Commercial exports using a lot of energy and polluting local areas.

Develop positive public relations

Sustainable tourism business in Sa Dec Cultural Tourism Village can also benefit investors, establishments, tourism businesses in terms of positive public relations and improve the image of homestays and hotels with shareholders and local communities. These benefits can differentiate a sustainable tourism business from its competitors and be a source of competitive advantage and new tourism market opportunities.

Get member satisfaction and high internal consensus

Through human resource management of sustainable tourism business, many members at Sa Dec Culture and Tourism Village are well rewarded, valued, and proud of their work, making a self-image more positive. Service quality and productivity are also likely to improve through more sustainable tourism and business practices. Moving towards sustainable tourism development requires a positive change in the tourism business culture at Sa Dec Culture and Tourism Village, which will lead to positive change and high consensus in the tourism industry. Building cultural beliefs, thoughts, and behaviors consistent with the concept and values of sustainable tourism business activities at Sa Dec Cultural Tourism Village.

Satisfying visitor needs is the most controversial benefit of sustainable tourism businesses. Environmental and social concerns are increasingly influencing tourist behavior. However, until now, it is still contentious if this "green" consumerism has reached the tourism industry, including business at Sa Dec Culture and Tourism Village. Again, the difficulties in defining sustainable tourism and business practices force visitors to choose based on personal judgment and limited knowledge. Sustainable tourism products are often

not readily available and specified. Therefore, more meaningful information and disclosure of the impact of products is needed. Increasing awareness towards social issues, in general, will eventually lead to an increase in demand for sustainable tourism and tourism products.

3.2.3. Difficulties to develop a sustainable tourism business in Sa Dec Culture and Tourism Village

Tourism businesses at Sa Dec Cultural Tourism Village may be limited in carrying out sustainable tourism business activities by external factors beyond their control, such as government policies or stakeholders' attitudes. But the internal obstacles in tourism businesses at Sa Dec Cultural Tourism Village may be the costs, the complexity of information, and the support of sustainable tourism business development.

Cost constraints

All tourism businesses at Sa Dec Cultural Tourism Village are concerned with the cost of implementing sustainable tourism business activities at Sa Dec Cultural Tourism Village. Many tourism businesses and households are worried about the shift to the cost of sustainable business practices and acknowledge that alternative or first-generation energy-saving technologies are costly and relatively inefficient. Today the development technologies and buildings designed to LEED standards are cost-neutral and less expensive than conventional methods. However, once the initial steps have been taken, the rise of environmental issues requires new investments that may not be financially profitable for the tourism business at the Culture Tourism Village in Sa Dec

The complexity of legal documents and documents on sustainable tourism development

Another issue is related to the definition of sustainability and practices' sustainable tourism business at Sa Dec. The lack of precision in the definition makes this problem confusing and challenging to translate into meaningful action and measures. It lacks an accepted model of sustainable tourism in practice and expertise on issues relevant to Sa Dec tourism culture-building action. The awareness level of some homestay owners and businesses also influences the adoption and implementation of documents on sustainable tourism development of Sa Dec Cultural and Tourism Village.

Information and support

To overcome the difficulties that Sa Dec Cultural Tourism Village businesses may face, such as the complexities of sustainable tourism business, information and support from the public sector are required. The role of those responsible for the development and management of infrastructure for sustainable tourism development Sa Dec Cultural and Tourism Village must be considered. It is related to the importance of involving all stakeholders in participatory approaches to develop a sustainable tourism business at Sa Dec Cultural Tourism Village.

4. Discussion and Conclusion

For Sa Dec Culture and Tourism Village to develop into a sustainable tourism business model, it is necessary to implement the following solutions.

Firstly, all Sa Dec Cultural and Tourism Village tourism businesses are concerned about the costs of carrying out sustainable tourism business activities here. Support costs should be through many channels to serve the development of tourism models with the

activities of Sa Dec Culture Tourism Village, such as flower festivals and anniversaries of ornamental flower and craft villages every year. Businesses need to develop diversified tourism products and innovate their structure to profit from the tourism business. With the increasing standard of living, people's demand for travel is also increasing. The current tourism products in Sa Dec are still relatively single. It is necessary to strengthen the development of a variety of tourism products To meet the needs of the masses of the people.

The development of tourism products should derive from market demand and attract many tourists to visit and travel through the development and construction of Sa Dec's tourism resources. In this regard, it is necessary to grasp people's inherent needs for tourism, develop resort tourism products, build public entertainment facilities, and create a positive entertainment culture here.

Secondly, because of the complexity of legal documents and documents on sustainable tourism business development, it is necessary to build software to manage, guide, promote, and make a brand identity of Culture and Tourism Village in SadeC, etc. in parallel with the implementation of tourism management innovation and a profound shift to the market mechanism. The renewal of the tourism management mechanism is based on a modern enterprise management system, upgrading the tourism industry's structure, standardizing the order of the tourism market, renewing the talent training program to create a good environment suitable for the positive development of the tourism industry.

Third, since tourism businesses often face difficulties in updating public sector information, support from the public sector and stakeholders is needed in sustainable tourism business development methods at Culture and Tourism Village of SadeC.

Fourth, the solutions are boldly innovating methods, constantly upgrading the structure of the local tourism industry, promoting the Sa Dec culture tourism industry to develop sustainably. For example, it is necessary to follow the view of the depth of reform and opening up of the tourism industry and implement the sustainable development of the tourism industry while enhancing planning efficiency. Planning tourism is based on the principles of high standards and high requirements. They must be professional, creative, and specific. Invest in implementing synchronous works and items are spatial planning, the landscape of culture and tourism village, promoting business and production of ornamental flowers, preserving traditional cultural values, and promote tourism activities in the flower village.

Fifthly, exploiting traditional cultural values creates valuable tourism resources to serve the needs of tourists for research, artistic exploration, and sightseeing, bringing economic benefits and protection of natural resources, etc. In the construction and development of scenic beauty, the sustainable development of the ecological environment and its possible impacts on the lives of residents at Sa Dec Culture and Tourism Village must be fully considered. Developing eco-tourism resources reasonably and scientifically is the first principle of protection. Besides, it is necessary to promote tourism integration with other industries at Sa Dec Culture and Tourism Village.

Sixth, it is recommended that the Government continue to balance the budget to support the province in implementing the program to build Sa Dec culture and tourism

village towards sustainable development. These are using tourism industry policy as a guarantee, relying on science and technology as support, and striving to build a suitable business and development model for tourism here. Enterprises must take responsibility for their profits, bear their risks, develop themselves, reform development models, establish a modern enterprise system, and improve economies of scale and service quality through social funding and government support while enhancing market competitiveness.

Seventhly, due to the specific nature of the industry, the employees in tourism in general and Sa Dec cultural tourism village, in particular, occupy a crucial position. The quality of tourism business services at Sa Dec Culture and Tourism Village partly depends on the capacity of tourism business staff. Therefore, it is necessary to create favorable conditions for fostering employees' capacity and recruiting and retaining experienced and passionate employees. The short-term training courses should regularly be open to improving the quality of human resources for sustainable tourism business at Sa Dec Culture and Tourism Village. The activities include establishing a training system for tourism practitioners, engaging local communities, strengthening tourism management, and educating environmental protection on sustainable regional tourism development. Installing a complementary system of planning and guidance for the sustainable development of Sa Dec Culture Tourism Village is necessary.

Eighth, building a security system for the local tourism industry is to enhance tourism safety. It is necessary to improve the service capacity of tourism management such as tourism consulting, information services, and safety rescue system To establish a safety system for Sa Dec Culture and Tourism Village. , It aims to be aware of the responsibility for the lives and property of so many tourists. Besides, it is also necessary to establish and perfect the travel insurance system, improve liability insurance of travel agents, travel accident insurance, and other travel insurance, improve the efficiency of travel insurance requirements, improve the ability to prevent and deal with risks.

Finally, it is necessary to continue improving the mechanism to settle tourism complaints, listen to and handle complaints of tourists in a timely and severe manner, and effectively protect tourists' legitimate rights and interests.

Sustainable tourism business in Sa Dec Culture and Tourism Village requires operators and tourists to take specific responsibilities, raise environmental awareness and love for nature, minimize interference and the impact of tourism activities on the local ecosystem. At the same time, through the development of tourism activities at Sa Dec Cultural and Tourism Village, it is necessary to create job opportunities for local people and actively attract them to participate in the protection of cultural and natural heritage. It aims to achieve a balance between tourism economic benefits, environmental and social benefits. This goal fully draws on successful international experience and has strategic foresight and long-term guiding significance.

In conclusion, sustainable tourism business at Sa Dec Cultural Tourism Village – following the basic principles, besides the benefits, there are still many difficulties implementing activities. Promoting the benefits and gradually overcoming the difficulties require the efforts of the government and tourism businesses and the participation of all local

people to restore and develop these cultural values and traditional professions. The activities lead to promoting the exploitation of local cultural values, creating valuable tourism resources for research, artistic exploration, sightseeing, bringing economic benefits, preserving the environment, protecting natural resources - this helps to improve the living environment in rural areas and improve the quality of life. By analyzing the current situation and shortcomings of sustainable tourism development, the solutions are given, hoping to contribute to promoting the development of tourism at Sa Dec culture tourism village in particular and tourism in Dong Thap in general.

ENHANCING THE UNDERSTANDING OF CIRCULAR ECONOMY-ORIENTED AGRICULTURAL PRACTICE IN VIETNAM

Dr. Le Quang Minh

lequangminh.hcmal@gmail.com

Faculty of Leadership Studies and Public Policy Academy of Politics Region I, Hanoi

Abstract

The definition of Circular Economy (CE) has evolved over time. It includes intervention options for reducing energy consumption, improving the efficiency of production, introducing recycling and reuse for materials management, including new business models geared at waste prevention. Circular economy is currently a popular concept promoted by several national governments and by many businesses around the world. However, the scientific and research content of the CE concept is superficial and unorganized. CE seems to be a collection of vague and separate ideas from several fields and semi scientific concepts. The aim of that paper is to show how CE can apply to Agricultural Practice in Vietnam. We first reviewed the literature with the Current Concept of Circular Economy, then we will present the characteristics of Agricultural Circular Economy in Vietnam with the Driving Force for Agricultural Circular Economy Development in Vietnam, then point out the Definition and Features of Vietnam's Agricultural Circular Economy. After that, three cases studies on Agricultural Circular Economy will be presented, the three case studies are the three typical models that can be successfully in practice. These case studies also give three suggestions when applying the circular economy model in the agricultural sector.

Keywords: *Agricultural Circular Economy, Circular economy, Vietnam's Agricultural Circular Economy*

1. Introduction

Since the middle of the 20th century, the rapid population growth, the pressure of economic growth, the urbanization, industrialization, the demand for fuels and energy have increased the exploitation of natural resources, causing environmental pollution and climate change. According to UN estimates, by 2030, if the development continues with a linear economic model (based on the process of exploitation, production, consumption and final disposal into the environment), the demand for resources will be 3 times higher than today, beyond the supply of the Earth, the amount of waste will exceed the load capacity limit of the environment. That fact leads to an urgent need to find a more efficient and sustainable economic model in terms of resource use, pollution reduction, environmental degradation, and response to global climate change.

In agriculture, for the past 5 years, Vietnam has always been an import surplus country for fertilizers and pesticides, with billions of dollars in spending. The World Bank (World

Bank, 2016) estimated that air pollution alone caused Vietnam to lose 5.18% of its GDP in 2013. Water pollution is forecast to cost Vietnam up to 3.5 % of GDP (World Bank, 2019). That is not to mention land pollution and land degradation which are seriously affecting agricultural production, a traditional profession of most Vietnamese people over the years, along with climate change has seriously affected the economic development of Vietnam.

Facing the above issues, many countries are now making progress towards a circular economy (CE), Vietnam cannot be out of that trend. Circular economy is the opposite concept to Linear Economy, which is considered as a suitable way of development in the context of realizing the goals of sustainable development (SDGs) and responding with climate change. An integrated circular economy and support for the implementation of 10 out of 17 common goals of sustainable development, including SDG2, SDG6, SDG7, SDG8, SDG 9, SDG 12, SDG 13, SDG 14, SDG 15 and SDG 17. In particular, there are targets directly related to the agricultural sector, such as SDG2-Eradication of hunger; SDG12-Responsible Production and Consumption and SDG15-Sustainable Land Use.

The current and traditional linear extract-produce-use-dump material and energy flow model of the modern economic system is unsustainable (Frosch & Gallopoulos, 1989). Circular economy provides the economic system with an alternative flow model, one that is cyclical. The idea of materials cycles has been around since the dawn of industrialization. The idea has also been practiced accompanied by the argument that it reduces negative environmental impacts and stimulates new business opportunities already during the birth of the industrialization (Desrochers, 2004). But the linear throughput flow model has dominated the overall development causing serious environmental harm. Unlike traditional recycling the practical policy and business orientated circular economy approach emphasizes product, component and material reuse, remanufacturing, refurbishment, repair, cascading and upgrading as well as solar, wind, biomass and waste-derived energy utilization throughout the product value chain and cradle-to-cradle life cycle (EMAF, 2013).

This paper has two research objectives. First, we will construct the concept of CE from the perspective of World commission on environment and development (WCED) sustainable development and sustainability science including the three dimensions of economic, environmental and social sustainability. Second, we will analyze the Circular Economy-Oriented Agricultural Practice in Vietnam. In the analysis, we will identify the different sides of Vietnam agriculture circular economy including driving force for agriculture circular economy development, the definition and features of Vietnam's agricultural circular economy, operation of Vietnam's agricultural circular economy and two case studies that can be the model for Vietnam.

2. Background: On the Current Concept of Circular Economy

2.1. The main challenge

The concept of circular economy is considered from the perspective of the concept of and scientific research on sustainable development. In particular, sustainability science (Kates, et al., 2001) and the three-dimensional concept of sustainable development are used as the main philosophy of the approach adopted in our discussion. Sustainable development

(WCED, 1987) was originally defined as development that meets the needs of the present without compromising the ability of future generations to meet their own needs. There exists a common consensus on this broad qualitative definition.

Figure 1. Nature - A shrinking parent system

In Fig. 1, the main challenge of sustainable development is depicted from the perspective of physical flows of materials and energy. The key issue in global sustainable development is the linear (one way) throughput flow of materials and energy between nature and human economy. The throughput flow is “running down” the system in which it operates, from which it sources and to which it releases its wastes and emissions. Brown (Brown, 2006) shows that the global ecosystem is becoming smaller. The global natural ecosystem is shrinking in size and volume. The shrinking is clear if measured simply in quantitative terms, but very apparent also in the sense of the qualitative potential of the earth's ecosystems to provide life-sustaining functions. Measured by the land area that can support human habitation, the earth is shrinking, and at an accelerating pace. Deserts are expanding, the sea level is rising, the population is growing, per capita consumption is increasing, the volume of livestock and cattle is growing and biodiversity is depleting at ever faster rates. The shrinking is best illustrated by advancing deserts and rising sea levels that work inwards in Fig. 1 toward the economic system, which in, turn is expanding outwards. This process is leading to a head-collision.

A simple and logical answer to the problem of the linear flow model is its reverse; a cyclical flow of materials and energy. Although, by definition, energy cannot be recycled, only cascaded for extended use on lower temperature and pressure levels, one can speak about materials and energy cycling for the purpose of simplification.

2.2. The Currently Proposed Circular Economy Solution

The answer to the question of unsustainable global linear flow economy would seem to come from the physical flow concept in which the flows are reverse; the concept of circular economy. In this paper, the CE concept is considered in scientific terms. The CE vision is here constructed from the viewpoint of the WCED definition of sustainable

development and from the perspective of planetary boundaries on environmental sustainability (Robèrt , Broman, & Basile, 2013).

The current practitioner and business world formulated CE concept is given in Fig. 2. The CE message is that the inner circles of Fig. 2, product reuse, remanufacturing and refurbishment, demand less resources and energy and are more economic as well than conventional recycling of materials as low-grade raw materials. The time the value in the resources spends/lives within the inner circles should be maximized. Materials should first be recovered for reuse, refurbishment and repair, then for remanufacturing and only later for raw material utilization, which has been the main focus in traditional recycling. According to CE, combustion for energy should be the second to last option while landfill disposal is the last option. In this way, the product value chain and life cycle retain the highest possible value and quality as long as possible and is also as energy efficient as it can be.

Figure 2. The current concept of circular economy (Mihelcic, et al., 2003)

The CE message is that the inner circles demand less resources and energy and are more economic as well. The time the value in the resources spends within the inner circles should be maximized.

Once a raw material is extracted, refined and produced with the usual costs, it makes economic and business sense to use the value produced as long as possible, i.e., keep the product function/service and use-value in economic circulation as long as possible. This often results in environmental gains as well when compared with traditional linear extract-produce-use-dump material and energy flow model of the modern global economic system. The currently popularized CE concept extends conventional waste and by-product utilization and recycling by emphasizing the utilization of the value embedded in materials in as high value applications as possible (Asif, Lieder, & Rashid, 2016). It adds to traditional recycling, which usually recycles materials as raw materials, i.e., in applications where much of the economic value of the product has already been lost.

3. The characteristics of Agricultural Circular Economy in Vietnam

3.1. Driving Force for Agricultural Circular Economy Development in Vietnam

Vietnam has remained a predominantly agricultural country since the Vietnamese civilization was born 4000 years ago. Since 2000, Vietnamese farmers have already had the pristine idea of the circular economy. They have fermented feces, garbage, crop stalks, green manure and biogas slurry etc. and reused them in agricultural production. Farmers' livestock and poultry, fish, mulberry, marsh gas, vegetable plots, farmland, fish ponds, wood and villages have constituted the prime ecosystem featuring circular economy development. "Mulberry fish pond complex" and "rice-duck farming" have been summarized as the pristine models of the circular economy development of Vietnam's agriculture. Even in the 1980s, Vietnam's circular agricultural production still went on in line with the traditional natural and ecological laws.

Vietnam has witnessed constant high-speed economic growth since the reform (Doi Moi in 1986) and opening-up drive was initiated. Benefiting from industrial achievements, the agriculture has also seen long-term stable growth. Nonetheless, its sustainability is currently facing the increasingly challenging constraints of resources and environment. The arable land per capita is decreasing in recent years and the land is primarily composed of mountainous regions and sloping fields. Nevertheless, 100 million Vietnamese people need to be fed. The grain security and the need to provide agricultural products for industrial production have imposed huge pressure on Vietnam's agriculture, for which top priorities shall be given to increasing yields per unit land area and guaranteeing the supply of agricultural products. Vietnam's technological advances and preferential policies for agriculture have significantly heightened the agricultural production efficiency and left much room for improvement. However, with the rising demands for agricultural products of large amounts and superior quality, Vietnam confronted with its fundamental realities of a big population and little land has to apply a large number of fertilizers and pesticides etc. made from petroleum products in agricultural production. The petroleum-based agriculture has triggered overuse of fertilizers and pesticides and rapidly increased discharge of agricultural waste, throwing Vietnam into the huge pressure from the deteriorating ecological environment and human life caused by the increasingly severe non-point source pollution and the accumulation of agricultural wastes. The petroleum-based agriculture, featuring capital-intensive, heavily-polluting and low-benefit extensive operation, has taken a terrible toll on Vietnam.

The Vietnamese government has recognized that Vietnam's agriculture has to transform its mode of development, and promote circular economy development in an effort to enhance agricultural production efficiency and address environmental problems in rural areas from the source by reducing resource consumption as well as reusing and recycling resources. As circular economy-oriented practice in Vietnam's industry has played an exemplary role, the concept of circular economy has been gradually introduced into Vietnam's agriculture and integrated into the whole process of agricultural production. Vietnam has established the recycling mechanism of "agricultural resources agricultural

products—agricultural wastes—reutilization or reproduction—return to agriculture” and developed a series of technologies and various models for circular economy development of agriculture. All these measures have contributed to the sustainable agricultural development, the supply of high-quality and safe agricultural products and the resource ecology balance.

Vietnam’s agricultural system is unique in many ways. American agriculture is based on highly commercialized family farms featuring large areas, capital intensiveness, mass production, mechanization, and intensive and specialized operation. Due to its large population with relatively little arable land, Japan’s agriculture has attached special importance to boosting its arable land utilization efficiency and is therefore highly intensive, facility and mechanization dependent, and eco-friendly. In order to overcome the constraints of small area of arable land per household, related groups like agricultural associations have been organized for mass production. In Vietnam, the circumstances of land, water and opt thermal vary greatly in different regions, and the per capita availability of arable land is quite low. The household responsibility system featuring “collective ownership, and decentralized operation” has been applied in Vietnam’s rural areas. For this reason, Vietnam’s agricultural production features decentralized household operation, intensive farming and stark regional differences. In recent years, the agricultural production has begun to present the features of enhanced specialization of agriculture and rural economy, accelerated land transfer, mass production, facility dependence, intensiveness and standardization. The uniqueness and development of Vietnam’s agriculture has given rise to its diverse modes of circular economy development.

3.2. Definition and Features of Vietnam’s Agricultural Circular Economy

Agricultural circular economy is meant to apply the principles of circular economy in agricultural production, reduce resource input, waste generation and discharge in agricultural production and during product life cycles and finally materialize both agricultural development and ecological friendliness (Qi, et al., 2016).

Agricultural circular economy also follows the “3R” principle of the ordinary circular economy, namely, “reducing”, “reusing” and “recycling”. “Reducing” refers to minimizing the amount of materials involved in production and consumption to save resources and reduce pollutant discharge. “Reusing” means enhancing the utilization efficiency of products and services and reducing the pollution caused by disposable products. “Recycling” indicates transforming spent goods into renewable resources. The “3R” principle can help fulfil the goals of “less exploitation, efficient utilization, low emission, and reutilization”, make the most of the materials and energy in production and consumption, improve the quality and performance of economic operation, reach a balance between economic development and resources and environmental protection, and conform to the goal of sustainable development.

Meanwhile, Agricultural circular economy is distinctive from ordinary circular economy in the following ways (Qi, 2010):

1. The food chain in agricultural production. The organisms involved in the circulation rely on each other as a food source, and the circulation is completed in the form

of food chain. All players involved in the circulations complement one another and form a symbiotic relationship.

2. Green production in the agriculture. Agricultural production attaches more values to product safety. In order to develop green agriculture, the amounts of applied fertilizers and pesticides must be under control.

3. Clean consumption of agricultural products. After being used to the greatest, agricultural products and byproducts return to fields in the form of biomass.

4. The function of soil and water purification. Everything depends on soil and water for growth. Soil and water boost the functions of percolation and purification. Additionally, soil can decompose biomass and purify the organisms through the natural cycle of water and soil.

5. Covering a broad range. It includes not only the internal agricultural material recycling but also the waste recycling after agriculture products processing.

3.3. Operation of Vietnam's Agricultural Circular Economy

The recycling of agricultural resources, products and waste composes the core of the agricultural circular economy and chiefly includes three levels of circulation. The circulation at the first level refers to the material recycling in the production of agricultural products, reducing the inputs of resources and materials and waste generation, facilitating cleaner production, and minimizing the amounts of discharged pollutants. Let's take crop farming as an example. Crop stalks can be used to produce feed, base material, energy and fertilizer etc, enabling the nitrogen, phosphorus, and potassium as well as the heat in them to be efficiently recycled. In the breeding sector, animal wastes have been utilized, in a comprehensive way, to produce natural gas and organic fertilizers to reduce pollutant discharge and increase the utilization efficiency of the materials and energy in them.

The circulation at the second level refers to the coexistence of crop farming, forestry, husbandry and fishery for mutual benefits as well as the exchange of materials and energy for minimized waste discharge. Let's take the multistory planting-breeding of the mulberry fish pond complex as an example. Fish can eat the pests on the lotus plants, and crabs can eat waterweed, saving the lotus from pest and disease damage. Feces of silk worms can feed fish and crabs whose feces can nourish lotus plants and mulberry and accelerate their growth. Mulberry can absorb CO₂ and release oxygen, while lotus plants can absorb the organic matters, nitrogen, phosphorus, and potassium in water, purifying the water and creating a nice environment for fish and crabs.

The circulation at the third level refers to the composite circular economy covering both agriculture and industry. Conforming to the "3R" principle, it effectively integrates the agriculture (including farming, forestry, animal husbandry and fishery) featuring mass operation, facility dependence, standardization, intensiveness and brand marketing, the industry of agricultural product processing, the industry of agricultural waste recycling and the sector of solar power utilization together in order to form the mode of circular economy or the multi-industrial composite recycling industry in certain regions or industrial parks

through technical and institutional innovations, following the flows of material and energy (as shown in Fig.3). Against such a backdrop, agriculture has been able to provide not only food and other daily necessities to human beings, but also many important raw materials and biomass energy for industrial production. The significance of the composite industrial and agricultural circular economy has become increasingly noticeable (Wang & Qi, 2013).

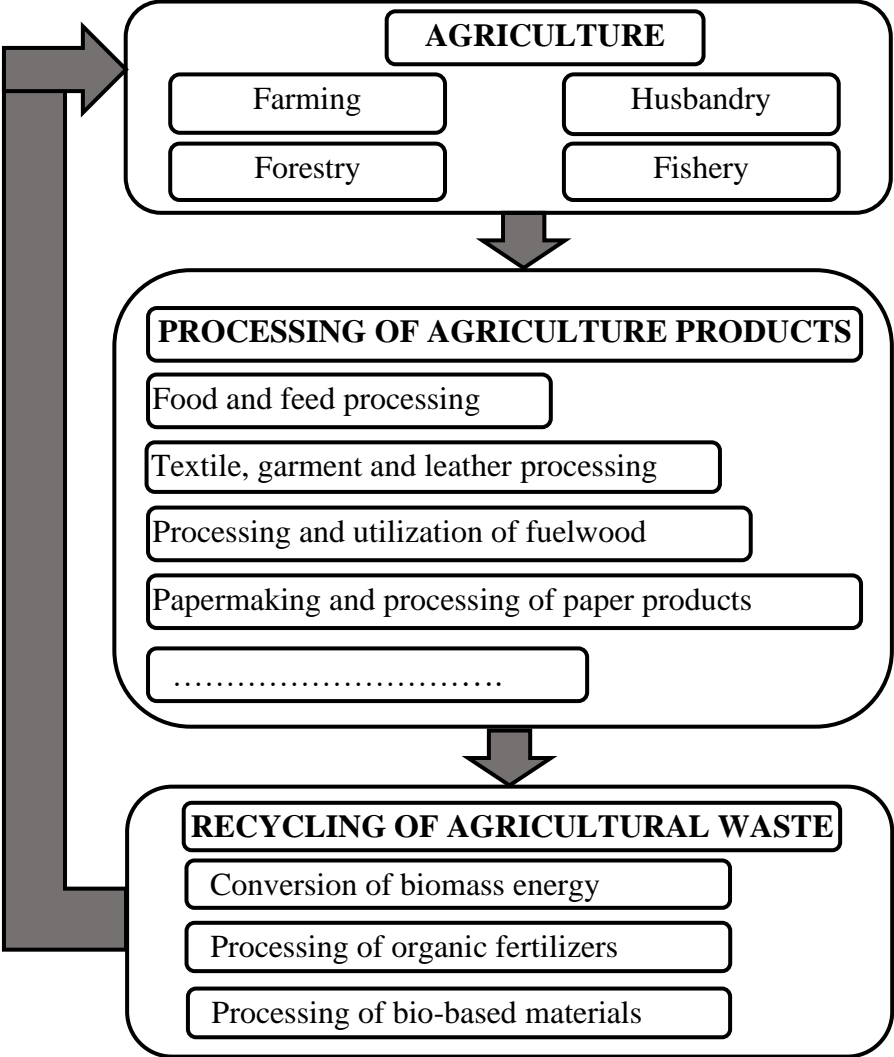

Figure 3. Schematic diagram of the model of the composite industrial and agricultural circular economy

3.4. Vietnam’s Policies and Measures to Promote the of Agricultural Circular Economy Development

The issues of sustainable management and development of the agricultural sector in the face of the pressures of resource depletion, increased waste and climate change are challenges for Vietnam. The circular economy is considered to be an appropriate approach for the development of zero-emission agriculture with economic and environmental efficiency in agriculture. Aware of this trend, the Communist Party of Vietnam and the State also have guidelines and policies to implement circular economy in general and circular economy in agriculture in particular.

Although the term "circular economy" has not been officially used, since 1998, Directive 36/CT-TW dated June 25, 1998 of the Politburo on strengthening environmental protection during the in the period of industrialization and modernization of the country, it is clear that it is necessary to "promulgate tax and credit policies to support the application of clean technologies" and "apply clean technologies with low waste, consume less raw materials and energy". This was followed by Resolution No. 41-NQ/TW dated November 15, 2004 of the Politburo stating "encourage the recycling and use of recycled products" and "step by step applying measures to force manufacturers and importers must recall and handle used products. Directives 29/CT-TW in 2009, Strategy for Socio-Economic Development 2011-2020, and Resolution 24/NQ-TW dated June 3, 2013 on proactively responding to climate change, strengthening resource management and environmental protection also continued to emphasize and detail the above tasks.

Regarding State policies and laws, Vietnam Sustainable Development Strategy 2011-2020; Environmental Protection Strategy to 2020, Vision to 2030; Green Growth Strategy; Decree 38/2015/ND-CP; Decision 16/2015/QĐ-TTg and especially the National Strategy on Integrated Solid Waste Management in 2018 are typical policies, demonstrating the policy shifts in the direction of Vietnam's circular economy and related to the development of circular economy in agriculture.

In fact, Vietnamese farmers already have some manifestations of circular economy in the agricultural sector. The Garden-Pond-Stable^{*****} (acronym in Vietnamese: VAC) model and the variant Garden-Pond-Stable-Biogas (acronym in Vietnamese: VACB), Garden-Pond-Stable-Forest (acronym in Vietnamese: VACR) - a model combining VAC with forestry activities in the mountainous provinces and Gardens - Ponds - Lakes (acronym in Vietnamese: VAH) - a model of farm on sand in the central provinces has not only helped reduce emissions but also brought good income to people. In particular, Garden-Pond-Stable-Biogas model is a solution to help overcome the unreasonableness in waste management, rationally using agricultural by-products and increasing soil fertility. In addition, this model safely treats animal waste, generates renewable energy, creates a source of fuel for daily life, reduces environmental pollution, and contributes to reducing emissions and the greenhouse effect that causes climate change. In the context that agriculture with products produced through the farm is becoming popular, the application of extended models of VAC, following the principles of circular economy will be the right direction for the sustainable development of agriculture and rural areas.

Recently, there have continued to appear a number of circular economic models in agriculture, that is the model of processing aquatic by-products (shrimp shells, shrimp heads, etc.) to create Chitosan, Shrimp Soluble Extract – (SSE), etc. with the potential revenue of 4-5 billion USD per year; organic straws made from grass and rice replace plastic straws. These examples need to be summarized and considered and supported for development and replication.

***** *The Garden-Pond-Stable (VAC) is an integrated agricultural production model including gardens (cultivation production), ponds (aquaculture), stables (raising livestock and poultry). This is an agro-ecological economic model appearing in many rural communities in Vietnam. The components in the system are closely related to each other, creating products to serve human needs and income sources for producers.*

4.1.1. Typical Case: Integration of Farming and Husbandry - “Rice-Duck Farming”

The model of “rice-duck farming” has integrated animals, plants and feed together to tap the resources in rice paddies. In terms of ecological mutualism, rice and duck make a perfect match. This mode has made full use of these natural resources of the rice paddies, light, heat, water, soil and gas, not only achieving cheering rice and duck harvests at low costs but also facilitating the virtuous circle of the ecosystem of the rice paddies. With this model, ducks are raised when double or single cropping rice is planted in double or single seasons. Three-week-old ducklings, about 150 g, are introduced in a rice paddy about 20–30 days after the seedlings have been planted. The number of ducklings can be 15–20 per 667 m². Feeds have to be released into the fields rationally and carefully. The ducks are left in the field for 60–80 days and nights. Once the rice plants form ears of grain, they have to be taken away for sale. All the processes shall be arranged in a proper order of time.

The “rice-duck farming” upgrades Vietnam’s traditional agriculture to the matching degree of the habitat featuring intergeneration, mutual promotion and inter-restriction of the organisms. Realizing planting and breeding both in the field, it has broken through the traditional method of duck feeding. Fulfilling ecological mutualism, it has also opened up a new way to integrate rice cropping with animal breeding amidst the thundering changes of the agricultural management system

4.2. Models of the Composite Industrial and Agricultural Circular Economy

The models of the composite industrial and agricultural circular economy include several sub-models.

- i. The circular economic model led by breeding and intensive processing of its products. The breeding industry provides raw materials to the sectors of food processing, fine hair processing, leather processing and the bio-industry, thus creating corresponding industrial chains.
- ii. The circular economic model featuring the integration of farming and breeding and the water-efficient combination of agriculture and industry. With agricultural product processing (liquor making and food) and breeding as the leading industries and based on the agriculture featuring mass operation, facility dependence, brand marketing, ecological friendliness, and recycling, the farming, feed industry, food industry, breeding industry, agricultural product processing industry and bioenergy (like biogas) industries, effective organic fertilizer industry, water conservation technologies, and the industries of comprehensive utilization of agricultural wastes and wastes from agricultural product processing are integrated efficiently. As such, multiple goals can be fulfilled: economic growth, job creation, environmental protection, carbon cycling promotion, agricultural upgrading and yield enhancement, higher incomes of farmers, energy revolutions in rural areas, provisions of high-quality and safe food, efficient application of water sources, resource conservation and recycling, intensive utilization of land resources, efficient carbon elements circulation, ecological environment protection, and climate change treatment.

- iii. The composite industrial and agricultural circular economic model led by the industry. This model integrates the agricultural production system and forms an industrial chain for agricultural product processing with farming as the material provider as well as a highly effective composite circular economic complex featuring the closed cycle of material flows between agriculture and industry. Such efforts can also give impetus to the ecological friendliness of regional economies. For example, corns, potatoes, sweet potatoes are used to produce bioethanol, enabling the economic model based on bio-energy recycling to take shape.
- iv. The circular economic model with forestry development as the core and the forest industry as the main thread. This model can facilitate forestry development, while the wastes from forest product processing are utilized comprehensively to develop the industrial chains of artificial forest products, food, and biomass energy to fulfill sustainable production without generating wastes.

4.2.1. Typical Case: Producing Wine in sustainable method

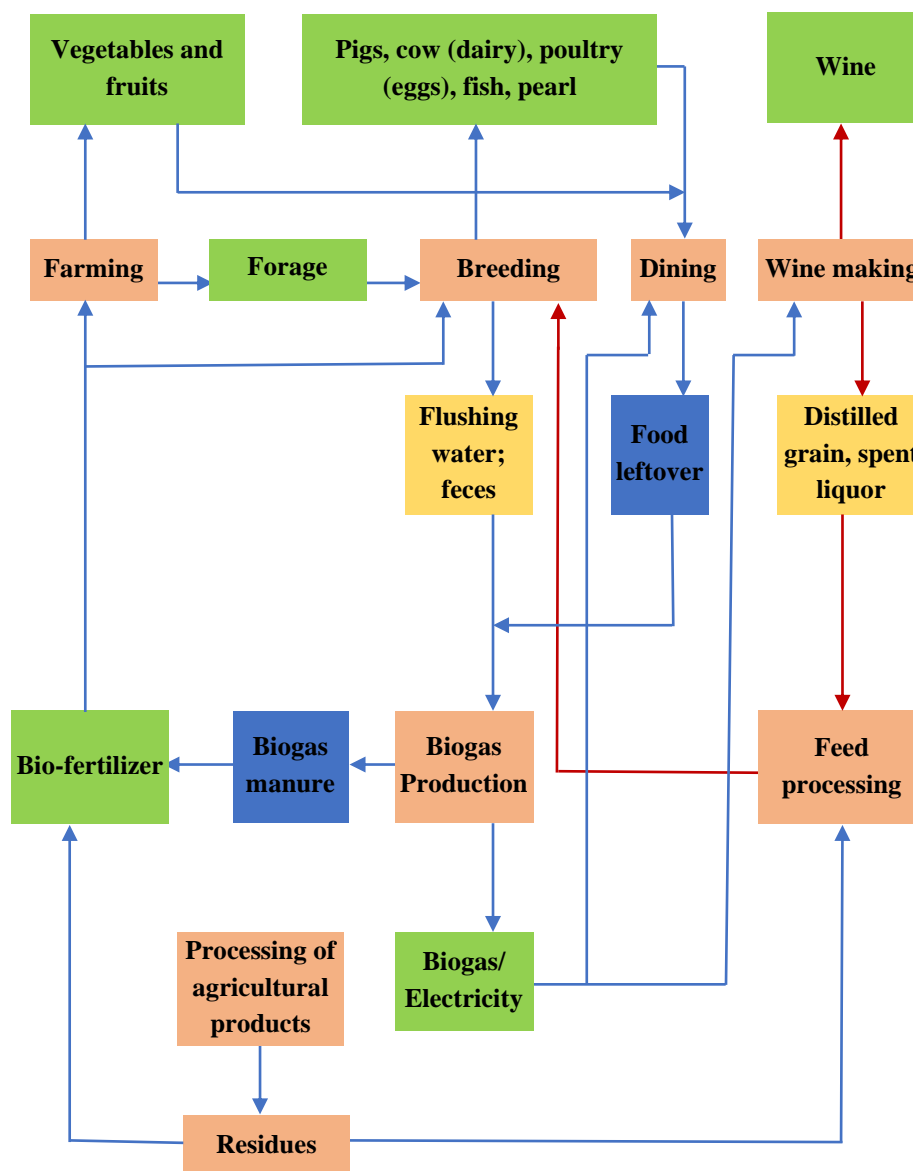

Figure 4. The technology pathway for producing wine sustainably

From the very first, the idea of circular economy development was initiated to resolve the environmental pollution caused by the distilled grain and plant and animal residues generated in liquor-making and during the production of wine as well as the sewage from factory cleaning.

- During the first stage, the company set up a biotech-based cattle feed production line with distilled grain, residues of the materials for wine production, and spent liquor from wine making as the major raw materials.

- During the second stage, the company utilized its self-produced feeds for water buffalo and cow farming, while wastes from wine making were used to produce various kinds of feeds for fish, chicken, duck, goose and pig farming.

- During the third stage, in order to resolve the pollution caused by the feces from breeding and sewage, biogas has been developed to provide clean energy.

- During the fourth stage, in order to dispose the biogas manure from biogas production, biotechnologies have been applied to process them into efficient liquid bio-fertilizer.

- During the fifth stage, the efficient liquid bio-fertilizers have been used for farming to produce organic agricultural products.

- During the sixth stage, in order to resolve the environmental pollution in neighboring areas, wastes from agricultural product processing will be processed into bio-fertilizers or bio-feeds for water buffalo and cow farming. The efficient liquid bio-fertilizer made with the biogas manure can be sold to the downstream industries (farming and husbandry).

Thousands of households in the neighboring areas have benefited from it, which has helped increase yields, improve quality, cut back on expenditures on pesticides and fertilizers, and vigorously fueling the farming and husbandry development around.

With the above-mentioned six stages of development, The Typical Case of producing Wine has made full use of the wastes generated in the production of one product, and processed them into raw materials for the production of other products, which has not only resolved the problem of resource supply but also has ensured the full utilization of resources and dissolved the environment-polluting materials. As the wastes have been disposed, the industrial chains spread vertically and horizontally, developing the company from a wine brewer into a composite circular industrial park integrating farming, animal (pig, chicken, duck, fish, swan, pearl, etc.) raising, feed production, biogas, fertilizer production, agricultural product processing, tourism and commercial trade together. The enterprise has thus fulfilled leap-frog development.

5. Discussion and Conclusion

The concept of circular economy is currently promoted by several national governments and by several business organizations around the world. The concept has been created mainly by practitioners, the business community and policy-makers. Implementing a circular economy is a trend in the world, happening in many sectors of the economy, and the agricultural sector is no exception. CE seems to be a promising concept, because it has been able to attract the business community to sustainable development work. It makes common sense, that if you extract a resource from nature and work hard for it to become a

product or a service that has an economic value, you use this value many times, not only once. This makes perfect business sense. It is also simple and logical to argue that once one uses the value embedded in resources many times, not only once as is the common practice in the linear material flow pattern of the global economy, one reduces the input and the waste and emission output of the economic activity.

In sum, this article makes the following contributions:

- The paper provides the first comprehensive attempt to make sense of the actual concept of the circular economy in terms of scientific research. We have shown the potential of CE in light of all the three dimensions of sustainable development, economic, environmental and social.

- Based on the above, the paper has demonstrated that the characteristics of CE in agriculture development in Vietnam. In addition, the paper has analyzed two case studies on Agricultural CE Development. That case studies have presented two issues that need to be taken into account when applying the circular economy model in the agricultural sector in Vietnam.

LEVELS OF SATISFACTION OF PEOPLE IN THE NORTHERN COASTAL REGION WITH THE CURRENT AQUACULTURE AND SUSTAINABLE AQUACULTURE

Bui Thi Van Anh

vananh1509@gmail.com

Institute of Human Geography, Vietnam Academy of Social Sciences

Abstract

The survey was conducted on 200 coastal farmers in Nam Dinh and Quang Ninh employing questionnaires and in-depth interviews as survey methods. Results show that the sampled farmers are relatively satisfied with their family's aquaculture practice, in which, people are most satisfied with the process and method of aquaculture; meanwhile, they are not satisfied with the way the state supports aquaculture practice. Aquaculture farmers with low levels of education have a higher level of satisfaction with the aquaculture processes and methods than highly educated ones. The current scale and conditions of aquaculture ponds/rafts, which are small-households in nature, as well as inadequate and limited water resources, breed sources and the discharge process of ponds/rafts, show challenges in aquaculture development these days. Nonetheless, many people remain quite satisfied and confident with their current aquaculture conditions. This is one of the factors preventing people from developing aquaculture in a modern and sustainable direction.

Keywords: *Farmers; levels of satisfaction; Aquaculture.*

1. Introduction

Aquaculture is a production practice based on the combination of available natural resources (sea surface, river water, ponds, lakes, low-lying fields, dead-end rivers, lagoons, climate, etc.) and aquatic animals (mainly fish, shrimp and other animals) with the direct contribution of humans. This practice in Vietnam includes rearing and growing freshwater, brackish water and saltwater aquatic products in some major forms: Intensive, semi-intensive, extensive and semi-extensive farming methods; Aquaculture in rafts on sea, river, lagoon and coastal waters surface; Krill farming; Aquaculture ponds, lakes, lagoons; Aquaculture in low-lying fields, rice fields.

The Northern coastal region includes 4 provinces and 1 city in the North of Vietnam, namely Quang Ninh, Hai Phong, Thai Binh, Nam Dinh and Ninh Binh. It is an area with rich and diverse coastal resources, allowing the development of numerous important economic sections such as transport - ports, tourism - services, industry, agriculture, forestry and fishery, etc. Northern coastal region has a large sea area with a coastline stretching from Mong Cai (Quang Ninh) to Kim Son (Ninh Binh). The coast has wide tidal flats and rich in alluvium, which provides favorable conditions for aquaculture development. Aquaculture livelihood is the typical type of livelihood in the Northern coastal region. Seizing natural

advantages, the aquaculture practice in the coastal areas has experienced constantly developing. In the 2016-2020 period, the total aquaculture production reach 3,113,4848 thousand tons. In which, 2020 achieve the largest output of 719,4128 thousand tons. Over the years, aquaculture has created sustainable livelihoods and has made a great contribution to the structure of the agricultural sector. Therefore, many localities in the region consider aquaculture as a priority industry in the province's socio-economic development.

Levels of farmers' job satisfaction in agricultural production in general and aquaculture in particular reflects their awareness, satisfaction in production conditions, process, and methods, as well as the challenges, the problems they are facing, the difficulties in production that bother them. When they are satisfied, excited, confident, and achieve their outcomes, they will truly commit to the profession, focusing on investment and production development to bring high economic efficiency.

In this article, people's satisfaction with aquaculture practice is studied at the level of satisfaction with aquaculture activities of households in general and that of the process and method of aquaculture in particular.

2. Method

The research sample includes 200 farmers in two localities of Quang Ninh and Nam Dinh. In each province, two communes were selected to participate in the study (communes were selected at the suggestion of the authorities based on the selection criteria of the researchers).

The main research methods used are questionnaire survey and in-depth interview. The questionnaire on the satisfaction of farmers with aquaculture practice as well as the process, methods and conditions of aquaculture consists of numerous questions, in which the question regarding farmers' level of satisfaction towards aquaculture activities employed a scale with 11 items. There are 9 items about the satisfaction of coastal citizens with the aquaculture process, methods and conditions includes. Each item has 3 answer options as follows: not satisfied (1 point); quite satisfied (2 points) and satisfied (3 points). The average score of the scale is calculated by the average score of the items. In quantitative data analysis, to measure the satisfaction of coastal farmers with aquaculture practice, we agreed that the higher the average score, the higher the farmer's satisfaction level. Reliability analysis results show that the scale has the Cronbach's alpha value is 0.70.

Survey data were processed using SPSS statistical software.

3. Results

3.1. Levels of satisfaction of people in the Northern coastal region with aquaculture practice

The general assessment about aquaculture activities of people in the Northern coastal region reveals that they are quite satisfied with the process, techniques, productivity, scale, consumption capability, household's income from aquaculture, the implementation of safety standards, planning, organization and management, and the state support for aquaculture farmers (mean = 2.31).

In matters related to aquaculture activities, people are most satisfied with the aquaculture process and methods (mean = 2.50). The current scale of aquaculture and implementation of safety standards in aquaculture are less satisfying to the people (mean = 2.40 and 2.39). The state support for aquaculture farmers has the lowest level of satisfaction (mean = 1.93).

Table 3.1. Levels of satisfaction of the families/local people in the Northern coastal region with aquaculture practices

Aquaculture practice	Levels of satisfaction (%)			Mean	Standard deviation
	Not satisfied	Quite satisfied	Satisfied		
1. Process	5.0	39.7	55.3	2.50	0.59
2. Methods	6.5	37.2	56.3	2.50	0.62
3. Productivity	17.5	45.5	37.0	2.20	0.71
4. Scale	8.5	43.2	48.2	2.40	0.64
5. Consumption	18.0	43.5	38.5	2.21	0.73
6. Income	17.3	48.7	34.0	2.17	0.70
7. The implementation of safety standards	9.2	42.1	48.7	2.39	0.65
8. Planning, organization and management	8.6	47.5	43.9	2.35	0.63
9. Products quality	9.6	48.5	41.9	2.32	0.64
10. State supports for aquaculture farmers	31.8	43.4	24.7	1.93	0.75
Average score				2.30	0.51

Source: Results of the survey

Over the past time, commercial banks and credit institutions in the surveyed areas have had numerous solutions prioritize credit support for households investing in developing economic models in general and aquaculture product in particular. Thanks to the preferential loans, many high-tech aquaculture models have proved their significant role in developing the marine economy and helped many households escape from hunger and poverty. However, the biggest difficulty for people in accessing bank loans in the aquaculture sector is the short-term contract due to the commune's management policy on land for flats and land for bidding. Therefore, it is not eligible for people to mortgage, the risk is high, not to mention other unavailable collaterals, consequently, the bank does not have enough legal grounds to lend customers loans for aquaculture production. It is necessary to raise the loan limit and loan period for aquaculture households, reduce lending interest rates so that households can borrow capital to invest in production, improve production efficiency and income. Specifically, there should be a policy to support loans for aquaculture households in the context of the Covid-19 pandemic as the production and consumption face noticeable

hardship when the selling price of agricultural products plummets, just equal to the price of agricultural products, cumbering aquaculture households.

The surveys showed that in 2020 and 2021, the Covid-19 pandemic has negatively impacted many fields, including the aquaculture sector of people in Nam Dinh and Quang Ninh. In Quang Ninh, for many years, the output of clams and oysters has been mainly exported to foreign markets, with little domestic consumption. However, from the beginning of 2020 until now, due to the influence of the Covid-19 pandemic, foreign partners have stopped importing oysters and clams, while these products are consumed in relatively small quantities locally. Declining tourist arrivals also results in relatively poor consumption. Fishermen in Van Don only harvest in moderation due to low prices and reduced purchase volume. Mr. Nguyen Van T. (50 years old), who is farming oysters and clams on Bai Tu Long Bay (Ban Sen commune, Van Don district, Quang Ninh province) said: “This year Van Don rains less than usual so the oysters are thinner and the price is also lower.” In addition, since it is only consumed domestically, the harvest is very slow. Not to mention, as the oysters have reached the age of harvest, if left for a long time, they will gradually die and may cause disease.”

To help aquaculture farmers deal with these difficulties, from the beginning of the year until now, the People's Committee of Van Don district has reported to the People's Committee of the province and relevant departments and branches to propose solutions to consume mollusk products of the province. Many farming households and small traders actively sell their products on social networks, associate and set up sales at a number of establishments inside and outside the province, initially consuming a significant number of products. The district continues to push commercial promotion to consume products through a system of agents in foreign provinces, selling through social networking channels; encourage and facilitate the formation of product processing or freezing facilities. According to an officer of the Department of Agriculture and Rural Development in Van Don district, although a specific unit price has been established, and transportation fee support has been established, the actual cost currently purchased by businesses and small traders is only about 3/5 of the expected price is built by the district, so many farming households do not want to harvest. On the other hand, although there supports from businesses, the consumption volume since the beginning of the year has also decreased significantly compared to 2019, causing many difficulties for farming households.

In Nam Dinh, due to the impact of the Covid-19 pandemic, the price of fresh seafood consumed in the domestic market dropped sharply, causing many difficulties for people. According to statistics of the Department of Agriculture and Rural Development of Nam Dinh province, in 2019, seafood export enterprises have exported about 3,000 tons of cobia to China through border trade and 40,000 tons of caught fish, 200 tons of acetes; exported to Europe, Japan, Korea about 6,000 tons of clams. However, from the beginning of 2020 until now, most seafood products of export enterprises have to be stored. In the domestic market, the social distancing policy makes seafood processing enterprises faced difficult in

terms of raw materials, leading to high production costs and reduced output due to decreased domestic demand. In addition, China's border trade policy does not allow seafood products to be imported through this way, but using official quota, along with the EC's yellow card, causing seafood exporters to Europe to bear more fees and waste more time as the products are held for inspection.

As a big name in the field of seafood processing with Ninh Co fish sauce product, which has had a long-standing brand name in the domestic market, in the first 4 months of 2020 due to the influence of the COVID-19 pandemic, Nam Dinh Seafood Processing, JSC processing only sold 30,000 liters of fish sauce and 3 tons of shrimp paste; which means 30% reduction in total product consumption compared to the same period last year; affecting the productivity and working progress of 38 regular workers, and greatly affecting the working days of 150 seasonal workers.*****.

To support seafood businesses to overcome difficulties, sectors and localities in the province have focused on creating conditions for businesses to promote domestic consumption. Most notably, the competent authorities have coordinated to support seafood businesses through the Provincial Association of Fresh Agricultural Products to establish the Center to introduce fresh seafood products in Nam Dinh city to strengthen the promotion and sale of seafood products in the domestic market. Furthermore, they continued to support seafood enterprises to maintain exports to the Chinese market. By this, seafood enterprises are encouraged to improve product quality, obtain product unit codes, quarantine and gradually change the form of export from border trade to official quota, avoiding economic risks.

In summary, the people in the sample are quite satisfied with their family's aquaculture practice. In which, they are most satisfied with the aquaculture process and method and the least satisfied with the state's support for aquaculture activities.

3.2. The levels of satisfaction of people with the current aquaculture process, methods and conditions

The survey results show that, in general, the aquaculture farmers in the sample are quite satisfied with the aquaculture process, methods and conditions of their families/local people (mean = 2.42). The item with the highest satisfaction of the people was the implementation of regulations on harvesting of cultured subjects (mean = 2.53 and only 4.1% of the respondents were not satisfied). The second is to implement regulations on food management in aquaculture (mean = 2.52). The third is to implement regulations on aquaculture sites, areas and conditions of aquaculture ponds, lagoons and rafts (mean = 2.47).

Table 3.2. The levels of satisfaction of people with the current aquaculture process, methods and conditions

Aquaculture process, methods and conditions of the family	Levels of satisfaction (%)			Mean	Standard deviation
	Not satisfied	Quite satisfied	Satisfied		
1. Implement regulations on aquaculture sites, areas and conditions of aquaculture ponds, lagoons and rafts	3.7	45.8	50.5	2.47	0.57
2. Implement regulations on water sources in aquaculture	9.7	47.2	43.1	2.33	0.65
3. Implement proper breeds management and stocking techniques	8.2	44.1	47.7	2.39	0.64
4. Implement food management for farmed subjects with correct technique	3.2	41.2	55.6	2.52	0.56
5. Comply with regulations on harvesting cultured objects	4.1	38.5	57.4	2.53	0.58
6. Implement management of cultured objects health management and the use of antibiotics for cultured objects	15.1	41.1	43.8	2.29	0.71
7. Assess the level and risk of pollution of the pond	23.1	37.9	39.0	2.16	0.77
8. Implement the process of cleaning and discharging waste of the pond	21.2	35.4	43.4	2.22	0.77
9. Implement technical management of farming	15.4	30.3	54.4	2.39	0.74
Average score				2.36	0.51

Source: Results of the survey

The item with the lowest level of satisfaction is the assessment of the level and risk of pollution of the pond (average = 2.16) and less than ¼ of the respondents rated it as unsatisfied (23.1 %).

When asked more about the reasons why they being dissatisfied with the sanitary and safe conditions of their family's ponds, rafts and lagoons, most of the respondents said that they have not handled waste in aquaculture practice well (94.7%); not actively control the water source (89.5%), due to the small area of the pond, they cannot treat it regularly (80.3%), and implement the aquaculture practice according to folk experience thus pollute the water (75%).

In fact, at present, in Nam Dinh and Quang Ninh, there are people spontaneously and widely developing aquaculture without planning, not complying with environmental commitments, farming in high density, leading to the risk of pollution. One of the causes of this problem is the inadequacies in the management of aquaculture land with water surface (Quang Ninh, Nam Dinh) and in planning management and conversion of inefficient rice-growing areas to aquaculture. In particular:

Main districts being invested are Giao Thuy, Hai Hau, Nghia Hung, Xuan Truong, Truc Ninh and Vu Ban. In addition, the areas where rice, sedge and salt production were inefficient before, people converted to aquaculture with the support in form of investment in building technical infrastructure for production of the province. The province currently has 44 conversion projects, of which 32 projects have achieved economic efficiency of many times higher level than before the conversion. The farming method in the project areas is shifted towards forming intensive and semi-intensive farming areas. However, realizing the profit gained from whiteleg shrimp farming, many households converted the area outside the planning to farming whiteleg shrimp in their own will. This situation broke the approved shrimp farming plan and caused difficulties in management. Due to spontaneous and unplanned development, many farming facilities do not meet the conditions of technical infrastructure such as storage ponds, settling ponds, water supply and drainage systems. The electrical system serving the farming areas is not yet complete. Shrimp ponds are interspersed with salt and vegetable fields, so it is difficult to apply technical measures, especially to handle problems arising from water quality and diseases. The irrigation system for shrimp farming must be used in conjunction with the irrigation system for salt production and vegetable growing, so there is no separate irrigation and drainage system. Many farming households lack knowledge of science and technology and experience; therefore, complicated diseases on white leg shrimp arise, causing significant economic and environmental impacts.

In Quang Ninh province, at present, in some localities, people on their own choice bring brackish water shrimp to farm in fresh water without planning; many shrimp farming facilities and households voluntarily drill wells to get underground water used for farming, raising the salinity of farming ponds; untreated wastewater from farming ponds is discharged directly into the environment, affecting the ecosystem, causing salinization of the farming area, soil environment pollution, groundwater pollution and in the long run will affect the rice-growing area and agricultural land, potentially causing land subsidence.

Thus, the people in the surveyed area are quite satisfied with the current aquaculture conditions in the locality. The issue that people are most satisfied with is the implementation of regulations on harvesting and feed management in aquaculture and the least satisfied is the condition for assessing the level and risk of pollution of the pond and the implementation conditions of the process of cleaning and discharging waste of the pond.

Comparison by level of education: People with low education have a higher level of satisfaction with the implementation of regulations on aquaculture sites, regulations on management of breeding stock than higher educated people. It is possible that people with high education have a deeper level of understanding and access to information and techniques of aquaculture than people with low education, so they understand the current process and methods of aquaculture of their households better; therefore their satisfaction level is not high.

Table 3.3. Levels of satisfaction of coastal people with the process, current methods and conditions of aquaculture (compared by level of education)

<i>Level of satisfaction with the family's aquaculture conditions</i>	<i>Levels of education</i>					P
	Elementary School	Middle School	High School	Technical school	College, University	
1. Implement regulations on places of aquaculture	2.82	2.40	2.40	2.47	2.50	P<0.01
2. Implement the decision on the management of breeding stock	2.75	2.19	2.31	2.25	2.25	P<0.01

It can be seen that people in the surveyed area are quite satisfied with the current process, method and conditions of their family's aquaculture. The item that people are most satisfied with is the implementation of regulations on harvesting and feed management in aquaculture. People are only relatively satisfied with the condition of the water source and the breeding animals. Aquaculture farmers with low education have a higher level of satisfaction with the place of aquaculture and breeding stock management than those with high education.

4. Discussion and Conclusion

The survey results show that the sampled farmers are quite satisfied with their family's aquaculture activities, in which, the people are most satisfied with the process and method of aquaculture; people are only relatively satisfied with the ability to consumption and income from aquaculture. People are not satisfied with the way the State supports aquaculture activities. In the process and method of aquaculture, people's families are not satisfied with the condition of water sources and breeds as well as the assessment of pollution levels and risks of aquaculture ponds, lagoons and rafts of the household. Aquaculture farmers with low education and long-term aquaculture experience have a higher level of satisfaction with the process and method of aquaculture than those who have high education and are new to aquaculture. With the scale and conditions of the current aquaculture ponds/lagoons/rafts, which are still small-family in nature, as well as the inadequate conditions in the ponds/samples/rafts, there are limitations in terms of water sources and breeds, the discharge process of ponds showing challenges posed in aquaculture development today, but many people in Nam Dinh and Quang Ninh are still quite satisfied and confident with their current conditions of aquaculture production. This has partly prevented people from developing aquaculture in a modern and sustainable direction.

In the coming time, in order to develop aquaculture in a modern and sustainable direction, ensuring the harmony between economic, social and environmental development, hunger eradication and poverty reduction, it is necessary to implement synchronous solutions: Completing legal policies on state management in the field of aquaculture, strengthen the role of state management in aquaculture and environmental protection of the authorities at all levels and sectors in the implementation of the Law on Environmental Protection for aquaculture and seafood processing facilities, increase investment in infrastructure, scientific and technical progress for aquaculture, strengthen propaganda to raise people's awareness of environmental protection, strengthen propaganda and education of the Law on Environmental Protection and methods of environmental protection, because they are the ones who have been, are and will directly affect the environment, affecting their own farming practice. Besides, in order to create favorable conditions for aquaculture households to develop and reduce current difficulties, the State's support is very necessary.

THE ROLE OF PUBLIC ENGAGEMENT IN DEVELOPING THE CIRCULAR ECONOMY IN VIETNAM

Dr. Ha Huy Ngoc

huynhoc47ql@yahoo.com

PhD student. Bui Nhat Huy

huybuihat1811@gmail.com

Vietnam Institute of Economics, Vietnam Academy of Social Sciences, Vietnam

Abstract

The traditional model of linear economy based on the extraction of raw materials and discharging the products at the end of their life which damages the environment is being replaced by the circular economy (CE). The circular economy system has been called “the economy systems of the future” because it not only aims at environmental protection but also towards economic growth due to new job opportunities, employments, groups of industries are created. For those reasons, this circular economy model is a suitable model for Vietnam, especially when Vietnam is pursuing a fast and sustainable economic growth goals. Evidently, in order to apply and develop this CE system in the world, the public sector must have initial engagement to secure and create the basis for efficient circular system. So that, this article will systematize the theoretical bases on the development of the circular economy and the role of the public sector, thereby analyzing the current situation and offering solutions and a roadmap to improve the conditions for it to be applied in Vietnam including legal, institutional, and resource requirements.

Keywords: *Circular economy, Public engagement, Public sector*

1. Introduction

The Circular Economy (CE) system is replacing the traditional linear system based on the extraction of raw materials, production and consumption systems that create the end-of-life products which are discharged and impact negatively to the environment. The circular economy is not only aiming at the sole goal of protecting the environment from negative impacts, but this model also aims at economic growth, improving people's living standards, through creating jobs, new industries contributing to the economic development. The circular economy system aims to change the concept end-of-life of materials by bringing all materials, chemical and biological waste at all stages of production back into other production processes. It is estimated that each year the circular economy creates benefits of more than 600 billion euros and more than 550 million jobs for the European region and helps reduce greenhouse gas emissions (Ministry of Industry and Trade, 2021). The circular economy not only represents the role of an economic sector geared towards material recycling, but also plays a huge role in changing production, market, culture, and way of life of people in every sector of the society. The application, creation and construction of a

circular economy system is a process that requires deeply study and reasonable models suitable for each country in the world.

Vietnam - a developing country in the world, with an economic system that is showing signs of positive development and has a lot of potential for the development of a circular economy. In the Socio-Economic Development Strategy for the period to 2030, with a vision to 2045, the issue of turning the circular economy into a development system model in Vietnam's economy is officially set forth to fit the fast and sustainable developing goals. However, in order to develop a circular economy model, it is necessary to involve subjects in the whole economy, but the current research system on the circular economy, especially the role of the State (public sector) in circular economy model has not been systematically addressed. Due to those reasons, this article synthesizes the theoretical system of the circular economy and the role of the State (public sector) to find the intersection between the two theoretical issues, thereby finding the theoretical basis for the State's interventions in fulfil specific conditions to apply and develop the circular economy.

2. Theoretical Framework

Circular economy

Circular economy is an open concept with many definitions and concepts that are not yet agreed upon by international research organizations and policy makers. According to Kirchherr (2017) there are more than 114 different concepts of circular economy. One of the concepts widely used by the European Commission in its guiding documents is that *"A circular economy is a system that is restorative and renewable through the central planning and design of motion. It replaces the concept of the end-of-life of materials with the concept of recovery, moving towards the use of renewable energy, without the use of harmful chemicals that harm reuse. and work towards minimizing waste through the design of materials, products, engineering systems and business models within that system* (Ellen MacArthur Foundation, 2012). The authors Abreu & Ceglia define a circular economy as *"a renewable system of production and consumption that maintains resource extraction and emission rates in line with environmental limits through closing the material cycle, reducing the size of the system and preserving the value of resources for as long as possible in a system based on circular economy design and education; and at the same time capable of being implemented at any scale"* (Abreu & Ceglia, 2018). France's National Strategy for Ecosystem Transition to Sustainable Development for the period 2015-2020 has shown that a circular economy model with low carbon emissions and low use of natural resources can be defined as a system of production, exchange, consumption design and organization that minimizes resource extraction (fossil fuels, raw fuels, water, soil, environment) and emissions.

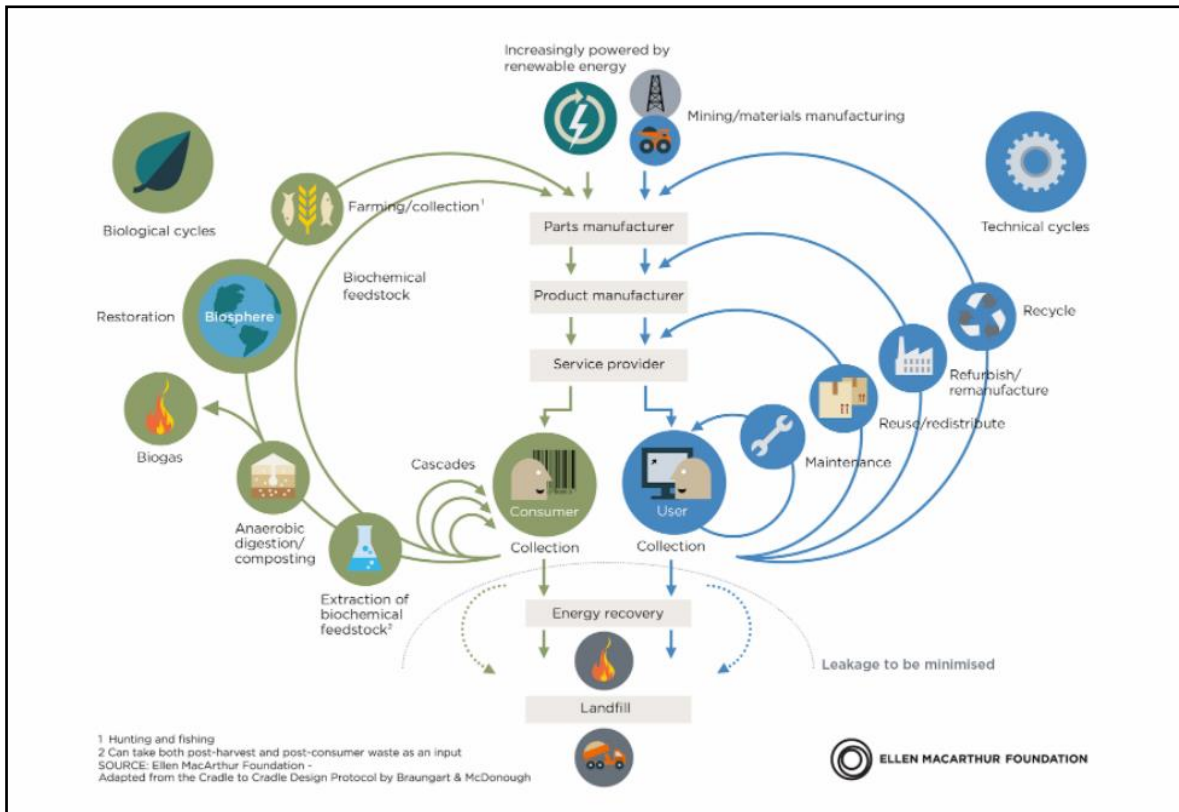

Figure 1. Circular Economy definitions

Source: Ellen MacArthur Foundation (2012)

The operation of the circular economy depends on the level of technology, which harmoniously links the technical process and the biological life cycle. Circular economy is developed from the cradle-to-cradle system of Braungart and McDonough (2002), circular economy is formed from two aspects that are biological cycle and technical cycle. These two aspects are measured and run across all circular economy activities. In the technical cycle, materials are reused, recycled, and regenerated at many stages throughout the product life cycle for the longest use of the raw materials and maximum benefits. In the biological cycle, non-hazardous ingredients are sorted and returned to the natural environment, restoring inherent resources, such as emissions from manufacturing. This means that to realize and apply the circular economy, for every production process it is necessary to be circular in both biological and technical aspects.

Based on the above analysis, the circular economy can be understood as an economic system and model where economic subjects interact with each other and operate based on economic principles and minimizing the impact on the environment through the treatment of waste materials, limiting the exploitation of primary materials, turning the waste into inputs of other materials. Therefore, the nature of the circular economy is reflected in three aspects: (i) Minimization of waste, the result of a by-product of one process being reused in another cycle; (ii) High resilience, thanks to a diverse system with many connections and flexibility to adapt to unexpected external influences; (iii) Conservation of energy, which means all the energy generated in the production process is conserved and stored, only transformed into another form. To be able to find out the conditions for the development of

a circular economy, first of all, it is necessary to base on the content of the circular economy. The circular economy operates on the basic principles of the market economy. According to Michael Watts (1998), a market economy is an economic model in which buyers and sellers interact according to the laws of supply and demand, value to determine the price and quantity of goods and services in the market. Therefore, there needs to be a circular economic model in which sellers and buyers interact according to the law of supply and demand under the influence of institutions created by the public sector. Therefore, the first necessary condition to be able to apply and develop a circular economy is the appearance of an economic model in which subjects who interact according to the law of supply and demand of the market. Therefore, it is possible to identify the actors participating in the circular economy model: the State (public sector); private sector; citizen.

A circular economy is an economy that aims to minimize its impact on the environment, create jobs and increase economic growth in the long term, but to be able to transition to a circular economy requires resources. Instead of using current disposal methods, businesses now will have to invest more resources to carry out design changes, product reproduction, recycling, major changes in production and post-consumption processes, and at the same time, circulating processing in the biological stage also requires more modern technologies. For consumers, changing from multiple disposal behaviours to sorting and returning to the production facility also poses certain requirements.

Requirements of developing a circular economy

Circular economy can be understood as an economic system and model where economic subjects inside interacting with each other and operating based on economic principles and minimizing impact on the environment through the treatment of waste materials, limiting the exploitation of primary materials, turning the waste into inputs of other materials. To find out the requirements for the development of a circular economy, it is necessary to look into the definitions of the circular economy. The circular economy operates on the basic principles of the market economy. According to Michael Watts (1998), a market economy is an economic model in which buyers and sellers interact according to the laws of supply and demand, value to determine the price and quantity of goods and services in the market. Therefore, a circular economic model is required in which sellers and buyers interact according to the law of supply and demand under the influence of institutions created by the public sector. Therefore, the first necessary condition to be able to apply and develop a circular economy is the emergence of an economic model in which the participants interact with each other according to the rules of supply and demand of the market. By that reason, it is possible to identify the participants involved in the circular economy model: the State (public sector); the Private sector; the citizen.

A circular economy is an economy that aims to minimize environmental impact, create jobs and economic growth in the long term, but to be able to transition to a circular economy requires several types of resources. Instead of using current disposal methods, businesses will now have to invest more resources to carry out design changes, product reproduction, recycling, having major changes in production and post-consumption processes. According

to Aglaia Fischer and Stefano Pascucci (2017), the main challenge faced by businesses participating in the transition to a circular economy is to arrange cooperation and relational business, while being constrained by an institutional system that conforms to the principles of linear economics. This shows the necessary of having interventions from the public sector in regulations, legal corridors, and policy making from the beginning of the transition to interfere in production and consumption behaviour of businesses and their clients. Japan, one of the countries earning many achievements in the circular economy has had to go through 3 stages of development of this economic sector. From the very beginning, Japan has built a very strict legal system that clearly defines who is responsible and handling standards from general to detailed, greatly contributing to the success. circular economy development with 9 sets of laws divided into 3 areas: Basic Law, Comprehensive Law and Special Zone Law (Xiujun Ji, Yongqing Zhang, Luying Hao, 2012).

Table 1. Legal basis system of circular economy in Japan

Classification of law	Names	Year
Fundamental law	Environmental Law	1993
	Promoting the formation of a recycling society Law	2000
Comprehensive law	Waste disposal law	1970
	Resource efficient law	1991
Special Law	The law of separate collection and recycling of container and packaging	1995
	Special household machine cycle law	1998
	Building construct recycling Law	2000
	Polychlorinated biphenyl wastes properly handle special measures law	2001
	Vehicle recycling law	2002

Source: Xiujun Ji, Yongqing Zhang, Luying Hao (2012)

The European Commission (2020) issued the Circular Economy Action Plan on 11 March 2020 to achieve the goal of being carbon neutral by 2050, emphasizing the implications of the circular economy including 3 areas: supply from economic actors; consumer needs and behavior; waste management. In the supply from economic actors, there are 4 pillars: Mining/production and sustainable supply chain; Eco-design (in products and manufacturing processes); Industrial symbiosis; Economic function. In consumer demand and behavior depends on 2 pillars: Responsibility of consumption; and Product Life Cycle Extension. In terms of waste management, emphasis should be placed on the recycling of organic materials and products.

Through the above analysis, we can clearly see that the necessary conditions for the application and development of the circular economy model are: (i) An economic model with participation and interaction of the participants in the model; (ii) The law system, regulations and policies create the basis for the implementation and development of the circular economy; (iii) Resources mobilized for the application and develop circular economy.

The Role of Public Engagement in Developing the Circular Economy

The basis for the State or the public sector intervention in the economy is one of the critical issues that had been studied over the past few decades. Most studies confirm that competition in a perfect market economy will bring the economy to a high level of efficiency, stimulating innovation, but markets can not always bring effects that society desires. One of the bases for such intervention is the Pareto efficiency theory, where the author states: “An allocation of resources is called Pareto efficient if there is no way to reallocate resources to make at least one person better without hurting anyone else. The Fundamental Theorem of Welfare Economics also states: “As long as the economy is perfectly competitive, that is, producers and consumers accept prices, so long under conditions the economy will inevitably move towards a Pareto efficient allocation of resources. However, in reality, there are always distortions and failures that cannot be solved by the supply and demand systems themselves. A second reason for public sector intervention in the Pareto efficient economy stems from the fact that individuals may not act in their best interests. Many studies have shown that individuals may not be fully aware of the benefits or harms of consuming any good or service even with sufficient information. This will cause the public sector to compel or take measures to affect the types of goods/services that individuals do not voluntarily consume, which are promotional goods (Vu Cuong, Pham Van Van, 2013).

A circular economy is an economic system and model where there are economic participants interact with each other and operate based on economic principles and minimize the impact on the environment through waste treatment, limiting the exploitation of primary materials, turn the waste into the input of other production processes. The nature of the circular economy depends heavily on resources such as finance, technology, and human resources due to the transformation of materials in two technical cycles including recycling, reuse, and recycling. The biological cycle and generation include processes that treat waste chemicals back into inputs for other processes. The application and development of the circular economy requires huge initial investment resources and a long investment process, potentially affecting the costs and profits of many businesses and individuals in the short term. This can be a burden to some enterprises, making them not excited to access and start the circular economy voluntarily despite the benefits that the circular economy brings such as job creation, economic growth. or reduce the impact on the environment. Therefore, the public sector needs to intervene in this system to apply and develop the circular economy.

So where should these interventions be aimed in this circular economy system? OECD (2005) shows that the public sector establishes SOEs (State-Owned Enterprises) to participate in investment and management to become a tool to serve certain goals of the State, which basically includes political and economic goals. These SOEs serve as tools to ensure employment; develop industries that require large investments that cannot be met by the private sector; control the decline of low value-added heavy industries (shipbuilding, mining, coal); support the private sector to bear great risks (such as natural disasters in agricultural production). SOEs are also expected to shoulder the mission of promoting economic development; ensuring the goal of equality and social stability through investment in

infrastructure and creating new jobs; generate revenue, budget sources for social allowances, etc. There was a period in history when many countries invested in a series of SOEs in many different industries and fields, from heavy industry, infrastructure, to agriculture, telecommunications, and technology. ... In developing and less developed countries, according to UNIDO (2003) in the early stages of independence, especially in the 1950s and 1960s, SOEs played an important role in building infrastructure; production and supply of essential goods and services; job creation, hunger eradication and poverty alleviation; promote development and ensure national economic security; generate revenue. Analysis of the EU Commission (2016) has highlighted some important roles of SOEs in the EU. The formation and development of SOEs in EU countries stems from historical, political, and socio-economic objectives. SOEs are also established to make long-term and risky national strategic investments that the private sector does not want to do. Governments have operated SOEs in sectors that are key to the economy, thereby exploiting SOE externals to benefit other industries or pursuing social goals such as social justice. and ensure inclusive development.

As for the world practice, in the UK, the Government plays an active role in establishing green financial markets. Commitment to implementing a green financial system is included in the overall development strategy of the economy as well as the Government is directly involved in the process of mobilizing green capital, through: (i) building a framework the policy of developing a green financial system that is simple, stable and easy to apply, and regularly reviews, evaluates and adjusts in a timely manner; (ii) directly invest capital in the green economic sector to promote implementation in practice through the development of a direct funding mechanism for green investment projects, and the implementation of government guarantees for green infrastructure projects as well as sponsoring environmental protection funds; (iii) establish a green investment bank to support investment in green infrastructure projects that cannot be financed by the market. In China, KVC has also set specific targets to reduce carbon emissions, mobilizing financial resources mainly from public finance. In addition, China also benefits from a special market funded by the state budget to reward businesses that carry out technical renovation towards energy saving; financial support for consumers when choosing to use energy-saving products; establishment of a dedicated fund for the treatment of polluting waste).

3. Method

The main research method used is on-desk study method.

Step 1: This study review of research related to circular economy, circular economy development, circular economy development models and issues related to the role of the public sector including the system theoretical basis and theoretical slices between the circular economy system and the role of the public sector as a basis for public sector intervention. Experiences of countries around the world are also synthesized to build a circular economy development model. Here, the study uses the method of meta-analysis, analyzes the collected data, and synthesizes the theoretical system to find common ground between the role of the public sector and the circular economy system. The study also uses a comparative method between countries' actual experience in developing a circular economy system, including countries and regions, such as:

the theoretical basis of the European Union; Netherlands; Germany; France. In the Asia region, the countries taken as case studies include China, Japan. From the experience is analyzed and synthesized, the study makes comparisons to find the relationships between the circular economy development models.

Step 2: After reviewing the studies related to the topic, this study designs an analytical framework to find the connection between the components and the content of the topic. Research conducted in-depth interviews with the number of 10 experts in the field to contribute to building a theoretical system.

Step 3: Based on the theoretical analysis framework provided, the study evaluates the role of the public sector in the current situation of circular economy development in Vietnam, evaluates the completion of conditions. From there, the study gives implications for the process of building conditions in Vietnam by the public sector.

4. Results

After analyzing world experience and combining ideas from expert interviews, it seems to have a common point that the circular economy model in most developed countries in the world is implemented from the top down. The circular economy hardly originates voluntarily from the business sector, despite the business sector's role as central to the circular economy system. Enterprises play both role of a source of production and a consumer of products of the circular economy because the transition to a new production process will increase operating costs and requires large resources. The public sector must take first steps to participate in creating the environment for the circular economy at different levels depending on the specific conditions of each country. In Europe, 16 policy interventions across the period from 2011 to 2020 have been systematically launched from the document guiding the economic transformation to achieve specific goals. In Japan, the first circular economy system is regulated by law with 3 stages, the public sector is the first part of the economy to participate in providing recycling services and then gradually transfers it to the private sector. Thereby, it can be seen that in order to be able to apply and develop the circular economy, first of all, the public sector needs to build an economic institution with participating actors including: the public sector; enterprise; consumers. And the public sector must participate initially as a creator, perfecting the conditions for the remaining participants to join in. The conditions to apply and develop the circular economy model is legal conditions; institutional conditions; resource conditions.

4.1. The role of the public sector in perfecting conditions on the legal and institutional basis

The above analysis has shown that the private sector will not voluntarily participate in the circular economy due to the cost-increase so that a tight sufficient regulatory framework is needed. These legal bases are classified by countries according to the size of the economic system as enterprises (micro), industrial zones (intermediaries) and social communities (macro) according to the affection of the economic components of the classification system. Countries around the world prescribe laws, policies and regulations that guide the stages of material conversion and regeneration in each material industry group. Specifically, the regulatory bases that must cater for phase-by-stage reproduction in all three of the product's loop-based phases are: (1) Design and manufacture; (2) Use and

consumption; (3) Discard the product. At the same time, recycle the product at stage (3) and return it as raw material for the product at stage (1). And these stages at each different hierarchy must have guidelines, regulations and adjustments to fit the micro, intermediate and macro system. Vietnam also has foundations in building a circular economy, but policies and legal regulations are still not comprehensive in giving specific guidelines.

Table 2. Legal basis system of circular economy in Vietnam

Year	Project	Content
1993	Law on Environmental Protection 1993	Basic concepts related to environmental protection have appeared as the basis for application in environmental management activities.
1998	Law on Water Resources 1998	Regulations on prevention and control of environmental pollution, environmental incidents, water quality protection
1998	Directive No. 36/1998/CT-TW	Strengthening environmental protection in the period of industrialization and modernization of the country in order to affirm political determination and determine the policy of environmental protection.
1998	Directive No. 36/1998/CT-TW	On strengthening environmental protection in the period of industrialization and modernization of the country in order to affirm political determination and determine the policy of environmental protection
2004	Resolution 41-NQ/TW	Directing the work of environmental protection in the period of accelerating industrialization and modernization of the country.
2012	Action plan of the Government for the period 2011-2016	socio-economic development associated with environmental protection and improvement, proactively responding to climate change; defining environmental goals by 2020 is that newly established business establishments must apply clean technology or equip equipment to reduce pollution, treat waste, and develop a green economy.

4.2. The role of the public sector in perfecting the resources conditions

Investment funds

Since the participation in the circular economy development model includes two main sectors, the State and the private sector, the investment capital source will be the State Budget and non-State budget sources. Firstly, it must be emphasized that the private sector will not voluntarily participate in investment in the circular economy system because this

will increase their own costs, so the State must take initial action on investing in the transition to a circular economy. For capital from the State budget, the public sector can participate directly in the supply chain, and the state budget will have an investment role in infrastructure and services, directly participating in the reproduction of products at discharging stage, converting waste into inputs for other production activities. In addition, the public sector can participate indirectly in the supply chain, the state budget will now invest in constructive policies for the transition such as renewable incentive programs, tax reduction for businesses which produce environmentally friendly products, collect environmental taxes on products that are harmful to the environment, or participate in investment and initial support to help businesses have capital to transform their production lines. production to circulation.

Technology resources

Technology is one of the key elements in the transition and development of the circular economy. In which, the recycling of materials to help convert waste back into input materials requires many modern refining technologies with infrastructure invested with large capital. Resources for technology can come from many different sources such as importing technology from abroad or developing the technology itself. For the self-development of technology, many countries around the world such as Germany, Japan, China, and the Netherlands have advocated education and investment in the R&D system since the beginning of the implementation of the policies. For technological resources from import, there can be three types: “direct import of remanufacturing technology lines; hire the third-party international enterprises to handle waste; technology chain transfer from FDI”. In which, the type of direct import of technology, although highly sustainable, requires high-quality human resources and large capital.

Human Resources

In order to meet the development needs of the circular economy requiring modern technology, countries such as Japan, Germany, Netherlands, and China have advocated the development of a large-scale education system in order to train highly qualified human resources and change the public's perception of the circular economy. At the beginning of policy implementation, high-quality human resources may also be called in from countries with a developed technology industry to transfer knowledge and technology, however, this is not the case. This is a short-term measure because it requires large costs. High-quality human resources can also be brought from the education and training process in the country through the policies and guidelines of the Government.

4.3. The role of the public sector in operation

The transition to a circular economy will not take place naturally because this process requires a large amount of investment capital and costs, which negatively affect profits, so businesses will not actively invest in material circulation technology systems, therefore, the Government must be the first participant in the development process.

The role of the Government is to issue guidelines and policies to encourage the development of the circular economy with specific guidelines and a full implementation roadmap, in addition, the Government has the role of investment as a driving force for the

economy. At the same time, complete the conditions to create the basis for the circular economy to operate, such as completing the legal basis system, using the government budget to invest in development policies, infrastructure systems, and technology systems to support the circularity of the economy. At the same time, disseminate knowledge about the circular economy through training, education, and research to acquire high-quality human resources. In the period after the circular economy becomes popular, the Government must play the role of managing and supervising the circular activities of the economy and attracting the private sector to participate in the investment, operation, and material circulation services. The role of the private sector is to invest as well as take part in completing conditions from the Government, it is necessary to actively invest and operate the circular economy.

In order to implement the circular economic development model, it is necessary to decentralize the economic system according to the scale of the economic system such as micro, intermediate, and macro, each decentralized system needs to have specific regulations and guidelines.

5. Conclusion

The circular economy is becoming a potential economic model that promises to replace the traditional linear economy which negatively impacts the environment by exploitation of limited resources, the process of discharging waste into the environment to serve the production and consumption activities. The world linear economic system seems to be coming to an end as countries around the world are strongly promoting this circular economy (Ghisellini et al., 2016). In Vietnam, a developing country, in order to achieve the goals of rapid and sustainable development, the circular economy has been identified as an economic model that needs to be applied and developed in accordance with the Socio-Economic National Development Strategy to the year 2030, with vision to the year 2045. However, up to this point, circular economy is still a new concept with research and implementation activities in the early stages. In order for this economy to operate smoothly and develop strongly, the role of the public sector has been shown to play a very important position in this circular economic system. The study has systematized the theoretical basis, asserting that the circular economy can be understood as an economic system and model where internal economic participants interact with each other and operate on the basis of economic principles and minimizing the impact on the environment through the treatment of waste materials, limiting the exploitation of primary materials, turning the waste into input materials. To apply and develop this economic model, it is necessary to complete the following conditions: (i) An economic model with the participation and interaction of the subjects in the model; (ii) The system of laws, regulations and policies creates the basis for the implementation and development of the circular economy; (iii) Resources to apply and develop circular economy. In which, the role of the public sector must be involved first, building an economic institutional system, a legal basis, building and attracting resources including technology, finance, infrastructure resources and human resources in both direct and indirect ways. It can be said that the leading role of the public sector is especially important in building and developing this circular economy.

ENVIRONMENTAL PROTECTION ISSUES IN VIETNAM'S CURRENT INTERNATIONAL ECONOMIC INTEGRATION PROCESS

PhD Candidate. Tran Quoc Viet

quocviet.lsd@gmail.com

Academy of Journalism and Communication, Hanoi, Vietnam

Abstract

Since Vietnam became an official member of the World Trade Organization (WTO) (2007) until now, Vietnam has implemented guidelines and policies on strengthening international integration, especially economic integration. This helped Vietnam achieve great achievements in many aspects: politics, economy, society, culture, security - defense.... In addition to the process of international economic integration and in other fields, including international integration in the field of natural resources and environment, recently, it is also being promoted to meet the actual requirements and trends. The article focuses on presenting the current status of guidelines and policies of the Party and the State of Vietnam in regulations on environmental protection, a number of commitments related to the environment of Vietnam in the WTO and free trade agreements (FTAs), and raised the advantages and disadvantages for Vietnam related to environmental commitments in the process of international economic integration to make some recommendations to improve the effectiveness of environmental protection in the process of the international economic integration of Vietnam.

Keywords: *Environmental protection, international economic integration, Vietnam.*

1. Introduction

According to the United Nations Environment and Development Commission, sustainable development is development that meets the needs of the present without compromising the satisfaction of the needs of future generations. To realize sustainable development, environmental protection will necessarily be an integral part of the development process and cannot be considered in isolation from that process.

Recognizing the importance of environmental protection, the Party and State of Vietnam always uphold environmental protection for the purpose of special sustainable development in the current process of renovation and international integration. Vietnam always emphasizes the view that the environment is a condition, foundation, and prerequisite for sustainable socio-economic development, so economic development must be in harmony with nature, respecting natural laws do not trade the environment for economic growth. Environmental protection is the responsibility of the whole political system and society as a whole, in which local authorities, businesses, communities, and people play an important

role. The orientation of the Vietnamese Party and State on environmental protection is to prioritize proactively preventing and controlling pollution, focusing on solving key and urgent environmental issues; overcoming pollution, and degradation, improving environmental quality, combined with nature conservation and biodiversity, contributing to climate change response.

Currently, the trend of international integration has brought many benefits, opportunities and potentials to many countries, but it also creates significant challenges for developing countries such as Vietnam. The new generation of free trade agreements (FTAs) which Vietnam has signed go in the direction of liberalization, facilitation, non-discrimination, etc. FTAs have many increasingly diverse of scopes, sizes and levels; besides there are obligations and the level of legal binding which are increasing; diversified and rich in content and fields, continuing to form many international frameworks or "playgrounds" with many new "rules of the game" at various scales of geography, region, area and global; requirements, requirements of increased responsibility when participating, accompanied by increased investment and financial contribution; has more and more connection with the economy, has influence and contributes a lot in the process of international economic integration and the economic development of the country; Mechanism to evaluate and monitor the implementation of obligations are increasingly strict, along with sanctions for non-compliance and implementation of committed obligations. The article focuses on presenting the current situation of guidelines and policies of the Party and State of Vietnam regarding regulations on environmental protection, and some contents of commitments related to the environment of Vietnam in WTO and FTA agreements. Then highlight the advantages and disadvantages for Vietnam related to environmental commitments in the process of international economic integration to make some recommendations to improve the effectiveness of environmental protection in the process of international economic integration of Vietnam.

2. Method

The topic is based on the Communist Party of Vietnam's viewpoints and guidelines, as well as the State of Vietnam's policies and laws on environmental protection. The author uses interdisciplinary methods from the social sciences and humanities. The author uses mainly historical methods to describe the guidelines, policies, and laws of the Party and the State on environmental protection and Vietnam's environmental commitments in the new generation of free trade agreements. Using a combination of methods: history, logic, combining history with logic, comparison, analysis, and forecast, this paper highlights advantages and disadvantages in the process of Vietnam continuing to fulfill its environmental commitments in the process of international economic integration and makes recommendations to improve the effectiveness of environmental protection in the process of international economic integration. These methods are used flexibly and appropriately in order to analyze, comment, and evaluate on protecting environmental issues in the current process of Vietnam's international economic integration

3. Results

3.1. Vietnam's international commitments on the environment and the guidelines and policies of the Vietnamese Party and State on environmental protection

In the system of WTO Agreements, there are many provisions directly related to environmental issues. For example, Articles I and III (which stipulate non-discrimination obligations), Article XI (on quantitative restrictive measures) and the provisions on general exceptions in Article XX. Trade and environmental issues are mentioned in the preamble of the Agreement establishing the WTO and in many other WTO agreements. Regarding trade and environmental issues, the GATT "non-discrimination" principle ensures that national environmental protection policies will not be applied discriminatorily between imported products and similar domestically produced products or to discriminate between like products imported from different trading partners. The principle of "non-discrimination" helps prevent the abuse of environmental policies and their use as disguised restraints on international trade.

The environmental content in the Free Trade Agreement (FTA) may not be entirely covered by a chapter or a provision. This content may be in the preamble or the provisions related to the environment. The following section will focus on understanding the environmental contents of the FTA that Vietnam has signed.

Table 1: Contents of commitments related to the environment in Trade Agreements

Agreements	Environmental factors
Vietnam – EU	<ul style="list-style-type: none"> - Hair waste, pet hair waste, waste of skin and parts of skin, tendons, bones, horns, shells, corals, shells of treated and untreated crustaceans, etc. Fish waste, cocoa shell waste, food processing industry waste, animal feed -Waste of chemicals, raw materials, leather shoes, paper, municipal waste. -Fuel, minerals, electric energy. -Chemical fertilizers and chemical treatment. -Chemical treatment of textiles, tanning,... - Climate change, biodiversity, sustainable management of forests and forest products, conservation and sustainable management of marine life and fisheries, application of low-carbon technology and energy efficiency, ecolabel program, mapping, assessment, valuation of ecosystems and ecosystem services, combating international wildlife trade, green growth.
ASEAN - India	<ul style="list-style-type: none"> -Environment, mining, and energy. -Limiting national treatment for environmental investigations. -Environmental services. -Environmental impact assessment service.

Agreements	Environmental factors
	<ul style="list-style-type: none"> - Treatment and disposal of hazardous waste. - Sea transportation of wastes.
ASEAN - Korea	<ul style="list-style-type: none"> - Cooperation in the field of environmental industry. - Mining for fuel and energy. - Natural resources. - Environmental services, environmental impact assessment. - Waste.
ASEAN - China	<ul style="list-style-type: none"> - Apply standards and technical regulations to protect the environment. - Cooperation on the environment and energy - Transporting hazardous waste, toxic solids - Recycling and waste treatment
Vietnam - Chile	<ul style="list-style-type: none"> - Exploiting water, mining minerals, fuel, and energy. Energy cooperation - Waste and scraps
Vietnam - Korea	Origin of natural minerals, seafood caught from the sea, waste, scrap
ASEAN – Australia và New Zealand	Standards, technical processes for environmental protection, environmental cooperation
Vietnam - Japan	Standards, technical processes for environmental protection, environmental cooperation.
Vietnam - Eurasian Economic Union	Regulations and technical standards for environmental protection. Sustainable development.

Source: USAID (2017), *Manual to Guide Businesses on Environmental Regulations and Free Trade Agreements*, p.25-26.

In addition, the new generation FTAs that Vietnam has signed and ratified recently, the CPTPP Agreement (ratified and effective) and the EVFTA Agreement (signed) are two standard regional FTAs. and typical of a high level of commitment, wide coverage with many new fields and contents, unprecedented in traditional FTAs before, such as intellectual property, government procurement, labor, environment school. The environmental content (Environment Chapter) in the CPTPP Agreement or sustainable development (Sustainable development Chapter) in the EVFTA Agreement covers many related fields. There are many similarities between these two Standard Agreements. Comparing the complexity, the level of commitments and constraints on the environment, the CPTPP Agreement is still higher than the EVFTA Agreement. It is necessary to note and pay more attention to the CPTPP Agreement (different from the EVFTA Agreement) which are the contents of the CPTPP's environmental commitments that are subject to the dispute settlement mechanism, which uses sanctions (imposition of trade sanctions or retaliation) for violations of commitments

and obligations [3, p.47]. Both CPTPP and EVFTA Agreements have a separate chapter regulating environmental protection and sustainable development, specifically Chapter 20 on Environment from Article 20.1 to Article 20.23 in the CPTPP and Chapter 13 on Trade and Sustainable development of the EVFTA from Articles 13.1 to Article 13.17, focus on addressing the following five issues: (i) climate change, (ii) ozone layer protection, (iii) environmental impact assessment, (iv) investment in the environment sector and (v) environmental dispute resolution. The requirements on environmental protection are committed by the two agreements to a high degree of binding to promote mutually supportive policies in trade and the environment [3, p.47].

Guidelines and policies of the Party and State on environmental protection in the process of international economic integration.

The Communist Party of Vietnam has many policies on environmental protection in the process of international economic integration, which reflected in the documents of the Party Congress from the Xth to the XIII National Congress. In order to continue to improve the efficiency of the international economic integration process, at the Fourth Executive Committee Meeting of the 12th term, Resolution 06-NQ/TW dated November 5, 2016 was issued by the 12th Central Committee on effectively implementing the process of international economic integration, maintaining socio-political stability in the circumstances that our country participates in many new-generation free trade agreements, in order to present the policy of solving environmental problems well, specifically:

- (i) Strengthening state management, perfecting mechanisms and policies, and synchronously implementing solutions to enhance management and effective use of natural resources, protect the environment, and respond to climate change. Resolutely ensure the requirements on environmental protection in investment projects. Pay attention to the inspection, examination and strictly handle violations of environmental protection. Implement emission regulations and standards according to the line roadmap with international commitments.
- (ii) Strongly implement measures to improve environmental quality and people's living conditions. Strictly control the source of pollution. Limit, proceed to completely prevent environmental pollution in craft villages, river basins, industrial zones, urban areas and coasts. Concentrate on thoroughly dealing with establishments causing serious pollution, especially large-scale foreign direct investment (FDI) projects. Rapidly deploying the emission control roadmap for motor vehicles, especially in big cities.
- (iii) Urgently develop, perfect, and strictly implement regulations on corporate social responsibility towards consumers and the environment. Promoting socialization, environmental sanitation, and protection. Each citizen is a person who implements and monitors the reality of environmental protection in order to promptly prevent, notify, and denounce acts of violation or destruction of the environment.
- (iv) Mining and using minerals is associated with environmental protection. Investigate, evaluate the potential and reserves, perfect the planning, and strengthen the management and supervision, use efficiently and economically the natural resources.

Exploiting and sustainably use of water resources; actively cooperate internationally in protecting, managing, and sustainable use of transnational water resources, especially the Mekong River's water resources. strengthen the protection and development of forests, especially coastal protection forests, watershed forests, special-use forests, nature conservation and biodiversity.

Regarding the specific contents of environmental protection, the Party issued Resolution No. 24-NQ/TW, dated June 3, 2013, of the 11th Party Central Committee "On proactively responding to climate change, strengthening resource management and protecting the environment"; and Resolution No. 36-NQ/TW on the Strategy for Sustainable Development of Vietnam's Marine Economy to 2030 with a vision to 2045. After 5 years of implementing resolution 24-NQ/TW, the Politburo directed the preliminary review and promulgation of Conclusion No. 56-KL/TW dated August 23, 2019 on "Continuing to implement the 11th Central Resolution on the proactively responding to climate change, strengthening resource management and protecting the environment," continuing to affirm that "protecting people's health is the top goal" and "do not trade off the environment for economic growth".

The 13th Congress of the Party (2021) has identified goals and directions to 2030 and a vision to 2045 in the field of the environment. The Party emphasized: "Taking the protection of the living environment and people's health as the top goals; resolutely eliminating projects that cause environmental pollution; ensuring the quality of the living environment; protecting biodiversity and ecosystems; building biodiversity and ecosystems; and building a green, circular economy and environmentally friendly economy" [5, p.117]. At the same time, compared with previous congresses, at the 13th Congress, the Party added a new content of environmental protection to become "the relationship between economic growth and cultural development, making progress, social justice, and protecting the environment" [5, p.119].

Institutionalizing the Party's viewpoints and policies on environmental protection in the process of international economic integration, the 2013 Constitution shows a strongly change when it first recognizes the right to live in a healthy environment. (Article 43); implement sustainable development (Article 50); protect environment; manage and use effectively and sustainably natural resources; nature conservation, biodiversity; proactively prevent and combat natural disasters and proactively respond to climate change (Article 63). Supplementing, developing and modifying the team to meet the actual situation of the Law on Environmental Protection in 1993, 2005, 2014, the Law on Environmental Protection in 2020, which was promulgated, also demonstrated a clear transformation of the Party's views on the Law on Environmental Protection, from the initial general regulation on environmental protection through amendments and replacements, the State has institutionalized the Party's views on proactively controlling environmental pollution; strengthen the role of the State and the community in environmental protection; supplement the principle of ensuring sustainable development, the principle of ensuring the right to live in a healthy environment and proactively responding to climate change.

The issue of exploitation, rational, economical, and efficient use of biological and microbial resources, and protection of the marine and island environment has also been institutionalized in the 2012 Law on the Sea of Vietnam, the law on natural resources and the environment of the sea and islands in 2015. At the same time, the view on sustainable fishing is consistent with international treaties; socialization of public services and decentralization of management are more clear when the State promulgates the 2017 Fisheries Law to replace the 2003 Fisheries Law.

In terms of forest protection and development, there is also a development along with the increasing importance of forestry economy; recognizing forests owned by organizations, individuals, and communities; forest allocation to people; Strict regulation on the conversion of natural forests, forest environmental services, processing and trading of forest products, contributing to the country's economic development has been institutionalized and improved, from the Law on Forest Protection and Development in 2004 to the Law on Forestry in 2017. The perspectives on conservation and sustainable development of biodiversity are institutionalized in the Law on Biodiversity (2008).

In addition, the Government also issued documents directing and strengthening environmental protection such as Decree No. 53/2020/ND-CP of the Government dated May 5, 2020 stipulating environmental protection fees for with wastewater; Directive No. 41/CT-TTg dated December 1, 2020 of the Prime Minister on some urgent solutions to strengthen solid waste management; Directive No. 33/CT-TTg dated August 20, 2020 of the Prime Minister on strengthening the management, reuse, recycling, treatment and reduction of plastic waste; Decree No. 54/2021/ND-CP dated May 21, 2021 on preliminary environmental impact assessment, Decree No. 55/2021/ND-CP dated May 24, 2021 on amendments to the articles of Decree 155/2016/ND-CP stipulating penalties for administrative violations in the field of environmental protection, to create synchronization with new laws passed by the National Assembly related to environmental protection. Decision No. 450/QD-TTg dated April 12, 2022, approving the National Strategy for Environmental Protection to 2030, with a vision to 2050. In particular, the goal of the Strategy is to prevent the trend of increasing pollution and environmental degradation by 2030, to solve urgent environmental problems, gradually improve and restore environmental quality; and to prevent biodiversity loss. improving capacity to proactively respond to climate change; ensuring environmental security, building and developing models of circular economy, green economy, and low carbon, striving to achieve the country's sustainable development goals.

3.2. Advantages and disadvantages in the process of Vietnam's continuing to fulfill its environmental commitments in the process of international economic integration.

The advantages and disadvantages come from the results achieved in the work of environmental protection.

Pollutant source control. Environmental pollution control and reduction activities in industrial parks and industrial clusters have made positive changes. By 2019, the whole country has 250/280 (89%) operating industrial parks with centralized wastewater treatment

systems, 219/250 (87.6%) of the industrial parks have invested in installing automatic and continuous wastewater monitoring equipment; 276/698 (40%) of industrial clusters have reports on environmental impact assessment or environmental protection projects; 115 industrial clusters have centralized wastewater treatment systems, 25/115 (21.7%) of industrial clusters have automatic wastewater monitoring systems. By 2020, out of a total of 435 establishments causing serious environmental pollution according to Decision No. 1788/QĐ-TTg, basically completed thorough pollution treatment measures with 352 facilities (compared to 167 establishments that completed treatment in 2015, increasing from 38.4% to 80.9%) [4, p.137].

The problem of solid waste collection. The rate of daily-life solid waste collection increases year by year (81% in 2010, 82% in 2011, 83% in 2012, 83.5 - 84% in 2013 and 85.5% in 2017). The rate of daily-life solid waste collection in urban areas is about 92%; in rural areas is about 66% and there is a large disparity between localities [10, p.6].

Regarding the supply of clean water on environmental sanitation. With a population of 97.4 million, the percentage of people accessing improved water sources increased from 65% in 2000 to 95% in 2017; the rate of access to basic sanitation services increased from 52% to 84% in the same period [11]. According to data of the Ministry of Natural Resources and Environment, by 2020, the proportion of urban citizen supplied with clean water through a centralized water supply system reached about 90%, rural population with access to hygienic water is estimated at 96.0%.

Monitoring, inspecting, inspecting and handling environmental violations. During the 2016-2020 period, the Ministry of Natural Resources and Environment has established Environmental Monitoring Teams to monitor facilities at risk of serious pollution in the North, Central, and South regions. Established and operated a hotline to receive information and report proposals on environmental pollution from the central to local levels; promulgated the regulation on coordination in handling environmental cases and environmental incidents; developed instructions for processing online monitoring data automatically.

In addition, there are still pressing environmental problems today.

Our country's nature, not only being affected by wars in the past, it now also being destroyed by unconscious activities, irresponsible sloppy attitude, and lack of planning in exploiting and using natural resources. According to statistics before 1945, forest coverage accounted for 43.8%, now only more than 28% (ie below the alarming level of 30%) [12]. According to the Department of Nature Conservation and Biodiversity, the size, quality, and diversity of natural ecosystems continue to decline; the establishment and expansion of the area of nature conservation zones is still slow; and wildlife species continue to decline. The fact that forest fires and deforestation have increased, causing serious damage to forest areas and vegetation cover (primary forest is only about 0.57 million hectares, 1% of coral reefs have a cover of more than 75%, and the number of species recorded in the Vietnam Red Book is increasing with 1,112 species). Peat swamps are also shrinking in area and decreasing in thickness. In 1950, the area of Melaleuca forest in the U Minh area had up to 400,000 ha, now only 10,300 ha (with a thickness of 0.4-1.2 m); seagrass beds also decreased

by 50% in 2012 compared to 1999; the largest lagoon is Tam Giang-Cau Hai (Thua Thien-Hue), which has decreased by 60% [2].

Environmental pollution in industrial parks, industrial clusters and craft villages is at a worrying level. Solid waste is a hot and urgent issue that needs to be prioritized for investment and settlement in Vietnam nowadays, with tens of millions of tons of domestic waste (the volume of solid waste increases by about 10% per year and has tends to continue to increase. According to the report of the Ministry of Natural Resources and Environment in 2019, the whole country generates more than 61,000 tons of domestic solid waste per day, more than 37,000 tons per day in urban areas and more than 24,000 tons per day in urban areas. The rate of solid waste collection in urban areas of localities is from 62–90%. The average rural area of the country is about 45-60%. In which, the country has more than 5,400 craft villages, of which Hanoi in particular has more than 1350 craft villages, but 95% of production activities pollute the environment, more than 50% cause serious pollution [12].

Air pollution, especially dust pollution (PM10 and PM2.5), is becoming an alarming problem in Vietnam, directly affecting health and causing psychological insecurity and anxiety for people. Air pollution in recent years in some localities tends to increase due to the increase of pollutants from economic activities; the air quality in urban areas and densely populated areas (especially in Hanoi and Ho Chi Minh City) has declined seriously. At sometimes of the day and some days of the year, increasing sources of emissions into the air combine with meteorological and climatic factors, the phenomenon of foggy weather. This has made air pollution worse. The concentration of dust in urban areas exceeds many times the allowable norm. Concentrations of CO2 emissions, especially in big cities and industrial zones, exceed the allowable standards by 1.5 to 2.5 times [15].

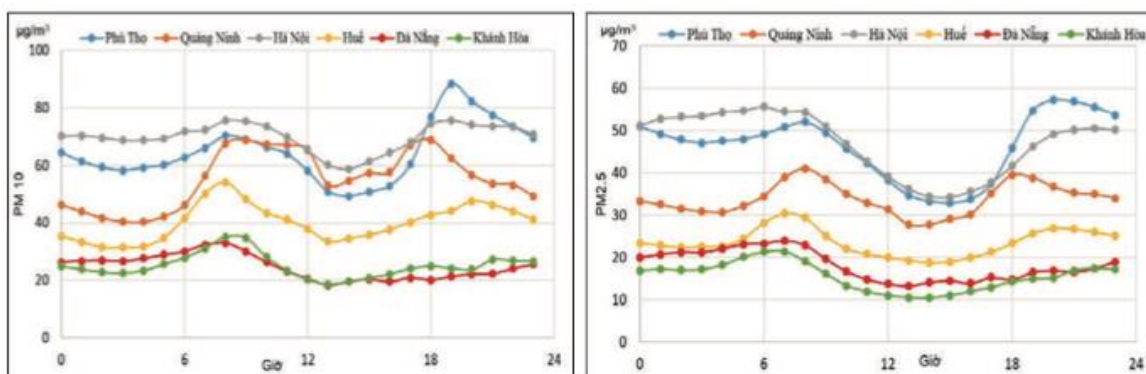

Figure 1. Movement of PM10, PM2.5 values during the day at automatic air monitoring stations

Source: Ministry of Natural Resources and Environment (2021), Report on the current state of the environment for the period 2016 - 2020, Publishing House Dan Tri, p.87.

Advantages and disadvantages stem from financial resources and coordination mechanisms in the process of implementing international obligations and commitments on environmental protection.

Integration in the field of environment occurred early in the country's process of international economic integration, in which some contents, such as conservation and

biodiversity or waste and chemicals, have become deeply integrated over time. The process of environmental integration has basically responded to the world's trend, in line with the process of international economic integration and development of the country, actively contributing to the process of building institutions, systems of policies and laws on environmental protection in Vietnam [9, p.14].

However, there are still some difficulties such as:

The system of policies and laws in general in all sectors is still in the process of being completed; The coordination in the process of developing legal documents to internalize the committed international obligations still remains limited and ineffective, leading to overlap and conflict of content among regulations or gaps in management, affecting enforcement performance.

Financial resources for environmental protection are still modest. Investment expenditure for environmental protection is still low compared to the current situation, only meeting for environmental protection; The source of revenue from the environment has not been used to invest again for environmental protection. Compared with other countries in the region and around the world, the spending on environmental protection in our country is still low. In China and ASEAN countries, the average annual investment in the environment accounts for over 1% of GDP, in developed countries usually accounts for 3-4% of GDP, while this cost in Vietnam is not average. up to 1% of GDP.

The mechanism for coordination and combination between relevant agencies at central and local levels in the implementation of international obligations and commitments is not really effective. The network of officials involved in environmental protection activities is currently still concentrated in the country, mainly in the system of state management agencies, without participation in the organizational system of management and operation of international frameworks. Therefore, Vietnam's influence and initiative in international frameworks related to the environment is still quite modest [9, p.15].

Since joining the WTO, Vietnam has actively and proactively participated in many organizations and signed many trade agreements, especially new-generation free trade agreements (FTAs) such as the CPTPP Agreement, the EVFTA Agreement, the RCEP Agreement, etc. These agreements have many commitments and obligations related to the environment. Meanwhile, the enforcement of environmental laws in our country still has certain limitations because the awareness of a part of people and businesses about environmental protection is not high [7, p.9] This creates pressures in the process of implementing commitments to the new generation of FTAs for Vietnam.

4. Discussion and Conclusion

4.1. Discussion

Some recommendations to improve the efficiency of environmental protection in the process of international economic integration of Vietnam

Firstly, promote institutional improvement; continue to review, systematize, supplement and issue new legal documents in order to perfect the legal system and economic institutions in line with international commitments related to the environment. Increase and

diversify investment capital sources for environmental protection. Prioritize the allocation of development investment capital, loans, and ODA to solve pressing, long-standing environmental problems affecting people's lives and health. At the same time, strengthen international cooperation and promote strategic environmental partnerships. Vietnam must really be a responsible and reliable member and partner at a strategic level in the field of the environment, especially in joint efforts to solve global environmental problems.

Secondly, solve environmental problems well in the process of economic and social development; perfecting and raising the effectiveness of the legal system on natural resources and the environment; continuing to operate in accordance with international regulations on environmental standards and conditions in Vietnam; promoting the socialization of environmental protection; strengthening the propaganda and dissemination of the law on environmental resources.

Thirdly, promote administrative reform and improve the efficiency and effectiveness of the state apparatus, such as: simplifying administrative procedures and processes; reviewing and eliminating administrative procedures that are no longer available; promoting the building of an e-government model; a public administrative service center in order to build an open, transparent, and stable investment environment; promoting decentralization associated with enhanced responsibility and inspection and supervision.

Fourthly, continuously improve the environment for attracting foreign investment, linking investment attraction with monitoring the implementation process, ensuring economic security, socio-economic efficiency - environment. Speeding up the process of restructuring public investment, encouraging public-private cooperation activities. Improve the efficiency of investment capital; strictly manage public debt, including foreign debt.

Fifthly, effectively implement international economic commitments. Develop and implement a strategy to join free trade areas with important economic-trade partners in a master plan with a reasonable roadmap, in line with the interests and capabilities of the country. Actively and proactively participate in the development of common rules and regulations.

Sixthly, promote the process of internalizing international commitments; comply with the implementation roadmap; fully meet the committed content and extent on the basis of ensuring optimal national interests and the interests of organizations and individuals.

4.2. Conclusion

It can be said that Vietnam's international economic integration is deepening with the participation in the signing and implementation of many new-generation FTAs, including commitments related to the environment. The improvement of institutions, policies, laws, and the internalization of the contents of the commitments that Vietnam has signed will promote environmental protection and contribute to the realization of the sustainable development goals set by the Party and State. Vietnam sets forth during the process of international integration. In addition, raising the awareness of environmental protection of the whole society, organizing various forms of propaganda about commitments in the FTA to people and businesses, and enhancing social responsibility are always a regular task to improve the quality of environmental protection in the present and in the future.

DEVELOPING AGRICULTURAL ECONOMY WITH ADAPTING TO CLIMATE CHANGE IN AN GIANG PROVINCE

MA. Nguyen Thi Xuan Loc

xuanlocntt2016@gmail.com

*Department of Tourism and Vietnam Studies,
Nguyen Tat Thanh University, HCMC, Vietnam*

Abstract

An Giang is a province that has strengths in agricultural economic development. It is one of the provinces with the leading rice production in the country, the rate of agricultural development always increases every year. To achieve high results in agriculture, An Giang province has been building new models of agricultural economic growth with many positive changes. In particular, An Giang province always focuses on developing the agricultural economy with adapting to climate change, in order to improve economic efficiency. The content of the article, referring to agricultural economic development with adapting to climate change in An Giang province, is to point out the impacts of climate change on the province's agriculture. From there, it gives suggestions for the agricultural industry of An Giang province to develop higher and higher.

Keywords: development, economy, agriculture, climate change

1. Introduction

From 2011 up to now, climate change has become more and more complicated, challenging many countries in the world and causing great disturbance to the world. According to experts, agriculture is one of the industries heavily affected by climate change because the characteristics of the industries: cultivation, husbandry, forestry, fisheries and irrigation all depend on geographical location and is directly influenced by natural factors. Climate change affects economic development, society and environmental resources in the world in general and Vietnam in particular. Particularly in the Mekong River Delta, which is increasingly suffering from the negative impacts of climate change, and An Giang province is also affected by this change. With favorable natural conditions, An Giang province identifies agriculture as a key economic sector, aiming to build An Giang to become the agricultural center of the Mekong Delta. But the harsh effects of climate change, which directly affect the agricultural economy, require An Giang province to actively find a direction to develop the agricultural economy in the right direction.

2. Method

Several research methods have been applied in this study to clarify issues of agricultural economic development with adapting to climate change in An Giang province.

Firstly, the methods of analysis and synthesis are applied to analyze documents related to research issues.

Secondly, the historical method is applied to describe the research problem according to the process, specifically over the years to clearly see the agricultural economic development of An Giang province.

Finally, the logical methods help to identify appropriate research issues.

3. Results

3.1. Theoretical basis

3.1.1. Climate Change

According to the definition in the United Nations Framework Convention on Climate Change (UNFCCC), climate change is a fundamental change in the climate that is attributed directly or indirectly to human activities that change the composition of the global atmosphere and this change is added to the natural variability of climate observed over comparable time periods (United Nations, 1992).

Climate change is a change in climate and related components including the oceans, land, Earth's surface, and the glacial atmosphere, such as increasing temperatures, melting ice sheets, and rising sea levels. Previously, climate change took place over a long period of time due to the impact of natural conditions. But recently, climate change has occurred due to the impact of human activities released into the environment. greenhouse gas field (Vietnam Opendedvelopment Mekong, 2019). Climate change has directly impacted on socioeconomic development, human health, migration and displacement, food security, and terrestrial and marine ecosystems.

3.1.2. Agricultural economy

Agriculture is a production field with specific characteristics, a production industry associated with plants and animals, governed by biological laws, external conditions (land, weather - climate) and is the industry that produces necessary products for the existence and development of society. So it has long been interested by economists and it is mentioned a lot in economic theories, especially in economic development models of less developed countries that are currently industrializing (Economic People, 2019).

We can understand that: agriculture, in the broad sense, includes forestry and fishery. Agriculture, in the narrow sense, is an industry that produces material wealth in which people must rely on the growth laws of plants and animals to create products such as food, foodstuff, etc. to satisfy their needs.

3.2. Situation of climate change affecting agriculture in An Giang province

The impact of climate change is becoming more and more serious, affecting the living environment, natural disasters, epidemics, directly affecting the production process, agricultural cultivation of people and causing heavy damage in agricultural production such as: hail, drought, flood, alum, salinity, etc.

Currently, agricultural production of our country in general and An Giang province in particular still depends on natural conditions, climate and weather. When the temperature of the weather and climate increase, it will greatly affect agricultural production, especially cultivation. The extreme changes of the climate change abnormally such as increasingly

complicated droughts and thunderstorms, floods in the rainy season, lack of water for production and daily life in the dry season, and salinity penetrates deep into the land, the risk of forest fire... has frequently appeared in recent years, affecting the quality of agricultural production such as affecting growth, crop yield, planting season, increasing the risk spreading pests and diseases to crops, affecting reproduction, growth, productivity, quality, and products of livestock and poultry, increasing the possibility of pathogenicity and transmission of livestock and poultry, causing danger shrinkage of agricultural land.

The general situation of the Mekong Delta provinces is that they are directly and increasingly severely affected by climate change, especially in the heavily affected agricultural economy. The salinization also significantly affects the growth and development of rice plants such as: reduced germination of rice, reduced height and tillering ability, poor root system development, reduced biological nitrogen fixation and nitrogen mineralization in the soil. On average, rice yield can be reduced by 20-25%, even up to 50%. Typically, in 2013, a survey in An Phu is the upstream district and Chau Thanh is the downstream district of An Giang province, showing that the amount of flood water is low, this is one of the factors that reduce aquatic resources, especially the landless poor farmers (Nguyen Van Thieu, Nguyen Thi Ngoc Dung, 2014). Reducing fish and shrimp production, low rice yield because low and late floods will cause delayed crops, lack of water sources for salt washing, leading to acid and saline soils. Climate change impacts on water resources, as changing rainfall patterns can cause severe flooding in the rainy season and drought in the dry season, making it difficult for water supply and water use.

In 2015, in An Giang, and other provinces in the Mekong Delta, the water level in the headwaters of the Mekong River and the inland area of the Long Xuyen Quadrangle was influenced by tides, the highest tide peak appeared in the last days of January, lower than the same period in 2015 from 0.10-0.20m; from the beginning of February to the end of March 2016, the highest tidal peaks were at 0.15-0.25m higher than the same period in the same period (Department of Minerals and Water Resources, 2016).

The lowest ebb tide level in January 2016 at the upstream stations of the Mekong River and downstream areas at Cho Moi, Long Xuyen was 0.10 - 0.20m lower than the same period in 2015, the interior area of the Mekong Delta is at a level of 0.10 - 0.20m lower than that of the same period in 2015. Long Xuyen quadrangle is lower from 0.05-0.10m; from February and March 2016 were all higher than the same period in 2015 from 0.10-0.30m (Department of Minerals and Water Resources, 2016).

In the dry season of 2015-2016, the salinity intrusion was earlier and deeper. Actual data measured in February and the end of March 2016 showed that the salinity in the estuaries of Kien Giang province had entered the province. An Giang in the two districts of Thoai Son and Tri Ton is from 20-30 km, some places are over 30 km with the highest salinity in Phu Lam on the H7-Chu U channel at 1.9g/l (March 23), from March 29 salinity at stations gradually decreases (Department of Minerals and Water Resources, 2016). The weather and hydrological situation in An Giang province during the dry season of 2016 had

complicated changes, with hot weather, drought and saltwater intrusion, especially in April and May 2016. This has had a significant impact on the agricultural cultivation of the people.

In 2017, the province's agricultural production still faced difficulties and challenges: saline intrusion, drought, prolonged rainstorms accompanied by thunderstorms, affecting crop yields in Winter-Spring and Autumn-Summer crops. The floods are big and come earlier than usual, so the production area of Autumn-Winter is much reduced.

In 2018, climate change also affected the early return of floods, also caused heavy damage to agriculture in An Giang province, the loss of nearly 500 hectares of rice outside the dike area in two communes Phu Hoi and Nhon Hoi, district An Phu.

In 2018, in Bac Dai hamlet and the area from Rach Xeo Tre to the border of Phu Hoi commune (An Phu district), due to prolonged storms, flood water rose rapidly, flooding the Summer-Autumn rice crop. The total area inundated by flood water, which cannot be harvested and completely lost is 31.5 ha. In which, the damage of 50% is 15ha; 100% damage is 16.5ha (Thanh Lam, 2018).

In the year 2019 - 2020, in An Giang province, the water level in rivers and canals was low due to the lack of rain in the dry season. Along with that, drought and saltwater intrusion in the dry season of 2019 - 2020 occurred earlier, deeper and more intense than the average of many years. The drought situation also greatly affects the lives and production of people, lack of water for production and daily life in the dry season, in border and mountainous districts. Climate change also affects the growth, development, planting season, the ability to increase crops, lack of water for crops, increase diseases and pests, reduce productivity and output of the crops. In addition, climate change is likely to increase the frequency, intensity, variability and extremes of dangerous weather phenomena such as storms, floods, and droughts, reducing crop yields. and livestock, increasing risks to agricultural production.

3.3. Policy of An Giang province on agricultural development and climate change adaptation

In the face of increasingly harsh climate changes, An Giang province implemented the Party's Resolution, the Resolution of the An Giang Provincial Party Congress for the 2015-2020 term defining: Agriculture is a key economic sector, constructing An Giang became the agricultural center of the Mekong Delta. Accordingly, the An Giang Provincial Party Committee focused on leading and mobilizing many resources for agricultural development in depth, constantly increasing the productivity, quality, efficiency and competitiveness of agricultural products, improving the living standard of the material and spiritual life of farmers,... making the province's agricultural economy the spearhead economy of the province as oriented.

One of the solutions prioritized by the An Giang Provincial Party Committee is to build and consolidate irrigation works, ensure water for production and daily life, in association with the implementation of measures to reduce damage caused by natural disasters, disease.

In 2016, facing new pressures in the context of climate change, food security and international integration, An Giang province's goal is to develop agriculture and rural areas comprehensively and sustainably.

In 2017, An Giang surveyed and identified 28 points of canals, and rivers at risk of landslide, with a length of 2.7km, and at the same time examined areas of saline intrusion and drought.

In 2018, the People's Committee of An Giang province issued Decision No. 44/2018/QD-UBND, regulating the management, exploitation and protection of irrigation works in the province. It is strictly forbidden to act as: Drilling, excavating soil and rock, illegally building within the protected area of irrigation works; illegally encroaching on and using land within the protection area of irrigation works; activities that obstruct the management and repair of works.

The Department of Natural Resources and Environment shall assume the prime responsibility for, and coordinate with the Department of Agriculture and Rural Development in, advising the Provincial People's Committee to guide the formulation of mining plans; granting permits for exploitation and use of water resources and discharge of wastewater into water sources according to regulations; carry out the appraisal and submit to the Provincial People's Committee for approval the plan on calculating charges for granting the right to exploit and use water resources to relevant individuals and organizations.

The province specifically prohibits acts of polluting the water source of irrigation works such as: discharging toxic waste, garbage, dead animal carcasses, bottles, pesticides; wastewater from industrial production facilities or industrial parks, wastewater from production and aquaculture zones, domestic wastewater from residential areas and business zones into irrigation works. The actions encroach on the river surface, obstruct flood drainage, change the flow, leading to local erosion in front and behind the structure.

- To organize the implementation of programs, schemes and projects on climate change response and adaptation, the People's Committee of An Giang province has directed branches and levels to develop and promulgate 10 plans provincial action (including action plans of 08 sectors and fields: water resources, land resources, agriculture and food security, fisheries and biodiversity, geological hazards and natural disaster prevention, construction, transportation, environment; action plan to respond to provincial climate change, communication plan for the period 2011 - 2015).

- Building a model of a water reservoir in arid areas to supply daily-life water to mountainous residents in Tri Ton district; Adaptive water management to climate change in An Giang province; Climate Change Adaptation in the Mekong Delta; Redirecting of flow to limit landslides, protect urban areas in Long Xuyen city to adapt to climate change...

Every year, branches and levels in An Giang province have developed plans and organized training courses for managers of provincial Departments, 11 districts, towns and cities in the province and the residential community; Organize workshops on climate change impacts and adaptation; Approving projects sponsored by international organizations related to climate change, many propaganda classes have been organized on knowledge and solutions to develop climate change adaptation plans for officials and farmers.

An Giang province has actively dredged 146/159 irrigation works with a length of over 233km, reinforced 83km of dikes; repairing and upgrading 195 sluices, irrigation

works... Locally managing and exploiting irrigation works, building projects on exploitation of water reservoirs in Tri Ton and Tinh Bien districts.

From 2015 to 2018, the An Giang Provincial Party Committee led the implementation of 62 provincial projects and topics, 67 grassroots scientific models and solutions. Irrigation works aim to facilitate agricultural restructuring, land accumulation and response to climate change (Nguyen Duy Hien, 2018). The Provincial People's Committee has approved 8 detailed plans for hi-tech agricultural production areas for 08 product groups; The Department of Agriculture and Rural Development has supported the implementation of 40 high-tech agricultural production models towards an efficient and sustainable agriculture associated with adaptation to climate change.

An Giang Provincial Party Committee has transformed from development by area, productivity and output to value and efficiency increase per unit area. Localities take the initiative in structuring agricultural products with comparative advantage in the market, identifying four key products, including: Rice, fish, vegetables, and medicinal plants. In particular, An Giang focuses on developing various types of farm economy, expanding the land tenure, accumulating large fields, prioritizing the conversion of land use purposes as a farm economy according to the model, joint stock company, mobilize people to contribute capital with land, together in production and business. Localities also actively converted inefficient rice growing areas to crops, fruit trees, and livestock. Currently, the province has shifted 9,316ha to grow mangoes and vegetables, nearly 22,000ha (Nguyen Duy Hien, 2018).

An Giang focuses on rapidly developing small and medium-sized enterprises specializing in vegetable production to associate with consumption enterprises. At the same time, training farmers to manage vegetable quality, building safe vegetable material areas and verifying and certifying safe vegetable products. To cope with the situation of drought and saltwater intrusion affecting agricultural development, An Giang province has enlisted the implementation of investment projects on upland irrigation systems, such as electric pumping stations, water reservoirs to store water and water conduit for agricultural production and people's livelihood, such as: O Thum Reservoir, Soai So Lake, O Ta Soc Lake, 3/2 Pumping Station, Chau Lang Pumping Station, Le Tri Pumping Station. The province has also invested in flood storage projects in areas that do not produce Autumn-Winter crops to store water in the flood season for use in the dry season and contribute to ecological regulation. At the same time, dredging large canals connecting main rivers such as Tien and Hau rivers to increase water supply flow into the Long Xuyen Quadrangle inland area. To build systems of regulating sluices, sluices to prevent salinity, and dams to prevent salinity.

3.4. Achievements in agricultural development adapting to climate change in An Giang province

Over the past time, the province's agricultural sector has made many positive changes, promoting agricultural restructuring to adapt to climate change.

In order to develop sustainably in depth with quality, the province plans to specialize in vegetable and color production in the direction of a model of linking consumption and production in the direction of high technology. At the same time, consolidating and

improving the quality of cooperative organizations and cooperative groups; develop a cooperative economic model for each concentrated vegetable production material area.

Continue to change the structure of crops, switch to growing crops and fruit trees in order to increase income per unit area. Localities have also actively converted inefficient rice-growing areas to crops, fruit trees, and livestock with high economic value. To increase from 2,000 to 3,000 ha the area planted with some crops such as tall potatoes, tapioca, lotus, vegetable soybeans, baby corn, peppers, leafy vegetables, etc. (Report 69/BC-SNN&PTNT, 2018).

The province's current rice growing area is about 469,200 hectares, a decrease of nearly 20,000 hectares; the total area of fruit trees increased to 15,800 ha, especially the mango area over 9,300ha.

Rice: the total cultivated area is 634,254 ha (decreased by 7000 ha over the same period), the average yield of the whole year is: 6.24 tons/ha (+ 0.17 tons/ha compared to the average), the output is 3,957 million tons increased by 66,000 tons over the same period) (Report 69/BC- SNN&PTNT, 2018).

Crops: the total turnover is 60.2 thousand hectares (increasing by 2-3 thousand hectares over the same period), the average yield of the whole year is equivalent to the same period.

A number of localities in An Giang province have actively converted to efficient production models, shifting from inefficient rice land to growing crops and fruit trees with more than 3,000 hectares, bringing the total area of food crops to more than 5,200 ha, profit from 57 million to 234 million dong/ha. In places where rice is not effective, the province has deployed people to grow jaggery, increasing their income by more than 300,000 VND/month. In order to adapt agricultural development to climate change, An Giang province has built a "High-tech Seed Center" to provide good seeds and ensure quality for production requirements in the province and Mekong Delta provinces. investment of 10 million euros. (Nguyen Duy Hien, 2018).

In 2017, An Giang province had 45 enterprises signed to link production and consumption chains with farmers through the model of 19 cooperatives and 32 cooperative groups, accumulating nearly 20,600 hectares of production land according to the big field model; built 24 effective production models such as shrimp farming on rice land in Thoai Son, profit of 100 million VND/ha, 5 times higher than rice cultivation; VietGAP vegetable growing model, organic vegetable has nearly 20ha in Long Xuyen city; growing straw mushrooms; commercial catfish farming with an area of 336ha.

An Giang province has up to 84.4% of agricultural production land, so focusing on building and consolidating irrigation works, ensuring water for production and daily life, is associated with implementing measures to reduce damage caused by natural disasters and epidemics: it is an extremely urgent problem. In 2017, the province surveyed and identified 28 canals and rivers at risk of landslides, with a length of 2.7km, and at the same time reviewed saline and dry intrusion areas... On that basis, An Giang province implemented 532/537 irrigation works. Implemented 62 projects, provincial topics, 67 grassroots scientific models and solutions. The works are aimed at facilitating agricultural restructuring, land accumulation and local response to climate change.

4. Discussion and Conclusion

Some recommendations in agricultural economic development to adapt to climate change

The province has achieved in agricultural development adapting to climate change, to improve the results An Giang province needs:

Firstly, it is necessary to identify the main solutions to respond to climate change: in which, continue to update, select and complete solutions to respond to climate change for the agricultural sector, the functional agencies need to identify and promptly announce climate change to people about water level rise, construction elevation, flood risk area, water shortage risk area... publicize it widely so that people can proactively respond and prevent.

- *Second*, reasonably and sustainably maintain land fund for agriculture in regions and localities to ensure food security in the context of climate change.

- *Third*, build more new growth models, adapt to climate change conditions, towards the development of agricultural economy. Change the use of suitable water, fertilizer and animal feed sources.

- *Fourth*, promote the development of green agricultural production. Developing and applying biotechnology, applying advanced production processes towards a modern, adaptive and flexible agriculture in increasingly harsh climate conditions.

- *Fifth*, apply new production model, apply modern technology, link regions. At the same time, solving capital problems, selecting new varieties, planning infrastructure, irrigation, and small-scale production in agricultural development.

- *Sixthly*, areas with frequent droughts, salinization, flooding and degraded land for inefficient rice production need to reduce the area of rice cultivation to switch to aquaculture and other suitable crops with higher economic profits. Building and perfecting the system of control and prevention of plant and animal diseases in the context of climate change.

Conclusion

Climate change impacts all fields, from natural to socio-economic on a global scale, both urgent and long-term. Therefore, in order to adapt to climate change in agricultural economic development, An Giang province has made constant efforts to achieve the goals set out in the province's agricultural economic development.

An Giang maximizes its potentials and advantages, effectively exploiting resources for agricultural development. Actively prevent natural disasters, protect the environment and adapt to climate change. Ensure regulation and creation of water sources for irrigation, drainage, combined irrigation and water supply pumps; flood drainage, flood prevention, storm surge prevention, saltwater prevention, salt suppression, salt washing, alum washing, and fresh water preservation; protect dikes against floods in sub-regions serving production and other irrigation according to the products that have been bid, ordered or delivered according to the plan. The province's agriculture is constantly improving productivity, quality, efficiency, competitiveness, changing the development mindset based on area, productivity, output to thinking about value and economic efficiency achieved in the land unit. From unceasing efforts in developing agricultural economy with adapting to climate change, An Giang province has achieved certain successes, being the leading province in the transformation of crops and livestock, as well as such as research on rice varieties adapted to fields contaminated with alum, salinity have been successfully tested and are being

moderated to expand the area of rice cultivation to adapt to climate change. However, at present, climate change is increasing and has direct impacts on the economy, environment and society. Therefore, the development of agricultural economy to adapt to climate change is an important and urgent factor in the economic and social development of An Giang province in particular and the country in general.

Abstract

The research has clarified the concept of green economy, sustainable development, and the relationship between the two concepts and analyzed the current situation of socio-economic development in Vietnam in recent years based on the criteria of development lasting. From there, study the inevitability, advantages, and challenges of Vietnam's transition to a green economy based on the Party and State's assessment of the green economy and sustainable development. On that basis, propose solutions and tools for green economic development in the process of planning, formulation, and implementation to achieve sustainable development goals in Vietnam

Keywords: *Green economy, sustainable development, green growth*

1. Introduction

In recent years, Vietnam's economy has achieved important achievements, but development is not sustainable. Economic development in Vietnam still relies heavily on the exploitation of natural resources, low labor productivity, production technology, and consumption patterns that use a lot of energy, raw materials, and waste. Many natural resources are exhausted and used wastefully and inefficiently. The natural environment in many places is seriously damaged, polluted, and degraded to an alarming level

Therefore, approaching and building a green economy is an urgent requirement and realizes the path of sustainable development and hunger eradication, and poverty reduction. Recognizing the significance of this opportunity, to develop the country and integrate with the world, the Government has issued important strategic documents: Decision No. 2139/QD-TTG, dated December 5, 2011, approving the National Strategy on Climate Change; Decision No. 432/QD-TTG, dated April 12, 2012, approving the Vietnam Sustainable Development Strategy for the period 2011-2020; Decision No. 1393/QD-TTG, dated September 25, 2012, approving the National Strategy on Green

Growth for the period 2011-2020 and a vision to 2050; Decision No. 339/QĐ-TTĐ, dated February 19, 2013, on approval of the Master Plan on economic restructuring associated with transforming the growth model towards improving quality, efficiency and competitiveness in the period of 2013 -2020

The content of these documents has covered most of the contents, meanings, goals, views, principles, solutions, and ways of implementing green growth, which is the legal basis for promoting green growth in Vietnam. Green growth in Vietnam is an important content of sustainable development, ensuring fast, effective, and sustainable economic development and making an important contribution to the implementation of the National Strategy on Climate Change. Green growth is a method to promote the process of changing growth models, restructuring the economy, maximizing competitive advantages, increase economic efficiency and competitiveness through research and development. applying advanced technology, developing a modern infrastructure system, to effectively use natural resources, respond to climate change, contribute to hunger eradication and poverty reduction, and create a driving force for economic growth and sustainable economy

Stemming from the above statement, to contribute to the study of the green economy, to properly assess the position, conception, and characteristics of the green economy in the sustainable development of the country, thereby proposing some solutions for green development, meeting the renewal and development of the country

2. Method

To serve this article, the author uses the Marxist philosophical methodology, while also using the method of analyzing documents, observation methods, and logistic-logistic methods

3. Results

3.1. Concept of green economy, sustainable development, and relationship

3.1.1. Concept of green economy

The term "green economy" was officially used at the United Nations Summit on Sustainable Development (June 2012) in Rio de Janeiro, Brazil (Rio +20). Previously, the adjective "green" was used quite a lot, associated with many development activities towards sustainable development, such as green production, green consumption, green lifestyle, green products... with the function. The main meaning is "environmentally friendly"

There are different definitions of green economy, of which the definition of the United Nations Environment Program (UNEP, 2011) in the book *Towards a Green Economy - Roadmap for Sustainable Development and Poverty Alleviation* Most cited by scholars in Vietnam: "A green economy enhances people's lives and improves social equity, while significantly reducing environmental risks and deficiencies. ecological deficit. Simply put, a green economy with low emissions, efficient use of resources, and social equity." (UNDP, 2011, p.13)

According to the Organization for Economic Cooperation and Development (OECD), "Green growth is a way to achieve economic growth and development goals while conserving the environment and preventing the loss of biodiversity." learning and

minimizing the unsustainable use of natural resources, green growth is about promoting economic growth and development while ensuring that natural resources continue to provide environmental resources and services essential to our lives. To do this, green growth must be the catalyst for investment and innovation, the basis for sustainable growth, and the creation of new economic opportunities”

The draft Green Growth Strategy for the period 2011-2020 and a vision to 2050 of the Ministry of Planning and Investment stated that "Green growth in Vietnam is a way to promote the process of economic restructuring, towards the efficient use of natural resources, reduction of greenhouse gas emissions through research and application of modern technologies, development of infrastructure systems to improve the efficiency of the economy, response to climate change, contribute to poverty reduction, and create a driving force to promote economic growth sustainably". In Vietnam, the green growth strategy is considered a concrete step in the sustainable development strategy, the main content of sustainable development

Regardless of the approach, all views agree that the green economy consists of three pillars: economic development (economic growth issues, employment); environmental sustainability (reducing carbon energy and natural resource depletion...); social cohesion (ensure the goal of poverty reduction, equality before the opportunities created by the green economy, and a healthy living environment)

3.1.2. Sustainable development

The United Nations agreed on the concept of sustainable development as development that meets the needs of the present, without compromising the ability of future generations to meet the needs future generations: “A development that meets the needs of the present. satisfy the needs of the present generation without compromising the ability of future generations to meet their own needs” (UNDP, 2011, p.107). It is a development that always maintains a balanced and harmonious combination of all three pillars of development in terms of economy, society, and ecology/resources and environment.

In Vietnam, in the documents of the IXth and 10th Party Congresses, and especially in the documents of the 11th Party Congress, the concept of sustainable development is clarified. To direct the implementation of the Socio-Economic Development Strategy 2011-2020, our Party has proposed five development perspectives, of which the first one is: "Fast development is associated with sustainable development, Sustainable development is a requirement throughout the Strategy”

In 2016, summarizing 30 years of Doi Moi in our country, the 12th Congress of the Party had a new development in awareness with the affirmation: "Ensure rapid and sustainable development based on macroeconomic sustainability and continuously improve productivity, quality, efficiency, and competitiveness Harmonious development of breadth and depth, focusing on in-depth development; develop a knowledge economy, green economy. The economy is closely linked with cultural and social development, environmental protection, proactively responding to climate change, ensuring national defense and security, and maintaining peace and stability for national construction."

(Communist Party of Vietnam, 2016, p.270), "Rapid and sustainable development (towards the United Nations' 2030 Sustainable Development Goals); Harmonizing economic growth with cultural development, realizing progress and social justice, environmental protection"(Communist Party of Vietnam, 2016, p.87)

3.1.3. The relationship between green economy and sustainable development

Sustainable development and a green economy are closely related and closely related to climate change response. With the connotation of the concept of green economy, it can be seen that the green economy not only includes economic goals but also extends to include social, environmental, and ecological goals

Therefore, there are comments that, in essence, the green economy is sustainable development or a new way to implement sustainable development in the context of climate change. The great and increasing impact of climate change has made more prominent the requirements for growth, economic and social development, but must ensure the provision of resources for growth, development, and maintenance of the living environment of human

The green approach or greening national development decisions is a prominent feature when talking about green growth, and the green economy. However, green growth and green economy do not replace the concept of sustainable development but are a tool to implement sustainable development in the context of climate change, in which more emphasis is placed on environmental resources

Talking about natural resources in the green economy, natural resources are considered a decisive factor for economic growth, improving value chains, and bringing stability and long-term prosperity. But when talking about the green economy, instead of emphasizing the harmonious combination of the three pillars of sustainable development, namely economy, society, and environment, the economical and intelligent use of natural resources, human-centered, and practical application. Climate change response is central and decisive for development decisions. Thus, the green economy does not replace sustainable development but is a way to express sustainable development, in which more emphasis is placed on the protection of natural resources and in connection with the response to climate change

The theory of the green economy is also based on the theory of sustainable development. The basic difference is that in the green economy to protect natural resources, climate change response is identified in the central position while the theory of sustainable development determines the harmony between environmental protection and economic growth and social progress, 3 pillars create sustainable development

Thus, there is a close relationship between a green economy and sustainable development. The concept of a green economy was born later, associated with climate change. The green economy is a way to implement sustainable development in the context of degraded natural resources and climate change. A green economy not only includes economic goals but more importantly, also extends to social and ecological goals. The green economy is also sustainable development, more specifically, it is a way to express sustainable development in the context of climate change, with much emphasis on

environmental resources. In the green economy, environmental resources are considered a decisive factor for economic growth, improving value chains, and bringing stability and long-term prosperity. Sustainability in environmental resources and response to climate change is considered the focus of the green economy. The concept of "green economy" does not replace the concept of "sustainable development", but it is increasingly recognized as a suitable model as the foundation for sustainable development. In other words, the green economy is an economic strategy to achieve sustainable development goals. Therefore, the approach to sustainable development is also the approach of the green economy with the content of maintaining the natural foundation for human activities and improving the quality of human life on earth.

3.2. Status of sustainable development in Vietnam

Vietnam is one of the countries that has made great efforts and has achieved many achievements in the process of sustainable development. Vietnam has promulgated a national program on sustainable development, established a National Council on Sustainable Development, and enhanced competitiveness.

Economically, maintain sustainable economic growth, gradually implement green growth, develop clean energy, and renewable energy; implement sustainable production and consumption; ensure food security, develop agriculture and rural areas sustainably; sustainable development of regions and localities. In 2020, according to the assessment of international organizations, the scale of Vietnam's economy is in the top 40 largest economies in the world and 4th in ASEAN. GDP per capita in 2020 will reach over 3,500 USD (calculated by purchasing power equivalent to about 10,000 USD). Despite being heavily affected by the Covid-19 pandemic, Vietnam is in the top 10 fastest growing countries in the world (One of the 16 most successful emerging economies in the world). Vietnam is an open economy with the world's high openness of about 200% of GDP (Phung The Dong, Nguyen Thanh Dong, Phan Thi Thu Trang, 2021)

Currently, in terms of foreign affairs, Vietnam has official relations with 189/193 countries; has economic, trade, and investment relations with over 224 countries and territories; Our country has signed 15 FTAs and has 16 strategic partners.

In recent years, Vietnam has been assessed as a country with a stable and favorable macroeconomic, political and social environment. National competitiveness in 2019 ranked 67/141, up 10 places compared to 2018.

Regarding society, focus on promoting poverty reduction sustainably; create decent jobs; The rate of poor households decreased by 2%/year on average, especially in poor districts, it decreased by over 4%/year. Making progress and social justice; well implement social security policies. On human development index and sustainable development: Vietnam's human development index (HDI) entered the group. countries with high human development and ranked 117th out of 189 countries (in the period 1990-2019, Vietnam's HDI value increased by nearly 46%). According to the Report on the Assessment of Progress on the Implementation of Sustainable Development Goals, Vietnam ranks 54th (2019), up 3

places compared to 2018 and the sustainability index ranks 2nd in Southeast Asia. Accomplish multiple Millennium Goals (Tran Nguyen Tuyen, 2021)

About resources and environment: Environmental issues have been given more attention. The protection of natural resources and the environment has come into order. With reasonable policies and drastic solutions, the issue of protecting the living environment, and combating pollution of water and air sources has been agreed upon by all localities, branches, and people of all strata. participation. More attention has been paid to afforestation and forest protection, so the situation of fires and deforestation has decreased

Besides encouraging results in sustainable economic development, Vietnam's economy still has limitations and weaknesses such as The economic growth rate has not reached the set target; economic restructuring associated with growth model innovation is still slow; science, technology, and innovation in several fields have not yet been promoted, the national science and technology level is still far from that of the leading group in the region; implementation of strategic breakthroughs in institutions, human resources and infrastructure are still slow; development gap, the income gap between regions tends to increase, slow to narrow.

3.3. Some solutions for green economic development - The path for sustainable development of Vietnam.

3.3.1. Opinion

Firstly, from an economic perspective, Vietnam's green economy is a way to promote sustainable economic development based on sustainable factors. This process must take place harmoniously and reasonably, suitable to the conditions and circumstances of Vietnam, that is, it must be gradually adjusted in the direction of saving and using resources more efficiently, protecting the environment. ; minimizing negative impacts on employment and employee income to avoid causing social conflicts. For the economy to become more environmentally friendly, it is necessary to reduce the reliance on unsustainable factors and gradually increase sustainable factors for the development

Secondly, from the perspective of environmental management, it is necessary to ensure a balance between the requirements of rapid economic growth with savings and more efficient use of natural resources and environmental protection. Focus on developing and innovating production technology towards environmentally friendly; formulating and implementing a roadmap to limit the use of fossil energy, develop clean energy, and renewable energy, and improve energy use efficiency; strengthen state management of natural resources, environmental protection, waste treatment, and response to climate change

Third, from a social perspective, this is the process of linking economic growth with ensuring progress and social justice. Vietnam is carrying out the process of ensuring economic growth in association with social progress and justice, perfecting the social security and social welfare system... At a higher level, it must be implemented. greening lifestyles and promoting sustainable consumption. Only then can the market be oriented (promoting green consumption) and thereby orienting production activities (green production)

3.3.2. *Some solutions*

To implement a green economic development policy in Vietnam in the context of global climate change, it is necessary to focus on the following key solutions:

Firstly, in view: Must harmoniously combine attracting resources (based on taking internal resources as basic, strategic, and long-term; external resources are important and breakthrough) and transformation. input structure in the direction of gradually reducing the contribution of physical capital, then labor, gradually increasing the role of the factor of aggregate productivity based on rapidly developing high-quality human resources, resulting in the application of scientific and technological advances. At the same time, the allocation of growth resources must follow the signals and principles of the market

Secondly, in terms of awareness, it is necessary to focus on propaganda and education to change the perception of society from the “brown economy” to the “green economy”. Creating a high consensus in society from leaders to people and businesses, thereby changing the concept and perception of a “green economy”. In the professional education system, innovative curricula and lectures toward the “green economy” approach

Third, develop mechanisms and policies to create favorable conditions for growth model innovation, focusing on restructuring industries, giving priority to developing high-tech, low-carbon industries; environmentally friendly technology; saving energy and resources, do not pollute the environment; restore resources and ecosystems. Accelerate the restructuring and equitization of state-owned enterprises in the fields of natural resources, energy, and heavy industry. Focusing on promoting the role of small and medium enterprises and the community in implementing green economic development policies. The active participation of the community will create a solid foundation for the realization of the green economy, therefore, it is necessary to focus on raising the community’s awareness of green economic development

Fourth, on the direction of investment: Focus on economic sectors that can promote Vietnam’s comparative advantages such as ecological agriculture; diversify and develop clean energy sources; develop high-quality recreational, ecological, and resort tourism... Pay attention to research and development of the cultural industry. Investing in the development of highly qualified human resources, building a knowledge economy; developing production technology towards environmentally friendly; focusing on solving environmental consequences directly related to social security (such as polluted water sources, coal dumping sites...); improving management and supervision capacity of state management agencies in the field of environment, increase investment in science and technology development; promote research and cooperation in research into fields of green economic development such as the use of renewable energy, production technology that saves resources and consumes less energy; reorient investment, towards an investment of about 2% of the total annual budget expenditure for ecosystem restoration and environmental protection...

Thus, in the context of global climate change, green economic development is the key to success, a breakthrough solution for Vietnam’s sustainable development, contributing

to the successful implementation of the goals. Objectives: rapid and sustainable growth, ensuring progress, and social justice, constantly improving the quality of life, attaching importance to environmental protection

4. Conclusion

It can be said that green growth is an important content to aim for in the process of renewing the growth model and restructuring the current Vietnamese economy. The development experience of many countries shows that the transition to a green economy creates great potential for sustainable development and poverty reduction. Transforming the growth model towards green growth is an affirmation of the implementation of Vietnam's socio-economic strategy. Transforming the development model of production methods to a green economy is a new approach, in line with the general development trend in the world system. The building of a green economic development model that is suitable to Vietnam's circumstances and development conditions still needs to be further studied.

Abstract

The study aims to summarize solutions to reduce the negative effects of saltwater intrusion on fruit farmers in Vinh Long province. The study conducted a survey of 250 fruit farmers in Vinh Long province affected by saltwater intrusion in 2020. The study used the method of interviewing farmers and relevant local authorities to assess the reality of the situation. saltwater intrusion in 2020 and investigate solutions that have been and are being implemented. Research results show that solutions to reduce the negative effects of saltwater intrusion are applied and highly appreciated by farmers, including water resource management, tree restoration, water storage, and from the local government. The method is the construction of irrigation works and timely information. Thereby, the topic has proposed solutions to improve the initiative of farmers as well as increase the coordination of local authorities in order to reduce the impact of saltwater intrusion on crop production.

Keywords: *saltwater intrusion, farmers, fruit, Vinh Long*

1. Introduction

Today, climate change is causing serious damage in economics and sustainable development of each country. Climate change is a change in the state of the climate relative to the average and/or a climate variability that persists for an extended period of time, often decades or longer (Ministry of Natural Resources and Environment, 2008). Vietnam is considered as one of countries most heavily affected by climate change. Under the impact of climate change, almost all farming activities of farmers are seriously affected. These are productivity and output losses or increased input costs for agricultural production. Many scientific reports and evidences have shown that Vietnam, especially the Mekong Delta region, is one of the "hot spots" for climate change and sea level rise in the world, causing many problems vulnerability to people's livelihoods (Dasgupta et al., 2009; IPCC, 2007).

As one of the typical factors of climate change, saltwater intrusion has been shrinking the agricultural land area. According to Barlow (2003), saltwater intrusion occurs when

saltwater mixes with fresh water. Saltwater intrusion is a serious problem for many local governments, which has been tried to solve in the context of climate change such as sea level rise, temperature rise, over-exploitation of groundwater to meet water demand for development, these causes are increasing the risk of saltwater intrusion (Darnault & Godinez, 2008). A significant portion of arable land in the Red River Delta and the Mekong Delta is saline because these two deltas are lowlands relative to sea level. Invasion reduces the area of arable land, from which the coefficient of land use can be reduced from 3-4 times/year to 1-1.5 times/year. Saltwater intrusion will be especially severe in the Mekong Delta, if the sea level rises by 1m, about 1.77 million hectares of land will become saline, accounting for 45% of the land area in the Mekong Delta and it is estimated that. In 2020, saltwater intrusion are reported to be one of the factors of climate change that have a great impact on the agricultural sector of Vinh Long province.

Although Vinh Long province has made great efforts in building dikes and forecasting stations, the development of saltwater intrusion has unexpectedly caused a lot of damage to the province's agricultural industry. In particular, saltwater intrusion have appeared in new localities that have not been affected by salt before, for example, mainly in Vung Liem, Mang Thit, Tra On and Long Ho district. According to a report of the Commanding Committee for Natural Disaster Prevention and Control and Search and Rescue of the Department of Agriculture of Vinh Long Province, the total damage caused by climate change in 2020 is VND 395,861.75 million with a total funding of 25,442.503 million dong.

It can be seen that the agricultural sector of Vinh Long province is facing many difficulties due to the increasingly complex situation of saltwater intrusion and has a significant impact on the province's sustainable development goals. However, there has been no in-depth research on agricultural income of farmers under the impact of mangrove forest in Vinh Long province. Besides, in order to promote the solutions applied by farmers to deal with saltwater intrusion, so far there has been no research on its effectiveness. While the solutions proposed and applied by farmers themselves are highly practical and have the potential to become lessons learned in production in the farming community (Thong et al., 2019). Therefore, the research team conducted a study to evaluate the effects of saline intrusion on fruit growing activities of farmers in Vinh Long province, analyze the effectiveness of solutions that have been applied by farmers and local government. Thereby, the topic proposes solutions for farmers and the State in dealing with the effects of saltwater intrusion.

2. Method

2.1. Data collection method

The research team directly interviewed 250 fruit farmers affected by saline intrusion in the districts of Vung Liem, Mang Thit, Long Ho and Tra On. In addition, the topic also interviewed experts who are specialized agricultural officers at district and commune level. In addition, the study also collects data from agricultural summary reports of Vinh Long province in general and of districts in particular.

2.2. Methods of data analysis

The primary data, after being collected, will be synthesized, coded, analyzed by descriptive statistics using Microsoft Excel tools and shown through graphs and average values, percentage to evaluate the solutions that farmers apply in reducing the negative effects of saltwater intrusion on agricultural production.

3. Results

3.1. Analysis of demographic characteristics of farmers

According to the survey results, the majority of farmers are male (accounting for 93.6%), the proportion of female farmers is very low. All surveyed farmers heads are Kinh people (100%), the majority of them have an education at secondary level, high school level (27.2%) and primary level (26.0%). The survey also showed that the average number of employees in a farmer was 4.29 members, of which the main number of employees was 2.76 members. The number of farmers participating in unions is quite high, with 152/250 farmers, accounting for 60.8%. In particular, the number of farmers participating in the Farmers' Union (108 farmers, 43.2%), the Women's Union (52 farmers, 20.8%).

Source: Data analysis results, 2021

Figure 1. Demographic characteristics of householders

3.2. Analysis of the effects of saltwater intrusion on agricultural production activities of farmers

3.2.1. Characteristics of agricultural production activities

The study surveyed 250 farmers growing durian and rambutan affected by saltwater intrusion, in which durian (126 farmers, rate 50.4%), and rambutan (124 farmers, rate 49.6%). The average farming area of producing farmers is 6,759.1 m², of which the average cultivated land area for durian is 8,790 m², for rambutan is 4,890 m². Production land is mainly owned by farmers, production farmers renting land to expand production are very few (7/250 surveyed farmers, rate 2.8%). This shows that, production farmers mainly rely on owned land, the expansion of production land area by renting more land is very little. The survey results also show that the source of investment capital for agricultural production of farmers is mainly from the available capital of production farmers (223/250 farmers, rate 87.4%), followed by loans from banks (10.1%) and from relatives and other sources.

3.2.2. Cost and efficiency of production

Through the survey results, for durian farming farmers, the cost of fertilizer is the highest, followed by the cost of land preparation, the cost of plant protection drugs, the cost of water intrusion prevention, and the cost of loan interest and some other costs. Farmers mainly use available family labor, so the cost of hiring labor to harvest is not available. However, due to the influence of rice invasion, it costs farmers an average of 2,672 million VND to buy seedlings to restore production and to replant the dead trees.

The cost of saltwater intrusion prevention includes the cost of buying a salinity meter, rubber latex for ponds, screens, anti-salinity drugs, labor in dredging canals (digging ponds, digging ditches), repairing sluices, besides. Some farmers have actively purchased salt water purifiers. The average cost of prevention and control of saltwater intrusion for durian trees is 3,631.62 million VND, for rambutan trees is 1,147.96 million VND. The cost of preventing saltwater intrusion of durian is higher than that of rambutan because durian farmers have experience in dealing with saltwater intrusion, so they have actively invested in implementing solutions to prevent mangroves.

For farmers cultivating rambutan, production costs also focus on buying fertilizers, seedlings and pesticides. The influence of mangrove forest has caused great damage to rambutan trees, so the producer has to spend quite a lot of money to buy replanted seedlings or other seedlings such as pomelos, oranges, and lemons to reproduce. The cost of buying seedlings is quite high, averaging more than 3,488 million VND. Farmers also spend quite a lot on prevention of the impact of mangroves and the cost of land reclamation due to salinity.

The production efficiency of farmers for durian and rambutan trees also has a big difference. Despite being severely affected by the mangrove forest, durian producing farmers still have income, with the average revenue/household/year of 249,828 thousand VND, the average production cost/household/year of 90,498.17 thousand VND. VND, average income/household/year is 159,329.84 thousand VND. In contrast, rambutan farming farmers are mostly severely affected, with average revenue/household/year of 16,200 thousand VND, while the average production cost/household/year is up to 17,814.41 thousand VND. VND, average income/household/year was negative 1,614.41 thousand VND.

Table 1. Average annual income of durian and rambutan producing farmers

Indicators	Durian trees	Rambutan trees
1. Revenue (thousand VND)	249,828	16,200
2. Cost (thousand VND)	90,498.17	17,814.41
Cost of land preparation	20,512.97	616.33
Cost of seedlings	2,672.22	3,488.78
Fertilizer cost	39,346.67	8,053.06
Drug costs	16,898.8	3,332.65
Labor cost	2051.28	575.51

Indicators	Durian trees	Rambutan trees
Harvest cost	0	6.12
Cost of land rent	2,564.10	0
Interest expenses	2,820.51	0
The cost of preventing and fighting against	3,631.62	1,147.96
Other costs	0	594
3. Income (thousand VND)	159,329.83	- 1,614.41

Source: Data analysis results, 2021

The production efficiency of farmers for durian and rambutan trees also has a big difference. Despite being severely affected by the mangrove forest, durian producing farmers still have income, with the average revenue/household/year of 249,828 thousand VND, and the average production cost/household/year of 90,498.17 thousand VND. VND, average income/household/year is 159,329.84 thousand VND. In contrast, rambutan farming farmers are most severely affected, with an average revenue/household/year of 16,200 thousand VND, while the average production cost/household/year is up to 17,814.41 thousand VND, average income/household/year was negative 1,614.41 thousand VND.

3.2.3. Impact of Saltwater intrusion on production activities

Saltwater intrusion in 2021 has a strong impact on the production of farmers. Specifically, according to the survey results, for durian growing farmers, the average number of dead trees per household is 36 trees, for rambutan growing farmers, 46 trees. Due to the large number of dead trees and the remaining trees affected by yield, there are 31/166 farmers growing durian (accounting for 24.6%) and 41/124 farmers growing rambutan (accounting for 33.06%). no income from farming. Besides, the research results also show that 47/126 (37.3%) and 84/124 (67.74%) farmers growing rambutan have no income in the year (negative income). This is a rather high rate, showing that mangrove forest seriously affects productivity and harvested output, causing great economic losses to producing farmers.

Table 2. Effects of saline intrusion on production and household income

Features	Durian tree	Rambutan tree
Average number of dead trees/household (trees) 36 46	36	46
No revenue (farmer)	31	41
Number of farmers with no income (farmer)	47	84

Source: Data analysis results, 2021.

3.2.4. Solutions to help farmers reduce the impact of saltwater intrusion on their income from cultivation

3.2.4.1. Solutions from local government

- Construction of irrigation works: culverts, dams, pumping stations, closed dikes, canals

As a result of the survey, all farmers surveyed highly appreciated this solution (247/250 respondents, accounting for 98.8%) evaluated from the level of efficiency for the construction of irrigation works: culverts, dams, pumping stations and 95.6% evaluated from

the level of efficiency for the closed canals. This solution has helped prevent salinity when the water is salty from the large river into the interior field.

- Timely information on hydrological data to farmers

According to the analysis results, this solution is highly appreciated by farmers, there are 121 opinions on the total sample of 250 have chosen the level of efficiency accounting for 48.4%, and the level of complete efficiency accounts for 49.2% with 123 opinions. Farmers receive messages from hydrologists and promptly do not irrigate when the salinity is high, affecting crops.

- Disaster support policies

Through the survey results, all farmers have highly appreciated this solution, with 188/250 opinions from the effectiveness level accounting for 75.2%, they have received support from the local government. All farmers damaged by saltwater intrusion, those farmers are supported with costs under the policy of the Government's Decree No. 02/2017/ND-CP. This solution helps farmers have the cost to buy new varieties, fertilizers, take care of the garden, restore and reproduce soon after saltwater intrusion, avoiding adverse effects in the following years.

- Organizing training courses

Through the interview results, 50% of the farmers rated this solution at the effective level and 36.8% rated it at the completely effective level. This solution has helped farmers improve their understanding of the current drought and saltwater intrusion situation in each area, as well as how to restore their orchards after saltwater intrusion.

3.2.4.2. *Solutions from farmers*

Level (1) Completely ineffective; (2) Ineffective; (3) Normal; (4) Effectiveness; (5) It's completely effective.

<i>Solutions from farmers</i>	Implementation rate	Efficiency level				
		(1)	(2)	(3)	(4)	(5)
Invest to dig ditches, build pond banks to store water for irrigation	87,6	0	2,4	11,2	35,2	47,6
Invest to buy plastic fabric sheet covering the ditch	61,2	5,6	6,0	29,6	36	19,2
Repairing drains, dams	100	0	1,6	8,0	52,8	44,8
Measure salinity before irrigation	100	0	0	4,8	31,6	62,4
Use more organic fertilizer for plants	84	0	12,0	13,2	37,6	26,8
Use lime for salty washing	62	2,0	16,0	28,4	30,0	11,2
Apply new planting methods	55,2	3,6	12,0	44,8	20,0	5,2
Invest to buy water storage tools, irrigation tools	55,6	12,0	9,6	18,4	35,2	12,0
Converting to other varieties or intercropping with other plants	54,8	10,0	6,0	22,8	24,4	24,4
Planting new salt-tolerant varieties	34,4	8,8	20,8	35,2	13,6	9,2

Source: *Data Analysis Results, 2021*

- Invest to dig ditches, build pond banks to store water for irrigation

According to the survey results, this solution is highly appreciated by respondents, 219/250 farmers have implemented this solution, accounting for 87.6%. Most of the farmers still choose to dig a pond to store water, although it is expensive, they will be able to control the water source and the pond can be used for several years.

- Invest to buy plastic fabric sheet covering the ditch

Through the analysis results, there are 153/250 farmers have implemented this solution. In particular, 138/250 respondents rated this solution from the level of effectiveness (accounting for 55.2%). Most of the farmers have implemented and achieved effective, the ground is covered with polyester film material that will help keep surface water from evaporating when hot weather will increase the salinity of the soil.

- Repairing drains, dams

According to the analysis results, all farmers have implemented this solution, of which 244 farmers rated this solution as very effective at levels 4 and 5.

Farmers have implemented this solution to ensure the closure and prevent salt water from entering the orchards.

- Measure salinity before irrigation

This solution has been implemented by the majority of farmers 212/250, of which, 155 out of 250 respondents rated from the level of effectiveness, accounting for 62.4%. Farmers measure salinity before each irrigation and non-irrigation with salinity higher than 1‰; for some fruit trees sensitive to salinity such as durian, rambutan, ... They do not irrigate with a salinity of more than 0.5‰ to avoid damage.

- Use more organic fertilizer for plants and use lime for salty washing

Through the analysis results, the majority of farmers are still implementing the solution with 210/250 farmers and highly appreciate this solution, with 161 options evaluated from the level of efficiency, accounting for 64.4%. Farmers have completely applied organic fertilizer to the plants during the time when the soil is saltwater intrusion and increased organic fertilizer application also increases the soil's resistance capacity and restores the garden after saltwater intrusion.

- Converting to other varieties or intercropping with other plants

According to the survey results, more than 50% of respondents implemented this solution, 122 out of 250 farmers rated this solution at the level of effectiveness (accounting for 48.8%). They renovated the soil and switched to intercropping with other crops or switched completely to planting other salt-tolerant crops such as: longan, oranges, grapefruit, jackfruit and coconut for short-term farming, ensuring revenue sources or less damage to saltwater intrusion.

- Apply new planting methods

As a result of the survey, 138 out of 250 farmers implemented this solution, of which 25.2% of respondents rated this solution from the level of effective. Because the

effectiveness of this solution will not be high if not combined with other solutions. Farmers implement higher planting or mulching in combination with organic fertilizers, in order to reduce the salinity in the soil and help the roots climb up to be less salinity.

- Invest to buy water storage tools, irrigation tools

According to the survey results, 55.6% of farmers have implemented and highly appreciate this solution. They have been implementing it effectively, accounting for 47.2%. A water-saving irrigation system will help save water because conventional irrigation uses a lot of water. In addition, it also helps to reduce labor and limit the amount of chemical fertilizers, prevent erosion, it helps to protect the ecological environment while keeping moisture and nutrients in the soil, helping plants grow well.

3.2.5. Solutions to reduce negative effects of saltwater intrusion on farmers

From the research results, in order to increase the income of farming farmers in the conditions of saline intrusion in Vinh Long province, the research team offers specific solutions as follows:

*3.2.5.1. Solutions from farmers to **prevent** saltwater intrusion*

Most of the farmers in saline intrusion areas are aware of the response to saline intrusion. However, it is necessary to promote the initiative in responding to saltwater intrusion further. The thesis proposes some solutions as follows:

First, manage and protect water resources. First, it is necessary to strengthen the manhole covers to prevent leakage, replace the manhole covers with trees because of high water leakage, replace with iron materials, and reinforce rubber pads. Next, farmers use tools such as rubber latex and ditch screens to store water to prevent salinity.

Second, proactively equip themselves with equipment to prevent saltwater intrusion. Farmers monitor their own salinity by equipping themselves with a salinity meter to check the salinity in water storage and when to water the plants. In addition, farmers memorize and update knowledge that salinity affects the type of crop they are cultivating.

Third, actively build a sprinkler irrigation system to save water. On average, each household cultivates about 0.6-0.7 hectares, so it is necessary to consider boldly investing in this system.

Fourth, farmers need to change their farming practices, focus on cultivating the soil, and attach importance to the role of organic fertilizers in agricultural production.

Fifth, farmers actively change the method of planting trees. This change is related to (1) varieties, (2) intercropping. This measure helps farmers to live with saline intrusion through soil improvement, use of suitable and resistant varieties and/or application of intercropping with other crops or completely switching to tolerant crops. Other salinity contributes to income enhancement and soil improvement.

Sixth, farmers actively diversify their incomes: for areas specialized in durian cultivation, in order to diversify their incomes and grow them for a long time, farmers can intercrop green-skinned pomelo in durian orchards for a short period of time. early period. For rambutan growing areas, intercropping with other fruit trees with high salt tolerance, suitable for each region's soil such as mango, longan, and plum to ensure income.

3.2.5.2. Solutions from the local government in preventing and combating saltwater intrusion

(1) Local authorities need to update the plans in organizing the implementation of the national target program to respond to saltwater intrusion in consultation with many stakeholders including experts, farmers, etc. farmers and associations so that the plans are fully implemented.

(2) Protect specialized farming areas affected by saline intrusion, especially areas with high economic efficiency (such as durian).

(3) Replicating the model of VietGap production groups, especially in specialized durian growing areas such as Mang Thit district to improve product quality and increase product value.

(4) Strengthening policies to support saltwater intrusion prevention and control through the support of loans from social policy banks to equip equipment for saltwater intrusion prevention and control.

(5) Invest in construction and improve the quality of irrigation works and non-constructions.

(6) Improve the quality of training courses, create prestige for farmers from training courses, invite experts, explain in detail according to the needs of farmers.

(7) Organize the updating and informing of information to farmers about salinity in rivers and canals as quickly as possible so that people can have a plan and timely treatment until the end of the saltwater intrusion cycle.

(8) Invest in research centers and breed more plant varieties adapted to saltwater intrusion conditions.

4. Discussion and Conclusion

The study was conducted to understand the current situation of saltwater intrusion in Vinh Long province in 2020. Thereby, the study investigated the level of application and assessment of farmers about the solutions currently applied by the State and the farmers themselves. Research results show that, to cope with the negative impacts of saltwater intrusion, the State and farmers have many different solutions to overcome. The solution groups applied and appreciated by many farmers are water resource management, tree restoration, and water storage. However, technical solutions such as changing new plant varieties, new planting methods, and applying technical methods in economical irrigation have not been implemented much. For the State's solution groups, farmers appreciate the construction and information solutions group, followed by the technical and financial support policies, and finally the transfer solutions. economical irrigation technology, plant variety conversion planning, provision of water storage tools.

Through the process of analyzing and synthesizing research results, the topic proposes some solutions to limit the impact of saltwater intrusion on the income of farmers. Firstly, farmers need to improve their initiative in preventing saltwater intrusion. Second, local authorities need to improve the effectiveness of coordination in the prevention and control of saltwater intrusion.

BAC YEN TOURISM - POTENTIAL, CURRENT SITUATION AND DEVELOPMENT ORIENTATION

MA. Tong Thi Quynh Huong

tqhuong87@utb.edu.vn

Dr. Pham Anh Tuan

phamtuan@utb.edu.vn

Faculty of Social Sciences, Tay Bac University, Son La, Vietnam

Abstract

Bac Yen is a highland district of Son La province, this land is the residence of many ethnic minorities with diverse traditional cultures. The district has rich natural and humanistic tourism resources, many tourist attractions have been exploited early, attracting many tourists and bringing about high economic efficiency. However, the achievements of Bac Yen's tourism industry are still quite modest, not clearly showing the role of the industry in the economy. On the other hand, tourism development is sometimes not sustainable, there are many challenges to face. In this article, the authors briefly assess the potentials for tourism development in Bac Yen, clarify the achievements as well as some limitations, and give appropriate tourism development orientations of the district more reasonable.

Keywords: *Bac Yen, routes - tourist attractions, tourism, travel resources.*

1. Introduction

Bac Yen is a highland district located in the southeast of Son La province. The district has a convenient location when it is 100 km from the center of Son La city to the northeast, about 200 km from Hanoi city to the southeast. With rich tourism resources including natural and human resources, in recent years, Bac Yen has been known as an attractive tourist destination for domestic and foreign tourists.

Bac Yen is famous for many beautiful natural landscapes, both wild, poetic and majestic of the Northwest mountains; at the same time, this is also a land with a long history with rich and diverse cultural traditions, imbued with the identity of 7 ethnic groups living together (Thai, Muong, Mong, Dao, Kinh, Tay, Kho Mu). Those are great potentials for Bac Yen to develop a variety of tourism types, from community, ecological and cultural tourism to discovery and adventure tourism...

In fact, the number of tourists coming to Bac Yen is increasing day by day, Bac Yen tourism industry has gradually positioned itself as a destination brand, which brings great revenue and opportunities to promote and introduce nature, culture and people of Bac Yen with all parts of the country and the world.

However, compared with the potential of available tourism resources, the achievements of Bac Yen tourism are only the first step, still very small and not commensurate with the potential of the district. On the other hand, many challenges have

also arisen such as landscape disruption, environmental pollution, loss of national cultural identity... Therefore, within the framework of this paper, the authors focus on assessing the potentials. potential for tourism development in Bac Yen, clarifying the tourism development picture of the district, thereby orienting products and tourism development space more rationally, effectively and sustainably.

2. Method

The author uses professional methods to research theoretical and practical bases for tourism development, applied in research in Bac Yen district; use methods of collecting, analyzing and synthesizing documents and data; field methods, experts; Sociological investigation method aims to assess the potential, clarify the current situation of tourism development in Bac Yen, on that basis, orient the product and space for tourism development more effectively.

3. Results

3.1. Potential for tourism development in Bac Yen district

3.1.1. Natural tourism potential

Bac Yen has high terrain with very complex characteristics, strongly fragmented, steep, many high mountains, deep crevices, small flat land area. The terrain is both diverse and majestic, with high mountain ranges (Phu Sa Phin, Hang Chu, Hang Dong, Pu Han Pao, Pu Ngan,...) interspersed with river valleys and streams, with many caves, suitable for visiting sightseeing, sightseeing, is a favorable condition for the development of tourism, sports, mountain climbing, exploration, waterfall...

Bac Yen's climate is generally favorable for the development of a variety of crops and livestock such as: industrial crops, fruit trees, cattle raising and forestry production, on the other hand, due to the very cool climate. suitable for developing eco-tourism and resort tourism. From October of last year to April of next year, there are often clouds on the high mountains, forming an ideal place for tourists to hunt for clouds.

Bac Yen is located in the Da River basin, with a rather thick system of rivers and streams. The water surface area of Hoa Binh hydropower reservoir is large, has been bringing great benefits to the people thanks to fishing, is a potential for developing sightseeing tourism for yachts, vacationers and tourists. ecological calendar. Besides, the climate and water characteristics in 3 communes Xim Vang, Ta Xua and Hang Chu can raise salmon.

The land characteristics of the district are very suitable for special crops with high economic efficiency such as peaches, apples, Ta Xua tea, flowers such as orchids, mustard flowers, buckwheat flowers, ect

On the basis of exploiting the advantages of natural conditions, Bac Yen district currently has two tourist attractions that are attracting a large number of tourists to visit and experience: Ta Xua Cloud Paradise and Dinosaur Back. in Hang Dong commune. In addition, in the district, there are many natural tourist attractions that are highly attractive to tourists such as Hua Nhan lotus pond, Ta Xua Hills, Dolphin's Peak, Basin waterfall, and hot springs in Lao Lay and Phieng Ban villages.

Ta Xua cloud paradise in Ta Xua commune has long been described by tourists as the "heaven on earth" of the North. This is one of the beautiful and attractive cloud hunting spots in Bac Yen in particular and the Northwest in general. The best time to hunt for clouds is in the mornings from October last year to April next year, at this time Ta Xua is like a magical cloud paradise - where the Mong people walk on the clouds every day, living with clouds, wind and mountains.

Dinosaur spine belongs to Anti Tra village, Hang Dong commune. There is a mountain range stretching out into the valley thousands of meters deep called "dinosaur spine". Conquer the spines of dinosaurs to discover the beauty of mother nature, such as clouds, waterfalls, and even terraced fields with typical Hmong techniques and methods of cultivation on rocky slopes.

Hua Nhan lotus pond is located in Hua Nhan commune, located on the top of a high mountain with a fresh and cool climate. Lotus lagoon is a valley stretching along the mountainside, lotus blooms at sunrise, flowers stretch on leaves creating a gentle and pure beauty.

It can be seen: Bac Yen has many natural advantages for tourism development, many beautiful natural landscapes have been exploited and brought about high economic efficiency.

3.1.2. Humanistic tourism potential

Bac Yen is the residence of 7 ethnic groups, this land has a long history and rich revolutionary tradition. The humanistic tourism potential of Bac Yen ethnic groups is very diverse and rich, many spots have been put into operation and attract a large number of tourists.

Typical archaeological, historical-revolutionary relics in the district include: Khe Ho ancient stone beach in Hang Chu commune and A Phu couple's cave in Hong Ngai commune.

Khe Ho ancient stone carving beach is located in the middle of a valley about 50 hectares wide in Hang Chu village. At this rocky beach, there are 9 carved granite blocks, divided into 6 clusters located 50-200m apart. On the faces of these blocks, there are many engravings with unique shapes with different themes, reflecting the aesthetic thinking and feelings of people in contemporary social activities. Khe Ho ancient stone beach is not only a unique work of art but also contains many values of culture, history, beliefs and scientific research values.

The historical site of A Phu couple's cave, also known as Tham Cop cave, is located in Hong Ngai commune. The cave is located in the U Bo mountain range, with a length of nearly 200m, the cave's widest place is up to 40m. Surrounding is the primeval forest, in front is the people's cultivation. According to local history, Tham Cop cave is located in the 99 resistances base area. During the resistance war against the French, this place was chosen by the Military Intelligence Company of the General Staff to station and store weapons to find a way to overcome. Da river prepared for the Northwest campaign in 1952. It can be said that the 99 resistances base area is a relic of special historical significance, marking an important stage in the revolutionary struggle of the people of the provinces. ethnic minorities in Bac Yen district in particular and Son La province in general under the leadership of the Son La Provincial Party Committee.

About 20m south of A Phu cave, there is a water cave. The entrance to the cave is about 5m deep underground. The cave is about 300m long. The cave is dark, with a width of about 7m, from the floor to the ceiling, the average height is about 10-12m, in some places it is only 4-5m high. The cave floor is a stream flowing along the cave. From the entrance of A Phu Cave, tourists can freely admire the beauty of the Northwest mountains, watch the peaceful and poetic Da River and experience the life of the Thai, Muong and Dao ethnic groups with extremely cultural features. Uniquely along the Da River.

Along with historical values, Tham Cop cave has entered literature with another name: "A Phu couple's" cave, a name associated with the famous literary work "A Phu couple" by writer To Hoai. In recent years, the number of tourists coming to contact and visit the cave has increased more and more through the commune, which shows that the "A Phu couple" cave is becoming a "unique" highlight of Bac Yen tourism.

Folk festivals: It can be said that the festival system of ethnic groups in Bac Yen district is quite rich and unique. This is not only a place for community cohesion, preservation, education, and transmission of good cultural values of the ethnic group, but also a very important human resource for economic development and local tourism. The most typical festivals such as Xen Muong, Xen Ban of Thai, Muong; New rice festival of the Mong people...

The festival of Xen Ban and Xen Muong in the blooming season is a festival for Thai people to pray for good luck and harvest, this is a very important cultural and religious activity for the community. They put into it their great wishes for a peaceful and prosperous life in Muong village, and at the same time, it is also an opportunity to compete and have fun, boys and girls learn and feel through singing and playing the piano. They pray to the God of Water to bless the rain, good weather, good crops, good health, peaceful village; at the same time, to thank the gods for giving the villagers a bountiful harvest, bringing prosperity to the village, to the community, to all people. In addition, there are many traditional folk games of the nation such as: drumming gongs, playing chess, throwing con, playing odd, singing and answering contests, playing the flute, playing the flute... These games have been closely associated with the Thai people. Since childhood, it has become a feature in the culture of the ethnic community.

For the Mong people in Son La in general and the Mong people in Bac Yen in particular, the rice celebration has long been an important ritual in the spiritual life of the people here. Because it is an important holiday, family members always gather around the tray to express gratitude to ancestors and heaven and earth. The new rice offering ceremony is chosen as a beautiful day, after the last bag of rice is brought home from the fields, then the Mong people will hold a new rice festival. For the Mong, when rice is brought back, everyone in the family cannot eat it before the ancestors, especially the head of the family. Only when the ancestor worship is finished, the head of the family can eat. In Bac Yen, the Mong live at an altitude of over 1800m, scattered on the slopes of the high mountains, their economy is mainly dependent on shifting cultivation and forestry, they can only grow a single upland rice crop in a year, a year, so the new rice celebration plays an extremely important role.

In addition, in Bac Yen, there are many traditional festivals that are being restored and preserved such as: Cau Autumn Festival of the Dao ethnic group - Phieng Con commune; Xen Ban Festival of the Thai ethnic group Cang village - Phieng Ban commune, Culture and sport festival in Hang Chu commune...

Culinary culture: As a district with many ethnic groups living together, Bac Yen's cuisine is also very diverse and rich, bearing the characteristics of the Northwest region, especially the cuisine of the Thai, Muong, and Mong people. With the cuisine of Bac Yen in general, of the Thai, Muong, and Mong in particular, the locality and ethnicity are deeply imprinted through the exploitation and processing of dishes. From ingredients, processing, presentation, enjoyment... creating its own uniqueness and appeal. Currently, these products are not only served to tourists with local needs, but also become commodity products (gifts) that follow tourists when they return to their families: Lam rice, seven-color sticky rice, buffalo meat kitchen counter, vegetables, spices...

In addition, there are many products of the district that are known and popular by tourists such as: Hang Chu wine, apple cat, Ta Xua Shan Tuyet tea, Hang Dong chili bamboo shoots...

Ta Xua Shan Tuyet tea is hundreds of years old, associated with the history, culture and lifestyle of the Mong people. The tea forest here naturally exists at the same time, without any human influence or care. Ta Xua Shan Tuyet tea has white buds, yellow wings, big leaves, and what makes Ta Xua tea special is that all the drying stages are done by hand. It is from the elaborate stages of making tea that the people consider this as a precious gift to entertain guests on important occasions. This is considered one of the beauties and typical specialties of Ta Xua highland.

Coming to Hang Chu, it is impossible not to enjoy the wine with the strange aroma of forest leaves, the rich taste of upland rice. Hang Chu wine is produced entirely from carefully selected rice, along with herbs, yeasts for brewing are also traditional yeasts. The fermentation is done meticulously and carefully, wine distillation is also an extremely important step. The longer the wine is left, the better it is, so when it's finished, the people here often brew the wine in jars, if the house has the conditions, it will brew on the ground for more than 1 year, then bring it out to drink. This wine was previously made by the Mong people to worship the land, heaven and ancestors on important occasions such as anniversaries, Tet, village festivals and treat distinguished guests. Up to now, with convenient transportation, Hang Chu wine has become a specialty gift and a commodity of the Mong people in the highlands of Bac Yen.

Traditional folk art: In addition to the above types, the folklore of the ethnic groups in Bac Yen district also has many unique folk songs and dances: Xoe dance, bamboo dance of the Thai and Muong ethnic groups; flute dance, lip lute of the Mong ethnic group, bell dance of the Dao ethnic group, and counter singing of the Muong people; The fairs bear the characteristics of the Northwest mountains and forests; games and performances in the festival: Throwing balls, Throwing pa pao, pushing sticks, Tulu, shooting crossbows...; Traditional crafts: brocade, bamboo and rattan... These are all sources of folklore capital that

can become materials for designing and building unique and attractive tourism-supporting products and activities guide.

It can be seen that Bac Yen has many advantages for tourism development, the richness of tourism resources has created an attractiveness and is an important basis for diversifying tourism activities. Coming to Bac Yen, tourists can not only discover the beautiful, fresh and majestic natural scenery, but also have many experiences when participating in traditional cultural festivals; participate in fairs and love markets typical of the Northwestern people; learn about the unique customs and practices of the ethnic minorities here; participate in folk games; enjoy traditional dishes...

3.2. Overview of the current situation of tourism development in Bac Yen

Along with the development of tourism in Son La province, tourism in Bac Yen has achieved remarkable achievements. Currently, the district is located in Phu Yen - Bac Yen tourist cluster, connected by important traffic routes: 37, 43 and Hoa Binh hydropower reservoir.

In recent years, Bac Yen district has implemented many policies and measures to focus on promoting tourism development, especially community-based tourism in association with preserving national cultural identity, contributing to economic growth local society with tourism products such as: "Phuot" tourism, national cultural experience tourism, eco-tourism, caves, adventure sports, discovery... at the same time focusing on collecting income. attract investment, improve the quality of infrastructure, develop accompanying services to serve well, with quality, and attract domestic and foreign tourists.

The district has also enhanced the promotion of images, natural beauty and ethnic cultures on the mass media, so the tourism development of Bac Yen has achieved quite positive results. The number of tourists to Bac Yen in the period 2015 - 2019 is constantly increasing at the rate of 19%/year. In 2018 reached over 30,000 turns of people, revenue reached 16.2 billion; In the first 6 months of 2019, there were 19,584 arrivals, of which 169 were international visitors, the revenue was estimated at about 9 billion VND [1, 26], [2, 11]. Bac Yen district is striving to turn tourism development into one of the important economic sectors, actively contributing to hunger eradication, poverty alleviation, and raising people's incomes.

Bac Yen tourism achieved the above positive results due to a number of basic reasons. First of all, the district has soon identified the potential and advantages of tourism development and created conditions for tourism to gradually become an important economic sector in the general economic structure. In addition, the district has issued many policies to encourage investment incentives and expand production and business activities. Secondly, initially, there was effective coordination between all levels, sectors, districts in the province - especially the coordination between the Department of Culture and Information and the grassroots in the management and operation of tourism activities, remove the remaining problems. Simultaneously, the awareness of tourism economic development among people of all walks of life, especially in the residential community in the tourist destinations of Bac Yen has been enhanced.

However, compared with the potential of available tourism resources, the achievements of Bac Yen tourism are only the first step, still very small and not commensurate with the potential. Many limitations and challenges have emerged, which require quick remedial action. That is the fragmentation in tourism development of the district, the tourism products are not attractive and attractive. Currently, tourism activities in the district are mainly enjoying and photographing natural landscapes, forms of cultural tourism and community tourism are still limited, traditional handicraft products and local specialties are still limited inaccessible to tourists.

On the other hand, the infrastructure system for tourism is still limited; the service system of motels, hotels, food and beverage services, small-scale goods trading, is not up to standard, has not yet met the needs of tourists; Tourism promotion has not been widely deployed. Besides, the education level in Bac Yen is relatively low, the labor force is very little trained in tourism, even the households involved in the tourism service business or the district cultural manager do not have Tourism expertise leads to confusion in tourism management, conservation and restoration of cultural values.

Besides the opportunities it brings, tourism activities also have potential risks such as disrupting the natural landscape, polluting the environment and losing the local cultural identity.

3.3. Bac Yen tourism development orientation

In order to overcome the limitations and promote tourism development, Bac Yen district needs to have the right orientations and synchronously implement breakthrough solutions in line with reality. One of the urgent requirements in the current period is to properly orient and plan specialized tourism products, and at the same time identify and build key intra-regional and inter-regional tours and routes.

The first is to identify specialized tourism products of Bac Yen.

Bac Yen has the advantage to exploit different experience tourism products: backpacking on the highland roads of Bac Yen, Ta Xua rattan hunting tourism, photography of natural landscapes, sports and adventure games, experience the ancient tea hill, Son Tra forest, indigenous peach garden, horse racing festival, Ta Xua tea star, Hang Chu winemaking process, traditional ethnic festival...

Developing souvenir products such as landscape photos, Ta Xua tea, Hang Chu wine, Son Tra wine, dried apples, soaked apples, ethnic costumes, ethnic musical instruments, ethnic utensils, honey Bees, traditional remedies, and typical safe fruits of Bac Yen district.

Developing a model of community-based tourism, homestay in traditional ethnic style and smart tourism, responsible tourism in a new trend.

The second is the orientation and planning of typical tourist attractions.

Currently, Bac Yen has two tourist attractions that are attracting a large number of tourists to visit and experience: Ta Xua Cloud Paradise and Dinosaur Back in Hang Dong commune. In the coming period, it is necessary to orient and build Bac Yen district to become a provincial tourist area, in which focusing on building 6 typical tourist sites: Ta Xua cloud paradise (Ta Xua commune); Dinosaur spine (Hang Dong commune); A Phu

Cave (Hong Ngai Commune); Pu Nhi Pine Hill (Phieng Ban Commune); Ho Sen (Hua Nhan commune); Khe Ho ancient carved stone beach (Hang Chu commune).

The third is to identify and build key tours and routes.

a) Currently, the development of tourism within the district associated with specialized tourism products plays a very important role. Associated with 6 tourist destinations planned in Bac Yen tourist area, it is possible to identify routes with the following products:

Bac Yen town - Ta Xua: experience the heaven of clouds, take pictures of natural landscapes.

Bac Yen town - Ta Xua - Hang Dong: experience adventure sports tourism: Dinosaur spine.

Bac Yen town - Hong Ngai: visit and experience caves and historical relics.

Bac Yen town - Phieng Ban: visit and experience ecotourism Pu Nhi Pine Hill.

Bac Yen town - Hang Chu visit and experience Khe Ho ancient carved stone beach.

Bac Yen town - Hua Nhan visit and experience Ho Sen in the mountains.

If associated with organizing tourism space and concretizing products, Bac Yen district can orient tourism development along two routes as follows:

Route along Da river (Including lowland communes along the river: Phieng Ban, Bac Yen town, Song Pe, Muong Khoa): Forming a tourist route for Song Da lake bed. Tourists will visit the river landscape of the lake bed (in which Bac Yen district alone has a length of over 72 km) with a quiet, peaceful scene of the Northwest mountains, visit the scenic Bac Yen town. (Ho Phieng Ban Park, Cho Phien, tourist entertainment, urban sports, tourism, ...), Song Da lake bed tourism, river civilization, ecotourism, community tourism In the field, visit to learn the cultural identity - history of the cultural villages of Muong, Thai, Dao, Mong people of the lake-bed communes, take a hot mineral bath in Mon village and on both sides of the river,... On the basis of those tours, planning to build amusement parks and entertainment areas along the River are: Chieng Sai, Song Pe, Muong Khoa, Pac Nga and local cultural, cultural, sports, and cultural sites. Traditional foods are tourism products: Xoe dance, music, cuisine, wine, rice lam, throw con,... along with the investment in construction of roads along the two riverbanks, afforestation will be planned. ecology associated with watershed protection forests. This route can be associated with tours in the district such as: Tourists from Bac Yen to Hong Ngai; Bac Yen to Ta Xua - Hang Dong.

Upland route (Including the communes of Ta Xua, Hang Dong, Hong Ngai, Lang Cuu, Xim Vang and Hang Chu): This route takes advantage of the cold climate ecology of the highlands combined with the cultural characteristics of the people. The highlands are also imbued with traditional identity. Exploiting the advantages of the locality to attract tourists such as: Cultural tourism, resort, extreme sports, discovering the values of wet rice civilization, terraced fields, waterfalls, lakes small electricity, associated with learning about traditional activities, unique cultural identity of ethnic minorities, highland cuisine (Ta Xua tea, forest fruit, wine and fruit juice made from Son Tra fruit); Peach, Hang Chu wine; pigs, chickens on the hill, salmon, Thang Co,...), develop traditional culture, arts and sports such

as new rice eating custom, trumpet dance, leaf trumpet, pounding, push sticks, tug-of-war, shoot crossbows,... Orientation for the development and construction of holiday houses associated with the ecological environment and natural landscape. This route is associated with tours in the district such as: Tour to visit Tham Ang and Toc Tac caves, Ang village in Pac Nga commune and down the lake bed of Song Da - Hoa Binh.

b) Within Son La province, identify inter-district lines such as:

Bac Yen - Son La - Quynh Nhai: visit and experience tourism to discover the reservoir area of Hydraulic lake, learn about historical sites.

Bac Yen - Yen Chau - Moc Chau - Van Ho: visit and experience highland tourism, historical sites.

Bac Yen - Son La - Muong La: visit and learn about Son La Hydroelectricity project, eco-tourism, discovery and relaxation (Ngoc Chien).

Bac Yen - Son La - Thuan Chau: sightseeing to learn about history, eco-tourism (Golden Forest, Pha Din...).

Bac Yen - Phu Yen - Moc Chau: sightseeing to learn about history, highland tourism.

Bac Yen - Phu Yen: visit to learn about history and ecology.

c) Building inter-provincial routes, linking with the Northwest provinces to expand:

Tour, tour route Bac Yen - Yen Bai - Lao Cai - Lai Chau: visit, experience travel discovery (Kau Pha pass, Fansipan), resort (Tram Tau).

Tour, tour route Bac Yen - Phu Tho - Tuyen Quang - Ha Giang: visit to learn history (Hung Temple), ecology (tea hill), experience discovery, adventure (Happiness road, Ma pass) Pi Leng, the North Pole...).

Tour, tour route Bac Yen - Hoa Binh - Hanoi: visit and learn about Hoa Binh Hydropower project, cultural villages of ethnic groups; research (museums in Hanoi).

Tour, tour route Bac Yen - Son La - Dien Bien - Lai Chau - Lao Cai - Yen Bai - Phu Tho - Hanoi: visit to learn history (Prison, Dien Bien Phu battlefield, Hung temple...), experience discovery (Fansipan, passes), academic research (museum...).

4. Discussion and Conclusion

Bac Yen upland district has many advantages for tourism development, both in terms of natural and human tourism resources. Bac Yen has many high mountains, deep ravines, steep slopes; has very rich vegetation, many old forests, hills, steep slopes creating beautiful natural landscapes; cool year-round climate, fresh environment; There are many precious and rare species of plants and animals, which are diverse tourism resources, ideal for sightseeing and scenic tourism activities, resort tourism, eco-tourism, sport tourism. Adventure climbing and nature exploration. From October of the previous year to April of the following year, there are often cloudy clouds creating a sea of white clouds, this is a different point to attract tourists to hunt for clouds. The district is home to the Mong, Thai, Muong, and Dao people for a long time, still imbued with traditional cultural identity, which can develop community tourism, visit historical sites, homestay, etc...

In recent years, the number of tourists to Bac Yen has been increasing, tourism products are increasingly diversified, better meeting the needs of visitors. However, many environmental, landscape and cultural problems have also appeared, requiring quick remediation. Therefore, the reasonable tourism development orientation, rapid planning and synchronous implementation of a series of solutions are being actively deployed and implemented by the district, in order to build tourism into a dynamic economic sector of the district.

The most effective and practical solutions for Bac Yen at this time is to accurately identify specialized tourism products of the district, on that basis, to plan and build tourist attractions, tours - routes associated with these products. specialization products. The next step is to strengthen the promotion and promotion of the destination in the forms of: building tourism image and brand, maintaining and organizing tourism events; publish and supplement publications on tourism, design electronic travel manuals... Third is to develop infrastructure systems such as transportation, restaurants, standard hotels, and to build points of interest. waste treatment, ensuring environmental hygiene for tourists to experience at tourist sites, spots and villages. Finally, develop smart tourism, step by step create a data source for businesses and people to participate in exploiting this source for business purposes, strengthening the link between the State - Businesses - Tourists and people in areas with tourism resources.

With rich and attractive tourism potential, combined with breakthroughs, integration and sustainable development, with professionalism such as developing typical, different, attractive and unique tourism products, approach 4.0 technology, develop smart tourism to promote and attract domestic and international tourists, Bac Yen tourism will surely quickly become a driving economic industry, making a positive contribution to the tourism industry. economic restructuring, creating more jobs, eradicating hunger and reducing poverty for the people here.

NEW VERSION OF ME LINH FLOWER VILLAGE MODEL CONCERNING INTERNATIONAL EXPERIENCES

Assoc. Prof. Dr. Nguyen Thuong Lang

langnt@neu.edu.vn

Nguyen Vu Thuy Linh

vulinhneu1505@gmail.com

*Faculty of Environmental, Climate Change and Urban Studies, National Economics
University, Hanoi, Vietnam*

Abstract

The article summarizes the flower business model from the experience of the world's leading flower exporting countries, featuring Dutch flower auction and farm models, Ecuadorian rose quality control, Colombian recirculating flower agriculture., Japanese flower value chain, Malaysian flower e-commerce, Israel smart flower watering system and Kenya flower copyright. Me Linh Flower Village (Hanoi) has a long history but is an old version with spontaneity, lack of investment in construction, so the flower value is not high. Based on reference to international experience, the new version of the Me Linh flower village model combines the characteristics of the flower village model of selected countries.

Keywords: *International experience; Model of Me Linh flower village; Flower; Model*

1. Introduction

Vietnam has only a few localities famous for growing flowers such as Sa Dec flower village in Dong Thap or Da Lat flower in Lam Dong. The organization of flower village business to create high value is always set, but the implementation method is not very effective. Available resources and easily accessible international experience have not been effectively exploited.

Flower agriculture has become the mainstay economic sector of Me Linh district (Hanoi). Flower products are still limited in terms of product quality, ability to research, develop and innovate varieties, small production scale, low degree of standardization and specialization, and lack of professional market skills.

Flowers of Me Linh district are almost not stagnant and are mainly consumed in the district and some neighboring markets. Consumption is mainly through intermediaries who are retail traders and peddlers. Besides the achievements, flower development is still limited as planning flower areas is difficult due to the fragmented, small, and scattered nature; Spontaneous flower production, depending on growers' preferences, unstable consumption markets, simple consumption forms, easily affected by price fluctuations, diseases, rudimentary preservation methods, make flowers easily crushed, there is no specific research on flower varieties.

Me Linh Flower Village (Hanoi) is a model of a traditional craft village, which is quite self-contained and has not effectively mobilized its potential. This model needs a new

version to both promote local potential and take advantage of international best practices and experiences. The study and summary of good international experience is a reference base for building a new version of the Me Linh flower village model, creating value on a larger scale because of exploiting local potentials.

2. Literature Review

Countries with the world's traditional flower industry provide abundant flowers from family farms. Unique flower auction models for effective marketing, perfect chain logistics system and reduced transportation loss, strict flower quality control system, strong product innovation, large research ability research, and development. Investment in information technology facilitates effective information promotion in all sectors. The study "Role of information technology in agriculture" (Jkaaya, 1999) highlights scientific achievements and the application of technology platforms to agricultural programs. The issue of protecting health, and combating environmental pollution, especially exposure to toxic substances and pesticides is also mentioned in the US Farm Law in the report "Sustainable Agricultural Policies" (Jackson),2009). The Solow economic growth model inherits and adapts the Harroth-Domar (1956) model, emphasizing that long-term growth can only depend on technological progress growth. Studying "The world of organic farming: statistics and trends 2008", Willer & colleagues forecast organic farming trends and improve human health based on country analysis data. have leading agriculture such as Japan, USA, Colombia, India.

The study "The successful experience of the Dutch flower industry for the development of the Yunnan flower industry" (Chen & Zhao, 2019), points to a scientific marketing system focusing on the competition model. price. The study "Evaluation of the life cycle of cut roses" (Alig & Frischknecht, 2018) showed that Ecuadorian roses have several 50 to 100 petals and are better tolerant of harsh environments than normal flowers. The study "Agriculture Colombia" (Kathryn, 1942) reveals biotechnology that allows to grow agricultural crops on mountain tops and uses special methods to eliminate pests. Agriculture is the most influential area of Japanese politics (Aurelia, 2013). Rural development increases international influence, especially young women could access many new ideas and livelihood techniques. The report "Flower similarities in the development of e-commerce infrastructure in Malaysia and Singapore" (2007) by Poong et al., built a flower e-commerce model. Israel's experience in water demand management (WDM) is a potential tool to enhance prosperity and growth with limited water availability (Arlosoroff, 2007). Kenya is interested in commercial negotiations with countries and the European Union (EU) on UPOV flower copyright (Whitaker & Kolavalli, 2006).

In Vietnam, the research on the flower village model is very limited. Research on "Developing a process for growing and propagating ancient roses in Sa Pa and Hai Phong in Long Xuyen, An Giang" (Nguyen Thi My Duyen et al., 2021) to evaluate the impact of the ancient rose variety *Rosa gallica* L. Sa Pa and Hai Phong in Long Xuyen, An Giang, for good growth and beautiful flowers.

3. Method

Research, analyze and compare flower industry models of 7 countries to find out the characteristics of each model, conduct surveys and in-depth interviews with 5 households about varieties, consumption markets, business types, cultivation techniques, costs, and annual revenue of floriculture.

4. Results

4.1. Flower production patterns of countries and characteristics

The Netherlands has a high production capacity and flower competitiveness. In 2011, the production value of flowers and ornamental plants in the Netherlands was 8.6 billion euros. The production value of cut flowers in the Netherlands is about 2.1 billion euros (2012) and 2.9 billion euros (2016). Most florist farmers in the Netherlands have mastered professional floriculture technologies. The scale of floriculture is according to the family farm, they mainly grow 1 or 2 varieties with large scale, specific variety, and a high degree of specialization (Chen & Zhao, 2019). The Netherlands organizes flower distribution through discount auctions, which is the highlight of the Dutch leading flower production brand in the world. At Bloemenveiling Aalsmeer (VBA), approximately 19 million flowers are distributed each day to customers in a 1 million square meter building within a few hours (Koster, Myu, 2006). After the auction, the products are shipped directly to the location specified by the buyer and the electronic ordering system provides the information. (Figure 1)

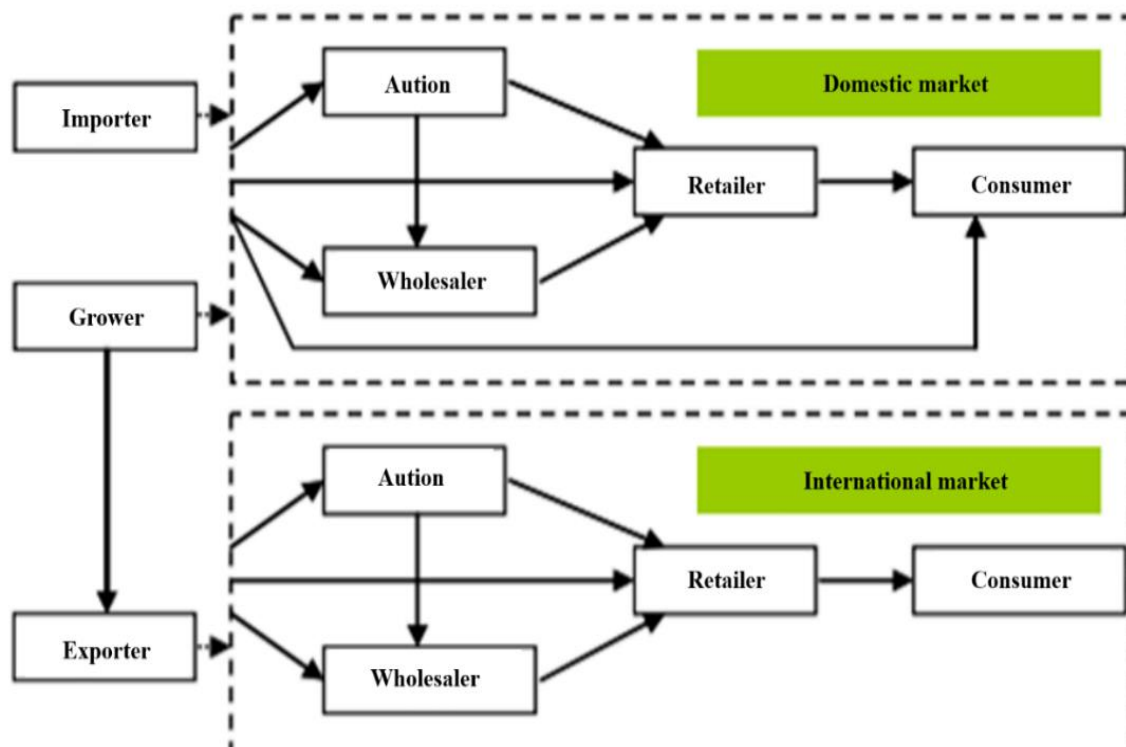

Figure 1. Flower auction model in the Netherlands

Source: Self-built by the author team

Ecuador organizes flower villages under the model of the IoT complex. Households growing flowers in Ecuador have an average income of about 5000 USD/person/year while the per capita income in this country is only about 1200-1300 USD/person/year. The Ecuadorian commission standard is a combination of smart technology, state development policies, and scientists (Alig & Frischknecht, 2018). All stages are connected to the Internet with the server system of the flower garden. The system analyzes data on ambient temperature and harmful agents to give warnings and methods to protect flowers. Trade agreements facilitate, the diffusion of technology from multiple sources and promote local entrepreneurship. (Knapp,2016). Agriculture has proven resilient to changing global trade conditions and climate change. (Figure 2)

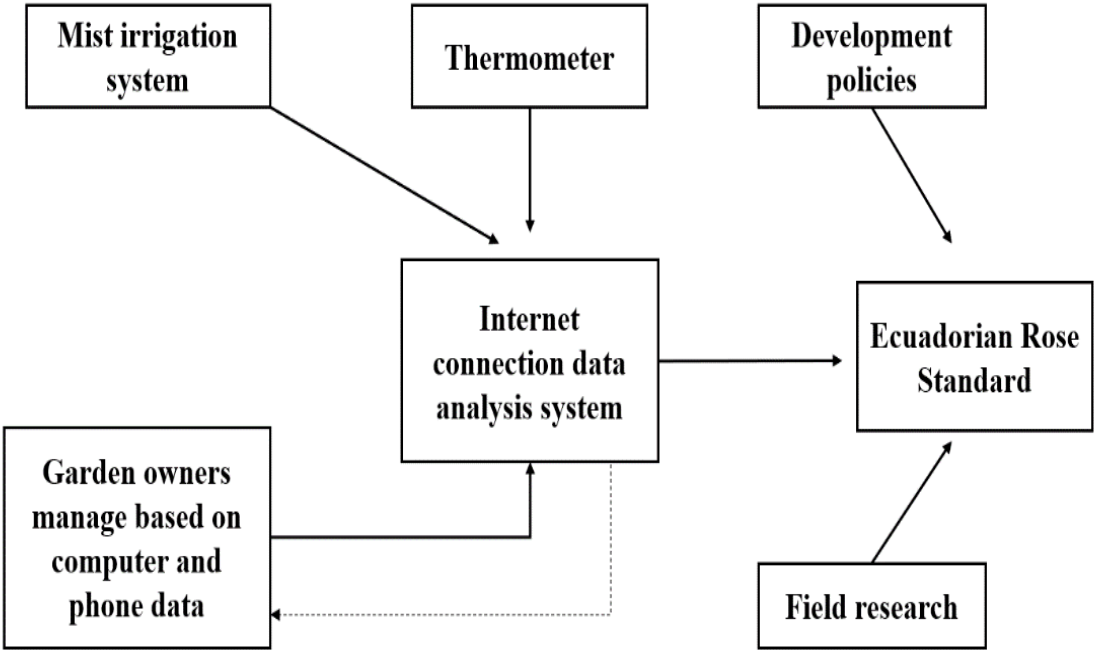

Figure 2. Ecuadorian rose quality control model

Source: Self-built by the author team

Colombia's cyclic flower model is divided into three phases: 1. The floriculture system includes infrastructure, disease management, fertilization, harvesting, and waste treatment; 2. Post-harvest work includes sorting, packing, and preserving; 3. Shipping to international markets (Parrado, Bojacá & Schrevens, 2011). The farm strictly checks the quality of flowers before they are sold to the market. Insect and crushed flower products are processed to produce fertilizers. This probiotic accounts for 30% of the total fertilizer that gardeners use in a flower growing season. (Figure 3)

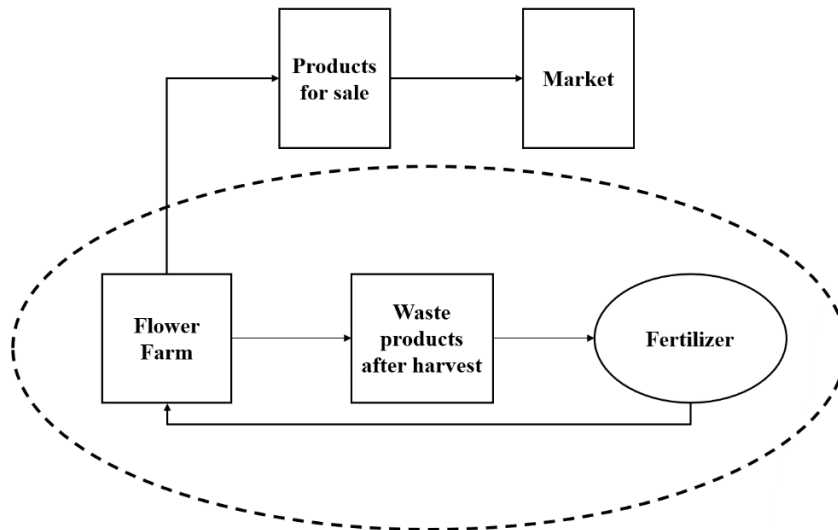

Figure 3. Simple model of cyclic flowers in Colombia

Japan associates flower production with flower consumption along the flower value chain between households, local authorities, collecting cooperatives, and businesses as the focal point of product consumption (Mulgan, 2013). The equipment system and production process are designed and delivered to flower growers from the Science and Technology Transfer Center. Accurate and transparent product purchase and sale contract information, along with efficient public service support, local cooperatives and businesses to facilitate smooth processing. (Figure 4)

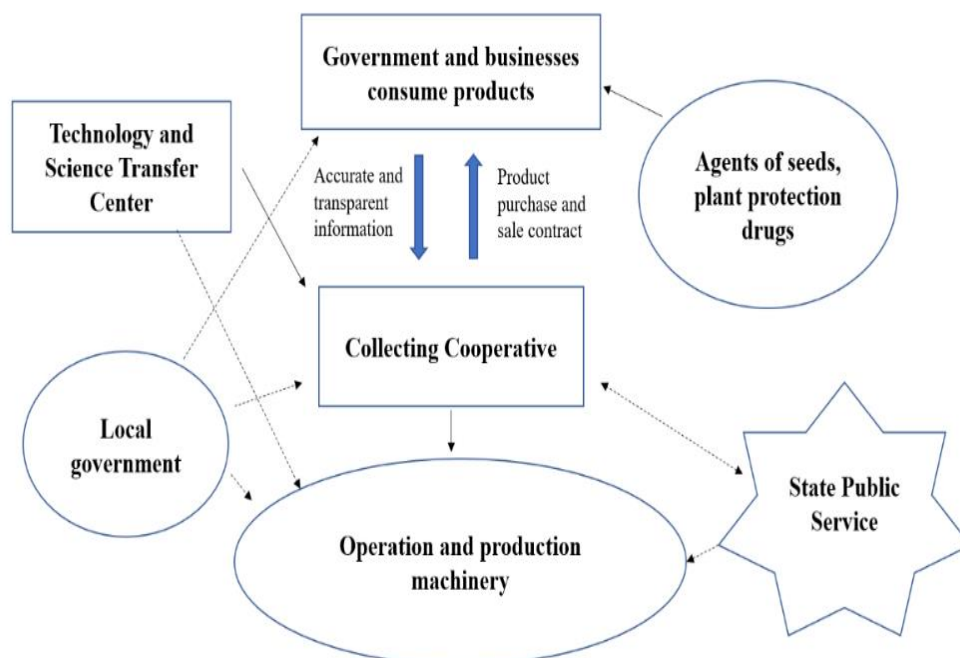

Figure 4. The model of linking flower production and consumption along the value chain in Japan

Source: Self-built by the author team

Malaysia uses an e-commerce model of flowers. Households after harvesting flowers will have 2 modes of transportation: Directly transporting flowers to traditional markets and through flower-collecting businesses. Businesses will connect with e-commerce platforms for consumers to choose the flower products they want with the listed prices. Once the flower order is paid, the shipping companies immediately pack and ship the flowers out the same day due to the perishability of the flowers. In the higher segment, if exporting internationally, shipping companies will have advanced methods of freezing and preserving flowers to reach foreign consumers while maintaining the color and value of flowers. (Figure 5)

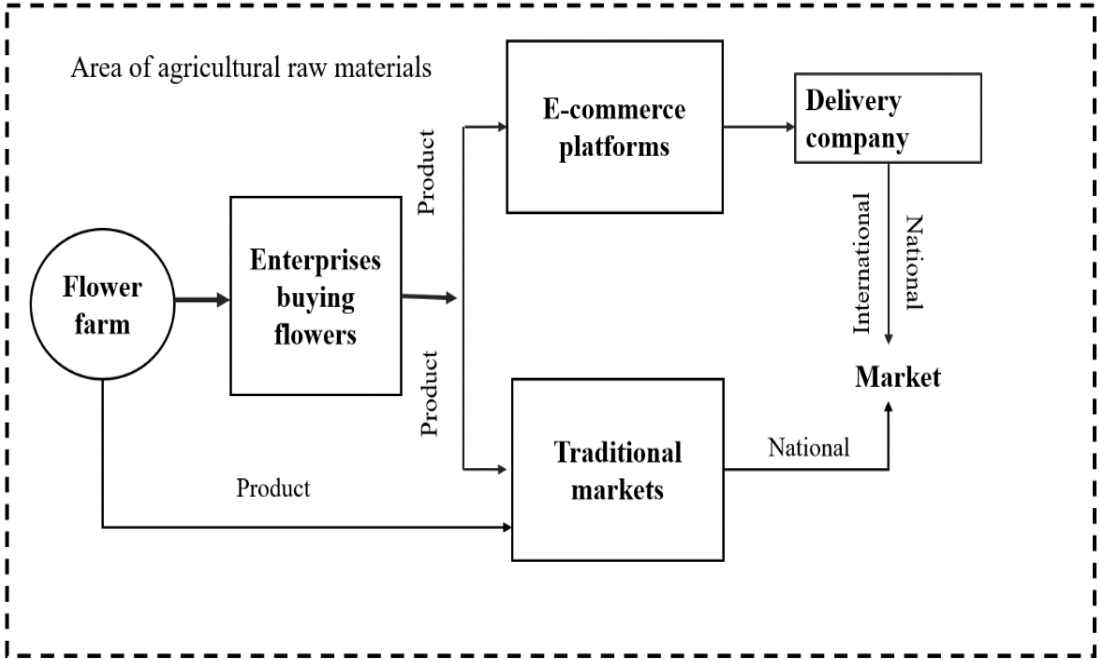

Figure 5. E-commerce model of flower production in Malaysia

Israel succeeds in the smart watering system model. This model has the highest water efficiency ratio of 70 to 80%, compared to open irrigation, which reaches 40% (Megersa & Abdulahi. 2015). Recycling using water, wastewater, adding nutrients mixed with water and desalination is an innovation used to solve water scarcity. The system automatically measures the ambient temperature and adjusts the appropriate amount of water for efficient water use. Technology continues to be innovated to save water resources for irrigation of dry areas to increase productivity. (Figure 6)

Figure 6. Model of smart irrigation system in Israel

Source: An Yen

Kenya leads the way among countries in Sub-Saharan Africa in the production and export of flowers, 60% of Africa's cut flowers originate in Kenya. The special feature of the model is the protection of intellectual property rights, access to high-quality inputs, marketability, and flower branding (Whitaker & Kolavalli, 2006). The flower growing model in Kenya is a combination of human, scientific, technical and environmental factors. The protection of flower copyright, the development of the environmentally and socially responsible flower industry creates confidence for high quality Kenyan flower products according to EurepGap standards. (Figure 7)

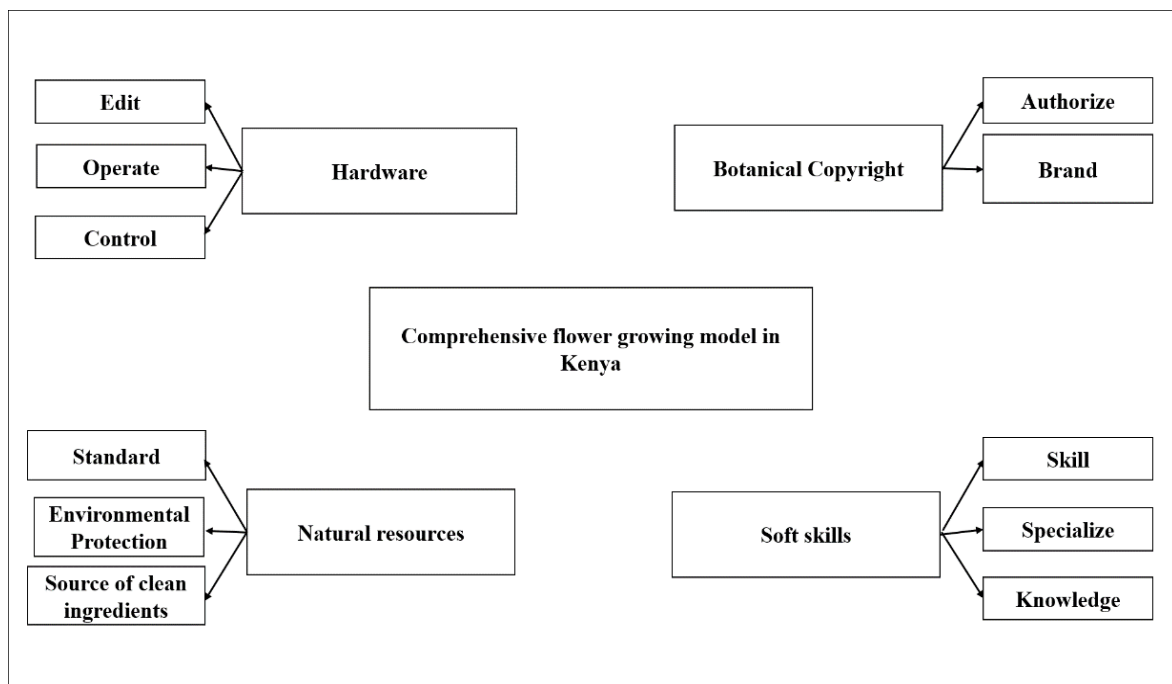

Figure 7. Comprehensive floriculture model in Kenya

4.2. Survey results on the model of Me Linh flower village

Out of 5 surveyed flower growing households, only 1 household (N.T.A) is organized as a small business. Spontaneous, small-scale business, not associated with other businesses, reduces the value of flowers, and increases costs when each household has to actively find markets. Me Linh flowers are only consumed in districts and provinces around Hanoi or beyond, exported to Thailand, China, and Japan. (Table 1)

Table 1. List of interviewed households

NO	Name	Address	Types of flower	Business type	Consumption market
1	P.M.T*	Noi Dong, Me Linh, Ha Noi	Roses	Small farm	Me Linh market, export China, Laos and Thailand

The technique of growing flowers and caring for them is quite simple. Methods of pest control are also manual in nature, mainly by spraying pesticides. The owner has 2 households (P.M.T and P.V.S) using biological methods of natural enemies and protection by nets. The inevitable weather risks are diseases that cause tree death and the weather in the North is too cold or frost in winter makes it impossible to grow. Regarding economic risks, growers must compete in the market with other floriculture villages. (Table 2)

The cost of growing flowers of households is mainly the cost of pesticides and fertilizers. These are the two essential factors of caring and nurturing flower plants. The larger the production scale, the higher the cost. Besides, other costs such as electricity, environmental costs, labor costs and transportation costs also play a particularly important role in the family flower business model. (Table 3)

Table 3. Survey results on flower growing costs

Flowering revenue ranges from 200 million VND to nearly 600 million VND/ha/year depending on the quantity of flowers grown and the cost of each flower. Households growing flowers all earn positive profits. Compared with small-scale households, using available family labor, large-scale households have reduced net profit due to high labor costs. (Table 4)

Table 4. Survey results on revenue from floriculture

<i>Unit: million VND/ha/year</i>					
Revenue from growing flowers	P.M.T	N.V.B	N.T.T	P.V.S	N.T.A
Flower production/ha	560.000	216.000	300.000	100.000	800.000
Average selling price of 1 cotton (VND)	1000	2000	1000	2000	2000
Average total revenue (million VND/ha/year)	560	432	300	200	1600
Average profit (million VND/ha/year)	349	378	183.5	162	1188

Source: Self-built by the author team

From the actual survey, it can be seen that the Me Linh flower village model is quite small in scale and has not been closely linked to flower farmers with consuming termite oil, which reduces the value of flowers. The care and farming techniques are rudimentary and lack of mechanization. The cost of hiring labor for tending, pruning and transportation is large, which reduces profits. The overuse of fertilizers and pesticides has a negative impact on people's health and the environment. Me Linh Flower Village has not yet invested in research and development, protected the copyright of Me Linh flower varieties, traded through traditional markets, has not gone through auctions or e-commerce platforms, has not had quality control regulations. quantity of flower products, lack of investment in innovation of flower varieties. The main flowers are hips, daisies and lilies which are difficult to create high value (Figure 8.a).

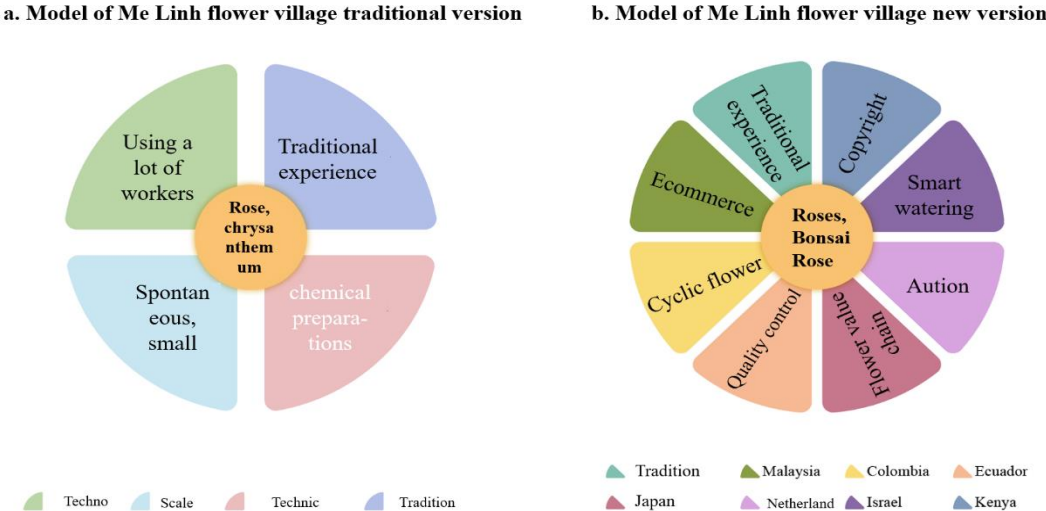

Figure 8. Model of Me Linh flower village traditional and new version

Source: Self-built by the author team

The new version (Figure 8.b) is a breakthrough based on good practice from 7 countries and 5 households studied. The centerpiece of the new version is a high value chemical that can be a Bonsai rose (which costs many times more than a regular rose) or an upgraded traditional flower. From the success of the model of other countries, it is possible to integrate into the model of Me Linh flower village, including the flower business tradition of Me Linh flower village, flower auction and farm (Netherlands), quality control. flowers (Ecuador), circular flower agriculture (Colombia), linking flower production and consumption along the value chain (Japan), e-commerce (Malaysia), smart watering (Israel), global farming representative (Kenya).

5. Discussion and Conclusion

Discussions of the results

From the experience and good practice of 7 countries with strong flower production, namely the Netherlands, Ecuador, Colombia, Japan, Malaysia, Israel and Kenya, to develop Me Linh flower village, the research proposes 7 solutions: 1) Receiving high technology, building and exploiting the process of planting, tending and consuming flowers from successful countries; (2) Transforming flower structure, expanding production scale of high-value chemicals; (3) Mobilizing the highest quality investment sources, namely investment in research and development of high-value domestic and international flower varieties; (4) Encourage innovation towards building a source of high quality flowers; (5) Focusing on the production of antique Bonsai roses as the core high value along with other high-demand chemicals, creating the brand name of Me Linh Bonsai roses as well as other flowers in the country and the region; (6) developing Me Linh flower e-commerce; (7) Completing the policy of developing the flower industry in the district. được nhận nguồn vốn này.

Recommendations

Hanoi needs to have a specific, clear and oriented strategy to promote the production and export of high-value flower products as a reliable basis, the premise of the locality to proactively plan to mobilize resources for product development. flower products. At the same time, it is necessary to support the locality to protect the geographical indication of the Me Linh flower.

Enterprises need to pay more attention to investment and development of Me Linh ancient flower breeding technology and promising new varieties. To shift the basic direction to producing flower products with high added value, good quality of varieties and using high technology in flower cultivation and preservation. There is an adequate mechanism to encourage scientists, researchers, and universities to participate in flower research.

District Farmers' Associations, socio-political organizations, and social organizations such as the Youth Union, the District Women's Union, appoint officials, members, and farmers to research, study, exchange experiences and promote Me Linh at domestic and foreign fairs, At the same time, promote. propagate and mobilize the production and business of high quality and safe flowers for the health of farmers and consumers.

Encourage farmers to change flower varieties, research, research and develop old varieties of Bonsai roses as well as other flowers, convert flower structure to high value ones. Support to connect forums, electronic exchanges such as Facebook, Zalo... so that business households can easily exchange information, experience, and consume flowers effectively.

Conclusion

The research is to build a new version of Me Linh flower village model with reference to international experience. On the basis of summarizing each outstanding aspect of each flower model of other countries, by surveying 5 flower business households in Me Linh district, the new version of Me Linh flower village is a breakthrough in organizing chemical business. overcome the limitations of the old version model, create a new state and increase the value of flower products. To make this new version effective, solutions need to be implemented in a synchronous manner and with suitable deployment conditions.

THE STUDY ON AGRICULTURAL DEVELOPMENT OF PATHEIN TOWNSHIP (1996 TO 2006)

Dr. Ah Mar

drmarmar1967@gmail.com

Department of History, Taungoo University, Myanmar

Abstract

Achieving balanced growth between regions within the country is important for the development of the country and efforts have been made for the promotion of regional development. The objective of the study is to examine the development of Pathein Township as a case study to show the development efforts of a region, which is one of the 24 special development Regions in Myanmar. The agricultural sector of Pathein Township has been improved because of modern techniques, loans from the government and construction of many water sluice gate and reservoirs and irrigation works, which has supported. Regional planning in developing countries is closely linked with Rural Development. Despite rapid urbanization, the mass of the population still has a rural way of life and earns its living in agriculture. In absolute terms the number of people dependent on agriculture continues to grow. In many developing countries where agricultural activities are predominant. Myanmar has been building up its economy by encouraging the development of agriculture as the base.

Keywords: *Agricultural, Pathein Township, Regional Development, Rural Development, Urbanization*

1. Introduction

Myanmar is embarking on a Program for all round national development and promoting the quality of life of the people to achieve the aim of the emergence of peaceful, modern and developed nation. The challenge of development is to improve the quality of life. Especially in the world's poor countries, a better quality of life generally calls for higher incomes but it involves much more. It encompasses as ends in themselves better education, higher standards of health and nutrition, less poverty a cleaner environment and more equality of opportunity, greater individual freedom, and a richer cultural life. In traditional economic measures, the term "development" may be defined as the capacity of national economy. Therefore, rural development may be fined and measures which are aimed at improving the living conditions in the countryside. It encompasses diversification of rural economies and new sources of income, development of enterprises and public services, of agriculture and industry, and of communities and the conditions for individual families. Myanmar still is predominantly an agricultural economy based mainly on rice and a few other major crops. The factors that can promote agricultural development are: improvement in technologies, rural infrastructure, and education. Agriculture is the most important economic activity because this sector provided about a half of the gross domestic duct (GDP) of Myanmar, and employed more than, two-thirds of the labor force.

2. Method

Aim and Objectives

- To express the changes of agricultural sector and modern techniques relate activities
- To observe the processes of regional planning in developing countries linked with rural Development

- To analyze the local people's response on agriculture is the most important economic activity because this sector provide about a half of the Gross Domestic Product (GDP) of Myanmar

This paper was based on both primary and secondary data. Primary data was collected from field survey and open talk and questionnaire. Secondary data has been collected from government official records. Data were analyzed by using both qualitative and quantitative techniques.

3. Results

✚ Rural Development Activities

Measures for the development of rural area have been undertaken with an added momentum under the guidance of the Head of State starting from 1989 to foster the national reconciliation and the regional development of the country. Owing to the fact, the state has already laid down the development programs implemented throughout the country. Those development programs are as follows:

✚ Agricultural Land and main Crop

In Ayeyawady Region, over 3.6 million acres out of more than 4 million acres of agricultural lands are paddy fields. The acreage of alluvial and garden lands is 0.2 million each. The total acreage farmland is over 20000 and that of the hill-side cultivation is over 500. Farmlands can be seen in the northern part of the division, and hill-side cultivation is found on Rakhine Yoma. There is 0.6 million acres of double cropping. In dry season, double cropping is carried out by irrigation. There are altogether about 33000 acres of irrigated farmlands.

The principal crop of Ayeyawady Region is paddy. The division is renowned as the rice bowl of Myanmar. Agriculture is the vital organ of the Myanmar economy as well as the basic part of it. The first of the four economic objectives is "Development of agriculture as the base and all-round development of other sectors of the economy as well". Pathein Township is one of the regions of 24 special development regions.

Table 1. Special development regions

Sr.	State / Region	Development Areas
1	Kachine State	(1) Myit Kyina (2) Baumou
2	Kayah State	(3) Loikaw
3	Kayin State	(4) Pa-An
4	Chin State	(5) Kalay
5	Sagaing Region	(6) Monywa
6	Taninthayi Region	(7) Dawei (8) Myeik
7	Bago Region	(9) Taungoo (10) Pyi
8	Magwe Region	(11) Magwe (12) Pakokku
9	Mandalay Region	(13) Mandlay (14) Meikhtila
10	Mon State	(15) Mawlamying

12	Yangon Region	(17) Yangon
13	Shan State	(18) Taunggyi (19) Pinlon
14	Shan State (North)	(20) Lashio
15	Shan State (East)	(21) Kyaington
16	Ayeyarwady Region	(22) Pathein (23) Hinthada (24) Maubin

✚ Location, Climate and People

Pathein township is situated in the Ayeyawady Region between North latitude 16°, 37', and 17°, 12' and East longitude 94°, 20', 94°, 45' and 27 feet above sea level. It is surrounded by Tharbaung Township in the North, Kan Gyi Dour Township in the East, Nge Pu Taw Township in the South and the Bay of Bengal in the west. The total area of Pathein Township is 644.88 square miles and the land area of Pathein Township is 412713 acre. The climate of Pathein Township is hot and wet and it is one of the regions, which has low temperature and monsoon climate. The highest temperature is 106.7 F mostly during the month of May. The average rainfall is 102.69 inches and the highest rainfall is 116.48 inches usually in August. The lowest temperature is 51.3 in July.

✚ Ayeyarwady Region in Myanmar

As Pathein Township is the capital of the Ayeyawady Region, the majority of the people are Burma and the second of Kayin, and Rakhine. Most of the people are Buddhist, but Christian, Hindus, Islam, and other believers also reside there. The population of Pathein Township by race and religion. There are 22 quarters and 53 villages tract and 51691 houses, 53549 families and the population of 34625 (Year 2004).

Agricultural Sector

In assessing regional development, it is needed, apart from the social sector, to look into the region's economic performances. Hence, this paper will focus on the economic sectoral performances of Patheingyi Township. The land area of Patheingyi Township is 412723 acres and the population is about 346425 (2006). The area of agricultural land is 123370 acres and the area of irrigated land is 99970 acres. The main crops of the region are rice, and others are corn, peanut, sunflower, beans, coconut, mango, banana, chili etc. There are 123370 acres of agricultural land, 289353 acres are fallow land and 412723 acres are potentially cultivable land, wet land, virgin land are included in potentially cultivated land.

Table 2. The structure of population in Patheingyi Township by races (1996 - 2006)

Sr.	Race	Population		Percentage%	
		1996	2006	1996	2006
1	Kachin	139	289	0.05	0.08
2	Kayar	35	88	0.01	0.03
3	Kayin	22856	37018	7.61	10.69
4	Chin	195	404	0.06	0.11
5	Bamar	271607	294636	90.43	85.05
6	Mon	73	281	0.02	0.08
7	Rakhine	4860	11752	1.62	3.39
8	Shan	176	467	0.06	0.13
9	Foreign immigrant	422	1490	0.14	0.43
Total		300363	346425	100	100

After 1990 wet lands can be cultivated by agricultural new technology. Similarly, virgin land also can be cultivated and agricultural land increased. Besides Monsoon paddy summer paddy can be cultivated alternately the whole year round and paddy production has increased steadily. The crops of Monsoon season are paddy, corn, groundnut and the crops of the winter season are bean, pea, peanut, chili and oil crops.

It can be seen clearly that because of the project for extension of agricultural land, the use of modern implements and fertilizers, loans from the agriculture bank and the construction of sluices and reservoirs for cultivation for all seasons, the agriculture of the region has improved. Perennials such as mango and coconut are also cultivated. The production of mango decreased because of the decline in cultivated area due to the increase in demand for other crops. In Patheingyi Township due to favorable climate and soil condition, coconut, betel vine, and mango trees are thriving. Due to utilization of commercial fertilizers and application of the latest and modern methods of plantation, yield per acre is increased. The utilization and distribution of fertilizers in Patheingyi Township from the Period 2001/02 - 2005/06 is presented in Table 3.

Table 3. The Utilization and distribution of Fertilizer (2001/02 - 2005/06)

Sr	Cropping year	Urea ton	T-Super (tons)	Potash (tons)
1	2001-2002	2980	2000	1200
2	2002-2003	1410	2914	1758
3	2003-2004	12162	1200	1200
4	2004-2005	5540	581	1196
5	2005-2006	4605	610	1297

According to Table 3 four main fertilizers, Urea, T-super, Potash and Compound were used. Farmer used 2000, 2914, 1200, 581, 610 tons of T-super fertilizer in 2001, 2002, 2003, 2004, 2005 respectively. In 2003, 12162 tons of Urea fertilizers were used. In 2003-04 to increase yield per acre, more Urea fertilizer was applied. In 2005-06, due to the proper cultivation method, the application of Urea, Tsuper and Potash was used correctly based on the right ratio and right method and instruction. As the agricultural sector has improved, the application of fertilizer is also improving year after year up till now. This kind of improvement supports the development of the region. Sluices and area under irrigation in 2005.

The role of sluices and reservoirs, one of the main factors for agriculture is also discussed in this paper. The government has undertaken dams, sluices and reservoirs projects for the development of different races and border regions. As Patheingyi has got many water resources, there were constructed sluices for cultivation of various crops. The name of the sluices and the area of irrigated cultivation are included in Table 4.

Table 4. Sluices and area under irrigation 2005

Sr	Sluices	Area of irrigation (Acres)
1	Boe Maung	4730
2	Ka Ta Gyi	1500
3	Ma Gyi Sin	800
4	Jade Late	1250
5	Bu Gwe	1800
6	Myat Oo	1250

Township Agriculture Department

Sr	Sluices	Area of irrigation (Acres)
1	Boe Maung	4730
2	Ka Ta Gyi	1500
3	Ma Gyi Sin	800
4	Jade Late	1250
5	Bu Gwe	1800
6	Myat Oo	1250

The natural resources of Pathein Township are the Ayeyawady River and its tributary river named the Pathein River. Water from these facilities is irrigated to the farmlands for cultivation by building the sluice gates. Before 1988 there were only one, but after 1988 another 5 were extended and there are of great support for the whole year round cultivation. The total area of cultivation is 123370 acres but only 99970 acres of them are irrigated. So, more are still needed there for better cultivations and for expansion of production.

Myanmar Agricultural Development Bank (Pathein Township) has extended annual yearly loans for agricultural development. There are two types of loans, namely loans for monsoon season and loans for the winter. Loans for crops such as rice and beans are included in the monsoon season loan, chili are included in the winter season loan. There are three types of loans, special, ordinary and normal, for the main crop, rice. Loans are given depending on the price of the seeds and type of crops. As shown in table 7, 303 million Kyats were distributed to 7101 borrowers in the year 2006 and especially for crops such as rice and beans. Beans are for export as the price for these crops has risen.

However, the agricultural sector of Pathein Township has improved because of the support in agricultural techniques and loans from the government. These factors supported the extension of cultivation which is important for the consumption of the growing population. The main products of Pathein such as paddy rice, other grains and marine products are distributed the country.

Improving the quality of life is the challenge of development. The achievements owe a great deal to the policies and strategies aiming at acceleration of growth based on equitable and balanced development of the whole country. In developing countries, most of the people live in rural areas. Through investment in rural infrastructure and social programs, the governments are making efforts to improve the lot of the rural population. Regional planning in developing countries is closely linked with Rural Development. Despite rapid urbanization, the mass of the population still has a rural way of life and earns its living in agriculture.

In absolute terms the number of people dependent on agriculture continues to grow. Development must therefore be conceived of as a multidimensional process involving major changes in social structures, popular attitudes, and national institutions, as well as the acceleration of economic growth, the reduction of inequality, and the eradication of poverty.

The tactics to rural development and poverty alleviation is to uplift the socioeconomic conditions of the rural area. Then the development of the States and regions is in turn dependent on the development of districts and townships. In this case, Pathein Township in the Ayeyawady Region has been select as a case study to show that the development a region is attributed to the development of a nation.

4. Discussion and Conclusion

Agriculture is the main occupation and the mainstay of the national economy of Myanmar. Agricultural development is a prerequisite for industrial development of Myanmar. Specially, Ayeyarwaddy region is the top paddy producer in the country as such is commonly known as the paddy granary of Myanmar (or) a big rice pot of Myanmar. Agricultural development can have significant direct impacts on rural welfare or Ayeyarwaddy region. If

agricultural productivity is increased in Ayeyarwaddy region, farmers receive benefits both through increased home consumption and through the income generated from farm product sales of domestic market and international market. The government deliberate to encourages and emphasizes on the agricultural development programs in the Ayeyarwaddy region (or) rural areas of Myanmar. The agricultural development programs should include such as providing agriculture credits to farmers, the adoption of new techniques of production in agriculture, using high-yield variety (HYV) seeds and chemical fertilizers and changing in entrepreneurial attitudes, provision of sufficient irrigation water, provision and support for agricultural mechanization, application of modern agro- technologies, and so forth. There are six major contributions of agriculture sector to economic development of Myanmar. They are following as:

If the government implements the agricultural development programs, it will lead to rising per capita income, the elimination of absolute poverty in rural areas, lessening income inequalities and employment opportunities for the people of Irrawaddy region (or) rural areas, improving social and economic conditions of peasantry, increasing living standard and rural welfare, and so forth.

Finally, agricultural growth stimulates on non-farm growth and employment, landless labor can benefit from those employment opportunities. In the long run, many farmers will also receive income from non-farm employment. An increased in agricultural production for domestic market is one of the primary contribution of agriculture sector to overall economic development of Myanmar.

Abstract

Wetland ecosystem services have a significant impact on people's lives in coastal areas. However, they are facing serious decline. This study analyzes the pressures on wetland ecosystem services in Xuan Thuy National Park (NP). 150 households were selected for interviews, 05 focus group discussions, 10 in-depth interviews were conducted in 5 buffer zone communes to collect both qualitative and quantitative data. The study used DSPIR model to evaluate the current status of ecosystem services in Xuan Thuy NP. The results show that the NP is facing challenges in conserving biodiversity by both human and natural impacts, six major pressures on ecosystem services, two of which are: infrastructure development; lagoon dredging operations need further clarification. Addressing these pressures requires the engagement of all stakeholders, especially managers.

Key words: *DSPIR, Biodiversity conservation, Xuan Thuy National Park, Mangrove*

1. Introduction

Wetlands are one of the most dynamic ecosystems on the planet (Ghermandi et al., 2008), and they provide a variety of valuable benefits to humans. They are, nevertheless, ecologically sensitive and adaptable systems (Turner et al., 2000). Origin, geographic position, water and chemical regimes, dominating species, and soil and sediment features all contribute to the diversity of wetlands. Wetland ecosystems are among the world's most significant, delivering a diverse range of ecological services that are important to well-being of humans (Barbier, 1997; RCS, 2007). Scientists came up with the first global nature conservation convention (Matthews, 1993) and remain the only group of ecosystems to have their own international convention (Turner et al., 2000).

Wetlands are estimated to cover 5–10 percent of the earth's land surface (RCS, 2007, Mitsch and Gosselink, 2007), or around 1,280 million hectares, globally, albeit this is

thought to be an underestimate (MEA, 2005). According to some estimates, the global amount of wetland destruction is over 50% (ICSU, 2008). This is hypothesis, based on extrapolation of 20th century wetland loss in the best-recorded regions, such as North America, Europe, Australia, and New Zealand. There is no accurate data on the worldwide magnitude of wetland loss, however evidence of major individual wetland loss exists (MEA, 2005).

People have become more vulnerable to environmental, economic, and socio-political disturbances as a result of the loss of wetlands, which has had a substantial impact on biodiversity and community livelihoods (ICSU, 2008; Odada et al., 2009).

One strategy to promote prudent use of wetlands and avoid conversion and development is to provide statistics and information on their values (Mmopelwa, 2006). However, in comparison to other wetlands, there is a general paucity of knowledge on wetlands in Vietnam, particularly information on wetlands in Xuan Thuy, where there is a lot of pressure, compromising wetlands' ability to deliver ecosystem services on a continuing basis. This necessitates a grasp of the environmental services supplied by wetlands as well as the risks they face. At the aggregate level, wetland ecosystem services, drivers of change, and subsequent impacts are pretty well understood, but such knowledge is necessary specifically for the area of interest in order to establish a sustainable use strategy. Wetlands in the Red River Delta currently lack this information. The widely used 'Drivers – Pressures – State – Impact – Response' (DPSIR) model examines the fundamental difficulties confronting wetlands' long-term use. Furthermore, the study discovered knowledge gaps that, if filled, might improve wetland management.

The purpose of the paper is to analyze and evaluate the causes and pressures on wetland ecosystem services in Xuan Thuy National Park, Nam Dinh province.

2. Method

Study areas

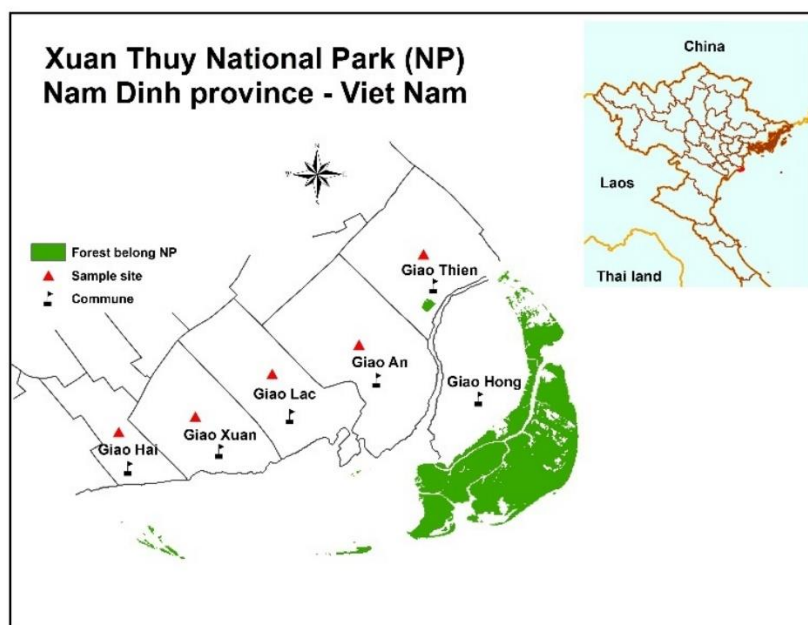

Figure 1. Location of Sampling

Xuan Thuy National Park: Xuan Thuy NP is located in the south of the Red River Estuary, within the administrative boundaries of Giao Thuy district, including the outer part of the Ngan dune, the whole Lu dune and Xanh dune. Xuan Thuy NP has a very convenient and important location with international significance as a Ramsar site and a world biosphere reserve. It is one of nine wetland areas in Vietnam that has been recognized as a world Ramsar site.

The study was conducted in five communes in the buffer zone of Xuan Thuy NP: Giao Thien, Giao An, Giao Lac, Giao Xuan, Giao Hai (Figure 1).

Data collection

Household survey

A total of 150 households located in five buffer communes in Xuan Thuy NP were interviewed during January 2021. We used semi-structured questionnaires to find out the ecosystem services utilized, people's dependence on them, the dynamics of change and people's impact on ecosystem services.

Group discussion

During the focus group discussion, the list of ecosystem services acquired from the home survey was confirmed. At the commune level, five group discussions were held, with an average of 8–10 participants in each group. The members of the group are selected based on their livelihood and dependence on the wetlands. The various sources of change, as well as people's reliance on wetlands, were explored in depth among the groups. The ecological services that were listed were also graded during the debates

In-depth interview with key informants

Representatives of the Xuan Thuy NP, Department of Agriculture and Rural Development, Department of Natural Resources and Environment, leaders of the People's Committees of 5 communes, and heads of villages were selected to conduct in-depth interviews. The key questions centered on wetlands livelihood strategies and changing dynamics. During the research, ten employees were interviewed as key informants to help us better understand change patterns and drivers. The main criteria for selecting informants were their knowledge of wetland resources, their dependence on and participation in wetland management. The main topics of the in-depth interviews focused on the following areas: (a) what is the state of the wetlands and availability of ecosystem services, (b) What are the main drivers of change, (c) The changing trends of available ecosystem services, and (d) the What management decisions are needed to manage wetlands?

Consultation workshop: the research results were presented at the consultation workshop in April, 2022, with the participation of the representatives from Nam Dinh provincial and Giao Thuy district levels: Department of Natural Resources and Environment, Department of Science and Technology, Department of Agriculture and Rural Development, leaders of 5 buffer zone communes and Xuan Thuy NP Management Board.

Data sources

The examination of secondary source data was used to synthesize wetland ecosystem services in Xuan Thuy NP, as well as threats to them. These sources include materials

published in journals, books, national and international conference presentations. Investigated and collated sources of information, with specific reference to ecosystem services (providing, regulating, cultural, supporting services) (MEA, 2005) and the DPSIR framework, were discussed.

Using the DPSIR model

Driving – D, Pressure – P, State – S, Impact – I, Response - R. The DPSIR model describes the interrelationships between Drivers (socio-economic development, root causes affecting ecosystem services), Pressure (livelihood activities, direct socio-economic development impact on the degradation of ecosystem services), State of ecosystem service quality, Impact of ecosystem services decline for public health, socio-economic development activities and ecological environment, Response of the state and society for sustainable development of ecosystem services). Applying synthetic analysis model, DPSIR (Driving Forces - Pressure - State - Impact - Response) to assess the current status of ecosystem services in Xuan Thuy NP. From there, provide solutions to manage, exploit and use natural resources rationally.

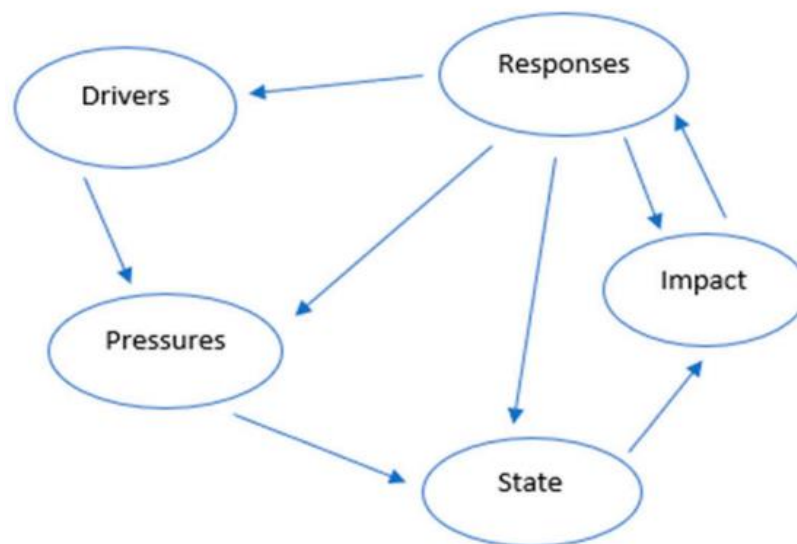

Figure 2. The DPSIR assessment Framework (Kristensen, 2004)

DPSIR has been widely used to examine the causes, consequences, and responses to environmental change in a holistic manner, as well as to organize environmental data. DPSIR has more recently been used to evaluate the influence of environmental change drivers on ecosystem services (Zhang and Lin, 2017). This study uses modeling as a convenient organizational framework to structure environmental information systematically.

3. Results

Basic information about the household survey

Among 150 respondents, 60 are male, accounting for 40%, the rest are female. The women in the 5 communes who participated in the interview are very brave, they not only

take care of the housework in the family but also know very well the business and economy in the family, they are the key people, keeping the money and taking care of the family, so the data is very reliable. The ages of the interviewees ranged from 24 to 89 years old, with a mean age of 48.5 years (Table 1). With 28.5 percent of responders, the age range 41-50 is the most well-represented. This implies that the respondents have experienced in various issues related to their own livelihood activities and in the community. Small family size (less than 4 people in the family) predominates (66.3%). Most of the respondents are owners, so they have a good understanding of the livelihood of their house as well as the disadvantages that their family is facing.

Table 8. Summary of socio-economic respondents based on the survey

Social-economic situation	Categories	Frequency (n)	Proportion (%)
Gender	Male	60	40
	Female	90	60
	21 – 30	10	6.4
	31 – 40	32	21.3
	41-50	43	28.5
	51-60	42	27.7
	Above 60	24	16.1
Number of persons in the family	≤ 4	99	66.3
	5 – 7	43	28.9
	≥ 8	7	4.8
Relationship with the owner	Owner	101	67.1
	Wife	28	18.5
	Husband	3	2.0
	Other	19	12.4
Years of stay in the commune	Under 20	15	10.0
	21-30	19	12.4
	31-40	26	17.3
	41-50	28	18.9
	51-60	35	23.3
	Above 60	27	18.1

Sources: Author's survey

Ecosystem services provided by Xuan Thuy National Park

A summary of the main ecosystem services provided by Xuan Thuy NP is shown in Table 2 as follows:

Table 2. Key ecosystem services provided by Xuan Thuy National Park

Main services provided	Details of services provided
<i>Providing services:</i>	
1. Food	Seafood: clams, fish, shrimp, <i>Solenidae</i> , fish
2. Fresh water	Planting rice and crops
<i>Regulating Services</i>	
1. Climate control	“The mangroves make the climate cool, it's so wonderful, it's a green lung, especially in the summer, it's too cool to come here”
2. Air Purifier	“The mangroves filter the air too well, making the air fresh”
3. Nutrition cycle	In alluvial soil, baby crabs living in mangroves make the soil porous.
4. Absorb and store carbon	“If there are trees, there is definitely carbon sequestration, but we don't know about storage”
5. Flood control, breakwater	“Mangroves can prevent waves a lot, if there is no forest, the dyke inside cannot withstand the waves from the sea, this service is very clear”
6. Pollination	In the season of <i>Aegiceras corniculatum</i> or <i>Bruguiera</i> flowers, from April to June, many beekeepers come here to raise bees, honey in Xuan Thuy NP has brand name, however, most beekeepers are outsiders, only few are local people”
7. Controlling illuvium	Every year in Xuan Thuy National Park, according to the people here, 30-40 cm of alluvial soil is deposited, leaves and branches fall, making the soil fertile and porous.
<i>Cultural services:</i>	
1. Travel	Most tourists come to Xuan Thuy NP in the summer, Xuan Thuy NP has tourism service unit.
2. Education and research	Sightseeing tourism, environmental education, bird watching. A few households here provide boat services for tourists to travel around.
3. Bird watching	Xuan Thuy National Park is a very good model for environmental education and biodiversity research
4. Spiritual value/inspiration	Many delegations of domestic and foreign tourists come to Xuan Thuy National Park to watch birds
	"Everywhere I go, I just want to go home quickly, I have been living here for a long time, get used to the forest, love the forest, whenever I look at the forest, I'm not tired anymore"
<i>Supporting services:</i>	
1. Restore nutrients to the soil	1. Alluvial soil and fallen tree branches contribute to the regeneration of soil nutrients (soil in mangroves).
2. Agricultural production support	2. Thanks to mangroves blocking waves and preventing salt water, people can do agriculture.
3. Spawning grounds, food supply, breeding animals	3. “Mangrove is a good shelter for fish, shrimp live there, there are trees based on it, March and April are season for shrimp and fish multiply”

The Red River Delta is a vital ecosystem for ensuring food security through supplying crops. The abundant soil resources in the wetlands support agriculture, with the cultivation of important food crops, including rice and peanuts. These crops contribute to ensuring consumption for households in the delta.

Seafood in Xuan Thuy NP is very rich, the wetlands provide a common supply of animal protein for most homes in the form of fish and fiddler crab. That seafood source is rich of amino acids, vitamins, minerals and many unsaturated fatty acids (Allison and Okadi, 2009). Xuan Thuy NP, has about 165 species of zooplankton and 154 species of benthic animals. This aquatic abundance supports the strong development of commercial fisheries in the delta, which serve as a major source of employment and income for many households.

Household consumption, income generation, and social obligations are all impacted by ecological services. These services are an equally essential supply of raw materials for the entire community, and they lead to other sectors like as purchasing and seafood processing, which employ a large number of people, particularly women, children, and the elderly. As a result, various employment opportunities are made available to the local community. Although the specific contributions of these services from wetlands (in terms of employment and cash revenue) are unknown, the available evidence highlights the importance of wetlands for local people's livelihoods.

Cultural services refer to spirit and inspiration, recreational and educational functions: ecotourism services are developed in Xuan Thuy NP, in the summer, the number of visitors to the Park increases significantly, In addition to traveling in the Park by boat, dining, entertainment, sightseeing on board, many tourists come to the NP to see birds. According to the 2020 report of Xuan Thuy NP, the number of tourists to the NP has increased steadily over the years, peaking in 2019 with 21,036 domestic visitors, 267 international visitors, and 300 delegations visiting and working at Xuan Thuy NP.

Wetland ecosystem services in Xuan Thuy National Park in the DSPiR model

Drivers to increase or decrease pressure on wetlands in Xuan Thuy National Park

Indirect drivers include demographics; economic (trade, market); sociopolitical, (legal corridor); science and technology; culture and religion (such as choices about what and how much to consume). Socio-economic development policies, including changes in local land use, infrastructure development for aquaculture, national security, water surface exploitation and climate change. There are several obvious direct drivers of wetlands ecological change in Xuan Thuy NP, particularly the encroachment of forest land for aquaculture. The population in 5 communes in the buffer zone of Xuan Thuy NP in the past 10 years has not increased significantly, only fluctuates around 38,000 people, therefore, population is not an indirect driving force that strongly affects the change of ecosystem services at the study site.

Pressure on wetlands at Xuan Thuy National Park

Wetlands face different pressures, wetland changes in Vietnam are generally the result of rapid urbanization, massive aquaculture expansion, pollution from excessive use of

pesticides in agriculture. Natural stresses include sea and shoreline erosion, subsidence, and seawater intrusion. Specifically, for Xuan Thuy NP, through discussions and in-depth interviews with local leaders, six pressures were identified (Table 3), of which two issues need to pay more attention. These two, discussed further below, include reclaimed wetlands for housing and infrastructure development; dredging operations. Dredging in the lagoon causes mangrove death due to the discharge of waste from the lagoon to the outside, they do not have a pipeline to collect waste to the treatment point.

Table 3. Pressure and impact on wetlands in Xuan Thuy National Park

Pressure	Impact
Aquaculture	Loss of mangroves.
Mining operations	Trapping wild birds, illegal harvesting of firewood and fishery products, including littering, uprooting trees and rafts by tourists, reduces the biodiversity resources. Using electrofishing equipment, the bag net destroys small species.
Dredging the lagoon	Use of machinery for dredging, noise pollution, construction of dykes to bring machines into dredging, sludge discharge from lagoons, Changes in terrain and hydrology, as well as dredging for direct burial and destruction of mangroves and related fauna... seriously affect biodiversity resources
Human activities	Deforestation, excessive hunting, overfishing, and the extinction of flora and wildlife are all examples of environmental degradation.
Wetland improvement	Serving agriculture and urbanization
Domestic wastewater, indiscriminate use of fertilizers for agriculture and animal husbandry	Soil and water pollution

*Source: Author's survey: Focus group discussions and household interviews in 2021
Many households in the core area of Xuan Thuy National Park*

Currently, in Xuan Thuy NP, there are still 6 households with aquaculture ponds in the core zone of the Park, because they lived and made a livelihood there before the NP was established, the planning of the NP covers their land, this is also a pressure on conservation work, because it is necessary to harmonize the interests of stakeholders.

Dredging

Dredging is the process of removing underwater and soil sediments. It is done in the delta for a variety of economic and social purposes, like as aquaculture and land reclamation. Some of these operations are so large, they include excavators to do the dredging. Mud, dirt, creek banks, and vegetation along the path are removed during dredging

and dumped as trophy dredging. Heads of households and authorities are responsible for dredging, although dredging is carried out after receiving an application from the household head for the NP, however, the NP staff is still thin to closely monitor all dredging activities. Dredging is considered a major problem for the NP. The research team could only collect information through group discussions, household interviews and field observations. Dredging has a major negative impact on water quality and has the potential to affect fisheries. Dredging causes physico-chemical changes in plain water, according to Ohimain *et al.* (2008), particularly in pH, total dissolved and suspended solids (TDS and TSS), electrical conductivity, turbidity, sulfate, dissolved oxygen, oxygen demand (such as biological oxygen demand (BOD) and chemical oxygen demand (COD)). These activities can result in the extinction of subtidal benthic species and communities (population densities and zooplankton taxa), the release of organic matter, nutrients, and/or contaminants on aquatic organisms, and the disruption of surrounding physical/chemical conditions (reduced light penetration and primary production) (Nayar *et al.*, 2007).

Other pressures mentioned in the report (Table 3) include indiscriminate fertilizer usage in agriculture, which leads to eutrophication (Obire *et al.*, 2008); As an economic activity, aquaculture (shrimp, crab, clam, and fish) has converted mangrove areas into shrimp ponds, resulting in wetland impacts; climate change; industrial and domestic wastewater (Ajao and Anurigwo, 2002); and unsustainable hunting and overfishing (Phil-Eze and Okoro, 2009); In October 2004 UNESCO recognized Xuan Thuy NP as the number one important area (core zone) of the Red River Delta Biosphere Reserve, which confirmed the special international position of Xuan Thuy NP. Next is the buffer zone, this area mainly focuses on aquaculture and agricultural production (mainly concentrated in 5 communes in the buffer zone), bringing high income for local people, and also the cause of environmental impacts, negative impacts on the environment, threatening the sustainable development of the NP. Unreasonable human intervention in agricultural production, aquaculture and the law of river sedimentation in the intertidal zone has caused the regulation of water regime and water quality in Xuan Thuy NP area. Xuan Thuy encountered great obstacles, negatively affecting the natural ecological balance of the area. Therefore, it is necessary to make reasonable adjustments, with technical measures as well as management institutions to ensure the sustainability of the ecological environment, while ensuring the development of aquaculture, fishing, agricultural production to improve people's living standards.

State of wetlands in Xuan Thuy National Park

Changes in the ecology (condition) of wetlands have been attributed to the factors mentioned above. A combination of these forces is harming the health and integrity of wetlands, raising the risk of rapid changes in the ecosystem, which could have serious ramifications for human health (MEA, 2005). Although the rate and magnitude of changes caused by any of these forces are unknown, it is obvious that wetlands are in danger of being degraded (Coleman *et al.*, 2008). The area's unique biodiversity has shifted dramatically, and many significant species have perished. More than 10 years ago, in Xuan Thuy NP, there were 70 spoonbill storks and nearly 30 spoonbills regularly coming to migrate. However, up

to now, that number is only counted on the fingers. Previously, when it was still a mangrove area, Xuan Thuy NP was auctioned by people in the surrounding communes for aquaculture in the core zone of the mangrove forest. Later, when it was recognized as Xuan Thuy NP, it became difficult to solve the balance and harmony between the issue of preserving the living environment for species and the interests of aquaculture households, although the Xuan Thuy NP management board has coordinated with the authorities of 5 communes in the buffer zone, including: Giao Thien, Giao Lac, Giao Xuan, Giao An and Giao Hai, clearly specifying the planning and boundaries of the area. Infringement is prohibited in the National Park.

Ecosystem services are degraded as the state of this ecosystem changes due to the loss of mangroves and a decline in the number and quality of wetlands, either directly or through the interconnections of these ecosystem services (ICSU, 2008). Because the ability to deliver a group of services is contingent on the proper functioning of others (MEA, 2005), any issue will have an impact on the others.

Impact on dependent communities in Xuan Thuy National Park

Plains have a strong link between healthy natural systems and human well-being (ICSU, 2008), and it is apparent that the loss of wetlands can result in abrupt changes in the ecosystem services provided, with serious implications for human well-being (MEA, 2005). The changes seen at the study site have resulted in a decline in the flow of ecosystem services reliant on the community, particularly the destruction of traditional livelihood systems, which has resulted in economic harm. and people are affected. The impact on the services provided is very clear in Xuan Thuy NP, that is the consecutive loss of crops of clam farming households. Many households can no longer depend on mangrove forests, they have to find other livelihoods. The rural poor are more directly reliant on natural resources than the urban affluent, who can provide substitutes.

Response in DSPIR model

At Xuan Thuy NP, there have also been many projects on community livelihoods, research on sustainable use of water resources in Xuan Thuy NP area, economics of biodiversity conservation in Xuan Thuy NP, analysis reports of benefits and costs of coastal wetland use options in Giao Thuy district, proposing a plan for rational and sustainable use of wetland resources.

4. Discussion and Conclusion

4.1. Discussion

The DPSIR model is increasingly being used to study environmental changes and their influence on human welfare. In developing countries like Vietnam, the DPSIR framework has the potential to be a useful instrument for communicating with and among policy communities. The model may be used in this study to determine the ecological services offered by wetlands in Nam Dinh, as well as the primary pressures threatening their continued provision, particularly in light of the benefits to local wetland users. Overall, the study provides a wide range of ecosystem services that are critical to local people's livelihoods. Among the most important ecosystem services are providing services, especially

food (fish, clams, shrimp, crabs), against natural disasters. Wetlands also serve as a large greenhouse gas storage facility, with benefits that extend beyond the region. However, because to development pressures such as aquaculture expansion, dredging, and land reclamation, the ecology has undergone significant alterations. The main stresses on the wetlands of Xuan Thuy NP are similar in some respects to the causes of wetland loss worldwide and elsewhere (Turpie, 2000). In the twentieth century, roughly half of the world's wetlands were lost due to conversion to agricultural and urban areas. (Rijsberman and Silva, 2006). The study also found that most, the main pressure is not directly rooted in local community activism, could go some way towards explaining why these groups view themselves as 'victims' of the plains' changing environment. However, in order to better understand how local communities contribute to shifting ecosystem service delivery, the role of local communities in contributing to such pressures has gotten scant attention. We discovered that delivering and regulating ecosystem services were the most under strain among the major ecosystem service groups, driven by all four fundamental pressures highlighted in the review. The cultural sector appears to be the least impacted.

The research on the relationship between ecological services and human well-being in the delta is limited, and any assessment of this relationship must rely on individual observations. With this caution in mind, we conclude that the loss of providing and regulating services will affect livelihoods in the study area, despite the fact that services are plainly crucial to human health elsewhere.

According to the findings of this study, inefficient wetlands pressure reduction is caused by mismanagement in legal and administrative entities. This is in line with the growing acknowledgment of institutional forces as significant environmental change drivers (Young, 2002). As a result, the dominant driver of ecosystem change in the delta at the study location must be considered governance. The political dynamics of wetland development are highlighted in many studies, including (MEA, 2005). To allow for an analysis of the full nuclear chain, more attention to the indirect drivers of change in deltas is required, including the application of ecological and social science linkage methodologies. The results run from indirect control processes to direct controls that change the ecosystem (ICSU, 2008).

First, the new study highlights the most prominent of the threats, but does not yet specify the extent to which each threat has altered wetland ecosystem services; where threats are most likely to occur and ecosystem services are most impacted.

Second, the amount to which each ecosystem service contributes to human well-being is still unknown due to a lack of research and documentation (Ebeku, 2004). Because the linkages between ecosystem services and human wellbeing are not always evident, and the value of ecosystem services is frequently unknown (and hence removed from the cost–benefit analysis), this lack of information hinders management decision-making.

Third, there is a need to better understand the nature of community-beneficial ecosystem services. Some authors emphasize the importance of economic valuation as a means of assessing the contribution of wetlands to people's welfare (Bingham et al., 1995;

Howarth and Farber, 2002), while others stress the importance of ecosystem services being overvalued (Balmford et al., 2002; Mmopelwa, 2006).

Finally, the absence of sufficient evidence to identify the beneficiaries and losers as ecosystem services fluctuate in place and time is a major knowledge gap identified in this study. A feature that distributes access to and benefits from ecosystem services (by time, space, and user from global to local using a scale) that will help us better understand the complexities of social and political dynamics that are key determinants of wetlands' ability to provide ecosystem services and thus sustain livelihoods. Ecosystem services in terms of space and time; how ecosystem services affect people's livelihoods in the delta; determining the whole value of wetland ecosystem services in the Red River Delta, taking into account non-economic factors; How institutions work, affecting the flow of ecosystem services benefits; and, eventually, how those benefits, or the loss of those advantages, are allocated across such groups and communities, inside and without deltas.

4.2. Conclusion

The use of DPSIR model and sociological investigation method to assess pressures on wetland ecosystem services is a right step, fully describing pressures, states, impacts, and drivers. It is a clear fact that the ecosystem services in Xuan Thuy NP are declining in both quantity and quality, caused by both human and natural causes, in which the six main pressures on ecosystem services are particularly noted. However, in this study, it only stopped at describing the pressures, to better understand the nature and impact level of each pressure, it is necessary to have more in-depth research, especially, it is necessary to have an evaluation study. Comprehensive assessment of the impact of infrastructure construction and lagoon dredging on trees and plants in Xuan Thuy National Park.

Acknowledgments

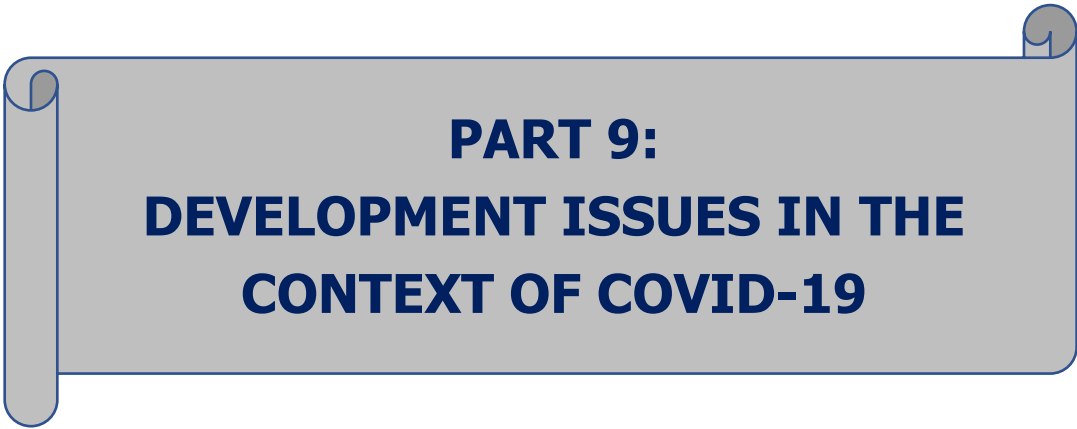

This paper has been part of the project QG.19.71, with financial support from Vietnam National University, Ha Noi. We would like to thank the staffs of Xuan Thuy National Park for their assistance in the field work, thank local people for their comments and sharing their knowledge of their daily life activities.

Abstract

This study aims exploring livelihood opportunities and factors impacting livelihood choice of the returnees to Son La province due to the Covid-19 pandemic in 2021. The survey of 300 returning migrant people show that most of the returnees had been engaged in agricultural activities before migrating to the cities. In the context of Covid-19 crisis in 2021, most of the returnees had to come back to their hometown because of their concerns over the Covid-19 infection, their suspended business or activities, downsized production scale, or reduced working hours. Upon their return, 85.5% returnees found job and most of them have been working on the household farmland. As soon as the pandemic under control, most of the returnees plan to migrate again to look for higher paid job and better life in the cities. While economic drivers encourage returnees to resume migration, the main reason making returnees to stay at their hometown is family concerns and responsibilities.

Keywords: *Covid-19, Livelihood, Returnee, Migrant workers*

1. Introduction

Vietnam has experienced a rapid modernisation and industrialisation over the past 20 years. GDP of manufacturing and industrial increased from 78,4% to 86,4% and urban population growth from 27.1% to 36.8% between 2005 to 2020 (GSO, 2020). Industry and manufacturing concentrate in industrial zones and city areas. In 2018, migrants from 15 years old is 788,9 thousand people, accounting from 1.1% of total population aged 15 and above (GSO, 2019). Migration in Vietnam is mainly driven by employment motivations (Ngoc et al., 2017; Phuong & Thuy, 2020) and most of places of destinations are cities and urban areas (GSO, 2019).

Son La, the mountainous province of difficulties, is one of the poorest province in Vietnam. In 2020, the rate of multidimensional poverty in Son La was 30.53% (higher than

the average rate of the whole Northern Mountainous region of 14.38%) and average monthly per capita income was 1,745 thousand Vietnamese Dongs (GSO, 2022) (equivalent to 34.3% income of Red River Delta region, to 41.1% of the national wide scale). Therefore, many workers in Son La province migrated to other provinces for working in industrial zones and urban areas. By 31 December 2021, according to the report of the Department of Labor, Invalid and Social Affairs of Son La province (DOLISA), Son La has 118,448 people migrating to other provinces. 4 districts having the high rate of migrants are Thuan Chau (accounting for 22.3%), Phu Yen (16.6%), Muong La (13.2%) and Song Ma (12.6%)

The fourth wave of Covid-19 since April 2021 of more severity leading to lockdown and in many provinces have had negative impact socio-economic activities, including production and business activities. Many enterprises and production facilities had to suspend their activities or reduce production and business (Cong Thang et al., 2021; Dau Anh Tuan, 2021; Quang & Dinh, 2022). During the Covid-19 crisis, migrant workers faced many difficulties and challenges such as job loss and reduced income (Quy et al., 2022; Thanh Mai et al., 2021). To cope with this situation, migrant workers had to cut their spending, seek support from communities or return to their hometown (Quy et al., 2022; Thi Mai Anh et al., 2022). Covid-19 crisis had led to a reverse migration across the country, especially from cities and key Southern economic zones to rural areas. Between early 2021 to 16th February 2022, as reported by DOLISA, about 104,000 people (accounting for 88.2% of total migrants) returned to Son La. The returnees came back from many provinces and localities, such as Hanoi (22.6% of total returnees), Bac Ninh (11.1% of total returnees), Hai Duong (5%), Bac Giang (4.7%).

As March 11, 2022, 81.14% of Vietnamese population were partially vaccinated against the coronavirus. Accelerating vaccination coverage have given Vietnam some latitude in opening its economy and relaxing movement restriction from March 2022. Upon the reactivating economic activities, returnees may migrate again for job opportunities. However, taking into account hindering risks to the health and employment opportunities, a part of returnees is still not ready for migration.

This short paper presents the results of a study on returnees to Son La province due to the Covid-19 pandemic. Specifically, the article presents demographic characteristics and reasons for migration, type of work at the destination place, livelihood during the stay at hometown and reason driving returnees to continue to migrate or stay at the hometown.

2. Method

Information of this short paper was collected through a survey of 300 returnees to Son La province during the 4th wave of Covid-19. Returnees are people of over 15 years old living in 15 communes and towns of three districts of Thuan Chau, Muong La and Song Ma. These districts are home of the most returnees in the province. In each commune, 20 returnees were randomly selected from the lists of returnees monitored by the DOLISA for direct interview through a structured questionnaire. One returnee represents one household in the commune. Of the total 300 interviewed returnees, 126 are female, accounting for 42%. The survey is done between 20th and 31st March 2022. The information and data captured in the survey were treated by STATA to produce descriptive statistical analysis to assess the livelihood status and choice of returnees.

3. Results

3.1. Livelihood and reasons for migration

The survey results show that 81.0% of returnees have experienced in agricultural production. Only 8.7% of female returnees had worked in non-agricultural work, lower than the rate of 15.5% for male returnees. 92.6% of respondents are ethnic minorities, specifically Thai people. Average age of returnees is 33 years and migration time is averaged at 3.5 years. Among interviewed returnees, 62.0% of respondents are aged between 25 and 35, 22.7% of respondents aged between 15 and 25, and only 15.3% of respondent aged 35 years old and above. These statistics may reveal that returnees of 25-35 year-old group are much concerned by responsibility of educating and taking after their children.

In terms of education level, most of returnees completed lower secondary education (66.3% of respondents), following by upper secondary education (27.0%) and then college or higher education (6,7% of respondents). The survey results also show that uneducated female returnees account for 16.7% while this rate among male returnees is only 6.9%. Several studies in Africa have shown that people who are better educated are more likely to migrate than those who are not (Caldwell, 1968; Sabot, 1972). In particular, the study in Tanzania shows that workers with lower secondary education are most likely to migrate (Sabot, 1972).

There are many reasons for returnees to migrate to work outside as shown in Table 1. However, the reason cited by 87.0% of respondents is low income from working at home. The other two reasons are relatively cited are that “they could not find suitable jobs at home (38.4% of respondents) and “employment shortage” at the hometown (34.8% of respondents). These two reasons further explain low income at the place of origin. As mentioned above, most of the returnees had worked in agriculture prior to their out-migration. Meanwhile, the average land area of a household is only about 6,600m² in mountainous areas, so agro-forestry-fishery production is not enough to cover family spending. 15.0% of respondents, most of them are young, said that they expected a changing living environment. The results of this study are consistent with the conclusion of Nguyen et al. (2015) that rural-urban migration is also caused by insufficient employment in rural areas.

Table 9. Reason for migration

Reason	Unit	Male	Female	Total
Couldn't find relevant job at hometown	%	44.4	30.3	38.6
Too little time for working at hometown/ employment shortage	%	39.2	28.7	34.8
Income at hometown too low/ wanna to have higher income	%	86.5	87.7	87.0
Relatives/Friends introduce jobs	%	21.1	22.1	21.5
Enterprises/Business going to the hometown for recruitment	%	0.0	0.8	0.3
Go to work right after vocational trainings	%	1.2	2.5	1.7
Wanna to change environment life	%	15.8	13.9	15.0
Have no land for production	%	7.0	9.8	8.2
Have no production resources	%	4.1	2.5	3.4

Source: Computed from the survey, 2022

3.2. Livelihood of returnees during migration

The majority of returnees migrated to cities (96.7% of respondents), of which 75.9% worked in big cities (Hanoi, Hai Phong, Binh Duong, Ho Chi Minh City, etc.). Only 3.3% of respondents migrated to other places in rural areas for job. The survey also shows that among interviewed returnees, 74.2% of respondents were workers before their return to home. 16.1% of respondents are self-employed and very few returnees do jobs as office workers, clerks, store staffs and maids. There is a clear difference in choosing job between male and female migrants. While 80.2% of female returnees applied for worker position, only 69.8% of male returnees were workers in factories. In contrast, 20.9% of male returnees chose to do manual labor, while only 9.5% of female returnees choose this type of work. This can be explained by the fact that women tend to opt for jobs with stable wages and working hours to match their role in family life while free job can bring higher income but longer and unstable working time.

Table 10. Economic activities that returnees did before coming back to the hometown

Name of job/employment	Unit	Male	Female	Total
Worker	%	69.8	80.2	74.2
Staffs in stores, supermarkets, agents, etc.	%	1.2	3.2	2.0
Administrative workers in organization, enterprises.	%	3.5	3.2	3.4
Manual job/free labor work	%	20.9	9.5	16.1
Manual job/servant in restaurant, food stalls	%	1.7	1.6	1.7
Other employment	%	2.9	2.4	2.7

Source: Computed from the survey, 2022

Although 79.5% of returnees worked for enterprises or business establishments, only 46.6% of returnees have labor contracts from 3 months to indefinite term. There is a relatively high percentage of employees working for the enterprise but don't have labor contract. The study shows that workers younger than 35 years old having a higher rate of labor contract (58.2% of respondents) than workers over 35 years old (45.9% of respondents)

The Covid-19 pandemic has negatively affected production and business activities of all economic sectors and people's lives, including migrant workers. Many migrant workers have to return to their homeland in 2022 for many different reasons as shown in Table 11. The reasons for the highest rate of returning migrant workers are: "afraid of contracting Covid-19 at the place of destination" (58.0% of respondents); "losing jobs" (32.3% of respondents) when businesses had to stop production, to cut workers due to complete social distancing at the place of destination; "unstable job due to reduced working time" (31.3% respondents); anxiety (24.3% of respondents); "Health concerns of children and relatives at hometown" (21.7% of respondents); and about 18.3% of respondents said they were called by their families due to worries about the serious pandemic situation at work. The study also reveals reasons as worries of getting Covid-19, losing job, unstable job, psychological stress were more cited by male returnees than female returnees. Meanwhile, female returnees are more concerned by taking care of relatives and children.

Table 11. Reasons for the coming back to the hometown

Reason	Unit	Male	Female	Total
Losing job/Laid off	%	36.2	27.0	32.3
Reduced working time, unstable job	%	35.1	26.2	31.3
Reduced salary, income	%	4.6	3.2	4.0
No income, money for living at the place of destination	%	15.5	11.9	14.0
Afraid of infected by Covid-19 at the place of destination	%	60.9	54.0	58.0
Health concerns of children and relatives at hometown	%	19.5	24.6	21.7
Anxiety and stress	%	28.2	19.0	24.3
Recalled by family at the hometown	%	20.7	15.1	18.3
Suffering from accident, health concerns of the returnees	%	1.1	1.6	1.3
Other reasons	%	9.8	6.3	8.3

Source: Computed from the survey, 2022

3.3. Livelihood of returnees after coming back to home

After their return, 85.5% of respondents found in economic activities, while only 14.5% of respondent don't have any work or job. The main reasons for not working are: “not finding work outside of the family” (41.5% of respondents); “workers do not want to go to work” (41.5% of respondents) as returning to their homeland is said as just a temporary measure to avoid Covid-19; “ I could not find suitable jobs” (26.8% of respondents) and “ I am afraid of being infected with Covid-19” (24.4% of respondents).

At home, 84.9% of respondents have been working in the agriculture for family. 13.4% of returnees participate in non-farm activities. While non-farm employment opportunities in Son La province is very low, work experiences that returnees had accumulated during migration making very little contribution to the livelihood of returnees at home.

3.4. Choice of livelihood of returnees for the post-Covid-19 time

From March 2022, with a relatively high percentage of adults being vaccinated, social distancing measures have been eased and production and business establishments reopened on a large scale, creating opportunities for laborers. Migrants who have returned to their homeland return to work in other provinces. The survey results in Son La at the end of March showed that 61.6% of respondents would continue to migrate to work outside. Only 38.4% of respondents would stay. However, those who said that they were staying in their homeland to work after the Covid-19 were in fact still in the consideration and waiting stage.

The reason for staying at home to work is that “caring of the family” (56.3% of respondents). Even if there is no epidemic, migrant workers can return to their homeland because of their responsibilities to their children and elderly parents (Thanh et al., 2017); “family business with full employment” (54.5% of respondents); Still worried about the Covid-19 (33.0% of respondents); the family does not want to go away (32.% respondents); Working away from home also does not save much (14.3% of respondents). Only 5.4% of respondents who would

stay said that there were job opportunities for them locally and 2.7% said that the job at home was quite good compared to the job in the place of destination. The study also shows that workers who stay at home have an average age of 34.3, higher than the average age of 32.1 of those would continue to migrate. Thus, more aged migrants tend to return to their hometown after along time working outside. The percentage of women who stay and work in their homeland is 43.2% compared with 34.9% for men. This is an issue that localities must pay attention to regarding employment policies for migrant workers when they no longer have the opportunity to find jobs in the place of destination, especially workers engaged in the labor-intensive industry are vulnerable to the potential of being fired after the age of 35.

Table 12. Reason for stay at the hometown post-Covid-19

Reason	Unit	Male	Female	Total
Business of family have sufficient employment for labor	%	58.6	50	54.5
Current job at home is better than job in other provinces	%	3.4	1.9	2.7
Need time to take care of family	%	60.3	51.9	56.3
Family don't want and encourage to work outside	%	31	33.3	32.1
Having more job opportunities at the locality	%	6.9	3.7	5.4
Little saving when working outside	%	17.2	11.1	14.3
Concern over Covid-19 pandemic	%	31.0	35.2	33.0
Other reason	%	1.7	3.7	2.7

Source: Computed from the survey, 2022

For returnees choosing to stay, difficulties include: no capital for production because of absence of accumulated assets (58.2% of respondents), lack of knowledge on agricultural production (41.8% of respondents), risk aversion against business and low income (26.5% of respondents), no land for production (17.3% of respondents). Only 4.1% of returnees who would stay say that they have no difficulty or barrier to stay in their hometown for work.

For returnees whose plan is to continue to migrate to other places, their motivations are driven by low-income jobs at home, employment shortage, boring life, concerns about the future of their children, external job opportunities introduced by friends or relatives. Among those reasons for re-migration, the most important reason is low-paid job at home (62.0% of respondents), followed by poor condition of living in the rural areas (12.9% of respondents). Quality of public services (school, healthcare....) are weighted in their choice to migrate to cities. Urban amenity is also a factor attracting the migration of rural labor to urban areas (Shilpi et al., 2014). 12.3% of respondents were called by their employers to return to work (Table 5). Average income of returnees working in other provinces is 8.1 million VND per month, 45% higher than the amount they earn at the hometown (4.6 million VND per month).

Table 13. The most important reasons for the returnees’ post-Covid-19 out-migration

Reason	Unit	Male	Female	Total
Insufficient employment at hometown	%	10.9	4.4	8.4
Job at hometown give low salary/income	%	60.0	65.2	62.0
Poor living condition at the hometown may affect the future of their children	%	15.5	8.7	12.9
Employers call to be back to work	%	10.9	14.5	12.3
Call by friends and/or relatives	%	1.8	4.4	2.8
Easy to find a job outside	%		1.5	0.6
Other reason	%	0.9	1.5	1.1

Source: Computed from the survey, 2022

Some challenges facing returnees who will continue to migrate are fear of Covid-19 infection (71.7% of respondents), worry about their children and parents at home (48.9% of respondents), not having enough employment (45.7% of respondents), fear of not finding a job (17.1%) and fear of not finding a suitable school for their children (2.2% of respondents).

4. Conclusion

The results of the investigation of 300 returnees to Son La province due to the Covid-19 pandemic show that the main reasons for migration have economic nature, i.e. higher income in cities and industrial areas. The majority of returnees complete lower secondary school and work as workers in business and enterprises in big cities. Reasons pushing migrant labor to coming back to their hometown are the fear of Covid-19 infection, losing jobs or reduced working time as well as reduce income at the place of destination in the context of prolonged lockdown. Upon their return, 85.5% of respondents found jobs and mainly do agricultural activities for their family. Once the pandemic control measures adaptive to the new circumstance, 61.6% of returnees confirm that they would continue to migrate to work, 38.4% of returnees would either stay at home or be still in hesitation. For those who would stay permanently, they would like to spend more time to taking care of their parents and children in one hand, and economic activities of the family are sufficient. It is noted that these people are more aged than those continue to migrate. For returnees who continue to migrate, the two most important reasons for their decision are “looking for a better-paid and higher-income job” and “concern about the future of their children” as living conditions in place of destination are believed to be better.

Acknowledgment

This short paper uses the data and information extracted from the study entitled “Rapid assessment of livelihood and of returnness to Lao Cai and Son La provinces due to Covid-19 pandemic” in the framework of the Program GREAT funded by Aus4Equity of AusAid. The authors convey thanks to GREAT for funding the study.

Abstract

The COVID-19 pandemic has significantly changed the online shopping behavior of Vietnamese consumers. This study aims to explore the factors affecting online shopping behavior and habits in Vietnam during the COVID-19 pandemic. Through a questionnaire sent via Google Form in February 2022, the authors received 778 responses with 750 responses being valid. The research results show that both the fear of the COVID-19 pandemic and the perceived behavioral control have significant impacts on the online shopping intention and behavior of consumers in the context of the COVID-19 pandemic. Since then, the study suggests several recommendations to enhance the transition from traditional shopping to the online form, to support consumers to shop with confidence in the context of the pandemic and even in the "new normal condition".

Keywords: *Theory of planned behavior, online shopping intention, online shopping behavior, shopping habits, COVID-19.*

1. Introduction

The outbreak of the COVID-19 pandemic has greatly impacted every aspect of people's lives worldwide (Liguori and Winkler, 2020; Zahra et al., 2021). The COVID-19 pandemic caused by the new strain of Corona virus (SARS-CoV-2) has affected 202/204 countries and territories and was officially declared a pandemic by the World Health Organization (WHO). During the 3 years of the pandemic, Vietnam's society and economy have had certain changes - people's fears have led to a change in daily activities, from face-to-face meeting to online conservation. This extremely affects people's life, but it is a condition to ensure the safety of the whole family and the whole society (Meyer, 2020). One of the visible impacts of how people cope with isolation is their changing shopping

habits (Nguyen, 2015). Online shopping on e-commerce platforms becomes necessary and useful (Nguyen, 2020).

Stemming from the above issues, the article studies the impact of COVID-19 on online shopping behavior and habits in Vietnam, thereby providing some orientations and recommendations for the regulatory agencies and online businesses in Vietnam.

2. Literature Review

2.1. Theoretical basis

Research on factors affecting online shopping behavior and habits in the context of the COVID-19 pandemic has been carried out by many researchers, in which academics often pay attention to the relationship among factors affecting online shopping behavior and habits of consumers during the COVID-19 pandemic. In these studies, the authors have applied the following theories: Uses and gratifications theory (UGT); Theory of Planned Behavior (TPB); Technology Acceptance Model (TAM) and Theory of Perceived Risk (TPR).

Uses and Gratification Theory (UGT)

The Uses and Gratification Theory, originating in the 1940s (Palmgreen, Wenner and Rosengren, 1985), argues that people have the initiative in choosing and using media based on their own needs (Wu et al., 2010). Thanks to the development of technology, businesses are now gradually turning to online business to meet the needs of customers better, thereby attracting them. These shows the role of UGT Theory in explaining motivations to use a particular e-commerce platform (Luo et al., 2011). In the current context where the COVID-19 pandemic is spreading rapidly and strongly, it is the pandemic that has pushed consumers to make purchasing decisions through e-commerce platforms with the demand to protect their health and safety (Tran, 2021). However, the UGT theory also has limitations such as too much emphasis on individual factors and heavy behaviorism. In addition, UGT focuses more on the public than the content of the message that the media wants to convey, the audience can only agree or refuse to receive the media message for ideological, cultural or political reasons.

The Theory of planned behavior (TPB)

The theory of planned behavior (TPB) was first proposed by Ajzen in 1985, claiming that behavioral intention determines the final behavior that the factor affecting behavioral intention is attitude (the evaluation of behavior) and subjective norm (other people's assessment of the behavior) (Ajzen and Fishbein, 1980). Currently, TPB theory is also widely applied in research and behavior related to the use of technology (Ajzen, 2020) and especially in the field of e-commerce or online shopping. In the process of online shopping, cognitive factors controlling behavior also affect consumers' decisions and purchase intentions, it may come from the opinions of friends, relatives, colleagues. and it leads to the decision to continue or not to continue the online shopping behavior (Hsu et al., 2006). In terms of strengths, TPB model is considered to be more optimal in predicting and explaining consumer behavior in the same research content and context, TPB overcomes the disadvantages of other models by additional cognitive behavioral control factors. An

individual's behavioral intention cannot be the sole determinant of behavior. By adding "behavioral control perception", the theory of planned behavior can explain the relationship between behavioral intentions and actual behaviour. Regarding limitations, the TPB model has some limitations in predicting behavior (Werner, 2004). The first limitation is that the determinant of intention is not limited to attitude, subjective standard, perceived behavioral control (Ajzen, 1991). Empirical research has shown that only 40% of behavioral variability can be explained by using TPB (Ajzen, 1991; Werner, 2004).

Technology Acceptance Model (TAM)

The Technology Acceptance Model (TAM) proposed by Fred Davis (1989) is based on the Theory of reasoned action (TRA) model developed by Fishbein and Ajzen (1975). This model is used to explain and make predictions about users' acceptance and use of technology. Previously, the model was only used a lot in the field of technology, however, today this model is applied more in the areas related to behavior, consumer intention on e-commerce sites and online shopping. There are typical studies that use TAM model to predict user behavior in email (Szajna, 1996), in website (Koufaris, 2002; Van der Heijden, 2003) and in online shopping (Van der Heijden, 2003; Xiang et al., 2016).

Theory of perceived risk (TPR)

In the Theory of Perceived Risk (TPR), Bauer (1960) has showed the theory of perceived risk related to consumption behavior. Theory of Perceived Risk demonstrates that the behavior of using technology always involves risks, including two factors: (1) Perceived risk related to products/services; (2) Perceived risks related to online transactions regarding conducting e-commerce transactions on electronic devices (Bauer, 1960). In which, product risk includes the possibility that goods are not as expected, not meeting the requirements of consumers (Peter et al., 1975). In addition to the perceived risk associated with the product, there is also the perceived risk of online transactions affecting customers' purchase intention.

2.2. Proposed research hypothesis

Fear of the COVID-19 pandemic

Consumers are changing their shopping habits from offline shopping to online shopping with more frequency than before the pandemic. Because the COVID-19 virus can be spread through person-to-person contact and effective drugs or vaccines have not been found yet (Smith et al., 2020), consumers must switch their purchases to online shopping to reduce disease exposure (Iversen et al., 2020). Similarly, Cintia et al. (2020) conclude that customers have the behavior to avoid crowded places, brick-and-mortar stores even if they are still open. Pandemic hazard perception significantly affects customers' shopping intention and consumption behavior in the context of a pandemic (World health Organization, 2020; Baker et al., 2020; Lima et al., 2020). Therefore, the proposed research hypothesis is:

H1: Fear of the COVID-19 pandemic has a positive impact on consumers' online shopping intention in the context of the COVID-19 pandemic

Safety

The issue of security in online payment systems is quite complicated because risks are shared between the seller, the buyer and the intermediaries that support the payment process (Fianyi et al., 2019). The rise of cybercrime and the development of tools to penetrate personal data have impacted the security of e-commerce, increasing cases of identity theft, privacy violations and financial information (Fianyi et al., 2019). However, Hartono et al (2014) argue that the aspects of confidentiality, integrity, availability and non-repudiation play an important role in the concept of security. Research by Raja et al (2008) shows that in order to enhance safety and security, it is necessary to increase the participation rate of relevant issuers or payment service providers to reduce threats. So, the proposed research hypothesis is:

H2: Safety in payment has a positive effect on consumers' online shopping intention in the context of the COVID-19 pandemic

Convenience

In addition to the safety that consumers pay attention to, there are advantages of online shopping including convenience and savings. Many businesses are well aware that e-commerce greatly affects their business operations (Zeithaml et al., 2002). So, the proposed research hypothesis is:

H3: Convenience has a positive effect on consumers' online shopping intention during the COVID-19 pandemic.

Saving

In addition, the price of online goods may be lower than the one of offline shopping because the seller saves several costs in the selling process. This makes customers feel that purchasing online will save more time and money for them. Low price is one of the main drivers of online shopping behavior (Jadhav et al., 2016). The research hypothesis proposed by the authors is:

H4: Savings have a positive effect on consumers' online shopping intention during the COVID-19 pandemic.

Online shopping intention and behavior

According to Pavlou (2003), when a consumer intends to use online transactions to shop, it is called online shopping intention. Similarly, online shopping intention represents the extent to which customers intend to use e-commerce platforms to shop in the future and have recommendations for others to do online shopping (Nguyen Thu Ha et al., 2019). In the process of online shopping, customers tend to continue using this form of shopping in the long term, forming the intention to continue to buy again in the future. This is considered to be an important factor affecting the operation of e-commerce websites in general and businesses in particular.

According to Fishbein and Ajzen (1980), intention is a factor to motivate an individual ready to perform a behavior in the future. Based on that theory, Delafrooz et al. (2011) have shown that online shopping intention is the likelihood that a person will definitely consume a product through shopping on the Internet. According to TPB theory,

the intention to perform a particular shopping behavior can be predicted by the impact levels of perception (purpose to control behavior), subjective norm and attitude (Ajzen, 1991). Therefore, the proposed hypothesis is:

H5: Intention has a positive influence on consumers' online shopping behavior in the context of the COVID-19 pandemic

From the theories and hypotheses presented above, the hypothetical model of the study is proposed as follows:

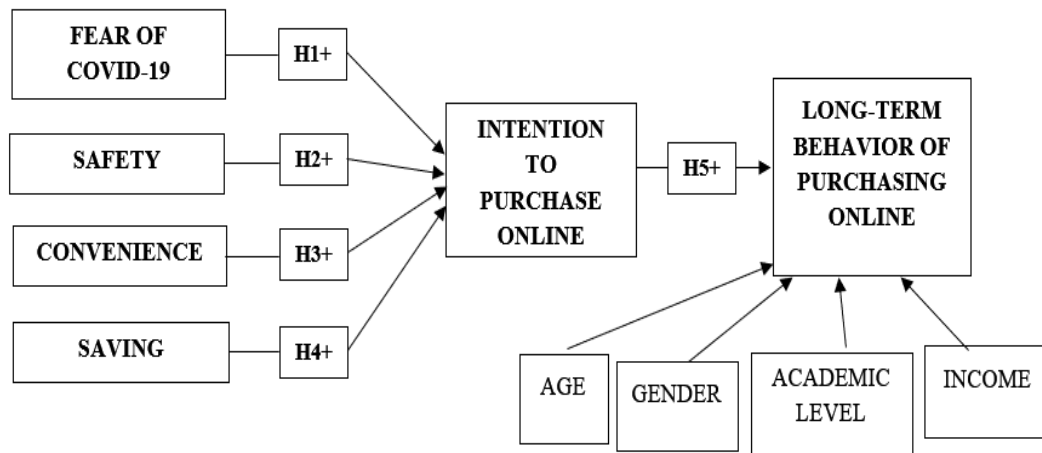

Figure 1. Hypothetical model of the study

Source: Proposal of the authors

3. Method

3.1. Sample selection and data collection

To test the model and research hypotheses, the authors use qualitative method, sampling method is conducted with the aim of saving cost and time. According to the regression method, the minimum sample size is $n \geq 8m+50$ (where n is the sample size, m is the number of independent variables proposed in the research model) (Tabachnick et al., 2007). The study uses 17 independent variables, so the minimum sample size will be $8 \times 17 + 50 = 186$. In order to ensure the reliability and significance of the research results, the authors collected and selected 750 survey questionnaires, completely meeting the requirements mentioned above.

The surveyed subjects are those who have used online shopping in Vietnam through social networking sites or e-commerce platforms. The authors used Google's questionnaire creation tool (Google Forms) to create the survey and approach the survey participants through posts on social networks such as Facebook, Instagram and direct contact via email from February 14, 2022 to the end of March 1, 2022. The research space is all geographical areas of Vietnam, so the authors have tried to get feedback from survey respondents from many different regions across the country. However, after closing the survey form, the authors found that the survey subjects were still concentrated mainly in the North, especially in Hanoi city.

3.2. Formation and construction of the scale.

The scale used to study the impact of the COVID-19 pandemic on shopping behavior and habits is a 5-point Likert scale ranging from 1- Completely disagree to 5 - Totally agree. The variables of the scale in the study were suggested by previous authors (Lazzerini et al., 2020; Vitenu-Sackey et al., 2021; Tran, 2021). Besides, the authors also develop new scales such as safety, convenience and economy. The scales used in this article are presented in Table 1.

Table 1. Scales used in the study

Symbol	Content	Source
Fear of disease		
NL1	I feel the COVID-19 pandemic is dangerous.	Tran Trong Thuy (2021).
NL2	Purchasing on e-commerce platforms will protect me from the risk of spreading the disease.	
Safety		
AT1	The site is fully featured to ensure safety and security	Nguyen Hong Quan (2021)
AT2	When I shop online, e-commerce platforms protect me against any potential commercial risks during my online shopping.	
Convenience		
TL1	I feel the interface of the e-commerce platforms is simple and easy to use.	Self-suggested group of authors
TL2	I find it easy to get information and order on the e-commerce platform.	
TL3	I feel there are many choices when purchasing on e-commerce platforms.	
TL4	I feel that shopping online will help me make payment more conveniently, without having to wait in line.	
Saving		
TK1	I feel that shopping on e-commerce platforms is faster than traditional shopping.	Eliasson Malin (2009)
TK2	Using e-commerce services can help me save travel costs to view goods.	
TK3	I feel that shopping on e-commerce platforms is much more economical than shopping directly (due to vouchers, offers, coupons, promotional codes ..)	
Shopping intention		
YD1	I only intend to shop online if the products are not available in brick-and-mortar stores	Arifani and Haryanto (2018)
YD2	I plan to shop online	
YD3	I will recommend friends and family to use online shopping	

Symbol	Content	Source
Shopping behavior on e-commerce platforms in the future		
HV1	I think online shopping will meet my shopping needs well in the future	Self-suggested group of authors
HV2	I tend to prioritize online shopping on e-commerce platforms over traditional shopping in the future	
HV3	I will shop online more often in the future	

4. Results

4.1. Descriptive Statistics

Table 2. Descriptive statistics of the survey sample

Characteristics	Options	Frequency	Ratio (%)
Sex	male	364	48.53
	Female	386	51.47
Age	Under 20 years old	183	24.40
	20 - under 30 years old	238	31.73
	30 - under 40 years old	181	24.13
	40 - under 50 years old	58	7.73
	50 - under 60 years old	53	7.07
	60 years old and up	37	4.93
Academic level	Under the university	114	21.87
	University	489	51.87
	After university	147	26.27
Monthly income	Under 10 million	387	51.6
	From 10 million - under 20 million VND	258	34.4
	From 20 million - under 30 million VND	56	7.47
	From 30 million or more	49	6.53
Area of study/work	North	311	41.47
	central	251	33.47
	male	240	25.07

Source: Analysis results of the author's team

The descriptive statistics in Table 1 show that 51.47% of survey participants are female and 48.53% of survey participants are male. The percentage of survey participation between the two genders is not too large, showing that the participation in online shopping of both men and women is almost equal. 31.73% of survey participants are between the ages

of 20 and under 30, with college/university education (51.87%) and graduate (26.27%). This shows that the majority of respondents are young, educated, so they tend to approach online shopping. Older age groups such as 40 to under 60 years old account for only nearly 15% and over 60 years old group accounts for only 4.93%, indicating that older people often have difficulty accepting new forms of shopping. In terms of monthly income, most samples focus on less than 20 million VND (86%), while income over 20 million VND is relatively small. Regarding the study/working region, the sample is relatively evenly distributed, with 41.47% in the North, 33.47% in the Central region and 25.07% in the South.

4.2. Check the reliability of the scale

Table 3. Results of testing the reliability of the scale

Factor group	Observed variables	Correlation coefficient on total variable	Cronbach's Alpha coefficient if excluding the variable
Fear of disease (NL)	Cronbach's Alpha = 0.751		
	NL1	0.604	-
	NL2	0.604	-
Safety (AT)	Cronbach's Alpha = 0.710		
	AT1	0.550	-
	AT2	0.550	-
Convenience (TL)	Cronbach's Alpha = 0.801		
	TL1	0.618	0.750
	TL2	0.620	0.749
	TL3	0.618	0.750
	TL4	0.601	0.758
Saving (TK)	Cronbach's Alpha = 0.750		
	TK1	0.567	0.678
	TK2	0.592	0.650
	TK3	0.575	0.670
Online shopping intention (YD)	Cronbach's Alpha=0.755		
	YD1	0.628	0.638
	YD2	0.582	0.679
	YD3	0.557	0.704
Shopping behavior on e-commerce platforms in the future (HV)	Cronbach's Alpha=0.754		
	HV1	0.591	0.662
	HV2	0.603	0.648
	HV3	0.556	0.701

Source: Analysis results of the author's team

The results of Table 3 show that the Cronbach's Alpha coefficient of the factors proposed in the study are higher than 0.06, which means that all observed variables are accepted and will be used in the next factor analysis. Besides, all observations of the scale have the total variable correlation coefficient greater than 0.3. In addition, if the Cronbach's Alpha coefficient is removed, all variables are smaller than the total Cronbach's Alpha coefficient, so no variables need to be removed. In other words, the observations of the scale have high reliability, making the research model reliable.

4.3. Result of exploratory factor analysis EFA

Table 4. EFA. analysis results

KMO. coefficient		0.797
Bartlett's test	Chi-squared value approx.	3873.804
	DF	136
	Sig	0.000

Source: Analysis results of the author's team

Table 5. Correlation analysis of scales

	NL	AT	TL	TK	YD	HV
NL	1					
AT	0.377	1				
TL	0.482	0.270	1			
TK	0.331	0.141	0.192	1		
YD	0.527	0.289	0.428	0.321	1	
HV	0.217	0.194	0.360	0.153	0.227	1

Source: Analysis results of the author's team

The KMO test results show that the KMO coefficient is $0.797 > 0.5$, helping to conclude that the factor analysis and research data are completely appropriate. In addition, the Bartlett test result is 3873.801 with the Sig significance level of $0.000 < 0.05$, showing that the observed variables are correlated with each other in the population and satisfy the conditions of factor analysis. Table 5 shows that there is no interaction between the independent variables, that is, the independent variables are all loosely correlated with each other.

4.4. Regression analysis

Table 6. Results of regression analysis

Hypothesis	Proposed impact	Normalization coefficient	SE	CR	P	Pass the test
H1	+	0.327	0.042	7,777	0.000	Yes
H2	+	0.092	0.036	2.585	0.010	Yes
H3	+	0.149	0.33	4.533	0.000	Yes
H4	+	0.121	0.034	3,606	0.000	Yes
H5	+	0.107	0.045	2.383	0.017	Yes

Source: Analysis results of the author's team

From the above table of regression analysis results, the authors propose the following regression model:

$$YD = 0.327 \times NL + 0.092 \times AT + 0.149 \times TL + 0.121 \times TK$$

$$HV = 0.107 \times YD$$

Thus, hypothesis H1, H2, H3, H4 and H5 have been tested, i.e. 4 factors are fear of disease, safety, convenience and saving have positive influences on online shopping intention. Simultaneously, online shopping intention has a positive impact on the long-term online shopping behavior of consumers. In other words, the 5 proposed hypotheses are all accepted and passed the tests. Specifically, with a standardized coefficient of 0.327, the variable fear of the pandemic has the strongest impact on the online shopping intention of customers in Vietnam, while the impact of the safety variable on the shopping online intention is the weakest (0.092). In summary, all impacts are statistically significant when $P\text{-value} < 0.05$. Therefore, the hypotheses proposed by the authors are statistically significant.

5. Discussion and Conclusion

5.1. Discussion

After running the test models and determining the impact coefficients, it can be concluded that the research hypotheses (H1, H2, H3, H4, H5) are accepted and no hypothesis is rejected. In which, the factor Fear of the COVID-19 pandemic has the largest standardized coefficient (0.327) which is considered to have the strongest impact on the intention to purchase online in Vietnam in the context of the COVID-19 pandemic. Therefore, this study is consistent with the research results of Tran Trong Thuy (2021). Although online shopping is not new and popular in Vietnam, it is especially effective when the COVID-19 pandemic continues to cause severe impacts on Vietnam society. During this time, the number of people purchasing online through websites increased dramatically due to the convenience, savings and safety of transactions.

The Convenience factor also shows a positive impact on the online shopping intention of customers in the context of the COVID-19 pandemic with a standardized

coefficient of 0.149. The research results show that the online shopping intention of customers is also influenced by the ease of finding information and the variety of choices when shopping online.

In addition, the Savings factor with a standardized coefficient of 0.121 also has a positive impact on the online shopping intention of customers in the context of the COVID-19 pandemic, when customers are increasingly aware of the speed of seeking information and reduce costs when shopping online.

Finally, the Safety Factor also shows a positive impact on the online shopping intention of customers in the context of the COVID-19 pandemic with a standardized coefficient of 0.092. Although it has the lowest standardization coefficient, it is still one of the factors that positively affect consumer purchasing behavior because online websites are full of safety and security features.

5.2. Recommendations

To state agencies

Firstly, in order to reduce consumers' fear of pandemics, state agencies should limit mass gatherings, establish checkpoints to check individual travel, and encourage people to stay at home. These have a strong influence on people's behavior. In addition, it is necessary to diversify forms of people's propaganda to minimize community gatherings.

Secondly, in the context that most people still consider cash as a familiar form of payment, even many people purchase online but still pay in cash with the delivery person, to increase savings by purchasing for online shopping, state agencies need to promote the awareness about the advantages of online payment trends with great incentives to encourage people to change their consumption habits.

Third, in order to improve people's security when making payments in online shopping, state agencies need to quickly complete the legal framework in this area. Currently, online shopping is still an emerging field in Vietnam, which is a combination of sales and technology, between physical products and virtual stores, with its own characteristics. Therefore, the regulatory framework in our country in general still has many loopholes, especially policies to protect consumers and limit the risk of fraud of corporate customers when conducting online transactions.

To online retail businesses

Firstly, instead of just propaganda on newspapers, television, radio, businesses need to come up with practical solutions such as opening safe collection points at pharmacies, supermarkets and launch smart lockers (iLogic Smartbox) so people can pick up goods automatically (Ministry of Industry and Trade, 2020). Smart lockers are an extremely convenient and safe method because they need an OTP or QR code to open, and customers can take the initiative to pick up their goods without having to come into direct contact with many people. These new forms both help to comply with the Government's policies and meet the needs of people to maintain their daily activities.

Secondly, in order to increase savings for consumers, in addition to a various source of goods, businesses need to provide many promotional policies when using e-wallets or

paying via bank accounts to purchase with reasonable prices and limit direct personal contact. In addition, businesses can also combine together to build promotion campaigns when purchasing combos at lower price.

Third, ensuring safety when making payments, quality and security of shopping websites is also a factor that directly affects online shopping behavior, businesses also need to pay attention to improve website quality and strengthen the security system to protect consumers from unnecessary risks.

Fourth, businesses need to constantly improve the quality of products and services provided. This is one of the top criteria that determines the online shopping behavior of consumers, as well as the ability of businesses to retain customers. Therefore, as long as one buyer receives a product that is not as advertised and reflects it back to groups and forums, others will immediately have a bad feeling about the quality of the product, leading to that they will find substitute products of other businesses

5.3. Conclusion

Applying the theoretical framework TPB, UGT, TAM, and TPR, the study examined the online shopping intention and behavior of Vietnamese people in the context of the COVID-19 pandemic through assessing the influence of four factors including: fear of the COVID-19 pandemic, convenience, saving and safety. The results show that the impacts in TPB model are statistically significant, and the results confirm that all four factors have positive impacts on online shopping intention and behavior, ranked in order of influence, respectively: i) Fear of the COVID-19 pandemic; ii) Convenience; iii) Saving and iv) Safety.

Due to the objective factor of social isolation in the context of the COVID-19 pandemic, the survey process and research results still have some limitations. In which, the biggest limitation is that the number of participants is not much and diverse, mainly students and officers. Further studies can apply the TPB model to assess the content of economic, social and political impacts on consumer behavior on a broader scale. In addition, COVID-19 is a prominent issue that needs attention at present, future studies should continue this topic and evaluate consumers' online shopping behavior through many more factors, such as perceived risk, customer trust or corporate brand name.

Abstract

Role conflict and ambiguity are serious problems in organizations. The role stressors undermine employee job satisfaction and engagement, negatively affect employee well-being and, in turn, promote turnover intentions. By extending the Job Demands-Resources model, we argue that psychosocial safety climate and team climate regulate working circumstances by managing these stressors. This study was conducted to provide a broader view of the composition and relationships among organizational climate, role stressors, and job retention. However, the Covid 19 pandemic has recently had a substantial impact on the organizational environment, employees' mental health. As a result, considering their relationships among organizational climate, role stressors, and job retention cannot be separated from the influence of the Covid 19 pandemic. As shapers of organizational culture, especially in the Asia region, managers should be responsible for creating a safe and supportive climate to reduce negative stressors, thereby promoting employee retention, especially in the context of global crisis.

Keywords: *Organizational climate, role stressors, job retention, covid 19*

1. Introduction

Scholars have been interested in the link between management and employees in organizations since the 1930s. An employee's attitude toward the organization reflects the outcome of the work environment, which is still an important problem in organizational behavior study. It has been demonstrated that the organizational climate is a crucial component in understanding employee behavior, and this topic has been explored in the organizational behavior literature since the late 1970s (Lee & Idris, 2017).

The organizational climate is the total of psychological atmospheres, which are employees' views of their workplace (James et al., 2008). However, because it is based on employee impression, determining the exact organizational climate is difficult (Berberoglu, 2018). However, it is undeniable that the organizational environment has a significant impact on individuals' attitudes toward their work, personal connections, and job performance. Furthermore, the organizational climate is a condition for managing job-related stress and strain. Understanding and developing a good culture that can mitigate the negative effects of stressors is an important management topic.

However, previous research has only looked at how the organizational environment affects employee satisfaction and organizational commitment. As a result, this research will develop a theoretical model emphasizing the importance of role stressors as a mediating factor in the link between organizational environment and job retention. Key factors such as organizational climate, role stress, and staff retention are investigated from the aggregate perspective of the sub-components.

Furthermore, the impact of the Covid 19 pandemic has recently changed the working environment, creating pressure and stress at work, resulting in the reduction or layoff of a huge number of employees in recent years. “*The pandemic of COVID-19 has drastically changed the way we work, communicate, and socialize and left us with the challenge of making significant changes in a matter of days on an extraordinary scale*” (Li et al., 2020). Undoubtedly, there have been other more issues confronting employees and corporate organizations so far. As a result, during times of global crisis or pandemic, managing the organizational environment, work stressors, and job retention must also be studied and evaluated more attentively. It not only changes their morphology but also impacts their relationship. That is the motivation for us to develop a framework of working environment management in the context of the crisis caused by the pandemic.

2. Literature Review

Organizational climate is defined as the way employees perceive their company and its goals (Payne et al., 1971). Griffin & Moorhead (2014) emphasize the recurrence of employee behaviors, attitudes, and emotions.

Previous research has separated the organizational climate into several components; however, we divided it into two sub-factors based on the viewpoint of Lee & Idris (2017): psychosocial safety climate and team climate. Although both factors have their characteristics, both can indicate the presence of psychological safety during teamwork, which permits teamwork to fulfill corporate goals more efficiently (Dollard & Bakker, 2010).

Psychosocial safety climate – PSC: refers to the organizational environment in which employees believe that the organization's policies, management processes, and practices, prioritize and ensure their employees' psychological safety, and well-being (Dollard & Bakker, 2010). The work environment is referred to as "psychological environments" when examined and studied at the individual level – that is, employees' views of how the organizational environment psychologically influences their health and well-being (Geisler et al., 2019).

Theoretically, PSC extends the theory of Job Demands-Resources (JD-R). According to JD-R theory, all work environments have specific demands and resources that contribute to work-related stress or motivation (Bakker & Demerouti, 2014). PSC is expected to improve employee psychological well-being, work satisfaction, and job engagement.

PSC is a specialized environment produced by management activities to safeguard employee well-being, provide incentives to meet employee requirements, or remove hurdles to employees reaching their goals (Yulita et al., 2014). As a result, a high PSC level will provide psychologically safe working conditions, allowing employees to feel like they

belong in their organizations (Lee & Idris, 2017). Employees with high PSC levels can accomplish their jobs more comfortably and without fear of failure. Organizations with a high PSC level have unambiguous orientations, and employees may believe the organization is concerned about their interests.

Team climate refers to the perceptions, actions, and attitudes of individuals in the group (Seibert et al., 2004), or the sharing of vision, safety, and work orientation, as well as encouragement for creativity among members (Basaglia et al., 2010). Mutual trust and respect among team members create a healthy group culture in which everyone feels comfortable being themselves (Edmondson, 1999). In other words, a good teamwork climate enables team members to understand their tasks to achieve group objectives. When roles are defined, team members can collaborate successfully to achieve the desired work outcomes (Kleingeld et al., 2011).

Role stressors: Employees usually attempt to achieve company goals by performing effectively in their roles. The role is a set of expectations associated with a work position in an organization. Depending on the type of request, people may feel stressed. When people think they are unable to comprehend and perform task-related role requirements, role stressors arise (Kahn et al., 1964). There are two forms of role stressors: role ambiguity and role conflict (Singh et al., 1996). Singh et al. (1996) discovered that clear rules, regulations, organizational norms, and well-communicated information reduce role stressors. In contrast, if managers are unclear about anticipated behavior, role conflict will arise.

Role conflict: One of the most well-studied psychosocial risk factors in the workplace is role conflict. Role conflict represents the coexistence of two or more groups of expectations of work towards the same person, whereby complying with one set of expectations makes conforming to another set of expectations difficult (Kahn et al., 1964; Singh et al., 1994). In this case, the job requirements they are taking on are competing and contradictory, making it hard for them to perform them all.

Based on the JD-R theory, role conflict is more likely to result in energy-depleting stress (Bakker & Demerouti, 2007). Role conflict causes employees to become stressed and capable of acting in ways that irritate coworkers and superiors, which has the potential to lead to interpersonal conflict. However, role conflict can be beneficial to an organization since it can encourage creativity when individuals work together to resolve these disagreements (Ortqvist & Wincent, 2006).

Role ambiguity is defined as the degree of disagreement between the information supplied to the individual performing the position or the insufficient information necessary to do the function successfully (Kahn et al., 1964). The root cause of job ambiguity is a lack of understanding regarding what tasks must be accomplished, as well as why and how to carry them out. Role ambiguity appears when an employee's job description or responsibilities are not clearly defined and employees do not understand their role (Brunsting et al., 2014). Despite that, it can also help businesses in some situations by facilitating adaptability to changing conditions and contributing to management flexibility (Ortqvist & Wincent et al., 2006).

Job retention: Job satisfaction and work engagement are constitutive factors of job retention (Halbesleben & Wheeler, 2008).

Work engagement is the contribution of members in work towards their company; and when engaged, they can express themselves physically, intellectually, and emotionally in accomplishing the task. Individuals are engaged when they are emotionally linked to others and mindful of their work (Kahn, 1990). Employees understand what they expect, what is expected of them, and what they must do to reach their work objectives; they see themselves as a part of the organization, meaningful to their colleagues, trusted with many opportunities to improve and grow. According to Saks (2006), work engagement is defined as a good attitude toward the organization's values and activities. Employees who are engaged are frequently aware of the business environment and work collaboratively with colleagues to improve work performance for the benefit of the company.

Job satisfaction: Hoppock (1935) and Davis et al. (1989) define work satisfaction as any combination of psychological, physiological, and environmental elements that lead a person to feel pleased with his or her employment. With this viewpoint, even while job satisfaction is influenced by a variety of external circumstances, it is still influenced by employees' internal feelings. Vroom (1964) describes job satisfaction as an individual's emotional orientation toward his/her duties. When an employee joins a business, they bring their own set of needs and desires. Job satisfaction is a comparison between an individual's level of expectation for a job and perceived benefits from completing that job (Kaliski, 2007). Job satisfaction is indicated by a favorable attitude toward work.

3. Results

3.1. Research framework

By minimizing role stressors, a healthy corporate climate enables staff to achieve organizational goals. More communication is exchanged between management and employees when the organizational atmosphere is actively established by management (Whitaker et al., 2007). Employees can focus more on their tasks when they have open contact with management. Firms with a good psychological safety climate are less likely to be bullied through dispute resolution procedures. Agreeing with this view, Kwan et al (2016) found that employees who operate in such environments are more inclined to take a proactive strategy by speaking up and asking for support from the organization as well as the managers, this prevents the tension from escalating. As a result, employees stay with the organization, express their optimism, satisfaction, positive attitudes, and proactive behaviors. Many studies have also demonstrated that role clarity has a favorable influence on work satisfaction, organizational citizenship behavior, and thus decreasing turnover intention (Hassan, 2013).

During the COVID-19 pandemic, social distance is critical for limiting the virus's transmission. We have to learn quickly how to stay connected at work using digital or social networking tools. However, maintaining social connections is critical for humanity's existence and mental wellness. At our remote workstations, we tend to feel more anxious and conflicted (Rymaniak et al., 2021). Fu et al. (2021) discovered that the reported number of COVID-19 cases impacts workers' job functioning (engagement, performance, and emotional exhaustion). Boin (2005) found that a crisis can destabilize a company and its employees. Organizations must function under stress in such an environment. As a result of

these difficulties, there has been a significant increase in staff layoffs (Adkins et al. 2001). Many firms also attempt to cut the number of employees to save expenses during the crisis, while expecting more resilience from remaining employees (Naudé 2012). Despite that, Naudé (2012) discovered that during a crisis, employees tend to complain less about labor conflicts due to fear of being fired.

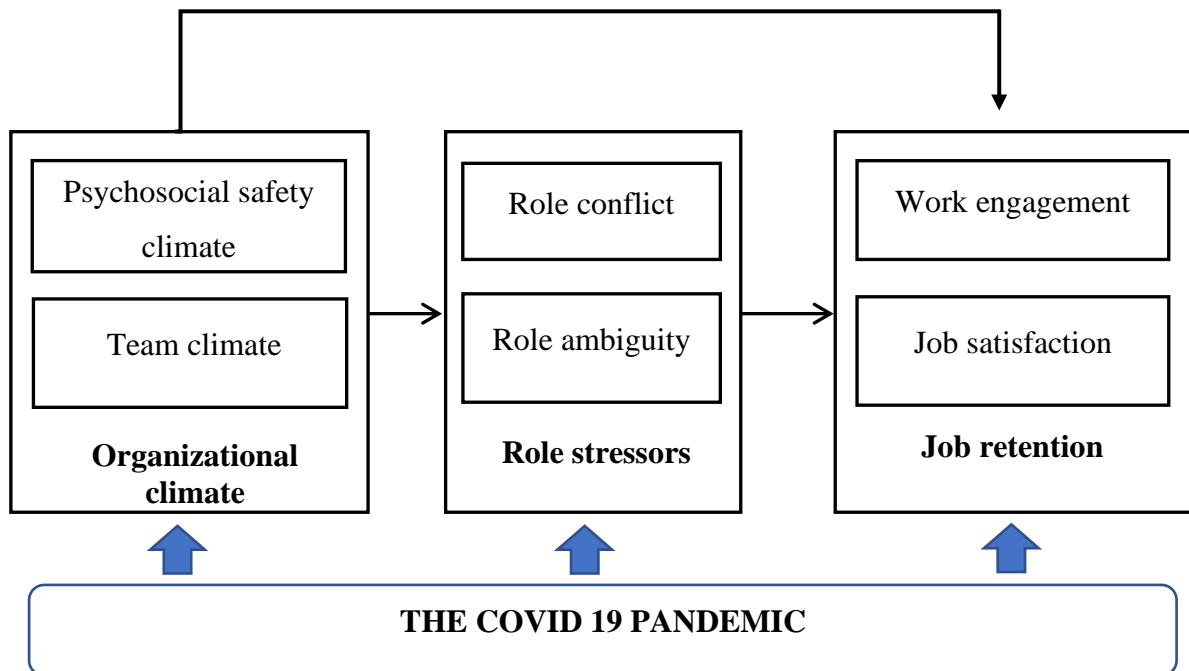

Figure 1. The research framework

3.2. Implication

Managers must build and develop a secure and supportive organizational climate that reduces negative role stressors. Because it can be actively shaped by powerful and influential people in the organization (James & James, 1989). This is especially true in the Asian culture, where the emphasis is on collective power structures and teams rather than individual efforts (Zhang et al., 2005; Zhong et al., 2016). Leaders must pay close attention to decentralization, assignment, and job design to avoid overlapping or unclear tasks among employees, hence limiting conflicts. Furthermore, they should notify and instruct staff on whom to contact and what steps to take if such problems arise. In addition, creating a friendly and mutually supportive cultural atmosphere should be promoted rather than just focusing on regulations and procedures. However, in some circumstances, role stressors can be beneficial by enhancing employees' inventiveness and spirit of overcoming difficulties. Managers must make use of this opportunity to find new ideas, boost team spirit, and so on.

During the Covid 19 pandemic, employees might face challenges with the new work environment and go through traumatic experiences, they will need to learn how to deal with complexity, how to adapt to the new reality of work, and they will need emotional and interpersonal support. Mental, emotional, and physical safety are being examined and organizations are implementing resources for employees. So, it is essential for business

managers and employees to become more flexible to the new situation. Organizations are engaging more with employees and learning what motivates them. Eisenberger et al. (2002) study affirmed that organizational support could help leaders to increase employee retention; this advantage can positively impact the organization's performance during and after the crisis.

4. Conclusion

Based on the theory of job demand - resources (JD-R), this study was conducted to provide a broader view of the composition and relationship amongst organizational climate, role stressors, and job retention. Accordingly, we emphasize the psychosocial safe climate and the team climate as a tool to prevent role conflict and ambiguity. Building and maintaining a good organizational climate is a long-term strategy to ensure the well-being of employees, motivating them to become more satisfied and engaged at work. In the context of the covid 19 pandemic, the links amongst organizational climate, role stressors, and job retention should be investigated more extensively, which helps organizations to have a more comprehensive view and develop strategies to build a sustainable organizational environment

Future research studies should perform quantitative analyses to test this proposed model, confirming and determining the relationships among factors; thereby building control solutions and developing effective organizational and human resource management strategies in the context of Covid 19 pandemic.

MEANS OF COMMUNICATION PREVENT FAKE NEWS DURING COVID-19 PANDEMIC IN VIETNAM

PhD Student. Nguyen Huu Dzung

dungnh.choa.kb@gmail.com

Faculty of Communication, Academy of Journalism and Communication, Hanoi

Abstract

Fake news is a painful problem for many countries worldwide, including Vietnam. The study was conducted to find out how the means of communication prevent fake news in Vietnam in the context of the COVID-19 pandemic showing no signs of stopping. The author used observation methods, in-depth interviews, and a sociological survey to conduct the research. Results show that in Vietnam, there is an extensive communication system. With which early and drastic involvement and coordination, communication has played an essential role in shaping the positive flow of information in social life in Vietnam. That has brought people progressive awareness, positive attitude, and right action during the epidemic. From there, the researcher proposes a communication model to prevent fake news. In which, the core role' social networks is emphasized as a key means of magnifying the influence of all information. At the same time, it affirms the decisive role of the official media as a reliable address to authenticate the information that the public is interested in. On that basis, the study recommends the combined use of social networks and official information channels in order to contribute to preventing fake news and cleaning up the information environment in social life.

Keywords: *means of communication, prevent, fake news, COVID-19, Vietnam.*

1. Introduction

The means of communication plays a vital role in social life. Especially in modern society, when the world is increasingly integrated and open, globalization is firm. They form chains of exchanging, receiving, and sharing information. From there, it helps each individual, organization, and a state agency have a broader view of the community and all aspects of social life. More importantly, through that understanding, the means of communication creates each individual's connection with organizations and state agencies. The most concentrated manifestation of modern means of communication is social media.

Besides the good things, social media's benefits are the negatives and negatives of society, such as violence, fraud, bullying... Especially the problem of fake news and misinformation, distorted. And this is very evident in the context of the COVID-19 pandemic that broke out and spread worldwide.

Due to their widespread social networks, many people are attracted to fake information, misinformation, or misrepresentation in Vietnam. However, along with the strong involvement of the Government, the means of communication system has also

been promoted its role in preventing fake news, misinformation, and distortion on social networking sites. Since then, they have been cleaning up the information environment, shaping the flow of positive information in social life makes an essential contribution to the anti-epidemic achievements that Vietnam has achieved and is working hard to maintain that achievement.

With the desire to clarify the activities of the means of communication in preventing fake news, misinformation, and distortions in Vietnam recently, focusing on the fight against the COVID-19 epidemic, the author has implemented research “Means Of Communication Prevent Fake News In Covid-19 Pandemic In Vietnam”.

Based on shown communication models such as Magic Bullet theory and Two-Step Communication and research results on how the media operate in Vietnam during the COVID-19 pandemic, the article proposes communication model to prevent fake news with the desire to contribute to preventing fake news, misinformation and disinformation in today's cyberspace. Thereby, this study contributing to cleaning up the information space not only during the COVID-19 pandemic but also in the future.

To achieve that goal, this article is built on the following sections: (1) summary of means of communication in Vietnam, (2) an overview of the state of fake news in Vietnam during the COVID-19 pandemic, (3) research methods and data, (4) research results and finally (5) conclusions.

Means of communication in Vietnam

“Communication is the exchange of messages between members or groups of a society to achieve mutual understanding” (Ta, N. T., 2001). At the same time, in that process, knowledge about science, technology, and cultural and spiritual values are also transferred. Because of communication, “natural people have developed into social people” (Luong, K. H., 2007). Thus, communication is an important activity that has contributed to the development of human society and separates us from other animals.

In Vietnam, there are many forms of communication (Luong, K. H., 2013) such as individual communication, group communication, communication, and communication through cultural institutions. Each type is divided into many different forms. For example, there are books, printed newspapers, leaflets, radio, television, electronic newspapers, and social networks in the means of communication. However, during the COVID-19 epidemic, several channels and means with appropriate advantages and strengths were widely used to contribute to raising awareness and changing attitudes and behaviors of people in dealing with COVID-19. Among them, we can mention the following:

Firstly, the means of communication such as radio, television, and electronic newspapers. The most significant advantage is the ability to reach many people in a short time; the information is constantly updated and the official source of information. In particular, this time, the SMS brand name messaging form was used, creating a very positive effect. Information about the epidemic of the authorities is sent directly to the phone number of each citizen.

Second, group communication with activities of social organizations, socio-political organizations. In Vietnam, most people participate in activities in organizations and participate voluntarily. Therefore, the strength of this communication channel is to ensure that the message reaches the right audience and is strictly enforced and enforced.

Third, communication through socio-cultural institutions such as cultural houses, markets, and places of community activities. This communication channel is aimed at the information centers of the communities, where people can easily access information about the epidemic if there are difficulties in accessing the data. The audience of this channel is usually the retired people, the elderly.

Fourth, communicate through the direct communication team, community COVID-19 groups. This communication channel is often used in cases where a case appears at a specific location to notify relevant people. This channel is very effective in emergencies.

Fifth, communication through social networking platforms (Facebook, Gazo, Lotus, TikTok, Twitter, Youtube, and Zalo). Social media is more than just a means of communication; it is more than a social platform. Most communication in modern society is done through social networks. Its advantage is that it is easy to access and share information anytime, anywhere with anyone.

🚩 Fake news and prevent fake news in COVID-19 pandemic in Vietnam

We have different definitions of fake news. The Cambridge Dictionary defines “fake news as false stories that appear to be news, spread on the internet or using other media, usually created to influence political views or as a joke”. Meanwhile, the Oxford dictionary defines “fake news as false reports of events, written and read on websites”. In addition, each science has different perspectives and offers other concepts about fake news (Andrew P. W., Ahmed A., Eric P. G., Julieta G., 2020).

Within the framework of this research, the author considers fake news as untrue information that misrepresents the inherent nature of things, a phenomenon that is spread and can cause social unrest.

Fake news about COVID-19 is false information about an epidemic, including how to prevent and control the disease, the activities of authorities during the epidemic, and related issues. Such data can cause social unrest, anxiety, insecurity in public opinion, fear of epidemics, and wrong actions in epidemic prevention and control.

Currently, fake news is a common and painful problem for many countries worldwide. In particular, in the context of the COVID-19 epidemic, false news causes even more severe consequences. “There had been many conspiracy theories and mis/disinformation about coronavirus. And now, false and misleading information related to vaccines are also being spread on social media platforms” (Khan Y. H., Mallhi T. H., Alotaibi N. H., Alzarea A. I., Alanazi A. S., Tanveer N., et al., 2020),

With about 3 billion users, social networks are the place to share and spread fake news faster than any other platform, despite efforts to control technology firms (Communist Party Of Vietnam Internet Newspaper, 2021). In Vietnam, the number of users of social

networks is about 72 million people (Laodong Internet, 2021), equivalent to 72% of the population. During the COVID-19 pandemic, fake news, disinformation, and misinformation were common, mainly on social networks. Most of the disinformation and fake news during the COVID-19 epidemic is news about the epidemic prevention and control measures of the Government and localities, about the vaccine allocation policy; calling for self-treatment and diagnosis at home, not following the instructions of the Ministry of Health; called for hoarding food, food and medical supplies (Communist Party Of Vietnam Internet Newspaper, 2021).

However, thanks to the intervention of the Government and functional agencies, the drastic news of the means of communication, then the fake information was quickly prevented, the phony news spreader was handled according to the regulation's provisions of law. Since then, they have been increasing the community's sense of responsibility. At the same time, people also expressed their harsh attitude to false information. Therefore, Vietnam is still controlling the epidemic and developing its economy with limited resources.

Researchers believe that communication can be used in social life based on communication theories such as the Magic Bullet theory (Harold Lasswell, 1927) and Two-Step Communication (Paul Felix Lazarsfeld & Elihu Katz, 1955) to prevent fake news, false information, distortion. Prevention is understood as early detection of fake news, the source of fake news, and quickly declaring to the public that it is fake news. Thereby stopping the spread and consequences of fake news, misinformation, and distortion in social life.

2. Method

Observation

When there is a notice of a case of fake news, false information, misrepresentation on social networks, researchers will find out how long it takes for fake news to be discovered by communication and how many people it reaches. The researcher then looks at how many shares the fake news gets and the consequences. At the same time, the researcher examines how many means of communication outlets have stepped in to unmask fake news and how many people the message reaches.

The researcher will evaluate the ability to detect and remove fake communication news through observation, mainly communication and fan pages on social networks.

In-depth interview

The researcher interviewed several individuals living in different provinces and cities about the COVID-19 epidemic. Through that, the researchers check whether the information they receive has fake information or not. If so, are they aware of it, how long do they know it's fake news, and if it has any consequences? Finally, check to see from where they know it's fake news.

Through the interview, the researcher will find out the information channel for the public to confirm whether the news about the epidemic is real or fake. At the same time, it also partially assesses the public's ability to detect fake news.

Survey

The researcher conducts a nationwide online survey to determine which information channels the public is interested in following, the fastest, most reliable, and used to share the most information. At the same time, check whether the information about the epidemic that people receive through the means of communication is valuable or not. Finally, check the public's trust in epidemic prevention and control activities to know if the means of communication works effectively or not.

Through a survey to find out what information channels the public trusts and which ones contain a lot of fake news, propose a communication model during the pandemic to meet society's information needs and prevention requirements anti-epidemic.

3. Results

Observations

Regarding the detected fake news, there are many, but the researcher only mentions a few typical examples.

From the end of January 2020, when the new disease spread in some countries around the world and Vietnam also recorded the first case of COVID-19 on January 23, 2020, fake information, false information, Distortion has appeared on social networking sites. Specifically, the message: "Tomorrow 1.2.2020 the whole city. Hanoi will have a helicopter with disinfectant strips against Coronavirus. Attention: From 4:00 to 7:30 a.m. tomorrow, everyone is restricted from leaving the house" Or "tonight the news will report that tonight our government sprays vaccine against Coronavirus in the sky nationwide" (Nhat L., 2021). Health authorities later refuted these messages. The message to prevent fake news is widely communicated to the people and society by electronic newspapers and national television stations.

Then, the end of March 2020 is when Vietnam begins to increase the number of community COVID-19 cases, and public opinion is very interested in information related to the disease. A series of fake news messages were detected, handled by the authorities, and sent a warning to the community. For example, "Punish the owner of 18 Facebook accounts for spreading fake news to block the whole Ho Chi Minh City", "Punish 10 million dongs of a young man who spreads fake news about the COVID-19 epidemic", and "Find out 20 Facebook accounts that spread news blockade Hanoi, will be strictly handled" (Chi H., 2020). These powerful messages are posted on online newspapers and Facebook pages' websites.

In Hue, at 9:00 am on March 30, 2020, through the social network Zalo, fake news was spread with the content: "Hue, tonight from 11:40 pm no one should go out. Doors and windows should be closed when five helicopters spray disinfectant into the air to kill the coronavirus. Please process this information for all your contacts." In the afternoon of March 30, 2020, fake news was handled by the authorities, and at about 8 pm on the same day, many online newspapers reported that they rejected fake news and sent warnings to the people.

She was also related to the spread of “helicopter spraying disinfectant”. Accordingly, in Gia Lai, fake news was spread at 13:00 on March 31, 2020, with the content: “Tonight 11.40 pm everyone should stay at home with all windows closed because there will be five helicopters spraying insecticide for disinfection, please inform your friends” (Van N., 2021). The message carrying fake news was sent to 51 people via the social network Facebook. On April 2, 2020, the authorities detected and handled fake news. By 12:55 p.m. on April 2, 2020, Public Security News had rejected fake news and sent a warning message to the public through the newspaper's website and social media fan page.

At the end of July 2021, the COVID-19 epidemic was very stressful in Ho Chi Minh City. A series of fake news, false information, and distortions have been discovered. Messages aimed at preventing phony transmission were also quickly released. Specifically, on July 26, 2021, the statement carried fake news “Tonight from 11:40 pm, no one should go out. Doors and windows should be closed when five helicopters spray disinfectant into the air to kill Coronavirus” (Luu Q., 2021). Bewildering fake news about Covid-19 has flourished on Facebook, YouTube, and TikTok, many of which come from celebrities who claim to be doctors (The Socialist Republic Of Vietnam Government Portal, 2021).

Figure 1. Message carrying fake news about five helicopters spraying disinfectant in Ho Chi Minh City (Giadinh.net, 2021)

In addition, the researcher also found that in residential areas with outbreaks of disease, the grassroots loudspeaker system, and direct communication were promoted, sometimes 15 to 20 times a day in some places, no one is left behind. Both inform people about the epidemic situation and prevent and remove fake news about the epidemic. Therefore, people are always assured of complying with the authorities' epidemic prevention and control measures.

Above are some typical observations about the spread of fake information about COVID-19 on social networks. Also, by word, the researcher found that communication can prevent fake news about COVID-19 by quickly and promptly transmitting messages to eliminate fake news and provide warnings. Inform the community through social networks.

In-depth interviews

The researcher has randomly interviewed 12 people through social relationships and acquaintances through social networks. The selected people are active in social interaction, including men and women, living in urban and rural areas, with education levels ranging from high school to university to graduate school. The selected people include people who live or work in Bac Giang, Bac Ninh, Dong Nai, Hanoi, and Ho Chi Minh City (localities with large industrial centers, which were once the center of Vietnam COVID-19 pandemic) from January 5, 2020, to October 2021 (when the Government issued Resolution 128, marking a new turning point in epidemic prevention and control in Vietnam).

According to sociological studies, the maximum natural size of chat groups can be up to 150 people (Yuval N. H., 2019). We can infer that interviewing 13 people actively socializing can equate to data from 1950 people.

Characteristics of survey participants: mean age 38.85, of which there are 8 males (61.5%) and 5 females (38.5%), 9 people (69.2%) in urban and 4 (31.8%) in the countryside. 9 people (69.2%) have college or higher education, and 4 (31.8%) have upper secondary education. They have diverse occupations: sales, street vendors, teachers, entrepreneurs, engineers, repairers, freelancers, office workers, farmers, students, advertising.

Analysis data from the results of 13 in-depth interviews showed that: 5 people (38.5%) said that they knew information about the epidemic from the end of 2019, the rest (8 people, 61.5%) said that they knew information about COVID-19 in early 2020. In which, updating information from social networks (Facebook, Zalo) has 10 people (76.9%), from online newspapers (Baomoi, Dantri, VnExpress) (App), Web) has 9 people (69.2%), from television (current news program at 19h VTV1) has 8 people (61.5%). Besides, there are other sources of information such as live chat, commune radio, groups (Group Zalo).

When asked if they have ever received fake news related to COVID-19, 100% of respondents confirmed receiving fake news, 5 people (38.5%) said there was a lot of fake news, with contents such as disease origin, outbreak somewhere, blockade, and isolated area; the number of positive cases, the number of deaths is exaggerated; information regarding vaccines. The spread of fake news was mainly Facebook and Zalo social networks, a few through live chat.

In the early stages of the epidemic (2020), 5 people (38.5%) confirmed that they had shared information about COVID-19 and then learned it was fake news and the channels they shared were Facebook and Zalo. In particular, one case (7.7%) shared fake news on the Zalo group with about 1000 people. But now (2021), 100% of respondents said they all authenticate information about COVID-19 through official channels such as news at 7 pm on VTV1, Zalo of the Ministry of Health, the Government's fan page, and online newspapers on Facebook. Then, if necessary, they share it with their love.

Accordingly, fake news makes people (11 people, 84.6%) confused, worried, and scared. Some people are afraid of being abandoned; others are scared of death. Besides, fake news about COVID-19 also caused a particular turmoil in social life when many people (4

people, 31.8%) rushed to buy groceries, leading to food shortages in transient and high risk of disease transmission. Since then, the authorities' anti-epidemic work and vaccination activities have been affected.

When asked about dealing with fake news related to COVID-19, there were 6 people (46.2%) willing to express their attitudes, some to oppose immediately, some to ask for verification and correction, and some to report it with authorities. The rest (7 people, 53.8%) let it go because they knew it was fake news. And out of 13 respondents, there are 8 people (61.5%) who said they still share and warn their loved ones about fake news related to COVID-19.

Thus, in Vietnam, after about two years of the disease outbreak, with a lot of fake news being spread in cyberspace, mainly on social networks, people can now distinguish fake news about COVID-19. And information authentication channels are official sources of authorities, the Government, the Ministry of Health, online newspapers, commune radio.

Surveys

The nationwide survey was conducted on the Google Form platform from November 11 to December 1, 2021. After sending the survey link to about 2500 people, 382 people, averaging 29.7 years old, answered the questions. Although this percentage is not high, the active participants in social communication may represent most people who regularly participate in information flow in social life. Therefore, the data can be used in making judgments and conclusions for scientific research.

According to survey data, most people access the epidemic from two or more sources (227 people, 59.4%). Social networks (Zalo, Facebook, Youtube, TikTok, Lotus, Gapo) are the most accessible information channels (320 people, 83.8%).

In another question, when asked about the fastest news source, 242 people (63.4%) chose social networks. However, only 16 people (4%) believe that information from social networks is reliable—instead, television with 298 people (78%) was selected as the most reliable information channel.

Answering the question about the ability to distinguish fake news from official information from the authorities, 272 people (71.2%) of the respondents confirmed to determine fake news. As for assessing the usefulness of information related to the epidemic, 358 people (93.7%) said the report was helpful to them. At the same time, up to 239 people (62.6%) regularly share information related to the epidemic. And 160 people (41.9%) of them choose social networks as the main information-sharing channel besides live chat (96 people, 25.1%) and phone calls (82 people, 21.5%). Therefore, most people (372/379 people, 98.2%) affirm their belief in epidemic prevention and control in Vietnam.

4. Discussion and Conclusion

4.1. Discussion

Over the past two years, since the outbreak in Wuhan, China, around the world there have been thousands of studies related to the COVID-19 pandemic. Especially those related to the communication, means of communication and issues such as fake news,

disinformation, misinformation and their consequences. Studies have been carried out and focused on many different aspects. For example, theoretical studies on the problem of fake news such as *Inoculating Against Fake News About COVID-19* by Sander van der Linden, Jon Roozenbeek and Josh Compton (2020) or *Fighting an Infodemic: COVID-19 Fake News Dataset* by Patwa, P. et al. (2021). Studies on modeling factors to predict fake news such as *Fake news and COVID-19: modeling the predictors of fake news sharing among social media users* by Oberiri Destiny Apukeab and Bahiyah Omara (2021) and *Research Model Generalization on COVID-19 Fake News Detection* by Yejin Bang, Etsuko Ishii, Samuel Cahyawijaya, Ziwei Ji & Pascale Fung (2021). And a lot of research on the problem of fake news like *Infodemic and the spread of fake news in the COVID-19-era* (2020) and *Regulation of COVID-19 fake news infodemic in China and India* (2020). However, almost no research has proposed to build a communication model to prevent fake news based on the coordination chain of the media. In which, the role of social networks and mainstream media is emphasized.

During the COVID-19 epidemic, fake news is a common problem in many countries, including Vietnam. Insensitive times, when there is a positive case, when an area is blocked or isolated when the epidemic situation becomes stressful, there are certain confusions in the public consciousness. That was when people received a lot of information, including fake news.

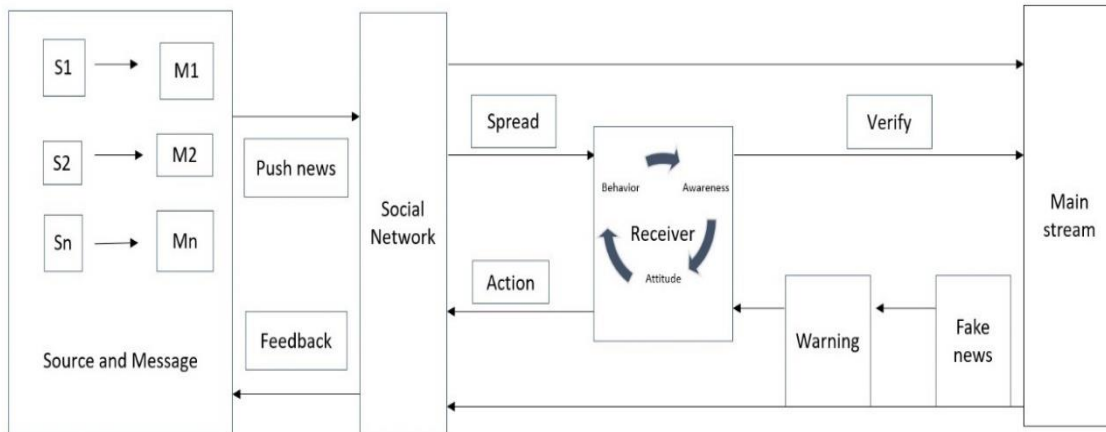

Fake news during the COVID-19 epidemic causes many consequences such as people rushing to buy food to stock up, leading to social unrest, panic, worry, fear, fear of abandonment... Therefore, it is necessary to participate and cooperate in the means of communication system to prevent and eliminate fake news.

Among those means of communication, special attention should be paid to social networks because it is a means of communication and a social platform, a virtual society. Social networks are the most popular social media today, with billions of users. And fake news also mainly follows social networks that spread to the public. According to the in-depth interviews, a case once shared fake news with a group of about 1000 people.

However, after participating in social networks, users have also realized the need to verify unofficial sources to avoid sharing fake news. This is also an opportunity for official news sources and other means of communication such as newspapers, radio, television, and personal touch to promote their roles. An essential requirement is the quick detection of fake news and the source of fake news to verify and clarify information promptly. Since then, it has become a reliable address for the public to confirm information about the disease and share when necessary.

From that practice, based on the theory of communication models such as Lasswell's one-way communication model, Claude Shannon's two-way communication model, Shannon and Weaver's communication model, David Berlo's model, communication model of Charles Osgood and Wilber Schramm, model of convergence of Kinkaid, model of social marketing (Nguyen V. D., Do T. T. H., 2012), and practical in preventing fake news in Vietnam recently, the author proposes a communication model called "communication model against fake news". The model is shown in the figure below.

Figure 2: Communication model against fake news

Inside:

- S(1-n): are sources of information
- M(1-n): are the messages of the sources from S1 to Sn, respectively.
- Push news: is the process by which news sources push information to social networks
 - Social network is the platform through which news sources carry out the communication and social communication process.
 - Spread: information spreads on social networks.
 - Receiver: the place to receive communication messages, individuals, social groups, or large or small with cognitive, attitude, and behavioral factors.
 - Verify: the receiver of communication messages authenticates the information received.
- Mainstream: official news sources will reject the public's message if it is fake news.
 - Fake news: fake news is detected after the authentication process.
 - Warning: official news sources, after detecting fake news, issue a warning message to the place that has received and wait for information verification. At the same time, social networks send warnings to the community at large.
 - Feedback: the social network has responded to the original news sources. The content is the reaction of the official news source and the attitudes and behavior of the public that have received fake information.

4.2. Conclusion

Based on communication models built from past studies and the results obtained by this study, we conclude that, through building and implementing chains of coordination between means of communication, the Vietnamese government has effectively prevented fake news about the COVID-19 epidemic. From there, we propose to build a model to prevent fake news to deal with similar problems in the future, thereby contributing to protecting the public by cleaning up the information environment on the internet. In which, social networks and mainstream media play a decisive role.

4.3. Limitations of the study

The epidemic context in Vietnam is the space in which the research was conducted. Therefore, in addition to certain advantages, the study also has limitations. Firstly, the survey implementation was carried out entirely by questionnaire online, by simple random method. Second, the number of samples was limited (382). Therefore, the generalizability of the study may not be confirmed. However, we believe that the fake news prevention model proposed by the study is the basis for the future development and improvement of the model for the sake of social progress and development.

Abstract

This study proposes a structural model of the relationships among fear of COVID-19, FOMO and phubbing by two factors: communication disturbances and phone obsessions to explore how these factors affect each other. Students from universities in Vietnam were randomly selected to participate in the questionnaire study. In this research, Exploratory Factor Analysis was performed to test the validity of the constructs, and using AMOS with the Confirmatory Factor Analysis was used to test the significance of the proposed hypothesis model. Results about the relationships between fear of COVID-19, fear of missing out, communication disturbances and phone obsessions were revealed. Specifically, fear of COVID-19, fear of missing out were found to have a positive impact on phubbing by two factors: communication disturbances and phone obsessions. Fear of COVID-19 was found to be positively related to fear of missing out. The research reveals that fear of COVID-19 has the most impact on phubbing, followed by FOMO.

Keywords: *Fear of COVID-19, Fear of missing out, Phubbing*

1. Introduction

In recent years, people have witnessed the great innovation of information technology and means of communication (Gummesson, 2004) and smartphones were indispensable in daily life (Oulasvirta et al., 2012). Admittedly, smartphones have a lot of perks. However, it also causes users some physical or mental problems (Baron & Campbell, 2012). A new term “phubbing” was introduced and defined as a behavior in which people are so concentrated on the phone that they ignore other people in communicative situations (Haigh, A. 2015). “Phubbing” results in several detrimental effects and there are some studies about reasons for these activities in the world. For instance, “Phubbing” might originate from phone addiction (Chotpitayasunondh & Douglas, 2016) or instability in people’s character (Çikrikci et al., 2019).

According to Karadağ et al. (2015) smartphone addiction impacts phubbing. From a technological and psychological point of view by Chatterjee (2020), research has shown that

smartphone addiction is a major factor affecting phubbing. Besides, social media plays a mediating role in the relationship between the fear of missing out and phubbing in students (Fang et al., 2020). In context of the COVID-19 epidemic, there have been studies showing the relationship between the fear of COVID-19 and mobile phone addiction - one of the factors that causes phubbing. Kayis et al. (2021) investigated the relationship between COVID-19 fear and mental health, by examining the mediating role of loneliness and smartphone addiction. The results showed that fear of COVID-19 can affect mental health through loneliness and smartphone addiction, respectively. Based on the findings of the study, it can be seen that a higher fear of COVID-19 can cause higher levels of smartphone addiction. This is further proven in the study by Albursan et al. (2021) with the results showing that anxiety about COVID-19 can lead to smartphone addiction with all its negative psychological effects physically. In Vietnam, there is almost no research to find out underlying causes of phubbing and awareness about these problems is not high. Therefore, this study aims to measure the factors affecting undergraduates' phubbing and give several solutions to improve these situations. In addition, provided with fear of COVID-19, this research becomes more relevant than those before in COVID-19 context. With two factors: Communication disturbances and phone obsessions make this study clearly confirm a significant relationship between fear of COVID-19, FOMO and phubbing.

In order to meet the research goals, the quantitative method was used. Furthermore, the ANOVA and t-test approaches were also applied to investigate the differences in the phubbing between undergraduates groups, according to gender, years of undergraduate education and average phone usage time.

2. Literature Review

Phubbing can be described as an individual looking at his or her mobile phone while conversing with others, handling the mobile phone and exiting communication between other people. The term "phubbing" became known and widely used when it was included in an update of the famous Macquarie Dictionary in 2012. The update team combined the two words "phone" and "snubbing" to create "phubbing". According to Roberts & David (2016), phubbing is a social behavior related to smartphone use, in which the user ignores his or her interlocutor to use their phones. In discussions, phubbing disrupts the sense of communication (Kadylak et al., 2018), leaves an impression of impoliteness and impatience, and creates poor quality conversation (Abeele et al., 2016). To date, several studies have been conducted on the factors that impact the phubbing within a higher education institution. Some studies focused on the impact of smartphone addiction, SMS (message) addiction, social network addiction, Internet addiction and to some extent game addiction to phubbing. Davey et al. (2018) showed that Internet addiction, smartphone addiction have an effect on phubbing. In addition to addictions, Davey et al. (2018) further investigated that fear of missing out (FOMO) and self-restraint also predict phubbing. The study by Chotpitayasunondh & Douglas (2016) revealed that Internet addiction, FOMO, and self-control affected phubbing. Saggaf (2020) examined the relationship between boredom, FOMO and phubbing. According to this study, boredom also significantly predicts phubbing by mediating FOMO.

In the context of the COVID-19 pandemic, only a few studies have attempted phubbing. The study of Zhao et al. (2021) has been undertaken to investigate the factors peer phubbing on students in China. Research showed that the behavior of phubbing is positively correlated with smartphone addiction. In other words, students who were phubbing a lot were more likely to be addicted to smartphones. This is explained by Zhao et al. (2021) because during the COVID-19 pandemic, when schools are closed, interaction between students and friends becomes more important. Kayis et al. (2021) investigated the relationship between fear of COVID-19 and mental health, by examining the mediating role of loneliness and smartphone addiction. The results showed that fear of COVID-19 can affect mental health through loneliness and smartphone addiction, respectively. Based on the findings of the study, it can be found that a higher fear of COVID-19 can cause higher levels of smartphone addiction. In another aspect, in the study of the relationship between the phubbing, loneliness, self-esteem and Facebook, Błachnio & Przepiórka (2019) examined the phubbing by two factors: communication disturbance and phone obsession. Research results show a negative relationship between communication disturbance and life satisfaction. Butt & Arshad (2021) indicated that the fear of missing out predicts phubbing including communication disturbances and phone obsessions. A research of Blanca & Bendayan (2018) also found that FOMO was positively associated with both factors of phubbing by two factors: communication disturbances and phone obsessions.

The fear of COVID-19 has a direct impact on smartphone addiction. Although smartphones have many positive benefits, smartphone use problems are specifically associated with excessive and social media use problems (Kuss & Griffiths, 2017). Cell phones help people find information related to COVID-19 and communicate with others while in quarantine (Deursen, 2020). Although cell phones make life easier when used properly (Fino & Mazzetti, 2019; Gavali et al., 2017), if you use in excess, smartphone use can disrupt physical and mental health (Lapointe et al., 2013; Oh & Kim, 2020). According to Kayis (2021), one reason that fear of COVID-19 has increased smartphone addiction and negatively affected lives is that almost all people have to spend time staying home more often because of the pandemic. Research by Montag et al. (2021) observed positive associations between COVID-19 fear and smartphone addiction.

Besides, smartphone addiction is also a determining factor in phubbing. According to research by Karadag et al. (2015), phubbing is the sum total of all virtual addictions. Phubbing can be limited if phone addiction is controlled (Chatterjee, 2020). Furthermore, phubbing is considered the norm (Chotpitayasunondh & Douglas, 2016). Therefore, this research generalizes, supplements this new scale in the proposed model and examines the phubbing by two factors: communication disturbance and phone obsession. Hence, two hypothesis were proposed:

Hypothesis 1a (H1a): *There is a positive relationship between fear of COVID-19 and communication disturbance.*

Hypothesis 1b (H1b): *There is a positive relationship between fear of COVID-19 and phone obsession.*

Social networks allow us to connect with social contacts both online and offline, and this connection is equally important. As a result, not being able to contact or keep up with people online can lead to feeling out of touch with the “reality” world (Clayton et al., 2015). Fear of being socially excluded plays an important role in experiencing FOMO (Abel et al., 2016). The intense COVID-19 epidemic has completely changed academic and daily life, universities, fearing the spread of the epidemic, have turned to online teaching. Therefore, the study, work and exchange of students in particular have moved to a digital platform, which also means that they feel it is even more necessary to maintain online communication so as not to miss work or interacting with friends.

Franchina et al. (2018) showed that the FOMO has an impact on phubbing. Blanca & Bendayan (2018) have researched with Spanish adults, the study showed the relationship between FOMO and phubbing, in that phubbing is divided into two elements. The results showed that FOMO was positively associated with both elements of phubbing. A research of Butt & Arshad (2021) with university students who abused their phones in Pakistan also came to the same conclusion as previous studies. In particular, FOMO has a relationship with phubbing, including communication disturbances and phone obsessions. FOMO has also been shown to have an indirect effect on ignoring others to use the phone through smartphone addiction in an earlier study (Chotpitayasunondh & Douglas, 2016). FOMO impact on different objects and spaces, hence this study hypothesized the following:

Hypothesis 2a (H2a): *FOMO is positively related to communication disturbance.*

Hypothesis 2b (H2b): *FOMO is positively related to phone obsession.*

Many studies have shown that the COVID-19 pandemic has posed serious threats to people's physical health and life such as anxiety and stress (Dong & Zheng, 2020). And health anxiety is also one of the factors that cause fear of COVID-19 (Mertens et al., 2020; Jungmann & Witthöft, 2020). Health anxiety refers to the tendency to misinterpret normal or benign physical symptoms and believe that a person has or is suffering from a serious illness, in the absence of any actual illness (Abramowitz et al., 2007). Research by Mertens et al. (2020) has shown that health anxiety is associated with increased fear about the current COVID-19 pandemic. Particularly, in addition to concerns about their own health and safety, that of others, and related safety and prevention behaviors, respondents are also concerned about the impact of COVID-19 on the health care system, economy, society, job loss and change in daily routine...

According to Goncalves et al. (2020) and Oosterhoff et al. (2020), during the COVID-19 pandemic, a higher level of health anxiety can increase the level of social distancing and stay at home to limit prevent contact. COVID-19 precautions taken by national governments during the pandemic have also caused individuals to spend a lot of time alone because of self-isolation and limited social interaction. This promotion of social distancing, together with the decline in social activities and social capital during the epidemic, may increase the level of fear of missing out because of unmet social needs (Casale & Flett, 2020). From the above study, this research hypothesized the following:

Hypothesis 3 (H3): *There is a positive relationship between fear of COVID-19 and FOMO.*

The following figure summarizes the theoretical framework for this research with the following factors: Fear of COVID-19, FOMO and phubbing.

Figure 2. Proposed research model

3. Method

3.1. Research Design

A questionnaire was formed based on the literature review and was modified based on the results of interviewing with twenty undergraduates. The last questionnaire included 35 objects. 5-Point likert scales would be evaluated, whereby 1 = totally disagree, 2 = somewhat disagree, 3 = neither agree nor disagree (neutral), 4 = somewhat agree, and 5 = totally agree.

The data were gathered from November 2021 to February 2022. A non-probability sampling method was carried out in the formal survey stage, and a total of 403 responses were received from the North of Vietnam. The 95 bias observations were eliminated. Finally, there were 308 observations valid for analysis in the future, all of which were from the online survey via Google Forms. Table 1 shows the descriptive statistics of the participants' demographics.

Table 1. Descriptive statistics of participants' demographics

Variables		N	%
Gender	Female	221	71,7%
	Male	87	28,3%
Years of undergraduate education	Freshman	59	19,2%
	Sophomore	67	21,7%
	Junior	165	53,6%
	Senior	17	5,5%
Average Phone Usage Time	< 1 hour	4	1,3%
	1 - 3 hours	47	15,3%
	4 - 6 hours	133	43,2%
	> 6 hours	124	40,2%

According to Table 1, the ratio of females to males is 71,7% and 28,3% respectively. In terms of years of undergraduate education, the majority of undergraduates (53,6%) fall into the Junior group, 21,7% fall into the Sophomore group, 19,2% fall into the Freshman

group, and only 5.5% of the undergraduates are Senior. With targeted participants and research objectives, the majority of learners use phones on average over 4 hours per day (83,4%), up to 43,2% and 40,2% were the proportions of 4 - 6 hours and over 6 hours, respectively while the number of undergraduates using phones under 1 hour and from 1 to 3 hours a day only account for 1,3% and 15,3%, respectively.

3.2. Data Analysis Techniques

Firstly, the t-test and ANOVA approaches were adopted to determine the differences in “phubbing” between undergraduates groups, according to gender, years of undergraduate education and average phone usage time. Then, SPSS were applied for determining sample features consists of sex, age, sector, phone time, communication time... according to their demographic characteristics. Next, Cronbach's alpha reliability coefficient was used to analyze reliability of data and scales therefore we can remove variables with small correlation coefficients. Then, Exploratory Factor Analysis (EFA) was employed to eliminate variables with small parameters by checking factor loading and extractable variance. By using Confirmatory Factor Analysis (CFA), observed variables were tested about quality. Structural Equation Modeling (SEM) was employed to show relationships between latent variables and check research hypotheses. By regression analysis, the research can evaluate the impact of the independent variables: FOC (Fear of Covid-19), FOMO (Fear of missing out) to dependent variables: FO (Phone obsession) và CD (Communication disturbance).

4. Result

4.1. T-test and ANOVA

Table 2 presents a summary of t-test and ANOVA results to demonstrate the difference between undergraduates’ phubbing among demographic variables.

Table 2. Summary of and t-test and ANOVA results

Group	Dependent Variable	Sig. of Levene's Test	Sig. of t-test/Welch/F Test	N	Mean
Gender		0.182	Sig. of t-test 0.009		
Female	Phone obsession			221	2.353
Male				87	2.203
Years of undergraduate education	Communication disturbance	0.325	Sig. of F Test 0.018		
Freshman				59	2.192
Sophomore				67	2.497
Junior				165	2.240
Senior				17	2.765
Average Phone Usage Time	Phone obsession	0.695	Sig. of F Test 0.000		
< 1 hour				4	2.250
1 - 3 hours				47	2.759
4 - 6 hours				133	3.125
> 6 hours				124	3.368

The difference in the phubbing of undergraduate groups is summarized hereafter. Regarding gender, there is a difference in phubbing between the sexes, shown by the sig. of the t-test being <0.05 . More specifically, the mean value shows that female students are more likely to have a phone obsession than male students.

Concerning years of undergraduate education, there is difference phubbing between these year groups, shown by the sig. of the F test being <0.05 . More specifically, the mean value of the year of undergraduate education shows that communication disturbance ability increases in the order of the following groups: Freshman, Junior, Sophomore and Senior.

In terms of average phone usage time, there is a difference in the phubbing among undergraduate groups with different time spent for phone, shown by the sig. of the F test being <0.05 . More specifically, the mean value of the groups shows that phone obsession rate increases by the level of time spent on the phone.

4.2. Measurement Proposed Research Model Assessment

Firstly, to evaluate the reliability and validities of the measures, the data were examined through the exploratory factor analysis (EFA). Then, the statistics were included in the SEM model on Amos Graphic version 20. The SEM model contained four constructs, namely fear of COVID-19, FOMO, phone obsession and communication disturbance. To test measurement of this model, composite reliability, the convergent and discriminant validity were carried out.

Table 3 shows several fingers to measure convergent validity and reliability of the model, all of the quality standards were reached. In particularly, factor loadings were greater than 0.7 (Hair et al., 2010), Cronbach's alpha values were above 0.7 (Fornell et al., 1981), composite reliability (CR) values were higher than 0.7 (Hulland et al., 1999), and average variance extracted (AVE) values were upper than 0.5 (Hair et al., 2016) respectively.

Discriminant validity is the degree to which items recognize constructs. The table 3 indicated that the square root of the average variance extraction is greater than the inter-construct correlations (Fornell et al., 1981). Regarding the cross-loadings standard, to assure the discriminant validity of the construct, the factor loadings of each item have to be greater than the rest of its cross-loadings (Hair et al., 2021). Table 4 presents the square roots of AVEs which are the diagonal elements in bold (Diamantopoulos & Sigauw, 2007), and the off-diagonal elements are the bivariate correlations between two constructs. All the diagonal elements are larger than any other correlation coefficients, so discriminant validity criterion was achieved.

Table 3. Convergent validity and reliability

Onstructs	Items	Loadings	Cronbach's Alpha	Composite Reliability	Average Variance Extracted (AVE)
Fear of COVID-19 (FOC)	FOC1	0.743	0.864	0.866	0.565
	FOC2	0.862			
	FOC3	0.774			
	FOC5	0.800			
	FOC6	0.784			

Onstructs	Items	Loadings	Cronbach's Alpha	Composite Reliability	Average Variance Extracted (AVE)
Fear of missing out (FOMO)	FOMO1	0.843	0.775	0.781	0.544
	FOMO2	0.834			
	FOMO3	0.774			
Communication disturbance (CD)	CD1	0.792	0.777	0.777	0.539
	CD2	0.828			
	CD3	0.798			
Phone obsession (FO)	FO1	0.787	0.762	0.763	0.518
	FO2	0.749			
	FO3	0.845			

Table 4. Discriminant validity

Scales	FOC	CD	FOMO	FO
FOC	0.751			
CD	0.422	0.738		
FOMO	0.413	0.369	0.735	
FO	0.422	0.629	0.352	0.720

Table 5. Hypotheses testing

Relationship	Hypothesis	Std. Beta	Sig.	p Values	Decision
FOC->CD	H1a	0.34	0.000	0.000	supported
FOC->FO	H1b	0.35	0.000	0.000	supported
FOMO->CD	H2a	0.25	0.000	0.001	supported
FOMO->FO	H2b	0.24	0.000	0.003	supported
FOC->FOMO	H3	0.41	0.000	0.000	supported

Note: FOC: Fear of COVID-19; FO: Phone obsession; CD: Communication disturbance; FOMO: Fear of missing out.

In table 5, the outcome of hypothesis testing by SEM model and the fulfillment of this standard for all the subscales, indicating the discriminant validity of the tested

instrument. The values of sig in all hypotheses are less than 0.05. Therefore, there is linear correlation between independent variables and dependent variables.

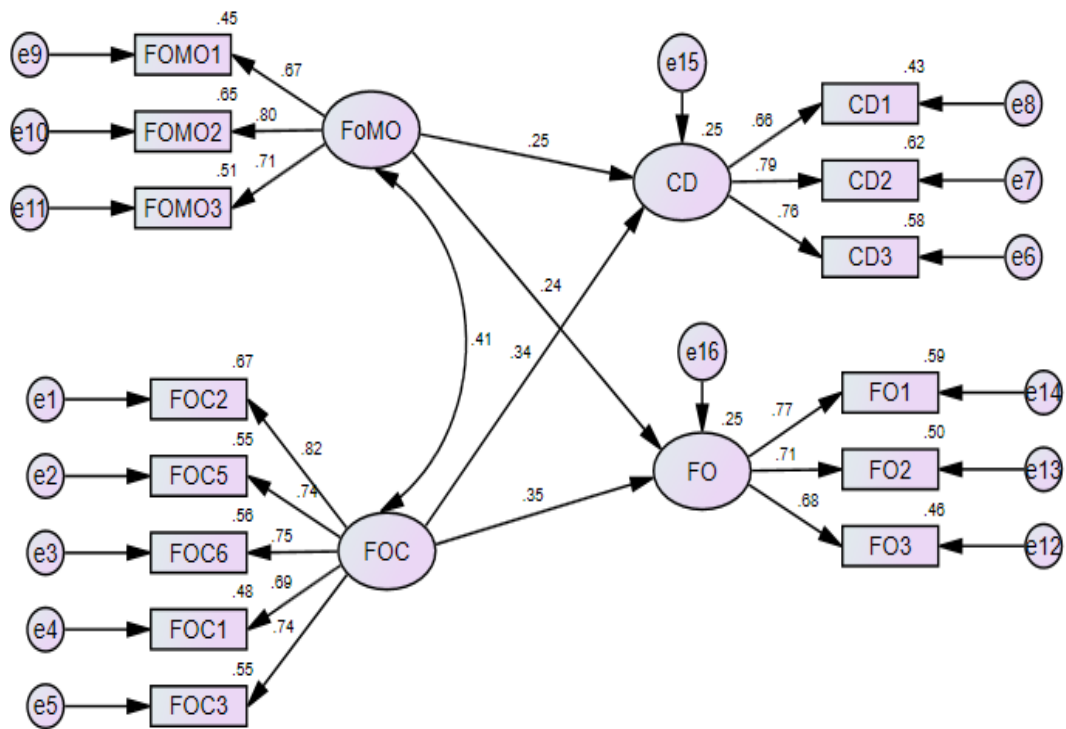

Figure 3. Confirmatory Factor Analysis Result

4.3. Testing Research Hypotheses

Table 5 and figure 3 indicate the relationships between four variables in the model. In particular, phubbing presented by phone obsession (FO) and communication disturbance (CD) shares a significant relationship with fear of COVID-19 (FOC) and fear of missing out (FOMO) ($p < 0.05$). In addition, this result illustrates the correlation between 2 independent variables which are fear of COVID-19 and fear of missing out. Therefore, all hypotheses in the research model were fully supported. Among these hypotheses, the relationship between fear of COVID-19 and fear of missing out was the most effective correlation ($\beta = 0.41$, $p = 0.000$). The second and third strongest relationships were that fear of COVID-19 had an impact on phone obsession and communication disturbance, respectively ($\beta = 0.35$, $p = 0.000$; $\beta = 0.34$, $p = 0.000$). Fear of missing out were also significant factors that affected phone obsession and communication disturbance ($\beta = 0.24$, $p = 0.001$; $\beta = 0.25$, $p = 0.003$, respectively). Therefore, Standardized Regression Equations are $Y (FO) = 0.35 FOC + 0.24 FOMO + \varepsilon$ and $Y (CD) = 0.34 FOC + 0.25 FOMO + \varepsilon$.

For the hypothesized structural model, the RMSEA is 0.065, demonstrating a “moderate fit” because 0.065 is less than 0.08 (Hu & Bentler, 1999). All other fit indices above the recommended threshold values (CFI = 0.945 > 0.09, GFI = 0.928 > 0.90; TLI = 0.929 > 0.90) (Diamantopoulos & Siguaaw, 2007), illustrating that the tested model is a sound structural Model. Table 5 and Figure 3 above represents the hypothesis test results.

5. Discussion and Conclusion

In conclusion, our analysis results have confirmed three of the proposed hypotheses in the theoretical framework regarding determinants of phubbing from the perspective of fear of COVID-19 and fear of missing out. Regarding hypothesis 1, the result indicates that fear of COVID-19 is positively related to phubbing by both two factors: communication disturbances and phone obsessions. This finding corroborates (Deursen, 2020) smartphones that provide internet access can be useful equipment for finding information related to COVID-19 and communicating with others in quarantine. Beside, the increasing trend of smartphones will form the basis of phubbing Karadag et al. (2015).

Next, the obtained results demonstrate that fear of missing out (FOMO) had a significant influence on phubbing. This finding provides a comprehensive assessment of how FOMO affects phubbing. In fact, FOMO promotes people's phone usage, social media usage so that they feel secure that they are not missing out on anything like events, life opportunities (Abel et al., 2016). In addition, people with higher levels of FOMO are more likely to abuse their phones under any circumstances to address their anxiety. This helps the person to keep up with the happenings online, but at the same time it also directly affects their actual social interactions, leading them to phubbing (Ofcom, 2018). The findings are also logical with the results of other studies in phubbing Blanca & Bendayan (2018) in that the relationships of FOMO and phubbing by two factors: communication disturbances and phone obsessions are strongly consistent with the proposed hypotheses.

The final hypothesis of this study, which states that the higher fear of COVID-19 the more positive fear of missing out is, has been validated and supported. This is also in line with previous research. The work of (Casale & Flett, 2020) demonstrated that promotion of social distancing along with the decline in social activities and social capital during the epidemic may increase the level of fear of missing out because of unmet social needs application.

The t-test and ANOVA results indicate that there is a difference between groups of students. More specifically, the phone obsession by females is more than that by males. The mean value of the groups shows that phone obsession rate increases by the level of time spent on the phone. With communication disturbance ability increases in the order of the following groups: Freshman, Junior, Sophomore and Senior.

The finding of this research is logical with the previous studies. However, provided with fear of COVID-19, this research becomes more relevant than those before in COVID-19 context. With two factors: Communication disturbances and phone obsessions make this study clearly confirm a significant relationship between fear of COVID-19, FOMO and phubbing.

In conclusion, our study has provided a theoretical model to understand the relationships between fear of COVID-19, fear of missing out and phubbing. By using the SEM method, this study adds empirical support to the literature and has tested three hypotheses related to the fear of COVID-19 and fear of missing out affecting phubbing. According to the results in this study, these results have identified several advantages that will be helpful for declining phubbing in school. Furthermore, the results also suggest that decreasing the link between fear of COVID-19 and fear of missing out is highly

recommended to reduce phubbing in students. This study recommends that the students should have more outdoor activities that help their mental health and balance life. In regard to school, the results show that the school should teach students how to use the Internet well.

Although this study contributes to the theoretical and educational implications, the model used in this study should be more developed in regard to life satisfaction in the future. Namely, a different construct could be introduced and tested as it may have a strong impact on promotional activities and expectations. In addition, future studies with larger samples could be conducted to allow for comparisons between regions' behaviors. Besides, the survey sample collected is not equal in quantity between universities and is limited to the university in the capital of Vietnam. However, the study could be further expanded when considering these factors in the future.

Abstract

By applying the push - pull - mooring model (PPM) and PLS-SEM, the study aims to examine the urban-returning intention of laborers in the Covid-19 pandemic with nearly 600 laborers who came back to their hometowns due to the impact of the pandemic nationwide. Our empirical results show that personal-family characteristics act as factors pushing laborers to leave their homeland; urban attractiveness acts as a pull factor, attracting laborer to return to work. The cognition of the “Responding to the Covid-19” solutions plays a moderating role in this model and acts as a mooring factor keeping laborers in their homeland. The results of the study can be served as a basis for policymakers in implementing measures to help attract and retain migrant laborers in the Covid-19 pandemic.

Keywords: *Covid-19, migration, intention to return to urban areas.*

1. Introduction

Migration is an unavoidable trend of the labor division of the development process, which occurs frequently when there are differences in opportunity, social variables, and the network of connections between the origin and destination countries (General Statistics Office of Vietnam and United Nations Fund Population Agency, 2016). This is also an important factor contributing to socio-economic development, especially domestic migration. In the face of adversity, such as the Covid-19 pandemic, migration is not only a necessity, but also an unavoidable option for the majority of laborers. According to Mukhra

et al. (2020), in the case of a government enforcing social separation, movement restrictions result in a higher rate of job loss and the fear of an unstable future economic existence so laborers begin to return to their hometown. This causes a labor surplus in rural areas and a labor shortage in urban areas (Singh & et al., 2020).

The majority of migration studies focus solely on first-time migration, neglecting to discuss migration intentions or return migration (second-time migration). In particular, in the Covid-19 pandemic, migrant laborers from urban to rural areas account for a sizable proportion of the population, making the study of the intention to return to urban areas for work become a new urgent issue. According to the results of the quick summary of reports of provinces and municipalities, on December 15, 2021, the country had about 2.2 million migrants, including up to 80% of laborers from big cities such as Hanoi, Ho Chi Minh City,... returning to the locality due to the pandemic's impact, resulting in a huge labor shortage in urban areas and a labor surplus in rural areas (Ngan Anh, 2021). Therefore, the findings of the study can be used as a foundation for managers planning to rehabilitate the labor market in Vietnam in the backdrop of Vietnam's Covid-19 pandemic.

As a result, the authors expect to use the PPM model to propose and validate a model for examining the relationship between personal-family characteristics, urban attractiveness, the cognition of the "Responding to the Covid-19 Pandemic" solutions, and the intention of Vietnamese laborers to return to urban areas for work. The authors also hope that the findings will help policymakers implement measures to help retain and attract migrant laborers back to urban areas in the Covid-19 pandemic.

2. Literature Review

2.1. Push - pull - mooring model

The movement of people from one geographic location to another or from one territory to another over a temporary or permanent period of time is referred as migration (Mangalam & Morgan, 1968). Many studies have confirmed that migration intention plays an important role in the process of reviewing overall migration decisions and predicting future migration flows and is the main indicator of actual migration behavior (De Jong, 2000; Van Dalen & Henkens, 2007). For the reason, it is possible to deduce that the intention to return to the urban areas refers to laborers' desire to leave their hometown and return to cities where they previously lived and worked.

Lee (1966) was the first to establish a migration rule based on push-pull factors, building on Ravenstein's foundational theory of migration (1885). The pull factor at the destination is identified as the pull force that motivates people to move, while the push force at the beginning place is identified as the force that drives them to leave. However, according to Moon (1995), the push-pull hypothesis does not fully describe the factors that directly affect individual migration, but migration is also influenced by the mooring factor. This factor is determined by the following aspects: culture-society, habitat; creating favorable conditions or hinder the decision to emigrate. Therefore, this study chose to use the push-pull-mooring (PPM) model that considers the worker's intention to return to the city: the

push factor is the personal-family characteristic, the pull factor is the urban attractiveness, the mooring factor is the cognition of "Responding to the Covid-19 pandemic" solutions.

2.2. Personal-family characteristics affect the intention to return to urban areas

Rural-urban migration is generally fueled by push factors emerging from the countryside in order to against some negative effects on the quality of life in the city (Moon, 1995). Personal-family characteristics, according to Jedwab et al. (2017), are the push factor that leads farmers away from rural areas.

Personal characteristics, such as gender, age, educational level, marital status, and the occupational status of migrant workers, are important factors that directly affect the choice of destination and the intention of each person to migrate (Chen, 2011; Mao & Zhao, 2012; Hengyu et al. , 2020;...). According to Zhu and Chen (2010), younger migrants in China are more resilient and have a higher educational level, providing them with the necessary knowledge of required city job placements, so they tend to move. When considering the free flow of ethnic minorities in the Northwest provinces to border and urban areas, Tan et al. (2019) discovered personal characteristics such as gender, age, marital status, education level, and technical expertise that led to the intention to migrate. Female employees are more likely to migrate to cities and cross borders quickly, and marital status has an impact on migration because family migration is more difficult than individual migration. Finally, the authors discovered that people with higher levels of education move more in ethnic minority areas.

According to Hossain (2001), family features are the primary motivator for rural-urban migration. Li et al. (2014) demonstrated that the larger the proportion of children in a family, the less likely members of the household are to participate in non-farm activities outside of the home. Family characteristics with older generation (such as grandparents) who can take care of children, on the other hand, encourage adults of working age to relocate. The authors also discovered that children's schooling and parents' migration had the opposite effect, i.e., the more children in school, the more likely parents are to work locally.

Based on the above research, we decided to use personal-family characteristics as factors, which have a direct impact on laborers' intention to return to urban areas for work.

2.3. Cognition of "Responding to the Covid-19 pandemic" solutions

Randolph (2003) defines "cognition" as "knowledge or understanding of a specific issue or situation". More specifically, Ambali et al. (2013) suggest that "cognition" occurs when a person has a specific interest or experience and is completely aware of what is going on at the time. Based on the concepts discussed above, Ifinedo (2014) demonstrated that perception influences intent, behavior in decision-making, and policy compliance.

According to Fan and Zhang (2019), perceptions reflect personal attitudes as well as social norms in the farmer's migration decision-making process, which is examined through two lenses: understanding of housing rights as well as knowledge of relevant government policies. The authors pointed out that perception is one of the key factors in the mooring

factor, which not only works as an independent variable influencing rural people's decision to leave the farm, but also has a regulatory impact on the model's remaining relationships. In the context of the Covid-19 pandemic in Vietnam, understanding and complying with the government's epidemic preventive efforts has a substantial impact on migrant laborers' decision-making and behavior. As a result, we used cognition of "Responding to the Covid-19 pandemic" solution as a mooring factor in this study to consider the impact on laborers' intention to return for work.

2.4. Urban Attractiveness

The attractiveness of a location is that it has its own unique pull and attraction due to both material and spiritual aspects (Hidalgo & Hernandez, 2001). According to Rodriguez & Ketterer (2012), the ability to attract residents plays a key role in the development prospects of cities. This possibility becomes even more important when there are demographic changes (population decline and aging - a problem that most developing and developing countries face). As a result, data on the factors that influence the attractiveness of urban areas to migrants is critical for local governments and urban planners (Royuela et al., 2010). According to Nguyen Thu Thuy (2020), a migrant's attraction to a location is frequently based on three factors: (1) work possibilities, (2) attachment to housing, and (3) quality of life.

In Vietnam, the process of industrialization and urbanization has resulted in significant increases in population in urban areas, including: family size in small urban areas; married late and had few children; better housing conditions; and many opportunities to access the comforts of life and learning conditions, as well as to work in an environment that requires professional training. These benefits are seen in places with high levels of urbanization, enhancing the attractiveness of large cities and encouraging considerable migration flows to these areas (Nguyen Viet Dinh, 2020). Especially in the context of the Covid-19 pandemic, laborers who lost their jobs had to return to their hometowns but many still hoped to return to the city to work in order to diversify their earnings and live a better life. Therefore, the authors decided to use urban attractiveness as a pull factor, attracting laborers back to work in the urban areas.

3. Method

3.1. Research models and research hypotheses

The research model of the factors influencing laborers' intentions to return to urban areas for work in the context of the Covid-19 pandemic is based on the PPM model (Moon, 1995) with the following hypotheses:

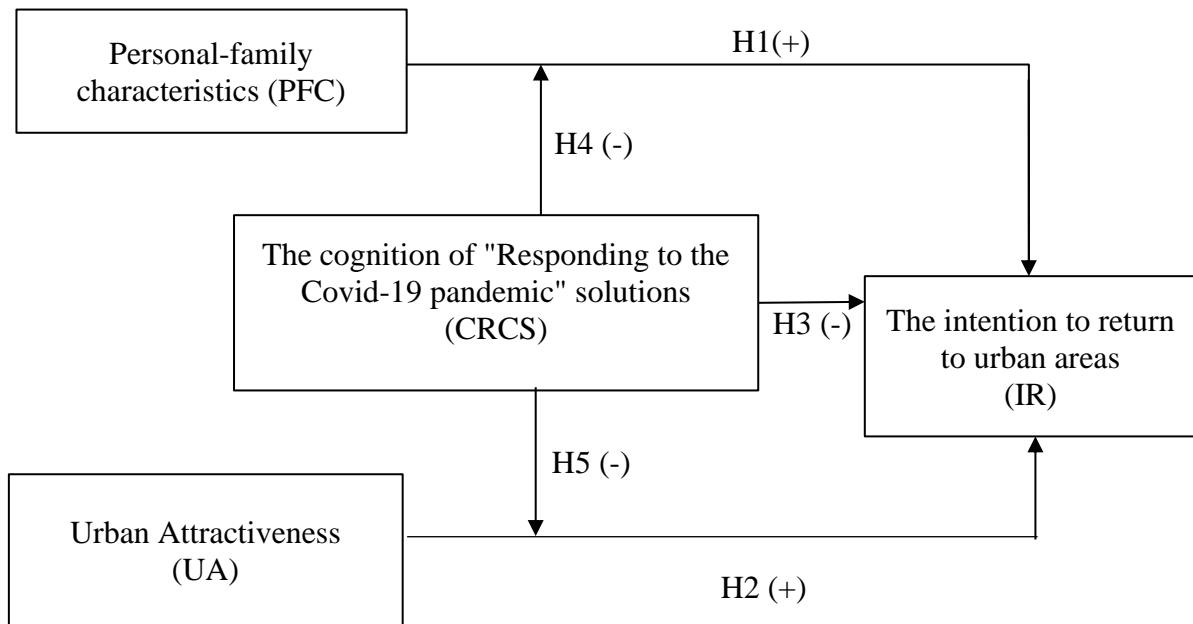

Hypothesis 1 (H1): The personal-family characteristics positively affect the intentions to return to urban areas for work.

Hypothesis 2 (H2): The urban attractiveness positively affects the intentions to return to urban areas for work.

Hypothesis 3 (H3): Cognition of "Responding to the Covid-19 pandemic" solutions negatively affects the intention to return to urban areas for work.

Hypothesis 4 (H4): Cognition of "Responding to the Covid-19 pandemic" solutions has a moderating role that reduces the influence of the personal-family characteristics on the intention to return to urban areas for work.

Hypothesis 5 (H5): Cognition of "Responding to the Covid-19 pandemic" solutions has a moderating role that reduces the influence of the urban attractiveness on the intention to return to urban areas for work.

Source: The research model

3.2. Method of data collection.

Between November and December 2021, we performed a study of over 600 laborers who had relocated to the city for employment but now returned to their hometown due to the impact of the Covid-19 outbreak in Vietnam. Direct interviews and Google Forms placed on job groups such as National Employment in General Labor, Ho Chi Minh City Job Recruitment, Compatriots' Association Nghe An - Ha Tinh are used to collect data. After removing invalid responses, we gathered a sample of 498 observations for study. The survey questionnaire is divided into four pieces. Except for the first section, the rest used a five-point Likert scale ranging from 1 to 5, with 1 representing "completely disagree" and 5 representing "completely agree".

The first section comprises questions concerning personal-family characteristics. The second section focuses on survey subjects' cognition of the government's solutions to the Covid-19 pandemic, which are based on measuring scale of Wang et al. (2021). The third section of the study focused on the level of laborers' assessment of urban attractiveness using the scale of Kourtit et al. (2021). The last component, which examines laborers' intention to return to urban areas in the future, draws on the scale of intents developed by Sandu & De Jong (1998), Van Dalen & Henkens (2008), and Tam & Khuong (2015).

3.3. Data processing method

In the structural equation model (SEM), there are two main approaches to estimating relationships: CB-SEM and PLS-SEM (Hair et al., 2011). CB-SEM is also known as variance structural analysis or causality model, and it is primarily used to prove (or disprove) theories. PLS-SEM, on the other hand, is also known as the path model and is primarily used in discovery research for theoretical development (Hair et al., 2017). PLS-SEM is a better fit for research that focuses on theoretical discovery rather than assertion. PLS-SEM also has the advantage of being able to handle not only complex model with multiple relationships, but also causal or structural measurement model (Hair & et al., 2014). For the reasons described above, the authors decide to use the PLS-SEM model, process on SmartPLS software to test the hypotheses in order to predict the willingness of people to leave their homeland and return intention to urban areas for work in the Covid-19 pandemic.

4. Results

4.1. Descriptive statistics

Table 1. Characteristics of the survey sample

		Frequency (people)	Percentage (%)			Frequency (people)	Percentage (%)
Age	Under 15	12	2.4	Marital status	Married	168	33.7
	15 - 19	50	10		Unmarried	228	45.8
	20 - 24	79	15.9		Widow	32	6.4
	25 - 29	106	21.3		Divorce	52	10.4
	30 - 34	88	17.7		Separation	18	3.6
	35 - 39	52	10.4	Total number of family members	Less than 3 people.	57	11.4
	40 - 44	49	9.8		3 people	64	12.8
	45 - 49	29	5.8		4 people	208	41.8
	50 - 54	20	4		5 people	111	22.3
	55 - 59	8	1.6		More than 5 people.	58	11.6
60 +	5	1.1	Number of people between the ages of 15 and 60 in the family	Less than 2 people	68	13.7	
Gender	Male	295		59.2	2 people	145	29.1
	Female	203		40.8	3 people	146	29.3
Educational level	Not yet graduated from elementary school	17	3.4	4 people	98	19.7	

		Frequency (people)	Percentage (%)			Frequency (people)	Percentage (%)
	Elementary school graduation	29	5.8	Number of children under the age of 15 in the family	More than 4 people.	41	8.2
	Secondary school graduation	41	8.2		Less than 2 people	165	33.1
	High school graduation	135	27.1		2 people	221	44.4
	Vocational elementary graduation	55	11		3 people	79	15.9
	Vocational intermediate graduation	51	10.2		4 people	28	5.6
	Vocational college graduation	83	16.7		More than 4 people	5	1
	Graduated from University and Postgraduate	87	17.5		Number of people over the age of 60 in the family	Less than 2 people	180
Current employment status	Have a full-time job	190	38.1	2 people		284	57.1
	Have a part-time job	168	33.7	3 people		34	6.8
	No job	140	28.2	4 people		0	0
					More than 4 people	0	0

Source: The author group's calculations

Males account for 59.2% of the 498 valid observations, while females account for 40.8%. The most common ages are 25-29, 30-34, and 20-24, with rate of 21.3%, 17.7%, and 15.9% respectively. In terms of marital status, unmarried people made up 45.8% of observations, while married people made up 33.7%. Besides, 27.1% of those who responded were high school graduates, 17.5% were university and postgraduate graduates, and 16.7% were vocational college graduates. The average number of family members of survey subjects is four, accounting for 41.8% of the total. Furthermore, when asked how many laborers the family has between the ages of 15 and 60, the majority of the responses were two or three people, accounting for 58.4% of the total.

4.2. Test the reliability of the scale

For the following reasons, we used Cronbach's Alpha (α) and Fornell's Composite Reliability (ρ) to assess the reliability of the PLS-SEM model (table 2): Cronbach's Alpha is sensitive to the amount of variables seen in the measuring scale, and it frequently underestimates internal consistency. Composite Reliability, on the other hand, has a tendency to overestimate internal consistency, resulting in a greater reliability estimate than Cronbach's Alpha. When analyzing and evaluating the internal reliability of the scales, the true reliability usually lies between Cronbach's Alpha (which represents the lower limit) and Composite Reliability (which represents the upper limit).

Table 2. Reliability's results of the scale

	Cronbach's Alpha (α)	Composite Reliability (ρ)	Average Variance Extracted (AVE)
IR	0.897	0.918	0.617
PFC	0.791	0.848	0.455
UA	0.922	0.933	0.521
CRCS	0.856	0.881	0.555

Source: The author group's calculations

The higher the Cronbach's Alpha coefficient, the more reliable the scale; a value of 0.7 or higher is considered good (Peterson, 1995). As a result, our Cronbach's Alpha test results show that the scale's reliability has met the standard. Many researchers, including Bagozzi & Yi (1988), Henseler & Sarstedt (2013), and Hair et al. (2014), recommend a rating threshold of 0.7 for composite reliability values. In general, all the structures in table 2 have a value of ρ greater than 0.7, indicating that they meet the structural value requirement. Therefore, it can be affirmed that the results of the test of the reliability of the scale are excellent and the observation variables that measure the factor is appropriate.

The Average Variance Extracted (AVE) is used to assess the convergence of the scale. Hock & Ringle (2010) states that a scale reaches a convergence value if the AVE reaches 0.5 or higher. This level of 0.5 (50%) means that the average maternal latent variable will explain at least 50% of the variation of each child observation variable. So, according to table 2, the AVE derivative variance index in all structural groups in our model is qualified, except for personal-family characteristics variables (AVE = 0.451).

This is because this factor is a demographic variable that consists of nominal scales of personal and family characteristics of the survey subjects, so the evaluation of AVE in this factor is not necessary.

Table 3. Results of regression model inspection

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (O/STDEV)	P Values (p)
PFC-> IR	0.155***	0.157	0.043	3.614	0.000
UA-> IR	0.201***	0.211	0.043	4.700	0.000
CRCS-> IR	-0.255***	-0.262	0.045	5.682	0.000
CRCS*PFC -> IR	-0.007	-0.004	0.049	0.146	0.884

*Note: Significant level: ** $p < 0.05$; *** $p < 0,01$*

Table 3 shows the results of the PLS-SEM model obtained through the bootstrapping technique. We investigate three major factors (personal-family characteristics, urban attractiveness, and the cognition of "Responding to the Covid-19 pandemic" solutions) that influence the intention to return to urban areas for work, as well as the moderating effect of cognition of "Responding to the Covid-19 pandemic" solutions on the relationship between personal - family characteristics, urban attractiveness, and the intention to return. The study's findings revealed fresh information about labor migration in Vietnam during the Covid-19 outbreak, including the following:

First: Personal-family characteristics positively affect the laborers' willingness to return to urban areas ($\beta = 0.155$; $p < 0.01$). This finding is in line with Zhu & Chen's (2010) study, which found that young, well-educated migrants are more likely to return to urban areas for work. Meanwhile, people who are over 40 or have low educational level or have a large number of children in need of care are less likely to return to the urban areas for work.

Second: Urban attractiveness significantly positively affects the return intention for work ($\beta = 0.201$; $p < 0.01$). This finding is consistent with Fan and Zhang's (2019) study, which claims that urban attractiveness has a strong impact on the intention to return to work.

Third: The cognition of "Responding to the Covid-19 pandemic" solutions negatively affects the willingness to return to urban areas ($\beta = -0.255$; $p < 0.01$). As a result, this study examines the relationship between cognition of Covid-19 measures and a return intention to urban areas which has not been mentioned in previous Vietnamese studies.

Fourth: The role of cognition of "Responding to the Covid-19 pandemic" solutions in the relationship between personal-family characteristics and laborers' intention to return to urban areas for work has yet to be demonstrated.

Fifth: The cognition of "Responding to the Covid-19 pandemic" solutions that plays a moderating role in reducing the influence of factors leading to laborers' intentions to return to urban areas ($\beta = -0.183$; $p < 0.01$). According to Fan and Zhang, this finding clarifies the

impact trend in cognition's moderating role as a mooring factor (2019). Following that, this finding expands on Moon's PPM model and aids researchers in gaining a more comprehensive understanding of it (1995).

5. Discussion and Conclusion

Through the PPM model, this study further examines and explains the impact of personal-family characteristics - urban attractiveness - cognition of "Responding to the Covid-19 pandemic" solutions to laborers' intentions to return to the urban areas for work in the context of the Covid-19 pandemic. The results show that personal-family characteristics and urban attractiveness have a positive impact on intentions motivating laborers to return to the city; while cognition of "Responding to the Covid-19 pandemic" solutions has the opposite effect, obstructs the intention, moderates to reduce the impact of attractiveness. Our empirical results give us some theoretical and practical implications.

Theoretically, this research varies the present labor mobility paradigm. In Vietnam, as well as around the world, studies on migration bases on the impact of the mooring factor, instead focusing on the two push-pull variables is very rare. Furthermore, other studies are usually focused on migration or repatriation, while the intention of returning to urban areas being overlooked. Therefore, testing the effects of the above factors is necessary to clarify the substance of this issue, especially in the context of the Covid-19 pandemic. Furthermore, a piece of evidence from a developing country will yield a meaningful comparison to previous studies which were primarily conducted in developed countries.

In practice, this research shows that individual-family factors has a beneficial impact on the desire to return. Young laborers (aged from 15 to 40) with a high level of education would be more likely to return to urban areas, whereas laborers who are over the age of 40 or have a large number of children in need of care or have low educational levels would be less likely to return.

The study's finding also reveals that the urban attractiveness has a positively effect on laborers' intentions to return to the urban areas if the government and businesses have solutions and policies in place to assure social security and health for workers in a "new normal" state. Therefore, businesses should take actions to retain laborers, such as proactively keeping information, communicating through groups on social media, implementing procedures to seek compensated employment, or suspending or departing without pay instead of terminating the employment contract,... Additionally, in the "new normal," businesses and governments must plan to create occupational safety method to protect employees, as well as strategies for remote work and automation.

The results also show that the cognition of "Responding to the Covid-19 pandemic" solutions has the effect of keeping laborers in their hometown, reducing the impact of urban attractiveness, especially laborers over the age of 40 who would be less likely to return to the urban areas for work if the locality in which they live is strictly implemented responding solutions to pandemics. Therefore, to take advantage of this workforce, localities must conduct statistics and reviews of unemployed laborers' employment needs, the ability of each person, create on-site jobs by creating conditions for capital, technology, breeding breeds and cultivation; conduct new vocational training, foreign language training so that they can get used to economics restructuring.

Abstract

The topic explores and evaluates the factors affecting the behavior of citizens in Hanoi during the Covid-19 pandemic. Through systematic surveys and research, there are scientific and practical assessments that help people have a certain understanding of the harmful effects of discharging medical waste on the community in the current pandemic situation. As a result, we want to raise the awareness of protecting the community and the environment of people in Hanoi city. Thereby, the research team proposed solutions to limit this behavior of the people of Hanoi city. Specific objectives include: (1) Presenting the theoretical basis of the behavior of medical waste littering during the pandemic; (2) Proposing theoretical models, testing research hypotheses on factors affecting the behavior of medical waste littering in public places of Hanoi people; (3) Proposing orientations and solutions to limit the situation of people dumping medical waste in public places in Hanoi city.

Keywords: *medical waste, environment, COVID-19, behavior, littering*

1. Introduction

COVID-19 is the pandemic that has affected all areas of activity. The most devastating effects were on health, the environment, and education. Medical waste has exploded in terms of quantity and influenced the reorganization of their management in hospitals, the public domain, and the environmental approach.

Medical waste remains a complicated issue for human society due to its health and environmental, economic, and social impacts. In particular, medical waste negatively

influences the health of the population and the environment, so it must be managed with great care and the right behavior.

The purpose of the study is to find out and evaluate the factors affecting the behavior of citizens in Hanoi from the analysis of the literature on medical waste from the beginning of the COVID-19 pandemic. This paper is divided into the following sections, which have been considered key to achieving the proposed objectives. Section 1 is the introduction; Section 2 defines the research method; Section 3 is results analysis and Section 4 is about discussion and conclusion.

2. Method

2.1. Research questions

A scientometric study was performed. The research was conducted based on the following three research questions were defined:

RQ1: During the Covid-19 pandemic, what factors affect the behavior of Hanoi residents to litter medical waste?

RQ2: What is the impact of the factors on this medical waste littering behavior?

RQ3: What will be the trend of the behavior of people in Hanoi in the next periods of the Covid-19 pandemic?

RQ4: While the Covid-19 epidemic is still extremely complicated, what is the solution to reduce the littering of medical waste in public?

2.2. Related theoretical models

2.2.1. Theory of rational action

Ajzen and Fishbein jointly developed the Theory of Reasoned Action in the late 1960s and then revised it extensively in the 1970s. This is considered a leading theory in the field of psychosocial research (Eagly & Chaiken, 1993; Olson & Zanna, 1993; Sheppard, Hartwick & Warshaw, 1998, quoted in Mark, C. & Christopher J.A, 1998, page 1430).

The TRA model shows that behavior is determined by the intention to perform that behavior. This relationship has been established and empirically verified in multiple studies in multiple disciplines (Ajzen, 1998; Ajzen & Fishbein, 1980; Canary & Seibold, 1984; Sheppard, Hartwick & Warshaw, 1988, cited in Ajzen, 1991 page 186), according to which the intention to perform the behavior is demonstrated and expressed through the tendency to perform the behavior. Intention is the state of awareness immediately prior to performing the behavior. It's a factor that leads to behavior.

According to the TRA theory of Ajzen and Fishbein, in predicting behavior, behavioral intention (BI) is one of the most important factors. Behavioral intention is affected by two factors: Attitude Toward Behavior (AB) and Subjective Norm (SN).

According to Gordon Allport (1970): "Attitude is a general tendency towards a person or thing". For Turnstone: "Attitude is an emotional measure of one's approval or disapproval of a certain externality".

Schiffman & Kanuk (1987) suggest that attitudes are illustrated through three factors: perception, emotion (favorite) and behavioral intention. Perception is related to knowledge about an object through the information received related to that object and the experience gained after performing that behavior to form their beliefs about that object behavior. Emotion (favorite) represents a general feeling of liking or disliking that object. Factors that show general liking about the object without separating each object's characteristics. Emotions are often mentioned as an important component of attitude while other components have a supporting effect.

Attitudes in the Rational Action Theory model demonstrate the correlation between perception and liking. Utility and importance are two characteristics used to make choices. These important attributes are the key to being able to predict the closest answer. Subjective normative factors can be measured directly by measuring how the emotions from the stakeholders think about their intentions and the intentions of the intended people to follow the wishes of the people involved (Nguyen Van Phu, 2011).

2.2.2. The Theory of Planning Behavior

The Theory of Planning Behavior (TPB) of Ajzen (1991) is built on the theory of rational action of two authors Ajzen & Fishbein (1975), hypothesizing that a behavior can be predicted or be justified by the intention to perform the behavior. According to the theory of intended behavior, intention is assumed to include motivational factors and is viewed as the degree of individual effort to perform the behavior; Intention is the closest basis of behavior and is predicted by Attitude Toward Behavior (AB), Subjective Norm (SN) and Perceived Behavioral Control (PBC) respectively. TPB further hypothesizes that the components are in turn determined by the most prominent expectation and estimate the expectations for each of those components: behavioral expectations with attitudes towards a given behavior; specific expectations about the outcome of performing the behavior. Subjective norm expectations about perceived agreement or disagreement with the behavior of other indispensable subjects. Expectations of control refer to factors that favor or inhibit the performance of a behavior. In short, according to TPB, the intention to perform the behavior is a function of three factors.

Firstly, the Attitude Toward Behavior (AB) factor is considered as a positive or negative assessment of the behavior. The author argues that a positive or negative personal emotion, namely an attitude that embodies a behavior influenced by psychological factors and the situations currently facing.

Next, the subjective norm (SN) or social influence is “perceived social pressure to perform or not perform the behavior” (Ajzen, 1991). Social influence refers to the influences and influences of important and close people that can influence the individual performing the behavior.

The last-mentioned motivating factor here is Perceived Behavioral Control (PBC). This factor indicates whether performing the behavior is difficult or easy and whether the performance of the behavior is controlled or restricted (Ajzen, 1991, p. 183). Ajzen (1991).

Ajzen (1988) firmly asserts that these underlying information are expectations of behavior and that the cause of behavior is primarily because of these expectations. Therefore, it is the change in expectations that leads to the change in behavior. Based on this explanation, some researchers have intervened with the purpose of changing expectations and determining whether the observed subjects change their behavior. In addition, other researchers find out the influence of the intervention policy by examining the change in expectations after using the policy. An accessible example here is: Bamberg and Schmidt estimate the impact of the Universal bus Pass (U-pass) program in Germany and show that people use a lot of buses. and less car use, partly explained by a change in bus usage expectations.

2.2.3. Rational Choice Theory

Rational choice theory is based on the premise that people always act in a purposeful, thoughtful way to make decisions and use rational resources to achieve the maximum at the minimum cost. Homans interpreted the basic postulate of the theory in a mathematical theorem as follows: “When choosing among possible actions, individuals will choose what they consider to be the product (C) of the probability of succeeding. of that action (P) with the value where the reward for that action (V) is the maximum $C = P \times V = \text{Maximum}$. In addition, John Elster said: “When faced with certain actions, people often do what they believe is most likely to achieve the 'best' end result (Le Ngoc Hung, 2009).

Rational choice theory requires an analysis of the individual's choice action in relation to its whole social system including other individuals with their needs and expectations, their choices and the outputs of each choice and other characteristics.

Kotler and Fox proposed a general model that represents the steps involved in making a complex decision, which is summarized graphically.

2.2.4. Procedural Fairness Theory

Penal and criminal policies have always reflected the contrast between simple and complex models of violation control. Key elements of these simple breach control models:

- People always evaluate the benefits that the violation brings to make a decision whether to perform that behavior or not.
- The containment of threats is a key tool of criminal justice.
- Feature and danger of behavior: The number of violators and the crime rate depends mainly on the ability to be punished. That likelihood can vary based on the certainty, severity, and quickness of the breach.
- Increasing penalties and expanding the scope of enforcement are seen as forms of response to violations.
- Violators' rights are seen as a limitation of this model.
- More sophisticated models of violation control suggest that formal criminal justice is just one of many systems of social control, most of which have a dense set of standards.

With respect to people's compliance with authority, the theory of normative equity proposes the relationships between the following factors:

- The treatment people receive from the police and justice agencies.
- The trust that the people have from the justice agency.
- The legitimacy that the people give to the justice agency, as a result of that trust.
- The authority that this agency has is sometimes considered legitimacy.
- Citizens' preparedness to obey the police, obey the law, and cooperate with justice.

Legitimacy is a central concept in the theory of procedural justice and there are two uses for the term. Political philosophers often argue that the political system derives from the fact that people legitimately agree on many objective criteria. But there are still questions about the legitimacy of the criminal justice system in the eyes of the public – whether supervisors see the legitimacy of the police. These questions are open-ended and answered based on experience. Regardless of whether the justice system achieves any of the above-mentioned objective factors or not, we should focus on studying it through survey and quantitative methods to gain insight into community attitudes, values, behaviors and beliefs (Mike Hough, Jonathan Jackson, 2012).

Supervisors can perceive legitimacy when they see authority as something they deserve and it's obligatory for them to obey. If people voluntarily submit to a system of authority that controls legitimacy, questions about who governs legitimacy will become a political concern. The theory of procedural justice is based on legitimacy and normative motivation. Based on the procedural justice and compliance model (Tyler, 2008), the nature of institutions can influence ethics. When people believe that morality is simply obeying the law, that law essentially forces every individual to perform appropriate behavior, in accordance with the law. From this compulsion, they will recognize their particular actions as illegal or immoral.

According to Tyler's "process-based policing" model (Sunshine & Tyler, 2003), legitimacy must then conform to the first law in society (and its judicial system) and have the power to dictate how appropriate conduct: although we may disagree with some points of these laws, we must follow them because we think it is the right thing to do with the authorities that make the laws. And second, if individuals see the police as lacking in 'moral fiber' - most importantly of behaving in a way that is clearly unfair - it can make the public skeptical of the law.

According to Sampson & Bartusch (1998: 786), legal skepticism is the consciousness, that '...laws or regulations are not considered to be 'constrained in the present existence or life of the respondent', and '...approval of acting in ways that are 'outside' of laws and social norms'.

Police legitimacy is represented by a single latent variable construct as measured by a series of questions about the obligation to follow. While believing in the effectiveness of the police by their own perception or the risks and risks of being caught, the research results show that the perceived risks of punishment are not a factor that cannot be ignored. lack of predicting the behavior of violators. The National Policing Improvement Agency (NPIA) data do not provide the desired results for this model but suggest that at least within the

confines of survey data and The model only stops at reporting the views, beliefs, calculations and behavior of the violator (The results coincide with the study of Pratt, 2006). The results suggest that deterrence is not an effective route to ensuring compliance.

3. Results

3.1. *Inspect Reliability coefficient*

All scales have Cronbach's Alpha coefficient greater than 0.7 and the total correlation greater than 0.4; Therefore, no variables have been removed, and the scale has ensured reliability.

Table 1. Results of the inspect reliability coefficient

Factor	Number of variables	Cronbach's Alpha	Minimum Corrected Item - Total Correlation
Influence of attitude	4	0,899	0,721
Influence of subject norm	4	0,870	0,582
Environmental awareness	4	0,936	0,821
Information awareness	3	0,858	0,661
Influence of penal risk	4	0,774	0,496
Medical waste littering behavior	5	0,912	0,712

3.2. *Analyze EFA component*

3.2.1. *Analyze EFA component for independent variables*

The results of the EFA component showed that 5 factors were extracted at the eigenvalue of 1,093 and the variance explained was 75.976%. KMO coefficient = 0.864 > 0.5 so EFA fits the data. Besides, the factor loading is above 0.5, so the observed variables are important among the factors and have practical significance. Sig (Bartlett's Test) = 0.000 < 0.05, showing that the observed variables are correlated with each other in the population.

Table 2. Results of KMO and independent variables' Bartlett

Evaluated item	Result	Comparison
KMO	0,864	0,5 < 0,864 < 1
Sig.	0,000	0,000 < 0,05
Cumulative	75,976%	75,976% > 50%
Eigenvalue	1,093	1,093 > 1

3.2.2. *Analyze EFA component for littering behavior scale*

Medical waste littering behavior includes 5 scales for measurement. EFA component analysis results show that 5 scales converge on one factor. KMO coefficient = 0.849 > 0.5 so EFA fits the data. Besides, the factor loading is all above 0.5, so the observed variables are important in the factor and have practical significance. Sig (Bartlett's Test) = 0.000 < 0.05, showing that the observed variables are correlated with each other in the population.

Table 3. Results of KMO and dependent variable Bartlett

Evaluated item	Result	Comparison
KMO	0,849	$0,5 < 0,849 < 1$
Sig.	0,000	$0,000 < 0,05$

3.2.3. Adjusted Research Model

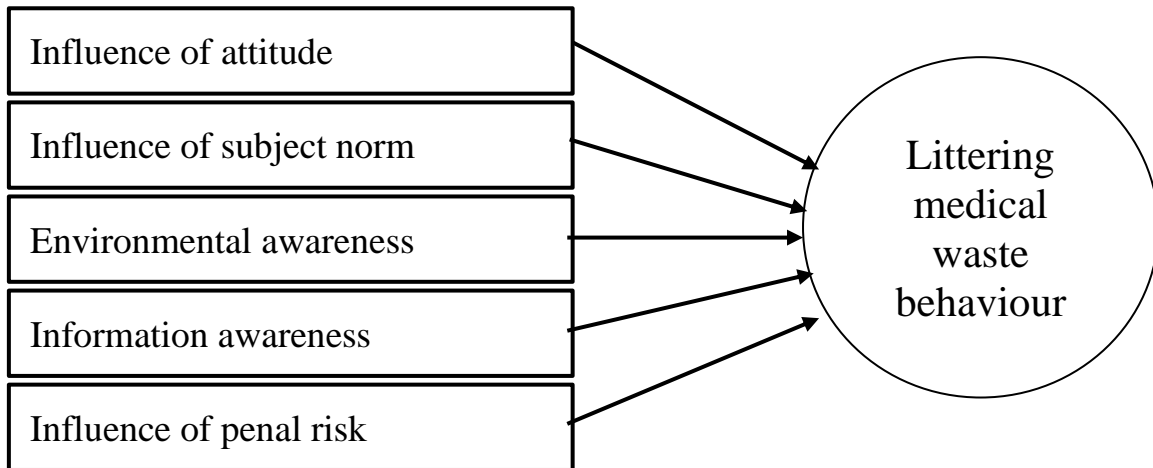

Figure 1. Adjusted research model

3.3. Analyze Pearson Correlation

We use the Pearson coefficient to analyze the correlation between quantitative variables. All correlation coefficients between variables ranged from -0.286 to 0.593. That proves the discriminant value has been achieved, showing that the relationship between the dependent variable (Medical waste littering behavior) and the independent variables is statistically significant (Sig. < 0.05). On the other hand, the dependent variable Medical waste littering behavior is also significantly negatively correlated with the variables Influence of attitude, Influence of subject norm and Information awareness, and influence of penal risk. At the same time, there is a positive correlation with environmental awareness. Furthermore, the magnitude of the correlation coefficients ensures that there is no collinearity.

Table 4. Results of correlation

	Behavior	Attitude	Subject norm	Environment	Information	Penal
Behavior	1					
Attitude	-0,281**	1				
Subject norm	-0,202**	0,593**	1			
Environment	0,672**	-0,286**	-0,286**	1		
Information	-0,229**	0,519**	0,425**	-0,238**	1	
Penal	-0,008	0,422**	0,285**	-0,066**	0,529**	1

3.4. Analyze Regression

Based on the standardized Beta coefficient, it was found that Environmental awareness has the strongest impact on Medical waste littering behavior (Beta = 0.636). In addition, the influence of attitude has the weakest effect (Beta = -0.142), the two factors that influence the attitude and the perception of information negatively affect the behavior of medical waste littering. (Beta < 0). Where the value Sig. All factors are less than 0.05, except for 2 factors. Influence of subject norm and Information awareness, so all 3 factors are accepted in this research model.

Table 5. Results of the factors affecting to the medical waste littering behavior

Independent variables	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinetary Statistics	
	B	Std. Error	Beta			Tolerance	VIF
Constants	1,447	0,427		3,389	0,001		
X1	-0,210	0,105	-0,142	-2,005	0,46	0,533	1,878
X2	0,080	0,074	0,071	1,077	0,283	0,618	0,618
X3	0,594	0,051	0,636	11,563	0,000	0,879	1,138
X4	-0,130	0,086	-0,101	-1,506	0,134	0,587	1,702
X5	0,149	0,074	0,127	2,028	0,044	0,680	1,470

F = 35,715, significance of F = 0,000
R square = 0,475, Adjusted R square = 0,462
Dependent variable Medical waste littering behavior (Y)

4. Discussion and Conclusion

The originally proposed model had five elements. After being tested, all factors are consistent with the scope of the study, and research hypotheses are accepted. The measurement results show that the scales are built and inspected all over the world and in Vietnam in the field of researching the intentions or behaviors of littering in the public area that can be used in Hanoi. Particularly, factors related to each individual in the littering of medical waste: Influence of attitudes (-0.142), Influence of Subject norm (0.071), Environmental awareness (0.636), Information awareness (-0.101) and Influence of penal risk (0.127). Besides, Environmental awareness (0.636) had the strongest impact and the Influence of attitudes (-0.142) had the weakest impact. The measurement results show that these variables help companies selling medical products and enterprises that have been and

will participate in environmental-related activities by offering a number of solutions and proposals to the Vietnamese government and companies in the treatment of medical waste and environmental protection.

The research model is based on Ajzen's Combination of Planned Behavior Theory (TPB) (1991), Ajzen's Theory of Planned Behavior (TPB) (1991), Rational Choice Theory, and finally procedural fairness theory. The group of authors inherited from the models that preceded the variables in accordance with the scope of the study of the topic: The influence of attitudes; The Influence of Subject norm; Environmental awareness; Information awareness and the Influence of penal risk. This topic focuses on the study of the behavior of discharging medical waste in public areas in the context of the COVID-19 pandemic and the factors that affect the behavior of medical waste in public places.

Stemming from the results of the study, the authors offered a number of solutions and proposals for hospitals and medical facilities, as well as state management agencies and market management agencies to manage people and solve the problem of medical waste treatment in Hanoi city.

In order to limit the indiscriminate littering of medical waste in public places, the city government needs to take many measures. For a waste collection agency, it is essential to set up an inspection team to monitor the situation of waste collection and treatment at the point of COVID-19 isolation. Besides, they should coordinate the monitoring and timely detection of the point of congestion and overload of medical waste with epidemiological elements to compile reports on the board of directors of companies and the Department of Natural Resources and Environment; quickly transport and handle, meet the requirements of epidemic prevention and control. In case of problems arising, the agencies jointly research and propose solutions, ensuring that there is no backlog of garbage polluting the environment and limiting the spread of pathogens.

COVID-19 that related to waste in quarantine zones, temporary quarantine zones, health facilities, etc. should be collected, transported and handled by environmental agencies with strict procedures, contributing to ensuring safety, avoiding the spread and spread of epidemics to the community. To ensure absolute safety, the collection team needs to disinfect the waste storage areas and the transport vehicles before moving them out of the waste receiving point. Returning to the treatment area, the waste will be treated with disinfection spray again, then treated with a high-temperature incinerator on the same day. At the end of the transportation process, the trash cans continue to be sprayed with disinfection, sprayed and exposed to the sun to continue for the next time.

Abstract

This study focuses on understanding the factors affecting the decision to participate in life insurance for Vietnamese people in the context of being affected by the COVID-19 pandemic. In the context of the raging COVID-19 pandemic, the insurance market in general and the life insurance market, in particular, are facing many serious challenges. Because the COVID-19 pandemic has fundamentally changed people's perception of the role and value of life insurance and disrupted the people's supply chain of life insurance consumption. By the method of actual survey combined with the method of investigating secondary documents, the study analyzes: 1) Factors affecting consumers' perception and decision to participate in life insurance in the context of impacted by the COVID-19 pandemic; 2) Issues raised in promoting people's decision to participate in life insurance in the context of being affected by the COVID-19 pandemic. On that basis, the article proposes solutions to raise consumer awareness about the role and value of life insurance in the COVID-19 pandemic.

Keywords: *Participating Decisions, Customers, Life Insurance, COVID-19*

1. Introduction

From March to June 2020, a series of surveys were conducted with the public in the United Kingdom, the United States, and the United Kingdom. The United States and Spain found that 30% of respondents said COVID-19 made them more likely to consider buying life insurance (Descombes, 2021). The Swiss Re Institute (2021b) estimates that global insurance demand will grow at above-trend rates of 3.3% in 2021 and 3.9% in 2022, a recovery significantly faster than the global financial crisis (GFC) 2008–09. Therefore, the epidemic has opened up favorable insurance model adjustments. One key demand driver is the dramatic increase in risk perception. Consumers feel they are being insured and are asking for more comprehensive life insurance. Consumers in China, the first market to face the pandemic and recover from a health disaster, are more likely to purchase new insurance when their lives return to normal in 2021 than a year ago. (Swiss Re Institute, 2021b). According to surveys conducted

by Swiss Re Institute (2021a) in Asia Pacific markets in 2021, during the pandemic, 30-40% of respondents have purchased complementary health and life insurance. supplement and 25% to 50% of people still have a new insurance plan. The demand for online life insurance transactions is also a growing trend. Consumers have quickly adapted to internet channels and increasingly prefer digital transactions at all touchpoints with insurance companies. This is especially important in developing economies, where public health care systems lack the infrastructure to provide free public health care unlike in developed economies. Economic growth has resulted in many people purchasing individual life insurance policies to cover themselves and their family members during medical emergencies, to finance medical expenses. private hospital. This study explores the demand for life insurance participation in a rapidly growing economy impacted by the covid-19 pandemic in Asia, Vietnam.

In the long term, low life insurance penetration, customer risk aversion and a better understanding of insurance as a means of mitigating life's unpredictable events, transformation trends strong digitalization, favorable demographic factors (e.g. golden population structure, rapid urbanization rate, growing middle class and growing per capita income, etc.) as well as the post-COVID economic recovery is expected to continue to drive the positive growth of the industry in Vietnam in the coming time. However, in the short term, the prolonged COVID and its wave of variations in the second half of 2021 that we are observing across Vietnam now will negatively impact customers who may lose their jobs. and/or reduced income during the pandemic. This will reduce their purchasing power to continue existing policies and/or purchase new ones. Low-interest rates and falling government and corporate bond yields due to the strong liquidity of the banking system and the supportive monetary policy of the State Bank of Vietnam during the current pandemic are challenges to improving. improving investment income, which is the main source of income for life insurance businesses, in 2021.

Although always considered one of the most humane and meaningful industries in the world, in Vietnam, The keyword "life insurance" is still frequently associated with mixed comments and reactions. With the current population of approximately 98.1 million people in Vietnam, but as of 2021, 18 life insurance companies are expected, the percentage of people participating in life insurance in Vietnam is only at the level of 9% of the population (while in Japan, the percentage of people participating in life insurance is 90%, the US 90%, Singapore 50%, ...) and the savings people buy life insurance. New life expectancy accounts for 3.45% of total savings in the residential sector. This is a very modest number. The current life insurance participation rate of Vietnamese people is low compared to many countries in the region and the world. The pandemic has been a major catalyst for increasing consumer health awareness, mortality, and financial concerns, driving awareness of insurance as a means of mitigating adverse events. measure in life. This contributed to the positive growth of the GWP as more and more people became risk-averse and bought new policies in the wake of the COVID-19 outbreak. Facing the heavy impact of the covid-19 pandemic on the economy, people's income and jobs are also significantly affected. Besides, people's awareness of life insurance is still limited, along with the spending habits of Vietnamese people, which are the main reasons affecting the demand for life insurance. Life insurance

companies all want to better understand the needs and spending psychology of customers in order to improve service quality. Therefore, studying the factors affecting the decision to participate in life insurance in the context of the impact of the covid-19 pandemic is an important issue that is of great interest to insurers and the State.

2. Method

The research method is carried out on the basis of qualitative research methods on the basis of descriptive statistics, analysis, comparison, interpretation, induction, synthesis of data from the Insurance Supervision Department, Ministry of Finance and Insurance Association to conduct research, achieve the objectives of the article. In addition, the research team also conducted a field survey in Hanoi, and an online survey in the provinces/cities of Hai Duong, Quang Ninh, and Ho Chi Minh City. Ho Chi Minh City ... is greatly affected by the Covid-19 epidemic in 2021, the total number of questionnaires is 339, with the content of factors affecting people's decision to participate in life insurance. Vietnam in the context of being affected by the Covid-19 pandemic. At the same time, combined with the method of investigating secondary documents, the article analyzes the current state of people's perception of the role and value of life insurance before the impact of the Covid-19 epidemic.

3. Results

3.1. Factors affecting customers' perception and decision to participate in life insurance in the context of being affected by the COVID-19 pandemic

In order to be able to collect information about the people's need to participate in life insurance in this context. Affected by the Covid-19 epidemic, the research team distributed questionnaires and obtained 339 online surveys. During the information filtering process, the team removed 35 invalid votes because they found that the answers were "proportional" and there was a lot of information in the questions that did not match. After removing the noise information, the group collected 304 valid questionnaires and started to process the data.

- Income affected by the Covid-19 pandemic

Figure 1. Structure by the degree of impact of the Covid-19 pandemic on the income of the survey sample

Source: Compiled from the research team's survey results

Look at Figure 1 shows that in the context of being affected by the covid-19 pandemic, the income of Vietnamese people has been affected. The majority of people's incomes are most affected at less than 50%, accounting for 48.7% of the total vote. In the second place, there is a small number of workers unaffected by the pandemic, accounting for 25.0% of the total vote. Most affected, almost all income, accounting for 9.9% of total votes and 16.4% of total votes for those affected with more than 50% of income. Thus, the pandemic took place, causing many impacts on the market and the economy of the country, along with the consequences affecting the income and life of Vietnamese people.

The team's research shows a high rate of household income loss as well as a decline in quality of life in several sectors of the general population in Vietnam due to the impact of the COVID-19 pandemic. The research team also found a number of potential factors related to changes in family income of Vietnamese citizens, with implications for future programs and interventions aimed at improving the socioeconomic status and well-being of people affected by the epidemic in resource-limited settings and promoting the intention to participate in life insurance.

- Information related to the use of life insurance of the sample

+ *Level of understanding about life insurance in the context of the covid-19 pandemic:*

Figure 2. Structure by the level of learning about life insurance survey

Source: Compiled from the research team's survey results

According to the results from the above survey, the group found that 135 people had studied and understood life insurance well before the Covid-19 epidemic. boom, accounting for 44.4% of the total votes; 42 people have studied and understood life insurance well after the outbreak of the Covid-19 epidemic, accounting for 13.8% of the total; There are 56 people who have studied but do not understand well about life insurance and there are 71 people who have never learned about life insurance, corresponding to 18.4% and 23.4% of the total.

- Understanding of life insurance

According to the survey data collected, out of 304 answers about the impact of the Covid-19 epidemic on the perception of life insurance consumers, up to 81.9% assessed at the level of "changes" to create peace of mind for health and 73.5% rated "changes" about life stability and also at this level, 63.7% rated "changes" on the implementation of future plans.

Unit: %

Figure 3. Graph of the impact of the Covid-19 epidemic on the perception of life insurance consumers

Source: Synthesized from the survey results of the research team

Thus, in the context of being affected by the Covid-19 pandemic, awareness of consumers about the role and value of life insurance is increasingly enhanced. Life insurance has created peace of mind for participants' health, brought stability to their lives, and helped consumers make future plans, so many people have been interested in this field. According to statistics of the Vietnam Insurance Association, only in 2020, the number of new insurance policies of major insurance products reached 3,180,110 contracts, an increase of 16.51% compared to 2019. However, a billion rates of not knowing/not responding about the content of stabilizing life and implementing future plans remain high. Specifically, the number of respondents was not stable (47 votes, reached 15.5%) and did not know/do not answer (29 votes, reached 9.5%) while the number of respondents did not implement future plans. hybrid (36 votes, reaching 11.9%) and do not know/do not answer (27 votes, reaching 8.9%). Thus, it can be affirmed that, in the context of being affected by the covid-19 pandemic, there are still a large number of consumers who are not properly aware of the role and value of life insurance. Insurance coverage is still low. In fact, according to statistics from the Vietnam Insurance Association, the Vietnamese market is close to 100 million people, but only 8.5 people have insurance, of which many customers own more than two life insurance policies.

- Knowledge of life insurance through information channels

Table 1. Consumer awareness of life insurance through information channels under the impact of the covid-19 pandemic

Awareness of life insurance	Know	Know but not related	No	Don't know/ Don't answer
TV/radio	73 %	4.7 %	17.1%	2.9 %
Books, newspapers, magazines	67.9 %	17.3%	13.4 %	7.2 %
Sales consultant	79.9 %	14.8 %	4.4 %	2.7 %
Workshop	83.3 %	13.9 %	5.7 %	4.1 %
Internet	89 %	9,1 %	3.9 %	3.7 %

Source: Synthesized from the survey results of the research team

Among 304 survey questionnaires, 73 % of respondents are aware of the role and value of life insurance via TV/radio; 67.9% of the respondents are aware of the role and value of life insurance through books, newspapers, and magazines; 79.9% of the respondents are aware of the role and value of life insurance through sales consultants; 83.3% of the respondents were aware of the role and value of life insurance through the workshop; 89% of the respondents are aware of the role and value of life insurance via the internet. However, 17.1% of the respondents did not know the role and value of life insurance via TV/radio; 13.4% of the respondents did not know the role and value of life insurance through books, newspapers, and magazines; 4.4% of the respondents did not know through the consultant; 5.7% of the respondents did not know through the Workshop, and 3.9% of the respondents did not know the role and value of life insurance via the Internet. The reason is due to the context affected by the covid-19 pandemic, some provinces such as Hanoi, Hai Duong, Quang Ninh, and Ho Chi Minh City. Ho Chi Minh City... implementing social distancing, so few seminars or face-to-face consultations are held, so consumers have the opportunity to contact and update information about life insurance on TV/radio, books, newspapers, and magazines. significantly reduced.

- Purpose when participating in life insurance:

Figure 4. Purpose of people participating in life insurance

Source: Summarized from the survey results of the research team

From the results of the above chart, the group The study found that the people's purpose of participating in life insurance was the most from health prevention, accounting for 25% of the total. It can be seen that awareness of protecting themselves and their families against risks in life such as illness, disease, accident, etc. has motivated people to own at least one life insurance policy, in order to ensure the health of themselves and their loved ones in the best way. After the purpose of health prevention, the percentage of people participating in life insurance for other purposes is 20% for the purpose of achieving long-term goals, 19% for the purpose of creating a retirement fund, 17% of people People buy for their children, 12% use it for profitable investment and finally, for the purpose of leaving assets for relatives with 7% of the total. These ratios do not differ too much, but these numbers clearly show the purpose of customers when choosing life insurance as a companion for themselves and their families in life. living. In addition to the purpose of coming to life insurance for health protection, the implementation of long-term future goals, preparing a retirement fund and worrying about the lives of children are also issues that people are very interested in. . The other two purposes, which are a profitable investment and leave the property for relatives, are less concerned, partly because the benefits it brings to customers are not as many as other factors.

3.2. The exploitation of new insurance

policies Despite the negative impacts of COVID-19, in 2020, the life sector will achieve double-digit growth of 21% in total abbreviated premiums (GWP). Although the growth rate is lower than the corresponding average in the period 2016 - 2019 (about 24% - 30% / year), the operating results are still superior to other markets around the world. (e.g. emerging markets up only 0.3%; developed markets down 5.7% Source: Swiss Re Institute Sigma Report) in 2020.

In the first half of 2021, thanks to the Vietnamese government effectively controlling COVID-19, the industry has seen a stronger recovery with year-over-year growth of 17% year-on-year.

Figure 5. Total insurance premiums and life insurance premium growth in Vietnam (VND billion and %)

Source: FiinResearch, Ministry of Finance

During the pandemic, the top 5 enterprises (such as Bao Viet Life, Manulife, Prudential, Dai Ichi, AIA) continued to maintain strong growth momentum and market share.

For the first 4 months of 2021, the Big 5 holds a 78.5% market share by total written premium. In terms of product segments, the top 3 products (i.e. investment links, incentives, and customer support) continue to account for about 98% of total GWP in the first 4 months of 2021.

Figure 6. Market share of leading key life insurance companies (%)

Life insurance usage rate in Vietnam is low compared to other peers

Life insurance penetration rate in Vietnam South is relatively low compared to other Asian neighbors, both in terms of GWP per capita and GWP as a percentage of GDP, showing great room for growth potential now as well as in the years to come. next.

Figure 7. Life insurance penetration rate by GDP per capita in USD, 2020

Figure 8. Life insurance penetration as a percentage of GDP (%) of GDP, in 2020

Source: FiinResearch, Ministry of Finance

Against the backdrop of the covid-19 pandemic, in the first 11 months of 2021, the situation The new life insurance policy has achieved total revenue of VND 43,998 billion, a growth rate of 21.5% over the same period last year. The market share of new insurance premiums is as follows: Manulife (23.6%), Prudential (12.9%), Bao Viet life (12.6%), Dai-ichi (12.3%), AIA (8.3%), MB Ageas (7.4%), Sun Life (4.7%), FWD (4.4%), Generali (3.3%), Chubb (2.5%), Cathay (2.1%), Hanwha (2%), Aviva (1.4%), and the remaining 5 businesses accounted for 2.5% market share.

The investment-linked insurance business has the largest proportion of new exploitation fees, reaching 83.8%. Followed by mixed insurance accounted for 2.7%, term life insurance accounted for 1.9%, the remaining main business lines (*life insurance, periodic payment insurance, retirement insurance, etc.*), *health insurance (main product)*) accounted for 1.4%. Supplemental insurance has premium revenue accounting for 10.2%. Compared to the same period last year, new revenue of investment-linked insurance business increased by 31.3%, mixed insurance business decreased by 53.6%, life insurance business increased by 6.3%.

Unit: million VND

Figure 9. Graph of new exploitation revenue by operations in the first 11 months of 2021

Source: Hiep hoi Bao hiem Viet Nam

In the first 11 months of 2021, Life Insurance has a new contract with the number of insurance policies reached 3,302,316, led by investment-linked insurance with 1,786,921 policies of individual and group members (accounting for 54.1%, up 4.2% compared to compared with the same period in 2020), followed by term life insurance products with 1,129,773 policies (accounting for 34.2%, up 35.5% over the same period in 2020), mixed insurance was 90,378 contracts (accounting for 2.7%, down 56.7% over the same period in 2020). The number of new mining contracts for the remaining main operations accounted for 8.9%, an increase of 197% over the same period in 2020.

Figure 10. Chart of the proportion of new mining contracts by operation in the first 11 months of 2021

Source: Hiep hoi Bao hiem Viet Nam

Total life insurance premium revenue reached VND 138,643 billion, up 22.1% over the same period of 2020. Calculating premium revenue by each operation, investment-linked insurance accounted for the largest proportion. with 67.6%, followed by mixed insurance business with 20.3%, the remaining main business lines accounted for 1.9%. Supplemental insurance premium revenue contributes 10.2% of the total market premium.

The specific market share of total premium revenue is as follows: Bao Viet Life (19.7%), Manulife (18.9%), Prudential (16.8%), Dai-ichi (11.8%), AIA (10.7%), MB Ageas (3.7%), Chubb (2.7%), Generali (2.7%), FWD (2.5%), Hanwha (2.5%), Aviva (2.1%), Sun Life (2.1%), Cathay (1.5%), BIDV MetLife (1%), the remaining businesses accounted for a small market share of less than 1%.

The above result has a significant contribution because the fee revenue of big companies like Manulife accounts for 19.71%; Bao Viet life accounts for 15.09%; Prudential accounted for 14.06%; Dai-ichi accounted for 12.53%; AIA accounts for 10.58%; MB Ageas accounted for 4.9%; Generali accounted for 4.83%; The remaining 11 life insurers accounted for a market share of 18.29%. It can be seen that Manulife has always led the life market in the proportion of fee revenue, and Bao Viet is not the enterprise with the highest proportion of new exploitation, but the proportion of fee revenue has always grown high. As can be

seen, for the big players in the industry, the trust of customers is still an advantage to help businesses sign large contracts to ensure that the total revenue of new mining is always good.

4. Discussion and Conclusion

4.1. Discussion and solution

Research shows that in the context of the impact of the Covid-19 epidemic, consumers' perceptions have changed and are properly aware of the benefits of life insurance in three areas: stabilizing life, creating peace of mind. health, contributing to life insurance. make future plans. However, many consumers are still not properly aware of the role and value of life insurance, so the percentage of population participating in insurance is still low.

Research results show that the impact of the Covid-19 pandemic on the perception of life insurance consumers is consistent with the research hypothesis. This shows that consumers are not fully aware of the importance of life insurance in the context of the impact of the Covid-19 pandemic. In the coming time, life insurance businesses must come up with appropriate business policies to develop the life insurance market in Hanoi, Hai Duong, Quang Ninh and Ho Chi Minh City. Ho Chi Minh City...

Research results also show that consumer awareness has an important impact on intention to take up life insurance. This has a positive impact on the development of consulting programs in life insurance businesses... Therefore, raising awareness of life insurance consumers amid the impact of covid-19 is an urgent and challenging issue.-19 epidemic on the life insurance market and must implement the following solutions:

- The research organization assesses the actual impact of the Covid-19 epidemic on the life insurance market to come up with a good idea, make effective use of modern technology applications such as developing an online sales network, through social networks, using artificial intelligence to appraise and pay insurance benefits ... so that consumers understand the benefits of life insurance, there will be thousands and millions of customers.

- After isolation and social distancing, continue to communicate in diverse and flexible forms to raise awareness of life insurance consumers after the impact of Covid-19. At the same time, organize seminars and consultation programs for consumers to grasp the benefits of life insurance.

- Life insurance enterprises must have legal policies to support consumers to develop production and business before the impact of the Covid-19 epidemic so as not to disrupt the supply chain of life insurance consumers.

- To do well in forecasting the negative effects of the Covid-19 epidemic on the life insurance market, in order to make appropriate and flexible decisions to deal with and adapt to the Covid-19 epidemic. Only then, will life insurance consumers fully feel the benefits of life insurance in the context of the impact of the Covid-19 pandemic.... /.

- Promote the development of the Bancassurance distribution channel system

- Create a direct distribution platform for life insurance

- Promote the application of information technology in the life insurance business

4.2. Conclusion

The study has systematized domestic and foreign research results on the decision and intention to buy life insurance products in the context of being affected by the covid-19 pandemic in Vietnam. Nam meticulously and meaningfully based on the above analysis and research results. In addition, the study has proposed a research model suitable for the socio-economic situation of Vietnam before the impact of the covid-19 epidemic on the basis of a survey of theoretical bases.

In addition, the paper can address these challenges by examining the potential and needs of existing life insurance consumers as well as conducting in-depth interviews with industry experts. . The question is what factors have influenced the decision of Vietnamese people to participate in life insurance in the context of being affected by the covid-19 pandemic, and why the rate of life insurance participation in our country? still quite low compared to the potential ground. This has been detailed in five chapters of the research paper by looking at the impact of a number of factors on the decision to participate in life insurance, which can be summarized as follows:

- The average income of Vietnamese households are still low compared to the affordable cost of life insurance. In particular, the Covid-19 pandemic has increased unemployment, reduced wages, and reduced people's disposable income. Moreover, Vietnamese people's confidence in insurance companies is very low.

- Domestic enterprises are under pressure to narrow the market due to the expansion of the government's compulsory health insurance program as well as competitive pressure and the risk of being acquired or merged when the EVFTA comes into effect. While the Covid-19 pandemic is complicated and has not been effectively controlled, they need to find solutions to reduce costs to maintain profit margins.

- Most of the large and effective domestic insurance companies have completed their search for foreign strategic partners. Therefore, opportunities for new FDI sources may be limited. Likewise, falling interest rates and capital market volatility can affect investment returns.

Abstract

The study was conducted to investigate the impact of perceived scarcity of essential goods on customers' panic buying in the Covid-19 pandemic context in Hanoi. The study first reviewed previous research and developed hypotheses related to the research objectives. Structural equation modeling (SEM) was conducted to test the hypotheses with the survey data of 508 individuals living and working in Hanoi, Vietnam. The findings indicated that there are four factors affecting consumers' perceived scarcity of essential goods. Besides, the result also reveals that perceived scarcity of essential goods has an indirect effect on panic buying through anticipated regret and attitude to panic buying. The study's empirical analysis carries implications for Policymakers.

Keywords: *Perceived scarcity, panic buying, COVID-19, essential goods*

1. Introduction

The COVID-19 pandemic has several negative influences on society. Thanks to many policies from the government, the 4th epidemic (starting from April 2021) witnessed a tedious decrease in the number of people buying uncontrollably (panic purchase, in-store hoarding), compared to 3 previous epidemics. However, this issue hasn't tended to disappear. It could lead to serious consequences, such as the quick spread of COVID - 19, rising prices of essential goods, social insecurity, or stocking out at supermarkets. It can be seen that the policies set by the government have some limitations due to policymakers' lacking information about factors causing customers' perceived scarcity of essential goods - one of the most significant reasons engendering panic buying behavior.

For giving recommendations to policymakers, this study set three main purposes: 1) Clarifying the rationale, concepts of panic buying and perceived scarcity of essential goods;

(2) Building a model describing the impact of perceived scarcity of essential goods on panic buying behavior in two directions: Direct and indirect, in which adding an intermediate variable suitable to elucidate the indirect impact of perceived scarcity on panic buying; (3) Suggesting some recommendations for the government in planning programs and policies to minimize the impact of factors affecting the panic purchase.

2. Literature Review

2.1. Health Belief Model

The Health Belief Model (HBM) is an empirically supported model of health behavior that provides a framework for understanding the adoption of public health measures driven by perceived risk from COVID-19, the benefits, and barriers; therefore, it recommends health-related behaviors to minimize COVID-19 transmission (Rosenstock, 1974; Janz and Becker, 1984). HBM includes six core elements: Perception of susceptibility and severity to a condition, perceived benefits and perceived barriers to recommended health-related behaviors, cues to action, and self-efficacy (Champion and Skinner, 2008). The HBM also considers factors that may moderate the relationship between six key components, such as age group (Jones et al., 2014).

This is a widely accepted model in the health behavior field to justify changing and sustaining health-related interventions (Mohammed Qussay Al-Sabbagh et al., 2021). In the present study's context, panic buying behavior can be considered as a preventive health behavior that helps to limit the likelihood of contracting COVID - 19 (Marcelo Fernandes Costa et al., 2020) and the possibility of being affected by an out-stock due to supply chain disruption.

Perceived susceptibility: Perceived susceptibility in the Health Belief Model (Irwin M. Rosenstock et al.) refers to “individuals that feel they are susceptible to a health problem will engage in behaviors to reduce the risk of developing such problems”. In the context of the COVID-19 pandemic, perceived susceptibility is an individual's perception of the risk or the chance of getting COVID-19.

Perceived severity: Perceived severity in the Health Belief Model refers to “the subjective assessment of the severity of a health problem and its potential consequences”. In relation to Covid 19, the perceived severity of an individual is the impact level of being infected with Covid 19 on his health and life.

Outcome Expectation: Outcome expectation is defined as “a person's estimate that a certain behavior will lead to a certain outcome” (Bandura, 1977). Kum Fai Yuen et al (2021) consider outcome expectation including perceived benefits and perceived barriers. It will be positive if perceived benefits compensate for perceived barriers of panic buying. Outcome expectation, by contrast, will be negative if the perceived barriers outweigh the perceived benefits.

Cues to action: The Health Belief Model (HBM) suggests that “a cue is necessary to promote engagement in health-protecting behaviors” (Rosenstock, 1974; Janz and Becker, 1984; Carpenter and Christopher J.; 2010). The cues that lead to action can be internal or external. Physiological signs (eg, pain, symptoms) are an example of internal cues

(Rosenstock, 1974; Barbara K. Rimer and K. Viswanath, 2008). External cues include events or information from close people, media, etc.

Self-efficacy: Self-efficacy refers to “an individual's perception of her/his capacity to successfully perform a behavior”. “Self-efficacy was added to the HBM in an attempt to better explain individual differences in health behaviors”. The model developers recognized that confidence in one's ability to effect change in outcomes (i.e., self-efficacy) was a key component of health behavior change.

2.2. Definition of panic buying

According to Oxford (2020), panic buying is “the act of buying large quantities of everyday items such as food, fuel, etc. because of concerns about them running out or prices rising”. Panic buying behavior is common consumers’ response to disasters and it often occurs when consumers anticipate and perceive disasters. Sheu and Kuo (2020) suggest that hoarding before or during a disaster can be understood as a form of self-protective behavior.

Panic buying is considered a common phenomenon; however, it has received little attention from researchers, and lots of topic research results over the world are inconclusive. According to the team’s knowledge, in Vietnam, there are limited scientific research reports on the panic buying behavior of consumers.

With months of social distancing in place due to the effects of COVID-19, panic buying has become not only a necessary action but also a psychological coping mechanism (Tahir Islam et al. 2021). Specifically, as reported by Tahir Islam et al. (2021), in the context of distancing grocery stores to close or shorten store opening hours, experts advise people not to go shopping unless necessary, and stores should keep indoor social distancing. All of these have increased consumers’ anxiety levels. This increase has the potential to stimulate consumers to buy products that they don't need or buy more than they would use. The distrust in governments' situation control and fear of store closure has also caused panic buying.

2.3. The effect of perceived susceptibility on perceived scarcity of essential goods

Perceived susceptibility to contracting COVID-19 refers to consumers' perceptions of the chance of illness related to their psychological and physiological health conditions, along with their confidence in the future management of the pandemic. According to Kum Fai Yuen et al. (2021), consumers will perceive scarcity if they feel the risk of contracting COVID-19 is high. They are concerned that the high risk of community spread of the disease will lead to movement restrictions which affect the transportation, supply, and goods replenishment. This leads to shortages and out-of-stock situations occurring more often, hence, it creates perceived scarcity. “What influences panic buying behaviour? A model based on dual-system theory and stimulus-organism-response framework" research (Xue Li et al, 2021) also shows that the perceived susceptibility factor has a positive effect on consumers’ perception of scarcity.

H1. Perceived susceptibility positively affects customers’ perceived scarcity of essential goods

2.4. The effect of perceived severity on perceived scarcity of essential goods

Perceived severity reflects how an individual feels the effects of being infected with COVID-19. It could be the impact on the person's job, health, relationships, or future. Pandemic-related problems such as movement restrictions, economic recession, unemployment, poverty, etc. have led to psychological problems, including anger, fear, frustration, and even suicide (Ahorsu et al., 2020; Pakpour & Griffiths, 2020; Sakib et al., 2020; M.A.Mamun & IrfanUllah, 2020). These negative effects can cause consumers to become distrustful and think of bad scenarios such as believing that the supply chain is broken, thereby engaging in selfish behaviors to protect themselves (panic buying, hoarding), causing perceived scarcity. The result of "What influences panic buying behaviour? A model based on dual-system theory and stimulus-organism-response framework" research by Xue Li et al (2021) has shown that perceived severity has a positive effect on the consumer's *perception* of scarcity. Therefore, our team hypothesized:

H2. Perceived severity positively affects customers' perceived scarcity of essential goods

2.5. The effect of outcome expectation on perceived scarcity of essential goods

In this study context, outcome expectation can be understood as the expected benefit from hoarding or from panic buying. It is the benefits that consumers expect themselves to gain (perceived benefits) from panic buying outweigh the loss they anticipate they will lose (perceived barriers). According to Kum Fai Yeun et al. (2021), the perceived benefits of panic buying include the protection of buyers from out-of-stock situations, a low chance of COVID-19 infection, and a sense of security.

Perceived benefits can be classified into four main categories as economic benefits, hedonistic benefits, functional benefits, and social benefits (Xuequin Wang et al., 2019). These types of benefits direct consumers to buy more than necessary to maximize the expected outcome. Perceived barriers are obstacles that consumers think might prevent them from making panic buying. It is a barrier to time, health, social, money, and negative social utility (the opinion that panic buying is a socially undesirable action). Research results of Kum Fai Yuen et al (2021) have confirmed that the expected benefit is one of the factors affecting the consumer's perception of scarcity of essential goods.

H3. Outcome expectation positively affects customers' perceived scarcity of essential goods

2.6. The effect of cues to action on perceived scarcity of essential goods

This study considers cues to action such as past experiences, mass media, and social influence (family, friends, neighbors, and co-workers) as triggers for readiness to panic buy consumer goods. Therefore, these cues will affect consumers' perception of the scarcity of goods (Rosenstock et al., 1974). Cues to action include external and internal stimuli. External stimuli such as broadcasting networks (online news, social networking services, and television) can provide significant predictors of perceived risk around health-related food risks (Moon et al., 2019). In addition, sociological theory indicates that consumers tend to follow herd instincts (Arafat et al., 2020). Internal cues such as past experience with the relevant goods can lead to a clearer perception of scarcity for that good (Baldini et al., 2020). Fragkou et al (2016) showed that

past experiences of water scarcity and profound distrust of water security (internal cues) can lead to water perceived scarcity. The results of “Panic Buying During the COVID 19 Pandemic: A Cross Country Test” found that excessive use of social media (external cues) increases messages about scarcity and perceived scarcity in all countries except India (Tahir Islam et al., 2021).

H4. *Cues to action positively affect customers' perceived scarcity of essential goods*

2.7. The effect of self-efficacy on perceived scarcity of essential goods

Self-efficacy in this study is called consumers' perceived ability to protect themselves from COVID-19 and respond to the pandemic. It fully regulates the consumer's self-regulatory mechanisms and the ability to protect themselves from failure events (Błażuchnio et al., 2018; Atroszko et al., 2016). In particular, people with less self-efficacy have an impaired ability to manage a variety of problems such as managing their anxiety and social stress (Wegmann et al., 2016). An increase in self-protection in response to the pandemic will make consumers more inclined to manage their stress and anxiety by proactively taking precautions to protect themselves from the virus epidemic. The study "Factors affecting panic buying behavior during the COVID-19 pandemic" by Kum Fai Yuen et al (2021) showed that self-efficacy is one of the factors leading to perceived scarcity. From the above theoretical bases and evidence, our team has a hypothesis:

H5. *Self-efficacy positively affects customers' perceived scarcity of essential goods*

2.8. The direct effect of perceived scarcity of essential goods on panic buying

This study considers scarcity as an individual's perception of the limited availability of essential goods, leading to the prediction that the product will soon become inaccessible due to the COVID-19 pandemic crisis.

According to Reactance theory, the perceived scarcity of a product implies a threat to personal freedom that induces a psychological response, which in turn increases the consumer's incentive to obtain substitutes, when this type of substitute product may soon become unavailable (Ditto et al., 1989; Worchel et al., 1971). Perceived scarcity is attributed to the effects of loss of freedom (i.e., banning or reducing access to products) (Sheu et al., 2020; Maghsoudi et al., 2018). Perceived loss of freedom increases the perceived attractiveness of restricted goods and services (Brehm et al., 2013), leading to an increased desire to engage in prohibited actions (panic buying with limited purchases of goods and services).

In addition, in situations where they perceive themselves to have and suffer the consequences of COVID-19, the greater the perceived scarcity, the more unprotected and vulnerable they are, and the more likely they are to participate. protective measures to avoid danger (Razmara et al., 2018).

As a result, they are more likely to panic buying to reduce the frequency of shopping and the risk of getting COVID-19. This psychological response leads to an increase in consumer panic buying for goods that are perceived to be scarce (Serman et al., 2015; Pan et al., 2020).

H6. *Perceived scarcity of essential goods positively affects panic buying*

2.9. The indirect effect of perceived scarcity of essential goods on panic buying

The study also suggests that perceived scarcity of essential goods will have an indirect effect on panic buying through anticipated regret. Regret is the negative feeling we experience when we think about past actions (or inactions) that we wish we had chosen differently. Anticipated regret is the present experience of regret we think we might feel in the future, often about decisions we are currently considering making. This feeling can influence our decisions a lot, sometimes more wisely and sometimes less.

In the context of this pandemic outbreak, perceived scarcity can be a concept of quantity scarcity due to increased demand. Thus, perceived scarcity of essential goods can lead to increased consumer perception of competition and perceived price insecurity for readily available goods. This increased perception of competition and price insecurity is likely to increase anticipated regret for consumers because they will foresee themselves regretting it if they fail to compete with others to buy goods for the purpose of hoarding (Breffni M. Noone et al., 2020). From a price uncertainty perspective, they can foresee that they will regret it if they don't purchase at a lower price than they are now before the price spikes (James Lemieux et al., 2011). Overall, the risk of not being able to buy products with limited supply and missing out on products sold at lower prices has caused this predictable regret.

H7. Perceived scarcity of essential goods positively affects anticipated regret

In times of low certainty, consumers predict that they will regret not making a panic buying (Shipra Gupta et al., 2017). This anticipated emotion develops from an unexercised option (i.e. panic buy option). They feel regret if the choice (panic buying) leads to a better outcome (Kum Fai Yuen et al., 2020). This may be because consumers regret paying a higher price on a later purchase than they would have paid if they bought it earlier as a panic purchase. In addition, consumers may regret encountering out-of-stock situations because they did not panic buy earlier when given the choice of buying behavior.

Resonating with Prospect theory, which describes decision-making behaviors under uncertain circumstances such as loss prevention, consumers are likely to feel more regret than joy for not panic buying due to receiving see scarcity (Zhiying Wang et al., 2019). With the anticipation of an uncertain future, consumers want to take precautionary action and buy panic to avoid future regrets such as paying higher prices or experiencing out-of-stock situations. Research by Charles Abraham et al., 2010 mentions that predicted regret has the effect of enhancing the intention to perform the current behavior.

H8. Anticipated regret positively affects panic buying

The context in Vietnam, specifically in this study, is Hanoi, which is one of the factors for the research team to consider adding an intermediary variable when thinking, reacting, and evaluating Vietnamese consumers. There are many points to note about panic buying and the term Panic buying is still quite new to Vietnamese consumers. According to the results of in-depth interviews, consumers who perceived scarcity of essential goods have some evaluations/attitudes toward panic buying behavior. These

consumers claim that the greater the perceived scarcity of essential goods, the stronger their attitudes towards panic buying.

H9. *Perceived scarcity of essential goods positively affects attitude to panic buying*

According to the Theory of Planned Behavior (TPB), the intention to perform a behavior is determined by three central constructs: subjective standard, attitude, and perceived control. “Attitude” is a behavioral assessment, favorable or unfavorable. In principle, the more favorable the attitudes and subjective norms, and the greater the cognitive control, the stronger the individual's intention to perform the behavior in question. Besides, the research results of Mira Lehberger and Anne-Katrin Kleih (2021) also show that the attitudinal variable has a significant influence on the consumer's hoarding behavior.

H10. *Attitude to panic buying positively affects panic buying*

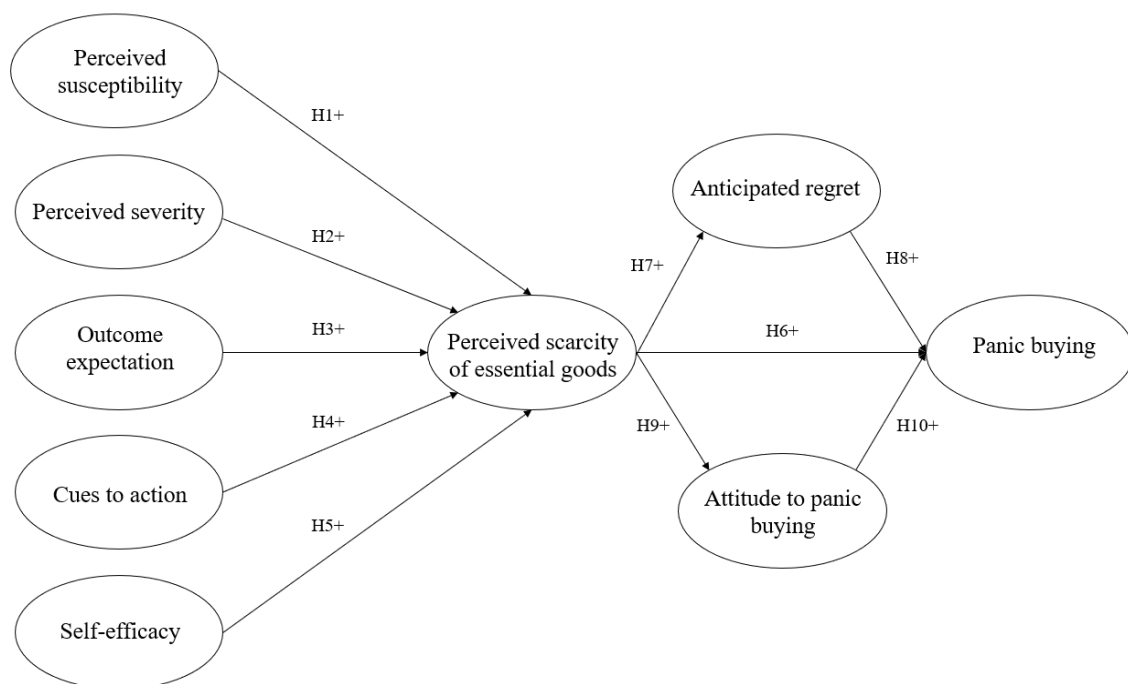

Figure 1. Proposed research model

3. Method

The research method was carried out in two stages. The first stage focuses on developing scales based on the definitions of each factor, this stage mainly adjusts the scales identified in previous studies. Content values were evaluated to ensure consistency of the scales. The second one involves testing the research hypotheses, using data collected from people living and working in the districts of Hanoi (Hai Ba Trung, Hoang Mai, Dong Da, Ha Dong, Hoan Kiem, Thanh Xuan,...) during the period affected by the COVID-19 pandemic from September 2021 to February 2022.

The observed variables of each factor in this study were adjusted from previous studies. The author has made small adjustments to the wording of previously observed variables to suit the research context. Since this research was conducted in the Vietnamese market, the observed variables were translated from English to Vietnamese and then back to

English to check the accuracy. If necessary, the Vietnamese translation can be adjusted.

A 5-point Likert scale from 1 = “strongly disagree” to 5 “Strongly agree” was used to measure the observed variables in the study. Perceived susceptibility was measured by three items proposed by Kum Fai Yuen (2021), Perceived severity was measured with four items developed by Huang (2016) and Kum Fai Yuen (2021); Self-efficacy was measured by three items by Kum Fai Yuen (2021); Outcome expectation, Cues to action, Attitude to panic buying was in turn measured by four items for each factor by Kum Fai Yuen (2021); Perceived scarcity of essential goods, Anticipated regret, Panic buying was in turn measured by three items for each factor by Kum Fai Yuen (2021).

With 586 survey votes collected, after screening and removing invalid votes, the author uses 508 valid votes to use in the official analysis. Of the respondents, 48 (9.4%) were male, and 460 (90.6%) were female. In addition, the majority of respondents shop at least twice a month (57.1%).

SPSS 22.0 and Amos 24.0 were used for data analysis. The author uses the two-step approach of Anderson and Gerbing (1988). First, Confirmatory Factor Analysis (CFA) to check the appropriateness of each scale and the structure of each factor. Second, the linear structural model (SEM) was used to test the research hypotheses.

Table 1. Analysis of demographic data (N=508)

Characteritics		Frequence	Percent (%)
Sex	Female	460	90.6
	Male	48	9.4
Monthly Income	< 5 millions VND	148	29.1
	From 5 – under 10 millions VND	110	21.7
	From 10 – under 15 millions VND	91	17.9
	From 15 – under 20 millions VND	72	14.2
	From 20 million VND	87	17.1
Age	18 – 26	463	91.1
	27 – 49	38	7.5
	> 50	7	1.4
Education level	Lower secondary school	3	0.6
	Upper secondary school	48	9.4
	High school, college, university	422	83.1
	Postgraduate (Master, Doctor...)	35	6.9
Online shopping frequency	Almost none (1 - 3 times/year)	29	5.7
	Several times per year (4 - 10 times/year)	114	22.4
	Several times per month	290	57.1
	Several times per week	61	12
	Daily	14	2.8

4. Results

4.1. Measurement model

Confirmatory Factor Analysis (CFA) was used to determine the unidirectionality, reliability, and validity of the scale after the initial stages of descriptive analysis. All index scale test results are accepted. Based on the indicators, the CFA results show that the compatibility with the model is feasible: evaluation index of CMIN/df is $2.024 < 5$: very good; GFI is $0.904 > 0.9$: good; CFI is $0.924 > 0.9$: very good and RMSEA is $0.045 < 0.05$: very good.

All normalized factor loading coefficients of the scales are greater than 0.6 ($P < 0.001$). Furthermore, the composite reliability (CR) of the seven factors is greater than 0.7 and all Average Variance Extracted (AVE) values are greater than 0.5, showing that the concepts are unidirectional and convergent. The scales are all unitary and have discriminable values because the correlation coefficients between the concepts on the overall scale are all different from 1, statistically significant $P < 0.05$ and the square root value. Two of the A.V.E of each concept is larger than the correlation coefficients between these concepts with other concepts. In addition, the calculated Cronbach's alpha coefficient for each scale ranges from 0.608 to 0.844. The results are detailed in Table 2.

Table 2. Total coefficient Cronbach's alpha, CR and AVE's of official scale

Factor	Number of items	Cronbach's Alpha	CR	AVE	Variable label
Perceived susceptibility	3	0.608	.711	.551	RR
Perceived severity	4	0.740	.834	.560	CN
Self-efficacy	3	0.610	.789	.596	NL
Outcome expectation	4	0.786	.865	.616	LI
Cues to action	4	0.759	.841	.572	TH
Perceived scarcity of essential goods	3	0.790	.898	.691	KH
Anticipated regret	3	0.810	.906	.707	HT
Panic buying	3	0.737	.905	.704	HV
Attitude to panic buying	4	0.844	.898	.690	TD

4.2. Structural model

The Structural Equation Modelling (SEM) was used to evaluate the proposed study model and test the study hypotheses. The fit of the model was accepted: Chi-square = 1148.844; Chi-square/df = 2.775; $p = 0.000$; GFI = 0.862; TLI = 0.845; CFI = 0.862; RMSEA = 0.059. Also, from SEM analysis, hypothetical relationships were tested. Perceived susceptibility has a positive impact on consumers' perceived scarcity of essential goods ($\beta = 0.121$, $t = 1.985$, $p = 0.047$). Perceived severity has a positive impact on consumers' perceived scarcity of essential goods ($\beta = 0.211$, $t = 3.661$, $p < 0.001$). Outcome expectation has a positive impact on consumers' perceived scarcity of essential goods ($\beta = 0.420$, $t = 6.869$, $p < 0.001$). Cues to action have a positive impact on consumers' perceived

scarcity of essential goods ($\beta = 0.116, t = 2.12, p = 0.036$). Perceived scarcity of essential goods had a positive effect on anticipated regret ($\beta = 0.659, t = 11.791, p < 0.001$). Anticipated regret for not purchasing goods during panic has a positive effect on panic buying ($\beta = 0.346, t = 4.495, p < 0.001$). Perceived scarcity has a positive effect on attitude to panic buying ($\beta = 0.387, t = 7.071, p < 0.001$). Attitude to panic buying has a positive impact on panic buying ($\beta = 0.390, t = 6.624, p < 0.001$).

Table 3 results show that there is no basis to confirm that self-efficacy has an impact on consumers' perceived scarcity of essential goods ($\beta = 0.098, t = 1.815, p = 0.070$); Perceived scarcity of essential goods has a direct effect on panic buying ($\beta = 0.053, t = 0.675, p = 0.5$).

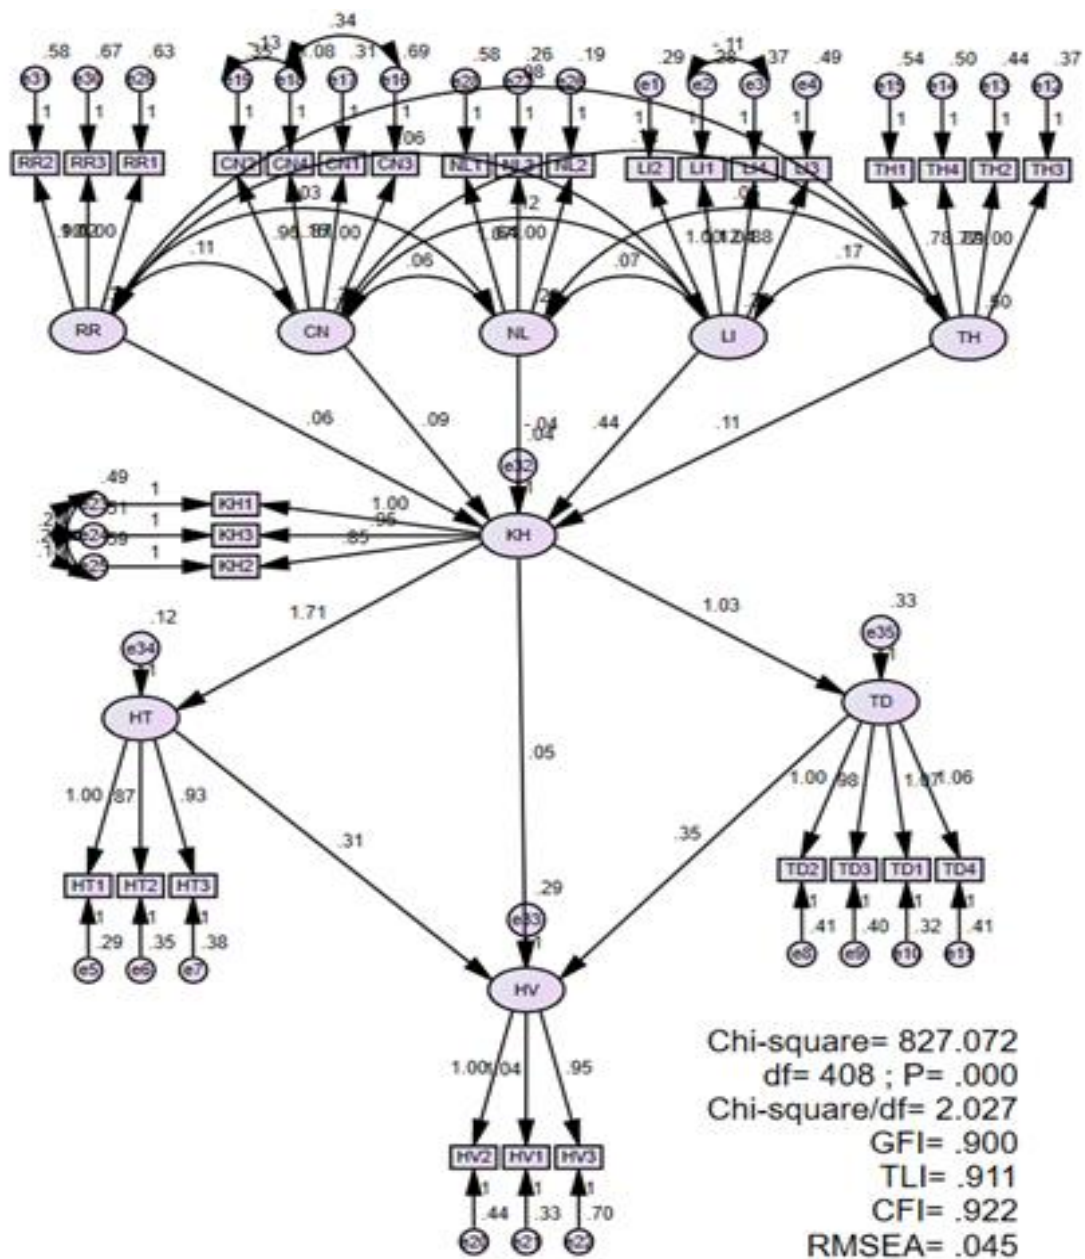

Figure 2. The results of testing the linear structural model

Table 3. The results of model testing do not have the effect of the moderator variable

			Estimates		SE	C.R.	P Value	Results
			Unstandardized	Standardized				
KH	<---	RR	.132	.121	.067	1.985	.047	H1: Accepted
KH	<---	CN	.184	.211	.050	3.661	***	H2: Accepted
KH	<---	LI	.127	.420	.062	6.869	***	H3: Accepted
KH	<---	TH	.424	.116	.050	2.102	.036	H4: Accepted
KH	<---	NL	.105	.098	.070	1.815	.070	H5: Not accepted
HV	<---	KH	.782	.053	.084	.675	.500	H6: Not accepted
HT	<---	KH	.428	.659	.066	11.791	***	H7: Accepted
HV	<---	HT	.057	.346	.069	4.495	***	H8: Accepted
TD	<---	KH	.310	.387	.060	7.071	***	H9: Accepted
HV	<---	TD	.375	.390	.057	6.624	***	H10: Accepted

Note: *** = $p < 0,001$.

4.3. Tests of mediation effects

To further the analyses, the mediating effects of anticipated regret, attitude to panic buying were investigated. A bias-corrected bootstrap-function with 1000 samples (Baron and Kenny, 1986) was used to investigate mediating effects. The research team proposed two intermediate variables in the impact of perceived scarcity of essential goods on panic buying, Anticipated regret and Attitude to panic buying. In which, the variable HT plays an intermediary role in the indirect relationship from KH to HV with a standardized impact coefficient of 0.228 and the variable TD plays an intermediary role in the indirect relationship from KH to HV with the coefficient the normalized effect is 0.151. Thus, the total standardized indirect effect coefficient in the intermediate relationship from KH to HV is 0.379.

5. Discussion and Conclusion

5.1. Policy Implications

To address policy limitations, this paper provides more information about the effect of perceived scarcity of essential goods on panic buying and proposes to policymakers and customers some following solutions:

For policymakers: It is necessary to introduce policies to minimize customer's outcome expectation in panic buying of essential goods, as well as anticipated regrets if consumers don't purchase panic these items (recommendations are made based on the factors that have a strong impact on the relationships in the model). Besides, the government should ensure the number of necessities in the market, stabilize prices and prevent acts of speculation and hoarding from some retailers. Furthermore, promoting the role of the mainstream media such as VTV, Thong tin Chinh Phu fan page.... in the COVID-19 context is needed because these channels have an influence on people's perception scarcity of essential products.

For customers: The first priority customers can consider is increasing self-protection measures during the pandemic to reduce the perceived risk of contracting COVID-19, or perception of damage in case contracted with COVID-19. This solution can minimize the perceived scarcity of essential goods and limit panic buying behavior. Besides, consumers should follow mainstream media channels. With an information source that accurately reflects the social reality and quickly updates the policies of the government, official communication channels play a crucial role in orientating consumers to reasonable buying behavior.

5.2. Limitations and future research

This research study has three main limitations to consider. Firstly, the survey time isn't suitable. The survey was conducted around December 2021 when the COVID-19 became a relatively familiar social issue for people after three previous phases of the pandemic. In addition, the policy of universal vaccination has contributed to reducing people's negative thoughts about the epidemic. Therefore, consumers' attitudes to the scarcity of essential goods have changed, especially compared to the period when the pandemic broke out in Vietnam (2020). Secondly, the research scope and research participants have limited. Authors have reached very few groups of over 50-year-old participants and 27 - 49-year-old participants. Besides, this study was only carried out in Hanoi. Future studies may expand the study scope to examine the difference in panic buying behavior between different regions. Thirdly, the authors haven't been able to turn occupational factor, which influences consumers' panic buying behavior according to Kum Fai Yuen et al (2021), into a control variable and consider its impact.

5.3. Conclusion

In general, except self-efficacy (standardized effects of 0.098), four-fifths of independent variables impacting perceived scarcity of essential goods (outcome expectation, perceived severity, perceived susceptibility and cues to action) are accepted with standardized effects of 0.420, 0.211, 0.121, 0.116 respectively.

Outcome expectation has the highest impact on perceived scarcity of essential goods (the highest standardized impact coefficient of 0.420). This result is similar to the research results of Kum Fai Yuen et al (2021). The majority of consumers perceive a shortage of essential goods because they perceive many expected benefits that panic buying behavior can bring in the COVID-19 context, especially before the social distancing order is implemented, which can be mentioned as protecting consumers from out of stock and high price of goods, reducing the risk of COVID-19 due to avoid going to crowded places.

Cues to action has the lowest impact on perceived scarcity of essential goods (standardized impact coefficient of 0.116). This is also similar to the research results of Kum Fai Yuen et al (2021). It can be seen that, in the context of COVID-19, the perceived scarcity of customers in Hanoi and Viet Nam is heavily influenced by subjective factors such as the expected benefits of hoarding, perception of damage if infected with COVID-19, perception of risk of contracting COVID-19. Objective factors such as family, friends and communication channels have a lower impact on perceived scarcity of essential goods.

The research results of the group show that perceived scarcity of essential goods has no direct impact on panic buying, but has an indirect effect through a few other intermediate variables. The authors believe that this result occurs because the survey time in December 2021 is quite late when people are familiar with COVID-19 and panic buying is a behavior that is not encouraged by the majority. Therefore, some participants may have given answers different from their actual behavior and perception. Perceived scarcity of essential goods indirectly affects behavior through two variables, namely anticipated regret and attitude to panic buying, in which the standardized effect of anticipated regret is higher ($0.228 > 0.151$). Many consumers purchase panic because they think about some regrets that may appear in the future if they don't buy panic, including not choosing the desired product and not preparing well enough for COVID-19.

AWARENESS OF HO CHI MINH CITY URBAN RESIDENTS ABOUT SOLUTIONS TO PREVENTION OF THE DISEASE OF COVID-19

Dr. Nguyen Minh Nhut

nhut227@gmail.com

*Deputy Head of Culture - Society Department,
People 's Council Ho Chi Minh City, Vietnam*

Abstract

The COVID-19 pandemic has affected people's health, physically and mentally. The epidemic has changed the way of working, lost jobs, financial deprivation and the living habits of residents were turned upside down. In addition, psychosocial stress, panic anxiety, depression, trauma due to infection, because a loved one is infected or lost due to COVID-19. Ho Chi Minh City has drastically prevented and controlled the COVID-19 epidemic and achieved many positive results such as: people's awareness of epidemic prevention and control has been improved; social security, the supply of necessities is guaranteed; partly help people feel secure, optimistic, confident in the city's epidemic prevention work. In that context, the author conducted a public opinion poll to find out people's opinions and assessments about epidemic control solutions in the city. From there, timely provide information, help city leaders implement epidemic prevention and control with good results.

Keywords: *COVID-19, awareness, Ho Chi Minh City.*

1. Introduction

The impact of the COVID-19 pandemic has affected people's health, physical and mental health, such as increasing anxiety, stress, and confusion. In the context of the complicated development of the epidemic, all people are interested in news related to the pandemic such as the number of cases, the number of deaths; measures to prevent and control the epidemic in the community, ... cause many people to panic and worry. The epidemic has changed working forms, the rate of job loss, job relaxation, increasing financial and economic worries, making socio-psychology also severely affected; prolonged epidemic affects all aspects of social life and upsets all daily routines, people become tired, bored, slow and sluggish; Pandemic increases the risk of anxiety, depressive disorders, trauma from infection, infection or death of a loved one from COVID-19²²⁷.

Over the past time, the City has drastically implemented solutions to prevent and control the COVID-19 epidemic and achieved many very important results; the health system is strengthened and consolidated; the number of hospitalizations, severe transfers and deaths continuously decreased; the vaccination rate for people aged 18 and over reached

²²⁷ Plan No. 3066/KH-UBND dated September 15, 2021 of the Ho Chi Minh City People's Committee on the prevention and control of COVID-19 and economic recovery in Ho Chi Minh City from the 15th of May. 9 year 2021.

98% who received the 1st dose and over 75% received the 2nd dose; people's awareness of epidemic prevention and control is enhanced; social security work, food supply, food is guaranteed. However, the epidemic situation in the city is still complicated, the number of new cases, the number of infections being treated at home and at medical facilities, and the death rate are still high. On the other hand, the vaccination rate in the provinces in the southern key economic region is still very low, the rate of vaccination with the second dose of the city is not high, which requires decisions and policies on economic recovery and prevention. The city's anti-epidemic must be carefully and carefully considered, suitable for the whole region²²⁸.

Therefore, the topic needs to objectively view and evaluate the city's solutions to prevent the COVID-19 epidemic in recent years under the perception of urban residents, as one of the ways help the city government have more useful information channels to perfect policies to help city people return to normal life soon.

In that context, the author conducted a public opinion poll to find out people's opinions and assessments about epidemic control solutions in the city. From there, timely provide information, help city leaders implement epidemic prevention and control with good results.

2. Method

Qualitative data is used and analyzed by the author from documents of the City's agencies and organizations; Quantitative data were collected in August 2021 through a pre-designed questionnaire with answer options, sent to respondents through OTT applications (Zalo, Viber, Messenger), fanpages and websites handled by the docs.google application for surveys, quick polls over the internet.

The survey results have 572 respondents with the following characteristics: the rate of male is 37.8% and female is 62.2%; Youth (from 18-30) accounted for 30.8%, middle age (31-60) accounted for 66.6%; occupation as cadres, civil servants and public employees accounts for 30.6%; Self-employed is 13.6%, office workers is 21.2%, is temporarily absent/lost job due to epidemic is 19.9%; The living area of the surveyed people is 20.1% in Thu Duc city, 55.8% in the district and 17.3% in the district. Thus, there are nearly two-thirds of women participating in the survey, most of them are middle-aged, the main occupations are cadres - civil servants - employees, office workers, freelance workers and are taking a break from work /lost their jobs due to the epidemic and most of them live mainly in the inner city districts of the City. The number of survey samples was randomly selected for convenience, ensuring representativeness of the population.

²²⁸ Directive No. 18/CT-UBND dated September 30, 2021 on continuing to control and adjust measures to prevent and control the COVID-19 epidemic and gradually recover and develop socio-economic in Ho Chi Minh City. Chi Minh.

3. Results

3.1. People's mood before the development of the COVID-19 pandemic

From 2020 until now, the city has been facing many COVID-19 outbreaks. In particular, the 4th epidemic outbreak in recent months has seriously affected all aspects of socio-economic life. In the context of the complicated development of the epidemic situation, people's moods have also changed a lot.

Source: Survey data of the author conducted in August 2021

The survey results in Figure 1 show that people in the city have different moods. In which, the mood "more fearful than before" (38.5%) has the highest percentage of people agreeing, accounting for more than one third of the respondents. That shows, feelings of anxiety, fear and insecurity than before have appeared in the minds of a segment of urban residents in the city. It is this same mood that has influenced and made people express many different emotions through the actions of hoarding essential goods, or strictly implementing the city's policy of "whoever stays where he is" to keep your family safe...

As for both, the moods "are less anxious than before" (30.6%) and "no longer panic, feel normal" (21.5%) accounted for more than half of the respondents. This result helps the city government feel confident and excited because most residents have a stable mood and trust in the government's epidemic prevention work. At the same time, the author also recognizes the positive change in people's awareness about the COVID-19 epidemic situation in recent times by the solutions that the government has taken such as: social distancing, Vaccination, community testing, treatment of F0 patients, F0 medical care at home and implementation of social security packages,... have helped people feel secure and adapt to the situation. current epidemic. In addition, in society, there is still a part of people who are "indifferent", not interested in the ongoing epidemic situation and have a "difficult to answer" mood (11.2%) accounting for more than 1/10 people asked.

Thanks to the solutions that the government has taken, people have peace of mind and are more comfortable with the current epidemic situation.

3.2. Information channels people use to learn about the situation of the COVID-19 epidemic

To find out the perception of urban residents about the COVID-19 epidemic situation in the past time. We need to clearly define the channel and the level of people's access to information.

Figure 2. Information channels people use to learn about the COVID-19 epidemic situation (N=572), %

Source: Survey data of the author conducted in August 2021

The survey results in Figure 2 show that city dwellers can learn about the epidemic situation through many different information channels. At "regular" usage:

- People "Searching for posts on social networks (facebook, zalo,...) (69%) accounted for the highest proportion compared to other information sources (more than 2/3 of respondents). Thus, it can be affirmed that the majority of people in the city have the habit of regularly using social networks to update news about the COVID-19 epidemic situation in recent times. However, the reality shows that the birth and development of social networks has brought many positives to people's lives, but besides that, there are also many consequences, as a place to spread fake information jamming information;

- For activities: "Watching news on television" (64.3%), "Viewing information on fanpages of cities, districts, wards, communes and towns" (63.1%)), "Find official documents issued by competent authorities" (60.8%). We see that these 3 information channels from the government that people use have a lower rate (about 6%) than the channel "Searching for posts on social networks (facebook, zalo,...) but there are nearly two thirds of respondents, accounting for the vast majority of people interested in and understanding the situation of the COVID-19 epidemic in recent times. In which, television channel is still an important information channel that people follow, so it is necessary to focus on news quality, appropriate time frame and broadcasting time; The information on the government's fanpage shows that the flexible application and adaptation to the change of the digital society helps the government promptly inform and transmit messages to the people in the fastest way, bringing high efficiency in disease prevention; On the other hand, people are also aware of the duality of using social networks, so they tend to "Find official documents issued by authorities" to research and avoid fake news, untrue.

- For the information channel "Reading printed and online newspapers of Tuoi Tre, Labor, Women, Saigon Giai Phong,..." (58.4%) accounts for more than half of the respondents, showing that Most people in the city still regularly watch and think that this is a useful information channel, an indispensable spiritual food of the people.

There are two information channels that people "occasionally" access: "Getting information from relatives and friends" (38.3%) and "Watching videos on You Tube about COVID-19" (33.4. %), accounting for more than 1/3 of the respondents, is the option most people are interested in. It can be said that these two information channels are not fully trusted by the people in terms of accuracy, so they are only used for reference; and for 2 information channels "rarely" used by people: "Ask the leader of the neighborhood, neighborhood, mass organization" (27.3%), "listen to the news on the radio" (24%), accounting for approx. 1/4 of the respondents.

Based on the above analysis, the author can confirm that the people in the city grasp the epidemic situation regularly through social networks, on television, on the government's fan pages, in print and online newspapers...; a few have information from relatives and friends; It is rare for people to get information from the head of the neighborhood, the neighborhood, the union, and the radio channel.

3.3. Communication helps people feel secure, optimistic, more confident in the prevention and control of COVID-19

One of the important orientations of the media during the epidemic season is to help people feel secure, optimistic, more confident in the government's epidemic prevention and control work, and to reflect in a general and honest manner the situation of the epidemic. epidemic patterns outside the society for people to monitor so that they can respond appropriately to changes in society.

Source: Survey data of the author conducted in August 2021

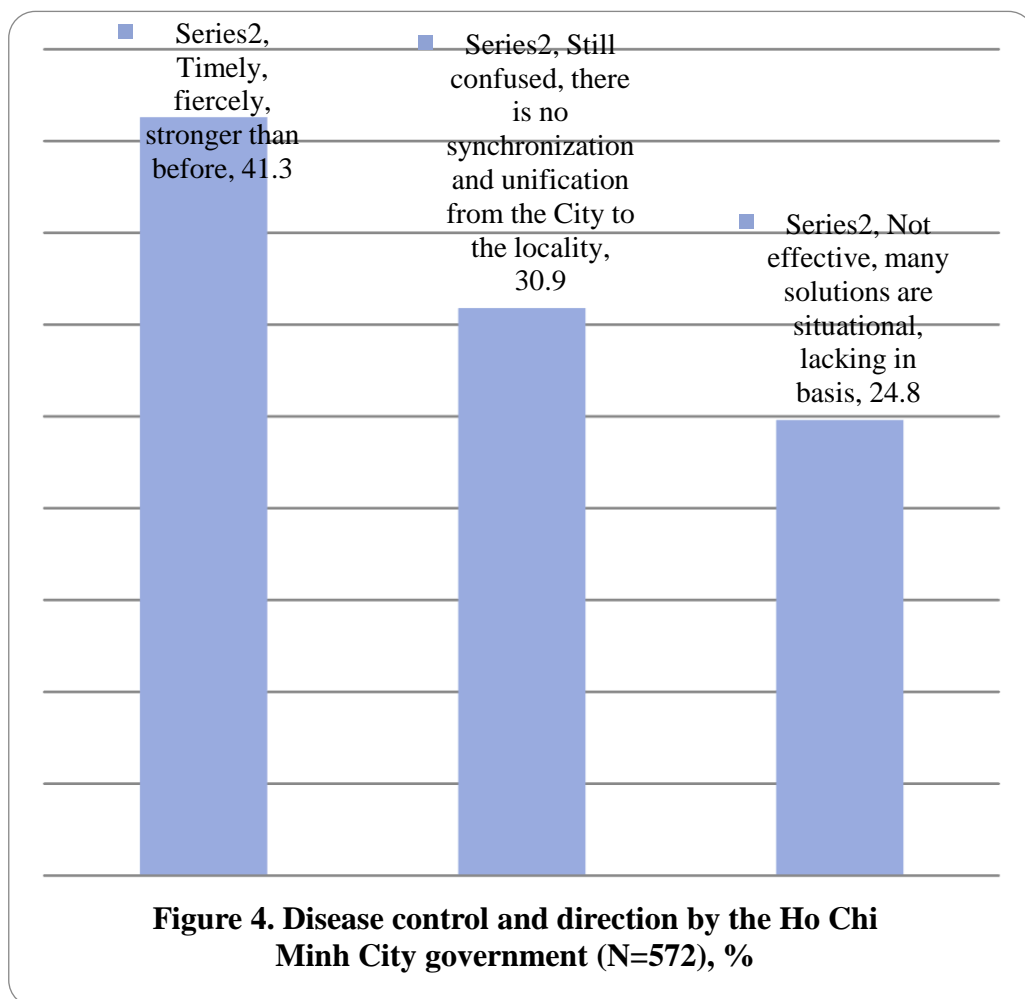

It can be seen that the survey results in Figure 3 objectively reflect people's feelings about whether the media has helped people feel secure, optimistic and more confident in the prevention and control of the Covid-19 epidemic. The survey results recorded: “Yes but not much” (46.3%) + “Yes” (22.4%) accounted for more than 2/3 of the respondents and the rate “Not much improved” (26, 9%) accounts for more than a quarter of the respondents. That shows us that the media in recent times has had a positive impact on the vast majority of people. They feel secure, optimistic and believe in the city's epidemic prevention work, but

not much. The rate of improvement has not been much, accounting for more than a quarter of the respondents. Besides, the opinion of the people said that: *"Supporting the people is to do exactly as said on the radio. On the radio, they say one thing, but when they return to the nest, the hamlet says another. The government has not reviewed all the workers unemployed due to the epidemic who are eligible for support and people receive unfair support because there are no houses, many houses are few, and it is uneven"* (Male, 40 years old).

This reflection of the people shows the inconsistency between media information and actual support policies of the government. In addition, the organization and implementation of policies still have many shortcomings, there is no fairness, so public opinion believes that there is still a part of the people who do not feel really secure and optimistic. This is also consistent with the quick survey data that the author has made.

3.4. Directing and controlling epidemics of the city government

In order to control the epidemic situation in the past time, the direction of the city government plays an important role, a decisive factor for the success in disease prevention.

Source: Survey data of the author conducted in August 2021

The results of the actual survey of people's opinions on the direction and control of the disease of the city government in Figure 4 show that: "Timely, decisively, stronger than before" (41.3%) accounting for more than one third of respondents confirmed, showing that the government's approach to the problem has changed in terms of thinking "Fighting the epidemic is like fighting the enemy" is the guiding ideology and action motto to ensure "The battle" against COVID-19 epidemic in the city achieved the fastest victory, "leaving no one behind".

In addition, there are still opinions that the direction of the government: "Still confused, there is no synchronization and unity from the city to the locality" (30.9%) and "Not effective, many solutions are still situational and lack foundation" (24.8%), both of these opinions account for more than half of the respondents. The survey results of the people also said that: *"It is necessary to strictly handle the cases of driving motorbikes to sell street goods, opening doors to sell secretly in people's houses. Go to the street to avoid the checkpoints by taking shortcuts"* (Female, 55 years old) and *"There are solutions to keep people apart in dense areas to avoid an increase in infections in neighborhoods and alleys in the city"* (Male), 45 years old).

From practice, in the last 4th epidemic, with the Delta variable, the spread rate is fast, the development is very complicated, making it difficult to forecast. In addition, the direction in some localities according to people's opinions is still in a hurry, handling is not strict, and timely solutions are not available to suit each time and each epidemic situation. cover all situations to deal with epidemics. In another aspect, it shows that the government is busy, both developing, implementing, and evaluating and drawing lessons in epidemic prevention, so the solutions and implementation stages are not really complete. Defects are inevitable. One of those issues was shared by people as follows: *"Implement social distancing to reduce infection, but let shippers operate again to ensure the supply of goods. The government needs to take measures to strictly control shippers to avoid causing infection and residential areas need to have latches so that goods are disinfected before reaching people"* (Male, 25 years old).

According to the suggestions of the people, in the solution at the stage of social distancing, the city government needs to allow the "Shipper" to work again but with conditions to ensure the prevention work. fight the epidemic according to regulations, ensure the supply of goods for the people, and meet the essential needs of society. At the same time, it is also one of the solutions to limit people going out.

3.5. Effective implementation of epidemic prevention goals

The epidemic prevention and control targets set by the government are orientations that are often attached to plans and are implemented in phases, with regular evaluation and control.

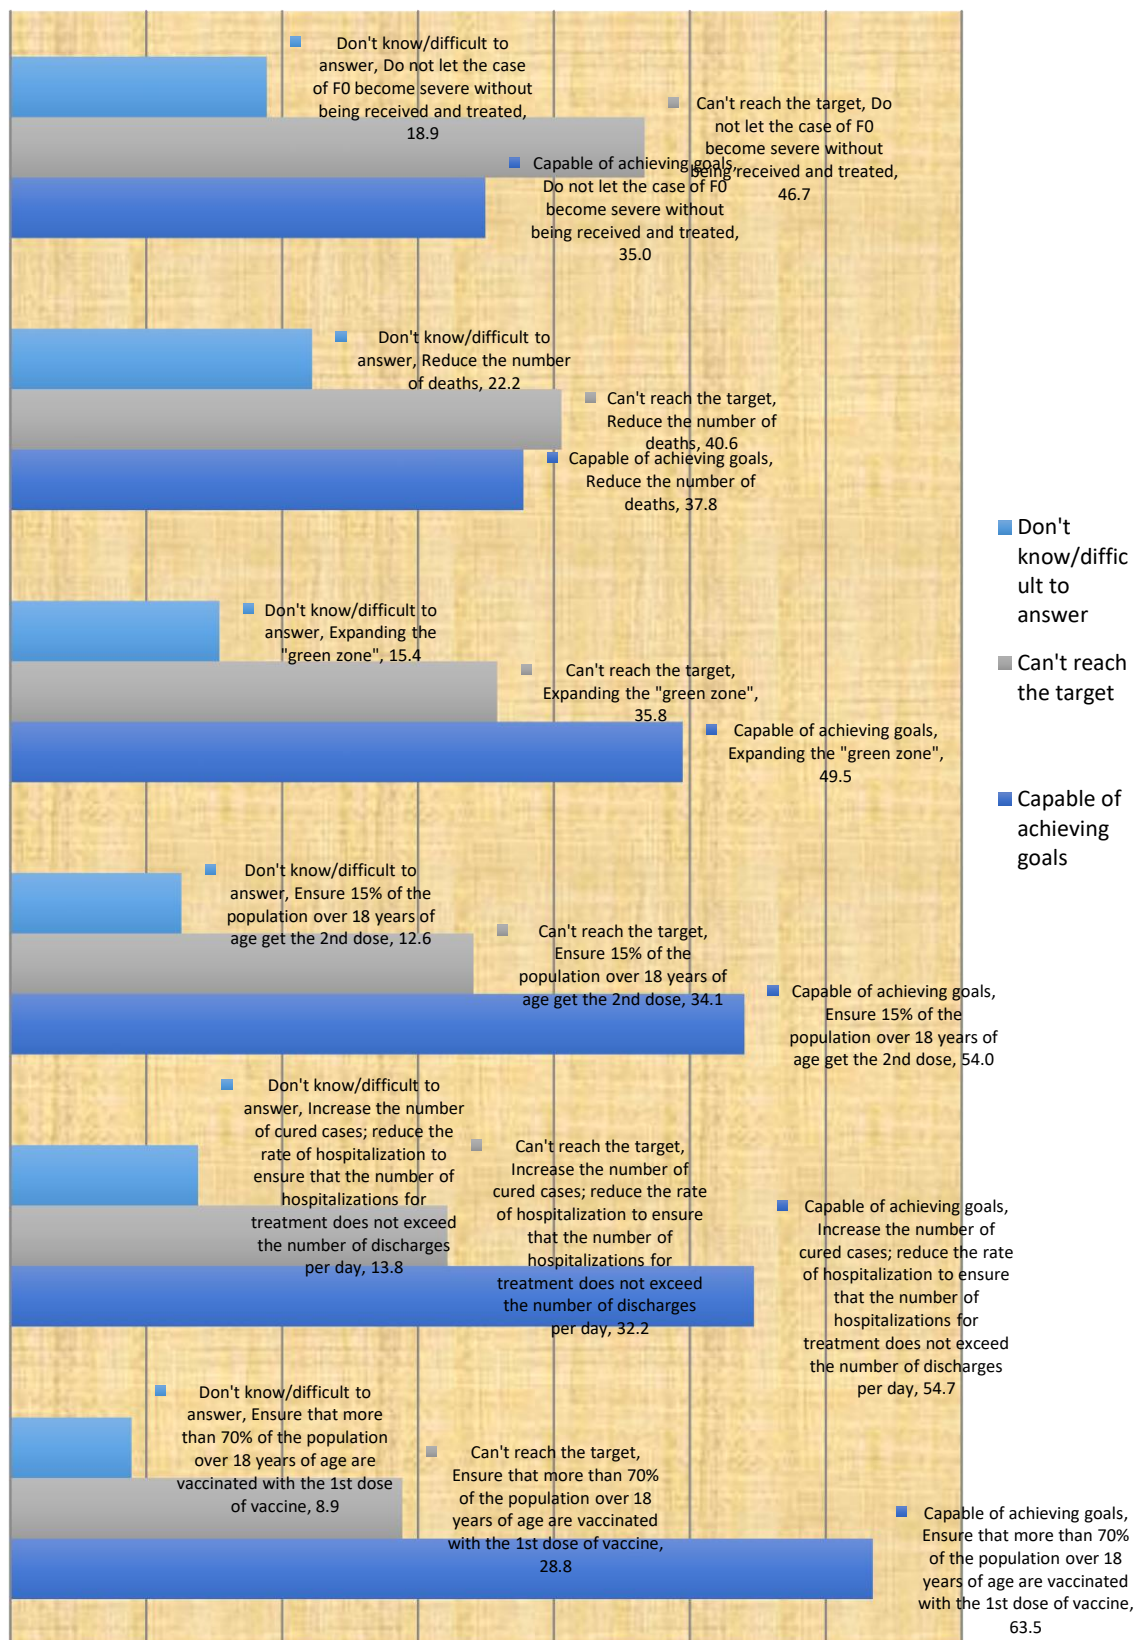

Figure 5. Implementation of COVID-19 prevention goals (N=572), %

Source: Survey data of the author conducted in August 2021

However, the effectiveness of implementing these goals is measured by people's trust according to the survey results in Figure 5, showing that:

- The targets are likely to be achieved such as: “Ensure that more than 70% of the population over 18 years old receive the first dose of vaccine” (63.5%), “Increase the number of cured cases; reduce the rate of hospitalizations to ensure that the number of hospitalizations for treatment does not exceed the number of hospital discharges per day” (54.7%), “Ensure 15% of the population over 18 years of age get the second injection” (54%) , Expand the "green zone" (49.5%). Thus, the majority of people believe that the effective implementation of the goals set by the city until September 15 can be achieved. In fact, one of the strategies to protect people's health and safety is to vaccinate on a large scale, and this work has been put in great effort by the government to organize and implement. Although the organization and implementation in the early stages are sometimes not thoughtful and rigorous, in general, it meets the expectations of the people, and the people see the practical care from the government. In addition, under the drastic direction of the government along with solutions to maintain the "green zone", which is a safe area without disease spreading in the community, and gradually expand the "green zone" according to the oil spill. This helps to increase people's confidence in the government. Besides, people also shared: *“Combining testing and vaccination, if the area is thorough in that area, if you want to expand the green area, you don't have to test and screen for F0, but also vaccinate the same way, saving time. Limit the number of times of mass gathering. Hit any point is to finish that place. But after testing, filter a few F0, then test another F0 protrusion, so when the red zone becomes green”* (Male, 39 years old).

In fact, the government has good guidelines and policies, but the method of implementation and implementation in some places is still unscientific, so the possibility of very high cross-contamination from these activities makes people worried and not assured, affecting the effectiveness of the city's implementation of epidemic prevention and control goals.

- Unattainable targets such as: “Reducing the number of deaths” (40.6%), “Do not let the case of F0 become severe without receiving and receiving treatment” (46.7%)), the survey results show that more than 1/3 - 1/2 of the respondents think that these two goals cannot be achieved. However, compared with the percentage of people who think that the target can be achieved (accounting for more than one third of respondents), it is lower than the target that cannot be achieved (about 7.2%). That shows us, the large-scale vaccine coverage also helps to reduce the number of deaths and disease progression, although the effectiveness is not high, it also partly eases the pressure of COVID-19 treatment in hospitals hospital.

3.6. The city government's COVID-19 disease control work

Viewed objectively in the context of complicated developments of the epidemic, people realized that the stage of organizing the implementation of disease prevention and control in some localities was still not strict and comprehensive, in some places currently confused, not guaranteed to follow the instructions of the superior authorities. The health

system also reveals a number of limitations, especially at the grassroots level, and preventive medicine has not been able to meet the needs of the fast-moving epidemic prevention with Delta strain. It is very difficult for people to access health services when the outbreak is widespread, leading to overcrowding and increasing the risk of death. Most of the medical equipment, biological products, medicines, and vaccines are imported, so initially they are still passive, not ensuring the motto 4 in place in the localities. Communication work is sometimes not well prepared and timely, so it is still awkward at first. The application of information technology in the early stages has not been integrated into a unified platform.

Source: Survey data of the author conducted in August 2021

It is these subjective and objective issues that affect people's perception when asked "About the belief that the city will control the epidemic situation before September 15". The results of the survey on people's opinions in Figure 6 show that: "Do not believe, it is difficult to achieve this goal" (58.7%) accounting for more than half of the respondents, "Confidence" (35.1). %) accounted for just over one third of the respondents. Thus, most people do not have trust and find it very difficult for the city to control the epidemic situation before September 15, 2021. In addition, people also suggested: "Speed up the vaccination process for people, ensure that 2 doses are given so that the city can reopen. Leaders need to pay more attention to motels and make sure that 70% of people over 18 years old get 2 injections before the city decides to relax social distancing, because when loosening, the above two things cannot be guaranteed. very easy to flare up again and lead to terrible breakdowns such as: Indonesia and India" (Male, 59 years old).

Compared with reality, it is not until October 1, 2021 that the city basically controls the epidemic situation and begins to relax social distancing in a new normal. That shows that the majority of the city's people have a fairly comprehensive awareness, care, and fairly accurate assessment of the city's disease control situation.

3.7. Support policies of the government when implementing social distancing

Since the City strictly implemented social distancing according to the directives of the Government and the City People's Committee to prevent the COVID-19 epidemic, people have faced many difficulties in all aspects. In that context, the city government has issued policies to support people to ensure social security and stabilize the situation of social order. The process of implementing support policies from the city to the grassroots and deploying to each household in many different ways. However, in order to better understand the level of people's access to these policies, it is necessary to analyze through the survey results.

Figure 7. Government support policy when implementing social distancing (N=572), %

Source: Survey data of the author conducted in August 2021

The results of the survey on people's opinions in Figure 7 show that: "Informed to take the community rapid test" (77.1%) accounted for more than 3/4 of the respondents, "Informed to go for vaccination" (67.3%) more than 2/3 of the respondents confirmed. Thus, the vast majority of people believe that the government has done a good job of screening to promptly detect F0 in the community in order to provide appropriate treatment solutions towards the goal of controlling the epidemic situation in the near future. at the earliest, widely deployed by local authorities. At the same time, the majority of people were also informed by the government to get vaccinated against the goal of herd immunity so that the city could have a basis to relax social distancing and return to the "new normal" state. These are the two policies that have been strongly directed by the city during the past time and are most clearly felt by the people. To see the companionship of the government and the people of the city to overcome the unprecedented difficulties and challenges, it is also an opportunity for this relationship to be firmly established, the people have trust and confidence. believe in better government. However, in the process of implementation by local authorities, there are many issues that people are concerned about, specifically as follows:

“Organize injection sites in residential areas, especially apartment buildings. This was done quite well in the past, but recently, the organization of centralized injections has caused a very high level of cross-infection, so people are afraid when they have to go to the centralized injection points. This will slow down the rate of vaccination” (Male, 45 years old); “The testing or vaccination organization should go to each nest and alley for injection to avoid crowding at the injection point, crowding each other, leading to cross-infection” (Female, 35 years old); “People are still afraid of the origin of some vaccines, although propaganda has been carried out, the results are still not high, the city should diversify vaccine sources so that people can feel secure and actively participate in vaccination race” (Male, 55 years old).

The comments reflected people's concerns about cross-contamination when gathering in large numbers but not being arranged and arranged for distance.

Regarding the issue of “Giving vouchers to buy food and food” (51%) accounted for more than half of the respondents. The nature of this solution of the government is to limit the concentration of people and meet the essential needs of each family, but practice shows that this has not been implemented synchronously and closely between the private sector and the private sector. individual and state, leading to inefficiency and formality. Therefore, in the process of policy implementation, the city government needs to have tougher solutions to the private sector to ensure the effectiveness and efficiency in state management. People's opinions will further clarify this situation: *“The leader does not give out vouchers to go to the market, the house is running out of food and needs milk for the children. Suggest the government loosen the distance as soon as possible. If there is, then the distance is only according to the directive of 15, so that the workers can make a living before they die from illness” (Female, 32 years old).*

Regarding the issue of "Provide information on implementing "shopping for households" in the days when the City strictly implements the principle of "who is there where"

from August 23rd, (35%) accounts for more than one third of people. asked to agree. According to people's assessment, this solution only meets the needs of a part of the people, the vast majority of people do not have access to registration information from the government and this solution is not really convenient for people. the needs of the people, so the participation of the people is still limited. The following comments from the people will further clarify what we are concerned about: *"I have yet to see any support from the village chief and the head of the hamlet in terms of going to the market and buying medicine for the people"* (man, 36). age); *"I consider it very difficult to do household shopping at the moment without using resources from service companies such as: Grab, Now, Beamin, Gojek"* (Male, 34 years old);

And from another perspective, people also sympathize, share and propose to the government the following contents: *"Reduce the burden on the military forces, ward officials, and their volunteers. don't have the expertise to manually assemble orders like we're doing. Only use these human resources for those who really need the support of the government, instead of as now everyone is passive, waiting for help from this force like now"* (Nam , 44 years old).

In fact, the government's policy of "go to the market" has not brought practical results to the people because the government has not met the great needs of the people, so spontaneous activities appeared in the society. In addition, the people also asked the government to use professional resources in society operating under the market mechanism under the management of the state on epidemic prevention and control. This is an effective solution to reduce the burden on the frontline core of the local government, to focus resources on other activities of epidemic prevention and control.

In addition, the policy "Support for food and food" (28.7%) and "Provide contact information for people to contact when having problems with health, food, etc..." (27.3%) nearly one third of the respondents affirmed. We see that the purpose and content of the government's policies are very humane, but only a part of the people are supported, the rest of the people have not been able to access these policies, leading to lameness policies compared with the original goal, creating conflicting public opinion among the people. On the other hand, when people have health problems, but the majority of people do not have access to medical communication, it makes people have to fend for themselves, feel more confused, leading to lack of confidence in the management capacity of local authorities. To better understand this policy, one resident shared his opinion: *"People in the alley only live by begging for donors. The ward's food supplies had not yet reached my family's alley. People in the alley have not received any welfare support package or money. The locality has facilitated registration to go to the market at supermarkets and shops in the ward by link, but it was overloaded, I registered but only 6 days later, the goods were not available and it was incomplete according to the combo. Many families in the alley cannot register to go to the market"* (Male, 39 years old).

As for the policy "Receiving cash subsidies and gifts from local authorities for disadvantaged households" (13,3) accounts for more than 1/10 of the respondents. Although the subsidy rate for disadvantaged households is still modest, this policy is like a sharing of difficulties of the local government with the people in the spirit of "Good

leaves protect torn leaves". We know that the government's resources for care are limited, there are many households facing difficulties during the pandemic, so the selection of the most difficult households belonging to the disadvantaged and vulnerable groups needs more attention. policy to reach these audiences is appropriate. However, the government also needs to have appropriate solutions to make the list and organize the implementation of the policy openly and transparently like the opinions of the people: *"The work of distributing support packages need to be transparent, avoid the situation where there is no place, the money does not go to the right people to support"* (Male, 45 years old); *"I am also poor, rent a boarding house and am unemployed, have 2 young children , now there is no money to buy milk, diapers and no one to help. Many co-workers received 1.5 million VND, but I did not"* (Male, 42 years old).

During the time when the City strictly implemented social distancing, policies aimed at herd immunity were focused and effectively implemented by the government participate in these activities. However, for the policy on social security, in the initial stage of implementation, there are still many shortcomings, only a part of the people are supported, the rest of the people have to manage to stabilize their lives living.

4. Conclusion

Thanks to the solutions that the government has taken, people have peace of mind and are more comfortable with the current epidemic situation; people regularly grasp the epidemic situation through social networks, on television, fan pages of the city, district, district and ward/commune,...; a few have information from relatives and friends.

People realize that the media has a positive impact on the majority of people, and partly helps them feel secure, optimistic, and confident in the city's epidemic prevention and control; more than half of the respondents found that the direction of the city to control the epidemic was still confusing, lacking in synchronization, uniformity, and efficiency was not high, many solutions were still situational; the majority of people believe that the effective implementation of the goals set by the city can be achieved.

In fact, people still do not have absolute confidence in the government's anti-epidemic solutions because the disease prevention work in many localities in the early stages revealed many limitations when the epidemic situation developed. disease change; Most of the city's people have a fairly comprehensive awareness, care, and fairly accurate assessment of the city's disease control situation. Compared to reality, it was shown that until October 1, 2021, the city had basically controlled the epidemic situation and began to relax social distancing in the new normal state until now.

Most of the work to ensure food and food for the people is done quite well by the localities, but there are still a few localities that do not perform well, so the government's social security support packages have not been able to arrive. All subjects need care. Therefore, the government needs to have an implementation control mechanism from the stage of advising and promulgating policies to organizing the implementation and evaluating the results of policy implementation to ensure that the guidelines and policies of the government are guaranteed. rights are exercised synchronously and effectively./.

Abstract

This study aimed to examine aspects of mental health affected during COVID-19 lockdown, while also assessing differences in mental strength among demographic groups. The study used survey data sets collected through quantitative research with questionnaires answered by 1150 Vietnamese who have been or are going through a period of social distancing. The findings from the study indicate that the majority of the community have moderate to severe levels of depression, stress and procrastination, in which, women, young people from 15 to 24, students, and people with a history of mental disorders are more affected during social distancing. Based on the study's empirical analysis, a number of recommendations are proposed to help the government, health facilities and related organizations take timely measures to improve and enhance the mental health of the population.

Key words: *Mental health, depression, general anxiety disorders, stress, insomnia, eating disorders*

1. Introduction

The COVID-19 pandemic has caused a global crisis and has affected politics, the economic situation, social security, foreign affairs, and international relations. In Viet Nam, the fourth wave of the pandemic and a new variant – Delta has a serious impact on the national economy. The downfall of the economic activities was caused by the strict social distancing on local key economic regions, industrial areas, export processing zones, large enterprises, and populated areas, which led to the broken circulation of commodities and the supply-chain corruption. Furthermore, this decline in economic activities also severely affected the manufacturing business of small companies, which has brought detrimental effects on people's lives. Specifically, according to the labor and employment situation in the third quarter and 9 months of 2021 announced by the General Statistics Office of Vietnam, the number of employed people decreased by 2.6 million people compared to the

second quarter and by 2.7 million people compared to the third quarter last year. The underemployment rate of the working age increased by 1.86 percent compared to the second quarter and by 1.74 percent compared to the third quarter previous year. The unemployment rate among the working-age rose to its highest level, increasing to 1.36 percent compared to the second quarter and 1.25 percent compared to the third quarter last year. Average monthly income of employees was reduced by 877,000 VND compared to the second quarter and by 603,000 VND compared to the third quarter of the previous year. The pandemic has also caused a disruption of the education system, prolonging the education and training process, which has led to the risk of supply shortage for enterprises, especially in the period of reproduction and economic recovery.

In addition to the negative impact on the global economy and financial markets, the COVID-19 has also generated a public health disaster. WHO (2020) published mental health and psychosocial considerations regarding the general public, acknowledging that the Public Health Emergency of International Concern (PHEIC) of the pandemic had the potential to impact the mental health of the community. In China and Europe, numerous studies have pointed out the popularity of depression, anxiety, and sleeping disorders (Wang et al., 2020; Rossi et al., 2020; Pieh et al., 2020). According to Hawryluck et al. (2004) and Reynold et al. (2008), the long isolation period would critically impact mental health. Furthermore, facing economic downturn, unstable jobs, frequent exposure to news about the epidemiologic situation,... are all hazards that negatively cause mental illnesses. COVID-19, along with the uncertainty, lack of understanding of the disease, and the rapidity of infection, have posed a serious threat to life safety and triggered panic attacks among communities, pushing them into states of extreme stress and anxiety, affecting human physiology, psychology, and behavior, and causing corresponding reactions (Wang et al., 2021). In conclusion, changes in social conditions and economic conditions affect mental health and the risk of mental disorders among the community.

Labor Newspaper (2021) stated that mental health is also harmful to personal life and sustainable socio-economic development. Without mental health, people are not able to actively maintain a healthy life and contribute to nation-building. The director of the National Institute of Mental Health emphasized that mental disorders has different levels of profound impact on the patients: reducing work and study performance, decreasing opportunities for career advancement, and leading to job loss, risk of marital breakdown, discrimination, and reduced quality of life, etc. Moreover, family, society, and the community are also heavily affected by the increasing costs of direct and indirect treatment of people with mental disorders. While most people believe that medication, clinic visits, and hospitalization are the genuine expenses of disease, in reality, the burden of disease, particularly mental disorders, extends far beyond these "direct" diagnostic and treatment costs (Trautmann, 2016). Most of the economic burden of mental disorders are not the cost of care, but the loss of income due to unemployment, expenses for social supports, incarceration, and a variety of indirect costs due to a chronic disability that begins early in

life (Tacoma-Pierce Department of Health, 2006). In the 2012 report of the global economic burden of non-communicable disease, Bloom et al. not only acknowledged the “indirect” costs of diseases but also their impact on economic growth at the macroeconomic level. According to Trautmann (2016), from a macroeconomic perspective, the cost of mental disorders could be determined as lost economic output by estimating the expected impact of mental disorders on the gross domestic product (GDP). From 2011 to 2030, the cumulative economic loss associated with mental disorders has been expected to amount to US\$16.3 trillion worldwide, making for the economic loss related to the mental disorder equivalent to the economic loss of cardiovascular disease, higher than cancer, chronic respiratory diseases, and diabetes.

Will the COVID-19 pandemic affect different aspects of Vietnamese people? What aspects of mental health will the COVID-19 have moderate to severe effects on? This study was conducted with an aim at answering those questions.

2. Literature Review

2.1. Mental health

Mental health is a state of well-being in which an individual is able to cope with normal stresses in life, work efficiently and contribute to society (WHO, 2014). The Centers for Disease Control and Prevention of America (2021) admitted that mental health consists of emotional, psychological and social well-being. Mental health affects the way people think, feel and behave in daily life. In particular, according to the British Mental Health Foundation (2021), sleep and mental health are closely related: mental health affects sleep and poor sleep quality causes mental diseases. Hepsomali and Groeger (2021) interpreted the relationship between mental health, eating behavior and sleep as bidirectional. In addition, mental health has an impact on people's productivity and morale (Lagerveld et al., 2010). Corresponding to those factors, the following 6 aspects are closely related to state and extent of mental health: depression, anxiety, stress, sleeping disorders, eating disorders, and procrastination. Positive thinking increases the ability to cope with stressors and promotes people's health (Nseem and Khalid, 2010). Berking and Wupperman (2012) suggested that emotions are related to mental states and are considered as a diagnostic factor in relation to the development and treatment of certain types of mental disorders. Besides, a healthy diet helps to strengthen sleep quality and mental health (Phillips et al., 2018). Furthermore, getting enough sleep reduces the incidence of mental disorders (Orzech et al., 2011). In addition, the Mental Health Foundation UK (2015) pointed out that mental health problems in the workplace cause serious consequences for individuals and corporate productivity. Performance of the employment, sickness absence rates, absenteeism, accidents and employee turnover are all affected by the employee's mental health.

2.2. Depression

Depression or major depressive disorder is a common mental syndrome, characterized by a state of sadness and lack of interest in daily activities (The National Institute of Mental Health, 2016). Iyer and Khan (2012) concluded that depression

manifested by symptoms interfering with the individual's ability to work, sleep, eat, and enjoy favorite activities. Depression causes people to feel sad, anxious, hopeless, guilty, irritable and intolerant to others, lose interests, have difficulty making decisions, have thoughts of suicide or harm themselves (National Health Service UK, 2019). Besides, Trivedi (2004) interpreted that there is a deep biological connection between depression and physical conditions, such as back pain, joint pain, fatigue, lack of sleep, etc. In general, depression can affect any age, even when living circumstances are relatively ideal (America Mental Health Association, 2013).

2.3. Generalized anxiety disorders

Anxiety is an emotion specialized by a state of inner turmoil consisting of fear and discomfort about anticipated events (Davison et al., 2001). According to Mayo Clinic (2018), anxiety disorders (Generalized anxiety disorder) are a repetition of sudden anxiety and fear within minutes. People with anxiety disorders experience long-term anxiety and fear about daily situations (American Psychological Association, 2013). Based on one of Mayo Clinic's researches (2017), anxiety disorders have a long-term effect on people's mental health, causing anxiety, fear, restlessness, stress, discomfort, difficulty to concentrate, etc. Moreover, people with anxiety disorders often feel tired, have trouble sleeping, muscle tension and body aches, tremors, and are easily startled (McDowell et al., 2018).

2.4. Stress

Stress is a feeling of pressure and mental tension (The American Institute of Stress, 2019). Low-intensity stress is considered to be helpful and even beneficial in work and health. Positive stress helps to adapt and respond to surroundings. However, too much stress can contribute to mental problems and physical problems to the human body, which is extremely harmful. Long-term stress can affect the body, thoughts, emotions, and behaviors (Mayo Clinic, 2021). The physical effects of stress include physiological reactions such as increasing cholesterol level (French and Caplan, 1972; Friedman et al., 1958), increasing catecholamine secretions, mainly adrenaline (Dimsdale and Moss, 1980; Karasek et al., 1982; Lundberg and Frankenhaeuser, 1980), increasing systolic and diastolic blood pressure (Shapiro, 1961). Lovibond (1998) suggested that stress was a good diagnosis of depression and anxiety.

2.5. Insomnia

American Psychiatric Association (2020) defined that sleeping disorders (Sleep-wake disorders) involve problems with the quality, duration, and quantity of sleep, resulting in daytime stress and impaired function of various organs that can interfere with normal physical, mental, social and emotional functioning of humans. Sleep disturbances normally co-occur with other mental health disorders, such as depression, anxiety, or cognitive disturbances, etc. Common symptoms of insomnia include: difficulty falling asleep, waking up in the middle of the night, not being able to go back to sleep, having struggles concentrating on daily tasks, memory loss, fatigue, lack of vitality, irritation and short-temper (Carr, 2018).

2.6. Eating disorders

According to the American Psychological Association (2021), an eating disorder is a mental disorder defined by abnormal eating behaviors that negatively affect a person's physical or mental health. People with an eating disorder have a strong obsession with food, body weight, or body shape (Healthline Medical Magazines, 2017). As claimed by the Health Services UK (2021), mental symptoms of eating disorders include: spending lots of time worrying about weight and body shape, excessive exercising, having strict habits with regard to food, changes in mood, withdrawal symptoms, anxiety or depression. In terms of physical conditions, people with eating disorders have physical symptoms such as: stomach cramps, acid reflux and other digestive symptoms, dizziness, fatigue or weakness, difficulty concentrating, trouble sleeping, fainting (Medical News Today, 2019).

2.7. Procrastination

Procrastination (working procrastination) is the voluntary tendency to prolong a course of action even though this delay will negatively affect the working progress (Steel, 2007). Procrastinators frequently have poor mental health and a tendency to overlook important health behaviors due to the stress of work delays (Sirois et al., 2003). Ferrari and Pychyl (2007) stated that there was a correlation between procrastination and the inability to control negative emotions such as sadness, anger, self-pity, etc. Moreover, procrastination affects sleep quality and human circadian clock and increases the incidence of physical symptoms of sleep disorders (Kroese et al., 2016).

From these above studies and theoretical discussions, COVID-19 could severely affect Vietnamese's mental health. Based on the analysis on the internal factors of mental health, the author proposes the following model of intrinsic factors of mental health:

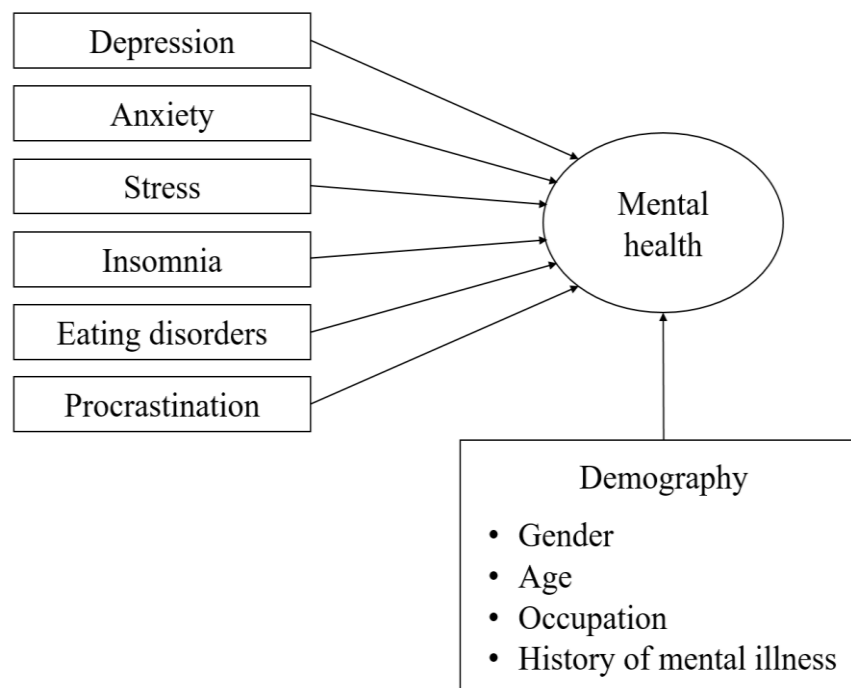

Figure 1. The proposed research model of intrinsic factors of mental health

3. Method

In order to assess the impact on Vietnamese mental health during the social distancing duration due to the COVID-19 pandemic, the study's research design included both qualitative and quantitative research methodologies, which were used as part of the research process to assess the impact of various factors on mental health based on the proposed research model.

Qualitative research with expert consultation and interview with individuals who have been or are experiencing social distancing periods in Vietnam was used to explore different aspects of mental health and adjust the scale to suit epidemic events in the Vietnamese context.

Quantitative research was conducted in two phases: preliminary research and official research. Preliminary quantitative research evaluated the reliability of the scales and removed unsuitable observed variables to build a complete questionnaire. In both stages, an online questionnaire survey method was used to collect opinions of Vietnamese people who had been or were going through a lockdown period due to the COVID-19 pandemic.

3.1. Measurement Scales

The authors conducted overall quantitative research using altered scales from foreign studies to measure survey subjects' level of agreement with the given statements. The scale included 45 observed variables (questions) divided into different mental health intrinsic factors as indicated in the proposed model. The questions were designed in the form of Likert scale to assess the mental health status of the community.

The construct of depression including 8 observed variables was built according to the adjusted PHQ-8 scale provided by Kroenke et al. (2009), based on the PHQ-9 scale by Spitzer et al. (1999). The anxiety disorder used the scale taken from Spitzer et al. (2006) with seven observed variables. Stress was measured using the concept and scale PSS-10 (1988) with ten observed variables adjusted from the PSS-14 scale of Cohen et al. (1983). The severity of sleeping disorder was assessed by seven questions of the ISI scale taken from Morin (1993). The eating disorder was scored by four observed variables inherited from the adjusted EDEQ-4 of Phillipou et al. (2020) which is developed based on the EDE-Q scale taken from Fairburn và Beglin (1994). Finally, the IPS-9 scale, developed by Steel (2010), is used to assess the impact of procrastination.

3.2. Sample and Sampling method

The preliminary quantitative study was conducted with a research sample of 100 elements. However, the obtained results were 80 valid responses (N = 80). In order to test the reliability of the scale, the research used Cronbach's Alpha reliability coefficient method using SPSS software version 22.0. The complete research questionnaire was then included in the official quantitative survey from September 1 to September 25, 2021, during the social distancing period in Vietnam. The study sample is people who are living and working in Vietnam.

The research questionnaire consisted of 45 observed variables used in factor analysis according to the minimum principle of at least 5 elements for 1 observed variable (Bentler and Chou, 1987). Therefore, the initial sample count was $45 \times 5 = 225$ elements. However, in order to increase the reliability of the study, the authors intended to collect a sample size of 1500 elements ($N=1500$) and the obtained results were 1222 elements (questionnaires). After screening and removing invalid data, the total valid responses collected were 1150 to be used in formal analytical processing. Respondents were recruited through online questionnaire submission, using convenience sampling method. Among the respondents, 710 (61.7%) were female, 440 (38.3%) were male. The number of respondents, who were students, salaried workers, self-employed, and others, were 601 (52.3%), 311 (27.0%), 118 (10.3%), 120 (10.4%), respectively.

Table 1. Sampling structure (N = 1150)

Variable	Description	Frequency	Percent (%)
Gender	Male	440	38.3%
	Female	710	61.7%
Age	15 - under 18 years old	29	2.5%
	18 - 24 years old	608	52.9%
	25 - 34 years old	184	16.0%
	35 - 44 years old	190	16.5%
	≥ 45 years old	139	12.1%
Occupation	Student	601	52.3%
	Salaried employee	311	27.0%
	Freelancer	118	10.3%
	Others	120	10.4%
History of mental illness	Yes	112	9.7%
	No	1038	90.3%

4. Results

The scales were checked for reliability and validity using Cronbach's Alpha analysis. The results of Cronbach's Alpha analysis in table 2 showed that Cronbach's Alpha reliability coefficient of the scales are all greater than 0.6, meeting the requirements. This result is aggregated from the execution of Reliability Analysis measuring the Cronbach Alpha.

Table 2. Summary on reliability of the scales

	Scale	Number of observed variables	Cronbac's Alpha reliability coefficient	Conclusion
1	Depression (PHQ)	8	0.884	All scales are reliable
2	Generalized Anxiety Disorder (GAD)	7	0.907	
3	Stress (PSS)	10	0.935	
4	Insomnia (ISI)	7	0.880	
5	Eating disorder (EDEQ)	4	0.737	
6	Procrastination (IPS)	9	0.956	

Results for mean scores and standard deviation of the PHQ-8, GAD-7, PSS-10, ISI-7, along with IPS-9, and number of participants below/above the cut-off score for moderate depression/anxiety/insomnia are presented in Table 3.

Table 3. Mean scores and standard deviation of the aforementioned scales

		Number of participants	Mean	Standard deviation
PHQ-8 score	<10	619 (54%)	9.32	5.890
	≥10	531 (46%)		
GAD-7 score	<10	803 (70%)	6.81	5.204
	≥10	347 (30%)		
PSS-10 score	<14	457 (40%)	17.28	8.036
	≥14	693 (60%)		
ISI-7 score	<15	804 (70%)	10.83	6.262
	≥15	346 (30%)		
EDEQ1		1150 (100%)	3.07	1.227
EDEQ2		1150 (100%)	3.18	1.231
EDEQ3		1150 (100%)	3.53	1.379
EDEQ4		1150 (100%)	3.10	1.253
IPS-9 score	<24	560 (49%)	25.76	9.046
	≥24	590 (51%)		

The authors calculated the total score of the scales before determining the average using the descriptive statistics analysis on SPSS to generalize the opinion of the survey subjects with these scales. Besides, the authors also tested the data fluctuation to see if the value points would be scattered far away or would be concentrated around the mean line through the coefficient of variation calculated by dividing the standard deviation by the mean (Brown, 1998).

The mean PHQ-8 score was 9.32, while the coefficient of variation of the PHQ scale was equal to $5,890/9.32 \approx 0.632$. Almost half of the respondents were above the threshold of $\text{PHQ-9} \geq 10$, indicating moderate to severe symptoms of depression. In terms of anxiety disorder, people reported a mild mean level of GAD-7, which was 6.81. The value of the coefficient of variation for GAD was less than 1, showing that the data variability was small, or in other words, the mean GAD score could be representative of the low anxiety level of the community. Anxiety levels were not seriously affected by the COVID-19 epidemic nor the time of social distancing. Regarding the perceived stress, a mean PSS-10 score of 17.28, greater than the cut-off point for PSS, was observed. Moreover, 60% of the participants assessed their stress at moderate to high level. It could be seen that stress was a common concern among many people during the period of social isolation. Concerning sleep quality, based on GAD-7 scoring and results, as well as the cutoff point for ISI mentioned in Table 3, just under a third (30%) of surveyees had moderate to severe clinical insomnia symptoms. Meanwhile, 804 (70%) cases had scoring for ISI-7 less than 10, with a low mean of 10.83. This indicated that the sleep disturbance of the community during the lockdown was insignificant. As for procrastination, the mean score for IPS scale was 25.76, higher than the cutoff point of 24. IPS scale's coefficient of variation was also less than 1, concluding that a relatively large number of people delayed their work due to social distancing measures.

For the EDEQ scale, the authors used a shortened version of 4 questions adapted from the Eating Disorders Examination Questionnaire of Fairburn and Beglin (1994). Therefore, it was not possible to calculate the total score of the entire scale. Instead, the authors conducted an average analysis for each item to show the changes in eating and exercise behaviors of the community. Variables EDEQ1, EDEQ2, and EDEQ4 corresponding to food restriction, bulimia, and exercising had mean values of 3.07, 3.18, and 3.10, respectively. Thus, the findings revealed that there was no considerable change in food intake restriction, binge eating, and exercise behavior. Meanwhile, the variable EDEQ3 had a mean level of 3.53, ranging from 3.50 to 4.49, showing that the practice of vomiting or using laxatives to control body shape and weight, in general, had a small, positive change when respondents reported this behavior happens less often than before the COVID-19 pandemic.

5. Discussion and Conclusion

The interpretation of One-way ANOVA and the cut-off points show that there is a difference in the impact of the COVID-19 epidemic on different aspect of mental health, in

which, depressive disorders (PHQ), emotional stress (PSS) and procrastination (IPS) are heavily affected. Results have shown that there are differences in mental health between groups of gender, age, occupation and anamnesis. To be more specific, women, young people from 15 - under 18 years old and from 18 to 24 years old, young workers and people who have a history of mental disorders had higher scores for six mental health aspects, compared to other groups. Therefore, these are the groups whose mental health are negatively affected in the context of social distancing due to the COVID-19 pandemic in Vietnam. From the findings above, the authors make some recommendations for government agencies, the Ministry of Health and related organizations as follows:

First, the encouragement of socio-economic recovery and development activities will stabilize people's lives. In order to improve people's mental health and the risk of mental disorders, the government needs to restore economic and social development, implement drastic and synchronous solutions to restore production and business activities, solve employment problems, and take advantage of new opportunities. Accelerating the disbursement of the public investment capital plan in an attempt to contribute to the construction and completion of socio-economic infrastructure, is necessary to improve competitiveness, support production and business activities of the people and businesses, and attract other sources of social investment capital. The economic stimulus and support packages will create favorable conditions for businesses to gradually restore production and business activities, resume supply chains, and improve employment and income opportunities for employees, which will improve work motivation and reduce procrastination along with depression and stress, relating to the negative impacts that the epidemic has caused such as health deterioration, jobs loss, reduced income, etc.

Second, the government and health agencies need to provide quickly and accurately information related to the epidemic. According to Wang et al. (2020), a higher level of community satisfaction with health information received has a lower level of psychological influence. Experts need to provide complete and accurate information on the epidemic situation, COVID-19 prevention and control in the mass media. In addition, the content of medical information provided needs to be based on evidence to avoid negative psychological reactions to meet the needs of the community to access information quickly and in a timely manner.

Third, the government, health authorities and non-profit organizations need to establish multidisciplinary mental health services for the community, especially for the vulnerable ones. Currently, the Ministry of Health of Vietnam has not had a focal point to develop policies, plans, and regulations, guide the implementation, and supervise the deployment of mental health care. Meanwhile, the COVID-19 pandemic has highlighted the growing need for mental health support and has disrupted the delivery of medical services and treatment for mental disorders. Therefore, programs and activities to support physical health, mental health and social health for the community should be urgently integrated and

parallel with economic recovery plans in both public and private sectors. Besides mental health services, mental health budgets and resources need to be used more effectively to meet the growing treatment needs of the community. In addition, the government and health authorities should provide online psychological counseling services for workers to avoid the possibility of infection and improve service access. Developing mental health counseling services through electronic platforms or smartphone applications is essential to understand counseling needs and provide support.

Fourth, the Ministry of Labor, Invalids and Social Affairs should expand policies to support workers. Some practical support packages for employees are the reduction of compulsory social insurance contributions, health insurance, and unemployment insurance. In addition, the level and duration of support also need to be adjusted to ensure flexibility and timeliness in meeting people's minimum living standards in the context of a prolonged and complicated epidemic. The ease of terms for receiving subsidies should also be considered in order to facilitate the deployment of support packages promptly, timely and appropriately. The coordination between ministries and sectors (especially the Ministry of Health, the Ministry of Labor - Invalids and Social Affairs, the Ministry of Finance, the Vietnam Social Security agency) is extremely necessary for the rational use of the surplus social security fund, to identify and support those in need. Moreover, the application of technology and the use of personal identification numbers should be enhanced to avoid mistaken identification or omission of subjects. According to the research report "Gender and the Labor Market in Vietnam: An Analysis based on Labor Force Survey" (2021), female workers are overrepresented in vulnerable employment, particularly in contributing to family work. Despite being highly economically active, women also discharge a disproportionate amount of family responsibilities. Therefore, supportive policies for female workers need to be supplemented and applied flexibly to help reduce family pressure, solve the problem of reduced income and expenditure, thereby contributing to improve the mental health of the female group.

Finally, special efforts should be made to young people, especially from 15 years old to under 18 years old, as they are not only under financial pressure but also academic pressure. The government and the Ministry of Education and Training should ensure the feasibility of online education platforms, develop online information gates and web-based applications to deliver lectures or other teaching activities. Educational institutions should raise awareness, play a vital role in identifying mental health risks posed by COVID-19, and implement actionable plans to reduce risks of mental disorders among students. In addition, it is necessary to quickly and widely conduct financial support, renewal and scholarship policies to reduce the financial burden on the learners. The implementation of supportive policies will contribute to mitigating the feeling of stress and anxiety caused by financial pressures, which will create favorable conditions for learning to develop professional and technical qualifications to become highly qualified workers in the future.

Abstract

This study aims to determine the factors affecting the intention and decision to participate in tourism activities, specifically to participate in the "travel bubble" tours of young people and the changes in awareness and participating behavior in tourism activities in the context of flexibly and safely adapting to the Covid-19 epidemic; thereby recommending solutions to promote visitor participation and restore activities in the tourism industry in the context of the "new normal". The study uses survey data collected through qualitative research with questionnaires, which were answered by 404 young Vietnamese people. The research results show that the majority of young Vietnamese have a great intention to participate in tourism even during the stressful time of the epidemic, in which the "travel bubble" is considered as an appropriate option with social context. In the new context of flexibly and safely adapting to the pandemic, young people's perceptions and behaviors about tourism activities tend to change in a more positive direction. Young people are sensitive to social changes and quickly catch up with tourism trends in the new era. In addition, based on the empirical analysis of the study, some recommendations are made to help the government, tourism enterprises, travel agencies, airlines and related organizations take timely measures to improve service quality, diversify forms of tourism organization to attract tourists and create a premise for restoring this important economic sector.

Keywords: *adaptation, flexible, new normal, safe, Travel Bubble*

1. Introduction

Tourism is a key economic sector of Vietnam in recent years, having a great impact on the country's socio-economic development. From 2018 to early 2020 is a period of great success for Vietnam's tourism with many unprecedented achievements. In 2019, this economic sector directly contributed 9.2% to the Gross Domestic Product (GDP), an increase of 2.9 percentage points compared to 2015 (World Bank, 2019). The tourism industry is expected to become a lever to bring Vietnam's economy closer to developed countries in the world.

However, the sudden outbreak of the Covid-19 pandemic destroyed all previous hopes of this potential economic area. WHO (2020) assesses Covid-19 as a global pandemic with the most severe severity in nearly 100 years. The Covid-19 pandemic has caused a global crisis and affected politics, economic situation, social security, foreign affairs and international relations. From March 2020, Vietnam temporarily stopped welcoming international tourists and only operated domestic tourism. But this market is also seriously affected, as evidenced by the continuous decline in revenue from our country's tourism industry, the General Statistics Office estimated that tourism revenue in May 2021 will reach VND 387 billion, down 53.5 billion VND. (17.8%) over the same period last year. For tourism to be restored effectively, Vietnam's tourism industry needs to build a more flexible and sustainable development model, especially for tourism businesses. According to an expert from the Tourism Advisory Board (TAB), the Government should consider opening the door in the direction of a "safe tourism corridor". The form of "travel bubble" tour is a solution to respond and promote safe tourism activities in the context of complicated epidemic developments. The two pioneering countries, Australia and New Zealand, set a goal of economic recovery after establishing a "tourist corridor" to support businesses and people. The chain of "bubbles" is increasingly spreading to countries in Asia such as Korea, Japan, and China. "The "travel bubble" is seen as an effective compromise in the prevention strategy." (International travel during the Covid-19 pandemic: impacts and risks associated with the 'travel bubble' - Khan Sharun, Ruchi Tiwari, et al., 2020).

On March 15, 2022, the Vietnamese government officially approved the complete opening of the tourism industry. Vietnam has entered a new post-pandemic phase: a period of flexible and safe adaptation to Covid-19. Many factors affecting young people's intention to travel no longer have great significance compared to the previous period, instead, they are comfortable psychology, more open awareness in their intention to participate in tourism activities. The public tends to be willing to take part in tourism to meet the need for relief after a long period of limited movement, as well as to join tourism activities.

Faced with the impact of the Covid-19 pandemic, has the intention and decision to participate in tourism activities, typically to join "travel bubble" tours, changed? What does the trend of changing young people's perception of tourism behavior in the context of a fully open country pose to society? This research paper aims to answer those questions.

2. Literature Review

Deeply examining the motivations and trends of young people's perception and participation in tourism activities, they discovered that tourism behavior is affected by many different subjective factors and customers. Below are some factors that are considered to influence the behavioral decision in general and the decision to participate in tourism in particular:

2.1. Psychological factors

Psychology is all mental phenomena arising in the human mind, associated with and governing all human actions and activities. Postponing gratification is very difficult, the phenomenon that we believe to be true, people will make decisions to satisfy themselves (Stanford University, USA (1960). Robert Plutchik (1980) visualizes aspects of gratification. This psychological aspect is simpler, which he calls the psychomotor wheel, the mechanism that allows individuals to explore the key emotions they are feeling. Emotions are triggered by specific stimuli, from there setting out certain behavioral models, psychology is one of the determinants of human behavior.

2.2. Health risk

The health risk is defined as the probability that exposure to a hazard will result in a negative health outcome. Anxiety and risk attitudes hurt travel intention (Jian Ming Luo and Chi Fung Lam, 2020). The health belief model shows people's beliefs about health issues, perceived benefits of action, and barriers to action (Champion, VL & Skinner, CS, 2008). D. Bernoulli states that even if the expected value of a bet is infinite, no one spends large sums of money on it (1730), i.e. as long as the health risks are still there. and is perceived as serious by the audience, the ability to decide to participate in tourism is low.

2.3. Social interaction

Social interaction is used to refer to the process of contact and interaction between two or more individuals. During interactions, individuals react to the actions of others, read and interpret them (Georg Herbert Mead, 1967), then discover individuals who have much in common with themselves. When the parties involved tend to make a good impression, trust, and sympathy (Baul, the 1960s), individuals make behavioral decisions if they perceive that the decision makes a good impression on social relations. other associations, even if that exchange is disadvantageous in terms of benefits.

2.4. Personal values

Thesaurus defines egoism/the selfness as a person's self-perception of one's dignity, worth, or worth, especially to distinguish oneself from the outside world. outside and other individuals. "Values" are used in a wide variety of ways, in many contexts, to refer to many different trends and nuances (Williams, 1979). Besides, each attitude or behavior implies more than one value, so choosing a certain attitude or behavior means a trade-off between values (Schwartz, 1992), a person feels A stimulating new travel experience is an important value to them, they are willing to make decisions even when they know the decision is high risk.

2.5. Service quality

There are many ways to understand service quality in general and tourism services in particular. Lewis and Mitchell (1990) argue that service quality is the degree to which a service meets the needs or expectations of customers; Parasuraman et al. (1985) consider it to be the result of a comparison between the actual service that customers perceive when consuming the service with their expectations. In tourism, considering the experiences of previous customers, referring to the diversity of tour booking forms of travel agencies, the ability to understand visitors' psychology, etc. are factors that are of great interest.

2.6. Price

Willingness to Pay (WTP) measures the intensity of an individual or society's preference for that good, thus measuring the degree of satisfaction from performing a certain behavior as expressed by the available price. their willingness to pay (WTP) for the costs of that behavioral decision (Turner, Pearce, and Bateman, 1995). The amount an individual is willing to pay for travel services is an expression of the value that travel brings to that person. On the other hand, as mobile searches for the term "compare prices..." have grown by more than 60% in the last two years alone (Administrative Control Report, 2019), people realize that they can easily find a similar option with a more "affordable" price, visitors before deciding to participate in tourism will have to consider the price of many units.

2.7. Media and advertising activities

Viewers are passive and directly influenced by the media, they implicitly accept the messages they receive from the media without needing to reconsider (Laswell, 1927, Hovland et al., 1953). Bernard Cohen (1963) discovered that the press may not always be successful at telling people what to think, but it is extremely successful at telling people what to think. about what. Therefore, the influence of the media has the ability to trigger behavioral decisions, including tourism behavior - an economic sector that values communication and advertising strategies.

2.8. Reference group

Hyman (1942) introduced the term "reference groups" as groups of people that influence an individual's attitudes and behavior. This influence is divided into 3 components: Information influence – when the individual accepts information and recommendations from the reference group if the source of information is reliable, in order to make the right decision, optimize the choice (Bearden and Etzel, 1982), utilitarian influence - when individuals are willing to meet the expectations of a given reference group in order to gain praise or avoid punishment from groups and value influence symbolic – when people are willing to better express themselves in society by aligning themselves with the group to which they want to belong (Kelman, 1961).

3. Method

In order to evaluate the intention to participate in "travel bubble" tours and the changes in the perception and behavior of participating in tourism activities in the context of

flexible and safe adaptation to Covid-19, the research issue This scientific formulation includes research methods. qualitative and quantitative, used as part of the research process.

Qualitative online open-ended questionnaires with individuals between the ages of 16 and 30 who experienced social distancing prior to the effects of the COVID-19 pandemic were used to explore dimensions, motivations, goals, and solutions proposed by individuals.

Quantitative research is officially put into use as soon as a complete questionnaire is developed to collect accurate and complete information. In this process, an online questionnaire survey method was used to collect opinions of young Vietnamese about their intention to participate in tourism in the social context of the "new normal".

3.1. Measuring scales

The authors have carried out quantitative research using variable scales from foreign studies to measure the degree of agreement of survey subjects with the given statements. The scale includes 43 observed variables (questions) divided into different subjective and objective factors affecting the intention to participate in tourism of young Vietnamese between the ages of 16 and 30 as indicated in the proposed model. The questions are designed in the form of a Likert scale to assess the trends and motivations for choosing to participate in tourism in general and the "travel bubble" in particular.

The structure of the questionnaire consists of 9 observed variables divided into 2 large arrays: subjective factors and objective factors. Subjective factors include psychological factors, health risks, social interactions and personal values. Objective factors include service quality, advertising communication activities, reference groups and random factors.

3.2. Samples and sampling methods

The study was carried out by quantitative method through detailed questionnaires. The sample for quantitative research has size $n = 404$ and is selected by random sampling method from young people living, studying and working mainly in Hanoi.

The data collected from this quantitative study will be used to evaluate the measure and test the model and hypotheses using SPSS 20.0 software.

With the criterion of selecting a representative and efficient sample, this study chooses to calculate the sample size when the population is unknown. The number of samples to be surveyed is calculated by the formula: , where $p = 0.5$ is the proportion of female tourists 50%, so $q = 1 - p = 0.5$ is the proportion of tourists. 50% male gender; $z = 1.96$ for 95% confidence level; $e = 0.05$ corresponds to the allowed error of 5%. From there, we have the minimum number of samples to be investigated, which is 385.

Among 404 survey participants, the number of female respondents is the majority (76.5%), male is 22.8%. In terms of profession, most of the respondents are students, accounting for 87.6%, followed by working people (8.4%), students (3.2%) and finally the group unemployed people (0.7%).

Table 1. Sampling Structure

Variable	Description	Frequency	Percent (%)
Gender	Male	92	22,8
	Female	309	76,5
	Others	3	0,7
Age	16 - 22 years old	349	86,4
	23 - 30 years old	55	13,6
Job	Student	13	3,2
	College student	354	87,6
	Working	34	8,4
	Unemployed	3	0,7
Income/ Benefits	Under 3 million dong	258	63,9
	3 - 6 million dong	95	23,5
	6 -10 million dong	32	7,9
	> 10 million dong	19	4,7
Travel frequency	Never been before	66	16,3
	less than 2 times/year	263	65,1
	2-3 times/year	64	15,8
	4 times/year or more	11	2,7
Number of vaccine administered	Not yet	1	0,2
	1 injection	8	2,0
	2 injections	113	28,0
	3 injections or more	282	69,8

The sample of the study was selected based on the stated research objectives and subjects.

4. Results

The research topic aims to clarify the intention of young people to participate in tourism activities in two phases, the first is the complicated development of the Covid-19 epidemic and the appearance of the "travel bubble" tour model; The second is the period when Vietnam adapts flexibly and safely to Covid-19. Accompanying the change of social context is a change in the perception of young people.

4.1. Motivation to participate in "travel bubble" tours of young tourists

On the basis of the development of the theory of consumer behavior in tourism by Solomon (2006) and reference to previous studies related to the topic, the author uses quantitative research methods to conduct research. assist.

After collecting online surveys, the author has obtained 404 meaningful surveys for the research, the collected data is processed through SPSS 20 software through descriptive statistical techniques, testing the reliability of the scale, factor analysis, correlation analysis, regression analysis. The results of the study are presented as follows:

STT	Scale	Number of observed variables	Cronbach's Alpha reliability statistics	Conclusion
1	TL	4	0,821	All scales are reliable
2	SK	3	0,774	
3	TT	3	0,762	
4	GT	3	0,783	
5	CL	6	0,849	
6	GC	6	0,830	
7	QC	5	0,824	
8	TK	5	0,825	
9	NN	3	0,773	

The results of testing the hypotheses are as follows:

(1) The direction of the impact of the research factors on the intention to join the tour, except for the random factor, is all positive because the β coefficients of the independent variables in the regression equation have values > 0 . Thus, when these factors increase, the intention to join the tour of young people increases.

The degree of impact of each factor is different. In which, the availability and quality of the tour has the largest impact on the intention to join the tour ($\beta = 0.218$), followed by

the reference group ($\beta = 0.211$) and communication and advertising activities have a small impact. ($\beta = 0.143$).

(2) When comparing the intention to join the tour of different groups in the same control variable by group test, the study gives the following results: Anova test between the control variables and the dependent variable intention participating in the tour showed that there was no difference between the groups of objects of the observed variable. Regardless of gender, age, income level or vaccination coverage, young people have the intention to participate in tourism, namely a strong "travel bubble tour". The restriction of regulations in the context of the epidemic cannot prevent young people's travel intentions and motivations.

4.2. Trends of change in perception and decision to participate in tourism activities in the new context

The social context has changed in the direction of adapting to the Covid-19 pandemic, leading to a change in the perception of young Vietnamese people about tourism behavior in a more positive direction. The intention to participate in tourism activities of 404 respondents is approached from both subjective and objective factors.

The perception of young people depends greatly on subjective factors. Most survey respondents feel optimistic about the epidemic situation as well as believe in the policies of the Government of Vietnam. After a long time fighting the epidemic, people have accumulated a certain amount of knowledge and experience to protect their health against the epidemic wave. In particular, in the context of the "new normal", the state conducts widespread vaccination coverage to create a resistance layer for the community, people tend to be more confident in their health when participating in activities. travel. In addition, two factors of social interaction and personal values are increasingly strongly revealed in this period of context change. Young people are inherently dynamic, passionate about experiencing new things and eager to affirm their leading position, so when society "opens up" completely, they are even more eager to participate in tourism activities. ever. However, the analysis results of the health variable also show that, although young people have a great intention to participate in tourism, they tend to focus on safe tourism activities. This is an opportunity, as well as a challenge for the state, local authorities as well as travel businesses. Many new forms of tourism have been born such as resort tourism (participating in meditation, yoga...), touchless tourism (taking advantage of the development of digital technology to convert all in-person operations into online). , local tourism (travel at home)... These types are more developments of the "travel bubble" tour at the time, demonstrating the spirit of flexible adaptation to the pandemic. Covid-19. Young people in the new context quickly approach these trends in the near future.

In terms of objective factors, young people's perception of the intention to participate in tourism has also changed in the new context. The quality of tours is the top concern of young people when participating in tourism regardless of social context. In the context of the "new normal", the quality of the tour depends on whether the quality of transportation, dining and living services is safe, and whether necessary medical measures are taken when there is an unusual epidemic situation. suspect or not. This is completely consistent with the

analysis above that young people tend to participate in safe tourism in the "new normal" society. The second concern is price, which tends to support people in the new context. Because, in order to build an environment that "flexibly and safely adapts to Covid-19", the state needs to stimulate tourism demand, so it tends to subsidize prices and open many preferential packages for people. The other two factors, advertising and reference, will grow stronger and stronger in the near future. After the period of social distancing, activities tend to return more vigorously than in the previous period, so young people have more opportunities to approach and arouse the intention to participate in tourism.

It can be seen that the trend of changing young people's perception of tourism in the context of "flexibly and safely adapting to Covid-19" is towards safe tourism. They care more about service quality than anything else.

With advantages compared to traditional forms of tourism, the tour model "travel bubble" has many opportunities for strong development.

(1) The form of "travel bubble" meets the requirements of the new stage of society. While traditional types of tourism are struggling to solve the problem of crowding and congestion at tourist sites, causing insecurity and order in the region, and potentially bringing the Covid-19 wave back. ; The form of "travel bubble" can both control the number of people participating in the tour and ensure the health and safety of tourists as well as for local authorities.

(2) The form of "travel bubble" tour is trusted by many countries to build. Many countries today are still facing many consequences of Covid-19, so they are not ready to put their faith in traditional forms of tourism. As a result, the "travel bubble" can become a travel bridge and at the same time create trust with international friends.

(3) The form of "travel bubble" tour perfectly adapts to the regulations of the State and enterprises. This new tourism model not only ensures disease safety for the country but also supports businesses to escape from stagnation before the Covid-19 wave.

(4) The welcome of visitors is a big door for all forms of travel, especially the "travel bubble". People both want to satisfy their passion for travel and also want their health to be guaranteed.

With such open opportunities, is the "travel bubble" no challenge? This is not true at all, because:

(1) The epidemic situation in Vietnam in particular and the world in general changes day by day. That means that the "travel bubble" must stand before the rules of society's elimination. The "travel bubble" needs to compete for a foothold with the back-to-back traditional forms.

(2) The form of "travel bubble" needs creative investment, synchronous coordination of people, businesses and authorities at all levels. Developing tourism while not allowing massive epidemics and cross-contamination is a difficult problem to solve.

(3) The cost of participating in a "travel bubble" tour is relatively high compared to traditional forms of tourism. Meanwhile, people's income decreased due to the impact of the pandemic, so there was a fear of spending.

"Travel bubble" is a new tourism trend with many potential opportunities but also faces great challenges in the context of the times.

5. Discussion and Conclusion

From the above results, the authors make some recommendations and solutions for the State and enterprises in Vietnam as follows:

5.1. Recommendations

Recommendation 1: The Government needs to approve and issue-specific policies and documents for tourism in the context of the "new normal", so that ministries, departments, branches, and units operating in the tourism industry can have a specific legal framework for flexible application.

Recommendation 2: The Ministry of Culture, Sports and Tourism needs to strengthen the establishment of action programs, linking regions to create unique tourism products based on regional and local strengths.

Recommendation 3: Local tourism management agencies coordinate with relevant departments, as well as local businesses in conducting tourism business activities to ensure safe and attractive post-pandemic tourism.

Recommendation 4: Tourism associations should coordinate with the Vietnam National Administration of Tourism to organize communication events to promote tourism at home and abroad; call for socialization among businesses

Recommendation 5: Research and develop new tourism products and services in line with the psychology and preferences of tourists in the open context of the post-pandemic tourism industry, promotion to attract domestic and foreign tourists; Interested in recruiting, fostering, training, high-quality tourism human resources.

5.2. Solutions

5.2.1. For administrators/tourists

Proposal 1: Timely solve human resource problems in the tourism industry

It can be seen that in the past 2 years, due to the impact of the Covid-19 epidemic, a large number of workers in the tourism industry had to quit or switch to another job to temporarily stabilize their lives. Travel and tourism businesses need to come up with policies to support improving human resources to prepare for a return to the service quality race.

Proposal 2: Focus on improving the quality of tours, accommodation, and tourism services

The results of the study showed that the quality of the tour is the most important factor leading to the decision of young people to participate in tourism or not. This shows that the enhancement of the destination's competitiveness is not in the price but in the quality of services and products, which is the decisive factor in the post-Covid-19 context.

Proposal 3: Increase piloting of "travel bubble" in popular tourist destinations

At present, the "travel bubble" is still a safe choice in a time when tourism needs to flexibly adapt to the new era. When businesses increase piloting of this type, dangerous scenarios can be foreseen, reducing the confusion of all levels in the process of organizing tourism activities.

Proposal 4: Build a new flexible pricing model to meet the needs of tourists (combo, stratified price)

Flexible pricing with subsidies, and stratification, will give tourists more choices, make tourists feel they have to pay less for travel needs, and when they feel the benefits, decide to travel. The calendar will be launched more easily, thereby increasing tourism revenue.

Proposal 5: Diversify advertising media, targeting the needs of visitors

At present, the trend of finding out different types of tourism through the internet, booking tours online is very popular, any business that takes advantage of the information development, that business will achieve effective results. communication to many visitors. If tourism can also be promoted in this form with a moderate amount of brief information, it is believed that tourist information will come to young people more easily.

Proposal 6: Have a medical team on duty 24/24 to monitor visitors

Creating a medical team for tourism is an act of anticipating bad scenarios in the future, and creating peace of mind for visitors. When being assured of safety, security, and health, tourism activities provide a comprehensive view for visitors when all aspects of problems occurring when participating in tourism are covered by businesses. This is a measure to promote the tourism industry in the long run.

5.2.2. For the State

Proposal 1: Gradually erase people's fear

The Ministry of Culture, Sports and Tourism has issued a document to restore domestic tourism, and at the same time, coordinate with businesses and localities to promote communication to gradually remove people's anxiety. Take the first step to return to tourism.

Proposal 2: Re-establish tourism cooperation with potential foreign partners

The "new normal" time to open up the country, including the tourism industry, is a trend that should be placed on top of cooperation with foreign partners.

Proposal 3: Support tourism businesses, transport businesses, airlines, tax

The State's policies to support transport and aviation businesses such as corporate tax reductions and subsidies in difficult circumstances when businesses make losses are the driving force for businesses to maintain and stabilize their operations. thereby stabilizing the tourism industry for sustainable development.

Proposal 4: Establish "travel bubbles" projects in various forms such as experience tourism, cultural tourism, and resort tourism.

This proposal also diversifies types of tourism, enriching the potential application of the "travel bubble" into practice.

5.3. Conclusion

The interpretation of One-way ANOVA and the cut-off points shows that there is no difference in the intention to participate in tourism activities of the respondent groups in terms of gender, age, occupation, and income. Regardless of the customer segment, in the context of society flexibly and safely adapting to the Covid-19 pandemic, all have

motivations and trends to participate in tourism. The results show that there is no difference in the impact of objective and subjective factors on the intention of young Vietnamese to participate in tourism, especially the choice of the form of the tour "travel bubble". Specifically, the results of hypothesis testing have shown that service quality plays the most important role in young people's decision to participate in tourism. In addition, internal factors such as psychology and personal values also have a significant influence on personal decisions. Besides, the price or communication activities also have a certain influence on the intention of tourists. All of them reflect the results that young Vietnamese people have a large intention to participate in tourism after the period of isolation because of the Covid-19 pandemic.

As the social context changes in the direction of "flexibly and safely adapting to the Covid-19 pandemic", the public gradually changes the perception that Covid-19 has become an endemic disease. At that time, young people's awareness has changed more positively about their intention to participate in tourism activities. The analysis results show that young people tend to participate in tourism in large numbers, but it must be a safe form of tourism that can both satisfy individual needs and ensure health in the face of the Covid-19 wave. 19. That sets the stage for travel businesses, local authorities and the whole state to take quick and practical actions to recover our country's tourism industry.

COMMUNITY RADIO STATIONS AND COMMUNITY COVID TEAMS COMMUNICATION DURING THE COVID-19 PANDEMIC IN VIETNAM

PhD Student. Nguyen Huu Dzung

dungh.choa.kb@gmail.com

Faculty of Communication, Academy of Journalism and Communication, Hanoi

Abstract

The COVID-19 pandemic that occurred and rapidly spread globally has led to an overload of information about the disease for the public. The study was conducted with the aim of understanding the operation and role of commune radio stations and community COVID-19 teams in Vietnam during the COVID-19 pandemic. From there, draw lessons from experience and new knowledge in communication. Especially communication during the COVID-19 epidemic and communication on COVID-19 disease prevention and control. To conduct the research, the author used the method of observation and in-depth interview. By observation method, researchers directly observe the commune radio stations and their operation. At the same time, observe the activities of the community COVID teams in communication about the COVID-19 epidemic. Then, the researcher conducted in-depth interviews with a number of people, in different residential areas, in many different provinces to further clarify the observations and increase the generalizability of the study. Observational results show that, with regular and continuous activities of the commune radio stations and community COVID teams, people feel that the community is always with them, no one is left behind, contributing to people's peace of mind and trust in the victory in the COVID-19 pandemic.

Keyword: *community, radio station, COVID team, communication, Vietnam*

1. Introduction

Radio is a popular mass communication medium in the world. In the UK, there is a national radio system, local radio, BBC local radio, commercial local radio, digital radio, cable and satellite, internet radio, restricted service licenses, access radio, pirate radio (Paul Chantler and Peter Stewart, 2013). In Vietnam, the national radio system has five levels: national radio stations, radio stations of provinces and cities, radio stations at the district level, radio stations at the commune level, and residential areas (Nguyen, D.D., 2014). The most numerous are the community radio stations (CRS). Mainly in Hanoi, there are 579 radio stations in communes, wards, and townships, providing essential information to the people (Viet, A., 2021). But not only Vietnam but many countries worldwide also have community radio stations (CRS) very massive. Examples of CRS are from countries like Bangladesh (Pavarala & Jena, 2020), Nigeria (Ephraim, 2020), and the UK (Coleman, 2020). In India, there are 316 licensed CRS (“Number of operational Community Radio Stations”, 2020).

In Vietnam, the CRS is part of the national radio system. It was once the most popular mass media until social networks appeared on television, electronic newspapers, and the internet (Nguyen, D.D., 2014). Although it does not maintain a leading position in the media, radio broadcasting and CRS operations still retain their work and audience. During the COVID-19 pandemic, the advantages of grassroots radio stations once again promoted and made an essential contribution to epidemic prevention and control in Vietnam (Viet, A., 2021).

Along with modern technology development, CRS has undergone drastic changes in the production and broadcasting process. For example, in the current Bac Ninh province, CRS uses the internet with 4G technology to broadcast wirelessly (Minh, L., 2021). This 4G innovative radio system was used for both district, commune, and residential. This system has a high level of availability can operate at any time, in any location with any internet-connected device. The CRS brings information directly to people in residential areas. Urban residential areas where primary radio stations are not installed, as in Hanoi, have mobile radio crews (Viet, A., 2021).

Also, during the COVID-19 pandemic, in Vietnam, along with CRS, group communication activities, and personal communications in residential areas, especially isolation and blockade areas, there was new creative development. The birth of the community COVID-19 team (CCT) is an example.

CCT was established in residential areas. The number of members of the team depends on the epidemic situation and the number of people in the area. The CCT was born as a combination of community health authorities and socio-political organizations, social organizations, and people of residential areas. “The task of the CCT is to go every day, knocking from door to door to: Communication, mobilize and remind people of measures to prevent and control the epidemic; Request and guide people to self-monitor their health, proactively make medical declarations when themselves or their family members show signs of illness (Ministry of Health Portal, 2021)”. Members of CCT participate voluntarily.

The media has contributed to the achievements in preventing and controlling COVID-19 in Vietnam in the past two years (Information And Communication Emagazine, 2021). Including the active activities of CRS and CCT (Ministry of Health Portal, 2021). Realizing that, the author has conducted a study to find out and clarify the role and method that CRS and CCT have coordinated with other media in communicating about the COVID pandemic -19 in Vietnam.

2. Method

The study was carried out by observation, in-depth interviews, and data collected from electronic portals and online newspapers. Direct observation helps researchers collect intuitive and vivid data about the activities of CRS and CCT. On the basis of those primary data, to ensure the generalizability of the study, the author conducted in-depth interviews with people in different areas throughout Vietnam. Simultaneously, with the observation and implementation of in-depth interviews, the author observes the provision of information by

the State on mass media such as electronic newspapers, electronic portals and social networks to with reasonable conclusions and recommendations.

Observation

In the observation, the author implemented the sampling technique to group by locality and group by epidemic area. First, the researcher made a list of provincial administrative units in Vietnam. The list includes 63 provinces and centrally run cities. After that, the author continued to select the localities that were and are the epidemic centers to made direct observations. The selected localities include Bac Giang, Bac Ninh, Hanoi and Ho Chi Minh City. However, due to the epidemic, travel was limited, so the author's main observations were mainly in Bac Ninh and Bac Giang.

The observation period was made from April 2020 to October 2021.

During that time, the researcher directly observed information activities about the COVID-19 epidemic in 03 residential areas in Yen Phong and Thuan Thanh districts of Bac Ninh province. The focus is on observing the operation of CRS and CCT. Thereby, the researcher can make statistics about the frequency of activities, information contents and make an assessment of the usefulness of information from CRS and CCT provided to people in those areas. At the same time, the observation helped researchers make initial assessments of the role of CRSs and CCTs in the prevention and control of COVID-19 in localities. With that researcher also collected data on CRS and CCT from official sources to had a basis to reinforce research results.

In that process, the researcher compares the information from CRS and CCT with information on other media such as television, online newspapers, and social networks, and compares CRS with CCT to make conclusions about the ability to support each other in the process of communicating about the epidemic to the people.

In-depth interview

To ensure the generalizability of the study, in addition to making observations, the researcher conducted in-depth interviews with the people. The sampling technique is similar to that in observational sampling. In the final step of sampling, selecting people to interview, the researcher used convenient randomization method, and at the same time uses stratified sampling technique. Accordingly, the selected people are from many different provinces, living in both urban and rural areas, diverse ages and occupations, including both men and women. Finally, the author compiled a list of 20 people to conduct interviews.

Interviews were conducted from December 22 to December 29, 2021. Due to epidemic conditions and travel restrictions, interviews were conducted by phone and each interview lasted about 15 minutes.

The in-depth interview questionnaire consists of two parts with 11 questions:

- The first part consists of 5 questions on sociological characteristics such as gender, age, education level, place of residence and occupation.

- The second part consists of 6 questions: one question about when people know about COVID-19 and how often they follow information related to the disease, two questions

about the role of CRS and CCT , two questions about the difficulties without CRS and CCT, and finally the question of whether it is possible to omit either CRS and CCT.

3. Results

Observation

CRS systems and their operation

Observational results show that each residential area was installed with 6 -15 speaker clusters. Each cluster has 1-2 speakers, including 4G wireless and wired speakers. The number of speaker clusters depends on each region's conditions, geography, and population. CRS were installed in high positions and could spread the sound to many households in a residential area. In Yen Phong district, Bac Ninh province, the researcher found 476 4G speaker clusters in 11/14 communes.

CRS was used for broadcasting activities at three levels, including district, commune, and residential. The district-level has a fixed distribution time frame and 6:30, 11:30, and 17:00. In the commune, there was a schedule to distribute at 6:00 and 18:00. In residential areas, depending on the actual conditions, it is possible to choose a time suitable for the content to be communicated. In case of emergency, they could improve communication at any time. For example, communication frequency can be up to 20 - 30 messages during peak times. The earliest news can be broadcast at 05h00, and the latest can be until 23h00.

CRS uses outdoor loudspeakers for broadcasting, which was affected by outdoor and weather conditions. There were locations where people could not hear or hear the sounds from the CRS. CRS works based on the primary device's internet connection and depends on a 4G signal at the installation site. If the 4G mobile signal is not stable, it will affect the radio quality.

CRS provides information on the COVID-19 epidemic situation directly related to people in residential areas, including information on disease prevention and control, 5K, 5T messages, epidemic levels, government policy, number of cases, medical isolation cases, locked areas, information on registration and vaccination. These are all specific and practical information aimed at serving the people of each residential area. This information is absent from other media such as television, online newspapers, or social networks.

In some emergency cases, the responsible people of the government directly broadcast and inform the people to correct the untruthful information spread among the people and on social networks.

Ordinary, the target audience of CRS is mainly older adults. They cannot access or have little access to other information sources such as online newspapers, television, and social networks. However, in the peak epidemic areas, CRS is the primary means of mass communication to update the information of the whole community.

Operation of CCT

According to a report from an unnamed source, Yen Phong district, Bac Ninh province was counted 816 CCTs in 14 communes with 1940 participants.

According to the collected data, Vinh Phuc province, where the CCT models started, had 1,496 groups with 11,314 members (Tran, Q.V., 2021). Da Nang city had more than 2,200 CCTs in residential groups and residential areas. As for Ho Chi Minh City, there were 19,000 CCT with 52,000 members, operating voluntarily, under the organization and management of local authorities and professional guidance from the health sector (Diep, C., 2021).

Each CCT is organized with 3-5 members; they go to people's houses, especially families with people with COVID-19, have F1, F2 cases or families in isolation, blockade, etc. to communicate, mobilize and remind people of epidemic prevention and control measures in each household as a stay at home, limit going out when not necessary; wear the mask; wash hands with soap; keep distance; limit contact with outsiders...

Communication messages from CCT have the advantages of personal communication and directly impact people's thoughts and feelings, making them feel secure and confident in preventing and controlling the epidemic. At the same time, information from CCTs contributes to correcting false information about the epidemic that people have approached. In addition, information from CCT contributes to supplement the activities of CRSs and other media because the information needs of individuals are uneven, and not all people can hear the news from CRS as analyzed above or access other sources.

CCT activities have promoted awareness of individuals, households, and communities in disease prevention and control. CCT also conveys that no one is left behind during the epidemic.

In-depth interview

The researcher interviewed 20 people, including: 13 people in Bac Ninh, 05 people in Hanoi, 01 person in Thai Nguyen and 01 person in Thanh Hoa. In which, there are 07 men (35%) and 13 women (65%); the average age of survey participants is 31.1 years old; 02 (10%) people have college degrees, 09 (45%) people have university degrees and 09 (45%) people have graduate degrees; occupations include students, office workers, reporters, journalists, civil servants, public employees and social activists. According to sociological studies, the maximum natural size of chat groups can be up to 150 people (Yuval Noah Harari, 2015). We can infer that interviewing 20 people actively socializing can equate to data obtained from up to date 3000 people.

Accordingly, 75% (15/20 people) answered that they knew about the epidemic from the end of 2019 and 25% (05/20 people) said they knew at the beginning of 2020. Of which, 90% (18/20 people) said that they regularly monitor information about the COVID-19 epidemic.

When asked about the role of CRS, 20% (4/20 people) said it was to quickly provide information in emergencies, 35% (7/20 people) said CRS had a role in providing information timely information on the epidemic, 65% (13/20 people) said that CRS has a role in providing necessary information such as information on regulations and guidelines in the prevention of COVID-19, information about the epidemic situation is closest to the actual situation including infections, anti-epidemic checkpoints, informing people about information about vaccines and registering for COVID-19 vaccination. In

which, 15% (3/20 people) rated CRS as the most effective in information on COVID-19 prevention and control.

When asked if there are any difficulties without CRS, 60% (12/20) said that there would be difficulties in accessing information and difficult to grasp the epidemic situation in the locality people live, people will be deprived of information about measures to prevent and control the epidemic, not know the cases, and importantly, public awareness will not be enhanced.

When asked about the role of CCT, 95% (19/20) of the respondents said that CCT was very close to the people, closely follows the epidemic situation to each household and was an important bridge between the people and the community local authorities in the prevention and control of COVID-19.

On the one hand, CCT regularly monitors, supervises, and reminds people to prevent and control the epidemic, such as implementing 5K, cleaning, and not gathering in crowds. Through CCT, authorities can detect cases requiring isolation, medical care, or needing help. On the other hand, CCT also absorbs people's feedback to convey to the authorities. Thereby helping people always feel secure to comply with the policies and measures of the leaders in the prevention and control of the epidemic.

When asked if there are any difficulties without CCT, 100% answered yes. Without the CCT, the authorities would not be able to get close to each person in detecting cases and suspicious cases, and could not timely capture people's thoughts and aspirations during the epidemic. And most importantly, there will not be enough forces to carry out epidemic prevention and control work. The reality of anti-epidemic work in Vietnam has also confirmed that if there had no CCT, it would definitely fail.

The interview data also shows that, out of who answered the question whether CRS and CCT were support each other and, if possible, which one should be omitted 40% (8/20 people) of respondents believe that CRS and CCT have a mutually supportive effect in communicating about the COVID-19 epidemic and cannot miss any communication activity in those two activities. The messages from CRS and CCT bring people a feeling of closeness, affection, and reliable information. Statements from CRS were public, while those from CCT were deeply personalized and clearly showed society's humanity.

4. Discussion and Conclusion

4.1. Discussion

CRS is a mass media that has appeared since the 70s of the twentieth century (Duc, D., 2003); so far, it is no longer the primary means of communication in modern society. But through the collected data, we can see that in the context of the COVID-19 epidemic in Vietnam, CRS, thanks to its advantages, still has its place and position (Viet, 2021).

Modern media such as online newspapers, social networks, and television can spread messages about the epidemic on a vast scale. Still, they cannot provide detailed information on the situation of each residential area. Meanwhile, with a limited scope of impact, CRS is arranged in an enormous enough number to inform the majority of residents in residential

areas in a timely and accurate manner about the local epidemic situation, along with other helpful information.

The limitation of CRS is fixed installation. But there is also an advantage of CRS. When there is information about the epidemic, people can actively go to CRS installation locations to update information or at least focus on the direction of CRS to listen to reports.

The sound from the CRS is susceptible to weather and ambient noise. But it has one advantage that is the power of direct speech. The direct of the broadcaster can affect the listener's emotions, making them ready to express their attitudes and respond behaviorally to the received messages positive. At the same time, the broadcaster can also adjust the intonation to suit the audience who are the elderly and do not depend on strict standards. However, the limitations of CRS are a big flaw and need a solution.

CCT is a breakthrough and innovative solution in epidemic prevention and control in Vietnam. CCT has responded to information and communication needs about the COVID-19 epidemic in residential areas more quickly, proactively, and drastically while helping to control the source of infection, trace the disease and take care of people in residential areas. The birth of CCT had created a decisive turning point in the fight against COVID-19 in Vietnam (Tran, Q.V., 2021).

Data from surveys show that Vietnamese people were very concerned about the disease, most of them had grasped information about the condition from the early days of the outbreak, around the end of 2019 to the beginning of 2020, and always followed the disease. Especially in the first time, everyone watched several times a day. When information about the epidemic became too much, many people were overloaded with the illness on social networks and online newspapers. They turned to monitor mainstream media such as television and radio. In epidemic areas, people are only interested in CRS and CCT without paying attention to other sources.

Thus, when an issue is communicated to the public long enough and quantity enough, the recipient is overloaded with information. They will no longer be interested in that information unless it is relevant directly to their lives. At that time, the public will look to reliable sources and only follow information from that source.

Since Vietnam transitioned to a safe coexistence with the epidemic, when the Government issued Resolution 128, marking a new turning point in epidemic prevention and control in Vietnam (Vietnam Government Portal, October 2021), information from CRS and CCT is more and more interested. Accordingly, the epidemic situation of each locality is continuously updated and has flexible adaptation changes according to the epidemic level to ensure both epidemic prevention and economic development. Therefore, information about the local epidemic situation is essential, and such information is only available on SRC and CCT.

In addition, we must also affirm that building a picture of information about the epidemic to form an objective and comprehensive view for the public requires the involvement of the entire media. The mass media provide broad details covering the whole society. Individual and group media provide in-depth, local information. That coordination has been very evident in Vietnam in past times.

On the social side, the mass media has intensely involved online newspapers, television, and radio on social networking platforms. Information about the epidemic is continuously provided by authorities, along with measures to prevent and control the outbreak. Information about attacks worldwide and throughout the provinces and cities in the country is continuously updated (Zalo of the Ministry of Health).

4.2. Conclusion

On a local level, information channels are also vibrant and diverse. But the most prominent at the commune are CRS and CCT. The combination of CRS and CCT had created in-depth and comprehensive information covered in each residential area, and at the same time, is a reliable information channel trusted. During the epidemic, when people have to distance themselves and not gather in large numbers, it can affect their daily activities and spiritual lives. Therefore, CCT is not only a personal communication channel it is also profoundly human during the COVID-19 pandemic.

Thus, along with inheriting results from previous studies, through observations, in-depth interviews, and analysis of data from official sources, the author concludes that:

Firstly, in the prevention and control of the COVID-19 epidemic, along with the communication on the mass media, the authorities and the government need to conduct group communication and individual communication. In particular, attach importance to personal contact in epidemic areas, isolation, and block down sites, thereby spreading the spirit of community, love for people, and spreading the nature of humanity and humanity so that no one is left behind.

Second, continue to promote the role of CRS and CCT in reflecting the local situation to help people promptly grasp information about the epidemic and the policies of the government and authorities.

Thirdly, the coordination between CRS and CCT is one of the critical, decisive factors in epidemic prevention and control in Vietnam. This cooperation model is a valuable and very creative experience that can become a model for other countries to refer to and learn. However, we must not forget that to have a typical result in success in Vietnam, the total involvement of the media is required to convey the messages of the government and authorities promptly, strictly.

Acknowledgments

The author would like to acknowledge Associate Professor Luong, K.H., Associate Professor Mai, D.N, and Dr. Luong, N.V. for helping the author complete this study.

Abstract

This study proposes a research model and factors affecting the decision to use Low Touch Economy's solutions. The study evaluates the risk perception, related legal issues and consumer readiness. The study's results indicate the safety, prevention of the COVID-19 pandemic and the replacement of the economy in the traditional form before and during the pandemic. Based on the study's results, some recommendations are made to improve and develop the Low Touch Economy in Vietnam.

Keywords: *E-commerce, e-logistics, e-payment, Low Touch Economy.*

1. Introduction

Definition of Low Touch Economy

Low Touch Economy is an economic solution in which transactions in economics, commerce, and services (shopping, education, health, restaurants, hotels, leisure, travel) are conducted without direct interaction, meeting face to face at the place where the transaction between the seller and the buyer; service users and providers takes place. Through the Internet of Things (IoT), 5G network, cloud computing, blockchain technology, 4.0, AI, robotics, virtual reality (VR), augmented reality (AR), Low Touch Economy's solutions have switched to marketing activities; buying and selling on e-commerce, paying online; providing and distributing services, online software remotely to reduce face-to-face contact and interactions, focus on health, follow government safety measures, and create significant shifts across industries.

Roles of Low Touch Economy:

- Protecting the health and safety of people, workers, economic organizations and businesses against the COVID-19 pandemic.

- Accelerating and promoting management, production and business activities of enterprises effectively.
- Developing a remarkable, innovative and creative economy in all fields.
- Helping Vietnam integrate into the world and participate in the globalization process.

Review of the Literature:

Research "Innovation in the 'New Normal' Interactions, the Urban Space, and the Low Touch Economy: The Case of Rio de Janeiro in the Context of the COVID-19 Pandemic" by Diego Santos Vieira de Jesus, Daniel Kamlot & Veranise Jacobowski Correia Dubeux (2020) to examine how a new change in the economic process influence the city of Rio de Janeiro, in the context of the COVID-19 pandemic, in relation to "new normal" interactions ", urban space and Low Touch Economy. The argument shows that the new use of information and communication technologies by Low Touch Economy to interact with others has allowed people to develop social and emotional relationships in different ways following health measures.

Authors Anamaria Bucaciuc, Gabriela Prelicean, Carmen Chasovschi (2020) focus on the concept of Low Touch Economy in the heritage of rural areas. Pointing out the difficulties and challenges people face due to the COVID-19 crisis by reducing close contact interactions and limiting travel distance through the solutions of Low Touch Economy. The challenges and opportunities of tourism in Low Touch Economy are also presented in the study by Cynthia Maria Montaudon- Tomas, Ingrid N. Pinto-López & Anna Amsler (2021). Research shows negative consumer sentiments during the pandemic and how they are adapting to Low Touch Economy.

Theoretical basis

Technology Acceptance Model – TAM

According to Davis' research, perceived usefulness is the determining factor for people to use computers, and perceived ease of use is the second specific determinant of people using computers.

TAM is considered as a typical model for application in studying the use of a system because TAM is a model for measuring and predicting the use of an information system (IS). Thus, e-commerce is also a product of information technology development, therefore, the survey model of factors affecting IT acceptance is also applied appropriately for the study of similar issues in e-commerce.

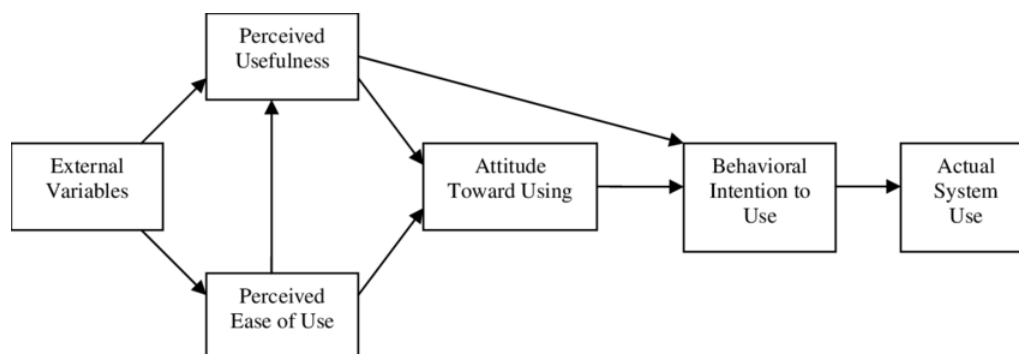

Figure 1. Technology Acceptance Model – TAM

Source: Research by Davis, Bagozzi & Warshaw (1989)

Model description: TAM shown in the figure above is the model first introduced by Davis (1989). TAM acknowledges that two factors perceived usefulness and perceived ease of use are the cornerstones of user acceptance of the system. The importance of these two factors is based on analysis from many aspects, such as: expectations theory, and behavioral determinism.

Theory of Perceived Risk – TPR

In the Theory of Perceived Risk (TPR), Bauer (1960) argues that the behavior of using technology always involves risks, including two factors: (1) Perceived risk related to products/services (perceived risk types: loss of functionality, loss of finance, loss of time, loss of opportunity, and overall risk perception with the product/service), (2) Perceived risk associated related to online transactions (risks that may occur when consumers conduct e-commerce transactions on electronic means - devices related to: confidentiality, safety - authentication, no waiver, and overall risk perception of online transactions). Bauer's (1960) risk theory is widely used in online purchase decision studies, in which two case studies show that this theory is also used in research on ticket purchase decisions, book tickets (events, trains, planes, hotel reservations) online in general, and buy airline tickets online in particular as studied by Kim, Kim & Shin (2009); Kim, Kim & Leung (2005).

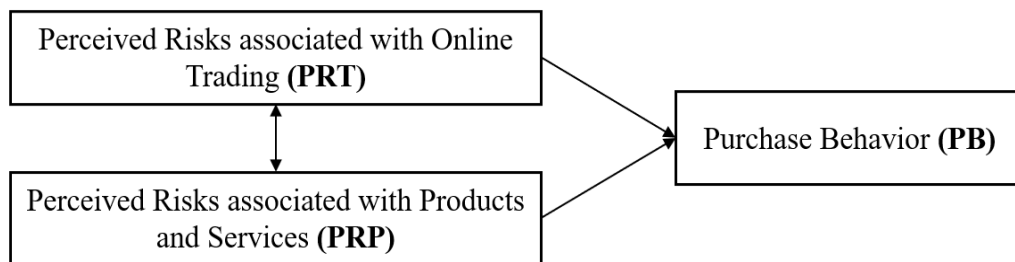

Figure 2. Theory of Perceived Risk – TPR

Source: Research by Bauer, R.A. (1960)

Objectives of the study:

- Systematizing the research on the trend of Low Touch economy. Clarifying customer segments, dynamics and the roles of Low Touch Economy.
- Researching and surveying for the purpose of providing information, testing the direction and level of impact of factors on consumers' decision to join the trend of Low Touch economy.
- Identifying the current status, position and importance of the current trend of Low Touch Economy. Anticipating the replacement of the trend of Low Touch Economy with Traditional Economy. Opportunity and challenge.
- Making recommendations in the development orientation.

Research questions:

- Question 1:* Does the current trend of Low Touch Economy take a more important position and can replace the traditional economy?

• *Question 2:* Consumers' perception of risks and legal issues related to the Low Touch Economy. How willing are they to participate in the Low Touch Economy?

• *Question 3:* For consumers in Hanoi City, what is the proportion, market share, and interest in the trend of Low Touch Economy? And are there any differences between types of participants using the Low Touch Economy's solutions?

Proposed model:

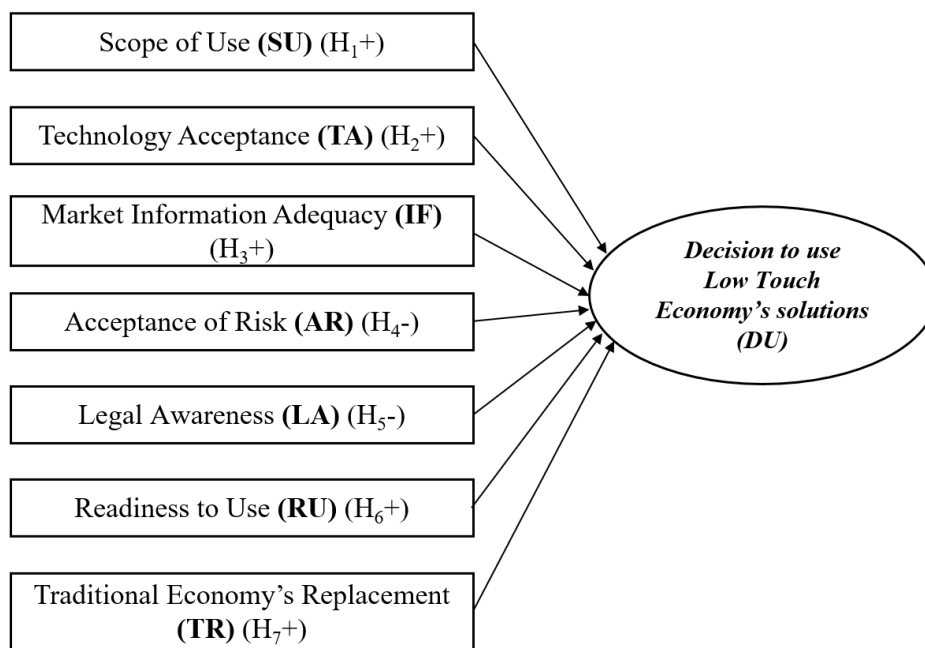

Figure 3. Proposed model

Source: Research team's proposal

2. Method

Data collection

Collected data used for this study include: (1) Secondary data of the research thesis are collected through theoretical systems and data related to Low Touch Economy; (2) The primary data of the qualitative research is collected through pre-built data tables, interviews and expert opinions; (3) Primary data of quantitative research is collected through survey method by pre-structured questionnaire.

- Methods of collecting and processing secondary data: Collecting, systematizing and analyzing secondary information from documents available at domestically and internationally on the contents related to the research topic.

- Methods of collecting and processing primary data:

+ Qualitative research includes overview research, theoretical basis, group discussion and expert interviews to develop the model and complete the scale.

+ Quantitative research with survey method: using pre-structured surveys and questionnaires to collect information on the influence of factors on intention to participate in the trend of Low Touch Economy in Hanoi City.

Data analysis

Implementing research model by using Cronbach's Alpha reliability coefficient test, EFA exploratory factor analysis, linear regression model and One-Way ANOVA to determine relationships related to consumers' decision to use Low Touch Economy's solutions? The whole process of processing and using SPSS 20.0 software to perform data processing and analysis. The data analysis process includes the following basic steps:

- Descriptive statistical analysis of surveyed object data.
- Univariate descriptive statistical analysis.
- Check regression model assumptions.
- Check the regression model.
- Test the research hypothesis.
- Analyze One-Way ANOVA

The entire process of performing data analysis and results is published in the form of statistics, charts, and model results of tests are published in PDF form of SPSS 20.0 software, attached in the Appendix.

3. Results

Description of the study sample:

The research team distributed 504 survey questionnaires to consumers in Hanoi City by way of an online survey. As a result, 463 valid votes were obtained and 41 invalid votes (mainly in online questionnaires that answered the same questions). Therefore, the research team conducted an analysis of 463 valid questionnaires. The results of the sample survey are as follows:

For gender group

The survey was conducted with 176 male consumers, accounting for 38% and 287 female consumers, accounting for 62%. With this result, the percentage of women is nearly 1.63 times higher than the rate of men surveyed.

For age group

The number of consumers under 18 years old is 64 (13.8%); The age group from 18 to 60 is 377 people (81.4%) and the group from 60 years old and above is 22 people (4.8%). The results show that the surveyed age group is mainly between 18-60 years old.

For the educational level group

The survey results show that there are 6 people with below high school qualifications (1.3%); 84 people have upper secondary education (18.1%); 318 people have a university/college degree (68.7%) and 55 people have a graduate degree (11.9%). The results show that the majority of surveyed individuals have a university/college degree.

For the group approaching the concept of Low Touch Economy

The number of consumers who have approached is 370 people (79.9%) and the group that has never approached the concept of Low Touch Economy is 93 (20.1%). The survey results show that the majority of consumers have approached the concept of Low Touch Economy (nearly 4 times more than the group that has never approached it).

The percentage of group that has never approached the concept of the Low Touch Economy is small, but it also reflects that the solutions of the Low Touch Economy need to be improved to be fully applied in various fields used by consumers.

Cronbach's Alpha coefficient analysis:

Cronbach's Alpha coefficient of the scales: Scope of Use (0.755), Technology Acceptance (0.633), Market Information Adequacy (0.693), Acceptance of Risk (0.742), Legal Awareness (0.603), Readiness to Use (0.604), Traditional Economy's Replacement (0.827), and Decision to use Low Touch Economy's solutions (0.601) are all greater than 0.6. The correlation coefficient of the sum of the observed variables in each scale is greater than 0.3. Therefore, 39 observed variables of 07 scales are accepted and included in EFA analysis.

Exploratory Factor analysis (EFA):

 *EFA factor analysis results for independent variables*

Table 1. KMO and Bartlett tests of independent variables

Kaiser-Meyer-Olkin Measure of Sampling Adequacy	0.887
Sig.	0.000
Cumulative (%)	55.567
Eigenvalue	3.522

Source: Compiled from SPSS, 2022

Table 1 shows that: The value of KMO coefficient is 0.887, eligible for analysis, the factor analysis is suitable with the data; Bartlett test results for Sig. coefficient = 0.000 < 0.05. Thus, the observed variables in the EFA factor analysis are correlated with each other in the overall population. Therefore, hypothesis H₀ is rejected, accepting hypothesis H₁. The first extracted variance results showed that all factors had Eigenvalues > 1. The total value of variance extracted in this EFA analysis was 55.567% > 50%, meeting the set requirements. With Principal components extraction method and Varimax rotation, 7 factors were extracted from 39 observed variables. Factor Loading coefficient of observed variables is greater than 0.3. This means that 07 extracted factors explain 55.567% of the variation of the data, the extracted scales are accepted.

 *EFA factor analysis results for dependent variables*

Table 2. KMO and Bartlett tests of dependent variables

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0.628
Barlett's Test of Sphericity	Approx. Chi-Square	148.648
	df	3
	Sig.	0.000

Source: Compiled from SPSS, 2022

Table 2 shows that: KMO coefficient = 0.628, eligible for analysis, factor analysis is appropriate with the data. Bartlett test: Sig = 0.000 < 0.05 shows that observed variables are correlated with each other in the population. Factor loading factor loading observed variables > 0.3. The breakpoint when extracting factors in factor 1 has Eigenvalues > 1. The total value of variance extracted is 55.983% > 50%, meeting the set requirements.

After analyzing EFA, the scales of the factors reach the convergent value and the observed variables represent the concepts to be measured. The remaining observable variables that meet the requirements after analysis are grouped, multiply the representative numbers of the factors (take the average value) to conduct the following analysis step.

✚ *Regression analysis*

The regression model has the following form:

$$DU = \beta_0 + \beta_1 SU + \beta_2 TA + \beta_3 IF + \beta_4 AR + \beta_5 LA + \beta_6 RU + \beta_7 TR$$

(β_0 : regression constant, β_i : regression weight)

Testing the fit of the regression model: The test results show that the Sig (F) value is very small and less than the significance level of 0.05. Therefore, hypothesis H_0 is rejected. This means that the independent variables in the model are linearly correlated with the dependent variable, the combination of the independent variables included in the model can explain the variation of the dependent variable. A linear regression model was built to fit the data set.

Table 3. Evaluation of the fit of the regression model

Model Summary ^b					
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	0.802 ^a	0.642	0.637	0.19865	1.78

Source: Compiled from SPSS, 2022

Table 3 shows that the research model has an adjusted R_2 of 0.637. Thus, 63.7% variation of consumers' decision to use Low Touch Economy's solutions is explained by factors, such as: Scope of Use, Technology Acceptance, Market Information Adequacy, Acceptance of Risk, Legal Awareness, Readiness to Use and Traditional Economy's Replacement. The Durbin-Watson coefficient of 1,780 is within the specified range. Therefore, there is no autocorrelation between the residuals.

In Table 4, the Beta coefficients of the independent variables all have Sig values. < 0.05. Therefore, the independent variables have their own partial regression coefficients that are statistically significant at the significance level of 0.05 (5% significance level). The variance exaggeration coefficients (VIF) are all less than 2, so it is concluded that there is no multicollinearity phenomenon, the relationship between the independent variables does not affect the explanatory results of the model.

Table 4. Regression analysis

Model		Coefficients ^a						
		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	1.172	.155		7.571	.000		
	SU	.176	.036	.184	4.859	.000	.550	1.820
	TA	.081	.026	.113	3.123	.002	.598	1.673
	IF	.086	.028	.110	3.101	.002	.627	1.594
	AR	-.028	.014	-.057	-2.003	.046	.968	1.033
	LA	-.139	.016	-.252	-8.877	.000	.973	1.028
	RU	.140	.027	.181	5.142	.000	.637	1.571
	TR	.266	.024	.406	10.886	.000	.564	1.772

Source: Compiled from SPSS, 2022

Table 4 shows consumers' decision to use Low Touch Economy's solutions in Hanoi city is affected by 7 factors, namely: Scope of Use ($\beta_1 = 0.184$), Technology Acceptance ($\beta_2 = 0.113$), Market Information Adequacy ($\beta_3 = 0.110$), Acceptance of Risk ($\beta_4 = -0.057$), Legal Awareness ($\beta_5 = -0.252$), Readiness to Use ($\beta_6 = 0.181$) and Traditional Economy's Replacement ($\beta_7 = 0.406$). Therefore, the multiple linear regression method is written according to the normalized Beta coefficient as follows:

$$DU = 0,406*TR + (-0,252)*LA + 0,184*SU + 0,181*RU + 0,113*TA + 0,110*IF + (-0,057)*RU$$

✚ Hypothesis testing:

The standardized regression coefficients of the hypotheses are all greater than 0 and the Sig coefficients are equal to $0.000 < 0.05$, so all hypotheses are accepted.

This means that when the factors of Scope of Use, Technology Acceptance, Market Information Adequacy, Acceptance of Risk, Legal Awareness, Readiness to Use and Traditional Economy's Replacement increase or decrease will make the decision to use Low Touch Economy's solutions of consumers in Hanoi City change.

4. Discussion and Conclusion

4.1. Recommendations

✚ Recommendations on personal data protection

- Raising awareness about network security and safe Internet usage skills of Vietnamese consumers
- Increasing administrative fines for violations of the right to protection of personal data
- Supplementing provisions on criminal liability for acts of infringing upon the right to protection of personal data in the Penal Code

- ✚ Recommendations on electronic identification and authentication
 - Raising awareness of people in the digital environment
 - Developing legal documents to specify the relevant contents of electronic identification and authentication
- ✚ Recommendations on product and goods quality
 - Raising consumers' awareness and responsibility when buying goods
 - Strengthening coordination, inspection, examination and handling of violations, improving law enforcement capacity on e-commerce; promoting propaganda and dissemination of legal policies to businesses and consumers
- ✚ Recommend shipping and service rates
 - Actively reducing taxes and fees to restrain the increase of gasoline, strictly managing the petroleum distribution system
 - Deploying and expanding the project of using electric delivery vehicles
- ✚ Recommendations on the quality of logistics supply chains and the Internet
 - Improving and developing logistics infrastructure
 - Scaling up testing and accelerating the commercialization of 5G.

4.2. Conclusion

Descriptive statistical analysis results from the survey sample show that the number of women is more than that of men. The age of the survey sample is concentrated in the range of 18-60 years old and the education level is mainly University/College. After performing descriptive statistical analysis, evaluating reliability by Cronbach's Alpha coefficient and exploratory factor analysis EFA, the method of coefficient extraction with Varimax rotation gave the results of a research model consisting of 7 independent variables established, 1 dependent variable with 39 observed variables.

The results of multiple linear regression analysis show that all 5 factors have positive impacts and 2 factors have negative impacts on consumers' decision to use Low Touch Economy's solutions in Hanoi City. In addition, participants with different levels of education also influence the decision to use Low Touch Economy's solutions.

Abstract

Ly Son has a long history of formation, a rich and diverse ecosystem with many scenic spots, and valuable historical - cultural relics. Over the years, the Party committees and authorities of Quang Ngai province and Ly Son island district have enacted many policies to exploit the potential and advantages of the locality to serve tourism development well. As a result, tourism activities have progressed in the Ly Son island district from 2015- to 2020. Infrastructure and tourism services are getting better and better, the number of tourists is growing, and tourism revenue is increasing. There are significantly contributing to increasing state budget revenue, creating jobs, and improving people's living standards.

In 2021, a large outbreak of the Covid-19 pandemic halted tourism service activities, causing heavy losses and damage to the tourism industry throughout the country, Quang Ngai, including the Ly Son district. Within the framework of the article, the author focuses on clarifying: The advantages of tourism development in Ly Son district Impact of the Covid-19 epidemic on tourism activities in Ly Son district, Quang Ngai province. From there, proposing some solutions to restore and develop tourism activities in Ly Son district in the coming time.

Keywords: *Impact, Covid-19 pandemic, tourism, Ly Son district, Quang Ngai province.*

1. Introduction

The complicated developments of the "Covid-19 pandemic in 2020 and early 2021" have strongly affected tourism activities in the world, Vietnam in general, and Quang Ngai province in particular, including the Ly Son district. The fear of tourists due to fear of the impact of the pandemic has made many hotels, restaurants and retail chains at tourist destinations become empty in Ly Son, and tourists and tourism revenue seriously reduced. In this article, in addition to introducing the advantages of tourism development in Ly Son district, and tourism activities in Ly Son island district before the Covid-19 pandemic, the author focuses on clarifying the impact of the Covid-19 pandemic on tourism activities in Ly Son district, Quang Ngai province in 2021.

2. Methods

In this article, the author is to clarify the content Impact of the Covid-19 pandemic on tourism activities in Ly Son district, Quang Ngai province. Besides, collects many

valuable sources such as Yearbook statistics of Ly Son district in 2017 and 2020; a Report of the People's Committee of Ly Son district on the results of the implementation of the guidelines of the Central and the province on tourism development in Ly Son district from 2017 to present and the summary report on implementation of resolutions on epidemic development, services and tourism in Quang Ngai province to 2020; Political report of the District Party Committee, term V, submitted to the 6th Congress of the District Party Committee, term 2015 - 2020; Statistics of historical-cultural relics and scenic spots of Ly Son district have been decided by the People's Committee of Quang Ngai province, the Ministry of Culture, Sports and Tourism to recognize as a provincial and national relic; Decision of the People's Committee of Ly Son district promulgating the Code of Conduct in tourism activities in the district,... thereby using historical, statistical, analytical, and comparative methods to clarify the issues, favorable conditions for tourism development in Ly Son district, Quang Ngai province. The current situation of tourism development in Ly Son District from 2015 to now, especially in the context of the outbreak of the Covid-19 pandemic affecting local tourism activities

3. Results

3.1. Advantages of tourism development in Ly Son district, Quang Ngai province

3.1.1. Tourism concept

Tourism has appeared for a long time in the history of human development. According to archaeologists, they have found the remains of people like Homo Erectus (China) and Java (Indonesia), according to human history originated in eastern and southern Africa about approx 1 million years ago. Scientists believe that to travel such a great distance, human took about 15,000 years at that time [6; p. 8]. Many theories have been put forward to explain the motivation to create such long-term journeys. For example, it is hypothesized that ancient people were nomadic to find food and escape danger. Another theory is that people observe the movement of birds, and want to know where they come from and where they fly, so they move along to find out despite being not deprived of food in their place. With those hypotheses, we know that since ancient times, people have been inherently curious to learn about the world around them, outside the place where they live. People want to know what view of other places, peoples, cultures, animals, plants, and topography of regions or countries.

In this era, with the development of the economy, material wealth is created, and living standard is improved day by day. That is the driving force to promote tourism development, making tourism a phenomenon socio-economic status is popular. Therefore, the International Travel Association believes that tourism is the largest economic sector in the world, surpassing the automobile industry, electronic steel industry, and agriculture [6; p. 8]. For some countries, tourism is now the most important source of foreign exchange earnings in foreign trade, and many countries even take the population's travel index as a criterion to evaluate the quality of life.

Currently, a history of research, there have been many different concepts of tourism.

In 1811, for the first time in England, scientists introduced the concept of tourism, saying that: Tourism is a harmonious combination between theory and practice of journeys with entertainment purposes.

At the United Nations Conference on Tourism, held in Rome, Italy (August 21 - September 5, 1963), tourism experts were the synthesis of relationships, phenomena, and economic activities originating in from the journeys and stays of individuals or groups outside their usual place of residence or abroad for peaceful purposes. The place they go to stay is not their place of work.

In 1930, Mr. Glusman - The Swiss, when researching tourism, said that tourism is the conquest of space by people to a place where they have no permanent residence. Another Swiss researcher named Kuns said that Tourism is the phenomenon where person travel places outside their usual environment get by transportation.

In Vietnam, the concept of tourism was approved by the National Assembly of the Socialist Republic of Vietnam in 2017. Tourism is "activities related to people's trips outside of the country" reside regularly for a period not exceeding 01 consecutive years to meet the demand for sightseeing, relaxation, entertainment, research, and discovery of tourism resources or to combine with other lawful purposes.

From the above tourism concepts, we can see that tourism activities have a long origin in history, develop at a fast rate in the present life, and many organizations, individuals, and scientists are interested in research. Up to now, the term of tourism has many different concepts, but we can see that scientists have a common opinion and think that tourism is a form of temporary movement of tourists from one place to another, from one region to another, from one country to another, without changing the place of residence or place of employment. This is an economic and service sector with the task of serving the needs of sightseeing, entertainment, and rest, whether or not combined with medical treatment, sports, scientific research, and other needs.

3.1.2. Advantages of tourism development in Ly Son district, Quang Ngai province

Ly Son is the island district located on the northeast coast of Quang Ngai province, at coordinates 1500.23'14" to 1500.38'14" North latitude and 1090,05'04" to 1090.14'12" ' East longitude, including the islands: Hon Lon, Hon Be, Hon Mu Cu. The distance from the mainland is 15 nautical miles, the natural area is about 10.32 km², and the current administrative unit consists of 03 communes: An Vinh, An Hai and An Binh; the population is 18,731 people [1; p. 11], so this place has a lot of potential for tourism development

For a long time, Ly Son is likened to a "fairy island" in the middle of the East Sea. Thanks to the lava eruption of the volcano about 25 to 30 million years ago, Ly Son has many beautiful and unique landscapes such as cliffs, caves, stone gates, rocky beaches, etc. That landscape, not to mention the crater ruins in the shape of a funnel, gently sloping with stone steps like rows of seats in the Olympic stadium of the brilliant Greco-Roman civilization. Along with its many beautiful and unique landscapes is that To Vo Gate - a natural masterpiece from a volcano or terraced garlic fields lined with volcanic rocks that

have created the charming landscape of a Dong Van place in Ha Noi. Giang is a miniature in the middle of a remote island.

Historically, Ly Son is a place of convergence and interference of cultures such as Champa, Sa Huynh, and Dai Viet. More than five centuries ago, a class of Vietnamese residents came to Ly Son island to make a living. They and the Cham people lived together to do business, build, and decorate their homeland, where it is more and more abundant. Experiencing many ups and downs of history, along with the process of living together and fighting against invaders, the Vietnamese - Cham residents have left on Ly Son island many valuable historical - cultural relics.

According to statistics, there are more than 50 historical-cultural relics, including large and small on Ly Son island. Of which six relics are ranked national level (An Vinh village communal house, An Hai village communal house, Hang pagoda relic, relics of Hang pagoda, etc. Gieng Tien mountain ruins, Thoi Loi mountain relic, Am Linh pagoda relic, and Hoang Sa soldier's tomb) and 19 provincial-ranked relics (Temple of Ong Fish, Church of Pham Quang Anh, Temple of Heaven Y-A-Na in the village) Tay An Hai, Tam Toa Palace, Lan Chanh, Vo Van Khec grave and temple, Thien Y-A-Na temple in Tay An Vinh village, Vinh Loc town, Pha dynasty relics, Tan mausoleum, Dun palace, Xó La well, the Vo Van family church, Xom Oc archaeological relic, Suoi Chinh archaeological site, Be island scenic relic, Vinh Hoa town, Long Thuy's palace and Yang's palace) [5; pp 1-2]. Historical and cultural relics on Ly Son island are diverse and rich with many different types, such as pagodas (Hang pagoda, Duc Pagoda,...), communal houses (An Hai village communal house, An Vinh village), church Temples of Pham Quang Anh, Vo Van Khiet), unicorns, palaces, mausoleums, etc. The artistic architecture of the monuments on Ly Son island is unique, often symmetrical and important components, which is arranged on the divine axis, the religion of monuments. Normally, the frontage has an open form to create ventilation, the structure avoids columns. The main hall usually has a wooden system in the form of a house. Decorative patterns and sculptures here are quite beautiful, with many themes such as flowers, leaves, four spirits, two dragons adorning the moon, song dragons of the day dynasty [4], and so on.

Annually, many special cultural festivals take place at the historical-cultural sites in Ly Son district, attracting a large number of tourists to visit. For example, ceremony remembers Hoang Sa soldiers, according to the Hoang Sa Squadron dating from the Nguyen Dynasty; the Thien Y-A-Na sacrifice ceremony, the Cau Ngu festival, the ceremony of Cua Van, the launching ceremony to catch seafood,... Cultural festivals on Ly Son island usually take place in the spring. Each festival has its rituals, but the meaning of the festivals has the same thing in common: they all show the principle "When you eat a fruit, think of the man who planted the tree", grateful for the merits of the forefathers who openly set up villages, built jobs, and prayed for favorable weather, calm weather, and favorable conditions for the people to do business.

In addition to traditional cultural relics, there are also revolutionary relics in Ly Son, which is Nha Pha (prison), now a lighthouse - this is the place where the French used to imprison local people because their rebellion against colonial oppression. In addition, there are quite a few ruins of ancient ships that were sunk. This island was once a stop for merchant

ships on the East-West route that world trade researchers dubbed the "sea ceramic road", and "sea silk road" through decades of trade and commerce. Such ruins have been discovered. However, they will be discovered more in the future. These are interesting undersea attractions for domestic and international visitors in the future.

Ly Son Island is surrounded by the sea. Addition, the geological tectonics in history has made the foothills of the island sink deep into the seabed, creating coral reefs stretching in the North and East of the island. Currently, there are more than 100 different species of coral on Ly Son island. The coral reefs are diverse in color, creating an interesting tourist highlight to attract tourists to Ly Son to visit.

Thus, Ly Son island - which keeps a huge amount of scenic spots, landscapes, and historical-cultural relics of great value, is a rare and precious cultural property deposited in the time flow of culture. Sa Huynh - Ancient Champa, which is mainly of Vietnamese culture associated with the process of island-building and island protection, exploitation, and protection of Hoang Sa and Truong Sa by Vietnamese people. Although the number of scenic spots and historical-cultural relics on Ly Son island is not much more than 50 large and small relics, they are still almost original, arranged evenly in localities on the island such as communal houses and pagodas. Ancient palace with unique architectural styles. Attached to many historical - cultural relics is a traditional system of intangible cultural heritage - it is a place to keep the customs, habits, and beliefs of residents. Ly Son is also home to a rich and diverse marine ecosystem with many beautiful colorful coral reefs that have made Ly Son an attractive tourist island for many unique types of tourism. and special

3.2. Impact of the Covid-19 pandemic on tourism activities in Ly Son district, Quang Ngai province

3.2.1. Tourism activities in Ly Son district before the Covid-19 pandemic

In the 19th session, term 2015-2020, the Party Committee of Quang Ngai province had the policy: It is necessary to plan and build Ly Son into a tourist island, strong in the economy, solid in defense and security, is outward to protect marine and island. Rapidly shifting the economic structure of the island district in the direction of increasing the proportion of tourism, fishing, and aquaculture. Rapidly increase the forest area, promote environmental protection, save freshwater, improve the quality of services, and develop community-based tourism. Implement the project of a marine nature reserve, build Ben Dinh Port, and compile a dossier to submit to the Government for recognition of Ly Son island as a special national cultural heritage. There are effective solutions, especially propaganda to raise awareness of the community for sustainable development to gradually change burial customs and practices, relocate and re-burial graves, and ensure the environment. save land fund for tourism development. [2].

The policy of building Ly Son into a tourist island of the Party Committee of Quang Ngai province, outlined in the 19th Provincial Party Congress, has profound and specific content, which is a guideline for the operation of the tourism industry in Ly district. Paint in the future. Implementing the policy of the Quang Ngai Provincial Party Committee on tourism development, between 2015 and 2020, the Party committees and authorities of Ly

Son district have issued many policies to mobilize all resources, and encourage participation. actively of the business community and people to promote tourism development in the district. Notably, from July 13-15, 2015, Ly Son Party Committee held the 6th Congress, clearly stating that the local tourism development goals in the coming time are: Developing tourism commensurate with the potentials and advantages of the district, identifying this as a breakthrough economic sector of the district. Focus on doing well in the planning of tourism development and organizing the implementation according to the planning. Planning to develop spiritual and ecological tourism of sea and islands in the direction of preserving historical values, exploiting spiritual-cultural relics, and exploiting marine resources sustainably. Improve the effectiveness and efficiency of the state management of tourism and the quality of tourist services. [3; p. 21].

In the context that many localities across the country consider tourism as a key economic sector, clearly stating the goal of local tourism development in the coming time of the Ly Son district Party Committee at the 6th Party Committee meeting is essential. This is a specific and clear tourism development orientation for all levels of the Party committees and authorities of Ly Son district to implement synchronously specific plans to mobilize all domestic and foreign resources and encourage participation in the tourism industry. Active participation of the business community and people invests in embellishing historical-cultural relics, building infrastructure, and propagating and promoting tourism to promote tourism activities in the locality. develop.

Between 2015 and 2017, Ly Son district directed the Department of Culture and Information to coordinate with functional units to compile a relic profile, requesting competent authorities to recognize Ba Thien Y-A-Na palace, Ba Thuy Long palace, Princess Yang's palace in An Hai commune, Dun palace, Tan mausoleum, Vinh Loc mausoleum in An Vinh commune, Vo Van family church, Pha house, Xo La well in Dong village, An Vinh commune, Vinh Hoa neighborhood are relics history - culture at the provincial level and Gieng Tien mountain in An Hai commune, Thoi Loi mountain are national monuments. Investing to renovate the Am Linh Tu national monument and the Hoang Sa soldier's grave, upgrading the national flagpole on Thoi Loi mountain, upgrading the roads from the border post to Am Linh Tu and the Hoang Sa soldier's grave, investing in upgrading provide lighting lines to monuments, scenic spots, etc. As a result, many historical and cultural relics on Ly Son island have been restored, embellished, and recognized as provincial and national relics, and many tourist attractions have convenient infrastructure systems. serve the sightseeing needs of tourists. Along with investing in embellishing and upgrading relics and infrastructure for tourism, the Ly Son district directs the construction and development of the Ly Son geopark and takes steps to plan, preserve, develop and submit documents to UNESCO for recognition as a global geopark, encourage the development of a community-based tourism model, and build new tourism products based on exploiting the district's potential, such as the longing oath ceremony Hoang Sa soldiers, Tu Linh traditional boat racing festival, coral reef viewing service, a cruise to visit Be island, Bich Hoa village, Be island, Bich Hoa street overpass to create many tourist products to serve the needs of tourists

To contribute to improving the quality of services and serving tourists, Ly Son district has also encouraged and mobilized domestic and foreign organizations and individuals to invest in high-quality tourist zones and destinations. As a result, infrastructure for tourism in Ly Son district has developed, and the quality of service for tourists has been improved. According to statistics by 2020, Ly Son island has 127 accommodation businesses put into use to serve tourists with a total of more than 800 rooms, including 11 hotels (with 2 hotels of equivalent standard). 4 stars are Muong Thanh and Ngoc Ly Son Island), 51 motels, 04 inns, and 61 service business households. Cultural tours (Am Linh Pagoda and Hoang Sa soldier's tomb, Hoang Sa exhibitor and Bac Hai manager, Tien well, Thoi Loi mountain, Cau cave, Lighthouse, Mu Cu island...), history of mind Linh (the relic of Hang pagoda, Duc Pagoda, the cluster of relics of An Hai village communal house, An Vinh village communal house, the relic of Mr. Lang Chanh fish temple,...) and marine eco-tourism suitable to Ly Son's strengths were opened. wide, service quality is increasingly professional. There are 12 high-speed trains, more than 100 taxis, trams, passenger cars, and many food and beverage establishments to meet the needs of visitors. [9; p. 4].

Ly Son Island is separate from the mainland in the middle of the sea, to develop the economy in general and tourism in particular, the problem is that it is necessary to open the sky to connect with localities in the country and the world economic. Along with the improvement of the local transport system, over the past time, Quang Ngai province has submitted a document to the Government, the Ministry of Transport, and the Civil Aviation Administration for approval of the policy of supplementing and updating the Department of Civil Aviation. Ly Son international airport is in the master plan of the system of airports and airports nationwide between 2021 and 2025 with a vision for 2030. The proposal to build the airport is derived from the practical needs of the locality. to perfect the transport infrastructure system, and create leverage to both promote socio-economic development and promote tourism development.

In order to bring the image of Ly Son tourism to a large number of domestic and foreign tourists, the Ly Son district conducts many activities, such as building a video clip to promote the image of "Ly Son tourism, things you need to know" online. social networks Facebook, Youtube, and slideshows on high-speed trains, LED screens at Sa Ky port station, building Ly Son tourism Website - Currently, the Website is officially operating at www.vanhoadulichlyson. Organized many unique cultural and sports activities, such as a cultural week in 2018 and 2019, in collaboration with the Department of Culture, Sports and Tourism to organize the Paragliding and Marathon national championships and the 61st Tien Phong newspaper [8; p. 3].

It is noticed that Ly Son district coordinated with the Department of Culture, Sports and Tourism of Quang Ngai province to organize a workshop on "Developing Ly Son tourism" in 2017. This is an important activity to concretize viewpoints, guidelines, directions, goals, tasks, and solutions following the specific characteristics and conditions of Ly Son tourism activities. The research results in the workshop will help Ly Son district properly assess the

current situation of local tourism activities in the past time to develop orientations and solutions for tourism development in the coming time. This is also an opportunity to connect cultural - tourism products, contributing to promoting tourism development linkages between Ly Son-Quang Ngai with the whole country and international. Besides, to promote potential, strengths, attract investors, build unique tourism products, and create a new development step for the tourism industry of Ly Son in particular and Quang Ngai in general.

In order to improve the quality of the tourism industry and make tourism activities of Ly Son island district "civilized - friendly and responsible", in 2017, Ly Son district issued a code of conduct in activities. travel. The Code of Conduct consists of 5 chapters and 14 articles, notably Article 4 - stating that the subject of the Code is: "Civilized, friendly and responsible tourism in Ly Son", Article 5 - stating the things to do for the local community, Article 6 - states what to do for tourists, Article 7 - states what to do for guides and tour narrators, Article 8 - states Clearly define what to do for organizations and individuals doing business in tourism and Article 9 - specifying 25 propaganda contents to organizations and individuals operating in the field of tourism, people living and working in the tourism sector. in the district, domestic and international tourists come to visit and stay in Ly Son district. [7] The introduction of the Code of Conduct in tourism is of great significance, contributing to changing the perception of tourist culture of tourists and people doing tourism on Ly Son island in a positive direction, towards the goal of tourism. soon to make Ly Son a national tourist destination in the future.

Thus, implementing the policy of the Party Committee of Quang Ngai province over the past time, the Party committees and authorities of Ly Son district have synchronously deployed many solutions to mobilize all local resources for tourism development. Awareness of tourism development benefits all levels, sectors, and people have been gradually raised, tourism infrastructure has been invested and developed with better quality. Many cultural and tourist activities were organized, especially the successful organization of Ly Son cultural and tourism week in 2018, 2019 with many unique and special activities; coordinated with the Department of Culture, Sports and Tourism to organize many national and international sports activities on the island district that have attracted a large number of domestic and foreign tourists. The model of community tourism and the development of new tourism products based on exploiting the district's potential is encouraged to develop; Organizations and individuals at home and abroad are given favorable conditions to invest in building quality accommodation facilities to meet the needs of tourists. As a result, tourism activities in the Ly Son district have prospered.

The number of tourists visiting is increasing day by day.

Table 1. Tourists to Ly Son, period 2015 – 2020

(Unit: Hits)

	2015	2016	2017	2018	2019	2020
Total visitor	95.000	164.900	206.000	230.320	265.000	290.000

Source: Report of the Department of Culture and Information on tourism development in Ly Son district from 2017 to 2022

The statistics in Table 1 show that the average increase rate of tourists to Ly Son is 25.0%/year with the total number of visitors in 2020 estimated at 290,000 people, increasing 3.05 times compared to 2015. It is noteworthy that at this stage in 2016 there was a strong breakthrough in the tourism industry in Ly Son district, welcoming 164,900 visitors, an increase of 1.74 times compared to 2015.

Tourism revenue is more and more increasing.

Table 2. Total tourism revenue in Ly Son district, period 2015 - 2020

Unit: billion

	2015	2016	2017	2018	2019	2020
Total visitor	114,00	179,82	323,15	276,13	317,00	435,00

Source: Statistical report of the Department of Culture and Information of Ly Son district

The statistics in Table 2, showed that the average growth rate of tourism revenue in the Ly Son district is 30.7%/year the total revenue in 2020 is estimated at 435.00 billion VND, 3.81 times higher than compared the previous year to 2015. It is noteworthy that 2017 saw a strong breakthrough in the revenue of the tourism industry in Ly Son district, with VND 323.15.82 billion, an increase of 2.83 times compared to 2015.

The continuous increase in total tourism revenue in Ly Son over the years is a clear demonstration of the logic of the increase in the number of visitors to visit and travel. On the one hand, this is creating conditions for Ly Son district to continue affirming its tourism brand with domestic and international tourists. On the other hand, making an important contribution to promoting growth and economic restructuring towards quality and sustainability.

3.2.2. Impact of the Covid-19 pandemic on tourism activities in Ly Son district, Quang Ngai province

As a paradise in the middle of the sea, Ly Son, where is many historical - cultural relics and valuable landscapes, has long been chosen by many domestic and international tourists to visit and experience.

At the beginning of 2021, the Covid-19 pandemic broke out again, causing the tourism market and tourism service activities in many localities throughout the country to be stalled, and broken, the whole industry did not meet the target and deviated from the development trajectory. However, during this time, in the Ly Son district, the Covid-19 pandemic has not yet appeared, taking advantage of that, Quang Ngai province has a document allowing domestic tourists to visit Ly Son to visit and experience. Due to the complicated development of the epidemic situation, plus the fear of tourists when leaving the residence, the number of visitors to Ly Son during this time did not meet expectations.

As of October 30, 2021, although Ly Son district has not had any cases of Covid-19 infection in the community, the situation of the Covid-19 epidemic across the country in general and Quang Ngai province in particular is complicated and has many positive cases of Covid - 19 in the community continuously. Facing the complicated development of the pandemic, Quang Ngai province requested branches and localities throughout the province to step up the implementation of measures to prevent and control epidemics and diseases; at

the same time seriously implement the guiding documents and instructions of the Government, the Ministry of Health and the Central Steering Committee for Covid-19 Prevention and Control. Implementing the island's directive of the province, on August 9, 2021, to protect and prevent the Covid-19 pandemic from entering the island, Ly Son district proposed the People's Committee of Quang Ngai province allow the locality to temporarily stop welcoming guests. Travel until further notice. Accordingly, many tourism service activities such as hotels, restaurants, and eateries have to close; Sports activities to stimulate tourism such as the National Paragliding Tournament in 2021 - the tourism event positioning the Ly Son tourism brand cannot be held (these are the expected events that can attract a large number of tourists). tourist island, stimulating domestic and foreign tourism); motels, homestays stopped working,... most of the tourism workers fell into unemployment, life became difficult, Ly Son tourism was crippled and state budget revenue plummeted. Implementing the island's directive of the province, on August 9, 2021, to protect and prevent the Covid-19 pandemic from entering the island, Ly Son district proposed the People's Committee of Quang Ngai province allow the locality to temporarily stop welcoming guests. Travel until further notice. Accordingly, many tourism service activities such as hotels, restaurants, and eateries have to close; Sports activities to stimulate tourism such as the National Paragliding Tournament in 2021 - the tourism event positioning the Ly Son tourism brand cannot be held (these are the expected events that can attract a large number of tourists). tourist island, stimulating domestic and foreign tourism); motels, homestays stopped working,... most of the tourism workers fell into unemployment, life became difficult, Ly Son tourism was crippled and state budget revenue plummeted.

According to a report by the People's Committee of Ly Son district, in the first nine months of 2021, tourists to Ly Son for sightseeing and tourism decreased by nearly 34% compared to the same period in 2020 and by nearly 83% compared to 2019. From January 2021 to now, the Ly Son district has only welcomed nearly 39,000 visitors. This is the lowest number of visitors in the past 5 years. Revenue from the district's tourism, trade, and service industries in the first nine months of 2021 decreased by more than 60% compared to the same period in 2020. This has had a significant impact on the budget revenue of the Ly Son district.

4. Discussion and Conclusion

The Covid-19 pandemic has caused heavy damage to the tourism economy sector of the country in general and Quang Ngai province in particular, including the Ly Son district. In 2021, the number of visitors to Ly Son district decreased sharply compared to the same period last year. Moreover, revenue from the accommodation, food, and travel services also did not reach the plan. Units and businesses operating in the tourism sector were the most affected, leading to a halt in other fields.

However, the Ly Son district is considered a place with great potential for tourism development. The strategic objective of tourism development Ly Son island is to become one of the focal points of tourism in Quang Ngai, community-oriented. Need to promote the potential and advantages of tourism such as island, natural attractions, and historical and cultural relics. Therefore, for Ly Son district tourism to recover and develop after the Covid-19 pandemic soon, in my opinion, it is necessary to focus on implementing the following solutions:

Firstly, Quang Ngai Province and Ly Son district need to have breakthrough policies to promote tourism. Cooperating with event organizers, and travel agencies to promote the organization of festivals, seminars, and fam trip groups (travel to learn, get acquainted, and market) to a large number of domestic and international tourists

Secondly, Quang Ngai Province and Ly Son district soon plan to support tourism businesses and units to retrain human resources in the direction of ensuring standards and conditions to serve local tourism in new situation. Supporting service businesses to promote images, brands, and services,... to tourists in many forms on the mass media; link localities and businesses to build and develop new tourism products and services, tours, and tourist routes.

Thirdly, tourism businesses need to plan to adjust their operations and study the market needs to have suitable and quality tourism products.

Abstract

The main content of the study is to quantitatively measure the impact of the Covid-19 pandemic on the income of informal workers in Ha Noi. The research results show that after 2 years of being affected by the Covid-19 pandemic, the income of informal workers decreased by 48.56 million VND/year, which means each month the employee's income decreased from 1 to 2 million. In addition, the study found that seniority (working experience) has a negative effect on the income of informal workers in Ha Noi. From studying the current situation and influencing factors, the research team finds out the cause of the problem and proposes recommendations for each group of stakeholders.

Keywords: *Covid - 19, informal workers, income, Ha Noi.*

1. Introduction

The Covid-19 pandemic has a heavy impact on workers, especially in terms of income. According to the General Statistics Office, in the third quarter of 2021, the average income of employees decreased by 0.3 million VND compared to the second quarter of 2020. Meanwhile, the second quarter of 2020 recorded the average income of employees as the lowest level in the past 10 years. The sharp decline in economic activities is expected to have serious consequences for a large part of the population, workers, especially informal workers. Currently, in Ha Noi, about 30% of jobs in the informal sector are precarious jobs, more than 60% of jobs do not have labor contracts and nearly 95% are not entitled to social

insurance (Cling, 2009). Although the Ha Noi government has proposed solutions to comprehensively support difficult workers in the context of Covid-19 in the city, informal workers do not have legal protections and labor contracts, so they can hardly access supportive policies from local authorities. Therefore, the authors believe that at present, a research topic is urgently needed to further study the impact of the Pandemic on informal labor income; from there, propose recommendations to limit the impact of the Covid-19 pandemic to improve income as well as develop the life of informal workers in Ha Noi.

2. Literature Review

Topics on the Covid-19 pandemic, income and the impact of Covid-19 on the income of informal workers have been interesting to scientists in recent years. The studies are approached according to the following problem groups:

Studies on the effects of the Pandemic in general on the economy such as Susilawati & partners (2020), Akbulaev & partners (2020), AKM Mohsin & partners (2021),... According to the authors, most economic sectors All economies have been negatively affected by the Pandemic, especially from the Government's orders to close, restrict movement and social distance. However, in some research articles, Vietnam has shown that a few economic sectors or indicators are affected with little or no impact from this pandemic (Hoang Tuan Dung (2020), Dr. Nguyen. Hoai Nam (2021)).

Studies in 2020 on the impact of the Covid-19 pandemic on the income of the labor force such as Gregory Acs & Michael Karpman, Tobin Hanspal & c.s, Nguyen Thi Nham Tuat & c.s... all show that: employees may lose their jobs and experience a significant reduction in income amid the Pandemic. Besides, the research paper of Dong Thanh Mai & partners in 2021 gives the opposite conclusion: some employees do not have a decrease in income due to policies from the company and employment position; even their income increased due to the rapid response to the Pandemic.

Studies on the impact of the Covid-19 pandemic on the income of informal workers both at home and abroad have reached a relatively uniform conclusion: the income of the informal force has decreased significantly due to the pandemic. Covid-19 lasts for a long time (Martínez & partners (2020), Chen & partners (2021)), especially women are affected more clearly than men (M.net, 2021).

In addition, studies on methods of assessing the impact of Covid-19 such as Erik Cuevas (2020), Almeida & c.s (2021), Nguyen Trong Hien & Nguyen Quynh Mai (2021), etc. have used models and Methods are quite rich and diverse, specifically: agent-based model, linear regression model, EUROMOD micro model, etc.

The DID (Difference in Difference) method studies have been interested in and used by scientists for many years, such as Phan Thi Nu (2012), Justin B. Dimick & partners (2014), Elizabeth & partners (2014). This method is often applied when comparing and analyzing when assessing the change of new policies on different subjects.

Informal labor and influencing factors

✚ Informal Labor

In 1993, the ILO and UNSD agreed to define informal labor. Informal workers are defined as those who have informal jobs, specifically jobs without compulsory or non-compulsory social insurance, and do not own a labor contract with a term of three months or more. Agarwala (2018) defines informal workers (variously referred to as "precarious", "non-standard", "irregular" and "flexible") as outsiders standard employment relationships and are therefore not protected and not regulated by most employment laws. However, they will still be governed by the laws of the area in which they live and work such as housing, migration, crime, etc. Informal workers make up a large proportion of the labor market. However, according to the Minister of Labor (2020), informal workers are the most vulnerable, suffer the most risks, and have the most hardship, as well as the income and benefits are the fewest.

According to the General Statistics Office of Vietnam, the income of working employees is income from wages, salaries and other incomes of the same nature as salary, including overtime, bonuses, allowances, self-employment. business, etc. These incomes can be in cash or in kind.

✚ Factors affecting informal labor income

Internal factors of informal workers

Academic level

Education is seen as an investment in human capital (Sullivan and Wolla, 2017). According to human capital theory, Mincer (1958) emphasized education and training as the most significant variables affecting income. The study by Jati et al (2021) analyzed the factors affecting the income of informal sector workers, the results showed that the level of education has a positive impact on the income of the informal sector workers. Informal sector workers, the higher the education level, the higher the income.

Experience

Burki et al. (1991) show that work experience is one of the most important variables affecting the income of informal sector workers. The relationship between years of experience and income of informal sector workers is inverted U-shaped, meaning that earnings will increase when the amount of experience reaches a maximum, then income will decrease. gradually as experience increases, specifically the maximum point is 25 years. With the same survey on workers in the informal sector, Jati et al (2021) emphasize the positive impact of experience on income, the more experience, the higher the income.

Sex

According to the ILO Global Wage Report 2018/19, men are paid an average hourly wage around 16% more than women. Huyen and Ngan (2018) synthesized and analyzed the theories and reality of income disparity by gender in Vietnam. The results show that the income of women is still lower than that of men despite the same level of education, which may be due to the fact that women are not allowed to hold high positions in the business, or

they have to work in the household. family without being paid. Having the same results as the above study, Jati et al (2021) also show that gender has an impact on the income of informal sector workers, men have higher incomes than women.

Age

Most workers with relatively low income in a few jobs first, at the youngest age, have a higher income in middle age, then decrease again after good retirement. Therefore, a society with age diversity will have different income distribution (Gardiner & Hills, 1999; Taylor, 2012).

External factors

Policy

The policies to regulate wages are still weak, there is a lack of a legal framework to protect and protect income, especially informal workers, who are the target group of little attention. As a result, the income of informal workers is precarious, markedly lower than that of formal workers (ILO, 2018). Without an income security policy, no security policy is possible or meaningful (Unni, 2004).

Work environment

Lund et al. (2016) emphasized that groups of informal workers are larger and poorer than the average, have lower incomes, are more likely to work in unhealthy, toxic, unsafe environments. safety and limited access to health-related preventive knowledge. In addition, according to the ILO (2018), informal workers have a bad place to work, a large part of them have to do mobile work, so it also leads to unstable income.

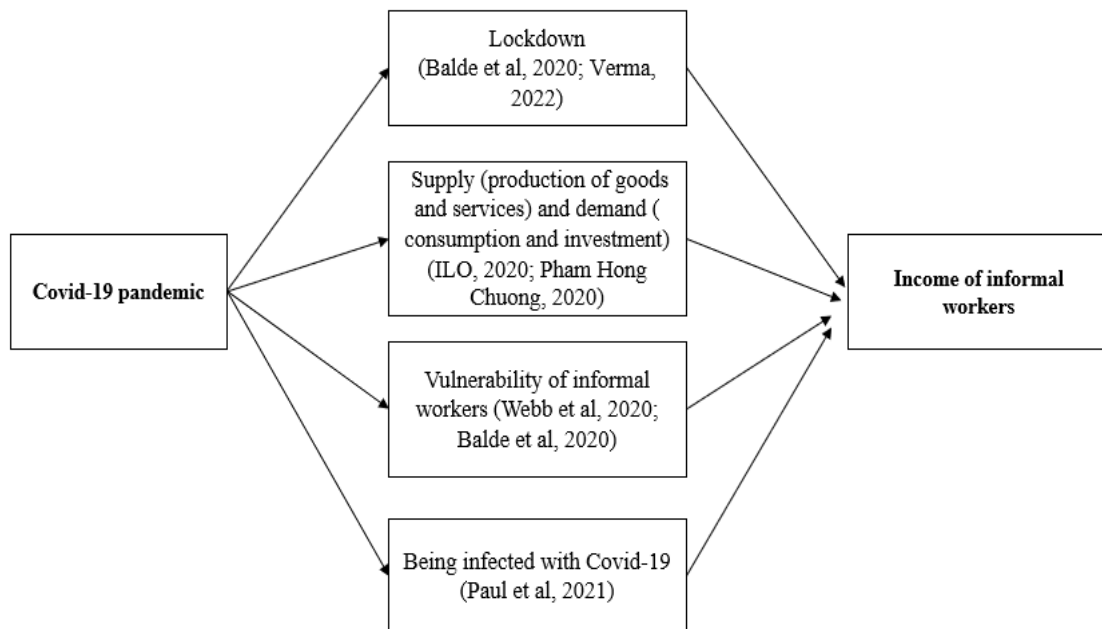

Figure 1. Model of business closures’s impact on informal workers’ incomes

Source: compiled by the research team

3. Method

3.1. Research models

3.1.1. Methods of constructing research models - DID methods

The DID method "difference in difference" is used in research to assess the impact of an economic policy, a new business strategy, etc.

This method is implemented by dividing the analyzed subjects into groups that apply the policy (participating group) and the group that does not apply the policy (comparison group - control group). These two groups must have similar characteristics at the time before the policy implementation. Apply the policy to the participating group and not the comparison group. If there is a difference in the degree of variation in output between these two groups, it is the effect of policy. This result reflects both the difference in time before and after the policy, as well as the cross-sectional difference between the participating and non-participating groups.

Figure 2. Graph depicting the DID method

Source: Suggested by the author team

3.1.2. Constructing research models

In the context and objective of this study, note the following three points:

The first, consider the impact of the Covid-19 pandemic as the impact of a policy.

The second, in order to deal with the problem of identifying groups not affected by the Covid-19 pandemic, the research technique applies econometric techniques - Forecasting (Approximate inference), based on data on income of employees in 2017, 2018, 2019 to forecast the scenario without the Covid-19 pandemic, take the income of the previous year plus the average amount of income change over each year to forecast for the next year.

The third, to ensure the research hypotheses, the study has selected control variables (playing the role of influence factors) to include in the model with the characteristics that these variables do not change under the influence of disease factor.

Therefore, determining the research model is the model that combines the DID method with array data regression.

The proposed research model is:

Includes:

+ D=1: Labor is affected by the pandemic; D=0: Labor is not affected.

+ T=1: Surveyed in 2021; T=0: Surveyed in 2019.

+ Z_{it} : Control variables include: Education level, seniority of work, time worked in the year, residence, type of employment, origin of workers, economic role of workers in the household family, family economic situation.

Table 1. Summary of the difference-in-difference method

	Average annual income of informal workers (Y_{it})		
	2019	2021	Different
Comparison group (Unaffected)	$\beta_0 + \beta_4 \times Z_{it}$	$\beta_0 + \beta_1 + \beta_4 \times Z_{it}$	β_1
Participating group (affected)	$\beta_0 + \beta_2 + \beta_4 \times Z_{it}$	$\beta_0 + \beta_1 + \beta_2 + \beta_3 + \beta_4 \times Z_{it}$	$\beta_1 + \beta_3$
Difference in difference			β_3

Source: compiled by the research team

3.2. Research methods

3.2.1. Data collection methods

Research data was collected through 2 sources:

+ *Primary data source*: Direct survey with survey respondents who are informal workers working in Ha Noi.

+ *Secondary data sources*: Information collected through books, informational websites, official data and related research articles, etc.

3.2.2. Sample selection methods

The subjects of the survey are informal workers such as street vendors, sidewalk car repairers, motorbike taxi drivers, freight forwarders, sidewalk barbers, etc., who are working in Ha Noi.

In the study, the selected sites are 13 districts of Ha Noi city, including Ba Dinh, Cau Giay, Dong Anh, Ha Dong, Gia Lam, Hai Ba Trung, Hoai Duc, Hoan Kiem, Hoang Mai, Long Bien, Thanh Xuan, Tay Ho, Tu Liem. Time to collect and enter data: 11/1/2021-

7/3/2022. The number of valid survey sheet collected was 223, which were included in the data analysis and reached 100% of the total number of survey sheet collected.

3.2.3. Data analysis methods

Research and analyze data using STATA software combined with data processing on Microsoft Excel 2017.

Data encryption and Data cleaning

The study was carried out through re-selection of necessary data and coding to facilitate data processing. Qualitative variables will be set according to dummy variables to apply to the model.

OLS Model (Pool OLS)

The regression model is:

After having the estimation results, it is necessary to perform a number of tests such as Multicollinearity test, Heteroscedasticity tests. If the model has heteroscedasticity, it should be estimated according to the fixed effects model FEM and random effects model REM.

Fixed effects model (FEM)

The fixed effects model is an extension of the traditional linear regression model. In which, the residual is separated into 2 parts: The regression model is:

Random effects model (REM)

The REM model is an extension of the FEM model. The residual is separated into 2 parts: So the residual is now rewritten as: The regression model is:

Hausman Test

To consider the more suitable FEM or REM model, we use Hausman test.

If the P Value < 0.05 , we reject H_0 , then ϵ_i and the independent variable are correlated and we use the fixed effects model (FEM) and vice versa.

Breusch-Pagan Test [HY1]

Continue to test the model's heteroscedasticity through the Breusch-Pagan test.

If the P_value > 0.05 , we accept H_0 , then the model has a defect that is heteroscedasticity and vice versa.

If the model has heteroscedasticity, continue to use the GLS estimation method.

FGLS Model

Then check the fit of the FGLS model and compare it with the above 3 models.

4. Results

Through the comparison table of the tested models, it is found that the FGLS model is the best and ensures the estimation requirements, without heteroscedasticity. Therefore, this study will use this model for analysis.

Regression results for the coefficient of the variable TD is -48.52, indicating that the impact of the Covid-19 Pandemic in 2 years (representing the "difference in difference" of the model) has reduced the average annual income of employees by 48.52 million VND,

provided that other factors remain unchanged. Thus, it can be seen that the impact of the Covid-19 Pandemic is not small on the income of informal workers.

After performing the necessary tests, the results of the regression analysis gave the following results: with the significance level $\alpha=5\%$, there are 9 factors affecting the dependent variable is the 1-year income of informal workers in the context of the Covid-19 pandemic, including: (1) Covid pandemic; (2) Education level; (3) Working years; (4) Place of residence; (5) Labor role; (6) Economic circumstances; (7) Working time; (8) Age; (9) Gender. Accordingly, the variable representing the impact of the pandemic (TxD) is the variable that has the strongest impact on the income of informal workers (Beta=48.52), and among the control variables, the variable representing the level of education reaching the upper secondary level (LEARN3) has the strongest impact on income (Beta=30.31).

Table 2. Hypothesis test results

Hypothesis	Test results	Regression coefficients
H1: The Covid pandemic has had a <i>negative impact</i> on the income of informal workers in Ha Noi.	Accepted	- 48,56 (TD)
H2: Working seniority has a <i>positive impact</i> on the income of informal workers in Ha Noi.	Rejected	-7,71 (EX3)
H3: Men who are informal workers have <i>higher incomes</i> than women who are informal workers in Ha Noi.	Accepted	4,04 (SEX)
H4: High level of education has a <i>positive impact</i> on the income of informal workers in Ha Noi.	Accepted	23,36 (LEARN1) 30,31 (LEARN2) 18,50 (LEARN3)
H5: Age has a <i>negative impact</i> on the income of informal workers in Ha Noi.	Accepted	-4,68 (AGE1)
H6: Informal workers from Hanoi have <i>higher incomes</i> than informal workers from other provinces in Ha Noi.	Rejected	No statistical significance
H7: Working time has a <i>positive impact</i> on the income of informal workers in Ha Noi.	Accepted	34,09 (TIME)
H8: Difficult circumstance has a <i>negative impact</i> on the income of informal workers in Ha Noi.	Accepted	12,59 (CIRCUM)
H9: The role of family labor has a <i>positive impact</i> on the income of informal workers in Ha Noi.	Accepted	28,22 (MAIN)

Source: Results of data analysis

With the proven hypothesis H1, the Covid-19 pandemic has a negative impact on the income of informal workers in Ha Noi. The explanation for this comes from two main groups of reasons: unskilled workers, contracts as well as protection commitments leading to easy dismissal, and other important factors such as social distancing orders, employees. unable to go to work normally, the change in people's consumption habits makes it difficult for workers in the production and trade groups.

The hypothesis H2 shows that people with less than 15 years of service life have no difference in their income, while informal workers with more than 15 years of seniority have a different income. lower than the group under 15 years. This can be explained by the fact that informal workers have low skill levels and the jobs they do often do not require too many qualifications, many years of experience does not mean improving skills, even is even backward due to not keeping up with the changes of the economy.

Hypothesis H3 means that men who are informal workers have higher income than women who are informal workers. This may be due to the nature of the employment of the majority of female workers, which is usually lighter than that of men, so there is a difference in the remuneration of men and women.

The accepted hypothesis H4 shows that the higher the education level, the higher the income level, especially for informal workers, the access to high school level brings them higher income. 30.31 million VND/person compared to primary level, higher than the other 2 levels

Hypothesis H5 shows that the group of people from 36 to 54 years old usually have a lower income than the group of people under 35 years old and over 55 years old. This is because between the ages of 36 and 54, workers are often no longer in good health as when they were 18 to 35 years old when they were young, and they also tend to look for formal jobs to stabilize the economy. family, stabilize life, but not everyone has the ability to enter the official labor market due to many reasons such as skills, qualifications, health, and age.

Hypothesis H6 was rejected. As the results show, the coefficient of the FROM measure representing the origin of the workers is not significant, so it can be seen that whether the workers are from Ha Noi or from other provinces and cities. they all face the same difficulties and barriers when participating in this informal labor market, which makes the incomes of the two groups not different.

Hypothesis H7 shows that the length of time employees work in a year has a positive effect on their average 1-year income. This can be easily understood because time is also one of the factors to determine the remuneration that an employee can receive. And this positive relationship is also the reason why during the pandemic period, when workers can't go to work, the income of informal workers decreases.

Hypothesis H8 shows that people with difficult circumstances have an average annual income of 12.12 million VND lower than those with good average economic circumstances.

This is because households with difficult circumstances still lack opportunities to access vocational training programs, in addition, disadvantaged families are accompanied by many things such as sick relatives, illness, making employees' time even more narrow.

Hypothesis H9 shows that informal workers who act as the main breadwinner in the family have a higher income of 16.15 million/year than the other group. The reason is also because the financial burden of the whole family rests on the shoulders of workers, making them work harder and harder with a desire to help their families have a more stable life.

5. Discussion and Conclusion

5.1. Discussion

The income of informal workers in the context of Covid - 19 has been heavily affected by many subjective and objective factors. From the research results, the research team has some recommendations to the Government in general, Ha Noi city in particular and to informal workers.

In the short term, the government needs to streamline the process of supporting informal workers, avoiding cumbersome procedures that make it difficult for those in need. Quickly conduct surveys to collect data on the status of informal workers, from which there are evaluation criteria for support as well as appropriate levels of support for each affected object. Informal workers also need to have savings, participate in insurance programs to receive support when there is an event in the most complete and fastest way.

In the medium and long term, the Government needs to establish a database on informal workers that is updated regularly at each level of government, helping to understand information about this subject. Accelerating completion of digital transformation, building e-government to help the coordination between levels become smoothest and fastest. It is necessary to create scenarios to deal with major events, to avoid unexpected situations. And above all, improving the quality of education, improving the qualifications of workers helps them increase their income and suffer less negative impacts.

5.2. Conclusion

The Covid-19 pandemic has brought many negative effects to the world economy in general and Vietnam in particular. One of the subjects most affected by this pandemic is the group of informal workers. They account for most of the labor force in Vietnam, but they have not yet received the necessary and timely attention and support from the government. This happens due to many objective and subjective factors coming from the government and informal workers. Realizing that there are still not many studies targeting this object in Vietnam and especially in Ha Noi as well as previous studies that are not really comprehensive, the research team decided to carry out the topic "The impact of the Covid-19 pandemic on the income of informal workers in Ha Noi" and achieved the following results:

The first, Unify the concept of informal labor, clarify the current context as well as related factors affecting the income of this group in the context of the Pandemic.

The second, properly assess the role of the target group in the Vietnamese economy as well as the measures that have been and are being applied by the Governments of other countries to help overcome the impact of the Covid-19 pandemic on the target group. .

The third, objectively analyze the effectiveness of the Government's policies, thereby giving appropriate solutions and recommendations to overcome the inadequacies in them.

Abstract

The Covid 19 pandemic has entered its third year, the effects of the pandemic on the global socio-economic have also been recognized more and more clearly. For international investment activities, the covid 19 pandemic can be said to be a "shock" causing global FDI flows to drop sharply in 2020, when the pandemic broke out. Entering 2021, global FDI inflows have witnessed a strong recovery, with an increase of 77% compared to 2020 and an increase of 11.3% compared to before the pandemic (in 2019). With a highly open economy like Vietnam, FDI inflows have become one of the main growth drivers of the economy. The article will evaluate the current situation of global FDI inflows in the period of 2020-2021 as well as the status of Vietnam's FDI attraction in the same period. On that basis, the authors propose some recommendations to increase the FDI inflows in Vietnam in the upcoming time.

Keywords: *FDI, covid 19, Vietnam, FDI, new normal*

1. Introduction

In the context of integration, FDI inflows have increasingly affirmed their role as the main growth engine for the Vietnamese economy. With a strategic geopolitical position in ASEAN - one of the dynamic regions with the fastest economic growth in the world, Vietnam has become a bright spot in the region in terms of attracting FDI. According to UNCTAD (2021), Vietnam ranks 6th in Asia in terms of FDI attraction. However, with the emergence and outbreak of the COVID-19 pandemic from the end of 2019 until now, global FDI inflows have witnessed a sharp decline. For Vietnam, the COVID-19 pandemic also negatively affects the supply chain and workforce in FDI enterprises. However, entering 2022, the amount of FDI attracted has shown signs of recovery and improvement. This article assesses the current situation of FDI in Vietnam and the global FDI during the 2020-2021 period. Based on these assessments, the authors propose a number of policy recommendations to "turn risks into opportunities" and anticipate a new wave of FDI into Vietnam.

2. Method

Based on the data collected from UNCTAD and Foreign Investment Agency (Ministry of Planning and Investment, Vietnam), the authors use qualitative analysis to evaluate the current situation of global FDI and FDI in Vietnam during the corona period.

The assessments show a significant impact of covid 19 on the global FDI as well as FDI in Vietnam.

3. Results

Regarding the global FDI trends, it can be said that the Covid 19 pandemic has created many big "shocks" for the global economy. Most countries had negative growth in 2020; the global supply chain has suffered an intermission, and the trend of protectionism and regionalization is returning. These adverse factors with unpredictable developments of the pandemic have caused a sharp plunge in global FDI. According to UNCTAD's 2021 investment report, global FDI collapsed in 2020, falling by 42% to about \$859 billion, from a 2019 value of \$1.54 trillion. FDI at the end of 2020 is 30% lower than the bottom after the global financial crisis in 2008. The Covid-19 pandemic is a supply, demand and policy shock for attracting FDI inflows. Policies taken by governments during the crisis, including new investment restrictions and the closure of international trade, and restrictions on labor mobility to prevent the spread of the disease, have impacted negative on global FDI flows. The disruption of the supply chain has caused some key industries of the world to fall into a state of loss, especially the auto industries (-44%), aviation (-42%), new investment activities (Greenfield), cross-border mergers and acquisitions (M&A) activities all decreased by more than 50% in the first months of 2020 compared to 2019.

Although COVID-19 has a severe worldwide impact, the size of the impact varies by region. Developing economies are projected to experience the steepest declines in FDI as these countries rely heavily on the mining, manufacturing, and global value chains (GVC) industries – sectors areas seriously affected by the covid 19 pandemic; and these countries cannot have the same strong economic support measures as developed countries.

Based on UNCTAD 2021, global FDI inflows recorded a strong and comprehensive decline in 2020. Developing countries, transition countries and especially developed countries all experienced a sharp decline in FDI attraction. Specifically, FDI inflows into developed countries fell by 69% in value, the sharpest decline since the 1997-1998 global financial crisis. Of the total \$630 billion in declines globally, nearly 80% were in developed countries. With an estimated US\$229 billion, FDI inflows into developed countries are only one-third of what they were after the 1997-1998 global financial crisis. Entering 2021, global FDI capital showed a strong growth again to an estimated 1.65 trillion, an increase of about 77% compared to 2020, 11.3% compared to 2019 – the time before the pandemic broke out. Developed economies experienced the strongest growth, with foreign direct investment (FDI) estimated to reach \$777 billion in 2021 - three times the record low in 2020. Meanwhile, FDI inflows into developing economies also increased by 30% to nearly \$870 billion, with growth rates in East and Southeast Asia of 20%. Latin America and the Caribbean, and Africa also saw a return to growth in FDI inflows, but in general, the increase was modest and did not reach the scale before the pandemic broke out.

Regarding FDI attraction in Vietnam, starting in early 2020, the Covid-19 pandemic has severely affected the world economy and Vietnam is no exception. In 2020, FDI into Vietnam only reached 28.53 billion USD, down 25% compared to the same period last year. By 2021, the total registered FDI capital increased by 9.2% compared to 2020, reaching 31.2 billion USD. This is a relatively low increase compared to the increase in global FDI inflows of 77%. In 2020, foreign direct investment projects disbursed USD 19.98 billion, equaling 98% over the same period in 2019, and the total newly and adjusted registered capital reached USD 28.53 billion, equaling 75% over the same period last year, 2019. In 2021, the total FDI registered capital in Vietnam reached 31.15 billion USD, equal to 109.2 % compared to 2020. The amount of FDI registered capital increased sharply, reaching over 9 billion USD, equal to 140.5% compared to 2020. This is considered a positive sign of recovery for attracting FDI into Vietnam after Covid-19.

Regarding FDI by sectors, in 2020, the processing and manufacturing industry was the field that attracts the most attention from foreign investors with 800 newly granted projects, 680 projects of adjusted investment capital, with a total capital of 13,601 billion USD, accounting for 47.67% of total investment capital. The field of electricity, gas, and steam production and distribution ranked the second with USD 5.1426 billion, accounting for 18.03% of total investment capital. The real estate business ranked the third with 4.18 billion USD, accounting for 14.67% of total investment capital. In general, processing and manufacturing industry, real estate business, electricity production and distribution, accommodation and food services, etc are the industries that attract the most FDI.

Figure 1. Structure of FDI in 2020 by sectors

Source: Foreign Investment Agency (Ministry of Planning and Investment)

In 2021, foreign investors invested in 18 out of 21 economic sectors. Which, the processing and manufacturing industry led the way with a total investment of over 18.1 billion USD, accounting for 58.2% of the total registered investment capital. Although the electricity production and distribution industry has attracted a small number of new projects, adjustments, and purchases of contributed capital, it has a large-scale project and ranked the second with a total investment of over 5.7 billion. USD, accounting for 18.3% of total registered investment capital. Followed by the real estate; wholesale and retail with a total registered capital of over 2.6 billion USD and over 1.4 billion USD respectively.

Figure 2. Structure of FDI in 2021 by sectors

Source: Foreign Investment Agency (Ministry of Planning and Investment)

Regarding FDI by regions, in 2020, foreign investors invested in 60 provinces and cities across the country. Ho Chi Minh City took the lead with a total registered capital of 4.36 billion USD, accounting for 15.3% of total investment capital. Bac Lieu ranked the second with a large project with investment capital of 4 billion USD, accounting for 14% of total registered investment capital. Hanoi ranked the third with nearly 3.6 billion USD, accounting for 12.6% of total investment capital. Following are Ba Ria - Vung Tau, Binh Duong, Hai Phong, etc. In terms of the number of new projects, Ho Chi Minh City was still the leading city (950 projects); Hanoi ranked the second (496 projects); Bac Ninh ranked the third (153 projects),....

In 2021, foreign investors invested in 59 provinces and cities across the country. Hai Phong took the lead in the whole year with a total registered investment capital of over 5.26 billion USD, accounting for 16.9% of total registered investment capital and nearly 3.5 times

higher than the same period in 2020. There are many other FDI enterprises that continued to increase capital in Hai Phong such as Regina Miracle International Vietnam Co., Ltd. in VSIP Industrial Park increased capital by 100 million USD; Flat Vietnam Co., Ltd in Dinh Vu Industrial Park increased capital by 75 million USD.

Long An ranked the second with over 3.84 billion USD registered capital, accounting for 12.3% of the total investment capital of the country. Ho Chi Minh City ranked the third with nearly 3.74 billion USD, accounting for nearly 12% of total investment capital, followed by Binh Duong, Bac Ninh, Hanoi, ...

The top 10 in terms of FDI attraction in 2021 are: Hai Phong, Long An, Ho Chi Minh City, Binh Duong, Bac Ninh, Hanoi, Dong Nai, Can Tho, Bac Giang, and Quang Ninh. Among the above, we must especially mention Bac Ninh and Bac Giang, which are the two epidemic centers of the 4th outbreak. Thanks to the efforts in disease control, overcoming difficulties and deploying many suitable solutions, these two localities have become bright spots in attracting FDI in 2021. It can be seen that in the top 10 localities attracting FDI, there are 5 localities in the North and 5 localities in the South. This is a good sign that FDI inflows have had relatively wide spillover effects throughout the country. Before 2012, FDI inflows were mainly concentrated in the southern region with leading localities such as Binh Duong, Ho Chi Minh City, etc. In Ho Chi Minh, Dong Nai, Ba Ria Vung Tau, etc. However, in recent 10 years, FDI inflows have had a spillover effect both in the southern region and the northern key economic region. However, the Central and Highlands areas are still relatively slow in attracting FDI. Typically, it can be mentioned that Da Nang, and Quang Nam, which are all localities with vibrant economic activities, but ranked in FDI attraction is quite low, not commensurate with their potential: Quang Nam ranked 17th while Da Nang only ranked 19th on the ranking of FDI attraction by location. On the other hand, the structure of FDI by regions and localities is still unbalanced. FDI projects are concentrated mainly in regions with favorable conditions such as the Southeast region, the Red River Delta, and some large provinces and cities with a high level of socio-economic development. From 2020 through 2021, several provinces and cities do not have new FDI projects, such as Gia Lai, Bac Kan, Ha Giang, Dien Bien, Lai Chau... As can be seen, these are mainly provinces and cities in Northern midlands and mountainous regions.

Regarding FDI by investment countries, 112 countries and territories invested in Vietnam in 2020. Singapore led with a total investment of nearly 9 billion USD, accounting for 31.5% of total investment capital in Vietnam; Korea ranked the second with total investment capital of over 3.9 billion USD, accounting for 13.8% of total investment capital. China ranked the third with a total registered investment capital of 2.46 billion USD, accounting for 8.6% of total investment capital. Followed by Japan, Taiwan, and Hong Kong.

In 2021, there were 106 countries and territories invested in Vietnam. Singapore leads with a total investment of over 10.7 billion USD, accounting for 34.4% of total investment capital in Vietnam, up 19.1% over the same period in 2020; Korea ranked the

second with nearly 5 billion USD, accounting for 15.9% of total investment capital, up 25.4% over the same period. Japan ranked the third with a total registered investment capital of nearly 3.9 billion USD, accounting for 12.5% of total investment capital, up 64.6% over the same period. Followed by China, Hong Kong, and Taiwan.

Thus, in recent years, Singapore, South Korea, and Japan are the three largest investors in Vietnam, with the total FDI capital from these three countries usually accounting for about 50%-65% of the total registered FDI. Notably, recently, FDI inflows of Chinese enterprises have shown signs of strong growth. If in the period 2011-2019, China's FDI inflows only accounted for about 4%-6% of total FDI inflows into Vietnam, then in 2020 and 2021, China's FDI inflows accounted for 8.6% and 9.38% of total registered investment capital in Vietnam, respectively. This is a situation that must be cautious about because FDI inflows from China are often associated with problems of environmental pollution, bad working conditions, and other negative issues.

Figure 3. FDI into Vietnam in 2021 by investment countries

Source: Foreign Investment Agency (Ministry of Planning and Investment)

Regarding FDI by the forms of investment, in 2020, the number of foreign investment projects with economic concentration activities in joint ventures and transfers into our country was 350 projects with a total capital of 2,034,531,431.31 USD. Projects were mainly in joint ventures (accounting for 74.57%), and the rest is 100% foreign capital (25.43%). In 2021, the number of projects was 294 (down 15% compared to 2020) with a total capital of

7,508,152,819.52 USD (increasing more than three times compared to 2020). Joint venture projects accounted for 64.29%; 100% foreign capital accounts for 35.71%. In fact, in the period 2011-2019, FDI projects were implemented mainly in the form of enterprises with 100% foreign capital (about over 70% of projects); meanwhile, joint venture projects only accounted for about 20%-25% in the period 2011-2019. Thus, it can be seen the shift in investment form from 100% foreign-owned enterprises to joint-venture enterprises in the past ten years. This is a good sign as with the increase in the number of joint venture enterprises is the transfer of advanced technology and high-quality human resources in FDI enterprises.

Figure 4. FDI into Vietnam in 2021 by the forms of investment

4. Discussion and Conclusion

Despite being heavily affected by the Covid-19 pandemic in the period 2020-2021, Vietnam still has optimistic signals to boost FDI attraction in the coming time. With the Government's drastic and synchronous measures such as tax exemption and reduction, timely support for businesses and employees, and ensuring the realization of the dual goals of anti-epidemic and production development, Vietnam is still a bright spot in attracting FDI of the world not only in Asia but around the world in the context of the pandemic. In addition, with the advantage of geographical location, a golden population structure with nearly 70% of the population of working age, the Government's initiative and activeness in signing a series of free trade agreements and new models such as EVFTA (2020), CPTPP (2018), RCEP (2020), and bilateral agreements like UKVFTA (2020), it can be said that Vietnam has succeeded in the strategy of "building nests to welcome eagles",

creating opportunities a solid base to continue to attract FDI in the upcoming time. With the profoundly changing of the world economic, social, and political context and the consequences brought by the COVID-19 pandemic, the attraction of FDI in Vietnam in the upcoming time requires strategic and political adjustments. Therefore, the authors propose the following recommendations:

Firstly, the world economy is operating in the context of the implementation of the fourth industrial revolution and the digital economy. Therefore, policies to attract FDI need to select and prioritize foreign investors and large multinational corporations who take the lead in applying technology from advanced countries to prevent pervasive FDI attraction as in the past. Vietnam is now in the group of middle-income countries, so in order for Vietnam's economy to develop quickly and sustainably based on selective FDI attraction, pay special attention to building and strengthening the economy, building knowledge and business cultures; training and employing a capable and responsible team to attract FDI, and at the same time building and implementing strong enough sanctions to prevent self-interest in FDI attraction implementation.

Secondly, economic recovery after the pandemic will require significant resources, and FDI inflow is one of those vital resources. Therefore, the Vietnamese government needs to review and supplement regulations and conditions to attract, maintain and screen effective investments that are more important than attracting FDI to maximize economic growth. It is necessary to have a perspective that the crisis caused by the pandemic is an opportunity for the government to re-examine its method of effectively attracting and maintaining FDI projects for the country's industrialization process and at the same time creating economic linkages between the FDI sector and the domestic economic sector. To do this, the Government need urgently come up with solutions and methods to support the domestic business sector to overcome difficulties in finding product consumption markets and importing markets for raw materials used for production and support shipping fees, warehousing... It is necessary to build a quality certification system that meets the standards of participation in the supply chain of foreign companies and improve the digital infrastructure that allows businesses to operate remotely along the global value chain and reach out to foreign markets. At the same time, amend regulations on industrial areas and processing zones so that the business community in these zones can connect economically, especially by creating a link between the FDI sector and the domestic economic sector to build and develop supporting industries in the country.

Thirdly, it is necessary to step up the propaganda and dissemination of commitments and agreements that Vietnam participates to each industry, each locality, business, and people so that relevant entities can effectively implement these commitments. Investment and trade policies need to comply with Vietnam's conditions and not conflict with commitments in FTAs to which Vietnam is a member. Promote the role of associations in providing information and advice to enterprises on business law and knowledge on international economic integration; promote the role of Vietnam's diplomatic missions

abroad, as a bridge to provide information, to organize conferences to promote investment of Vietnam in foreign markets.

Fourthly, develop and synchronize supporting industries to identify auxiliary industries in line with the Vietnam Industrial Development Strategy, ensure the effectiveness of policy implementation, and improve the competitiveness of Vietnamese industries in the context of integration. The impact of the Covid-19 epidemic on the supply for domestic manufacturing industries clearly shows one of the biggest weaknesses of the Vietnamese economy: the internal resources of the manufacturing industries are limited, depending heavily on the foreign supply chains; the supporting industry is underdeveloped, which means it is not autonomous in terms of production inputs. Therefore, it is necessary to form and develop domestic value chains by attracting effective investment and promoting business connections between Vietnamese enterprises and multinational enterprises, local and abroad manufacturing, and assembly companies.

Last but not least, it is necessary to diversify supply sources and reduce dependence on China, especially for inputs in the textile, garment, and footwear industries to ensure supply chain stability in the context of China's economy being volatile and the Chinese government implementing the Zero Covid policy. In recent years, China holds the leading position in supplying raw materials for production to Vietnam. Especially, the textile and garment industry is too dependent on imported fabrics from China. Therefore, as there is a problem with the source of raw materials on the Chinese side, it will immediately affect the production of goods and services in Vietnam. A typical example is China's Shenzhen warehouse, which was blocked at the end of January due to the COVID-19 epidemic, which has severely affected many Vietnamese businesses. Therefore, it is required that enterprises take the initiative in finding new markets, reduce dependence on China for both output and import of raw materials and auxiliary materials, to avoid long-term impacts. At the same time, the Government also needs to strengthen trade promotion activities in the direction of diversifying the import market of raw materials such as fabrics, textile raw materials, footwear, pesticide raw materials, iron, and steel as well as catalysts export goods such as vegetables, fruits, rubber, rice...

Abstract

Online learning has been making a huge contribution to the quality of university's education, significantly affecting student learning outcomes during the Covid-19 pandemic. The study was conducted to identify the factors affecting the learning outcomes of students majoring in Accounting & Auditing by means of online learning. Thereby providing solutions to enhance the quality of education with high efficiency, contributing positively to the decisions related to online teaching of educators and administrators. The authors used quantitative analysis, regression model analysis and other analytical tools using SPSS 23.0 software. The research sample was collected from 352 survey questionnaires conducted by students majoring in Accounting & Auditing in Vietnam. The results of the model show that the students' performance in online learning is affected by 07 factors in descending order, respectively (i) Course design, (ii) Impact of COVID-19, (iii) Competency of lecturers, (iv) Characteristics of learners, (v) Perceived Ease of Use, (vi) Perceived Usefulness and (vii) Course content.

Keywords: *Covid-19 pandemic, E-learning, Learning outcomes*

1. Introduction

The worldwide COVID-19 pandemic is spreading with extremely unpredictable developments, causing a series of great disturbances, and at the same time causing countries to face difficulties in maintaining economic, political, and social stability. One of the areas most affected in Vietnam is education when students cannot directly go to school to study.

The COVID-19 pandemic has forced universities in Vietnam to quickly apply online learning, continuing the educational process instead of face-to-face learning activities in the classroom to stabilize their learning process. As Vietnam is a low-and-middle-income country, with unequal access to technology across the country, online education, in general, is still unfamiliar and challenging for both teachers and students. Delivering content, knowledge, and assessing student learning with an online learning system are complex processes.

Up to now, the amount of information along with research topics on the current situation, advantages or disadvantages, and students' evaluations of online education is still quite limited. Moreover, the amount of available information mainly focuses on the context when the world has not had a pandemic, there is a lack of research on the direction or extent of the impact of the COVID-19 pandemic on learning outcomes, especially for training in Accounting & Auditing.

Numerous studies have demonstrated that technology plays an integral role in the Accounting curriculum. Kotb et al (2019) argue that the technology element represents an essential aspect that needs to be addressed in the Accounting curriculum to address changes in the market and promote the employability of graduates. Most Accounting & Auditing students appreciate the curriculum when it comes to using technology and online learning systems to assess learning outcomes (Helfaya, 2019). Furthermore, accounting students' perception of academic performance is improved by online exams (Aisbitt & Sangster, 2005). However, when the COVID-19 pandemic appeared, accounting and auditing training also faced certain difficulties.

Therefore, the article aims to research and identify factors affecting learning outcomes by online learning during the COVID-19 pandemic of students majoring in Accounting & Auditing. Thereby assessing the influence of each factor and making recommendations to improve the effectiveness of online learning for accounting and auditing students in Vietnam.

2. Literature Review

2.1. Theory of factors affecting student learning outcomes

Dickie's application model (1999)

In the applied model of Dickie (1999), the factors affecting learning outcomes are Family characteristics, Learner characteristics, and Learners' thinking ability. From there, it can be seen that student learning outcomes are influenced by three main groups of factors, which are family, school, and themselves. These three factors are closely related to each other and affect students' learning outcomes.

Bratti and Stapolani's application model (2002)

Learner's attitude is the main factor affecting students' learning outcomes, as determined by the applied model of Bratti and Staffolani (2002). The main reason given is that students can have complete autonomy and initiative in their learning, thereby making decisions in the most effective way to achieve the best learning results. Therefore, learning outcomes are greatly influenced by the attitudes, or characteristics of learners.

This model points out that learner characteristics are the only factor and have the strongest influence on learning outcomes, focusing on self-study as well as learners' attitudes. Therefore, the limitation of this model is that it does not focus on external factors, while those factors also have a great impact on students' learning outcomes, especially the results of online learning during the pandemic.

The research scope of the two models introduced above is very different. From these two models, it can be said that this is the premise for the author's team to select the factors that affect the results of students' online learning during the COVID-19 pandemic, specifically students majoring in Accounting and Auditing.

2.2. Literature review and research hypothesis development

Perceived ease of use and online learning outcomes

Perceived Ease of Use is a concept used to assess the extent to which an individual considers that it will not take too much effort in the process of adopting an online form of learning (Davis, 1989). Online learning platforms are designed with the purpose of sharing and learning knowledge. Today, in a globalized world, the use of technology for knowledge acquisition, information gathering and learning has become a daily necessity (Bakhuizen, 2012). These resources are easy to use and accessible, facilitating the knowledge-sharing process. Ease of use, accessibility and transfer speeds of online media and mobile devices are an integral and very important part of the learning process, which has been shown and demonstrated in experiments. The increased adaptability of online learning is due to easier access, which in turn leads to positive outcomes (Salloum et al., 2020). The link between technology adoption having a positive influence on learning outcomes by e-learning has been demonstrated in several scientific works (Mbarek & Zaddem, 2013; Pham, Q., & Huynh). , M., 2018) based on Davis' TAM technology acceptance model (Davis, 1989) where students find the ease of use helps them use more, thereby improving learning outcomes. Based on these researches, the following research hypothesis is developed:

H1: Perceived ease of use has a positive effect on students' online learning outcomes.

Perceived usefulness and online learning outcomes

Perceived Usefulness is understood as the degree to which learners believe that using e-learning will improve their job performance (Davis, 1989). The usefulness of online learning can be realized by helping learners save costs and time used for traveling and accessing many different methods. Many studies have shown that perceived usefulness has a positive impact on learners' attitudes and motivation, thereby demonstrating improved learning outcomes (Habes, 2018; Alhumaid, 2020).

Based on these reasons, the following research hypothesis is developed:

H2: Perceived usefulness has a positive effect on students' online learning outcomes.

Competency of lecturers and online learning outcomes

The approach to online learning is learner-centered, as opposed to teacher-centered like traditional education (Debattista, 2018). Instructors need to take necessary measures to improve the quality of online learning, thereby enabling students to study better during times

affected by the COVID-19 pandemic (Abbasi & et al. events, 2020). Pedagogy, professional competence, level of application of science and technology, and ability to form and combine different ideas and practices in building content for online learning programs in higher education learning are important keys to improving student learning outcomes for the better. From that, the following research hypothesis is developed:

H3: Competency of lecturers has a positive effect on students' online learning outcomes.

Online course content and online learning outcomes

Little and Knihova (2014) concluded that engaging curriculum content attracts a lot of students' participation and initiative, thereby affecting learning outcomes. In addition, Khamparia and Pandey (2017) said that the curriculum content also includes additional materials to help students better understand and deepen their knowledge. From that, the authors put forward the following research hypothesis:

H4: Online course content has a positive influence on students' online learning outcomes.

Online course design and online learning outcomes

The online course design includes structure, curriculum design interface, testing and assessment methods, and exchange forums between lecturers and learners. A good course design will attract and facilitate students to learn through online classes (Oh et al., 2020). The curriculum design interface is used to introduce the course content, designed according to the students' ability and understanding level, appropriate in time and space to promote and support the learning process. Based on these reasons, the authors develop the following research hypothesis:

H5: Course design has a positive impact on students' online learning outcomes.

Characteristics of learners and online learning outcomes

Online learning entails greater responsibility for learner engagement (Moore & Kearsley, 2011). Interaction is a mutual interaction, having a relationship to exchange information with each other. Interaction with instructors and other students is crucial, through strong interaction and consistent practice, thereby achieving the effectiveness of online learning (Jung et al., 2002). The combination of cognitive, emotional, and physiological characteristics dictates how students may learn, which is defined as learning style (Shenoy, 2013). Studies also show that learning styles also lead to different learning outcomes. Students' attitudes towards online learning are an important factor in the learning environment supported by online learning tools. Studying learners' attitudes towards online learning may reflect learners' later use of technology (Smith et al., 2000). In addition, initiative, self-learning ability, and a sense of discipline are important requirements for achieving better learning outcomes as the regulations and requirements of online learning become more and more relaxed. Compared to face-to-face instruction, students participating in online learning may face external temptations or interference at home during the pandemic. Therefore, the process is more difficult to control than with traditional methods. Accordingly, student self-discipline has a positive impact on learning outcomes for online learning.

From that, the following research hypothesis is developed:

H6: Characteristics of learners influence students' online learning outcomes.

Impact of COVID-19 pandemic on online learning outcomes

According to Thandavaraj (2021), students tend to be anxious when living in a socially distancing environment during the COVID-19 pandemic. Vitasari (2010) proves that anxiety in the learning process of students will negatively affect learning outcomes. The sudden change in learning method also makes students worry about changing the approach to the subject, and the method of assessing learning results, leading to a negative impact on learning results. Therefore, the stress caused by the impact of the COVID-19 pandemic and the rapid shift from traditional to online classrooms can negatively affect the effectiveness of online learning and learning outcomes. students during the pandemic. From there, the authors develop the following research hypothesis:

H7: Impact of COVID-19 has a negative effect on students' online learning outcomes.

3. Method

Based on literature review and hypothesis development, the authors come up with a research model as shown in Figure 1.

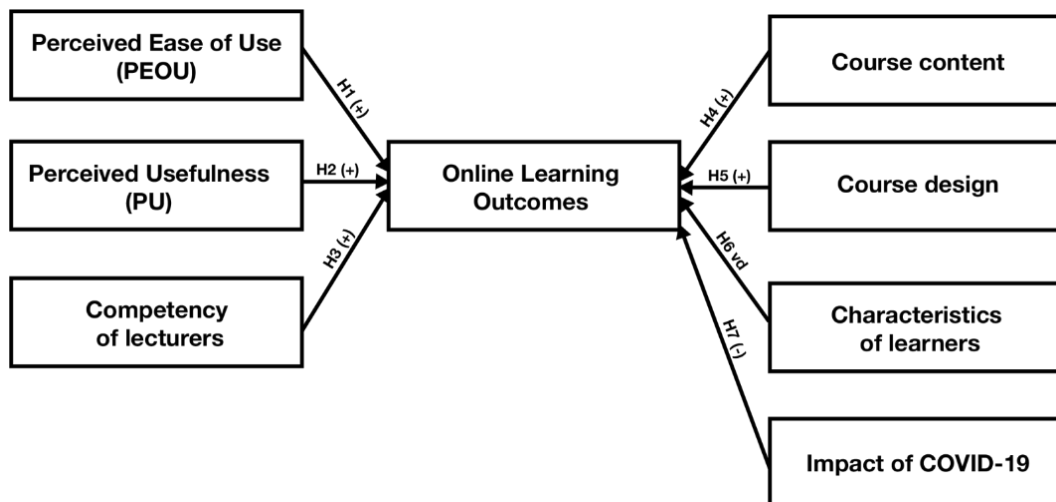

Figure 1. Research Model

Source: Results of the authors' analysis

Applying the primary data collection method through designing an online questionnaire on Google Forms, the authors carry out research on students majoring at Accounting & Auditing in Vietnamese universities.

In this study, the sample was selected according to the convenience sampling method by selecting a non-probability sample. The sample size applied in the study is based on the requirements of Exploratory Factor Analysis (EFA) and multivariate regression. For Exploratory Factor Analysis: the minimum sample size must reach 100 samples. For multivariable regression analysis: the required minimum sample size is calculated by the formula as $50 + 8 \times 7 = 106$ (7 independent variables). The authors received 352 responses with sufficient data, meeting the requirements of number of research samples.

Then, the authors used regression analysis with the dependent variable: the online learning results of Accounting and Auditing students to evaluate the influence of these variables on the online learning outcomes of students. The factors described in the exploratory analysis (EFA) above are independent variables of influence. Here is an example of a regression model:

$$\mathbf{KQ} = \beta_0 + \beta_1 \mathbf{DSD} + \beta_2 \mathbf{HI} + \beta_3 \mathbf{NLGV} + \beta_4 \mathbf{NDCTH} + \beta_5 \mathbf{TKCTH} + \beta_6 \mathbf{DD} + \beta_7 \mathbf{COVID} + \varepsilon_i$$

Where as:

- KQ: Online learning results during the Covid-19 pandemic of Accounting & Auditing students.

- DSD: Perceived ease of use

- HI: Perceived usefulness

- NLGV: Competency of lecturers

- NDCTH: Course content

- TKCTH: Course design

- DD: Learner characteristics

- COVID: Impact of the COVID-19 pandemic

$\beta = \{ \beta_0, \dots, \beta_7 \}$: Regression coefficient affects the dependent variable

- ε_i : Error of the regression equation

4. Results

4.1. Descriptive statistics

The survey has collected 352 valid and eligible answers to perform data analysis and official verification. Regarding subjects, out of a total of 352 valid survey samples, there were 194 students majoring in Accounting (accounting for 55.1%) and 158 students majoring in Auditing (44.9%). Most of the survey samples were taken by freshmen and sophomores.

The results show that the average student's average score is statistically with the majority of students reaching 3.20 - 3.59 (162 students, accounting for 46%) and 3.60 - 4.00 (158 students, accounting for 45%). The rest of the scale only accounts for 9%.

4.2. Reliability of the scale test

The results of evaluating the reliability of the scale and the Cronbach's Alpha measurement variables (Table 1) of the observed variables range from 0.676 to 0.829, ensuring the reliability of the official survey model, and there is no total correlation number is less than 0.3, the variables are suitable for inclusion in EFA exploratory factor analysis.

Table 1. Test results by Cronbach's Alpha coefficient of factors

Variables	Average of scale if variables rejected	Scale variance if variables rejected	Coefficient of correlation of total variables	Cronbach's Alpha coefficient if variables rejected
Perceived ease of use Scale (DSD): Cronbach alpha: 0.705				
DSD1	6.77	1.977	.478	.667
DSD2	6.82	1.539	.572	.548
DSD3	6.77	1.726	.523	.612
Perceived usefulness Scale (HI): Cronbach alpha: 0.722				
HI1	9.86	3.206	.521	.654
HI2	9.80	3.155	.510	.660
HI3	9.87	3.151	.530	.648
HI4	9.88	3.359	.479	.678
Perceived usefulness Scale (NLGV): Cronbach alpha: 0.744				
NLGV1	9.93	3.631	.516	.697
NLGV2	10.00	3.595	.497	.708
NLGV3	9.99	3.419	.592	.654
NLGV4	9.98	3.493	.546	.681
Perceived usefulness Scale (NDCTH): Cronbach alpha: 0.676				
NDCTH1	9.86	2.956	.461	.608
NDCTH2	9.91	2.947	.461	.608
NDCTH3	9.88	2.912	.471	.601
NDCTH4	9.89	3.006	.437	.624
Course design Scale (TKCTH): Cronbach's Alpha = 0.789				
TKCTH1	10.10	3.634	.628	.723
TKCTH2	10.16	3.845	.545	.763

Variables	Average of scale if variables rejected	Scale variance if variables rejected	Coefficient of correlation of total variables	Cronbach's Alpha coefficient if variables rejected
TKCTH3	10.15	3.443	.613	.730
TKCTH4	10.18	3.524	.607	.733
Characteristics of learners Scale (DD): Cronbach's Alpha = 0.829				
DD1	17.04	8.910	.564	.809
DD2	16.93	8.835	.606	.800
DD3	16.99	8.863	.592	.803
DD4	16.90	8.805	.619	.798
DD5	16.98	8.786	.602	.801
DD6	16.96	8.873	.612	.799
Impact of the COVID-19 Scale (COVID): Cronbach's Alpha = 0.770				
COVID1	10.16	3.232	.630	.683
COVID2	10.13	3.694	.532	.735
COVID3	10.16	3.699	.581	.712
COVID4	10.10	3.535	.548	.728
Online learning results Scale (HI): Cronbach's Alpha = 0.828				
KQ1	10.05	4.111	.643	.788
KQ2	10.09	4.081	.686	.769
KQ3	9.97	4.147	.655	.782
KQ4	9.96	4.070	.634	.793

The results of EFA data (Table 2) show that the factor loading coefficients of all the observed variables meet the requirements greater than 0.5 and the total variance extracted factors of the independent variables and the dependent variables greater than 50%. That means these factors explain for 57.980% of the independent variable and 66.023% for the dependent variable.

Table 2. Result of Exploratory Factor Analysis (EFA)

	Coefficients of loading factors						
	1	2	3	4	5	6	7
EFA analysis results with independent variables							
DD4	.743						
DD2	.709						
DD5	.695						
DD3	.671						
DD1	.666						
DD6	.662						
TKCTH1		.737					
TKCTH4		.736					
TKCTH3		.734					
TKCTH2		.588					
COVID1			.792				
COVID3			.771				
COVID4			.738				
COVID2			.711				
NLGV3				.745			
NLGV2				.706			
NLGV1				.682			
NLGV4				.645			
HI2					.791		
HI3					.686		
HI1					.683		
HI4					.562		
NDCTH3						.732	
NDCTH1						.720	
NDCTH2						.677	
NDCTH4						.666	
DSD2							.769
DSD3							.745
DSD1							.723

	Coefficients of loading factors						
	1	2	3	4	5	6	7
Extracted Variance (%)	23.104	31.323	38.083	44.315	49.625	54.119	57.980
Eigenvalues	6.700	2.384	1.961	1.807	1.540	1.303	1.120
KMO = .860				Sig. = .000			
EFA analysis results with dependent variables							
KQ2	.835						
KQ3	.813						
KQ1	.804						
KQ4	.797						
Extracted Variance	66.023						
Eigenvalues	2.641						
KMO = .812				Sig. = .000			

For the independent variables, the KMO index of 0.860 is greater than 0.5 for Sig. = 0.000 is less than 0.05, so it can be concluded that the variables are correlated with each other and satisfy the conditions for factor analysis. The value of Eigenvalues coefficients are all greater than 1 with the 7th factor having the lowest Eigenvalues of 1,120 greater than 1, so the authors divided the original 29 observed variables into 7 main groups. The total value of variance extracted is 57.980% (> 50%), so it can be concluded that these 7 factors explain 57.98% of the variation of the data. Simultaneously, the loading factors' coefficients are all greater than 0.5, showing that all variables have an influence on the factor that the variable represents.

For the dependent variable, KMO = 0.812 > 0.5 for Sig. = 0.000 is less than 0.05, so the above variables are correlated and are eligible to perform exploratory factor analysis. With the extracted variance = 66.023% > 50% and Eigenvalues = 2,641 > 1, the 4 observed variables above converged on one factor and this group of factors explained 66,023% of the variation of the data.

4.3. Pearson's correlation analysis

From the results of Pearson correlation analysis, the authors found that the independent factors were strongly correlated with the dependent factors, the correlation coefficients were statistically significant (Sig. < 0.01), specifically, the correlation relationship between the mean variable of learning outcomes (KQ) with the following variables: DSD is 0.418; HI is 0.438; NLGV is 0.553; NDCTH is 0.236; DD is 0.518 and

COVID is 0.433; TKCTH is 0.537. Thus, it is completely appropriate to use the above data to include in the linear regression analysis.

4.4. Analysis of Variance ANOVA

The results of ANOVA analysis for test values $F = 68.348$ and $\text{Sig.} = 0.000 (<0.05)$ prove that the data and model are appropriate and usable.

Table 4. Results of analysis of variance ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	88,019	7	12,574	68,348	0.000 ^b
	Residual	63,287	344	0,184		
	Total	151,306	351			

Source: Results of the authors' analysis

4.5. Regression analysis

To analyze the influence of factors on learning outcomes of Accounting & Auditing students, the authors performed linear regression analysis to determine the impact of independent variables on the dependent variable.

Table 5. Results of analysis of coefficients of regression equation

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics		
	B	Std. Error	Beta			Tolerance	VIF	
1	(Constant)	0,631	0,289		2,181	0,030		
	DSD	0,130	0,042	0,122	3,091	0,002	0,775	1,291
	HI	0,096	0,047	0,084	2,038	0,042	0,715	1,398
	NLGV	0,239	0,046	0,219	5,180	0,000	0,681	1,468
	NDCTH	0,101	0,044	0,083	2,276	0,023	0,906	1,104
	TKCTH	0,313	0,047	0,292	6,681	0,000	0,637	1,571
	DD	0,174	0,049	0,155	3,567	0,000	0,645	1,550
	COVID	-0,244	0,040	-0,225	-6,059	0,000	0,885	1,1

The independent variables HI, NDCTH have Sig. coefficients less than 0.05, so they have statistical significance at 5% level, in addition, the remaining independent variables DSD, NLGV, TKCTH, DD, COVID have Sig. coefficients. less than 0.01, so these independent variables have statistical significance at 1% level. Thus, it is possible to confirm the significance of all the independent variables, they all affect the learning results in the form of online learning.

We have the following regression model:

$$KQ = 0.631 + 0.130DSD + 0.096HI + 0.239NLGV + 0.101NDCTH + 0.313TKCTH + 0.174DD - 0.244COVID$$

The above equation leads to the conclusion that there are 07 factors affecting the learning outcomes by online learning during the COVID-19 pandemic of students majoring in Accounting & Auditing in decreasing level, respectively: i) Course Design, (ii) Impact of COVID-19, (iii) Competency of Lecturers, (iv) Characteristics of learners, (v) Perceived Ease of Use, (vi) Perceived Usefulness and (vii) Course Content.

5. Discussion and Conclusion

The authors' results have demonstrated that student outcomes in the online learning process are influenced by 7 factors in descending order, respectively, Course Design, Impact of COVID-19, Competency of Lecturers, Characteristics of learners, Perceived Ease of Use, Perceived Usefulness, and Course Content. This result is similar to the results of previous studies when it is shown that these independent factors have a significant influence on student learning outcomes (Pham, Q., & Huynh, M., 2018; Alhumaid, J., 2020; Sut & Amy, 2021). However, contrary to Pham's conclusion, T.T.T. et al. (2021) that the factor of course design has no great influence on the research object, the group's results show that the above factor has a great impact on students' learning outcomes because the difference, especially in the training of Accounting & Auditing, has made the above factor even more necessary to create an effective online learning environment.

The results of the study will have contributions in adding to the theoretical framework for topics related to online learning as well as education taking place during the COVID-19 pandemic. At the same time, research is the basis for educational leaders, lecturers and students to understand the importance of factors affecting student outcomes in the online learning process, thereby shaping into policies focusing on the organization, design and implementation of online training programs in particular and higher education in general.

THE MEANS OF COMMUNICATION AND THEIR ROLE IN THE PUBLIC HEALTHY COMMUNICATION DURING COVID-19 PANDEMIC IN VIETNAM

PhD Student. Nguyen Huu Dzung

dungnh.choa.kb@gmail.com

Faculty of Communication, Academy of Journalism and Communication, Hanoi

Abstract

Since the COVID-19 pandemic broke out in China in 2019, it has quickly become a global pandemic, which threatened health and lives of billions of people around the world. In fact, the pandemic has claimed nearly 6 million lives worldwide and left long-term health issues for those who contracted this virus. Based on the situation, the paper was conducted with the aim of clarifying the roles and the way means of communication in Vietnam contributed to bringing about positive results with limited resources during this period. To conduct the research, the author has implemented the method of observation, in-depth interview and survey by online questionnaire. Research results showed that, during the COVID-19 pandemic, the means of communication in Vietnam has played the role as a bridge to provide necessary information to the public. Moreover, they have been combined into series of topics to create a spillover effect and have a strong impact on public consciousness in preventing and combating the pandemic.

Keywords: *means of communication, health, public, the COVID-19 pandemic, Vietnam*

1. Introduction

Vietnam's current means of communication system was formed in the 30s of the 20th century. Initially, it was quite sketchy, which just contains telephones, radios and mail. There has been 816 press agencies (print and electronic newspapers), 72 licensed agencies operating in radio and television in Vietnam until at the end of November in 2021. As of June 2021, there has been 829 licensed social networks in Vietnam. Not to mention that there are hundreds of thousands of radio stations (wired and wireless), information centers in residential areas, villages, hamlets, and so on.

Means of communication systems helped to raise awareness and promote social positivity among people, especially public health issues.

Health communication is considered as an important task in public health care. Through public health communication, the government disseminated policies and knowledge on health to help raise awareness, form positive attitudes as well as promote appropriate behavior among people in the prevention and control of the disease and the improvement of individual health. It helped citizens to be proactive in protecting and improving the health of their families and the community, and simultaneously assists in treatment and management to avoid the spread of infectious diseases. In Vietnam, communication for health community is carried out on a regular basis.

Under normal condition, besides health programs on national and provincial radio, television stations, and health columns on electronic newspapers and radios, local health stations also regularly organize events to popularize knowledge related to public health such as monthly vaccinations, seasonal health care instructions, contests themed health care, ...

The COVID-19 broke out in early 2020 and soon after that, WHO had to declare it as a global pandemic in March, 2020²²⁹. It laid down new tasks for countries and territories around the world in response to the public health emergency. In this context, it is important to select the types of means of communication and the modes of communication which helps to promptly provide accurate information about the pandemic as well as medical instructions to the community.

Like many other countries, Vietnam was also seriously affected by the COVID-19 pandemic and undertook severe problems, especially regarding to public health. However, Vietnamese government has quickly responded to deal with the disease, especially in communication to protect the community. As a result, despite having limited resources, Vietnam has achieved great success in the fight against the COVID-19 pandemic, in which communication made a significant contribution.

2. Literature Review

Up to now, there have been many studies on public health communication during the pandemic since WHO declared it as a global disease.

In the paper *“Role of Mass Means of communication and Public Health Communications in the COVID-19 Pandemic”*, authors (Ayesha Anwar, Meryem Malik, Vaneeza Raees, Anjum Anwar, 2020) described the coverage of disease information in different means of communication methods including false and untruthful information. Research has mainly focused on social means of communication platforms and telehealth applications. At the same time, the authors have pointed out six roles of the mass means of communication including: Public health communication; Health education; Strategies for social distancing; Reduction of stigma, discrimination and prejudice; Telemedicine; Managing infodemics.

In another study named *“Digital technologies in the public-health response to COVID-19”* (2020), authors focused on digital means of communication and social platforms which are described as a space with the large number of regular users. The author has pointed out the role of the means of communication combined with digital technology in minimizing the impact of misinformation amid the pandemic.

In the research *“Effective Risk Communication for Public Health Emergency: Reflection on the COVID-19 (2019-nCoV) Outbreak in Wuhan, China”* (2020), authors developed a communication strategy during an emergency on health community with the focus on risk messages. Authors listed out three principles in risk communication including: Accessibility and Openness of Risk Information; Communicate Early and Often About Risk; Strategic Method for

²²⁹ <https://www.who.int/director-general/speeches/detail/who-director-general-s-opening-remarks-at-the-media-briefing-on-covid-19---11-march-2020>

Communicating Uncertainty. Through principle development, the authors suggested “A Simplified Model of Government–Expert–Public Risk Communication”.

In the study “*Topic Analysis of Traditional and Social Means of communication News Coverage of the Early COVID-19 Pandemic and Implications for Public Health Communication*” (2021), based on research in journalism, television and social means of communication platforms (Twitter, Reddit).) in the USA , authors showed that the means of communication lack the focus on public health comparing with economics and politics, along with the widespread of misinformation, greatly influenced to the performances of disease prevention and public health protection.

In the research “*Challenges in Tackling COVID-19: Use of the Mass Means of communication versus Interpersonal Channels in Pakistan*” (Babar Hussain Shah, Zaheer Khan, Saqib Riaz, 2021), based on two-step flow of communication, authors analyzed and clarified the relationship between mass means of communication and personal communication channels in the application of COVID-19 prevention measures. After pointing out the general role of mass means of communication and the role of personal communication channels, the author proposed three research hypotheses and proves them. In which, it is confirmed that if information on the pandemic is fully accessed with great intensity through personal communication channels, it will contribute to the application of preventative measures for COVID-19.

In the study “*Public health agencies outreach through Instagram during the COVID-19 pandemic: Crisis and Emergency Risk Communication perspective*” (2021), authors focused on researching the contents of public health communication on Instagram accounts of WHO, CDC, IFRC, and NHS, thereby affirming the great potential of social networks in delivering messages about public health, especially Instagram. The role of combating fake information is once again confirmed. The study also mentioned the role of authorities and celebrities as reliable source.

In Vietnam, studies named “*The social orientation role of the press - from the actual “war” to prevent and control the Covid-19 epidemic*” (2021) and “*The Covid-19 fake news problem and the role of the press*” (2021) also pointed out the role of the press in the fight against fake news and directing the public to reliable information amid the COVID-19 pandemic. In the article “*Application of multimeans of communication communication in the current Covid-19 epidemic prevention and control*” (2021), authors proved the roles of mass means of communication and social networks in providing information related to the pandemic. In addition, they produced some lessons regarding transparency of information and the delivery of accurate information in a quick and proactive way to meet the needs of the people.

In general, current papers showed that governments have used a variety of means of communication such as social platforms, multimeans of communication, newspapers, radio and television to communicate on public health over the period of the COVID-19 pandemic. However, there has been almost no research analyzing the system of means of communication used within a country or territory serving for the common purpose of health communication in an emergency situation to protect the community and prevent diseases.

Although many studies showed the role of the means of communication in public health communication, they only focus on the role of single mean, or two or three ones combined. Moreover, aforementioned studies mainly mentioned the role of the means of communication in providing information, fighting against the influence of fake news and misinformation, but not analyzing other roles. Therefore, in this research, the author will clarify the role of the means of communication system on public health during the COVID-19 pandemic in Vietnam.

The study focuses on handling the following questions:

RQ1: Which means of communication did Vietnamese government use to communicate on public health during the COVID-19 pandemic?

RQ2: What role did the means of communication system play in preventing the COVID-19 pandemic in Vietnam?

3. Method

To answer research questions, the author conducted a survey using questionnaire, in-depth interviews and observation (direct and indirect).

Observation method helped the author to have an overview of the means of communication system's activities of providing information about COVID-19 in Vietnam. Through an online survey, the author realized the sources which the public access news and information from and the role of information sources for social groups. However, random sampling through online questionnaire may not guarantee the accuracy of the research, the author continued to conduct in-depth interviews. In the in-depth interviews, the author used stratified sampling technique and selected subgroup samples by making a sample list with different demographic characteristics such as gender, age, education level, occupation, place of residence in order to ensure the diversity and representativeness of selected samples.

Observation

The author observed by updating information about the pandemic on the means of communication such as newspapers, radio, television, social networks... In addition, the author also typed keywords to search news related to COVID-19 in Google - the most popular search engine in Vietnam²³⁰ to identify sources of information concerning the pandemic, for example, how to prevent the disease and protect health. The duration of observation took place in a year from March 2020 to March 2022.

Regarding direct observation, due to living in a COVID-19 hot spot and directly participating in communication activities in the prevention and control of the COVID-19, the author had an opportunity to directly observe such communication activities in residential areas.

In addition, the author also studied documents from official sources, compared and contrasted data to draw assessments on the operation and effectiveness of the means of communication in public health communication during the pandemic in Vietnam.

²³⁰ <https://vietnamnet.vn/cong-cu-tim-kiem-made-in-viet-nam-lieu-co-can-h-tranh-noi-voi-google-495536.html#:~:text=T%E1%BA%A1i%20Vi%E1%BB%87t%20Nam%2C%20theo%20th%E1%BB%91ng,ki%E1%BA%BFm%20Made%20in%20Vi%E1%BB%87t%20Nam.>

Online survey using questionnaire

A national online survey was conducted in November 2021. The survey was carried out by selecting a random sample through sharing a link of Google Form for users on social networks including Facebook and Zalo. These has been the two most popular social network platforms in Vietnam up to now. Participants were supposed to answer questions about information channels they accessed during the COVID-19 pandemic, rating the effectiveness of such information in protecting and taking care the health of individuals and the community, residents' response to information on the pandemic and their attitudes towards government's prevention and control work.

In-depth interviews

To examine the outcomes of the online survey and remove unreliable data, the author conducted in-depth interviews.

The author implemented the sampling technique to group by locality and group by epidemic area. First, the researcher made a list of provincial administrative units in Vietnam. The list includes 63 provinces and centrally run cities. In the final step of sampling, selecting people to interview, the researcher used convenient randomization method, and at the same time uses stratified sampling technique. Accordingly, the selected people are from many different provinces include Bac Giang, Bac Ninh, Dong Nai, Hanoi, Ho Chi Minh City and Thai Nguyen, living in both urban and rural areas, diverse ages and occupations, including both men and women. Finally, the author compiled a list of 13 people to conduct interviews.

The interviews were carried out between November and December 2021. Each interview lasted from 10 to 15 minutes.

The in-depth interview questionnaire consists of two parts with 14 questions:

- The first part consists of 6 questions on sociological characteristics such as gender, age, education level, place of residence and occupation.

- The second part consists of 8 questions: one question about when people know about COVID-19 and how often they follow information related to the disease, one question about the sources of information that people had access to during the pandemic, six questions related to fake news about COVID-19 during the pandemic, people's perceptions, attitudes and behaviors when knowing the information they had access is fake news.

4. Results

The outcomes of observation

The results from the observation process showed that, during the COVID-19 pandemic, Vietnamese government has applied a variety of means of communication to communicate information about public health, including *radio, television, press, and social and cultural institutions*:

Radio

In Vietnam, the radio system includes the Voice of Vietnam (VOA), and local radio stations²³¹ serving communication at the levels of province, district and commune are

²³¹ <https://nhandan.vn/tranghanoi-tin-chung/phat-huy-vai-tro-cua-he-thong-thong-tin-co-so-trong-tuyen-truyen-phong-chong-dich-covid-19-645042/>

installed in each residential area. During the pandemic, besides the fixed radio system, there was also a mobile radio system applied in residential areas

Television

There is a system of agencies and television stations from the national level to the provincial level in Vietnam. In addition to the existence of the national television station and 63 television stations of provinces and cities, there are also television channels of the Vietnam News Agency (VNA) and central agencies. Channels are broadcasted on many platforms such as free digital TV, paid TV, social means of communication platforms such as Facebook, Lotus, TikTok, Youtube which are the most popular social networks in Vietnam.

Press

According to a report at the end of 2021, there has been 816 press agencies in Vietnam by the end of November 30, 2021²³². However, the author mainly made observations in the most visited online newspapers in Vietnam, based on the ranking of Alexa.com website, such as VnExpress.net, Zingnews.vn, Vtv.vn, Laodong.vn, Dantri.com.vn, Vietnamnet.vn, Thanhnien.vn, Tuoitre.vn and qdnd.vn. In addition to websites, these e-newspapers are available on Facebook, TikTok and Youtube. Some also appear on such mobile applications as vtv, dantri, vnexpress, tuoitre. Full and timely information on the prevention and control of the COVID-19, and medical instructions are provided on such e-newspapers.

Social and cultural institutions

Amid the outbreak of the COVID-19, the large number of signs, panels and posters were set up at locations where community activities take place such as traditional markets, supermarkets, commercial centers, parks, cultural houses, etc., with a view to giving instructions on how to keep hygiene, and measures to prevent and control the disease. The most popular sign is “5K message” issued by the Ministry of Health.

Group communication²³³

The establishment of local medical stations, mobile medical stations, health consultation centers (1022) and Community-based COVID-19 prevention teams have created a turning point in communication on public health during the pandemic. A 3-5-person team performed many tasks concentration on communicating about the COVID-19 prevention and control, checking people with risk of infection in the community and replying to people’s questions on health issues in the area.

Social network platforms

During the pandemic, social means of communication platforms were common means of communication about public health. Not only authorities, radio, television, and electronic newspapers, but individuals also regularly shared information on health protection and COVID-19-related issues through social networks.

²³² <https://www.vietnamplus.vn/infographics-so-lieu-ve-cac-co-quan-bao-chi-viet-nam-nam-2021/764886.vnp>

²³³ https://moh.gov.vn/tin-tong-hop/-/asset_publisher/k206Q9qkZOqn/content/to-covid-cong-ong-ong-tho-sat-can-h-cung-y-te

These tools are available and used on a regular basis in Vietnam when it comes to communication policies and public health issues. During the pandemic, they were adjusted and combined to create series of messages towards protecting and taking care of public health.

The outcomes of online survey

In the online survey of 382 participants, there were 241 females (36.1%) and 141 males (36.9%), with an average age of 26.6. The results showed that, during the pandemic, the public actively looked for and accessed a variety of source, in which social networks were the most accessible channel with 83.8% (320/382 people). The detail data are presented in Table 1.

Table 1. Information sources

Information channels that people follow about the COVID-19 epidemic (N = 382)

Information sources	Frequency	Percentage
Live Chat	75	19.6%
Online Newspapers	170	44.5%
Radio	143	37.4%
Social Networks (Facebook, Gapo, Lotus, TikTok, Youtube, Zalo)	320	83.8%
Television	220	57.6%

Social networks were also rated as fast-accessed sources by 63.4% of respondents (242/382). However, only 4.2% of the respondents (16/382) said that information from social networks is reliable. In contrast, ranking third in terms of delivering information, television was considered as the most reliable source of information by 78% of participants (298/382)

Accordingly, 93.7% of the respondents (358/382) rated that information on health amid the pandemic is “useful” to “very useful”. The details are shown in Table 2.

Table 2. The usefulness of disease-related information COVID-19

Frequency of participants’ responses to the file-level Likert-scale question about the usefulness of disease-related information (N = 382)

LIKERT SCALE	Frequency	Percentage
1 Strongly disagree	0	0.0%
2 Disagree	0	0.0%
3 Neither disagree Nor agree	24	6.3%
4 Agree	147	38.5%
5 Strongly agree	211	55.2%

41.9% of people (160/382) said that they “often” and “very often” shared health information related to COVID-19 and 33.5% of people (128/382) shared it normally. What is more, up to 71.2% of respondents (272/382) said that they clearly distinguished information from main sources and from fake news. As a result, 98.2% of the respondents (372/379) said that they believed in the performance of government’s pandemic prevention and control.

It shows that the information about the epidemic is provided in a complete, timely, exactly and systematic manner in on means of communication, which had positively contributed to improved the community's awareness, attitude and behavior towarded the disease COVID-19 epidemic.

The outcomes of in-depth interviews

The researcher interviewed 13 people, including: 02 people in Bac Giang, 04 people in Bac Ninh, 01 people in Dong Nai, 02 people in Ho Chi Ming City, 02 people in Hanoi, 02 person in Thai Nguyen. In which, there are 08 men (61.54%) and 05 women (38.46%); the average age of survey participants is 38.85 years old; 04 (30.77%) people graduated from high school, 01 (7.7%) people have college degrees, 05 (38.45%) people have university degrees and 03 (23.08%) people have graduate degrees; 04 (30.77%) people in rural areas and 09 (69.23%) people in urban areas; occupations include sales, street vendors, teachers, business, civil engineers, engineering, freelance workers, office workers, farmers, pr and students.

Results from in-depth interviews with 13 people from Bac Giang, Bac Ninh, Dong Nai, Hanoi, Thai Nguyen, and Ho Chi Minh City, show that:

Firstly, the results of the online questionnaire survey were relatively accurate and reliable. People had tendency to access to multiple sources of information, and social means of communication was still most visited source of fast news but the reliability was very low. Accordingly, 100% of the respondents said that there was many fake news on the COVID-19 prevention and control measures as well as medical instructions on disease prevention and treatment that spread on social networks, mainly on the Facebook. 5/13 people (38.46%) said they had shared fake news about public health during the pandemic and it caused confusion among the community, they felt guilty and sad about it. Then, they can verify the information by accessing news from television, or radio, or from relatives.

Secondly, notably, in the COVID-19 hot spots, 100% of the respondents (13/13) agreed that local radio stations and group communication through Community-based COVID-19 prevention teams were the two fastest and trustful means for information.

Thirdly, the fact that information on public health, medical guidelines for prevention and treatment of COVID-19 was communicated by different means to help people easily access and 100% respondents (13/13) said that above mentioned information were useful information which helped them feel secure and trust in the COVID-19 prevention and control work of the government.

Fourthly, 100% of respondents (13/13) said that, besides meeting the needs of information during the pandemic, the sub-means of communication provided a lot of practical ones such as health issues, social security issues, sate's supportive policies, volunteer activities, food issues, channels to receive support... Therefore, there was almost no worry among citizens in the pandemic.

5. Discussion and Conclusion

5.1. Discussion

Through the research results, it is shown that, in response to the public health emergency during the COVID-19 pandemic, Vietnamese government has taken advantages of the means of communication system to communicate necessary information. Each mean has its own advantages and limitations, so the systematic use of a variety of means of communication is considered as an optimal option.

For example, information from national radio and television stations is comprehensive and universal, but it lacks the depth, locality, and region, which makes it difficult to access for people in rural areas with low literacy skill. Such restriction is covered by the support of local radio and television stations. Information from the mass means of communication can be very fast, but it lacks the closeness and direct interaction, which may fail to encourage people in the community. The limitation is supported by the group communication system from local health stations, mobile health stations and Community-based COVID-19 prevention teams. Social networks are considered to be a fast mean of communication, but it contains many potential risks such as fake news and misinformation. The other means such as television, radio and electronic newspapers have become channels which were trusted by the public.

Therefore, the means of communication system helped Vietnamese government approached a large number of people and simultaneously minimized the inherent limitations of each means of communication, which resulted in a significant communication effect.

Another remarkable point is that messages were delivered in a concentrated way, which has created strong impacts on the community's awareness. “5K message” has been introduced to the public by the means of communication under various forms, contributing to the positive results of the fight against COVID-19 in Vietnam. On October 11, 2021, Vietnamese government issued Resolution 128 on “Safe adaptation, flexible and effective control of the pandemic”, marking a major turning point in the fight against COVID-19 in Vietnam. Accordingly, the communication goal has also changed from preventing and removing the pandemic to living safely with the disease. Medical measures and instructions on treatment, isolation for asymptomatic patients at home and related issues were delivered to the community.

Besides the means of communication, the author found out that tools such as government policies and strict regulations helped to prevent spreading false information on public health during the pandemic have also contributed greatly to establishing credibility on social means of communication among the public and driving their interest to official and reliable sources.

In addition to the usual role of single means of communication, the results of the research proved that the system of means of communication has played important roles such as:

First of all, it is the ability to strongly influence the perception of the community. The means of communication system on public health would certainly make a profound

impact on awareness, thereby contributing to changing attitudes and behavior towards COVID-19 of each citizen. As the public had tendency to access to multiple sources of information, the use of a variety of channels and means of communication would help affirm and imprint messages about public health amid the pandemic.

Second, it is the ability to widely communicate to all people. In the context of digital age, the majority of people in Vietnam have used the internet and social networks (about 72%), but their needs to access and looking for information are not the same. Therefore, the use of a series of means in delivering a message, such as “5K message”, has played an important role in disseminating health information and medical instructions to each citizen during the epidemic so that “no one is left behind”.

Third, it helped to create an information ecosystem for the public. The fact that everywhere, from cyberspace to daily life, from Facebook, TikTok, Youtube, to Zalo, from smartphones to desktop computers, from elevators to offices, hospitals, supermarkets, from fixed locations to anywhere, the disease-related information and medical guidance on the prevention and treatment of COVID-19 are available for everyone. In addition, along with information on public health, other useful information was also provided, including government policies and legal regulations on the prevention and control of COVID-19. All of which helped to create an information ecosystem so that “no one is left behind” in the pandemic.

Fourth, it is the ability to quickly identify and prevent fake and false information. Means of communication has the ability to prevent or reduce the effects of fake news, disinformation, and misinformation. However, if such situation is quickly detected and effectively prevented, it will require the participation of a whole system. It means that means of communication were combined to form a bridge to provide information between the government, authorities and the community. In other words, it was also easy for the public to search and check for health information thereby making citizens feel secure and trust in government’s prevention measures.

Fifth, it is both a reliable fulcrum for information and an address for verifying health information. Amid the pandemic, there were a large amount of public health information. Of which, government's means of communication is the most reliable one, when needed, all problems can be answered, all information can be verified quickly and timely. Information from the government channels were not always the fastest, but it was certainly accurate and scientific. People were assured of protecting the health of themselves, their families and the community.

5.2. Conclusion

In Vietnam, the conditions of infrastructure, geography, population distribution, regions, customs and the cultural diversity with more than 54 ethnic groups set objective requirements in communicating to protect public health during the COVID-19 pandemic. In which, the use of a variety of means of communication to communicate to protect public health is a compulsory requirement.

From the research results, the author showed that if the means of communication is built into a system, or at least during the COVID-19 pandemic, they work together to communicate so as to protect public health, their roles will become much larger. That is so-called the “resonance” power. People were not only equipped with adequate information on disease prevention and health care, but also were protected in a safe and healthy “information ecosystem” contributing to the protection of physical and mental health.

In addition, the research indicated that it is necessary to build slogans in communication on public health. The author realized that slogans in the prevention and control of COVID-19 and communication on public health protection, such as “5K”, “going to every alley, knocking door to door, checking every person”, “the best vaccine for you is the one available to you right now, “Leave no one behind”..., were considered to be concise, easy to remember, easy to understand, easy to share and able to. These slogans have contributed largely to shaping public consciousness and behavior, and thereby creating a great consensus in the prevention and control of pandemic in Vietnam.

Along with that is the role and decisiveness of Vietnamese government in the prevention and control of the COVID-19 pandemic. It could be seen clearly that the government quickly detected and addressed false, misleading and untrue information in accordance with the provisions of Vietnamese law, thereby cleaning up the information space regarding the disease. Therefore, it is noted that the provisions of the law could be viewed as one of the effective tools to prevent fake news in Vietnam, contributing positively to the performances of communication to protect public health.

Last but not least, while the COVID-19 pandemic is now under control, WHO warned that we had not completely overcome it.²³⁴ Along with the process of globalization, the gap between rich and poor, and the inequality in basic human rights has increased, especially in Africa²³⁵. Another global pandemic can suddenly break out at any time. The most recent is the monkeypox outbreak and 12 countries have reported cases²³⁶. Therefore, studying the means of communication and their roles in Vietnam during the COVID-19 pandemic is not only meaningful to Vietnam but also other countries and territories as well. At the same time, it could be work for all countries and territories to join hands to repel and prevent future global pandemic so that “no one is left behind”.

Acknowledgements

The author would like to acknowledge Associate Professor Luong KH, Associate Professor Mai DN, and Dr Luong NV for helping the author complete this study. The author is also grateful to survey and interview participants for their informative empirical data. Any content errors, however, remain the sole responsibility of the author.
