**SOCIO-ECONOMIC AND ENVIRONMENTAL
ISSUES IN DEVELOPMENT, 2022**

Steering Committee

1. Assoc. Prof. Dr. Bui Huu Nhung, Vice President, NEU, Vietnam
2. Dr. Trinh Mai Van, Deputy Head, Department of Science Management, NEU, Vietnam
3. Assoc. Prof. Dr. Dinh Duc Truong, Dean, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
4. Assoc. Prof. Dr. Orathai Piayura, Dean, Faculty of Humanities and Social Sciences, Khon Kaen University, Thailand

Organizing Committee

1. Assoc. Prof. Dr. Dinh Duc Truong, Dean, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
2. Dr. Trinh Mai Van, Deputy Head, Department of Science Management, NEU, Vietnam
3. Assoc. Prof. Dr. Pham Thi Bich Chi, Head, Department of Planning and Finance, NEU, Vietnam
4. Dr. Dao Thanh Tung, Head, Department of International Cooperation, NEU, Vietnam
5. MA. Bui Duc Dung, Head, Department of Administration, NEU, Vietnam
6. Dr. Vu Trong Nghia, Head, Department of Communication, NEU, Vietnam
7. Dr. Le Viet Thuy, Director, Center for Applied Information Technology, NEU, Vietnam
8. Dr. Nguyen Thi Thanh Huyen, Vice Dean, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
9. Assoc. Prof. Dr. Le Thu Hoa, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
10. Dr. Nguyen Cong Thanh, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
11. BSc. Bui Huy Hoan, Department of Science Management, NEU, Vietnam
12. Assoc. Prof. Dr. Orathai Piayura, Dean, Faculty of Humanities and Social Sciences, Khon Kaen University, Thailand
13. Assoc. Prof. Dr. Sutida Ngonkum, Faculty of Humanities and Social Sciences, Khon Kaen University, Thailand
14. Assistant Prof. Dr. Ratana Chanthao, Faculty of Humanities and Social Sciences, Khon Kaen University, Thailand

Proceeding Editorial Board and Peer Reviewers

1. Assoc. Prof. Dr. Dinh Duc Truong, Dean, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
2. Assoc. Prof. Dr. To Trung Thanh, Head, Department of Science Management, NEU, Vietnam
3. Dr. Trinh Mai Van, Deputy Head, Department of Science Management, NEU, Vietnam
4. Dr. Nguyen Thi Thanh Huyen, Vice Dean, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
5. Dr. Doan Quang Tri, General Administration of Hydro-Meteorology, MONRE, Vietnam
6. Assoc. Prof. Dr. Le Ha Thanh, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
7. Assoc. Prof. Dr. Nguyen Ngoc Son, Dean, Faculty of Planning and Development, NEU, Vietnam
8. Dr. Ngo Thi Phuong Thao, Dean, Faculty of Real Estate and Resources Economics, NEU, Vietnam
9. Dr. Nguyen Kim Hoang, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
10. Assoc. Prof. Dr. Pham Thi Huyen, Faculty of Marketing, NEU, Vietnam
11. Dr. Nguyen Cong Thanh, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
12. Assoc. Prof. Dr. Vu Thi Hoai Thu, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
13. Assoc. Prof. Dr. Tran Van Nam, Dean, Faculty of Law, NEU, Vietnam
14. Assoc. Prof. Dr. Pham Thi Thanh Thuy, Dean, Faculty of Foreign Languages Economics, NEU, Vietnam
15. MA. Le Huy Huan, Faculty of Environmental, Climate Change and Urban Studies, NEU, Vietnam
16. Assoc. Prof. Dr. Orathai Piayura, Dean, Faculty of Humanities and Social Sciences, Khon Kaen University, Thailand
17. Assoc. Prof. Dr. Sutida Ngonkum, Faculty of Humanities and Social Sciences, Khon Kaen University, Thailand
18. Assistant Prof. Dr. Ratana Chanthao, Faculty of Humanities and Social Sciences, Khon Kaen University, Thailand

LIST OF PAPERS DIVIDED BY TOPIC

PART 1: ECONOMIC DEVELOPMENT AND INTEGRATION

1. **ARE BIG DIFFERENCES AMONG VALUE ADDED TAX OF VIETNAM, THAILAND AND CHINA?** 1
Nguyen Tat Thang, Tran Manh Dung, Truong Quang Cuong
Pham Thi Thuy Hang, Pham Huy Hung
Dinh Thi Thanh Nga, Nguyen Thi Hoai Thu
2. **APPLYING STRUCTURAL EQUATION MODELING TO IDENTIFY DETERMINANTS OF MICRO, SMALL AND MEDIUM ENTERPRISES' SUSTABILITY** 14
Cao Thuy Xiem, Do Van Huan, Truong Doan The
3. **BLOCKCHAIN TECHNOLOGY ADOPTION BARRIERS IN VIETNAM AGRICULTURE SUPPLY CHAIN: INTERVAL-VALUE HESITANT FUZZY DEMATEL APPROACH.....** 29
PhD student. Tran Dinh Hieu, Prof. Dr. Tsai Jung-fa
Dr. Nguyen Phi Hung, Prof. Dr. Lin Ming Hua
4. **LABOR QUALITY ADJUSTMENT IN PRODUCTIVITY MEASUREMENT: THE CASE OF VIETNAMESE AGRICULTURE** 40
Le Hoang Minh Nguyet
5. **IMPACTS OF MONETARY POLICY ON VIETNAM'S ECONOMIC GROWTH.....** 48
MA. Le Tat Phuong
6. **RICE EXPORT IN THE WORLD MARKET IN THE CONTEXT OF COMMITMENT OF CARBON EMISSION REDUCTION: CASE STUDIES IN VIETNAM AND THAILAND.....** 58
MSc. Nguyen Van Trong
MSc. Bui Thi Viet Anh
7. **RESEARCH ON THE IMPACT OF TECHNICAL BARRIERS TO TRADE (TBT) AND SANITARY AND PHYTOSANITARY MEASURES (SPS) ON VIETNAM'S EXPORT OF SEAFOOD AND CEREALS.....** 67
Nguyen Thu Phuong, Nguyen Thien An, Nguyen Ba Thai Duy
Do Hai Anh, Ngo Hong Son
8. **BUILDING A FINANCIAL EXHAUSTION FORECASTING MODEL FOR VIETNAMESE STEEL INDUSTRY ENTERPRISES** 78
MBA. Ngo Thanh Xuan, Bui Nguyen Tu Uyen, Nguyen Thi Van Anh

9.	FACTORS AFFECTING INTERNATIONAL SUPPLY CHAIN COOPERATION OF VIETNAMESE SEAFOOD ENTERPRISES.....	88
	Assoc. Prof. Dr. Nguyen Xuan Hung, Nguyen Hoang Duong Tran Ngoc Duong, Mai Thi Xuan Lan Nguyen Duc Manh, Bui Thi Tuoi	
10.	THE IMPACT OF HUMAN CAPITAL ON SOCIAL MOBILITY IN VIETNAM	102
	Dr. Hoang Thi Hue, Nguyen Thu Hang, Dinh Viet Giang Dang Yen Nhi, Nguyen Thi Binh	
11.	IMPORTANCE OF CUSTOMER SERVICE AND LAST MILE DELIVERY IN ORDER MANAGEMENT OF E-COMMERCE B2C VIETNAM	120
	MA. Pham Thi Minh Hanh	
12.	TRADE RELATION BETWEEN VIETNAM AND THAILAND: EVIDENCE FROM TRADE INDICES.....	129
	MSc. Le My Linh	
13.	IMPACT OF FOREIGN DIRECT INVESTMENT ON EMPLOYMENT AND WAGE GAP BY GENDER IN VIETNAM.....	143
	Doan Thi Kim Tuyen	
14.	DETERMINANTS OF TOTAL FACTOR PRODUCTIVITY OF DOMESTIC SUPPORTING INDUSTRY FIRMS IN VIETNAM.....	155
	MSc. Nguyen Quynh Trang, Assoc. Prof. Dr. To Trung Thanh	
15.	PROMOTE ECONOMIC COOPERATION WITH THE ASIA-PACIFIC REGION IN THE PROCESS OF VIETNAM'S ECONOMIC INTEGRATION.....	167
	Dr. Ngo Tuan Anh	
16.	THE CURRENT SITUATION OF VIETNAM'S SEAFOOD EXPORTS TO EU MARKET: BARRIERS AND DIRECTIONS	177
	Assoc. Prof. Dr. Dinh Duc Truong, Nguyen Thu Trang Nguyen Xuan Duy Anh, Nguyen Thi Minh Phuong, Vu Minh Anh	
17.	THE EFFECTS OF FINANCIAL DEVELOPMENT AND ECONOMIC GROWTH ON CO₂ EMISSIONS IN VIETNAM	187
	Le Thi Thuy Hang 187	
18.	SOLUTIONS TO PROMOTE ECONOMIC GROWTH IN VIETNAM 2022: OPPORTUNITIES AND CHALLENGES	199
	Dr. Dong Thi Ha, MA. Vu Thi Thanh Huyen	
19.	THE MERIT OF BORDER CARBON TAX ADJUSTMENT AND ITS IMPACT ON THE TRADE AND ECONOMY OF VIETNAM.....	207
	LLM. Do Minh Thu, LLM. Anna Mae Avenido	

20.	FRAUD RISK FACTORS AFFECTING FRAUDULENT FINANCIAL REPORTING: THE ANALYSIS OF FRAUD CASES	220
	Dr. Doan Thanh Nga, Dr. Ta Thu Trang	
21.	ATTRACT HIGHLY-SKILLED FOREIGN WORKERS IMMIGRANTS TO VIETNAM: SOME POLICY IMPLICATIONS	233
	Nguyen Phuong Trang	
22.	DEVELOPING THE NIGHT-TIME ECONOMY IN HANOI CITY	246
	Assoc. Prof. Dr. Nguyen Ngoc Son, Dr. Nguyen Thi Phuong Thu Dr. Ngo Quoc Dung, Dr. Bui Thi Thanh Huyen	
23.	AWARENESS AND BEHAVIOR OF YOUNG PEOPLE TOWARDS NIGHT-TIME ECONOMY: A CASE STUDY IN HANOI	258
	Dr. Nguyen Thi Thu Thuy, Dang Minh Tam Vu Thi Hoang Dieu, Nguyen Doan Minh Trang	
24.	CURRENT SITUATION AND POLICY SOLUTIONS TO MANAGE IMPORTED TIMBER MEETING THE LEGAL TIMBER REQUIREMENTS OF VIETNAM.....	271
	Dr. Hoang Lien Son, Dr. Nguyen Gia Kiem MSc. Pham Thi Luyen, MSc. Vu Duy Hung MSc. Nguyen Thi Thu Ha, Dr. Bui Thi Minh Nguyet Dr. Kieu Tuan Dat	
25.	IMPACT OF GREEN LOGISTICS ON INTERNATIONAL TRADE: AN EMPIRICAL STUDY IN ASIA – PACIFIC ECONOMIC COOPERATION (APEC)	285
	Nguyen Thuong Lang, Le Thu Hien, Khuat Thi Mai Huong Nguyen Huu Kien, Nguyen Thanh Vu Linh, Pham Thi Phong Thu	
26.	RESEARCH ON THE SUCCESSFUL LEVEL OF THE STATE'S ROLE IN VIETNAM'S TOURISM DEVELOPMENT AFTER FORMING THE ASEAN ECONOMIC COMMUNITY (AEC)	303
	Dr. Nguyen Thi Anh Tuyet	
27.	CURRENCY, FINANCIAL STABILITY IN VIETNAM IN THE PROCESS OF INTERNATIONAL ECONOMY INTERGRATING	312
	Dr. Doan Phuong Thao	
28.	THE RECENT EVOLUTION OF EXCHANGE RATE POLICIES IN VIETNAM	321
	Dao Bui Kien Trung, Dao Bui Trung Kien, Tran Thi Thuy Duong	

PART 2: BUSINESS ADMINISTRATION

29. **EFFECTS OF GREEN MARKETING STRATEGY ON GREEN FOOD PURCHASE INTENTIONS: CASE STUDY OF WINMART SUPERMARKETS337**
Assoc. Prof. Dr. Vu Tri Dung, Dang Thi Nhu Quynh
Nguyen Dieu Linh, Nguyen Thi Thu Hang
Nguyen Thi My Hanh, Vu Thi Tam
30. **RESEARCH ON FACTORS AFFECTING TO CAPITAL STRUCTURE OF TOURISM ENTERPRISES IN VIETNAM.....347**
Dr. Dinh Thi Hai Hau, Dr. Ha Van Sy, Ha Dieu Linh
Dr. Vu Xuan Dung, Dr. Pham Thi Thu Ha
31. **MOSCOW TECHNIQUE IN PROJECT MANAGEMENT: RESEARCH ON REQUIREMENT PRIORITIZATION RATIO IN SOFTWARE PROJECT TO INCREASE CUSTOMER SATISFACTION BASED ON MOSCOW-INTEGRATED KANO MODEL361**
MSc. Ton Nguyen Trong Hien, Ton Nguyen Minh Hien
32. **FACTORS AFFECTING THE QUALITY OF AUDIT SERVICES OF FINANCIAL STATEMENTS IN VIETNAM, RESEARCH FROM THE PERSONAL PERSONALITY OF AUDIT CUSTOMERS369**
Pham Huy Hung
33. **FACTORS AFFECTING THE APPLICATION OF BSC TO IMPROVE THE OPERATIONAL EFFICIENCY OF LISTED COMPANIES IN VIETNAM .383**
Dr. Ta Thu Trang, Dam Tuan Anh, Pham Trinh Manh Quyen
Vu Minh Tu, Nguyen Thi Van Anh, Nguyen Thi Nhu Quynh
34. **IMPACTS OF CORPORATE SOCIAL RESPONSIBILITY ON BRAND AWARENESS IN VIETNAM400**
Nguyen Thi Thanh Nhan, Nguyen Quoc Cuong, Nguyen Ngoc Anh Tu
35. **RESEARCH THE FACTORS THAT IMPACT TO SUCCESSFUL EKYC'S IMPLEMENTATION IN VIETNAMESE BANKS412**
Nguyen Thi Bach Tuyet, Nguyen Khanh Linh, Bui Phuong Linh
Dang Tien Dat, Nguyen Vu Phuong Anh, Nguyen Ba Huy
36. **FINANCIAL INCLUSION DEVELOPMENT IN SOME COUNTRIES AND VIETNAM430**
Truong Thi Hoai Linh

37. **THE IMPACT OF BELIEF, ATTITUDE AND SUBJECTIVE NORM ON OCOP PRODUCTS PURCHASE INTENTION OF VIETNAMESE CONSUMERS 437**
 Dr. Phan Thi Thanh Hoa, Nguyen Le Kim Ngan, Nguyen Le Phuong Nga
 Trinh Ngoc Anh, Nguyen Thi Thuy Linh
38. **STUDY ON THE EFFECTS OF CORPORATE GOVERNANCE ON ENTERPRISE EFFICIENCY: EXPERTIVE EVIDENCE FROM NON-FINANCIAL ENTERPRISES LISTED ON THE VIETNAM STOCK MARKET 446**
 PhD. Nguyen Thi Hong Nham
39. **DETERMINANTS OF BUSINESS PERFORMANCE OF THE FIRMS: A CASE OF VIETNAM LISTED BANKS..... 455**
 Dr. Vu Ngoc Xuan, Dr. Nguyen Tuan Anh
40. **THE EFFECT OF POLITICAL CONNECTION ON FIRM'S OPERATIONAL EFFICIENCIES: THE CASE OF SMES IN VIETNAM..... 466**
 Duong Thuy Linh
41. **FACTORS AFFECTING HANOI STUDENTS' ENTREPRENEURIAL INTENTION IN THE FIELD OF CLEAN AGRICULTURE 480**
 Assoc. Prof. Dr. Vu Thi Minh, Dang Thi Ngoc
 Do Thuy Linh, Nguyen Thi Ngoc
42. **THE IMPACTS OF AGENCY COSTS ON THE PERFORMANCE OF VIETNAMESE LISTED REAL ESTATE FIRMS 492**
 Tran Phuoc Huy, Nguyen Thi Hien Anh, Pham Thi Kieu An
 Nguyen Thi Kim Anh, Nguyen Anh Thu, Nguyen Bao Quyen
 Nguyen Thuy Linh
43. **THE RELATIONSHIP BETWEEN HRM, INNOVATIVE WORK BEHAVIOR, AND EMPLOYEE PERFORMANCE AT COMMERCIAL BANKS 506**
 Le Thuc Anh, Tran Huong Giang, Vu Minh Huyen
 Nguyen Quynh Ngoc, Dang Thu Trang
44. **FACTORS AFFECTING LOYALTY ATTITUDE AND BEHAVIORAL LOYALTY CUSTOMERS' QUALITY OF BANKING SERVICES IN HA NOI 518**
 Assoc. Prof. Dr. Pham Van Tuan, Le Thi Phuong Huyen
 Hoang Le Anh Tho, Do Ha Xuyen
 Nguyen Quynh Chi, Le Ngoc Yen Chi

45. **THE IMPACT OF INFORMAL COMPETITION ON PRODUCT AND PROCESS INNOVATION IN VIETNAM.....527**
 Dr. Tran Lan Huong, Le Tri Nhan, Nguyen Thi Ngoc Anh
 Nguyen Linh Trang, Le Viet Hoang
46. **THE EFFECT OF CUSTOMER RELATIONSHIP AND ASSOCIATION MEMBERSHIP ON SME’S INNOVATION: EVIDENCE IN VIETNAM.....544**
 MSc. Chu Mai Linh, Nghiem Hoang Phong, Du Thoai Ngoc
47. **CORPORATE SOCIAL RESPONSIBILITY IN TECHNOLOGY ENTERPRISES.....553**
 Le Huy Huan, Nguyen Thi Binh Minh, Phan Thi Thu Hien
48. **BOARD OF DIRECTORS AND BUSINESS PERFORMANCE: A CASE STUDY IN THE REAL ESTATE AND CONSTRUCTION SECTOR566**
 Nguyen Van Chien
49. **THE IMPACT OF DEVELOPMENT INVESTMENT ON ENTREPRENEURSHIP PERFORMANCE IN GLOBAL VALUE CHAIN..574**
 Dinh Thuy Dung, Tran Hoai Nam
50. **THE IMPACT OF CORPORATE SOCIAL RESPONSIBILITIES ON CUSTOMER ATTITUDE WITH CUSTOMER PERCEIVED VALUE AS MEDIATING VARIABLE581**
 Nguyen Thi Ngoc Anh, Nguyen The Bao
 Do Trang Linh, Huynh Dac Son Tung
51. **IMPACTS OF CORPORATE SOCIAL RESPONSIBILITY ON EMPLOYEE OUTCOMES IN COMMERCIAL BANK: PROPOSAL RESEARCH.....593**
 Thanh Kim Hue

PART 3: INFORMATION TECHNOLOGY AND DIGITAL ECONOMY

52. **TOUCHLESS HOTEL - A POTENTIAL SUSTAINABLE MODEL FOR THE HOSPITALITY INDUSTRY IN THE POST-PANDEMIC PERIOD THE CASE IN HOTELS IN VUNG TAU, VIETNAM.....603**
 Pham Xuan Quyet, Tran Ngoc Anh Vu
53. **THE PROSPECT O PEER-TO-PEER ACCOMMODATION: A CASE STUDY OF AIRBNB IN HANOI.....617**
 Nguyen Ha My, Nguyen Huu Binh Nguyen, Hoang Nguyen Long
 Nguyen Thao Hau, Nguyen Thi Minh Tam

54. **FACTORS INFLUENCING GENERATION Z INTENTION IN USING FINTECH DIGITAL PAYMENT SERVICES - EMPIRICAL STUDY IN VIETNAM 628**
 PhD. Nguyen Thi Hoai Phuong, Nguyen Dieu Thuy
 Tran Linh Giang, Bui Thi Ngoc Han
 Tieu Hoang Hieu, Nguyen Tan Long
55. **THE PERCEIVED SECURITY OF CUSTOMERS WHEN DECIDING TO USE E-COMMERCE SERVICES IN VIETNAM 640**
 Nguyen Phuong Anh, Dao Phuong Thuy, Dang Quynh Anh
 Ngo Quoc Anh, Dr. Do Anh Duc
56. **A RESEARCH ON FACTORS AFFECTING PURCHASE INTENTION OF ORGANIC AGRICULTURAL PRODUCTS ONLINE AMONG NORTHERN CONSUMERS 652**
 Dr. Trinh Hoai Son, Vu Thi Dieu, Do Thi Hoang Anh
 Nguyen Thi Anh, Bui Thi Lieu Duong, Nguyen Van Khuong
57. **A RELATIONSHIP BETWEEN EWOM, CONSUMER PERCEIVED VALUES AND BEHAVIORAL INTENTION TO BUY ORGANIC AGRICULTURAL PRODUCTS ON E-MARKETPLACE: A CASE STUDY IN HANOI, VIETNAM..... 661**
 Bui Minh Chinh, Le Hoai Thuong, Nguyen Thi Thuong
 Hoang Thi Hai Ngan, Hoang Thi Mai Thuong,
 Dr. Nguyen Thanh Lan
58. **THE IMPACT OF GAMIFICATION ON ONLINE PURCHASE INTENTION ON E-COMMERCE APPLICATIONS OF GEN Z CONSUMERS IN VIETNAM 673**
 Le Anh Duc, Vu Khanh Huyen, Tran Thi Lan Anh
 Nguyen Bao Quyen, Nguyen Trong Tung, Tran Thuy Hien
59. **IMPACT OF AUGMENTED REALITY TECHNOLOGY ON SAFENESS AND MEDIA USEFULNESS ON USER EXPERIENCE ON ONLINE SALES PLATFORMS..... 688**
 Ph.D. Nguyen Dinh Toan, Ngo Hong Hanh, Ninh Cong Thinh
 Nguyen Minh Quang, Trinh Ngoc Hung
60. **FACTORS AFFECTING THE YOUNG’S IMPULSE BUYING BEHAVIOR ON E-COMMERCE PLATFORMS FOR COSMETIC PRODUCTS..... 696**
 Bui Minh Duc, Nong Hoang Anh, Ha Huong Giang
 Dang Hoang Yen Nhi, Le Quynh Lan

61. **MOTIVATIONS FOR INDIVIDUALS TO PARTICIPATE IN SELLING ON SHOPEE IN VIETNAM IN THE CONTEXT OF THE DIGITAL ECONOMY: A QUALITATIVE STUDY.....706**
 Dr. Nguyen Dieu Hang, Pham Thi Hoai Thu, Vu Hoang Giang
 Nguyen Vu Phuong Nam, Nguyen Quynh Anh
62. **ANALYSIS OF P2P ONLINE LENDING MODEL SELECTION AND SUPERVISION BASED ON EVOLUTIONARY GAME THEORY715**
 Dr. To Minh Huong
63. **THE EFFECTS OF SOCIAL CAPITAL ON STUDENTS’ ONLINE IMPULSE BUYING728**
 Bui Thi Thanh Huyen, Ha Thi Hoai Thuong, Tran Thi Anh
 Nguyen Thi Lua, Bui Thi Thuy Linh
64. **YOUTUBER'S EFFECT ON PURCHASE INTENTION OF YOUNG VIETNAMESE.....737**
 Nguyen Minh Ngoc, Nguyen Thi Khanh Hoai, Nguyen Thi Hong Loan
65. **IMPACT OF TECHNOSTRESS AND TECHNOLOGY SELF-EFFICACY ON THE INTENTION TO USE FINTECH SERVICES OF YOUNG PEOPLE IN HANOI750**
 Dr. Tran Phuoc Huy, Tran Thi Thuong, Nguyen Khanh Ly
 Nguyen Thi Hien Trang, Nguyen Hong Bao Cach, Nguyen Thuy Linh
66. **THE EFFECT OF DURATION AND THEMATIC CONGRUENCE ON PODCAST ADVERTISING ON BRAND AWARENESS: AN EXPERIMENTAL RESEARCH ON UNIVERSITY STUDENTS IN HANOI762**
 MSc. Hoang Tuan Dung, Pham Le Quynh Anh, Tran Thi Thao Dan
 Le Thanh Giang, Nguyen Thi Hoa, Tran Thi Thanh Hoa
67. **FACTORS INFLUENCING ONLINE SHOPPING INTENTION BASED ON THE EXPANDED TAM773**
 Truong Thi Thu Huong, Assoc. Prof. Dr. Le Anh Tuan
68. **THE IMPACT OF THE INDUSTRIAL REVOLUTION 4.0 ON LOGISTICS BUSINESSES: A CASE IN MEKONG DELTA783**
 Huang Ying Ying, Ngo Hong Ngoc
69. **AE-COMMERCE TAX POLICY: INTERNATIONAL EXPERIENCE AND LESSONS FOR VIETNAM.....793**
 Assoc. Prof. Dr. Nguyen Thi Thuy Duong, Nguyen Thuy Linh

70. **THE DIGITAL TRANSFORMATION OF VIETNAM LOGISTICS SERVICES PROVIDERS: BARRIERS AND RECOMMENDATIONS..... 803**
MSc. Nguyen Thanh Nga
71. **FACTORS AFFECTING ONLINE PURCHASE BEHAVIOR ON THE PEOPLE’S ELECTRONIC COMMERCE PLATFORM IN HANOI..... 812**
Dr. Tran Thi Kim Nhung, Nguyen Thuy Trang
Chu Dieu Thuy, Nguyen Phuong Ha, Pham Huy Hoang
Duong Le Ha Vi, Nguyen Ngoc Linh
Nguyen Manh Cuong
72. **VIETNAM'S OPPORTUNITIES AND CHALLENGES FROM THE INNOVATION START-UP IN INNOVATION IN DIGITAL TRANSFORMATION..... 826**
MA. Nguyen Chu Du
73. **DIGITAL ECONOMIC DEVELOPMENT EXPERIENCE OF SOME ASIA COUNTRIES AND POLICY IMPLICATIONS FOR VIETNAM..... 834**
Dr. Nguyen Mai Phuong
74. **DEVELOPMENT OF E-COMMERCE IN VIETNAM: OPPOTUNITIES AND CHALLENGES 845**
MA. Do Thi Nga
75. **THE INFLUENCE OF DIGITAL TRANSFORMATION ON JOB SATISFACTION AND WORK-LIFE BALANCE OF EMPLOYEES IN THE BANKING INDUSTRY IN VIETNAM..... 856**
Dr. Phung Minh Thu Thuy, Tran Cong Thanh, Nguyen Thi Van Anh
Nguyen Nhat Thanh, Nguyen The Long Hai
76. **THE ROLE OF DIGITAL TRANSFORMATION IN AGRICULTURE IN TUYEN QUANG PROVINCE..... 867**
MA. Nguyen Thi Hai Huong
77. **DEVELOPING INFORMATION TECHNOLOGY HUMAN RESOURCES TO MEET THE REQUIREMENTS OF DIGITAL TRANSFORMATION..... 876**
MSc. Bui Thi Bich Thuan
78. **INFLUENCE OF EWOM ON THE INTENTION TO USE DIGITAL BANKING: A RESEARCH ON GENERATION Z CUSTOMERS IN HANOI, VIETNAM 888**
M.A. Nguyen Viet Ha, Assoc. Prof. Dr. Truong Dinh Chien

PART 4: RESOURCES, ENVIRONMENT AND CLIMATE CHANGE

79. **DETERMINE FINANCIAL CONTRIBUTION RESPONSIBILITY IN THE IMPLEMENTATION OF EXTENDED PRODUCER RESPONSIBILITY (EPR) POLICY IN VIETNAM905**
Assoc. Prof. Dr. Le Thu Hoa
80. **THE IMPACT OF ECO-LABEL ON GREEN PURCHASE BEHAVIOR OF VIETNAMESE YOUTH.....918**
PhD, Nguyen Dinh Toan, Dang Thi Ngoc Anh, Nguyen Thi Hoang Yen
Hoang Thi Thu Trang, Vu Thi Bich Huyen, Nguyen Thi Thu Phuong
81. **EFFECTS OF GREEN SUPPLY CHAIN MANAGEMENT PRACTICES ON SUSTAINABILITY PERFORMANCE.....934**
Assoc. Prof. Dr. Nguyen Xuan Hung, Nguyen Quang Son, Le Mai Huong
Nguyen Phuong Dung, Do Trong Hieu, Vu Van Hop
82. **EXPLORING STRATEGIC BEHAVIOUR IN CHOICE EXPERIMENTS: A CASE OF AIR QUALITY IMPROVEMENTS IN HANOI CITY, VIETNAM...946**
Dr. Nguyen Cong Thanh
83. **MEASURING THE EFFICIENCY OF IRRIGATION SYSTEMS USING DATA ENVELOPMENT ANALYSIS METHOD: THE CASE OF BAC HUNG HAI958**
Dr. Le Thanh Phuong
84. **EFFECTS OF FINANCIAL DEVELOPMENT ON TRADES IN GREEN GOODS: INTERNATIONAL EVIDENCE966**
Nguyen Thu Hien, Nguyen Thi Thu Hang
85. **ACHIEVEMENTS AND CHALLENGES OF RENEWABLE ENERGY DEVELOPMENT IN VIETNAM982**
Assoc. Prof. Dr. Dinh Duc Truong
86. **AN OVERVIEW OF INFLUENCES OF MICROPLASTICS POLLUTION ON SOILS AND PLANTS995**
PhD. Tran Ly Tuong, PhD. Truong Thi Hoang Ha
87. **FACTORS AFFECTING FINANCING DECISION FOR WIND ENERGY PROJECTS IN VIETNAM.....1007**
Cao Truong Giang

88. **DETERMINANTS OF WILLINGNESS TO PAY FOR IMPROVING SERVICES OF MUNICIPAL SOLID WASTE COLLECTION AND TRANSPORTATION: THE CASE OF THANH HOA CITY 1022**
 Dr. Ngo Thanh Mai, Nguyen Tram Anh
89. **APPLICATION OF FISHING MANAGEMENT SYSTEM, METHODS: CHINA’S EXPERIENCE AND LESSONS FOR VIETNAM 1031**
 Dr. Ha Thi Thanh Thuy, MA. Dao Hong Van
90. **RESPONSES TO GLOBAL CLIMATE CHANGE: VIETNAM’S INITIATIVE AND IMPRINTS 1048**
 Dr. Nguyen Thi Anh
91. **GREEN PROACTIVENESS ORIENTATION AND GREEN PERFORMANCE: A LITERATURE REVIEW 1061**
 Le Huy Huan, Phung Thi Thao Nguyen, Phan Thi Thu Hien
92. **DIFFERENTIATING PRODUCTS TO EXPLOIT INTERNATIONAL MARKET OPPORTUNITIES FOR NATURAL FLAVORING INSECT REPELLENT PRODUCTS 1074**
 Assoc. Prof. Dr. Nguyen Thuong Lang
 Nguyen Hoang Duong, Ngo Khanh Huyen
93. **DETERMINANTS OF ENERGY CONSERVATION INTENTION IN VIETNAMESE HOUSEHOLDS BASED ON THE THEORY OF PLANNED BEHAVIOR AND THE KNOWLEDGE - ATTITUDE - BEHAVIOR MODEL..... 1088**
 MSc. Le Bao Ngoc
94. **LOAD ESTIMATION OF SOME HEAVY METALS (CU, FE, MN, ZN, PB) AT CAI RIVER MOUTH (NHA TRANG, KHANH HOA) USING LOADEST MODEL 1098**
 Pham Hong Ngoc, Assoc. Prof. Dr. Dao Viet Ha, Le Trong Dung
 Le Hung Phu, Nguyen Hong Thu
95. **INTERNATIONAL LAW ON FIGHTING CLIMATE CHANGE AND EXPERIENCE FOR VIETNAM..... 1108**
 LL.M. Huynh Thi Hong Nhien, LL.M. Nguyen Thanh Quyen
96. **ENVIRONMENTAL, SOCIAL AND GOVERNANCE (ESG) ECOSYSTEM TAKES ENVIRONMENTALLY SOUND TECHNOLOGIES (ESTS) AS THE FOCUS IN THE GOAL OF SUSTAINABLE DEVELOPMENT AND ENHANCES THE COMPETITIVENESS OF VIETNAMESE COMPANIES 1122**
 Thieu Thi Thu Thao, Dr. Nguyen Van Thanh

97. **THE ROLE OF NATURAL RESOURCES IN THE INFORMATION SOCIETY .1131**
Dr. Dinh Thien Duc, MA. Tran Thi Duong Ngan
98. **CIRCULAR ECONOMY IN VIETNAM: OPPORTUNITIES AND CHALLENGES.....1139**
Nguyen Thi Anh Ngoc, Nguyen Thi Diem, Truong Thi Hoang Oanh
99. **THE WILLINGNESS TO PAY OF VIETNAMESE PEOPLE FOR REDUCING AIRLINE CARBON EMISSIONS1150**
Assoc. Prof. Dr. Ngo Thi Phuong Thao, Nguyen Huy Thanh Nam
Chu Thuy Linh, Hoang Duc Nghia
100. **JOB OPPORTUNITIES ASSOCIATED WITH THE DEVELOPMENT OF SOLAR ENERGY IN NINH THUAN PROVINCE.....1170**
Dr. Tran Thi Tuyet, Le Thu Quynh, Nguyen Thi Hoa
101. **SPECIFICITY OF AN ELECTRONIC PRODUCT LIFE CYCLE: A CASE STUDY AT ENTERPRISES PRODUCING ELECTRONIC PRODUCTS IN VIETNAM.....1179**
MA. Le Quynh Anh, MA. Bui Nhat Giang,
Assoc. Prof. Dr. Nguyen Thi Phuong Hoa
102. **THE FACTORS AFFECTING VIETNAMESE HOUSEHOLDS’ ELECTRICITY- SAVING BEHAVIOR: AN EMPIRICAL STUDY USING EXTENDED THEORY OF PLANNED BEHAVIOR1189**
Dr. Nguyen Thi Hao, Dr. Nguyen Van Hau, Nguyen Thi Thu Phuong
103. **PAYMENT FOR FOREST ENVIRONMENTAL SERVICES IN VIETNAM .1204**
Dr. Pham Thi Linh, MA. Vu Viet Phuong
104. **AIR POLLUTION IN VIETNAM: IMPACT FROM THE ENVIRONMENT ..1218**
MA. Nguyen Vu Tram Anh, MA. Nguyen Trung Tien
105. **FACTORS AFFECTING THE SUSTAINABLE DEVELOPMENT OF RENEWABLE ENERGY: CASE STUDY ON SOLAR POWER IN DA NANG CITY1232**
PhD Candidate. Nguyen Duc Duong, MSc. Nguyen Tu Anh
106. **VIETNAM IN RESPONDING TO CLIMATE CHANGE: PERSPECTIVES, PRACTICES AND SOLUTIONS1245**
Assoc. Prof. Dr. Dinh Xuan Ly
107. **CLIMATE CHANGE AND AGRICULTURE IN VIETNAM: A GENDER PERSPECTIVE1255**
Assoc. Prof. Dr. Vu Thi Hoai Thu, Nguyen Vu Thu Anh

PART 5: URBAN AND REGIONAL DEVELOPMENT

108. **APPLICATION OF THE PLS-SEM MODEL TO RESEARCH THE IMPACT OF LAND ACQUISITION POLICY ON THE SATISFACTION AND LIFE OF PEOPLE IN THE SUBURBAN AREA IN HANOI CITY..... 1271**
Hoang Thu Linh, Hoang Yen Nhi, Phan Ha My
Vu Thi Bich Phuong, Le Thi Hai Anh
109. **DETERMINANTS OF RESIDENTIAL LAND PRICES: AN EMPIRICAL STUDY IN VIETNAM 1282**
Pham Phuong Nam
110. **FINANCE FOR SMART CITIES IN VIETNAM 1298**
Tran Le Thu Phuong, Duong Thi Van Anh, Nguyen Thi Mai Anh
Pham Thi Thu Hien, Dao Thi Bich Duyen
111. **THE IMPACT OF URBANIZATION ON THE REAL ESTATE MARKET IN VIETNAM..... 1316**
Dr. Nguyen Thi Thanh Huyen, Nguyen Cong Thanh
Nguyen Phuong Anh, Pham Thu Hue, Phan Anh Tuyet
Nguyen Thi Phuong Anh, Vu Thi Thanh Tam
112. **THE RELATIONSHIP BETWEEN PLACE ATTACHMENT, RESIDENTIAL SATISFACTION AND HOUSING BEHAVIORAL INTENTION: A CASE STUDY IN VIETNAM 1326**
Nguyen Thanh Ha, Pham Quynh Chi, Nguyen Cong Hao
Do Thi Len, Le Quynh Mai, Dr. Nguyen Thanh Lan
113. **RESEARCH ON THE INFLUENCE OF ONLINE KEY OPINION LEADERS ON VIETNAMESE TOURISTS' INTENTION TO REVISIT HOI AN ANCIENT TOWN..... 1337**
Le Thi Xinh
114. **LIVELIHOOD CHARACTERISTICS OF ETHNIC MINORITIES HOUSEHOLDS IN VAN HO DISTRICT, SON LA PROVINCE 1360**
Dr. Dao Thi Van Anh, Nguyen Thi Thach Thao
115. **GARDENING FOR SUSTAINABILITY IN URBAN VIETNAM..... 1368**
Dr. Dang Thi Anh Nguyet, Vu Dang Hoang, Bui Thi Thanh Thuy
116. **FACTORS AFFECTING THE LINKING SUSTAINABLE TOURISM IN THE NORTH CENTRAL REGION..... 1381**
Le Van Vien

117. **SOME SOLUTIONS TO IMPROVE INCOME ASSOCIATED WITH THE DEVELOPMENT OF GREEN ECONOMY FOR PEOPLE IN SONLA PROVINCE**1394
 Dr. Tran Thi Thanh Ha, Dr. Duong Van Manh, Dr. Pham Anh Tuan
118. **A STUDY ON THE FOREIGN DIRECT INVESTMENT STRUCTURE INTO HANOI CAPITAL REGION TOWARDS SUSTAINABLE DEVELOPMENT GOALS**1407
 PhD student. Bui Huy Cuong
119. **CHALLENGES OF PPP MODEL APPLICATION FOR THE URBAN WASTEWATER SECTOR IN VIETNAM**.....1421
 Assoc. Prof. Dr. Le Thi Bich Ngoc
120. **INFRASTRUCTURE PLANNING AND IMPLEMENTATION IN VIETNAM**.1430
 Dr. Nguyen Kim Hoang

Abstract

This study was conducted to show the specific differences between value added taxes between countries and illustrate the differences between the environments in Vietnam, Thailand and China. The secondary data collected is the legal framework for value added tax of Vietnam, Thailand and China. Based on this secondary data, we synthesize, compare, analyze and evaluate to determine if there is a significant difference in value added tax of Vietnam, Thailand and China. The results show that there are still many gaps between the understanding, calculation, measurement and recognition of value added tax. This is the basis for reference for individuals, organizations or tax legislators in Vietnam, contributing to the value-added tax in accordance with international practices.

Keywords: *value added tax, Vietnam, Thailand, China, tax framework*

1. Introduction

Vietnam is one of the fastest growing countries in the world. Contributing to those conditions, it is undeniable that tax is a large source of revenue for the State, especially

value-added tax. However, each country has different policies regarding this tax. Given the economic conditions of our country, all economic sectors are entitled to freedom of business and in law. Value-added tax is an indirect tax, calculated on the added value of products, goods and services from the process of production, circulation and to consumers. Value-added tax has the effect of regulating the income of organizations and individuals consuming goods and services subject to value-added tax. Value added incentives, export of goods. Promote the accounting, accounting, use of invoices and vouchers and payment via banks.

In this paper, the authors want to conduct an in-depth study of the value-added tax being applied in Vietnam, Thailand and China. At the outset, the main content of this tax for each country will be explained in detail. The author then wants to do some comparisons between the three countries to show the differences.

2. Framework of value added tax of Vietnam

VAT is an indirect tax, the cost of which ultimately falls on the consumer.

Taxpayers

The majority of transactions involving the supply of goods, the provision of services and imports will be subject to this tax. Broadly, VAT is levied on the value added at each stage of the production and distribution supply chain. Registered businesses act as collection points for the Value Added Tax department.

Tax rates

The standard rate is ten percent (10%). In addition, there are other rates of 5% and 0% and VAT exemption, as below:

0%: This rate applies to exported goods/services including goods/services sold to overseas/non-tariff areas and consumed outside Vietnam/in the non-tariff areas, goods processed for export or in-country export (subject to conditions), goods sold to duty free shops, certain exported services, construction and installation carried out for export processing enterprises, aviation, marine and international transportation services.

5%: This rate applies generally to areas of the economy concerned with the provision of essential goods and services. These include clean water; teaching aids; books; unprocessed foodstuffs; medicine and medical equipment; various agricultural products and services; technical/scientific services; rubber latex; sugar and its by-products; certain cultural, artistic, sport services/products and social housing.

Exemptions

Under this treatment, no output VAT shall be charged and the input VAT shall be uncreditable, but considered as deductible expenses for CIT purposes, comprising the following: Certain agricultural products; Supply of fertilizer, feed for livestock, poultry, seafood and other animals; Goods/services provided by individuals having annual revenue of VND 100 million or below; Imported or leased drilling rigs, airplanes and ships of a type which cannot be produced in Vietnam; Transfer of land use rights (subject to limitations); Financial derivatives and credit services (including credit card issuance, finance leasing and factoring); sale of VAT able mortgaged assets by the borrower under the lender's

authorization in order to settle a guaranteed loan and provision of credit information; Various securities activities including fund management; Capital assignment; Foreign currency trading; Debt factoring; Certain insurance services (including life insurance, health insurance, agricultural insurance and reinsurance); Medical services; Teaching and training; Printing and publishing of newspapers, magazines and certain types of books; Passenger transport by public buses; Transfer of technology, software and software services except exported software which is entitled to 0% rate; Gold imported in pieces which have not been processed into jewellery; Exported unprocessed mineral products such as crude oil, rock, sand, rare soil, rare stones, etc.; Imports of machinery, equipment and materials which cannot be produced in Vietnam for direct use in science research and technology development activities; Equipment, machinery, spare parts, specialized means of transport and necessary materials which cannot be produced in Vietnam for prospecting, exploration and development of oil and gas fields; Goods imported in the following cases: international non-refundable aid, including from Official Development Aid, foreign donations to government bodies and to individuals (subject to limitations).

In addition, there are regulated cases that goods and services are not required to declare and pay VAT, it means that no output VAT has to be charged but input VAT paid on related purchases may be credited, including: Compensation, bonuses and subsidies, except those provided in exchange for marketing/promotional services; Transfers of emission rights and other financial revenues; Certain services rendered by a foreign organization which does not have a PE in Vietnam where the services are rendered outside of Vietnam, including repairs to means of transport, machinery or equipment, advertising, marketing, promotion of investment and trade to overseas; brokerage activities for the sale of goods and services overseas, training, certain international telecommunication services; Sales of assets by non-business organizations or individuals who are not registered for VAT; Transfer of investment projects; Sale of agricultural products that have not been processed into other products or which have just been through preliminary processing; Capital contributions in kind; Certain asset transfers between a parent company and its subsidiaries or between subsidiaries of the same parent company; Collections of compensation/ indemnities by insurance companies from third parties; Collections on behalf of other parties which are not involved in the provision of goods/services (e.g. if company A purchases goods/services from company B, but pays to company C and subsequently company C pays to company B, then the payment from company C to company B is not subject to VAT); Commissions earned by (i) agents selling services, including postal, telecommunications, lottery, airlines/bus/ship/train tickets, at prices determined by principals; and (ii) agents for international transportation, airlines and shipping services entitled to 0% VAT; and (iii) insurance agents; Commissions from the sale of exempt goods/services.

Tax calculation methods

There are two VAT calculation methods:

Credit method applies to business establishments maintaining full books of account, invoices and documents in accordance with the relevant regulations, including: (i) Business

establishments with annual revenue subject to VAT of VND 1 billion or more, and (ii) Certain cases voluntarily registering for VAT declaration under the deduction method.

Accordingly, VAT payable = Output VAT – Input VAT.

Input VAT is creditable if it meets the requirements of: Relevant to business activities; Having sufficient legitimate invoice and vouchers; Settlement via forms of non-cash payment for transaction more than VND 20 million; and Paying under the registered bank account.

Indirect method applies to: Business establishments with annual revenue subject to VAT of less than VND1 billion; Individuals and business households; Business establishments which do not maintain proper books of account and foreign organizations or individuals carrying out business activities in forms not regulated in the Law on Investment; and Business establishments engaging in trading in gold, silver and precious stones.

Accordingly, VAT payable = revenue x ratio for direct VAT calculation.

Ratios for direct VAT calculation vary upon the business activities, as below: 1%: this ratio is for the business of “distribution, supply of goods”; 3%: this ratio is for “the production, transportation, service associated with goods, construction exclusive of the materials; 5%: this rate is for “service, construction exclusive of material”; and 2%: this ratio is for other business activities.

Tax refunds

If an enterprise's input VAT exceeds its output VAT during 12 consecutive months, it can claim a refund from the authorities.

In certain cases (e.g. exporters where excess input VAT credits exceed VND 300 million), a refund may be granted on a monthly/ quarterly basis. Newly established entities in the pre-operation investment phase may claim VAT refunds on a yearly basis or where the accumulated VAT credits exceed VND3 00 million.

Newly established entities and certain investment projects which are in the pre-operation stage may be entitled to refunds for VAT paid on imported fixed assets based on shorter timelines than normal, subject to certain conditions.

3. Framework of value added tax of Thailand

Value Added Tax (VAT) has been implemented in Thailand since 1992 replacing Business Tax (BT). VAT is an indirect tax imposed on the value added of each stage of production and distribution.

Taxpayers

Any person or entity who regularly supplies goods or provides services in Thailand and has an annual turnover exceeding 1.8 million baht is subject to VAT in Thailand. Service is deemed to be provided in Thailand if the service is performed in Thailand regardless where it is utilized or if it is performed elsewhere and utilized in Thailand.

An importer is also subject to VAT in Thailand no matter whether one is a registered person or not. VAT will be collected by the Customs Department at the time goods are imported.

Certain businesses are excluded from VAT and will instead be subjected to Specific Business Tax (SBT). Under VAT, taxable goods mean all types of property, tangible or intangible, whether they are available for sales, for own use, or for any other purposes. It also includes any types of articles imported into Thailand. Services refer to any activities conducted for the benefits of a person or an entity, which are not the supply in terms of goods.

Exemptions

Certain activities are exempted from VAT. Those activities are: small entrepreneur whose annual turnover is less than 1.8 million baht; Sales and import of unprocessed agricultural products and related goods such as fertilizers, animal feeds, pesticides, etc.; Sales and import of newspapers, magazines, and textbooks; certain basic services such as: transportation: domestic and international transportation by way of land; healthcare services provided by government and private hospitals as well as clinics; educational services provided by government and private schools and other recognized educational institutions; professional services: Medical and auditing services, lawyer services in court and other similar professional services that have laws regulating such professions; income from business, commerce, agriculture, industry, transport or any other activity not specified earlier; Cultural services such as amateur sports, services of libraries, museums, zoos; Services in the nature of employment of labor, research and technical services and services of public entertainers; Goods exempted from import duties under the Industrial Estate law imported into an Export Processing Zones (EPZs) and under Chapter 4 of the Customs Tariff Act; Imported goods that are kept under the supervision of the Customs Department which will be re-exported and be entitled to a refund for import duties; and Other services such as religious and charitable services, services of government agencies and local authorities.

Tax Base

- General Goods and Services

Tax base of VAT is the total value received or receivable from the supply of goods or services. Value means money, property, consideration, service fees, or any other benefits which is ascertainable in terms of money. Tax base will also include any Excise tax arises in connection with such supply. However, tax base is exclusive of the value added tax itself and does not include any discounts or allowances, but only if discounts or allowances are clearly shown in the tax invoices.

- Imported Goods

Tax base = C.I.F. price + Import duty + Excise Tax (if any) + other taxes and fees (if any)

- Exported Goods

Tax base = F.O.B. price + Excise Tax (if any) + other taxes and fees (if any)

Tax rates

General Rate: currently, the rate is 7 percent.

Zero Percent Rate: certain activities are liable to VAT at the rate of zero percent. Those activities include: export of goods; services rendered in Thailand and utilized outside Thailand in accordance with rule, procedure and condition prescribed by the Director-

General; aircraft or sea-vessels engaging in international transportation; supply of goods and services to government agencies or state-owned enterprises under foreign-aid program; supply of goods and services to the United Nations and its agencies as well as embassies, consulate-general and consulates; supply of goods and services between bonded warehouses or between enterprises located in EPZs.

Time of Supply

The time of supply of goods or services is important because it determines when a registered person should account for VAT. The time of supply will be determined as follows:

- Goods

General goods, the earliest of: the time of delivery; or when ownership of goods is transferred; or a payment is made; or a tax invoice is issued. Hire-purchase or installment sale, the earliest of: the time each payment is due; or a payment is made; or a tax invoice is issued. Supply of goods on consignment, the earliest of: the time the consignee makes delivery or transfers; or ownership of the goods to buyer; or a payment is made; or a tax invoice is issued. Imports, the earliest of: the time import duty is paid; or a guarantee is put up; or a guarantor is arranged for; or a bill of lading is issued. Exports, the earliest of: the time export duty is paid; or a guarantee is put up; or a guarantor is arranged for; or a bill of lading is issued; or goods are sent from Thailand to an EPZ; or goods are exported from a bonded warehouse.

- Services

In general, the earliest of the time a payment is made; or tax invoice is issued; or service is utilized. Service contract where payment is made according to the service performed, the earliest of the time a payment is made; or tax invoice is issued; or service is utilized. Imports: the time the payment is made.

Tax Invoice

VAT registered person or entity is required to issue tax invoices every time the transactions are made showing details of nature and value of goods sold or services provided and also amount of VAT due. Tax invoice is used as evidence for claiming input tax credit. Tax invoice must contain at least the following elements: The word "Tax invoice" in a prominent place; Name, address and tax identification number of the issuer; Name and address of the purchaser or customers; Serial numbers of tax invoice and tax invoice books (if applicable); Description, value and quantity of goods or services; Amount of VAT chargeable, and Date of issuance.

Tax calculation methods

$$VAT\ liability = Output\ Tax - Input\ Tax$$

"Output Tax" is a tax collected or collectible by VAT registered person from his customers when goods or services are supplied.

"Input Tax" is a tax charged by another registered person on any purchase of goods or provision of services. The term also includes any tax charged on imported goods.

Tax Refunds

In each month, if input tax exceeds output tax, taxpayer can claim for the refund, either in form of cash or tax credit to be used in the following months. Therefore, in case of

zero-rated, taxpayer will always be entitled to VAT refund. As for unused input tax, it may be creditable against output tax within the next 6 months. However, the refund can only be claimed within 3 years from the last day of filing date.

Certain input taxes, such as tax in relation to entertaining expenses, are not creditable under VAT. However, those non-creditable input taxes can instead be used as deductible expenses under Corporate Income Tax (CIT).

Tax Registration

Any person or entity who is liable to VAT in Thailand must register to be VAT registered person or entity (Form VAT 01) before the operation of business or within 30 days after its income reaches the threshold. The registration application must be submitted to Area Revenue Offices if the business is situated in Bangkok or to the Area Revenue Branch Offices if it is situated elsewhere. Should taxpayer have several branches, registration application must be submitted to the Revenue Office where the head-quarter is situated.

Tax Return and Payment

VAT taxable period is a calendar month. VAT return therefore must be filed on a monthly basis. VAT return (Form VAT 30) together with tax payment, if any, must be submitted to Area Revenue Branch Office within 15 days of the following month. If taxpayer has more than one place of business, each place of business must file the return and make a payment separately unless there is an approval from the Director-General of the Revenue Department. Services utilized in Thailand supplied by service providers in other countries are also subject to VAT in Thailand. In such a case, service recipient in Thailand is obliged to file VAT return (Form VAT 36) and pay tax, if any, on behalf of the service providers.

In the case where supply of goods or services is also subject to Excise tax, VAT return and tax payment, if any, must be submitted to the Excise Department together with Excise tax return and tax payment within 15 days of the following month. In case of imported goods, VAT return and tax payment must be submitted to the Customs Department at the point of import.

4. Framework of value added tax of China

VAT can apply to the sale and importation of goods in or to China, and the provision of all services in or to China. VAT also applies to the provision of services from China to overseas except where exemption or zero rating applies. VAT in China exhibits some of the features of other VAT regimes throughout the world (albeit with some uniquely Chinese characteristics), in the sense that it taxes final private consumption expenditure (as well as some public expenditure), by generally relieving the burden of VAT on transactions between businesses through an input VAT credit mechanism.

Taxpayers

VAT taxpayers fall into two categories: general VAT taxpayers and small-scale VAT taxpayers.

General VAT taxpayers refer to enterprises whose accumulated taxable income during a consecutive period of no more than 12 months, or four quarters, exceeds RMB 5 million or those who have a sound accounting system. Multiple VAT rates of 13%, 9%, and 6% apply to general VAT taxpayers. The input VAT can be credited against the output VAT.

Small-scale VAT taxpayers refer to enterprises whose accumulated taxable income during a consecutive period of no more than 12 months, or four quarters, are below RMB 5 million or without a sound accounting system. A 3% levying rate is applied to small-scale VAT taxpayers, but they cannot deduct input VAT from output VAT.

Newly registered companies or companies whose accumulated taxable income during a consecutive period of no more than 12 months, or four quarters, do not exceed RMB 5 million can voluntarily apply to be recognized as VAT general taxpayers, provided that they are capable of setting up legitimate, valid, and accurate bookkeeping and can provide accurate tax information to local tax authorities.

If a small-scale taxpayer derives revenue whose accumulated amount for the consecutive 12 months, or four quarters, reaches or exceeds RMB 5 million, it is required to register as a general VAT taxpayer within 15 days after the filing due date of the period in which the taxpayer meets the above threshold, or it shall be compulsorily ratified as a general VAT taxpayer.

Table 1. VAT taxpayers

Type	Small-scale VAT taxpayers	General VAT taxpayers
Taxable income	Equal to or less than RMB 5 million	More than RMB 5 million
VAT rate	3% (5%* on certain occasions)	13%, 9%, 6% and 0%
VAT payable	Tax-exclusive income x VAT levying rate (3%)	Current output VAT - current input VAT
VAT declaration	Monthly/quarterly	Monthly

Exemptions

Agricultural products; unprocessed by farmers; import goods for processing for export; import equipment to use in foreign investment capital projects or in projects are encouraged by the State; import equipment and tools to use direct in scientific research, experiment and education; imported supplies and equipment are sponsored by foreign governments, international organizations; dedicated import products for the disabled; contraceptive drugs and devices, antique books. Certain exported services: in general, the export of services is exempt from VAT. This includes services such as: Licensed international transportation services by Chinese domestic carriers; Production and publication of radio, film and television services for foreign entities abroad; Offshore outsourcing services; Research and development services provided to foreign entities abroad; Software services and information systems services provided to foreign entities abroad etc.

Tax rates

China maintains a multi-rate VAT system of 13%, 9%, 6% and 0%. The standard VAT rate of 13% is applied to the sale and importation of most goods, the provision of repair, replacement, processing services, and the leasing of tangible moveable assets unless otherwise stipulated by tax authorities. Reduced VAT rates apply to items as outlined below.

Table 2. Tax items and VAT rates

Sectors	Tax items	VAT rate
Most goods and some services	Sales and imports of most goods (unless otherwise specified) Labour services, including processing, repair, or assembling services Tangible moveable property leasing services	13%
Real estate, transportation, postal and agriculture	Agricultural, forestry, animal husbandry products: grains, vegetable oils, fresh milk, medicinal and other plants, agricultural machinery, fertilizer, and pesticide Tap water, heating, cooling, gas, coal/charcoal products for residential use Books, newspapers, magazines, audio-visual products, electronic publications Transportation services Postal services Basic telecommunications services Real estate, construction, transfer of ownership of properties and land use rights, real estate leasing service Other goods specified by the state council	9%
Services	Financial and insurance services Modern services: research and development, technical services, information technology services, cultural and creative services, logistics and ancillary services, leasing, consulting, radio, film and television services, etc. Lifestyle services: education, healthcare, travel, entertainment, catering, accommodation, cultural and sports services, other daily lifestyle services Value-added telecommunications services Intangible assets, excluding land-use rights Sales of virtual props for online games	6%
Small-scale taxpayers	For most goods and services, a uniform rate of 3% applies to small-scale VAT taxpayers	3% (*)
Exports	Export of goods and services (except where otherwise stipulated by the State Council)	0%

(*): except certain actual transactions applicable to 5% VAT rate

Tax calculation methods

- For general taxpayers, the basic formula for calculating VAT payable is:

$$\text{VAT payable} = \text{Output VAT in the current period} - \text{Input VAT in the current period}$$

If the output tax for the current period is insufficient to offset the input tax of the current period, the difference can be carried forward to the next term for continued offset.

When making a sale of goods or providing a taxable service, the taxpayer should calculate the amount of output VAT and charge this to the buyer according to the below formula:

$$\text{Output VAT} = \text{Sales} \times \text{VAT Rate}$$

The Interim Regulations define “sales” as the total amount of prices and other outlays received from the buyer, excluding output VAT. If the original price of the product(s) already includes VAT, the sales amount excluding VAT should be determined based on the formula:

$$\text{Sales} = \text{Sales including Output VAT} / (1 + \text{VAT Rate})$$

Input VAT is the VAT amount paid by the taxpayer when purchasing goods or taxable services.

- Small-scale taxpayers

For small-scale taxpayers, the formula for determining VAT payable is:

$$\text{VAT} = \text{Sales} \times \text{VAT levy Rate}$$

$$\text{Sales} = \text{Sales including VAT} / (1 + \text{VAT levy Rate})$$

5. Differences among value added tax of Vietnam, Thailand and China

Based on theoretical frameworks of value added tax among Vietnam, Thailand and China, differences are presented in Table 3, below:

Table 3. Differences among VAT of Vietnam, Thailand and China

Items	Vietnam	Thailand	China
Taxpayers	The majority of transactions involving the supply of goods, the provision of services and imports will be subject to this tax. Broadly, VAT is levied on the value added at each stage of the production and distribution supply chain. Registered businesses act as collection points for the Value Added Tax department.	Any person or entity who regularly supplies goods or provides services in Thailand and has an annual turnover exceeding 1.8 million baht is subject to VAT in Thailand. Service is deemed to be provided in Thailand if the service is performed in Thailand regardless where it is utilized or if it is performed elsewhere and utilized in Thailand. An importer is also subject to VAT in Thailand no matter whether one is a registered person or not	VAT taxpayers fall into two categories: general VAT taxpayers and small-scale VAT taxpayers.

Items	Vietnam	Thailand	China
Exemptions	<p>Under this treatment, no output VAT shall be charged and the input VAT shall be uncreditable, but considered as deductible expenses for CIT purposes;</p> <p>In addition, there are regulated cases that goods and services are not required to declare and pay VAT, it means that no output VAT has to be charged but input VAT paid on related purchases may be credited</p>	<p>Certain activities are exempted from VAT. Those activities are: small entrepreneur whose annual turnover is less than 1.8 million baht; Sales and import of unprocessed agricultural products and related goods such as fertilizers, animal feeds, pesticides, etc.; Sales and import of newspapers, magazines, and textbooks; certain basic services such as: transportation: domestic and international transportation by way of land; healthcare services provided by government and private hospitals as well as clinics; educational services provided by government and private schools and other recognized educational institutions; professional services: Medical and auditing services, lawyer services in court and other similar professional services that have laws regulating such professions; income from business, commerce, agriculture, industry, transport or any other activity not specified earlier; Cultural services such as amateur sports, services of libraries, museums, zoos; Services in the nature of employment of labour, research and technical services and services of public</p>	<p>Agricultural products; unprocessed by farmers; import goods for processing for export; import equipment to use in foreign investment capital projects or in projects are encouraged by the State; import equipment and tools to use direct in scientific research, experiment and education; imported supplies and equipment are sponsored by foreign governments, international organizations; dedicated import products for the disabled; contraceptive drugs and devices, antique books. Certain exported services: in general, the export of services is exempt from VAT. This includes services such as: Licensed international transportation services by Chinese domestic carriers; Production and publication of radio, film and television services for foreign entities abroad; Offshore outsourcing services; Research and development services provided to foreign entities abroad; Software services and information systems services provided to foreign entities abroad etc.</p>

Items	Vietnam	Thailand	China
		entertainers; Goods exempted from import duties under the Industrial Estate law imported into an Export Processing Zones (EPZs) and under Chapter 4 of the Customs Tariff Act; Imported goods that are kept under the supervision of the Customs Department which will be re-exported and be entitled to a refund for import duties; and Other services such as religious and charitable services, services of government agencies and local authorities.	
Tax rates	The standard rate is ten percent (10%). In addition, there are other rates of 5% and 0%	Currently, the rate is 7% and 0%	China maintains a multi-rate VAT system of 13%, 9%, 6% and 0%.
Tax calculation methods	There are two VAT calculation methods: credit method and indirect method	VAT liability = Output Tax - Input Tax "Output Tax" is a tax collected or collectible by VAT registered person from his customers when goods or services are supplied. "Input Tax" is a tax charged by another registered person on any purchase of goods or provision of services. The term also includes any tax charged on imported goods.	- For general taxpayers, the basic formula for calculating VAT payable is: VAT payable = Output VAT in the current period - Input VAT in the current period - For small-scale taxpayers, the formula for determining VAT payable is: $VAT = Sales \times VAT \text{ levy Rate}$

In short, through the process of conducting this study, it can be concluded that there are still some differences between the regulations on value-added tax of Vietnam, Thailand and China. The difference lies in the subject of tax, the object of tax exemption, the tax rate, the tax formula. Understanding tax regulations, especially value added tax, not only in

Vietnam but also in other countries such as Thailand and China is very important for those who will work in the business sector, economic, financial. This is also the basis for Vietnamese legislators to refer to issue policies on value-added tax.

Abstract

Micro, small and medium enterprises (MSMEs) are of great importance in socio-economic development in Vietnam. Sustainable enterprise has received global attention in the context of climate change, environmental pollution, and natural resource depletion. According to indicators on primary dimensions of sustainable development, Vietnam has achieved remarkable achievements. The driving force belongs to enterprises that play an active role in designing, manufacturing, and managing products. This research tries to measure the effects of factors influencing the sustainable development of MSMEs in Vietnam by applying PLS technology. 5 factors that affect enterprise governance and thus the sustainability of MSMEs were found. Based on the findings policy implications to enhance enterprises' role in achieving national sustainable development goals were proposed.

Key words: *enterprise sustainability, circular economy, Garden-Pond-Stables model*

1. Introduction

In the context of climate change, economic inequity, and environmental pollution here and there around the world, poverty has not been well handled in many countries sustainable development has been receiving global attention. The current state of technology and social organization places physical, social, institutional, psychological, and conceptual limits on conventional economic expansion. In various scenarios of the future, the only realistic direction is to learn to live together on this small and crowded planet. This means a sustainable development future (Robertson, 2008).

The purpose of this research is to identify factors determining the sustainable development of enterprises, thus their role in achieving national sustainable development goals. This research is structured in five sections. The first section is an introduction which is followed by a literature review, the third section is methodology and data, the next section is results and discussion about empirical analysis of factors determining the role of micro, small and medium enterprises (MSMEs) in achieving sustainable development goals in Vietnam, and the last section is policy implications and conclusion.

2. Literature Review

2.1. *The role of enterprises in achieving sustainable development goals*

The concept of sustainable development emerged in the context of the rapid population growth and the depletion of natural resources in the 1970s. However, for the first time, this concept was formally introduced in United Nations' Brundtland Report released in 1987, "Sustainable development is a development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (UN). Sustainable development can ensure harmony between competing goals, economic prosperity, environmental quality, and social equity (Hasna, 2007). In other words, three pillars of sustainability are economic, environmental, and social.

The environmental pillar of sustainable development illustrates the responsibility of the present generation to improve the lives of future generations by repairing previous damage to the ecosystem and combating what may cause further damage to it. These practices help the planet and improve financial results by reducing waste and using fuel efficiently. Externalities are among the challenges with the environmental pillar because costs are not fully reflected in market prices.

The social pillar of sustainable development focuses on maintaining and improving social quality. Agyeman, *et al*, (2003) defined sustainable development as the need to ensure a better quality of life for all, now and in the future, in equitable ways while living within the confines of supporting ecosystems. A sustainable community is referred to as one with cohesion, reciprocity and honesty, and the importance of relationships among people. It can be encouraged and supported by laws, information, and shared ideas of equity and rights (Diesendorf, 2000). A sustainable company is one that treats employees fairly and is a good neighbor and community member, both locally and globally. Such a company should be supported and approved by its employees, stakeholders, and the community in which it operates.

The economic pillar of sustainable development sometimes is referred to as the governance pillar. This means compliance, proper governance, and risk management. The board of directors must harmonize the shareholders' interests and that of the community, the value chains, and the end-user consumers as well. To be sustainable, a company must be profitable; however, profit goals cannot overwhelm environmental and social ones. Although the use of fossil fuels and chemicals harms the environment the economic pillar enables companies to phase in changes instead of abandoning them immediately.

Companies with social responsibility play a crucial role in achieving sustainable development goals. The term social responsibility (SR) means that companies, in addition to maximizing value for shareholders, must act in a manner that benefits society. Social responsibility applied to enterprises is known as corporate social responsibility (CSR) which refers to practices and policies undertaken by corporations aimed to have a positive influence on the world. CSR is a self-regulating business model by which a company is socially accountable to itself, its stakeholders, and the public. Companies that practice CSR means are operating in ways that are good for society and the environment instead of damaging them. CSR is the typical strategy implemented by large companies. Small and medium

enterprises (SMEs) also undertake socially responsible programs. CSR is always encouraged. To help organizations translate CSR principles into practical actions, in 2010, the International Organization for Standardization (ISO) released ISO 26000 (ISO, 2010) which clarifies what social responsibility is.

Sustainable development has many facets which may be expressed by four primary dimensions (WCED, 1987): (1) Safeguarding long-term ecological sustainability, (2) Satisfying basic human needs, (3) Promoting intergenerational equity, and (4) Promoting intergenerational equity, each of them can be measured by his own indicators. Threshold values of these primary dimensions are measured and recommended their limits for the year 2030 in Table 1.

Table 1. Primary dimensions, indicators, and suggested 2030 threshold values for sustainable development

Dimension	Indicator	2030 Threshold
(1) Safeguarding long-term ecological sustainability	Yearly per capita ecological footprint	Maximum 2.3 gha per capita
(2) Satisfying basic human needs	Human Development Index	Minimum 0.63
(3) Promoting intragenerational equity	Gini coefficient	Maximum 40
(4) Promoting intergenerational equity	The proportion of renewables to the total energy in primary energy production	Minimum 27%

Source: Holden et. al., 2014.

2.2. Measuring the sustainable development of the enterprises

Economic development aligns with environmental protection and social equity has been pursued globally. Enterprises are the driving force of economic and social development and also agents that negatively influence the environment. The 2030 Agenda for Sustainable Development of the United Nations defines sustainable development as a harmonious combination of three basic factors, namely: economic development, social security, and environmental protection. For sustainable development, enterprises should use inputs efficiently and minimize damaging waste to the environment. Hart (1997) proposed three strategies for enterprises to develop sustainably.

1. *Pollution prevention*: this means the shift from pollution control to pollution prevention. Enterprises should reduce or eliminate waste instead of handling them. Continuous improvement is the way to make this strategy implemented.

2. *Product life cycle management*: it focuses on minimizing pollution in production and throughout the product life cycle.

3. *Clean technology*: developing and using green and environmentally friendly technologies. This implies that all stages related to the product life cycle must be considered: product designing, manufacturing, and recycling.

Krajnc & Glavic (2003) introduced indicators relevant to economic, social, and environmental dimensions. Most of the mentioned above indicators are qualitative. Veleva & Ellenbecker (2001) proposed a set of indicators of sustainable production regarding energy use, emissions, effectiveness, contribution to society, employee welfare, and product.

To help translate corporate responsibility into practical activities, corporations, such as NIKE (2020), Samsung (2020), and others have developed and applied their code of conduct. In 2016 Vietnam Chamber of Commerce and Industry (VCCI) released the corporate sustainability index (SCI) for ranking companies in Vietnam by their sustainability.

2.3. Research model

Our research model is illustrated in Figure 1.

Environmental Sustainability

Resource savings and waste minimization are the first requirements for sustainable development. This means product must be produced, distributed, processed, and recycled in a way that minimizes resource use and negative impacts on the environment.

Companies with social responsibility try to minimize air emissions, discharge, and climate impacts and properly manage chemical fertilizers, waste, and appreciative water. Thus, we hypothesize

H1: Environmental sustainability indicators positively relate to enterprise governance and thus to sustainable development.

Social Sustainability

To measure social sustainability Veleva & Ellenbecker (2001) proposed indicators reflecting a company's contribution to the community and social development, and employee rights. Socially sustainable enterprises ensure a better quality of life for all; everyone is respected and treated fairly. The term respected in social sustainable enterprises means employment is voluntary, the minimum working age is 16, suppliers do not discriminate, and freedom of association and collective bargaining are respected. Therefore, we hypothesize

H2: respected indicators positively relates to enterprise governance and thus to sustainable development.

The concept of equity means harassment and abuse are not tolerated, working hours are not excessive, compensation and benefit are paid on time, and regular employment is provided. Thus, we hypothesize

H3: equity indicators positively relates to enterprise governance and thus to sustainable development.

Economic sustainability

Economic sustainability may be expressed by financial and employee indicators (Krajnc & Glavic, 2003). Financial indicators of economic sustainability include primarily the followings: adequate investment in R&D and environmental protection, paying the cost

of environmental responsibility to the affected party if it occurs, minimizing customer complaints, rarely breaking contracts with suppliers because of inconsistent environmental, health, and safety standards. Here we hypothesize

H4: Financial indicator positively relates to enterprise governance and thus to sustainable development.

Employee indicators of economic sustainability mainly encompass ensuring a safe workplace, healthy and safe dorms, canteens, and childcare facilities, building fitted for the purpose, fire and emergency action plans are in place, and occupational health and hygiene hazards are controlled. We hypothesize

H5: Employee indicator positively relates to enterprise governance and thus to sustainable development.

A sustainable enterprise is one managed by responsible, creative and innovative leaders. Indicators of enterprise governance include sustainable development strategies, risk management, procurement management, customer satisfaction, public relation, and innovative ideas. Thus, we hypothesize

H6: enterprise governance positively relates to sustainable development

2.4. MSMEs in achieving sustainable development goals in Vietnam

For enterprises, sustainable development simply is a corporate governance strategy that adapts to all circumstances, so as their profit goals in harmony with the interests of employees and environmental protection.

Since the UN 2030 Agenda, each country has a specific and unified destination in the process of achieving inclusive development and prosperity. Since 2016, in pursuing the goals of sustainable development Vietnam has been promoted in the global rankings, from 88/149 countries in 2016 to 51/165 in 2021.

However, the sustainable development goals in Vietnam mainly use public resources. Private resources are limited due to the fact that private enterprises, mainly MSMEs, are disadvantageous regarding enterprise competitiveness and effectiveness. In addition, many enterprises have applied outdated technology, with low labor productivity, and use fossil energy which both negatively affects the environment and adversely influences the welfare of future generations. Recognizing this, the Vietnam National Energy Development Strategy

to 2030 and Outlook to 2045 (Vietnam Politburo, 2020) has focused on improving the efficiency of energy use, to save 8-10% or 60 million tons of oil equivalent of the energy needed to develop the country under the normal scenario. 63 provinces/cities were divided into 7 groups with energy-saving goals. The local governments have been requested to build and implement energy savings schemes, in which enterprises were considered a breakthrough in achieving those goals. This is because goods and services are offered by companies while consumers choose products available in markets. Whether products are environmentally friendly produced or not mainly depends on enterprises.

Enterprises, especially those in energy-intensive industries/fields such as chemicals, construction materials (cement, ceramics, etc.), metallurgy (production of iron, steel, etc.), paper and paper powder, and other key energy users are subject to special attention in terms of efficient energy use. For many industries/sectors, energy costs of manufacturing account for more than 60% of total production costs. Therefore, the effective implementation of energy savings schemes will increase the enterprise's competitiveness and contribute to environmental protection and achieve the energy savings targets.

Vietnam's efforts have resulted in remarkable achievements as illustrated in Table 2. Indicators of the first three dimensions of sustainable development are desirable, particularly the first and the third indicators are below the maximum, and the second is above the minimum level of the thresholds, while the indicator of the fourth dimension is far from the threshold, of 11.3 percent.

Table 2. Vietnam's Indicators of four primary dimensions of sustainable development compared to 2030 thresholds

Dimension	Indicator	2030 Threshold	Achievement of Vietnam
(1) Safeguarding long-term ecological sustainability	Yearly per capita ecological footprint	Maximum 2.3 gha per capita	1.65
(2) Satisfying basic human needs	Human Development Index	Minimum 0.63	0.693
(3) Promoting intragenerational equity	Gini coefficient	Maximum 40	0.373
(4) Promoting intergenerational equity	The proportion of renewables to the total energy in primary energy production	Minimum 27%	11.3%

Source: UN, 2019; MOIT, 2021.

In Vietnam, enterprises are numerous by quantity but small by size. On December 31, 2019, in Vietnam micro, small and medium enterprises (MSMEs), accounted for 97.4 percent of the country's enterprises, on average in the 2016 - 2019 period, this figure is 93.7 percent (Ministry of Planning and Investment, 2021). Contributions of MSMEs to GDP and

Government revenue were 45 percent and 31 percent, respectively (VCCI, 2016). Compared to large enterprises MSMEs create smaller economic contributions however they play an important social role. The 2021 Enterprise White Book (Ministry of Planning and Investment, 2021) shows that on December 31, 2019 micro, small and medium enterprises provided jobs for 4.4 million people, accounting for 28.7 percent, and together, MSMEs provided jobs for 5.7 million people or 37.5 percent of total employment in the enterprise sector. In the 2016-2019 period that number is 5.6 million people or 38.4 percent.

Although, MSMEs in Vietnam often are in short of finance. In 2019 total finance for MSMEs were VND 14.5 million trillion, accounted for 33.4 percent of finance of all enterprises in the country. On average, in 2016 - 2019 that number is VND 10.9 million trillion or 40.5 percent which leads to low profit and effectiveness. In 2019 micro and small enterprises made a loss of VND 74.7 million trillion while small enterprises had a before-tax profit of VND 27.1 million trillion. In the 2016 - 2019 period the situation has improved, small and medium enterprises had before-tax profits of VND 3.1million trillion, and only micro-enterprises have lost money. Financial indicators of MSMEs in the year 2019 are very low in comparison with that of large enterprises. For micro and small enterprises, ROA, ROE, and ROS are all negative, these figures for medium enterprises are positive, 0.9, 3.0, 1.0 respectively, compared to 0.7, 12.8 and 4.9 of large enterprises.

Employees working in MSMEs receive lower monthly income compared to that of those working in large enterprises. In the 2016 - 2019 period monthly income of employees working in the micro, small, medium, and large enterprises is VND 6.3, 7.3, 8.1, and 9.3 million. Although, employment provided by MSMEs is of great importance, because the common practice in Vietnam is the fact that MSMEs do require not so high skilled labor, thus unskilled workers or vulnerable can find jobs to earn their family livings.

3. Method

Our questionnaire consists of two parts. The first part includes questions regarding enterprise general information, and the second part comprises questions relating to indicators of factors potentially determining the level of enterprise sustainable development: Environmental sustainability, social sustainability which is expressed by respected and equity indicator, and economic sustainability that is expressed by financial and employee indicators, all that affected enterprise governance and sustainable development. Respondents were requested to mark on the Likert five-point scale with increasing level of agreement, from “Do not agree at all” to “Fully agree”. The estimated time for completing it was between 10 to 15 min. The survey was conducted virtually through Google Forms in March and April, 2022. The survey URL was sent to enterprises and people working in enterprises via e-mail, SMS, and social media (Facebook, Zalo...).

4. Results

359 valid responses were collected. Majority of responded enterprises are non-state owned, 270 enterprises or 64.9 percent, 61.28 percent enterprises are commerce-service ones. By number of employee (less than 200) 61percent enterprises were MSMEs. 92.48 percent of enterprises have their registered main office in urban area (see Table 3).

Table 3. Characteristics of the sample

		Number	Percentage (%)
Enterprise category by ownership	Total	359	100.00
	Non-state owned	233	64.90
	FDI	37	10.31
	State owned	89	24.79
Major enterprise's activity	Total	359	100.00
	Production	84	23.40
	Commerce-services	220	61.28
	Other	55	15.32
Number of employees	Total	359	100.00

Our research topic belongs to the area where theory is not well developed we apply the structural equation model-based PLS technology to test the research model (Figure 1). The data was processed by SmartPLS 3.3.7.

Test of the measurement model

Firstly, the test of the measurement model was conducted by estimating the internal consistency and the convergent and discriminant validity of the instrument items. Most loadings were above .70 which indicate the measures are reliable for all constructs (Chin & Marcoulides, 2009). The model fulfilled requirements of adequate internal consistency because all reliability measures were higher than the recommended level of .70 (Fornell, 1981; Nunnally, 1994) (see Table 4).

To assess discriminant validity we compared the square root of the AVE for each construct with the correlation between the construct and other constructs in the model (Chin & Marcoulides, 2009). All the estimated model's constructs meet the requirement of discriminant validity (see Table 5).

R² for dependent constructs

The results indicate that 83.0 percent of the variance in the governance was explained by five constructs, and 66.6 percent of the variance in the sustainable development was explained by the variance in the in the governance. This percentage of variance explained above 10 percent implies satisfactory and substantive value and predictive power of the PLS model (Falk & Miller, 1992).

Structural Path Coefficient

The estimated model illustrated that five constructs hypothesized affecting the enterprises sustainable development were significant, of which four, employee, financial, respected and governance indicators, were supported at $p < 0.001$, and two, environmental and equity, were supported at $p < .050$ (Table 7).

The estimates resulted by using bootstrapping procedure are shown in Table 9 and Figure 2 reflecting a total effect of the factors influencing the dependent variable.

Effect size (f square)

f square expresses the effect size of independent variables on dependent variables. According to Cohen (1988), *f* square < 0.02 implies an extreme small effect, $0.02 \leq f$ square < 0.15 : shows a small effect; $0.15 \leq f$ square < 0.35 indicates a medium effect; and *f* square ≥ 0.35 : indicates a large effect. The estimated model shows all constructs have a small effect on the enterprise sustainable development, of which employee indicator has a largest and respected has a smallest effect (Table 8 and Figure 2).

4. Discussion and Conclusion

Sustainable enterprises require the right environment at the regional, national and local levels to facilitate driving innovation for more and better jobs. In recent years, VCCI and Vietnam Business Council for Sustainable development (VBCSD) have played a guiding and supporting role to promote enterprises' driving force role in achieving sustainable development goals, encouraging enterprises to apply sustainable business models, clean technology, efficient use of resources, environmental protection, promotion of innovative start-ups, and effective implementation of supporting policies for MSMEs. At the same time, they provide the government with consultant services in implementing solutions to handle challenges in the public-private partnership (PPP) in order to create a favorable environment to attract the participation of enterprises in pursuing sustainable development goals in Vietnam.

In this study, we found that the environmental pillar of sustainable development in Vietnam has not been given enough attention. This can be interpreted by the fact that the role of enterprises in environmental protection has not been legitimated. The social pillar, expressed by respected and equity indicators, and the economic pillar, expressed by financial and employee indicators, illustrated larger effect. Regarding the social pillar, the change of Vietnam political system since 1945 has created significant progress in gender equity, women have more job and leadership opportunities, and the vulnerable are also received more support. In general, MSMEs in Vietnam although have limited access to finance and advanced methods of enterprise management, they have paid fairly enough attention to the financial obligations to stakeholders and their employees. This was illustrated by its highest estimated coefficients.

Based on the findings we suggest the following policy implications. *Firstly*, for MSMEs to become more involved in achieving sustainable development goals, their role in this regard should be legitimated. *Secondly*, circular economy should be encouraged because it is suitable for MSMEs. The Garden-Pond-Stables model in Vietnam has appeared 20 years ago, and that is related to the concept of a circular economy. Today, the circular economy is an essential trend for all countries, Vietnam is no exception. Enterprises that implement a circular economy can reduce their input costs, increase their effectiveness and competitiveness, and contribute to achieving the national goal of promoting intergenerational equity. Concepts such as ecological industrial zone, cleaner production, zero-emission, and recycling are part of a circular economy that appeared in policies relating to environmental protection. The point is to put them into practice instead of written on paper. This requires a drastic change in institutional reform, emphasizing the enforcement characteristics. *Thirdly*, to provide MSMEs with technical and financial support in suitable forms such as tax exemption, and loans with preferential interest rates.

Limitations

The survey was conducted in a short time, the significant rate of respondents was employees, 85 percent, and only 15 percent were enterprise leaders. In addition, 61.28 percent of enterprises operate in the commerce and service sector. All this may cause bias. Future research will try to use a balanced sample.

Abstract

Blockchain technology is emerging and being applied in many fields such as finance, energy, agriculture. The technology has high potential to improve and transform the agriculture supply chain. Since it's a relatively new technology and immature, we expect to face many challenges while adopting the technology. This study aims to investigate critical barriers of blockchain technology adoption in Vietnam agriculture supply chain using interval-value hesitant fuzzy DEcision-MAking Trial and Evaluation Laboratory (IVHF-DEMATEL). In this study, the IVHF-DEMATEL technique is applied to identify cause and effect relationship, draw the influence-relations-map (INRM) between ten barriers based on literature review and 12 experts' opinions. In contrast to prior work, which convert fuzzy sets into crisp set then use crisp set operations, here we use fully hesitant fuzzy operations which represent experts' assessment better and avoid information loss. The results indicated that lack of government regulation, lack of scalability and system speed, large amount of resource and capital requirement, and lack of trust among agro-stakeholder or public perception are main barriers in adopting blockchain technology in the context of Vietnamese agriculture supply chain management. Furthermore, the findings of this study can assist policymakers, businesses, farmers, and agro-stakeholders in prioritizing barriers that must or must not be addressed and in devising collaborative and appropriate solutions to overcome these obstacles in order to accelerate blockchain adoption in ASC.

Keywords: *Agriculture supply chain; Blockchain; DEMATEL; Interval-value hesitant fuzzy, Vietnam*

1. Introduction

In the challenging and fast-changing technology world, new technologies emerge more frequently. They can revolutionize “the economic structure *from within*, incessantly destroying the old one, incessantly creating a new one” (Schumpeter, 1962). One of emerging sector using blockchain technology is agriculture.

To be more specific, Blockchain technology is a "shared, cryptographically unaltered distributed ledger" that records and maintains digital transaction history. Each connected node on the blockchain system stores a copy of all previous records/transactions ever executed on the concerned system. It is important to note that no single stakeholder owns the system, so it is decentralized and visible to all stakeholders, and each activity performed on the system is also auditable. As a result, such a system would create a guarantee of trust for today's business. Blockchain can apply to many areas in agriculture business: Finance, energy, logistics, environmental management, farming, livestock (Demestichas et al., 2020). Many countries are actively investigating the applications of blockchain technology in agriculture such as United States, China, India, and Italy (Mirabelli & Solina, 2020). Since Vietnam is projected to be in the top 10-20 percent of developing countries that has the largest export volume of agricultural products in 2025-2030 (Jaffee et al., 2016), Vietnam has high potential for new technologies such as blockchain technology.

In fact, Vietnamese enterprises started to use blockchain technology to provide traceability and to help them export their products. Dong Thap province, one of the most exporting provinces in Vietnam, exports 93,000 tons of mangoes to high-standards-requirements countries such as Australia, Japan, South Korea, Russia. However, its enterprises still face difficulties in exporting the product to US market. With blockchain-based system, the producers can ensure quality and export their product to US. In fact, Vietnam's first eight tons of mangoes were exported to US market on 18 April, 2020.

Not only helping export agricultural products, blockchain-based system also has other benefits (Vu & Trinh, 2021) such as : Creating a more sustainable world, providing transparency, strengthening the accountability and reduce bureaucracy, and promoting more environmentally friendly behaviors.

However, farmers or enterprises face many barriers while adopting blockchain-based system: Environmental barriers, institutional barriers, enterprises barriers, technology barrier. The previous studies show, there are a large number of barriers affecting the blockchain adoption. Since the blockchain technology is in its early stage, its barriers can lack of structural network or the structural network of barriers has not been known yet.

Due to the complex network of the barriers, finding causal relationships and interdependencies between variables is considered as one of “Multi-Criteria Decision Making” (MCDM) issues (Nguyen et al., 2021a). Among established MCDM models such as Analytic Hierarchy Process (AHP) (Nguyen et al., 2021b), Analytic Network Process (ANP) (Tsai et al., 2021a), Technique for Order of Preference by Similarity to Ideal Solution (TOPSIS) (Tsai et al., 2021b), DEMATEL technique has been widely applied to not only identify cause-effect relationship but also prioritize proposed factors affecting research topics (Si et al., 2018).

Biswas and Gupta (2019) used DEMATEL to analyse barriers in implementing blockchain in industry and service sectors. Yadav et al. (2020) employed DEMATEL integrated with ISM to identify interrelationship between barriers in adopting blockchain in Indian agriculture supply chain. Their study revealed that Fuzzy DEMATEL could capture more accurate pictures than original model. However, fuzzy DEMATEL often converts linguistic variables to fuzzy sets, then apply some score functions to convert fuzzy sets to crisp number then apply DEMATEL. Example: warm temperature $\rightarrow (20^{\circ}\text{C}-30^{\circ}\text{C}) \rightarrow 25^{\circ}\text{C}$. It may not make sense that cold temperature (after transformation) become 25°C then apply DEMATEL. Asan et al. (2018) proposed interval-valued hesitant fuzzy DEMATEL that transform linguistic variables into fuzzy sets then apply fuzzy operations to reduce information loss.

To our best understanding, a few studies investigate the blockchain situation in Vietnam and none of them applied IVHF-DEMATEL approach in the adopting-blockchain process. Therefore, this study aims to answer the following questions:

- (i) What are barriers in adopting blockchain technology in Vietnamese agriculture supply chain?
- (ii) What are the causes and effects among critical barriers?
- (iii) Which barriers should be prioritized to tackle?

The remaining structure of the study is organized as follows: Section 2 presents proposed method. In section 3, the results are comprehensively provided. Finally, section 4 summarizes discussion and conclusions.

2. Method

2.1. Interval-value hesitant fuzzy sets

Hesitant fuzzy sets (Torra, 2010) are very useful to deal with group decision making problems when experts have a hesitation among several possible memberships for an element to a set. During the evaluating process in practice, however, these possible memberships may be not only crisp values in $[0, 1]$, but also interval values. Some basic operators and definitions are provided as follows:

Definition 1: Let X be a reference set, and $D[0,1]$ be the set of all closed subintervals of $[0,1]$. An interval-valued hesitant fuzzy set (IVHFS) on X is

$$\tilde{A} = \left\{ \langle x_i, \tilde{h}_{\tilde{A}}(x_i) \rangle \mid x_i \in X, i = 1, 2, \dots, n \right\} \quad (1)$$

where $\tilde{h}_{\tilde{A}}(x_i): X \rightarrow D[0,1]$ denote all possible interval-valued membership degrees of the element $x_i \in X$ to the set \tilde{A} . $\tilde{h}_{\tilde{A}}(x_i)$ is called an interval-valued hesitant fuzzy element (IVHFE) and is shown as

$$\tilde{h}_{\tilde{A}}(x_i) = \{ \tilde{\gamma} \mid \tilde{\gamma} \in \tilde{h}_{\tilde{A}}(x_i) \} \quad (2)$$

where $\tilde{\gamma} = [\tilde{\gamma}^L, \tilde{\gamma}^U]$ is an interval number, $\tilde{\gamma}^L = \inf \tilde{\gamma}$ and $\tilde{\gamma}^H = \sup \tilde{\gamma}$ represent the lower and upper limits of $\tilde{\gamma}$, respectively.

Definition 2: Some basic operations on IVHFEs:

$$\tilde{h}^c = \left\{ \left[1 - \tilde{\gamma}^U, 1 - \tilde{\gamma}^L \right] \mid \tilde{\gamma} \in \tilde{h} \right\} \quad (3)$$

$$\tilde{h}^c = \left\{ \left[1 - \tilde{\gamma}^U, 1 - \tilde{\gamma}^L \right] \mid \tilde{\gamma} \in \tilde{h} \right\} \quad (4)$$

$$\tilde{h}_1 \cup \tilde{h}_2 = \left\{ \left[\max(\tilde{\gamma}_1^L, \tilde{\gamma}_2^L), \max(\tilde{\gamma}_1^U, \tilde{\gamma}_2^U) \right] \mid \tilde{\gamma}_1 \in \tilde{h}_1, \tilde{\gamma}_2 \in \tilde{h}_2 \right\} \quad (5)$$

$$\tilde{h}_1 \cap \tilde{h}_2 = \left\{ \left[\min(\tilde{\gamma}_1^L, \tilde{\gamma}_2^L), \min(\tilde{\gamma}_1^U, \tilde{\gamma}_2^U) \right] \mid \tilde{\gamma}_1 \in \tilde{h}_1, \tilde{\gamma}_2 \in \tilde{h}_2 \right\} \quad (6)$$

$$\tilde{h}^\lambda = \left\{ \left[(\tilde{\gamma}^L)^\lambda, (\tilde{\gamma}^U)^\lambda \right] \mid \tilde{\gamma} \in \tilde{h} \right\}, \lambda > 0 \quad (7)$$

$$\lambda \tilde{h} = \left\{ \left[1 - (1 - \tilde{\gamma}^L)^\lambda, 1 - (1 - \tilde{\gamma}^U)^\lambda \right] \mid \tilde{\gamma} \in \tilde{h} \right\}, \lambda > 0 \quad (8)$$

$$\tilde{h}_1 \oplus \tilde{h}_2 = \left\{ \left[\tilde{\gamma}_1^L + \tilde{\gamma}_2^L - \tilde{\gamma}_1^L \tilde{\gamma}_2^L, \tilde{\gamma}_1^U + \tilde{\gamma}_2^U - \tilde{\gamma}_1^U \tilde{\gamma}_2^U \right] \mid \tilde{\gamma}_1 \in \tilde{h}_1, \tilde{\gamma}_2 \in \tilde{h}_2 \right\} \quad (9)$$

$$\tilde{h}_1 \otimes \tilde{h}_2 = \left\{ \left[\tilde{\gamma}_1^L \tilde{\gamma}_2^L, \tilde{\gamma}_1^U \tilde{\gamma}_2^U \right] \mid \tilde{\gamma}_1 \in \tilde{h}_1, \tilde{\gamma}_2 \in \tilde{h}_2 \right\} \quad (10)$$

Definition 3: An interval-valued hesitant fuzzy weighted averaging (IVHFWA) operator is a mapping $IVHFWA: \tilde{H}^n \rightarrow \tilde{H}$, where

$$IVHFWA(\tilde{h}_1, \tilde{h}_2, \dots, \tilde{h}_n) = \otimes_{j=1}^n (w_j \tilde{h}_j) = \left\{ \left[1 - \prod_{j=1}^n (1 - \tilde{\gamma}_j^L)^{w_j}, 1 - \prod_{j=1}^n (1 - \tilde{\gamma}_j^U)^{w_j} \right] \mid \tilde{\gamma}_1 \in \tilde{h}_1, \tilde{\gamma}_2 \in \tilde{h}_2, \dots, \tilde{\gamma}_n \in \tilde{h}_n \right\} \quad (11)$$

2.2. Proposed method

In this study, modelling of barriers for blockchain adoption in Vietnamese ASC is investigated. For this purpose, the ten key barriers are proposed through a comprehensive literature search and based on a panel of the twelve experts providing opinions through multiple rounds of the questionnaire. The proposed barriers are analysed using IVHF-DEMATEL model, which was proposed by Asan et al. (2018). The details of the computing process is presented as follows:

Step 1: Establish the initial direct-relation IVHF matrix

Assume there are K decision makers. The k^{th} expert assigns the relationship degree between pairwise of barriers in closed sub-intervals of $[0, 1]$. If there is no relationship, the degree is assigned $[0, 0]$. The corresponding k^{th} initial direct-relation IVHF matrix (\tilde{H}^k) between barriers is established as equation (1)

$$\tilde{H}^k = \begin{bmatrix} \tilde{0} & \tilde{h}_{12}^k & \cdots & \tilde{h}_{1n}^k \\ \tilde{h}_{21}^k & \tilde{0} & \cdots & \tilde{h}_{2n}^k \\ \vdots & \vdots & \ddots & \vdots \\ \tilde{h}_{n1}^k & \tilde{h}_{n2}^k & \cdots & \tilde{0} \end{bmatrix}, k = 1, 2, \dots, K \quad (12)$$

where IVHF element $\tilde{h}_{ij}^k = \{(\tilde{\gamma}_{ij}^k)^L, (\tilde{\gamma}_{ij}^k)^U\}$ is single interval and represents the influence exerted from i^{th} barrier to j^{th} barrier according to possible relationship degrees. $(\tilde{\gamma}_{ij}^k)^L$ and $(\tilde{\gamma}_{ij}^k)^U$ represent the lower and upper limits of IVHF element \tilde{h}_{ij}^k of k^{th} expert.

Step 2: Generate the group direct-relation IVHF matrix (\tilde{D})

We aggregate the relationship degrees into a single IVFH matrix by using equation that is interval-valued hesitant fuzzy weighted averaging operator (Chen et al., 2013)

$$\tilde{d}_{ij} = \oplus_{k=1}^p (\lambda_k \tilde{h}_{ij}^k) = \left\{ \left[1 - \prod_{k=1}^K (1 - (\tilde{\gamma}_{ij}^k)^L)^{\lambda_k}, 1 - \prod_{k=1}^K (1 - (\tilde{\gamma}_{ij}^k)^U)^{\lambda_k} \right] \right\} \quad (13)$$

where \tilde{d}_{ij} denotes the ij^{th} entry of matrix \tilde{D}

$$\tilde{D} = \begin{bmatrix} \tilde{0} & \tilde{d}_{12} & \cdots & \tilde{d}_{1n} \\ \tilde{d}_{21} & \tilde{0} & \cdots & \tilde{d}_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ \tilde{d}_{n1} & \tilde{d}_{n2} & \cdots & \tilde{0} \end{bmatrix}, \tilde{d}_{ij} = \{[\tilde{d}_{ij}^L, \tilde{d}_{ij}^U]\}, i, j = 1, 2, \dots, n \quad (14)$$

Step 3: Normalize the group direct-relation IVHF matrix \tilde{D}

The endpoints of $\tilde{d}_{ij} = \{[\tilde{d}_{ij}^L, \tilde{d}_{ij}^U]\}$ are divided by the maximum value of all row sums, which is given by equation (15). Because the lower limit of IVHF is always smaller than the upper limit, only summing the upper limits is sufficient

$$d = \max_{1 \leq i \leq n} \left\{ \sum_{j=1}^n \tilde{d}_{ij}^U \right\}, \tilde{s}_{ij} = \{[\tilde{s}_{ij}^L, \tilde{s}_{ij}^U]\} = \left\{ \left[\frac{\tilde{d}_{ij}^L}{d}, \frac{\tilde{d}_{ij}^U}{d} \right] \right\} \quad (15)$$

The normalized IVHF matrix (\tilde{S}) is split into two separate matrices (\tilde{S}^L and \tilde{S}^U), which are composed the lower limit and upper limit of IVHF elements (\tilde{s}_{ij}), respectively, as given by Equation (16)

$$\tilde{S}^L = \begin{bmatrix} \tilde{0} & \tilde{s}_{12}^L & \cdots & \tilde{s}_{1n}^L \\ \tilde{s}_{21}^L & \tilde{0} & \cdots & \tilde{s}_{2n}^L \\ \vdots & \vdots & \ddots & \vdots \\ \tilde{s}_{n1}^L & \tilde{s}_{n2}^L & \cdots & \tilde{0} \end{bmatrix}, \tilde{S}^U = \begin{bmatrix} \tilde{0} & \tilde{s}_{12}^U & \cdots & \tilde{s}_{1n}^U \\ \tilde{s}_{21}^U & \tilde{0} & \cdots & \tilde{s}_{2n}^U \\ \vdots & \vdots & \ddots & \vdots \\ \tilde{s}_{n1}^U & \tilde{s}_{n2}^U & \cdots & \tilde{0} \end{bmatrix} \quad (16)$$

Step 4: Derive the total-relation hesitant fuzzy matrix

The total-relation hesitant fuzzy matrix (\tilde{T}) equals the sum of all direct and indirect relationships between each pair of barriers of IVHF. It can be computed by using equation (17) where m is sufficiently large.

$$\tilde{T} = \tilde{S} \oplus \tilde{S}^2 \oplus \cdots \oplus \tilde{S}^m \quad (17)$$

We can separate the lower and upper limits then raise them to powers by using the summation operator and multiplication operator as follow Let T^L and T^U the lower and upper limits of total-relation hesitant fuzzy matrix \tilde{T} , respectively. T^L and T^U can be calculated by equation (18) and (19)

$$\tilde{T}^L = \tilde{S}^L \oplus (\tilde{S}^L)^2 \oplus \dots \oplus (\tilde{S}^L)^m \quad (18)$$

$$\tilde{T}^U = \tilde{S}^U \oplus (\tilde{S}^U)^2 \oplus \dots \oplus (\tilde{S}^U)^m \quad (19)$$

Then we can combine T^L and T^U to obtain the limit matrix \tilde{T} as shown below:

$$\tilde{T} = \begin{bmatrix} \{[\tilde{t}_{11}^L, \tilde{t}_{11}^U]\} & \{[\tilde{t}_{12}^L, \tilde{t}_{12}^U]\} & \dots & \{[\tilde{t}_{1n}^L, \tilde{t}_{1n}^U]\} \\ \{[\tilde{t}_{21}^L, \tilde{t}_{21}^U]\} & \{[\tilde{t}_{22}^L, \tilde{t}_{22}^U]\} & \dots & \{[\tilde{t}_{2n}^L, \tilde{t}_{2n}^U]\} \\ \vdots & \vdots & \ddots & \vdots \\ \{[\tilde{t}_{n1}^L, \tilde{t}_{n1}^U]\} & \{[\tilde{t}_{n2}^L, \tilde{t}_{n2}^U]\} & \dots & \{[\tilde{t}_{nm}^L, \tilde{t}_{nm}^U]\} \end{bmatrix} \quad (20)$$

Step 5: Calculate the sum of the rows \tilde{r}_i and \tilde{c}_i columns of total-relation matrix

We use hesitant fuzzy summation operator, equation (9), to calculate the sum of each row and column where \tilde{r}_i represents the total influence exerted from i^{th} barrier to the other barriers, and \tilde{c}_i represents the total influence that i^{th} barrier receives from the other CVPs, as shown in Equation ...

$$\tilde{r} = \begin{bmatrix} \{[\tilde{r}_1^L, \tilde{r}_1^U]\} \\ \{[\tilde{r}_2^L, \tilde{r}_2^U]\} \\ \vdots \\ \{[\tilde{r}_n^L, \tilde{r}_n^U]\} \end{bmatrix}, \tilde{c} = \begin{bmatrix} \{[\tilde{c}_1^L, \tilde{c}_1^U]\} \\ \{[\tilde{c}_2^L, \tilde{c}_2^U]\} \\ \vdots \\ \{[\tilde{c}_n^L, \tilde{c}_n^U]\} \end{bmatrix} \quad (21)$$

Step 6: Construct the influence-dependence graph

The influence-dependence (I-D) graph is a two-dimensional map, where horizontal axis denotes sum of columns (\tilde{C}_i) and vertical axis denotes sum of rows (\tilde{r}_i). Four quadrants of this map respectively represent critical, influential, dependent and excluded regions. This I-D map is linked to the causal diagram proposed by Godet (1994). The role of each barrier can be detected as its belonged region.

The cut-off points of horizontal axis and vertical axis (Asan et al., 2018), which separate four quadrants from I-D map are determined by calculating the average sum of columns as Equation (22) and the average sum of rows as Equation (23), respectively.

$$\{[\tilde{c}_{avg}^L, \tilde{c}_{avg}^U]\} = \left\{ \left[\frac{1}{n} \otimes \left(\oplus_{i=1}^n \tilde{c}_i^L \right), \frac{1}{n} \otimes \left(\oplus_{i=1}^n \tilde{c}_i^U \right) \right] \right\} \quad (22)$$

$$\{[\tilde{r}_{avg}^L, \tilde{r}_{avg}^U]\} = \left\{ \left[\frac{1}{n} \otimes \left(\oplus_{i=1}^n \tilde{r}_i^L \right), \frac{1}{n} \otimes \left(\oplus_{i=1}^n \tilde{r}_i^U \right) \right] \right\} \quad (23)$$

3. Results

Case study

3.1. Proposed barriers

In this study, we analyze barriers of adopting blockchain in Vietnam agriculture supply chain. Based on barriers analyzed by (Yadav et al., 2020), we revise the barriers to be appropriate for Vietnam case. As a result, we find 10 barriers in Table 1.

Table 1:
Adoption barriers & their explanation

No.	Barriers	Explanation	Reference
1.	Lack of government regulation (B1)	Most of the countries haven't regulated and legislated blockchain.	Biswas and Gupta (2019); Zhao et al. (2019)
2.	Large amount of resource and capital requirement (B2)	Blockchain-based system consumes high energy and requires large initial investment, sufficient infrastructure.	Biswas and Gupta (2019); Zhao et al. (2019)
3.	Security and privacy concern (B3)	Blockchain-based systems can be hacked and attacked by malicious actors. Agro-business organizations also concern about confidentiality due to exposure of their information to competitors.	Biswas and Gupta (2019); Zhao et al. (2019); Zheng et al. (2018)
4.	Lack of standardization (B4)	There is no universal standard so it's difficult to integrate and operate blockchains.	Biswas and Gupta (2019); Zhao et al. (2019)
5.	Lack of consortia (B5)	Consortia can provide more resources and meet financial requirements and take advantage of economy of scale	Deloitte Blockchain Survey (2018)
6.	Lack of trust among agro-stakeholder or public perception (B6)	Agro-stakeholders suspect the uses of blockchain-based system, Stakeholders like farmers may not aware blockchain-based system	Yadav et al. (2020)
7.	Lack of Scalability and system Speed (B7)	It's difficult to scale up the blockchain-based system; the transaction speed is deficient	Deloitte Blockchain Survey (2018), Biswas and Gupta (2019); Zhao et al. (2019); Zheng et al. (2018)
8.	The complexity of blockchain-based system design (B8)	The efficiently blockchain-based system design requires a high level of skill sets	Yadav et al. (2020)
9.	Agro-stakeholder resistance to blockchain culture (B9)	The middleman in the agro-supply chain may resist blockchain due to affecting their benefits	Yadav et al. (2020)
10.	Lack of consumption demands for certified products (B10)	Consumers may not prefer blockchain-based (certified) products due to high prices	Hoang (2020)

3.2. Results

We interviewed 12 experts who work in agriculture sector, companies related to blockchain technology. Each expert assessed the relationship between barriers in the survey questionnaire. After that, we applied the method mentioned in section 2 to aggregate 12 individual assessments into single intervals. We assume that the experts have equal weight.

The results are described in Table 2 and Figure 1.

Table 2. The sum of rows and the sum of columns

Barrier	\tilde{r}_i	\tilde{c}_i	Rank (\tilde{r}_i)	Rank (\tilde{c}_i)
B1	{[0.791,0.907]}	{[0.478,0.662]}	1	10
B2	{[0.664,0.803]}	{[0.6,0.76]}	4	7
B3	{[0.57,0.717]}	{[0.534,0.717]}	8	9
B4	{[0.343,0.542]}	{[0.654,0.793]}	9	3
B5	{[0.575,0.743]}	{[0.623,0.792]}	7	4
B6	{[0.636,0.789]}	{[0.602,0.761]}	5	6
B7	{[0.666,0.809]}	{[0.573,0.748]}	3	8
B8	{[0.681,0.827]}	{[0.67,0.814]}	2	2
B9	{[0.332,0.536]}	{[0.597,0.769]}	10	5
B10	{[0.591,0.773]}	{[0.687,0.823]}	6	1

Using the interval-valued hesitant fuzzy sum operator (Eq. (9)), the sum of rows indicating the sum of influence exerted from factor i to the other factors and sum of columns indicating the sum of influence that factor i receives from the other factors are obtained.

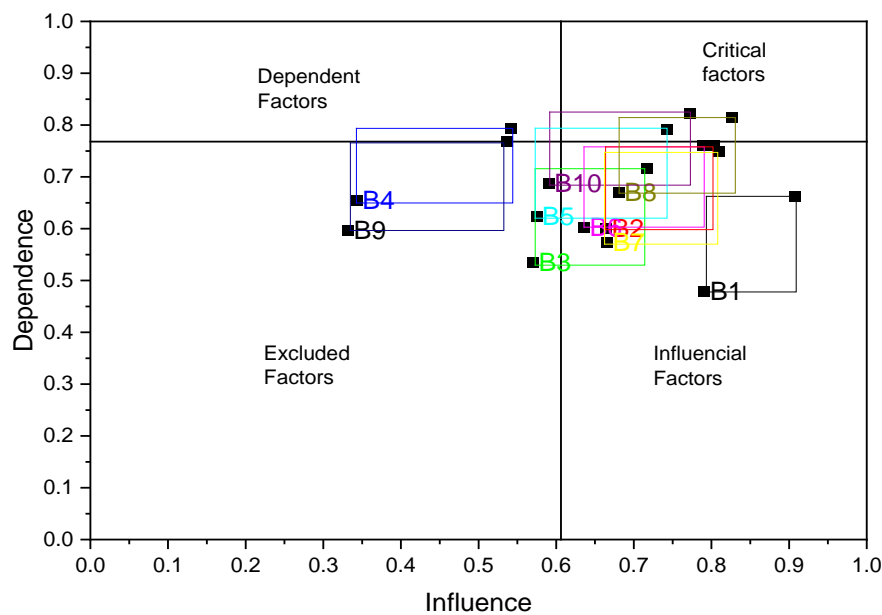

Figure 1. The Influence - Dependence Chart

4. Discussion and Conclusion

We use three indicators as follow to analyze the results:

- Distance: How far and overlapping between barriers is. According figure 1, B4 and B9 are overlapping; B2, B3, B5, B6, B7, and B10 are overlapping. These overlapping factors don't have no clear-cut difference.

- Relative size: A larger rectangular describes the higher level of hesitancy. B9 is associated with the most hesitancy, followed by B5, B4, B3, B7, B10, B6. Other three barriers, B2, B1, B8, have smaller rectangular which represents experts were less hesitant in their assessments.

- Position: it describes the position of each barrier on the influence-dependence chart. B1, B2, B6, B7 belongs to influential region; B9 belongs to excluded region; B3 belongs to both excluded region and influential region, B8 belongs to both critical region and influential region; B5 and B10 belong to all four regions, it means B5 and B10 become critical, influential, dependent, or excluded based on how the situation happens.

Table 3. The characteristic role of barriers based on different scenarios

Barriers	Optimistic Scenario	Pessimistic Scenario
B1	Influential	Influential
B2	Influential	Influential
B3	Influential	Excluded
B4	Dependent	Excluded
B5	Critical	Excluded
B6	Influential	Influential
B7	Influential	Influential
B8	Critical	Influential
B9	Excluded	Excluded
B10	Critical	Excluded

For priority, B1, B7, B2, B6 belong strictly to influential regions. It implies that we should tackle B1, B7, B2, B6 in descending order. B4 and B9 can be ignored. B8 has relatively better positions than B3, B5, B10 in term of influence, so we may prioritize B8 over B3, B5, and B10. Since B3, B5, B10 may be excluded factors, we may have less priority for them. If we must decide, we can prioritize factors have less dependence which means we prioritize B3 over B5 over B10.

As shown in figure 1, many barriers overlap each other, it may confuse practitioners. Future research can focus on reducing the size of rectangular, identifying under which conditions the barriers belong to certain regions, or an objective function that transform the rectangular to crisp values.

LABOR QUALITY ADJUSTMENT IN PRODUCTIVITY MEASUREMENT: THE CASE OF VIETNAMESE AGRICULTURE

Le Hoang Minh Nguyet

lehoangminhnguyet@gmail.com

Faculty of Statistics, National Economics University, Hanoi, Vietnam

Abstract

In many studies on agricultural productivity, the productivity indicator is calculated by considering the efficiency of using inputs without mentioning the quality of the inputs. This fact leads to an inaccurate assessment of agricultural production productivity because the quality of input is also an important factor determining output in agriculture, in other words agricultural productivity depends on the quality of inputs. Many guidelines and research papers about productivity such as ones of the World Food Organization (FAO) and the Organization for Economic Cooperation and Development (OECD) refer to this issue. They also affirmed that agricultural productivity depends on the quality of inputs and the degree of integration of those inputs in the production process. For example, soil productivity is highly dependent on the location of the soil and its physical characteristics. It is the same for labor as the quality of the workforce varies. This study examines labor quality adjustment, introduces the method calculates the labor quality adjustment coefficient for agricultural productivity in Vietnam in the period 2000-2020.

Keywords: *Adjusting labor quality, agricultural productivity, TFP*

1. Introduction

In recent years, many countries with developed and modern agriculture have taken into account adjusting quality of inputs by the measurement and quality classification of input factors when calculating productivity indicators in agriculture. That requires needed data for this purpose. As such, data needs to be collected for different input types or quality classes. Taking input quality into account is important for accurate Total Factor Productivity (TFP) estimates, but this requires having detailed and accurate datasets of input quantities, values, and prices available for other quality classes. This requirement leads to increased data collection costs and a higher response burden.

For labor inputs, the quality of the workforce varies across labor types and the variation in labor quality over the years needs to be taken into account when collecting data and adjustments should be made. This means that agricultural labor data needs to be collected for different types of labor and different quality classes. Thus, family labor, unpaid labor, and paid labor must be distinguished when collecting. On the other hand, the quality of agricultural labor may also depend on other characteristics such as gender, education, etc., since workers with different skill levels have different levels of productivity.

First estimates of labour input holding labour quality constant were constructed by Denison (1962) and Jorgenson and Griliches (1967) using US data. A seminal study in this

literature, Jorgenson et al. (1987) contains a detailed examination and estimates of labour quality for the US. This work has been recently updated by Ho and Jorgenson (1999). Ho and Jorgenson construct a quality-adjusted measure of labour input for the US based on a cross-classification of hours worked into a number of cells by observed worker characteristics (sex, age groups, education and self-employment status). Alternative estimates for the US using different methodologies are provided by the Bureau of Labor Statistics (BLS) (1993) and by Aaronson and Sullivan (2001). The BLS uses a slightly modified version of the Ho and Jorgenson method to estimate labour quality in the United States (see BLS, 1993). The method differs mainly in the estimation of the weights. Aaronson and Sullivan (2001) extend the regression approach taken by the BLS to calculate the labour quality measure using microdata of individuals only. Similar to the BLS, they obtain predicted wages for each individual using a regression approach.

The United States Department of Agriculture (USDA) uses the changing demographics of the agricultural workforce to construct an index that adjusts for the quality of labor inputs. Labor account of the collective farm sector incorporating a demographic cross-classification of the agricultural labor force was developed by Jorgenson, Gollop and Fraumeni (1987). The matrix of working hours and hourly wages of workers in the agricultural sector is cross-classified by gender, age, education, and type of labor (hired and family labor, self-employed, unpaid labor). Hence, they have a complete state-by-year panel data set of annual hours worked and a wage matrix for employees cross-disaggregated by gender, age, education, and employment type. Labor input indexes were developed for each State and farm. This method is also used to adjust the quality of New Zealand workers in the study of Kam Leong Szeto et al (2008). Fuglie (2009) when studying the sources of Indonesian agricultural TFP growth also accounted for labor quality adjustment. Data on two types of workers - male and female adult workers employed in the agricultural sector - are available from FAO. Wages for male and female workers are the average daily wages paid for weeding crops (from the 1993-2007 BPS survey). To find the total annual labor cost, the daily wage (in rice equivalents) is multiplied by 300 working days per year for men and 250 working days per year for women. Yu Sheng (2013) takes into account labor quality differences using the Australian Bureau of Statistics (ABS) quality-adjusted index. This indicator uses Census Data, cross-disaggregated by sex, age and education. The age groups are: 15-24, 25-34, 35-44, 45-64. The groups of educational attainment are university degree, skilled and unqualified workers. Steven Block (2010) uses a qualitative adjustment for the agricultural labor force based on literacy rates.

2. Method

Based on the literature review as well as specific data sources from Vietnam, the selected method is the Pre-Adjustment method - Building the labor quality adjustment index from the matrix of each type of labor and the level of education. hour-wage suggested by Jorgenson et al. (1987).

To be able to adjust for differences in the quality of hours worked by different types of labor, this can be done by separately accounting for different types of labor inputs.

Considering the aggregate production function to describe how to form the labor quality adjustment index, the production function is expressed as follows:

$$Q_t = f(A_t, K_t, H_t) \quad (1)$$

where: Q_t indicates input, K_t indicates capital, A_t is TFP, H_t is labor input expressed by the total of working hours.

Replace the function above with the following expression:

$$Q_t = g(B_t, k_t^1, \dots, k_t^M, h_t^1, \dots, h_t^N) \quad (2)$$

Where, each capital input (k_t^1, \dots, k_t^M) and each labor input (h_t^1, \dots, h_t^N) are accounted for separately. B_t denotes the alternative measure of multifactor productivity (which is interpreted below). When the productive capital stocks of various asset types are used, the aggregate capital stock measure is formed using the corresponding user cost of capital measures as weights in the index formula. Likewise, when different types of labor inputs are used, income shares for the different types of labor inputs are used as weights in the index formula.

The difference between the multifactor productivity measure (A_t) corresponding to the underlying production function in equation (1) and the multifactor productivity measure (B_t) corresponding to equation (2) is the latter measure accounts for changes in the composition or quality of labor inputs. This can be seen from the analysis that follows.

Consider the case where the Tornqvist index is used to measure multifactor productivity. Assuming that the aggregate capital stock has been formed using rental prices for different asset types, the multifactor productivity indices can be written as follows:

$$A_t = \frac{Q_t}{K_t^{1/2(w_0^K + w_t^K)} H_t^{1/2(w_0^L + w_t^L)}} \quad (3)$$

$$B_t = \frac{Q_t}{K_t^{1/2(w_0^K + w_t^K)} L_t^{1/2(w_0^L + w_t^L)}} \quad (4)$$

where w_t^K is capital's income share and w_t^L is labor's income share.

$$H_t = \frac{\sum_{n=1}^N h_t^n}{\sum_{n=1}^N h_0^n} \quad (5) \text{ the total number of hours worked, and } L_t = \prod_{n=1}^N \left(\frac{h_t^n}{h_0^n}\right)^{\frac{1}{2}(w_0^n + w_t^n)} \quad (6)$$

a Tornqvist index of aggregate labor input. Furthermore, the labor quality index (LC_t) can be written as:

$$LC_t = L_t/H_t \quad (7)$$

This index is the ratio of the aggregate labour input index to an index of total hours worked. This labour quality index is akin to that adopted in work by Jorgenson, Gallop and Fraumeni (1987) and Jorgenson and Fraumeni (1989, 1992).

Finally, the formula of the index for multifactor productivity is:

$$B_t = A_t LC_t^{1/2(w_0^L + w_t^L)} \quad (8)$$

Equation (8) shows the alternative multifactor productivity index (B_t) is simply the original multifactor productivity (A_t) adjusted for the quality composition of the labor input. In forming the alternative multifactor productivity measure (B_t), it is necessary to have

estimates of labor income shares for the various labor types. Labour shares for the various labor types can be estimated in one of two ways. One approach is to classify the labour inputs into different categories based on the characteristics of various workers and then use the average wage in forming labor shares for the various labor inputs. For example, workers could be classified into various categories based on their level of educational qualification. This approach has been adopted in work by Jorgenson, Gallop and Fraumeni (1987).

An alternative approach is to estimate wage equations econometrically using worker characteristics, such as the number of years worked, as explanatory variables and then use the predicted values from the wage equations to form weights for the various types of labor inputs. This approach has been used by the Bureau of Labour Statistics (1993) when forming their multifactor productivity estimates that account for changes in the composition of labor over time (Bureau of Labour Statistics, 1993).

3. Results

✚ *Calculate the coefficient of adjustment for the quality of agricultural labor in Vietnam*

* *Data*

To construct a matrix on labor to adjust the quality of labor, it is necessary to have specific information about the number of working hours, the salary received, the number of employees of each type of labor.

Based on the overview, the following criteria can be selected to form the matrix table:

- Sex: Male and Female
- Education level: Never attended school, Did not finish elementary school, Elementary school, Middle school, High school, and Higher education
- Age group: 15-25, 25-35, 35-45, 45-55, 55-65.

Data from the Vietnam Population Living Standard Survey (VHLSS) can provide the following information:

- Information about employment (in the agricultural sector)
- Information about employees: gender, type of labor, educational level and technical expertise, age.
- Income of hired labor.
- Number of hours worked in the last 30 days.

Thus, a labor matrix for even years can be formed from the VHLSS survey data:

Table 1. Labour matrix of Vietnam for a year

Education level	Neverattended school		Did not finish elementary school		Elementary school		Middle school		High school		Higher education	
	Male	Female	Male	Female	Male	Female	Male	Female	Male	Female	Male	Female
Age group												
15-25												
25-35												
35-45												
45-55												
55-65												

From the data of each matrix, it is possible to calculate the labor quality index according to the formula mentioned above. Since these labor quality indicators are only available in even years, the adjusted index for odd years can be calculated by estimating from the closest 2 years.

*** Steps**

Step 1: Construct labor matrices according to identified classes

Using the Vietnam Population Living Standard Survey (VHLSS) dataset of years to calculate the annual data for the matrix in Table 1. The information of the VHLSS dataset completely meets the data needs. above data (using weights to ensure representativeness). In the VHLSS dataset, we calculate:

- Calculate the total number of hours worked by a labor in a year by multiplying the average number of hours worked per day of agricultural labor and the number of working days in the corresponding year. The number of working days in a year is calculated according to the method of Fuglie (2003) with appropriate adjustments. The total number of working hours in agriculture in a year of a cell in the table is equal to the total number of working hours of a labor in a year multiplied by the corresponding number of workers in that cell.

- Calculate the total annual income using the ratio between the total number of people and the number of paid employees. This calculation is used from the recommendation of FAO (2018), where no information is available on the income of self-employed, it can be assumed that their income is equal to a paid employee. Therefore, this figure will be:

(Wages for 30-day labor) x (Number of agricultural employees/Number of paid employees) x (365/30).

The following is an example of the labor matrix for 1 year (2000):

Education level	Never attended school		Did not finish elementary school		Elementary school		Middle school		High school		Higher education	
	M	F	M	F	M	F	M	F	M	F	M	F
Year 2000												
Hour – wage per labour (hour)												
15-24	2,8312	2,5481	3,5210	2,8489	4,4265	3,3137	5,9075	3,9482	6,7304	4,9388	6,7304	6,0574
25-34	3,3689	3,0320	4,1292	3,1994	4,8321	3,1683	6,4173	3,8980	5,7612	5,0993	11,7177	11,7177
35-44	3,5925	3,2332	4,0321	2,9054	4,8818	3,4150	7,3242	4,0374	6,0054	5,4048	10,3785	9,3407
45-54	3,6952	3,7632	4,1948	2,8826	5,5605	3,4432	5,8689	4,3962	7,1997	6,4797	17,3316	15,5984
44-64	1,8828	1,7116	3,3357	2,4180	4,9385	4,4447	6,0492	5,4443	6,5006	5,6220	7,8899	7,1009
Income share												
15-24	0,0019	0,0019	0,0302	0,0241	0,0492	0,0395	0,0398	0,0289	0,0125	0,0074	0,0003	0,0002
25-34	0,0017	0,0018	0,0321	0,0285	0,0438	0,0329	0,0454	0,0391	0,0108	0,0101	0,0004	0,0004
35-44	0,0031	0,0030	0,0285	0,0292	0,0372	0,0301	0,0732	0,0512	0,0128	0,0112	0,0012	0,0005
45-54	0,0034	0,0037	0,0216	0,0252	0,0256	0,0167	0,0305	0,0243	0,0088	0,0033	0,0021	0,0010
44-64	0,0013	0,0011	0,0111	0,0160	0,0113	0,0088	0,0110	0,0041	0,0022	0,0004	0,0015	0,0012

Source: Author's calculation form VHLSS survey in 2000

Step 2: Calculate the labour quality index LC_t

First of all, calculate the total working hours and the Tornqvist index of the aggregate labor input, calculate the total working hours index according to formula (5), and calculate the Tornqvist index of the aggregate labor input (6):

where h_t is the number of agricultural working hours of the group n years t and h_0 is the number of agricultural working hours of the group n year 0, where 0 denotes the year 2000. w_t is the income share of that group in the total income of year t and w_0 is the income share in the income of year 0 (2000). N is the total number of groups (class) formed in the matrix.

LC_t can be calculated from equation (7).

Step 3: Adjust TFP by coefficient as below:

$$LC_t^{1/2(w_0^L+w_t^L)}$$

Hence:

$$B_t = A_t LC_t^{1/2(w_0^L+w_t^L)}$$

Where: A is the TFP index before adjusting for labor quality, and B is the TFP index after adjusting for labor quality.

From the data of the matrices, performing the calculations according to the above steps, the results are as follows:

Table 2. The results of computation

Unit: times

Year	L_t	H_t	LC_t	Income share of labour in total income	Adjustment coefficient of TFP
2000	1,0000	1,0000	1,0000	0,5544	1,0000
2002	1,6544	1,6489	1,0033	0,5231	1,0018
2004	0,3198	0,3426	0,9335	0,5125	0,9639
2006	1,4936	1,7051	0,8759	0,4931	0,9330
2008	1,3267	1,5532	0,8542	0,5048	0,9199
2010	0,2853	0,2795	1,0205	0,5075	1,0108
2012	0,2905	0,2762	1,0518	0,5135	1,0273
2014	0,2812	0,2640	1,0653	0,5229	1,0346
2016	1,2345	1,1588	1,0653	0,4984	1,0339
2018	1,1258	1,0043	1,1209	0,4644	1,0599
2020	1,1557	1,0215	1,1314	0,4782	1,0608

Source: Author's calculation form VHLSS survey

This coefficient will be used to adjust the TFP index due to the impact of labor quality. However, because the VHLSS survey was conducted only in even years, data for odd years were not available. To complete the time series of the TFP quality adjustment coefficient series, assumes that this data for odd years is equal to the average of the last two even years.

With such assumptions, the data set of the quality adjustment coefficient of TFP due to the influence of labor quality used in this study is as follows:

Table 3. TFP adjustment coefficient of Vietnam's agriculture in 2000-2020

Unit: times

Year	TFP adjustment coefficient	Year	TFP adjustment coefficient
2000	1,0000	2010	1,0108
2001	1,0009	2011	1,0194
2002	1,0018	2012	1,0273
2003	0,9909	2013	1,0310
2004	0,9639	2014	1,0346
2005	0,9484	2015	1,0343
2006	0,9330	2016	1,0339
2007	0,9264	2017	1,0469
2008	0,9264	2018	1,0599
2009	0,9643	2019	1,0602
		2020	1,0608

Source: Author's calculation form VHLSS survey

These coefficients will be used to adjust input quality when calculating the agricultural TFP in Vietnam.

The calculation results show that there is a clear difference in the labor quality adjustment coefficient by period. From 2000-2002, these coefficients were almost unchanged in value. In the period from 2003 to 2009, these numbers were less than 1, with the smallest values belonged to the year 2007 and 2008. After that, there was a gradual recovery. In the period 2010-2020, these coefficients were greater than 1, and tend to increase gradually over the years.

From formula (8), it can be seen that the values of these coefficients will directly affect agricultural TFP after adjusting for labor. Accordingly, agricultural TFP after adjustment for labor quality will remain unchanged compared to TFP before adjustment in the period 2000-2002, decrease in the period 2003-2009 and gradually increase in the period 2010-2020. The changes after applying the labor quality adjustment coefficient have a large influence on the value of agricultural TFP. For example, in 2008, after adjustment, TFP will decrease by 7.36%, in 2020, TFP will increase by 6.08%. The application of this coefficient will help to have a more accurate assessment of the value of agricultural TFP.

4. Discussion and Conclusion

Quality adjustment coefficients calculated in Table 3 can be used to adjust agricultural productivity indicators such as TFP. It can be seen that from 2000-2009 these coefficients tend to decrease, while from 2010-2020, these coefficients have increasing coefficients. This will have a similar effect on agricultural TFP.

Research on the quality of inputs should be concerned more to get accurate productivity indicators for research and policymaking. The most important issue is the source of the data needed to calculate the quality adjustments of inputs such as labor. The research still has limitation in terms of data such as can just construct the matrix of labor coefficient in even years. However, the study has contributed a view on this issue and performed an experimental calculation of the labor quality adjustment coefficient in the period 2000 - 2020.

IMPACTS OF MONETARY POLICY ON VIETNAM'S ECONOMIC GROWTH

MA. Le Tat Phuong

letatphuong@gmail.com

National Center for Socio-economic Information and Forecast, MPI, Vietnam

Abstract

Monetary policy plays a very important role in every economy. Recently, Vietnam's monetary policy is gradually adjusted to the changes of the economy. This study will analyze and assess impacts of monetary policy on economic growth by using both qualitative and quantitative analysis to examine impacts of some specific monetary policies (interest rate, monetary supply, exchange rate, credit) on Vietnam's economic growth.

Keywords: *Growth, monetary policy, Vietnam, quantitative*

1. Introduction

Monetary policy through the increase or decrease of monetary volume will affect interest rates and aggregate demand, leading to an increase in productive investment, thereby affecting economic growth.

Recently, Vietnam's monetary policy has played a significant role in economic growth, reflected in the key tasks that monetary policy has been aiming for, including maintaining macroeconomic stability, promoting and sustaining growth.

This study uses a number of quantitative tools such as correlation analysis, econometric models to clarify the impacts of some monetary policies on Vietnam's economic growth.

2. Method

Methodologies used in this study to examine impacts of monetary policies on Vietnam's economic growth includes:

•Correlation coefficient analysis

The correlation coefficient is a statistical indicator to measure strength of relationship between two variables. The correlation coefficient has a value from -1.0 to 1.0. A positive correlation coefficient shows that two variables have a positive relationship, whereas a negative value indicates an inverse relationship, and the correlation coefficient is zero for two independent variables.

There are many types of correlation coefficients, but the most common one is the Pearson correlation. This index measures the strength and linear relationship between two variables. It cannot measure nonlinear relationship between two variables and cannot distinguish between dependent and independent variables.

Formulation

$$\rho_{xy} = \text{Cov}(x,y) / \sigma_x * \sigma_y$$

In which:

- ρ_{xy} : Pearson correlation coefficient
 $\text{Cov}_{(x, y)}$: Covariance of x and y
 σ_x : Standard deviation of x
 σ_y : Standard deviation of y

• *Multivariable regression econometric model (Hadjimichael model, 1994)*

This model is to evaluate the impact of fiscal and monetary policy on economic growth, based on Hadjimichael's model (1994), which is described as follows:

$$Y_{it} = \alpha_{it} + Y * \text{MonVar}(t-1) + \beta * X_i(t-1) + c + \varepsilon_{it}$$

In which:

- Y_{it} : Dependent variable
- MonVar: Variable representing monetary policy
- X_i : Control variables
- c : Intercept coefficient
- ε : Residual

Monetary indicators and control variables in the model are delayed because:

First: Economic policies in general and monetary policies in particular often have lags in impacts

Second: technically, to avoid the endogeneity problem between dependent and control variables

The above model is applied by following steps:

Step 1: Build an aggregate monetary indicator

To develop the composite fiscal indicator, principal component analysis (for Dimensionality reduction) – PCA is used.

Principal Component Analysis (PCA) is one of the simplest multivariate data analysis methods. The idea of this method is to extract the greatest amount of information from single variables and indices when combining them in ways through the fewest number of principal components (PCs). In other words, the PCA method allows a transformation to convert from a large set of variables and observations into a set of less variables but carrying the full or maximum amount of information of original variables. Through PCA analysis, principal components (PCs) are generated by modeling the resonance of single variables in different spatial directions, which ensures the maximum information of single variables and indices is retained in the principal components (Stock and Watson, 2002).

Step 2: Use the Hadjimichael model above to estimate the impact of monetary policy on growth

Step 3: Analyze the results

3. Results

3.1. Impact of monetary policy on Vietnam's economic growth

Over 70 years of development (State Bank of Vietnam was established in February 1951), Vietnam's banking system has continuously grown and achieved many important results, contributing positively to the growth of Vietnam's economy. Notably, important results have been recorded since 1986, when Vietnam implemented policy to open its economy when the country faced great difficulties and challenges.

Figure 1. Economic growth and some monetary indicators (%)

Source: Author's calculations from GSO and ADB data

The impact of monetary policy on growth can be examined into following stages:

- *Period 1986 - 1989*
- *Period 1990 - 1996*
- *Period 1997 - 2005*
- *Period 2006 - 2010*
- *Period 2011 - 2016*
- *Period 2016 - 2021*

Period 1986 - 1989 : During this period, Vietnam started to renovate in the context of the economy facing a series of difficulties and challenges such as stagnant production, galloping inflation, extremely difficult living...The main reason is that the long existed centralization, bureaucracy and subsidy mechanism in the economy has eliminated the drivers for development. However, thanks to Doi moi policy in 1986, including policies to eliminate subsidies, liberate production power, liberalize production and circulation of goods, and gradually liberalize prices, economic difficulties have been gradually overcome. Regarding monetary policy management, the State Bank switched to a positive real interest rate mechanism, which has attracted deposits to the banking system, contributing to stabilizing the currency and market, and boosting production. This is a breakthrough solution and determines the success of this period.

However, in this period, monetary policy has not been clearly shaped, the State Bank still supplied money under the direction of the Government. Thus, in the early years of renovation, the cash management regime was still according to the will and orders, not according to the laws of commodity economy and money circulation.

Period 1990 - 1996 : The collapse of the Soviet Union and the socialist countries in Eastern Europe during this period pushed Vietnam 's economy into more serious difficulties , though inflation during this period was controlled, it was still around 10%/year. The Party and Government are determined to give up the central planning mechanism and switch to a market economy under the management of the State, but it was not able to fully operate according to the market mechanism.

During this period, the State Bank continued to implement the positive real interest rate policy, associating with indirect tools and direct control tools in operating monetary policy; formed money market; initially modernize technology and strengthen human resource training for the operation of the new banking system. Credit capital was expanded to all economic sectors and achieved an average annual growth rate of 36%/year, contributing to restructuring and promoting economic growth in the following years. However, signs of hot development also revealed, especially in the real estate market. High-risk lending activities increased; many bank leaders take advantage of the bank's capital to invest in their own companies, credit fraud increased... leading to the collapse of credit cooperatives and the weakening of many commercial banks.

Period 1997 - 2005 : The Asian financial - monetary crisis in 1997 - 1998 had negative impacts on the domestic economic situation, economic growth slowed down, import and export activities decreased, foreign investment stagnated, the banking system faced many risks and challenges. The inherent weaknesses of the banking system were exacerbated by the impact of the above crisis.

To respond to the crisis, the State Bank has implemented flexible and prudent monetary policy, contributing to minimizing negative impacts on the economy. Besides, the State Bank continued to improve the monetary policy management mechanism, especially the interest rate management mechanism; promulgate safety regulations and institutions to strengthen credit institutions' ability to prevent bad changes; applied provisioning for risks in an increasing direction; established Vietnam Deposit Insurance, separated policy credit from commercial credit and established the Social Policy Bank. Thanks to the above solutions, Vietnam's growth was kept at a decent rate: GDP growth averaged 7% in the 1996-2000 period and 6.9% in the 2000-2005 period.

However, this stage also backlogs and contains many risks when facing external shocks. Growth model based on increased investment; bank credit increased at an average annual rate of 25 - 30%/year, loose budgetary discipline has weakened the sustainability of the macro foundation, leading to high inflation again (from 2007 - 2011) and strongly fluctuated exchange rate.

Period 2006 - 2010 : During this period, the world political and economic situation was complicated, the global financial crisis 2008-2009 and economic recession had a strong

impact on Vietnam's economy, in the context that Vietnam has just joined the WTO (January 11, 2007), puts Vietnam's financial - monetary system in front of many difficulties and challenges.

Facing complicated developments of the domestic and international economic situation, monetary policy in this period was flexibly operated from time to time:

(1) From 2006 to October 2008: Focus on controlling inflation, stabilizing the macro-economy, limiting hot growth;

(2) From November 2008 to the end of 2010: Loosening to prevent economic downturn.

Accordingly, the State Bank required credit institutions to extend credit effectively and in accordance with the provisions of law; promptly handled problems related to loans and customers' access to credit; focused on effective implementation of lending mechanisms to support interest rates; strictly controlled credit quality, coupled with credit expansion in the direction of concentrating capital to meet needs of production, small and medium-sized enterprises, agriculture, rural areas and large and key projects of the State; strictly controlling loans for real estate, securities and consumption.

Policy administration of the State Bank during this period has actively contributed to curbing inflation, promoting growth, and preventing economic decline from the negative impacts of the global financial crisis and economic recession. However, the administration of expansionary fiscal policy and loosening monetary policy along with other reasons have pushed prices up quite high, adversely affecting inflation control in the following years .

Period 2011 - 2016 : Due to the adverse impact of the financial crisis in 2008 - 2009 and the internal weaknesses of the Vietnamese economy for many years, in the period 2011 - 2016, Vietnam's economy faced many challenges such as high inflation from 11.8% in 2010 to 18.13% in 2011; the money market, foreign exchange and gold market fluctuated considerably with high lending interest rates, up to 20-25%/year, VND was under pressure of devaluation, state foreign exchange reserves decreased. However , monetary policies were implemented effectively in this period, thereby having a positive impact on the economy: inflation was controlled and gradually decreased, the macro-economy gradually stabilized, major balances of the economy were maintained. The growth rate of consumer prices dropped sharply from 18.13% in 2011 to 0.63% in 2015, the lowest level in the past 15 years; interest rate level decreased from 20-25%/year to only 6-9%/year ... Besides, the economic growth model was also gradually transformed towards improving quality, efficiency and competitiveness. .

2016 - 2021 period : During this period, Vietnam's economy is continuously affected in term of supply and demand due to abnormal developments in the world economy, severe natural disasters and epidemics, trade tensions between the US, China and many other key economies. In early 2020, the Covid-19 pandemic broke out and devastated most of the countries in the world . In the financial sector, the world market is volatile and unstable.

To promote economic growth, the State Bank has synchronously administered solutions to maintain stability and gradually reduce interest rates. Since 2016, the State Bank has adjusted down the operating interest rates by 2 - 2.5%/year, down the ceiling deposit

interest rates for terms of less than 6 months by 0.8 - 1.5%/year on, reducing the ceiling lending interest rate by 2%/year for priority sectors; timely regulated and responded to the needs of credit institutions, maintain the interbank market interest rates at a reasonable level to facilitate credit institutions' access to capital at reasonable costs.

Regarding the exchange rate and foreign exchange market, the State Bank has managed the exchange rate proactively, flexibly, in line with the macro balances, actual developments in the market and objectives of monetary policy in each specific period. Accordingly, the State Bank has announced the central exchange rate daily on the basis of reference to domestic and foreign market movements, macroeconomic balances and monetary balances and objectives of monetary policy, contributing to stabilizing domestic exchange rate and foreign currency market.

In addition, the State Bank of Vietnam has also set up targets for credit orientation and credit administration in line with the macro balances, meeting the capital demand of the economy associated with improve credit quality, focus on production and priority areas, strictly control risky areas.

3.2. Quantifying the impacts of monetary policy on growth

Correlation coefficients

Considering the correlation relationship between some indicators of monetary policy and growth, it can be seen that since the financial crisis 2008, Vietnam's monetary policies (credit, money supply, exchange rates, interest rates) has been gradually stabilized, thereby contributing to stabilizing the macro-economy and promoting Vietnam's economic growth.

Figure 2. Correlation coefficients between some monetary indicators and growth¹

Source: Author's calculations

Impact assessment model

Using Hadjimichael model to evaluate the impact, we have the equation:

$$\text{Log(gdp)} = \alpha + \beta_0 * \text{INDEX_MON} + \beta_1 * \text{LOG(FCF(-1))} + \beta_2 * \text{LOG(LF_AC(-1))} + \beta_3 * \text{LOG(OPEN(-1))} + \beta_4 * \text{DUMMY} + \epsilon$$

¹CORR_GDP_G_CREDIT_V, CORR_GDP_G_EXRATE. CORR_GDP_IR12, CORR_GDP_G_M2_V : Correlation between growth and credit, exchange rate, interest rate and money supply

In which:

- ✓ GDP: gross domestic product (2010 price)
- ✓ INDEX_MON: Aggregate variable for monetary policy (calculated by PCA method)
- ✓ FCF: accumulation of fixed assets
- ✓ LF_AC: economically active workforce
- ✓ OPEN: openness of the economy
- ✓ DUMMY: dummy variable
- ✓ ε : Residual

Data:

The data used in the analysis and estimation were collected from GSO and ADB

*** Developing aggregate indicator for fiscal policy**

Using the dimensionality reduction method for fiscal and monetary indicators, we have the aggregate indicator of fiscal policy (Estimation results in Appendix 1).

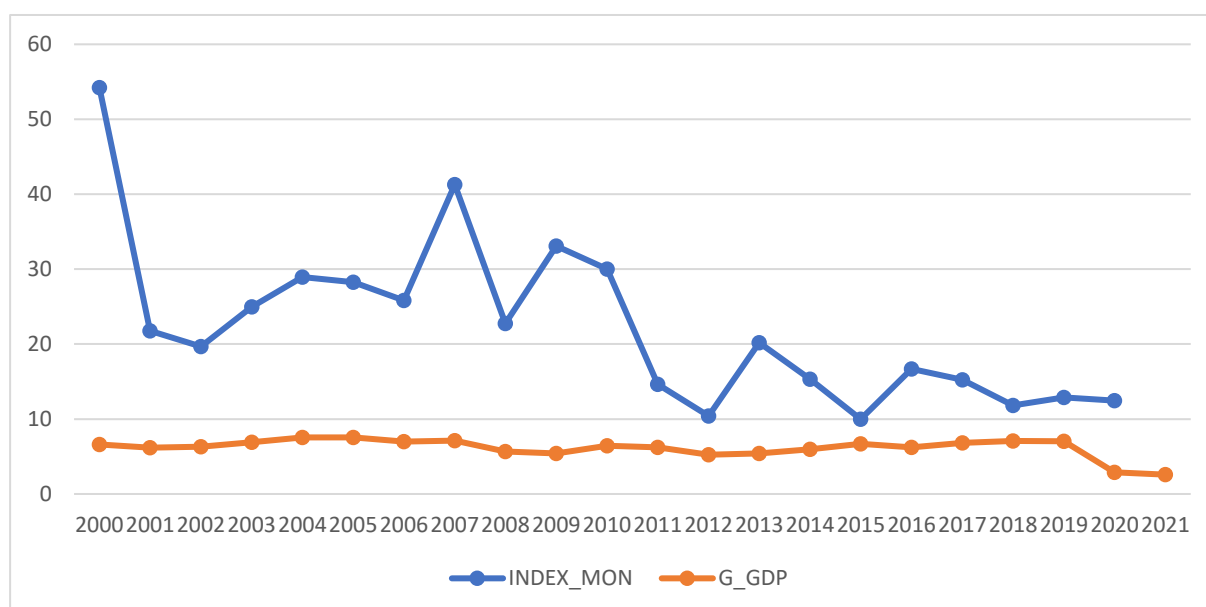

Figure 3. Aggregate indicators of monetary policy and growth²

Source: Author's calculations

Impact estimation model

When constructing aggregate indicator in the monetary sector by PCA method from fiscal component indicators³, we find that the coefficient of the aggregate fiscal index is -0.057, showing that there are coordinating problems among monetary policies bring positive effects to growth

$$\text{LOG(GDP)} = -0.057 \cdot \text{LOG(INDEX_MON)} + 0.421 \cdot \text{LOG(FCF(-1))} + 0.692 \cdot \text{LOG(LF_AC(-1))} + 0.350 \cdot \text{LOG(OPEN(-1))} - 0.079 \cdot \text{DUMMY}$$

²INDEX_MON: Aggregate monetary index calculated by PCA method from 4 monetary indicators: credit, exchange rate, interest rate, money supply; G_GDP: Growth rate

³Exchange rate, credit, money supply m2, interest rate 12 months

Vietnam's growth is still wide-ranging as the coefficients for labor (0.692) and capital (0.421) are very high, and the coefficient for economic openness is 0.350, indicating that Vietnam's economy has been integrating deeply into the world economy.

4. Discussion and Conclusion

In conclusion, in 35 years since Doi moi policy, although facing many difficulties and challenges, monetary policy has achieved many positive results and has made great contributions to the socio-economic development of the country. The management of monetary policy has had strong innovation in the direction of being proactive, leading the market, and gradually shifting from the regulation by volume to the regulation by interest rate. The State Bank has announced the interest rate management orientation and implemented synchronously measures to achieve the goal of gradually reducing the interest rate level, removing difficulties for businesses and households; flexible adjusting operating interest rates, combined with the application of appropriate administrative measures according to market developments.

In the coming time, in order to continue to improve the efficiency and effectiveness of the monetary policies for economic growth, following solutions should be paid attention: (1) As COVID-19 pandemic affects all aspects of socio-economic life, negatively affecting economic growth, commercial activities, labor, employment and income... maintaining policy solutions to support the economic recovery is necessary but inflationary pressure should be taken into account, which requires close coordination between policies as well as implementation methods; (2) Control interest rates at a reasonable level in a proactive manner, actively curbing inflation, curbing credit growth, improving the value and attractiveness of VND compared to foreign currencies, and at the same time controlling the conversion of credit in VND into foreign currencies ; (3) manage the exchange rate and foreign exchange market flexibly, in line with market movements. Strengthen foreign exchange management, immediately take necessary measures for organizations and individuals to sell foreign currencies to banks when they possess and buy them when they have reasonable need, ensuring foreign currency liquidity, stabilizing the exchange rate, meeting the essential production development of the economy and increasing foreign exchange reserves; and (4) Improve the quality of information and communication on monetary policy management and operations. bank.

RICE EXPORT IN THE WORLD MARKET IN THE CONTEXT OF COMMITMENT OF CARBON EMISSION REDUCTION: CASE STUDIES IN VIETNAM AND THAILAND

MSc. Nguyen Van Trong
trong.nguyen@cap.gov.vn

MSc. Bui Thi Viet Anh
anh.bui@cap.gov.vn

*Center for Agricultural Policy – Under Institute of Policy and Strategy for
Agriculture and Rural Development*

Abstract

Vietnam and Thailand are big producers and exporters in the world. However, Vietnam and Thailand's export competitiveness could be affected by policies on cleaner production and reduced carbon emissions by partners. Such policies could impact the global rice market that lead to changes in consumer tastes or tariffs on high-emission rice. In this context, the study is carried out to assess the impact of policies related to carbon emission reduction on Vietnam and Thailand rice export in the coming time. The gravity model is used in this study to estimate the impact of carbon tariffs on rice export value. The study also applies the stochastic frontier approach (SFA) to estimate the gravity equation and scenarios development of carbon tariff based on previous research. Given the regression coefficient of tariffs on the value export of rice, we calculate the impact of carbon tariffs on rice export of Thailand and Vietnam at three levels (10%, 20%, and 35%) for 2 scenarios: (i) only US and EU27, and (ii) all countries in the world impose carbon tariff on rice import. The results show that, in the first scenario, Thailand's rice export value will decrease from 20 million USD to 71 million USD whereas Vietnam's rice export value will decrease from 1 million USD to 5 million USD. But if all the countries in the world take action, both Vietnam and Thailand will lose a similar amount from 83 million USD to 349 million USD. Accordingly, the government and value chain actors in both countries need to take action to strengthen international cooperation on green development, develop and implement joint programs of research, and transferring science and technology for a green food system and emissions reduction. In addition, it is necessary to change and raise awareness the perception of production and consumption towards green and low-carbon production.

Keywords: *carbon emission, rice export, carbon tariff.*

1. Introduction

At the top of 10 rice producers, Vietnam and Thailand, produced around 71.7 million tons of paddy, equivalent to 48.7 million tons of rice accounting for more than 9,4% of global production (FAOSTAT, 2019). Both countries make an important contribution to the world's food security when they are always in the top 3 largest rice export countries in the world, contributing over 25% of the world's rice export value (Trademap, 2020). As a staple food,

over half of the global population depends on rice as a major part of their diet. Rice is considered an essential part of nutrition in many countries and is estimated to provide more than one-fifth of the calories consumed worldwide by humans. The demand for rice continues to grow as the world's population is expected to increase by 2 billion persons in the next 30 years, from 7.7 billion currently to 9.7 billion in 2050 (United Nations, 2019). At the same time, thanks to international economic integration, the tariffs on rice are gradually removed, which creates many opportunities to boost rice exports for both Vietnam and Thailand. However, rice production is already responsible for 70% of the world's water consumption and 30% of global greenhouse gas (GHG) emissions. In the context of the world promoting carbon emission reduction, countries will prioritize importing low-carbon rice products. Meanwhile, Vietnam and Thailand are pledging to reduce carbon emissions by 2050. In contrast, due to climate change, epidemics, and soil degradation pressures, there is an increasing trend of using inputs to ensure output. This increases the risks of carbon emissions. The risks will affect the promotion of rice export potentials and advantages in economic integration. Accordingly, both countries need to consider and promote measures in production quickly towards reducing carbon emissions.

In this context, there is little research on assessing the impacts of the tax on carbon emission on rice export of Vietnam and Thailand. Therefore, the research on "*Assessing the potential of rice exports to the world market of Vietnam and Thailand in the context of carbon emission reduction requirements in accordance with international commitments*" is carried out to identify the impact of the carbon tax on the rice sector, with a focus on Vietnam and Thailand. In this study, we applied the gravity model theory to identify the impact of tariff reduction on the export of rice. The research team proposed tariff scenarios imposed by rice importers on rice products from Vietnam and Thailand when the risk of increasing Carbon emissions from rice production took place in the context of climate change and degradation of natural production resources.

2. Method

To assess the impact of carbon tariffs on rice export of Vietnam and Thailand, firstly we identify the impact of tariffs on the rice export sector using the gravity model (e.g. 1% increase in tariffs will lead to how many percentage change in rice export). In the next step, we build up scenarios on carbon tariffs based on the scenario of carbon tariff from Nordin et al. (2019) since there are no official statements on how much a country will impose tariffs on rice.

First step: identify the elasticity between tariffs and the value of rice export

Generally, the gravity model has been extensively used to examine the relationship the bilateral trade flows between two countries (Kaliappa, 2008). The general gravity equation is as follows:

$$\text{Trade}_{ij} = G * S_i * M_j * \theta_{ij} \quad (1)$$

Where:

Trade_{ij} is the value of the bilateral trade between country i and j,

S_i is factors that make up the total importing demand of country i such as income, GDP

M_j is factors that represent the total amount of country j are willing to supply such as income, GDP, domestic production, etc.

θ_{ij} represents the ease of country i to access of country j (for example: distance)

G is a variable that does not depend on country i or j such as the level of world liberalization

Given this form, the standard procedure for estimating a gravity equation is simply to take the natural logarithms of all variables and obtain a log-linear equation (Bacchetta et al., 2012). Based on the research objectives and previous literature review, the estimation model in this study is:

$$\ln Trade_{ijt} = \alpha_0 + \alpha_1 * \ln GDP_{it} + \alpha_2 * \ln GDP_{jt} + \alpha_3 * \ln Distance_{ij} + \alpha_4 * \ln Population_{jt} + \alpha_5 * \ln Production_{it} + \alpha_6 * \text{Tariff}_{ijt} + \alpha_7 * \text{FTA}_{ijt} + \varepsilon_t \quad (2)$$

Where:

$Trade_{ijt}$ is the value of the rice export value of country i to country j in year t

GDP_{it} , GDP_{jt} are respectively the GDP of country i and country j in year t

$Population_{jt}$ is the total population of country j in year t

$Production_{it}$ is the total rice production of country i in year t

Tariff_{ijt} is the minimum effective applied tariff between country i and j in year t

FTA_{ijt} is whether country i and j has any Free trade agreements in year t

$Distance_{ij}$ is the distance between country i and j

α is the regression coefficient of the model

ε is the error term

There are a wide range of estimation methods such as OLS, tobit, panel fixed effects, Heckman model, etc. (Saleh et al., 2019). However, the method has some weaknesses such as loss of information due to the removal of zero trade flows, biased coefficient or exclusion of required variables. To address this problem, this study applies the stochastic frontier approach (SFA) to estimate the gravity equation. Kaliappa (2008) pointed out three main advantages of the suggested method of estimation are as follows. Firstly, it does not suffer from a loss of estimation efficiency. Second, it estimates the combined effects of the ‘economic distance’ bias term, which is creating heteroscedasticity and nonnormality, isolating it from the statistical error term. Third, the suggested approach provides potential trade estimates that are closer to free trade estimates. Finally, the suggested method bears strong theoretical and trade policy implications (Kaliappa, 2008). The frontier gravity equation for exports can be estimated as:

$$Trade_{ij} = f(Z_i; \alpha) \exp(-u_i + v_i)$$

Given this model, the equation (2) becomes:

$$\ln Trade_{ijt} = \alpha_0 + \alpha_1 * \ln GDP_{it} + \alpha_2 * \ln GDP_{jt} + \alpha_3 * \ln Distance_{ij} + \alpha_4 * \ln Population_{it} + \alpha_5 * \ln Production_{it} + \alpha_6 * \text{Tariff}_{ijt} + \alpha_7 * \text{FTA}_{ijt} + (v_t - u_t) \quad (3)$$

Step 2: After estimating the tariff elasticity (α_6), we multiply the carbon tariffs with the tariff elasticity. There is not much information on the specific carbon tariffs for each country in the world. The only available information is that the EU27 is proposing to introduce carbon tariffs in 2026 and the US is considering the same method for reducing

carbon emissions, but they have not announced the level of carbon tariffs either. Therefore, we applied the carbon scenarios developed by Nordin et al. (2019), carbon tariffs at the farm gate for agricultural commodities are 120 eur/ton (equal to the Swedish CO₂ tax on fossil fuels). This carbon tariff is equivalent to 21% for Vietnam and 35% for Thailand

Table 1. Estimation of tariff carbon for Vietnam and Thailand

	Vietnam	Thailand	Sources
Rice (HS-100630)	175 Eur/ton	175 Eur/ton	Macmap
Tariffs (equivalent)	23%	23%	Macmap
Carbon tariffs	120 Eur/ton	120 Eur/ton	Nordin et al.
CO ₂ /rice	1.33	2.21	Calculated from FAO
Final tariffs (Equivalent)	21%	35%	

In scenario 1: Only the United States (US) and European Union (EU27) are introducing carbon tax to rice of Vietnam and Thailand in three levels: low (10%), medium (20%) and high (35%).

In scenario 2: we assume that all countries in the world will participate in introducing carbon tax at 3 levels: low (10%), medium (21%) and high (35%).

Export value decrease of Vietnam = tariff elasticity (α_6)* proposed increase tariffs (β)*rice export value of year 2021

Export value decrease of Thailand = tariff elasticity (α_6)* proposed increase tariffs (β)*rice export value of year 2021

Data selection: The data includes the rice export value of top 10 largest rice exporters with their partners during 2005 – 2020. These countries are: India, Thailand, Vietnam, Pakistan, United States of America, China, Myanmar, Italy and Brazil, representing 85% of total rice traded globally. Hence, this panel data can represent the global rice sector and its sensitivity with tariff reduction. The main data sources for each variable are described in table 2.

Table 2. Data sources for each variable

Variable	Source
Total export	World Integrated Trade Solution (WITS)
GDP	World Development Indicators (World Bank)
Distance	Distance between cities (DistanceFromTo)
Population	World Development Indicators (World Bank)
Production	Rice production (FAO)
Tariff	World Integrated Trade Solution (WITS)
FTA	Market Access Map (ITC)

3. Results

3.1. Overview of rice sector in Vietnam and Thailand

Rice sector is a key source of greenhouse gas emission⁴. For Vietnam, its total greenhouse gas emissions in 2018 were equivalent to 376.53 million tons of CO₂, ranking 23rd in the world in terms of total greenhouse gas emissions (Worldbank, 2022). Among all the sectors, greenhouse gas emission from the rice industry accounts for 36 million tons of equivalent CO₂ (FAO, 2022). In Vietnam, rice cultivation was responsible for 75% of CH₄ in agriculture and 15% of Vietnam's total GHG emissions (Monre, 2020). Thailand has the same position with Vietnam related to carbon emissions from the rice sector. In 2018, Thailand ranked 20rd in 2018 with a total of 416.950 million tons of equivalent CO₂ and its rice sector contributed 47.683 million tons of equivalent CO₂ (FAO, 2022; Worldbank, 2022). Hence, in the context when other countries commit to reduce greenhouse gas emissions by introducing carbon tariffs, the rice sector of both Vietnam and Thailand will be heavily affected.

Both Vietnam and Thailand are among the top rice producers and exporters in the world. In 2020, Vietnam and Thailand produced 28.5 million tons and 20.2 million tons of rice respectively, accounting for 7.5% of global rice production (FAO, 2022). In terms of exporting, Vietnam and Thailand are among the top rice exporters after India. Viet Nam's rice exports grew strongly during the period 2005 - 2012, however, from 2012 to 2016, rice exports tended to decrease gradually and only recovered within the last 4 years. Rice exports peaked in both volume and value in 2012 with 8 million tons of rice reaching US\$3.7 billion, the compound annual growth rate of 43% compared to 2005. Southeast Asia remains to be the largest importer accounting for 40% market share, followed by African countries such as Ghana and Ivory Coast. China has also become a major trading partner of Vietnam in the past 10 years. Although exports to Europe, the US, Australia and Japan remain limited, Vietnam has opportunities of expanding its export share of high-quality rice due to tariff cutting under free trade agreements.

The rice export value of Thailand decreased from \$4.56 million to \$3.69 million during the 2015 - 2020 period. The decrease indicates Thailand has tended to decrease low and medium-quality rice, particularly for white rice in African markets, which accounts for approximately 40-50 percent of total rice exports over the past five years (USDA, 2019). Thailand has retained itself as a high value and strong brand name rice in developed countries, especially plays an important role in supplying rice for the US and the EU27 markets, accounting for 59% and 16.7% of rice import value in these markets respectively. However, in 2020, South Africa becomes the second largest partner of Thailand whereas the other countries remain little changed.

3.2. The estimation results of gravity model on impact of carbon tax on rice export value

For a large rice exporter such as Vietnam and Thailand, the impact of carbon tariff will decrease the competitiveness of these countries as well as export value. Based on the

⁴ The primary greenhouse gasses in Earth's atmosphere are water vapor (H₂O), carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), and ozone (O₃). CO₂ accounts for 9 - 26% and CH₄ accounts for 4-9%.

gravity theory, using the SFA method, the estimated results of impacts of tax and other factors on rice export are provided in table 3.

Table 3. Estimation results for gravity model using SFA method

Coefficient	Coefficiency	Standard error	Pvalue
Tariff	-0.003	0.001	0.000
Population	0.172	0.052	0.001
Gross Domestic Product (GDP) of importer	0.352	0.037	0.000
GDP of exporter	0.286	0.030	0.000
Production	0.556	0.050	0.000
Distance	-0.876	0.114	0.000
Free trade agreement (FTA)	0.386	0.053	0.000
constant	8.452	1.481	0.000
Mu = 7.532 (Pvalue = 0.000), sigma2 = 8.21, gamma = 77.76%			
Log likelihood = - 23098, Chi-square = 820 (Pvalue =0.00)			

Sources: Estimation results from STATA (2022)

The gravity model for rice sector are:

$$\ln\text{Trade}_{ijt} = 8.45 + 0.352*\ln\text{GDP}_{it} + 0.286*\ln\text{GDP}_{jt} - 0.876*\ln\text{Distance}_{ij} + 0.172*\ln\text{Population}_{it} + 0.556*\ln\text{Production}_{it} - 0.003*\text{Tariff}_{ijt} + 0.386*\text{FTA}_{ijt}$$

The value of gamma in the model is 77.76%, implying the presence of hidden factors affecting the bilateral trade of rice between countries. Therefore, the high significance of gamma indicates that the SFA method is appropriate to estimate gravity models for rice exporting. The Pvalue of Wald test is also significant at the 1% level, hence we can conclude that the selected explanatory variables are suitable for explaining the variations in rice export. All of the independent variables are significant at 1% implying this is a very good model and the SFA is suitable for estimating the regression coefficient. Overall, the results are similar to the classical theory of gravity model. The sign of regression coefficient of both GDP variables and population is positive whereas that of distance is negative, indicating that bilateral exports of rice are proportional to economic size and inversely proportional to geographic distance. This proves the hypothesis of traditional gravity model theory (Chaney, 2018).

Among all of the factors, the study found that distance is the factor having the most profound impact on export rice between two countries. If the distance increased 1%, the rice export value would decrease 0.87%. Hence, the closer the two countries are, the larger the value of rice reaches. In fact, the closer distance can reduce the shipping cost and risks during transportation (Bui & Chen, 2015; Carrere, 2003; Nguyen & Heo, 2009).

Production of the exporter is the second largest factor affecting the rice export value, 1% increase in production will lead to 0.56% increase in the export value. The production implicates the exporter's capacity to supply. Besides, 1% increase in the GDP of exporter

and importer will lead to 0.35% and 0.28% respectively increase in the export value. Hence, for the rice commodity, the increase in GDP and production reflect the increase in the exporter's supply capacity and importer's demand, leading to the increase of trade as economic theory. The impact of the importer's population only led to 0.17% increase in the export value.

In terms of the ease of trade, if the two countries are engaging in any free trade agreement except for WTO, their export value will increase 0.38%. And 1% increase in tariff rate will lead to 0.3% decrease in the rice export value.

3.3. Carbon tariff scenarios and impacts on rice export value in Vietnam and Thailand

The below figures illustrate the impact of carbon tariffs on Vietnam and Thailand rice export values based on the result of gravity model estimation and carbon tariff scenarios of the research team.

Sources: Authors' calculation

Figure 1. Impact of carbon tariffs on Vietnam and Thailand rice export value in two scenarios

In scenario 1: Only the US and EU27 are introducing carbon tax to rice production of Vietnam and Thailand in three levels: low (10%), medium (20%) and high (30%). From figure 1, it can be easily seen that Thailand will suffer more than Vietnam as the US and EU27 are one of the principal trade partners for Thailand. Thailand's rice export value will decrease from \$20 million to \$71 million whereas Vietnam's rice export value will decrease from \$1 million to \$5 million. Although the figure of Vietnam is small, this increases a heavy burden for Vietnamese enterprises as it is developing its strategy into integrating into wealthy markets.

In scenario 2: All countries in the world will participate in introducing carbon tax at 3 levels: low (5%), medium (10%) and high (20%). It can be clearly seen that Vietnam and Thailand will lose from \$83 million to \$349 million if they continue with the current technique for rice production. This is a huge loss for the rice industry, which can have a split-over effect on farmers in both countries.

4. Discussion and Conclusion

Vietnam and Thailand's rice industry is important for national and world food security, affecting the lives of the majority of farmers, welfare, and social stability. Both countries are also actively involved in the global rice value chain and implement international commitments under free trade agreements with new constraints of enhanced environmental responsibilities. Consumers in many markets are shifting in friendly-environment consumption habits. As joining global value chains, both countries are also under increasing pressures from buyers across the globe to reduce greenhouse gas emissions and environmental footprints. Their commitments require Vietnam and Thailand to commit to produce towards sustainability, energy saving and low-carbon production emission. Accordingly, stakeholders along the rice value chain must increase investment to better clean production, so that their production costs can increase. As a result, the trade advantages will be significantly reduced.

Vietnam and Thailand's rice production mainly relied on small-scale and scattered farming households. The requirements for reducing carbon emissions associated with small farmers are quite difficult. While the development of the rice industry is facing challenges with resources and other input intensification requirements due to the impact on climate change, natural disasters, epidemics and degradation of natural resources. Accordingly, the risks of increasing carbon emissions from rice production have always existed. The introduction of a carbon tariff will pose a threat to rice export of Vietnam and Thailand. If the tariffs are at 20%, Vietnam and Thailand will suffer a loss of 2 million and 35 million respectively in case only the US and EU27 impose. But if all the countries in the world take action, this value could decrease to 167 million for Vietnam and almost 200 million for Thailand.

In order to reduce greenhouse gas emissions (CO₂ and CH₄) in the rice production chain of Vietnam as well as Thailand, it is necessary to promote management and monitoring solutions as well as production techniques - business processing - emission reduction along the rice value chain. Accordingly, countries need to focus on: i) International cooperation on green growth - transitioning to a green food system, GHG emissions reduction, developing emission control and measurement systems, ii) Develop and implement joint programs of research and transfer of science and technology for green growth - transition to a green food system, GHG emissions reduction, iii) Monitoring and calculating which stages in the rice value chain play an important role in carbon emissions. In term domestic production system, it is necessary to build trainings for producers to: i) Raise awarenesses for transitioning to a green food system and emissions reduction, ii) Change the perception of production and consumption, and meet the requirements of low-carbon production, iii) Promote the application of production technologies and techniques to save production resources

(economical irrigation systems, exploitation of natural irrigation water sources, effective application of hydroponics, application of clean and safe production standards). In terms of rice products with permeable carbon emissions, it is necessary to focus on brand development and ecological label expansion.

Abstract

Non-tariff measures (NTMs) are gaining popularity as a trade protection measure and have an impact on international trade. According to I-TIP, since 2010, the number of NTMs has increased 2.5 times. In Vietnam, of the total NTMs imposed by the importing countries, 54% are technical barriers to trade (TBT) and 27% are sanitary and phytosanitary measures (SPS). The research assesses the impact of TBT and SPS on seafood (HS 03) and cereals (HS 10) exports of Vietnam for the period 2001 - 2020. Using the extended gravity model and Poisson estimation method, the results show that SPS has an export-restrictive effect on both seafood and cereals of Vietnam. In addition, while TBT has the same negative effect as SPS on cereals, it has a positive effect on seafood. However, the magnitude of those impacts are not significant and does not differ when comparing seafood and cereals. Research results imply that the Government should actively support capacity building of enterprises. Simultaneously, businesses need to invest in product quality and work closely with the Government to ensure product origin.

Keywords: *SPS, TBT, Vietnam's export*

1. Introduction

In the context of global integration, growing trade liberalization, tariffs have been significantly reduced through the wave of signing of Free Trade Agreements. However, at the same time, there is an increase in the number of non-tariff measures (NTMs). Initially, NTMs were used for legal purposes such as human health, animal and plant health, environmental problems, food concerns, and so on. However, now, some countries are

abusing this measure for the purpose of trade protection. NTMs are often applied to protect the domestic industry from competition of foreign products (Fridhowati & Asmara, 2013; Disdier et al. 2008). By the end of 2021, the world has applied a total of 61543 NTMs, an increase of 2.5 times compared to 2010 (I-TIP, 2021). Among the current NTMs, phytosanitary measures (SPS) and technical barriers to trade (TBT) are the two most commonly-used NTMs, accounting for 36% and 53%, respectively. The proliferation of NTMs and their effect on trade has been the subject of debate among researchers, especially with regard to SPS and TBT (UNCTAD, 2016). Despite an increasing focus on investment and development, Vietnam's export products cannot avoid the negative influence of NTMs. Even compared with other countries in the region and in the world, Vietnam's products are subject to a rather large number of NTMs. By the end of December 2021, Vietnam's exports had been affected by 56186 NTMs, accounting for 92% of the total number of more than 61298 NTMs in the world; of the total NTMs imposed on Vietnam, 57% are TBT and 35% are SPS (I-TIP, 2021). According to statistics from I-TIP, Vietnam suffered from a total of 2821 NTMs in the world applied to seafood products (HS 03) with the TBT and SPS rates of 50% and 50% respectively. Cereals products (HS 10) are affected by 3531 NTMs with TBT and SPS rates of 45% and 47%, respectively (I-TIP, 2021). Based on the above-mentioned rationales, the research objective is to assess and compare the magnitude of impact of TBT and SPS on the export of Vietnam's seafood and cereals. In addition, some recommendations were made to enhance the export of Vietnamese cereals and seafood products.

Previous research has reported that the imposition of NTMs produces a variety of effects for different subjects. From an economic perspective, the impact of TBT and SPS on trade has received much attention from researchers with different approaches and their empirical results suggest inconsistency. In other words, they have documented both trade-promoting and trade-restrictive effects of such two types of NTMs (Shepotylo, 2017; Crivelli & Groeschl, 2016; Bao & Chen, 2013).

TBT and SPS promote trade

Quantifying the impact of China-imposed NTMs measured by coverage ratio, Devadason & Chenayah (2014) concluded a higher coverage ratio of TBT would promote exports from ASEAN to China, although such impact is not large for the member countries that have recently joined ASEAN. Particularly, the authors said that chemical products exported from ASEAN benefited the most from China's TBT compared to other products. Though Bao (2014) used a different indicator called frequency index to quantitatively assess TBT imposed by China, he yielded the same results as Devadason & Chenayah (2014). With a combination of coverage ratio and frequency index to measure the impact of NTMs, Rindayati & Kristriana (2008) drew a conclusion that frozen tuna is most affected product by SPS and TBT and the two NTMs increased Indonesia's overall tuna exports by a factor of 0.011 and 0.15 respectively. On the basis of past studies, the benefits of NTMs for export continue to be verified across the product range (Shah et al., 2014; Wood et al., 2017; Bhyuana & Oh, 2020).

TBT and SPS restrict trade

However, TBT and SPS exert a trade-restrictive effect on the value of countries' exports as well. Studying the impact of an EU-imposed SPS about food safety standard on cereals, dried fruits and nuts, Otsuki et al. (2001) concluded that the measure would reduce the value of exports of these items from Africa to Europe by 64%, although it prevented 1.4 billion deaths annually. Additionally, the stringent SPS adopted by the OECD developed countries cost South Africa \$69 million in agricultural exports (Gebrehiwet, 2007). Disdier (2008) found similar negative results for TBT and SPS from OECD countries but added that they had no effect on intra-regional trade between the member countries. Applying a gravity model, Wei et al. (2012) agree with the results of Bao & Qiu (2012) that a strict SPS or TBT measure will reduce China's agricultural exports. This may result from the sensitivity of the country's agricultural trade to changes in food safety standards (Chen et al., 2008). Research results by Grant et al. (2015) argue it is true that SPS measures are often trade-restrictive, but this level of restriction will gradually decrease as exporters accumulate more experience. In her study, Nguyen (2018) discussed the negative impact of SPS on Vietnam's rice exports, gradually decreases as the income of importers increases. Today, the negative impact of NTMs on exports continues to be demonstrated when Sandaruwan et al. (2020) reported that TBT and SPS led to a 15% and 48% reduction in seafood exports from Sri Lanka between 2001 and 2017. In a follow-up study, Ngo (2020) found that NTMs restrict exports from Vietnam to ASEAN by about 3.7% only when they come into effect after two years.

A comparison in the magnitude of impact of SPS and TBT by product

While measuring TBT and SPS, some researchers have compared the magnitude of their impact between products. Chen et al. (2008) reported that spinach suffered a greater impact than onions and garlic due to the imposition of a maximum excess of Chlorpyrifos by importing countries on Chinese agricultural products. Meanwhile, Disdier et al. (2008) made a more complex comparison when they study with different numbers of 2-digit HS items. Results of studied 8 items showed that TBT and SPS had stronger negative effects on HS 06 "living plants", HS 13 "resin", HS 22 "alcoholic beverages and vinegar" and HS 24 "tobacco and substitutes". On the other hand, when the number of items studied is reduced to 7, the impact becomes positive and has the strongest magnitude for HS 10 "cereals" and HS51 "wool and animal hair". Generally, various notable research gaps have been identified. Global research has diversified in indicators (frequency index, coverage rate, etc.) to assess the impact of TBT and SPS but they only analyze and compare without further comments on the causes and implications of such differences in the magnitude of impact not only between products but also between TBT and SPS. In addition, the number of studies revolving around the export value of seafood and cereals in Vietnam is relatively scarce and the inventory approach has not been applied to specify the share of exports affected by TBT and SPS, given the fact that previous studies by Nguyen (2018) and Ngo (2020) only used dummy variables. This is the research gap that this study focuses on exploiting.

2. Method

2.1. Empirical model

2.1.1. The extended gravity model

The Gravity Model was first applied by two economists, Tinbergen (1962) and Poyhonen (1963) to analyze the factors affecting international trade flows. Leamer & Levinsohn (1995) claimed it produced very significant outcomes for empirical economics. The modern gravity model includes additional independent variables, namely tariff (Anderson & Wincoop, 2003) or regional FTA, language, common border (Hatab et al., 2010). Meanwhile, many researchers quantified the impact of NTMs, including TBT and SPS, by using coverage ratio and frequency index, for example, and added them on to the classic gravity model such as: Disdier et al. (2008); Bao & Qiu² (2010); Choi et al. (2015). Based on such research, we propose an extended gravity model below:

$$\ln EX_{ijt} = \ln GDP_i + \ln GDP_j + \ln DIST_{ij} + \ln(TAR_{jt}+1) + FI_{TBT} + FI_{SPS} + BOR_{ij} + FTA_{ij} + REL_{ij} \quad (1)$$

2.1.2. The Poisson estimators

In the research sample, the value of Vietnam's export to several countries equals zero, which makes $\log(0)$ undefined; therefore, these cases are usually eliminated or ignored. Accordingly, when OLS regression is applied, the estimates may be incorrect or biased. Currently, Heckman and Poisson estimation methods are most prevalent for their ability to deal with "zero-trade" situations. However, according to Liu (2009), Heckman sample selection method can cause heteroskedasticity as it uses log-linear specifications like OLS estimate and suffers from the problem of Jensen inequality. Therefore, the Poisson regression will be more ideal for two following reasons: *firstly*, it can deal with heteroskedasticity and zero trade effectively instead of ignoring them like OLS; *secondly*, there is no need to test both the normality of error term and homoscedasticity assumptions. In addition, Poisson regression allows the dependent variable to be logaritized while independent variables can be in logarithmic form or not.

2.2. Data

The study relies on secondary data collected as panel data, which includes time series data from 2001 to 2020 and cross-sectional data on TBT and SPS measures imposed on seafood products (HS 03) and cereals (HS 10) of 15 importing countries: China, Chile, India, Thailand, New Zealand, South Africa, USA, Russia, Netherlands, Canada, Brazil, UAE, Korea, Malaysia, Australia. Regarding the dependent variable, EX_{ijt} stands for exported value of Vietnam, to 15 partner countries (j) in year t, which is collected from Trademap. With regards to the independent variables, about GDP_i and GDP_j , they are the Gross Domestic Product of exporting country Vietnam and Gross Domestic Product of the importing country j, respectively. Both of the GDP mentioned above are taken from Worldbank. $DIST_{ij}$ is the geographical distance from Vietnam to importing country j and collected from CEPIL. TAR_{jt} is the simple average importing tariff under Most Favored Nation (MFN) from WTO. FI_{TBT} and FI_{SPS} are frequency index for TBT imposed on Vietnamese product by importing countries and frequency index for SPS imposed on Vietnamese product by importing country. Both of them are all calculated by the author based on the data of I-TIP. BOR_{ij} is border exposure between Vietnam and the importing country j taken from Nationsonline (Political Map of the World). FTA_{ij} is Free Trade

Agreement between Vietnam and importing country j , which is collected from Findrulesoforigin. REL_{ij} is common religion between Vietnam and the importing country j from Nation Master. In addition, in terms of the expected sign of independent variables, apart from $DIST_{ij}$, TAR_{jt} , FI_{TBT} , FI_{SPS} , all of the rest are forecasted to have a positive impact on the dependent variable.

2.3. Frequency index FI_{TBT} and FI_{SPS}

Disdier et al. (2008) applied the “inventory approach” through two indicators, the frequency index and the coverage ratio, to measure the level of trade-restrictiveness of NTMs proposed by importing countries. However, the coverage ratio’s magnitude does not adequately represent the SPS and TBT requirements’ restrictions (Wood et al., 2017). Furthermore, the coverage ratio might lead to endogeneity issues with the dependent variables (Wood et al., 2017). Therefore, in this study, the frequency index is the only indicator used by the authors to assess the impact of TBT and SPS on Vietnam’s seafood and grain exports.

The following formula is used to compute the frequency index of product type j in year t :

$$FI_{jt} = \left[\frac{\sum D_{xt} M_{xt}}{M_{xt}} \right] \times 100 \quad (2)$$

i = product classification i with 4-digit HS code

j = product classification j with 2-digit HS code

t = 2001 – 2020

x is the product identified at the 4-digit HS code level of the product classification j at the 2-digit HS level; if an SPS or TBT measure is imposed on product x in year t , the dummy variable D_{xt} takes on a value of one or, conversely, zero. M_{xt} is also a dummy variable, which is equal to one if an import of product x exists or zero if no value exists.

3. Results

3.1. Descriptive statistics

Table 1 summarizes the statistical values of the variables used in the gravity models for seafood (HS 03) and cereals (HS 10). The minimum and maximum values of both FI_{TBT} and FI_{SPS} are 0 and 100, which means no HS 4-digit product line or all HS 4-digit product lines of seafood or cereals are subject to TBT and SPS in one year.

Table 1. Descriptive statistics of variables

Variable	Mean	Standard deviation	Min	Max
EX_{ijt}	142029.4*	51756.03**	233993.4*	159306.7**
$\ln GDP_i$	18.52	0.69	17.30	19.42
$\ln GDP_j$	20.50	1.34	17.80	23.79
$\ln DIST_{ij}$	8.71	0.85	6.90	9.83
$\ln(TAR_{jt}+1)$	1.61*	1.92**	1.04*	1.47**
FI_{TBT}	38.36*	39.67**	48.36*	49.00**
FI_{SPS}	35.90*	25.22**	45.65*	43.14**
BOR_{ij}	0.07	0.25	0	1
FTA_{ij}	0.68	0.47	0	1
REL_{ij}	0.73	0.44	0	1

Note: *, ** are seafood and cereals respectively

Source: Authors’ calculation

Table 2 summarizes the correlation between the research variables in the model for seafood. Generally, no independent variable has a strong correlation with another. The correlation coefficient is lower than the limit of 0.75 (Tsui et al., 1995), meaning that the data set does not have serious multicollinearity. Therefore, no independent variables are excluded.

Table 2. Correlation matrix of independent variables in the model for seafood

	lnGDP _i	lnGDP _j	lnDIST _{ij}	ln(TAR _{jt+1})	FI _{TBT}	FI _{SPS}	BOR _{ij}	FTA _{ij}	REL _{ij}
lnGDP _i	1.0000								
lnGDP _j	0.3062	1.0000							
lnDIST _{ij}	-0.0001	0.0638	1.0000

3.2. Results of regression

Due to the "zero trade" phenomenon, Poisson regression was applied to estimate the coefficients of the independent variables. The Hausman test confirms the model is subject to random effects instead of fixed effects, with a probability value of 0.93 and 0.77 (higher than 0.05) for seafood and cereals models respectively. The main reason is the presence of a time-invariant independent variable (Bell & Jones, 2014), which is the geographical distance between Vietnam and the importing country in this research. Table 3 presents the results of regression analysis by Poisson estimation method, assuming that the model has a Gamma distribution. Most independent variables ensure high statistical significance at a level of 1% for both products, only the variable BOR_{ij} has statistical significance at a 5% level. In addition, the variable DIST_{ij} is not significant in the model for cereals and the variable REL_{ij} is insignificant in the model for seafood.

Table 3. Results from Poisson regression (Gamma random effects)

Independent variable	Seafood		Cereal	
	β	p-value	β	p-value
lnGDP _i	0.174638*** (0.000519)	0.00	1.089015*** (0.000865)	0.00

4. Discussion and Conclusion

4.1. Discussion

4.1.1. The impact of independent variables of gravity on seafood and cereals exports

Based on the sign of β coefficient, gross domestic product (GDP) of Vietnam and importing partners are statistically significant and positively correlated with seafood and cereals exports. This relationship is in line with expectations and supported by previous researchers such as Bao & Qiu (2010) and Darhyati & Rifin (2017). They explained that the increase in GDP of both exporting and importing countries encouraged the exporters to boost their production and enhance the consumption demand of importers. Conversely, geographical distance is negatively correlated with the exports of both products. Thus, the sign is as expected. Darhyati & Rifin (2017) stated that the further a country was from another, the more expensive the imported products became, which might lead to the prohibitive shipping costs and a decline in consumption demand for imported products. While BOR_{ij} has statistical significance at 1% in the model for cereals, this independent variable only becomes significant when the significance level rises to 5%. Contrary to initial expectations, the sharing of common borders has a trade-restrictive impact on exports. Moreover, when two nations join one common FTA, it would increase 71.29% of cereals exports but decrease 68.22% of seafood exports. This situation was once explained by Wood (2017) when he analyzed the growth in export value between New Zealand and China before and after their bilateral FTA. A notable independent variable is the common religion of the exporting and importing countries REL_{ij} , which appears in the study of Helpman et al. (2008). Although this variable is not statistically significant in the seafood model, the negative effect of REL_{ij} on cereals exports is significant at the 1% level with a coefficient of 1.7686. This result is in contrast to that of Helpman et al. (2008), who found that sharing a common religion increased exports. For the variable TAR_{ij} , the results show it is statistically significant and has a negative relationship with seafood export values. Meanwhile, for cereals exports, a surprising finding was that increasing the simple average MFN tariff rate by 1% would increase the value of cereals exports by 3.0645%. Such finding contradicts with expectation and is explained by the phenomenon of trade diversion when Vietnam joins many FTAs with other countries (Dai et al., 2015; Sun & Reed, 2015).

4.1.2. Effect of TBT and SPS on seafood and cereals exports

a. Evaluating the impact of SPS and TBT on two products

Noticeably, both important variables that are frequency indexes of TBT and SPS have statistical significance at 1%, although their coefficients are negligible. Regarding SPS, this NTM restricts the exports of seafood and cereal. This result is reinforced by the majority of research papers in the same field such as: Otsuki et al. (2001), Gebrehiwet et al. (2007) and Bao & Qiu (2010). According to Gebrehiwet et al. (2007), developing countries, including Vietnam, lack expertise and resources to upgrade the quality of the exported products; therefore, they fail to meet the stringent requirements of importing countries. And such countries must face the financial burden to satisfy the conditions. Regarding TBT, while it has a negative effect on cereals export like SPS, this NTM promotes seafood export by

0.19%. The cause for the adverse effect of TBT on cereals is similar to that of SPS on seafood. In terms of seafood's regression model, the sign is contrary to our expectations and this outcome was once mentioned by Shepotylo (2016) when he explained that unlike SPS, TBT imposition contributed to fixed cost in seafood industry. Therefore, any firms overcoming this financial barrier thanks to their economies of scale could beat other inefficient producers successfully. In this case, TBT works as a protectionism mechanism for efficient exporters. Based on this analysis, the first research question is answered.

b. Comparing the magnitude of impact of SPS and TBT by product

Generally, the magnitude of SPS's adverse effect on seafood is more significant than that on cereals, with the gap of 0.06%. This discrepancy arises given that seafood products are often inspected and controlled more stringently to make sure such products meet sanitary standards while less restrictive measures of this type are imposed on cereals. Additionally, because seafood is high-value, the decline in its export caused by SPS is very clear. According to Nguyen & Dang (2014), the most frequently-rejected products of Vietnam by foreign large markets is seafood due to the high content of heavy metals, antibiotic residues and additives during 2002-2010. However, the gap between cereals and seafood is small, which proves seafood producers gradually adapt to SPS requirements given by developed markets. This results from the supervision and support from the Government, the Associations and exporters' adaptation. Meanwhile, the export of seafood is positively impacted by TBT while the opposite pattern is seen in that of cereals. Regarding seafood products, TBT mainly includes packaging and labeling requirements. In reality, such Vietnamese seafood products met 5/6 exporting conditions promulgated by EU, according to Nguyen (2019), at that time, most of which belonged to TBT group. Accordingly, it has created protectionism for Vietnamese seafood compared to that of other producers as long as Vietnam entered foreign markets successfully. However, the magnitude of both positive and negative impact is not significant, which means that cereals producers have tried to overcome the barriers created by TBT to take advantage of this measure's protectionism power.

The result of this comparison implies the capability of Vietnamese exporters has improved remarkably thanks to close supervision from the Government and Associations. Such producers successfully adapt to SPS and TBT introduced by difficult markets; hence, the impact of both measures is not enormous. These favorable conditions should be maintained and enhanced so that Vietnam's exports really increase in value and quantity.

4.2. Conclusion

This study establishes a quantitative framework to assess the impact of NTMs on Vietnam's seafood and cereals exports by adopting the extended gravity model and Poisson estimators. The results indicate SPS has export-restrictive effects on both products. While TBT has negative effects on cereal, it has positive effects on seafood. Moreover, the magnitudes of impact of TBT and SPS on seafood and cereals are not considerable, indicating that businesses are adapting well to NTMs. Particularly, SPS has created a higher negative impact on seafood than on cereals export, with a difference of coefficients being 0.0006. Based on the result, the authors propose some solutions for two groups, namely

Government and enterprises. Firstly, Government aid packages and priority loans for enterprises investing in human resources and technology are required. This might strengthen the capacity to meet demanding NTMs and improve the economies of scale advantage of enterprises over competitors. At the same time, exporters need to actively update alerts of TBT and SPS imposed by different markets. They may then create a quality management and assessment system for the whole manufacturing and processing procedure, meeting the censoring stage, based on specific criteria.

Abstract

The steel industry, as one of the most important sectors of the Vietnamese economy, is gradually establishing its effect on the broader economy. However, our steel sector continues to face several difficulties and obstacles in comparison to the development levels of steel industries in other countries in the region and around the world, including tough rivalry for foreign steel products, trade defense cases, and so on. The COVID-19 epidemic, in particular, has had a significant detrimental impact on the steel industry's production and consumption over the last two years. Even bankruptcy is possible. The paper evaluates financial, market, and macroeconomic elements' ability to anticipate financial fatigue and develops a model for forecasting financial exhaustion for steel businesses using 2016-2020 data.

Keywords: *finance, financial exhaustion, steel industry, Vietnam*

1. Introduction

With the economy entering a period of rapid growth as a result of global economic integration, Vietnamese firms are always interested in financial risks, elements that affect the financial fatigue of corporate finances. The rise of the steel industry demonstrates the industry's capacity for growth, exerting significant economic influence. However, Vietnam's steel sector is confronted with numerous problems throughout this period. In comparison to other nations in the region, Vietnam's steel enterprises are still developing slowly, and their competitiveness with steel products from other countries is low. Additionally, the COVID-19 epidemic has had a detrimental influence on the steel sector, both in terms of output and consumption. According to a report by Vietcombank Security in 2020, the volume of sales at steel sector firms declined significantly in the first six months of the year compared to the same period previous year. In the production dimension, the supply chain in markets worldwide is disrupted as a result of the country's implementation of blockade measures and trade controls. The COVID-19 epidemic erupted as a result of extended social isolation tactics that disrupted

supply networks and altered consumer mood. Due to the current difficulties, negative oscillations have resulted in the loss and financial exhaustion of some steel firms.

Numerous experts define corporate financial exhaustion as a period of financial distress experienced by a firm before declaring bankruptcy and continuing until the business files bankruptcy (Altman, 1968; Jiming & Weiwei, 2011; Tinoco & Wilson, 2013). According to Campbell et al. (2011), financial exhaustion is a negative effect of a business's operations becoming weaker, which can be caused by a lack of calculation when growing the business's size, bad management, or competitive pressure from competitors. The business's debt is unsustainable, putting it at risk of lawsuits and losing money on unprofitable contracts. Tran Ngoc Tho et al. (2005) state the following: "Financial depletion happens when creditors are unable to keep their commitments or reply in a timely manner. Occasionally, financial depletion results in bankruptcy. Occasionally, this simply indicates that you are in trouble."

The purpose of this study was to identify the factors affecting the financial exhaustion of Vietnamese steel enterprises, to develop a model for forecasting the possibility of financial exhaustion, and to provide a number of conferences and policy implications so that businesses can take measures to improve their financial health and avoid unnecessary risks.

2. Method

Research methods

The study employs a series of procedures to ascertain the link between independent variables, including correlation analysis, multilinear testing, and eventually binary logistic regression methods such as those used by Ohlson (1980), Tinoco & Wilson (2013).

Research data

The study's data were derived from the financial statements of 26 publicly traded companies that provided sufficient continuous data for the period (2016-2020) with 130 observations. With the research objective of developing a model that incorporates three factors: financial factors, market factors, and macro factors in order to forecast financial exhaustion for steel enterprises in Vietnam, the retained observation patterns are said to be consistent with the model after searching and classifying. The dependent variable is a binary variable that is assigned one of two values: one for businesses that are financially tired and zero for businesses that are not financially exhausted. The study employed STATA 16 software to conduct descriptive statistics, examine variable correlations, develop a forecasting model, and classify the model's accuracy. Additionally, the forecasting model was used to several steel firms in Vietnam.

Research model

The team developed a formal study model with the following six elements determining the possibility of steel industry financial exhaustion based on previous theories and experimental research findings. Specifically, with the following six hypotheses:

H1: The circulating capital-to-total-assets ratio is inversely related to the likelihood of financial exhaustion.

H2: The cash-to-total-assets ratio is inversely related to the likelihood of financial exhaustion.

H3: The percentage of earnings before taxes and interest on total assets is inversely related to the likelihood of financial exhaustion.

H4: The size of the business is inversely related to the likelihood of financial exhaustion.

H5: Gross domestic product growth rate is negatively related to the likelihood of financial exhaustion.

H6: Inflation is positively related to the likelihood of financial exhaustion.

General Logit regression model form:

$$\text{Log} \left(\frac{P_o}{1 - P_o} \right) = \text{Log} \left\{ \frac{P(Y = 1)}{P(Y = 0)} \right\} = \beta_0 + \beta_i \cdot X_{it-1} + \mu_i + U_{it-1}$$

In which:

$P(Y=1) = P_o$ is the probability of financial exhaustion occurring

$P(Y=0) = 1 - P_o$ is the probability that financial exhaustion does not occur

3. Results

Wruck (1990) defined financial exhaustion as when a business's cash flow is insufficient to cover its present financial obligations. As a result, we will identify steel businesses that have reached financial exhaustion in this research article using the interest coverage ratio determined using the following formula:

$$\text{Interest coverage ratio} = \frac{EBIT}{\text{Interest expenses}}$$

Specifically, if the ability to pay interest is less than 1, the business is predicted to be likely to suffer from financial exhaustion. If the ability to pay interest is greater than 1, the business is not expected to be financially exhausted.

Table 1. Statistics describing the number of observations that are likely to suffer from financial exhaustion and are unlikely to be subject to financial exhaustion

Criteria	Number of bservations	Proportion
There is a possibility of financial exhaustion	27	20.77%
There is no possibility of financial exhaustion	103	79.23%

Source: Authors' calculation using Stata 16, 2022

Our research article examined 26 steel businesses listed on the HNX, HOSE, and UPCOM exchanges over a five-year period from 2016 to 2020, totaling 130 observations. The whole data sample is separated into two groups: those subject to financial exhaustion and those not subject to financial exhaustion. The following tables detail the descriptive statistics.

The number of observations, the average value of each variable, the standard deviation, and the greatest and smallest values are all included.

Table 2. Statistical table describing independent variables

Variable	WCTA	CASH	EBITA	SIZE	GDPR	INF
Average value	-0.1232744	0.0552348	0.0475087	14.01524	-2.868261	3.067624
Standard deviation	1.178577	0.076583	0.1510575	1.927373	0.3468545	0.3436636
The greatest value	0.7332373	0.527301	0.2732452	18.6946	-2.647896	3.438535
Smallest value	-8.014449	0.0000128	-1.218254	9.821301	-3.537017	2.643347
Number of observations	130	130	130	130	130	130

Source: Authors' calculation using Stata 16, 2022

The correlation coefficient between the model's independent and multilinear variables was then determined. The results of the pair correlation coefficient test indicated that the independent variables were not associated with one another, indicating that there were no indicators of similar events correlating between independent variables. Additionally, the independent variables were not multilinear.

Table 3. Results of correlation and multi-line coefficient testing

Variable	WCTA	CASH	Ebita	SIZE	GDPR	INF	Mean VIF
Correlation coefficient matrix							
WCTA	1.0000						
CASH	0.2150	1.0000					
EBITA	0.3256	0.1490	1.0000				
SIZE	0.0972	-0.2235	0.2129	1.0000			
GDPR	0.3486	0.0876	0.3420	0.4709	1.0000		
INF	0.0012	-0.0190	0.0854	0.0150	0.0127	1.0000	
Multi-line statistics							
VIF	1.17	1.16	1.20	1.13	1.02	1.01	1.11

Source: Authors' calculation using Stata 16, 2022

Finally, the team obtained the following model by running the Logit regression model at the times t and t-1:

Research model at time t:

$$\begin{aligned} \text{Log} \left(\frac{\text{Financial exhaustion} = 1}{\text{Financial exhaustion} = 0} \right) \\ = 31.53743 - 2.918193 * WCTA + 32.64786 * CASH - 148.4575 \\ * EBITA - 0.7 \end{aligned}$$

Research model at the time of t-1:

$$\begin{aligned} \text{Log} \left(\frac{\text{Financial exhaustion} = 1}{\text{Financial exhaustion} = 0} \right) \\ = 8.247388 - 0.6979484 * WCTA + 7.010734 * CASH - 13.15864 \\ * EBITA - 0.3036188 * SIZE + 5.681004 * GDPR + 3.197909 * INF \\ + \mu_t + U_{it} \end{aligned}$$

For the non-late variable regression model (model t), reflecting the extent of the factors affecting the likelihood of financial exhaustion of the listed steel industry enterprises as follows:

- (i) When the circulating capital-to-total-assets ratio is reduced by 1%, the probability of an enterprise experiencing financial exhaustion increases by approximately 0.1219%.
- (ii) When the cash-to-total asset ratio increased by 1%, the probability of the business falling into financial exhaustion also increased by about 1.364%.
- (iii) When the percentage of earnings before taxes and interest on total assets increased by 1%, the probability of the enterprise experiencing financial exhaustion decreased by 6.202%.
- (iv) When the business size increases by 1%, it reduces the probability of an enterprise experiencing financial exhaustion by 0.0301%.
- (v) When the growth rate of gross domestic product reached 1%, the probability of enterprises experiencing financial exhaustion increased by 0.1807%.

For the regression model using a 1-year late variable (t-1 model), the meaning of the values is explained as follows:

- (i) When the percentage of earnings before taxes and interest on total assets increased by 1%, the probability of the business experiencing financial exhaustion decreased by about 1.667%.
- (ii) When the business size increases by 1%, it reduces the probability of enterprise experiencing financial exhaustion by 0.0384%.
- (iii) When inflation in the economy increases by 1%, the probability of businesses experiencing financial exhaustion increases to 0.405%.

The two models t and t-1 demonstrate that, among financial, market, and macroeconomic variables, financial variables have the greatest impact on the probability of steel sector exhaustion, followed by macroeconomic variables and lastly market variables. Enterprise finances have a direct impact on their ability to operate and maintain a firm foothold in the economy, followed by the macroeconomic environment, which has a moderate impact on the economy of steel businesses and a negligible impact on the market.

The probability of financial exhaustion of a steel sector listed business is forecast using models. The team sent applications to the following businesses: (i) Dana Steel Joint Stock Company (DNY), which will be delisted from the HNX in 2020. Also, its trading registration on UPCOM will be canceled in 2021, and its securities registration with the Securities Depository will be canceled in 2021. (ii) Hoa Phat Group Joint Stock Company (HPG), which will continue to operate regularly.

After getting the equation expressing the model's output, the team applied it to the logistical accumulation probability function in order to anticipate financial exhaustion in the following manner:

With P_o the probability of financial exhaustion occurring, we have a process:

$$P_o = \frac{1}{1 + e^{-(\beta_o + \beta_i X_{it-1} + \mu_i + U_{it-1})}}$$

Model year t

$$P_o = \frac{1}{1 + e^{-(31.53743 - 2.918193 * WCTA + 32.64786 * CASH - 148.4575 * EBITA - 0.7222345 * SIZE + 4.326492 * GDPR - 2.347614 * INF + \mu_t + U_{it})}}$$

Model year t-1

$$P_o = \frac{1}{1 + e^{-(8.247388 - 0.6979484 * WCTA + 7.010734 * CASH - 13.15864 * EBITA - 0.3036188 * SIZE + 5.681004 * GDPR + 3.197909 * INF + \mu_t + U_{it})}}$$

The meaning of odds= value $\frac{P_o}{1-P_o} \geq 1$ or $P_o \geq 50\%$ the business is forecast to be financially depleted.

Table 4. Table of Forecast Results

Stock Code	Year	Year t	Year t + 1
DNY	2018	99.994%	24.777%
	2019	100%	68.344%
	2020	87.870%	73.761%
HPG	2018	0.00%	3.012%
	2019	0.00%	4.916%
	2020	0.00%	7.903%

Source: Authors' calculation using Stata 16, 2022

Commenting on the results in the table shows:

HPG is a big enterprise in the steel industry that operates in a normal and stable manner. As a result, HPG's forecasted outcome of financial exhaustion is always less than 10%. HPG's 2020 projection for the likelihood of depletion in 2021 yields a value of 7.903 percent in the one-year early forecast model. This demonstrates that, in light of HPG's current financial and macroeconomic conditions, the business remains viable for at least another year.

In comparison, DNY is a company that was delisted from the HNX in 2020 due to a high probability of depletion. The results indicated that DNY's chance of financial exhaustion was 68.344 percent by the end of 2019 (i.e. one year in advance), which is the clearest warning indication regarding the risk of financial exhaustion for this business. Additionally, in 2021, DNY canceled the transaction on UPCOM and canceled the securities registration with the Securities Depository. The results indicated that by the end of 2020 (i.e., within one year), the probability of DNY's financial exhaustion is 73.761 percent, which is also the clearest signal of risk. Financial depletion of this business in 2021 results in the cancellation of securities registration and trading on Upcom, as previously stated.

4. Discussion and Conclusion

The study's findings indicated that the variables had an effect on financial exhaustion, but their magnitude of influence varied across models. More precisely, as follows:

When financial, market, and macro variables are combined at time t , we observe five significant variables: the ratio of capital rotation to total assets, cash ratio to total assets, ratio collected before tax and interest on total assets, business size, growth rate of gross domestic product. The whole year of variables has a negative impact on the probability of financial exhaustion of steel enterprises. All financial factors are statistically significant except for the WCTA variable, which is statistically significant at 5%. This is also consistent with prior research conducted by Keige (1991), Kiragu (1993), Altman et al. (1977), Pranowo (2010), Widhiari & Merkusiwati (2015), Moch & colleagues (2018), and Dinh Thi Thu Ngoc (2019). Following that comes the cash variable, which has a statistical significance of 10%. This finding is also consistent with prior study conducted by Jiming & Weiwei (2011), Pham Thi Hong Van, and others (2018). EBITA, the final financial variable, is statistically significant at 5%. Platt (2006), Shumway (2001), Altman (1968), and Dinh Thu Ngoc (1968) have all used this interpretation previously (2019). This is also consistent with prior studies such as Ohlson (1980), Tinoco & Wilson (2013), and Vo Trung Nhan (2015). This result corroborates the economic consequences of prior studies such as Bunn & Redwood (2003) and Vo Trung Nhan (2015).

When the team ran the model at the time of the $t-1$ which also incorporated all three financial, market, and macro factors, the results show that there were sufficient financial, market, and macro variables that impacted the likelihood of financial exhaustion including the ratio collected before tax and interest on total assets, business size and inflation. The EBITA variable is statistically significant at 5% and is in line with the team's expectations. The SIZE variable is statistically significant at 10% and this is also in line with the team's expectations. Finally, the INF variable has statistical significance at 1%, in line with expectations and in accordance to previous studies by Mare (2012), Tinoco & Wilson (2013), Pham Vo Ninh Binh et al. (2018), Dinh Thu Ngoc (2019).

Long-term remedies are required to prevent restricted steel firms from succumbing to financial exhaustion. Domestic agencies and businesses must prioritize implementing significant and flexible solutions to maintain macroeconomic stability while also controlling inflation, promoting the economy vigorously, increasing the growth rate of steel enterprises, and providing premises and opportunities for businesses to thrive in the face of epidemics.

For state agencies

To begin, while closely monitoring the construction strategy toward industrialization and modernization, state agencies and the government must constantly monitor the strategy of destroying the steel industry within the 10-year socioeconomic development strategy and the fundamental objectives set forth in the Resolution of the Party's 13th National Congress.

Second, it is critical to prioritize research and broaden the strategic vision in order to assure the most effective implementation of the steel industry's development objectives. Additionally, the government should place a premium on tax incentive measures that foster enterprise growth.

Third, boost ore mining in order to develop a rich raw material market, thereby assisting domestic steel businesses in increasing their competitiveness.

Fourth, establish and complete investment funds using state budget and social security funds. Additionally, it is necessary to contribute to and invest in infrastructure and laboratories dedicated to the research and production of special steel products, not only to improve the quality of input materials used in domestic manufacturing industries, but also to increase exports to international markets, thereby reaffirming Vietnam's steel industry's position in the region and throughout the world.

Fifth, it is vital for entities within the Ministry, the Department of Industry and Research, to work with VSA when presenting policies to develop strategies and orientations for the steel industry's future development. Simultaneously, it is vital to continuously monitor production and market conditions, proactively resolving issues confronting domestic steel firms.

Sixth, it is necessary for the Department of Science and Technology to promote research, develop quality standards, and technical barriers in order to ensure an equal competitive environment; to assist laboratories in producing high-quality steels; and to research the primary steel in order to solidify its market position. It is vital for the Department of Trade Protection to pioneer and execute proactive trade defense solutions for steel products that adhere to international legal norms.

Finally, it is vital for the General Department of Market Management to strengthen market inspection and control, consequently offering timely answers to conditions of speculation hoarding, pricing fever, and commodities picking. On the side of the Export-Import Department, it is critical to have a strong grasp on the import and export situation in the country, particularly with regard to steel goods, and to swiftly implement suitable policies to stabilize the domestic manufacturing market.

For steel enterprises in Vietnam

To begin, Vietnam steel business managers must focus on their long-term financial strategies and their implications for the elements that contribute to financial exhaustion in order to maintain stable and sustainable operations, ensuring the business's long-term viability.

Second, the study's findings serve as a signal to assist businesses in monitoring their financial status, so that they may quickly spot warning indications of financial weariness and design appropriate solutions, thereby assisting businesses in mitigating losses and risks.

Thirdly, during the export process, firms must adhere to the Ministry of Industry and Trade's instructions, which include regular monitoring of information, particularly information on trade restrictions imposed on imported goods. Additionally, enterprises must prioritize diversifying export products, growing export markets, and avoiding excessive reliance on a single market to minimize the risk of export taxes.

Fourthly, VSA must rise to the challenge of supporting local steel firms while also contributing to market stabilization by protecting the reasonable rights and interests of the three parties involved: the state, the enterprise, and the consumer.

Additionally, financial depletion may be influenced by unmentioned internal and external causes. Thus, in future studies, the research topic might be narrowed to certain sectors or research professions with a greater number of listed firms in order to strengthen the research field's representation and trustworthiness. Additionally, additional research can be conducted on the entire subject to broaden the scope. Simultaneously, adjusting the lengthier study period and including additional factors from past studies or developing new ones to account for Vietnam's economic and social situations, and drawing new results.

Abstract

The article aims to understand the influence of factors affecting cooperation in the international supply chain of Vietnamese seafood enterprises. Based on the previous theories and studies, the team inherited and developed a research model for international supply chain cooperation of Vietnamese seafood enterprises in the context of the COVID-19 pandemic affecting the international supply chain. The study used qualitative research methods and quantitative research methods based on data collected from 327 different seafood enterprises across the country. After researching, the authors conclude that the cooperation in the international supply chain of seafood enterprises in Vietnam is directly affected by 6 factors: trust level between the partners, the power of partners, the distance between partners, government policies, cooperation strategies of partners, and information sharing. All factors have a favorable impact on cooperation in the international supply chain in the long run but the power of partners is the most powerful. From there, the authors proposed solutions for Vietnamese seafood enterprises to participate in international supply chain cooperation more effectively, removing barriers in the cooperation process.

Keywords: *Cooperation in Supply Chain, Factors affecting collaboration, International Supply Chain, Seafood Enterprises.*

1. Introduction

The supply chain plays an important role in the whole business cycle of the enterprise. According to Michael Porter (1990), the supply chain is a transition from raw materials to finished products through processing and distribution to the end customer. Another definition holds that the supply chain is the network of organizations involved, through upstream and downstream links, in different processes and activities that create value in the form of products and services offered to the end consumers (Christopher, 1992). Mentzer et al. (2001) take a different perspective when defining the supply chain as a collection of three or more partners (organizations or individuals) directly involved in the flow of movement before and after products, services, finance, and/or information from origin to customer. In Vietnam, research on supply chains has only stopped in some industries in more thoroughly understanding the structure of supply chains.

To develop and maintain a stable and durable supply chain, businesses need to promote supply chain cooperation, especially international supply chain cooperation. In the study of Mentzer et al. (2000), cooperation is defined more broadly, as "a common set of joint activities of closely related businesses to accomplish goals that benefit each other." By working together and coordinating actions, supply chain participants become partners in an alliance (Monczka et al., 1998). Many companies seek to coordinate operations with other companies and work back and forth over time to produce superior performance (Anderson and Narus, 1990; Stern and Reeve, 1980). The underlying reason behind the cooperation is that a company can't compete successfully on its own while customers are more rigorously demanding products and services (Kotler, 1997). Therefore, cooperation increases the organization's ability to work across boundaries to build and manage unique value-added processes to better meet the needs of customers (Fawcett et al., 2008). The goal is to ensure higher performance than operating individually (Lambert et al., 1999).

The need for supply chain cooperation is due to global competitive pressures or risks from environmental fluctuations including changes in supply, demand, and technology, opportunities in new markets (Tate et al. 2010a; Chen et al. 2017). Companies enter into multi-stakeholder cooperation agreements to share both risks and benefits while accessing additional resources, improving their capacity to learn and transfer knowledge quickly, towards the goal of ensuring higher performance than operating individually (Lambert et al., 1999). This can also create a long-term competitive advantage for the business (Jap, 1999). Organizations have been working for many years to improve the efficiency of their internal supply chain operations, e.g. procurement, manufacturing, and logistics (Rae-Smith and Ellinger, 2002; Fawcett and Magnan, 2002).

It can be seen that in the supply chain there are many forms of potential cooperation, but can be divided into two main categories as Figure 1, first, vertical cooperation: can include cooperation with customers, internal cooperation, and cooperation with suppliers; and second, horizontal cooperation: including cooperation with competitors, internal cooperation and cooperation with other enterprises.

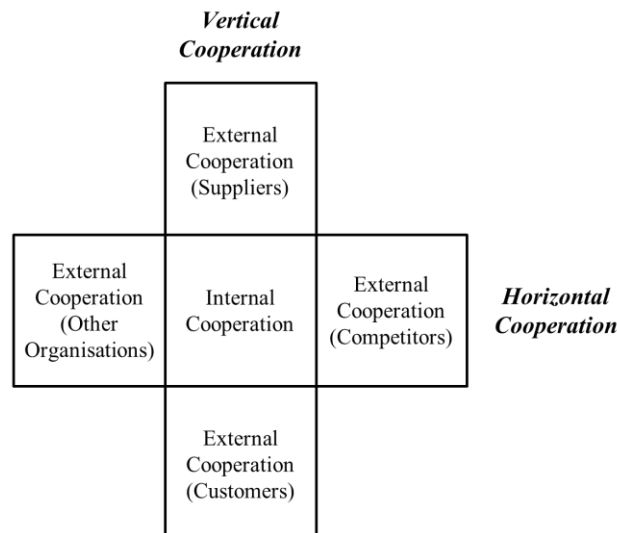

Figure 1. Scope of cooperation

Source: Authors' compilation

Although there are great roles and benefits, in Vietnam, cooperation in the international supply chain, typically the fisheries industry, is still not popular. This issue becomes even more urgent as the situation of the Covid-19 epidemic still raging and the international situation is changing. Therefore, the authors implemented the topic: "***Factors affecting cooperation in the international supply chain of Vietnamese seafood enterprises***" to identify the factors affecting this extremely important cooperation.

The team applied game theory, resource dependency theory, social exchange theory, collaborative network theory, and realism to find the factors that influence and identify the link between these factors and the international supply chain cooperation of the enterprise.

This article was structured into five parts: (1) Introduction; (2) Research Methods; (3) Results and (4) Discussion, Conclusion and Recommendations.

2. Method

2.1. Research model proposes

The team inherited the preceding research model with appropriate variables for the research process: The level of trust between partners (Huynh Thi Thu Suong, 2013); Power of partners (Kumar, 1996); Distance between partners (Van Donk, 2010); Government Policy (Mentzer et al., 2001); Partnership strategy of partners (Muckstadt et al., 2001); Information Sharing (Kim et al., 2006).

When comparing the research model of research works in the world, it is only possible to draw 5 factors of significance to the research problem of the topic. However, by looking up academic articles, some experts in the supply chain industry have emphasized the role of information sharing in international supply chain cooperation. Based on the operational practices of the industry, the author interviewed directly managers in the industry, the results of which all agreed with the meaning of the role of the information sharing factor. Therefore, the authors proposed a research model as shown in Figure 2:

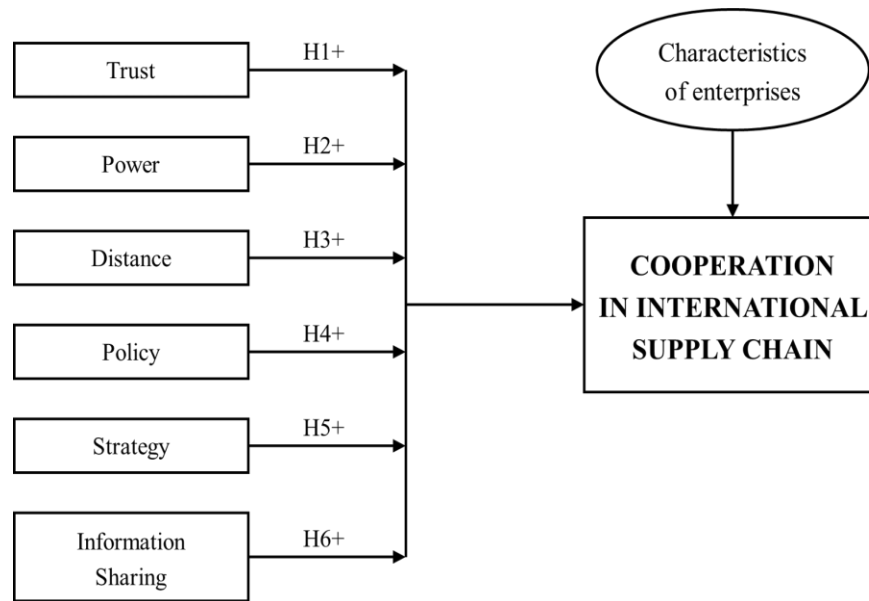

Figure 2. Proposed research model

Source: Authors' compilation

Based on the above research model, the study proposes the following research hypotheses:

Trust reflects trust in the partner and covers some aspects of weakness and uncertainty in the trusted partner (Smith, 1997). A successful relationship is characterized by mutual trust and businesses that trust each other to always be profitable, serve customers better and adapt more easily (Sin et al., 2002). Tangible assets can play an important role in fostering trust among intermediaries' partners (Clark, 1999). While subsequent studies suggest that trust is a function of citizens' relationship behaviors and frequent interactions. Both studies emphasize reliability among organizations to minimize the cost of administrative procedures (Lui, 2004).

H1: There is a positive relationship between the level of trust between partners and supply chain cooperation.

Power is considered the center of all business relationships (Hingley, 2005). The strength of a business or organization over a partner is determined by the extent to which the business or organization depends on other resources-specific resources (Inkpen et al., 1997). In a relationship, when a party has more power, it is more likely to pressure the less powerful party to make decisions in favor of the more powerful party (Kumar, 1996). In the supply chain, there is no close relationship between power and dependence. In the relationship between the buyer and the seller, the more unilateral power, the use of the contract with clear and detailed terms.

H2: There is a positive relationship between the power of partners and supply chain cooperation.

The gap between partners in the supply chain means referring to geographical, cultural, and organizational distances between partners in that supply chain (Van Donk, 2010). Distance in general has a certain effect on cooperation in the supply chain. That is, the closer the distance between partners, the more similar partners have in terms of culture, language, business practices. So it makes it easier for partners to choose each other and work together.

H3: There is a positive relationship between the gap between partners and supply chain cooperation.

Any business that wants to enter the supply chain in the industry but does not meet national and international policies and laws will be difficult to cooperate with (Tate et al., 2010b). A policy issued by the government of the partner or the partner itself will always have certain effects on the ability of partners to cooperate in the supply chain. The policy is not permanent but will likely change over time (Huynh Thi Thu Suong, 2013). In the complex and extensive operation of the supply chain, it is necessary to improve cooperation between businesses and governments, domestically and internationally, to control and manage risks in the international supply chain.

H4: There is a positive relationship between government policy and supply chain cooperation.

When researching the supply cooperation chain, the cooperation strategy consists of four basic contents: merger and acquisition strategy, capital streamlining strategy, manufacturing fusion optimization strategy, and new product introduction strategy (Anderson, 2004). Collaborative strategies include basic strategies for activities such as planning, forecasting, and supplementing collaborative content in the supply chain (Stadtler, 2005). The strategy of the partners in the chain includes strategies from suppliers, manufacturers, and distributors complementing each other to develop together, surely the higher the cooperation between partners and vice versa (Huynh Thi Thu Suong, 2013). A business that plans a supply chain management strategy reasonably will be more likely to strengthen cooperation in its chain (Doan Thi Hong Van, 2008).

H5: There is a positive relationship between the partners' cooperation strategy and supply chain cooperation.

Information sharing is the foundation of supply chain integration (Lee, 2000), and decisions about supply chain engagement are closely correlated with decisions about what information is shared and how it is shared. The configuration design of the supply chain not merely determines which companies should integrate, but also how the company's operations should be designed about the operations of both partners should decide what information the partners should access. Some comments in previous documents on supply chain management have stated the importance of cooperation and information sharing among chain participants (Stank et al., 2001). Information sharing and cooperation in the supply chain are closely related to the formation of the supply chain.

H6: There is a positive relationship between information sharing and supply chain cooperation.

2.2. Methods of collecting and analyzing data

In qualitative research, the authors conducted in-depth interviews with experts and senior leaders such as directors, deputy directors, heads of departments, deputy departments, and officials in charge of supply chain cooperation. The interviewees came from government agencies, economic experts, businesses, and seafood-related organizations in Vietnam such

as the Vietnam Association for Seafood Processing and Export (VASEP). The subjects interviewed with different characteristics will provide multidimensional and complete information for the study content, ensuring the achievement of the goal. Open-ended questions are included in the interview for participants to present their opinions under the author's guidance.

Qualitative research results show that all six factors affecting the international supply chain cooperation of Vietnamese seafood enterprises are accepted and no new factors are proposed. The factors included in the quantitative study are (1) The level of trust between partners (6 variables); (2) The power of partners (4 variables); (3) Distance between partners (3 variables); (4) Government policy (5 variables); (5) Cooperation strategies of partners (4 variables); (6) Information sharing (7 variables). A total of 29 observational variables of 6 factors affecting international supply chain cooperation of Vietnamese seafood enterprises were included in quantitative research.

About preliminary quantitative research by direct survey slip with a small study sample (20 enterprises). The majority of subjects accepted the survey slip but needed to adjust some of the words accordingly and design the question more rationally. The team of authors built the originally planned sample of 300 survey votes. This number of observations both met the sample size requirements of Hair et al. (2014) with 167 observations and Green's study with 115 observations. The expected number of observation slips of the group greater than the minimum sample size makes the study more valuable.

Of the 327 enterprises surveyed, the majority were small and medium-sized enterprises, of which up to 35% were enterprises [200;500] employees. The results of the survey of operating time of enterprises showed that the majority of operating enterprises [10;15] in year accounted for 32%, followed by operating enterprises [15;20] for 24% of the year. Seafood enterprises are mainly concentrated in the Mekong Delta region, accounting for 48% of the total seafood enterprises in the country. The main seafood items of enterprises are shrimp and fish, especially pangasius and tuna. Of which, shrimp accounted for 44%, pangasius 18%, tuna 8%, other fish 20%. In terms of processing type, up to 82% of frozen seafood processing enterprises, 11% of dry goods processing enterprises, 5% of fish sauce processing enterprises, and the number of canned processing enterprises accounted for only 2%.

The data is processed using SPSS 20 software. Data from independent variables are analyzed through steps: Cronbach Alpha scale reliability testing, EFA discovery factor analysis, correlation analysis, and linear regression analysis.

3. Results

Coefficient Analysis found that there were 6 scales used in the study with Cronbach's Alpha coefficient greater than 0.7 satisfying reliability and a total variable correlation coefficient greater than 0.4. Thus, it is possible to identify the scales that ensure reliability and are suitable for use in further analysis.

Table 1. Cronbach's Alpha Reliability Test Results Table

Scale	Variable number	Cronbach's Alpha	Smallest Corrected Item-Total Correlation
Level of trust between partners	7	0.924	0.755
The power of partners	5	0.822	0.604
Distance between partners	4	0.860	0.716
Government policy	4	0.772	0.429
Cooperation strategies of partners	5	0.761	0.490
Information sharing	3	0.917	0.723

Source: Authors' compilation from primary data

The scale consists of 29 observation variables, after testing the scale reliability using Cronbach's Alpha, which is included in the EFA factor analysis. The EFA factor analysis showed that there were 5 factors extracted at the Eigenvalue value of 1,574 and the total variance of 66.063% indicating that the model was appropriate. The KMO coefficient = 0.803 > 0.5 so the EFA factor is consistent with the study. In addition, the factor loading factor is > 0.5, so the observation variables have good statistical significance and are important in the elements, have practical meaning. Sig. (Bartlett's Test) = 0.000 < 0.05 shows that observed variables are correlated with each other overall.

Table 2. KMO and Bartlett Test Results for Independent Variables

	Result	Compare
KMO coefficient	0.915	0.5 < 0.915 < 1
Sig. value in Bartlett audit	0.000	0.000 < 0.05
Extracted variance	66.426%	66.426% > 50%
Eigenvalue Value	1.531	1.531 > 1
Approximate squared limb	4982.527	
df	406	

Source: Authors' compilation from primary data

The authors used the Pearson coefficient to analyze the correlation between quantitative variables. Pearson correlation coefficients between variables run from 0.136 to 0.601. That demonstrates the distinguishing value achieved, suggesting that the relationship between dependent variables (Procurement Decisions) and independent variables is statistically significant (Sig. < 0.05). Purchasing decision dependency variables are correlated favorably with variables Credit levels between partners, Power of partners, Distance between partners, Government Policies, Partnership Strategies of Partners, and Information Sharing. So other statistics can be used to find a link between independent variables and dependent variables.

Table 3. Correlation matrix between factors in the model

		TN	QL	KC	CS	CL	TT	HT
TN	Correlation coefficient	1	0.387**	0.136*	0.407**	0.310**	0.429**	0.601**

Note: (**) meaningful correlation at 0.01 (1%)

Source: Authors' compilation from primary data

The linear regression equation with dependent variable is international supply chain cooperation:

$$HT = 0,226TN + 0,413QL + 0,129KC + 0,145CS + 0,189CL + 0,158TT$$

In it:

TN: Level of trust between partners

QL: The power of partners

KC: Distance between partners

CS: Government policy

CL: Cooperation strategies of partners

TT: Information sharing

HT: Cooperation in the international supply chain

The model consists of 6 independent variables TN, QL, KC, CS, CL, TT, and one HT dependent variable (International Supply Chain Cooperation). Based on the standardized Beta coefficient, the authors found that the Power factor of the partners had the strongest impact on the International Supply Chain Cooperation of Vietnamese seafood enterprises (Beta = 0.413). In contrast, the Distance factor between partners (Beta = 0.129). At the same time the Sig. value of the elements is less than 0.05, all hypotheses are accepted.

Table 4. Analysis of factors affecting international supply chain cooperation of Vietnamese seafood enterprises

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	Constant	0.767	0.171		4.474	0.000		
	TN	0.226	0.031	0.253	7.214	0.000	0.704	1.421
	QL	0.413	0.040	0.367	10.354	0.000	0.689	1.451
	KC	0.129	0.035	0.119	3.730	0.000	0.855	1.170
	CS	0.145	0.033	0.149	4.367	0.000	0.745	1.342
	CL	0.189	0.032	0.197	5.965	0.000	0.798	1.253
	TT	0.158	0.037	0.158	4.262	0.000	0.632	1.583

Source: Authors' compilation from primary data

The results of the study showed that there are 6 factors affecting the International Supply Chain Cooperation of Vietnamese seafood enterprises, in which the power of partners is most powerful.

4. Discussion and Conclusion

4.1. Factors affecting cooperation in the international supply chain of Vietnamese seafood enterprises

After studying the influencing factors, we can conclude that the cooperation in the international supply chain of seafood enterprises in Vietnam is directly affected by the factors of trust level between the enterprises. partners, the power of partners, the distance between partners, government policies, cooperation strategies of partners, information sharing. These factors directly affect cooperation in the long run. We can draw the following conclusions:

First, the level of credibility affects international supply chain cooperation. Like previous studies by Corbett et al. (1999), the level of trust between partners has a positive effect on international supply chain cooperation. When you don't trust each other, cooperation is very unlikely. The more partners trust and trust each other, the more favorable and beneficial cooperation is.

Second, there is a positive relationship between the power of partners and supply chain cooperation. According to the study, the team found similarities to previous studies by Hingley (2005) and Joyce and Mattew (2002). Moreover, the study also agrees with Kumar (1996) that the higher power party will have a greater influence on the actions and decisions to cooperate. Furthermore, the higher the power of the partner will positively affect cooperation, which is similar to the research of Heide (1994) and Lusch and Brown (1996).

Third, there is a positive relationship between the gap between partners and supply chain cooperation. The gap between partners here is not just geographical distance, cultural differences, and organizational structure in a supply chain. This was demonstrated in Van Donk's

research (2010). The more geographical distance is appropriate, the differences in culture and way of organizing, the less business style businesses will trust and be more confident in the decision to cooperate, which also helps the cooperation process become favorable.

Fourth, there is a positive relationship between government policy and supply chain cooperation. The authors support the results of previous studies by Tate et al. (2010b). Government policies can be detrimental or favorable to the business activities of businesses depending on the type of business, their origin, or the culture of the business. Thereby, it can create difficulties and risks for cooperation in the chain.

Fifth, the strategy in cooperation has a great impact on international supply chain cooperation. The results of the study are quite similar to the research results of Huynh Thi Thu Suong (2013) and Doan Thi Hong Van (2008). The business strategies of partners and strategies applied in a cooperative relationship directly affect the decision to cooperate and the effectiveness of cooperation. When the partners' strategies are appropriate and convenient businesses will tend to agree to cooperate in the higher supply chain.

Sixth, information sharing has a positive impact on decisions and cooperation in international supply chains. This conclusion coincides with the results of research by Kim et al. (2006), Sundram et al. (2018), Pamulety, and Pillai (2011). Previous studies have shown that sharing information improves operational efficiency. When cooperating, information sharing helps partners cooperate and handle work faster and more accurately, thereby improving the efficiency of international supply chains. Sharing information also increases the trust of partners, but it also needs to be carefully controlled when important information cannot be disclosed to other individuals or organizations.

4.2. Some policy implications from the study results

4.2.1 Recommended to state management agencies

To improve cooperation in the international supply chain of Vietnamese seafood enterprises, the authors make several recommendations to state management agencies as follows:

Firstly, there should be clear legal mechanisms and reform of administrative procedures such as reducing the burden on enterprises in complying with regulations related to fees, fees, accounting regimes, and simplifying financial statements while perfecting dispute handling solutions in the implementation of economic contracts.

Secondly, the State should issue support mechanisms and policies so that enterprises can easily cooperate in development with other enterprises, encourage cooperation, promote trade as well as create all favorable conditions to make Vietnam's seafood industry truly become the economic spearhead of the country.

Thirdly, it is necessary to further strengthen the propaganda and advocacy and training for enterprises in cooperation in the seafood supply chain; encourage models of organization, linkage, cooperation, production joint ventures, trade between the fields of seafood production, between raw material producers, processors, traders, seafood exporters, credit investors ... according to the supply chain of goods industry with the participation of management and organization of industry associations and associations.

Fourthly, promote the role of professional associations such as the Vietnam Tuna Association, Vietnam Seafood Processing, and Export Association, Vietnam Fisheries Association,... in conjunction with task force 970 of the Ministry of Agriculture and Rural Development informing information channels on seafood supply chains for enterprises, especially providing up-to-date information on legal mechanisms; advising businesses in the process of cooperation and handling if disputes occur... so that enterprises and cooperatives can link and cooperate, contributing to promoting effective production and consumption.

4.2.2. Recommendations to the Vietnam Fisheries

Association To enhance cooperation capacity for our seafood enterprises, the authors make several recommendations for VASEP as follows:

Firstly, it is necessary to promote the organization of trade promotion programs that are carried out periodically annually and publicly announced in the mass media, support enterprises, and production facilities to participate.

Secondly, regularly organize seminars to exchange experiences of the Law on Cooperatives in 2012 and relevant documents on how to organize and operate effective agricultural cooperative models, how to approach markets for consumption of aquatic products, build links between cooperatives, professional associations, and businesses.

Thirdly, actively build and develop the capacity to forecast the world seafood market in terms of changes in import policies, regulations on food safety and hygiene standards, quarantine requirements, import conditions for seafood products, prices and product types, demands and consumption trends, market fluctuations and product quality need to promptly supply businesses and manufacturers.

Fourthly, step by step build representative offices and distribution networks of Vietnamese seafood products. The Association needs to focus its trade promotion resources on major markets such as the EU, the US, Japan ... and emerging markets such as China, Hong Kong, Eastern Europe, The Middle East, North Africa, and South America. Fifth, it is necessary to promote the key role of the Association in negotiating and agreeing on international cooperation to ensure the rights and legality of the fisheries sector and seafood export products to improve the value of agricultural products and exports.

4.2.3. Recommendations to Vietnamese seafood enterprises

From the research results combined with the experience of cooperation in the supply chain of seafood enterprises in the world, the authors make several recommendations for Vietnamese seafood enterprises as follows:

First, build a business brand to increase credibility. To build trust for cooperation, what Vietnamese seafood enterprises need to do is focus on building a business image. Before cooperating, partners will usually consider several criteria, including brand, size, financial ability, how to pay, payment method,... Especially, for small and medium-sized enterprises, it is necessary to build a brand for themselves through the selection of quality products and services, ensuring the progress of delivery as well as type and quality; And especially on time to pay,...

Second, strengthen the building of corporate power. Strengthening the power of the business will enhance its position with partners while creating the motivation for cooperation in a more certain way. Accordingly, enterprises need to have a clear specific business strategy, at the same time increasing investment in upgrading modern machinery and technology to increase the value of supply products, improve productivity in business activities of enterprises...

Third, enhance information sharing between components of the supply chain in a way that is fair, transparent, fast, and efficient. Information sharing is key to improving the ability to respond to changes in customer needs and market uncertainty, which helps reduce the communication gap between members and can reduce supply chain performance. Observed practice shows that suppliers often do not offer exclusive to a single customer; Non-close cooperation relationships can cause shortages of materials.

Fourth, applicating of information technology in supply chain operations. With the support of information technology systems, the supply chain will operate more efficiently by ensuring the smooth flow of information, making more accurate supply chain decisions, and ensuring that the information posted is accurate and detailed. To be able to exploit this common data source, Vietnam's seafood supply chain can apply Blockchain technology - a database containing information that is simultaneously managed by multiple participants in the same system. In addition, in terms of the issue of traceability of fisheries to increase the level of trust between businesses, businesses can apply RFID technology to improve and improve the efficiency of supply chain management instead of documents and papers. In addition, with GIS technology, through information sharing, managers can collect and analyze hundreds of supply chains, develop and compare contingencies of plans, better control warehouse space to suit production strategies, forecast and balance supply and demand as well as manage potential risks.

Abstract

The paper investigates the impact of human capital on social mobility in Vietnam during the 2010–2018 period. Using data from the Vietnam Household Living Standard Survey in 2010, 2014, and 2018, it finds that human capital not only plays an important role in increasing upward mobility but also contributes to decreasing downward mobility. Besides, ethnicity and geography have a substantial impact on social mobility. The result serves as the basis for the authors' recommendations to the government in order to increase upward mobility for the disadvantaged group in Vietnam.

Keywords: *human capital, social mobility, income mobility, employment mobility*

1. Introduction

Social mobility is considered as the movement across different social positions of an individual or a household over time (Blau and Duncan, 1967; Torche, 2015). There are many ways to approach social mobility. For example, in the status-oriented approach, social mobility can be “upward” or “downward” in direction of an individual from one social position to another (vertical social mobility); or backward or forward movement of a group in the same social status (horizontal social mobility) (Fitcher, 1938). Besides, in the structure-oriented approach, Rooney Stalk (1985) has divided social mobility into structural social mobility (which is the movement in social status between the upper and lower position of society) and non-structural social mobility (which takes place when some individuals have

a decrease in position/ social status creating opportunities for other individuals to moving forward, take their place in the social hierarchy). Moreover, social mobility can be either a movement of position/ social status of a person into adulthood in comparison with their parents (intergenerational social mobility); or over the years in the life cycle (intragenerational social mobility) in the generation-oriented approach (Nguyen, C. V., & Nguyen, L. T., 2019). This approach is often applied within the household and is considered a clear, reliable measurement (David, 1991). In order to match the research objective and the scope of research in the household in Vietnam, this paper will also approach social mobility in the generation.

Human capital plays a very important factor in social mobility (Psacharopoulos and Patrinos, 2004). Approaching human capital from an individual perspective, Schultz (1961) states that human capital is not only the knowledge, skills but also other factors such as physical, mental, and moral characteristics (Gableta, 1998), attitudinal and behavioral factors (Rastogi, 2002) associated with an individual. Broadly, OECD (2012) agrees that human capital is the knowledge, skills, abilities, and characteristics belonging to individuals, which can facilitate the creation of welfare for persons, society, and the economy. Approaching human capital from an enterprise perspective, human capital is considered a resource helping enterprises gain competitive advantage and operate effectively (Barney, 1991). Human capital can be expressed through creativity and problem solving, leadership ability, management skills, or the synthesis of knowledge, skills, and abilities of an individual (Grodzicki, 2003). Although the concept of human capital is used widely with complicated and different definitions, the OECD concept of human capital from an individual perspective not only fully refers to the components of human capital such as knowledge, and experience but also emphasizes the benefit of human capital to both individuals and the economy. Therefore, this paper will approach human capital based on the OECD concept.

When studying the influence of human capital on social mobility, most research relies on two hypotheses: First, the educational hypothesis indicates that human capital is considered as a formation by investment in skills through formal education and/or experience. In other words, the important factors of human capital are knowledge and skills that can be improved through an increase in educational quality, thereby boosting productivity and income individual and social mobility (Psacharopoulos and Patrinos, 2004; Schultz, 1997, 2002). Specifically, Blau and Duncan (1963) measured human capital by taking education as the central mechanism through which advantages/disadvantages are passed from generation to generation, then concluding the impact of the education system on improving social mobility. Similarly, Oxfam (2018) demonstrates that the higher the education of the householder is, the more likely the movement from low-income groups to higher-income groups of families is. Second, the income hypothesis shows a relationship between social mobility and human capital (which is measured by the economic, social, and educational status of parents in comparison with their children, but the conclusions are still contradictory). Most research in the twentieth century reveals that the more affluent families are, the more likely attention to their children's education is. As a result, their children get

better grades, set higher ambitions for the future, and have advantages when entering the labor market (Sewell and Hauser, 1980). Moreover, Goldthorpe (2013) also argue that upper-class parents can find better jobs for their children because of their influence and power. This increases the gap in education and income between their children from prosperous families and from needy families, thereby decreasing the opportunities for social mobility of disadvantaged groups. Other studies show that the social mobility of disadvantaged groups can be hindered by education (especially privileged/discriminatory education), depending on the specific background of each country in each period and policy for each social group... (Mitnick et al., 2013; Blanden and Macmillan, 2014)

While most studies indicate that human capital has a positive impact on social mobility (Deininger and Squire, 1998; Glewwe, 2002; Goldthorpe, 2013), there are some research find a negative relationship (Mitnik et al., 2013; Blanden and Macmillan, 2014). From the above contradiction, this paper is expected to shed new light on the theory of the influence of human capital on social mobility. At the same time, the function of education in upward social mobility is limited or even tends to decrease in Vietnam-a developing country (Brand-Weiner 2015). Specifically, the average income of an individual with a post-secondary degree is only 40-50% more than that of an individual with a primary school degree (Baulch et al., 2012). Therefore, this paper also is expected to serve as a reference basis for managers to make better decisions about the quality of education, thereby promoting social mobility in Vietnam. The structure of the article includes 4 sections: The research method are mentioned in part 2, after the introduction, the third part is the research results; finally, the discussion and conclusion are presented in part 4.

2. Method

2.1. Sample and data collection

In order to achieve the objectives, the data used in this paper were collected from VHLSSs in 2010,2014, and 2018. The VHLSSs are conducted by the GSO every two years. In this paper, we use the three VHLSSs to analyze the change over 2010–2014 and the change over 2014–2018. The surveys contain household-level and individual-level data. Data include basic demography, employment and labor force participation, education, health, income, expenditure, housing, lands, and participation of households in poverty alleviation programs.

The number of households sampled in the VHLSSs 2010, 2014, and 2018 is 9399, 9398, and 9396, respectively. The number of individuals from these sampled households in the VHLSSs for 2010, 2014, and 2018 is 36,999, 35,520, and 35076, respectively. The VHLSSs are representative at the urban/rural and regional levels. There are panel households (1914 households) between the 2010 VHLSS and 2014 one. There are also panel households (1912 households) between the 2014 VHLSS and 2018 one. However, there are a few panel households between the 2010 VHLSS and 2018 one. As a result, we don't use panel data for this research.

2.2. Variables and measurements

Independent variables. This paper uses different variables to examine social mobility. Social mobility is divided into income mobility and employment mobility. Income

mobility includes upward mobility, downward mobility, and income change. Employment mobility contains occupation skills, wage jobs, and employment sectors.

Dependent variable. Human capital is measured by two items:

The highest education level, including Less than primary education; Primary; Lower-secondary; Upper-secondary; Technical degree

The schooling years.

Control variables. are measured by using information from the VHLSSs.

Gender: is a dummy variable that equals 1 for male and equals 0 for female.

Age: is the age of the household head or individual

Ethnic: is a dummy variable that equals 1 for Kinh, Hoa, and equals 0 for rural.

Urban: is a dummy variable that equals 1 for urban and equals 0 for rural.

Several previous studies have shown that demographic characteristics consisting of gender, age, ethnicity, and geographical location have an impact on intergenerational mobility, especially in high-income countries, e.g. Black and Devereux (2010); Corak (2013a); etc

Household size: is calculated by the number of household members.

Proportion of children below age 15: is measured by the ratio of the number of children below age 15 and the number of household members.

Proportion of members above age 60: is measured by the ratio of the number of members above age 60 and the number of household members.

Empirical studies point out that family structure and household size can affect children's human capital and indirectly influence their mobility (Becker and Lewis, 1973; Becker and Tomes, 1976).

2.3. Research Method

Both descriptive statistics and regression analysis were utilized for our research objectives. First, we compared social mobility across other groups: gender, age, education, rural/urban, and ethnicity. Regression analysis using OLS Equation was employed to examine the impact of human capital on social mobility, controlling for other factors in the models. Firstly, we model the income mobility as follows:

$$Income_{j,\Delta t} = \beta_0 + \beta_1 Human\ capital_{j,t-1} + \beta_2 X_{j,t-1} + \epsilon_{j,\Delta t} \quad (1)$$

where $Income_{j,\Delta t}$ is the dependent variable indicating the mobility of household j across income quintiles between years t and $t-1$. As explained in the next section, we measure income mobility by both upward and downward mobility; that is an increase and a decrease in income between years t and $t-1$. The explanatory variables are measured in the original year; that is, year $t-1$. $X_{j,t-1}$ is a vector of household j 's head and household j characteristics including age, gender, ethnicity, household size, proportion of children below age 15, proportion of members above age 60. $Human\ capital_{j,t-1}$ is the human capital of household j 's head.

We use the panel data between the 2010 and 2014 VHLSSs to define the income mobility of households over the 2010-2014 period, the panel data between the 2014 and 2018 VHLSSs to define the income mobility of households over the 2014-2018 period.

There are a few panel households between the 2010 VHLSS and 2018 one. Thus, we cannot use panel data techniques such as household fixed-effects or random-effects regressions. Instead, we append two above panel data and use OLS regression to estimate model I.

We also model the intra-generational mobility of employment of individuals using the following regression:

$$Employment_{i,j,\Delta t} = \beta_0 + \beta_1 Human\ capital_{i,j,t-1} + \beta_2 X_{l,j,t-1} + \epsilon_{j,\Delta t} \quad (2)$$

where $Employment_{i,j,\Delta t}$ is the dependent variable measuring the employment mobility of individual i in household j over the period $t-1$ and t . X is a vector of individual i and household j characteristics including age, gender, ethnicity, household size, proportion of children below age 15, proportion of members above age 60. $Human\ capital_{i,j,t-1}$ is the human capital of individual i in household j . It should be noted that we estimate equation I using household-level data and equation II using individual-level data. The mobility of employment is defined by the change in employment over the 2010–2014 period and by the change over the 2014–2018 period. In both Equations (1) and (2), we use the Robust standard errors to fix the defect in the model.

3. Results

3.1. Income mobility

Descriptive Analysis

Table 1. Income mobility of households over 2010 – 2014, 2014 – 2018

Groups	Upward mobility		Downward mobility		Income change	
	% moving up from the bottom 20% to a higher quintile	% moving up from the bottom 40% to a higher quintile	% moving down from the top 40% to a lower quintile	% moving down from the top 20% to a lower quintile	Absolute change in per capita income	Relative change in per capita income
Genders						
Male	38.41	26.75	32.32	48.39	16080.13	66.99
Female	38.84	27.44	29.76	42.5	12650.08	57.78
Age

Ethnic minorities	23.62	10.40	50.00	66.67	6363.78	54.60
Total	38.75	27.3	30.42	44.14	13448.87	59.57

Source: Estimates from VHLSS 2010, 2014, and 2018

Table 1 shows the proportion of households moving up and down across income quintiles over the 2010-2014 and 2014-2018 periods. We choose the two bottom quintiles to analyze how households below the average improve their economic position over time. Furthermore, our purpose is to examine the characteristics of people who can move from the poorest and near poorest quintiles to higher quintiles.

The results reveal that there is a large difference in income mobility among population groups. Specifically, around 52.96% of Kinh and Hoa households in the poorest quintile moved to a higher income quintile, while this figure for ethnic minorities was only 23.62%. In addition, urban households are more likely to move up than rural households, the proportion is 46.00% and 38.26%, respectively.

The results also present that income mobility is related to characteristics of household heads, including gender, age, and level of education. Regarding the gender of the household head, there is no significant disparity in the upward mobility of income between male-headed households and female-headed households. In terms of household head age, households with old heads are relatively more likely to be mobile than those with younger heads. During the 2010-2014 and 2014-2018 period, the percentage of households with heads aged 31-60 moved from the bottom quintile to a higher quintile is 41.71%, while only 18.18% of households with heads below the age of 31 moved from the bottom quintile to a higher quintile. Because of less experience, young people find it difficult to move up.

Education, especially post-secondary education (college and above) plays an important role in income mobility. 50% is the percent of households with a head with post-secondary education moved from the bottom to a higher income quintile over the period of 2010-2014 and 2014-2018. For households with heads with a lower level of education, these figures are only 31.43% and 41.05%, correspondingly.

We also consider the downward movement from the highest income quintile to the lower-income quintile. Kinh and Hoa are less likely to have downward mobility than ethnic minorities. Households with young heads and male-headed households are more likely to move down. Moreover, education is a vital factor in reducing the downward mobility of households.

In the last two columns of Table 1, we assess the relative and absolute income mobility indexes (Fields and Ok, 1996, 1999). The absolute change index is equal to the average of the absolute difference between the 2010 income and the 2014 income, between the 2014 income and the 2018 income. The relative change index is equal to the average of the absolute change divided by the per capita income in the base year. Table 1 shows that male-headed households have higher mobility than female-headed households. Households with young heads are less likely to move than households with older heads. Households with highly educated heads have higher absolute mobility than those with low education. However, as the basic income of households with highly educated heads is higher, their relative mobility is lower.

Impact of Human capital on Income mobility

The impact of human capital on income mobility is given in Table 2 & Table 3. Table 2 reports the impact of the highest education level, while the impact of the number of formal schooling years is reported in Table 3.

The results present that human capital has a positive and statistically significant impact on the upward mobility of income and a negative and statistically significant impact on the downward mobility of income regardless of how it is measured. Specifically, in Table 2, households with highly educated heads are more likely to move from the poorest and near-poorest groups to higher-income groups. The probability of upward income mobility also increases with more years of schooling.

Unlike the statistical analysis described in Table 1, the regression results have not proven the influence of the household head's age on income mobility. The results show that the gender of the household head and household size have a negative and statistically significant impact on household income mobility. Furthermore, ethnicity is also correlated with income mobility. Specifically, compared with Kinh households, ethnic minority households are more likely to move down but less likely to move up in income mobility. In addition, households with more children and more elderly people tend to move down to a lower income quintile. Obviously, more dependents would increase the economic burden for households and hinder their income. Finally, the regional variables are correlated with income mobility, urban households are more mobile than rural households.

Table 2. The impact of the highest education level on income mobility over 2010-2014, 2014-2018

Explanatory variables	Dependent variables					
	Moving up from the bottom 20% to a higher quintile	Moving up from the bottom 40% to a higher quintile	Moving down from the top 40% to a lower quintile	Moving down from the top 20 % to a lower quintile	Absolute change in per capita income (Fields and Ok (1999) index)	Relative change in per capita income

Source: Estimates from VHLSS 2010, 2014, and 2018

Table 4 shows the employment mobility of households over the period 2010-2014, 2014-2018. The results reveal that there is substantially large occupation mobility: 22.83% of unskilled workers became skilled or non-manual workers. However, there was also downward mobility: 20.71% of skilled and non-manual workers had unskilled jobs. Meanwhile, wage-job mobility has a smaller difference: a 13.91% increase in self-employed workers switching to wage jobs; in the opposite direction, the percentage of people switching wage jobs to self-employed jobs relatively decreased to 20.34%. Finally, the proportion of sector mobility is still low, the movement from agriculture to non-agriculture employment is 17.03% and from non-agriculture to agriculture is 14.59%.

There is only a small difference in employment mobility between men and women. In terms of age, older people had lower movement from self-employed to employed employment, from skilled or non-manual jobs, and higher movement from employed to self-employed employment, from skilled or non-manual jobs than young people. Higher levels of education help people find a skilled or non-manual job and reduce the downward mobility

from a skilled to an unskilled job. Rural people and ethnic minorities are less likely to move up and more likely to move down in employment than urban, Kinh and Hoa people.

Impact of Human capital on Employment mobility

The impact of human capital on employment mobility is given in Table 5 & Table 6. The dependent variables include the change in occupation, employment status, and economic sectors. The meaning of occupational skills is similar to Brand-Weiner et al. (2015). The categories are unskilled manual, skilled manual (e.g. craft and related trades workers, machine operators), and non-manual (e.g. service and sales workers, technicians, managers). Non-manual occupation is considered highly skilled. The employment sector is classified into agriculture, industry, and services. Workers in the agricultural sector tend to have lower skills and income than workers in the other two sectors. Table 5 reports the impact of the highest education level, while the impact of the number of formal schooling years is reported in Table 6.

In all models, the coefficients on human capital variables are statistically significant and positive. For instance, an additional year of formal schooling would increase the probability of moving up from unskilled to skilled or non-manual, moving from self-employed to wage jobs, and moving from agricultural to non-agricultural. In Table 5, the result indicates that the probability of moving up from unskilled to skilled or non-manual, moving from self-employed to wage jobs, and moving from agricultural to non-agricultural also increases with a higher level of qualification.

We also found that gender has a significant effect on employment mobility. Specifically, men are less likely to move down from skilled and non-manual occupations to unskilled occupations than women. They are also more likely to move from self-employed to wage jobs than women.

Table 6 shows that there is an U-shaped non-linear relationship between age and moving down from skilled and non-manual to unskilled, from wage jobs to self-employed and from non-agricultural to agricultural employment. Specifically, the higher the age is, the higher the ability to move down from skilled and non-manual to unskilled, from wage jobs to self-employed, from non-agricultural to agricultural is. This is shown by the positive correlation between age and moving down from skilled and non-manual to unskilled, moving from wage jobs to self-employed, moving from non-agricultural to agricultural. However, when age increases to a certain threshold, the ability to move down from skilled and non-manual to unskilled, moving from wage jobs to self-employed, moving from non-agricultural to agricultural increases. The research shows the opposite effect of the age squared variable and the moving down variable from skilled and non-manual to unskilled, from wage jobs to self-employed, from non-agricultural to agricultural.

In addition, ethnicity also has an influence on employment mobility. Compared with ethnic minorities, the Kinh and Hoa ethnic groups have more ability to move up from unskilled to skilled and non-manual, from self-employed to wage jobs, from agricultural to non-agricultural and vice versa.

Geographically, urban residents are less likely to move down from skilled and non-manual to unskilled, moving from wage jobs to self-employed, moving from non-agricultural to agricultural in comparison with people in rural areas.

Household size, proportion of children below age 15, Proportion of members above age 60 have barely demonstrated an effect on employment.

4. Discussion and Conclusion

4.1. Discussion

In this paper, we examine the impact of human capital on social mobility of employment and income in Vietnam over the 2010-2014 and 2014-2018 periods.

The result shows that human capital has a positive impact on income mobility. In particular, the higher the education of the householder is, the more likely the movement from low-income groups to higher-income groups of this family is. Additional years of formal schooling also increase the probability of a household's income mobility. Moreover, human capital not only plays an important role in increasing upward mobility but also contributes to decreasing the downward mobility of income. This conclusion is consistent with the research results of Psacharopoulos and Patrinos (2004), Schultz (1997, 2002), Nguyen, C. V., & Nguyen, L. T. (2019).

The relationship between human capital and employment mobility is positive. The higher the person's educational attainment is, the more years of formal schooling, the more likely they move from agriculture to non-agricultural occupations (industry and services), from unskilled/ traditional workers to skilled workers. Furthermore, higher education reduces the downward mobility of employment. This conclusion is consistent with the research results of Sewell and Hauser (1980), Goldthorpe (2013).

In addition, ethnicity also affects social mobility. Specifically, ethnic minorities are more likely to shift downward mobility and less likely to shift upward mobility of income in comparison with Kinh and Hoa. Moreover, the ethnic minority group has a higher ability to change occupational mobility in the downward direction than the Kinh and Hoa groups. Besides, geography has a substantial impact on social mobility. Not only do having a higher ability to switch occupations from unskilled to skilled, from agriculture to non-agriculture employment, people in urban areas also have a lower probability to shift downward mobility of income than people in rural areas. This conclusion is consistent with the research results of Black and Devereux (2010), Corak (2013a).

4.2. Recommendation

The research results show that human capital affects not only income mobility but also employment mobility, and upward mobility for ethnic minorities and people in rural areas is more difficult. Therefore, the research focuses on the following four solutions to increase upward mobility for the disadvantaged group. Specifically:

First, improved access to upper secondary education: graduating from upper secondary school is an important factor and a huge opportunity for young people, especially the poor and the ethnic minorities to gain access to skilled jobs and increase income mobility. As a result, it is necessary to have more effective, supportive policies for upper secondary schools to increase enrolment rates among poor and ethnic minority students.

Second, career-oriented programs for students, especially for high school students should be the main problem focus: The problem with poor families is when they have spent too much on their children's education, but their children have been unable to find high-

paying jobs. The lack of career orientation as well as the choice of majors, and levels of study is the main reason for this problem. Therefore, depending on the student's strengths and weaknesses, other conditions, and factors, both parents and school give some clear and specific advice in their children's careers to connect higher education with the labor demand of the market.

Third, subsidies and preferential loans for poor and disadvantaged students: Although the poor and ethnic minorities in Vietnam receive a reduction in tuition fees, tuition fees only account for a relatively small percentage of the total educational expense. Therefore, educational subsidies and preferential loans are essential for poor and disadvantaged students.

Fourth, reducing the quality gap in education: the existence of a large gap in the educational quality between children from wealthy families and from poor families, the Kinh, and ethnic minorities, in rural and urban areas is tremendously serious because it shows the lack of fairness in education for disadvantaged groups. These measures should be started from the smallest level (kindergarten) to the higher levels (such as high school and university). Furthermore, the elimination of language barriers for ethnic minority children is extremely difficult and necessary. The proportion of ethnic minority children who have access to the national language will increase if the government has efficient policies on building a bilingual learning environment (in national and ethnic minority languages), improving the quality as well as the number of teachers through incentive policies on salary and bonus, especially for local ethnic minority teachers.

IMPORTANCE OF CUSTOMER SERVICE AND LAST MILE DELIVERY IN ORDER MANAGEMENT OF E-COMMERCE B2C VIETNAM

MA. Pham Thi Minh Hanh

ptmhanh@hcmute.edu.vn

*Faculty of Economics, Ho Chi Minh City University
of Technology and Education - Vietnam (HCMUTE)*

Abstract

This study is an identification of the need for a "last mile delivery" logistics model in e-commerce enterprises in the current period in Việt Nam. In addition, it is emphasized that "Customer service" and "last mile delivery" are the keys to help the order management in e-commerce development.

Keywords: *last mile delivery, order management, e-commerce B2C, customer service*

1. Introduction

Firstly, in the 4.0 era, Vietnam is having a lot of opportunities for Vietnam's e-commerce to participate in the electronic and high-tech logistics chain. However, according to (Duong Hong Ngoc, 2020) on tapchitaichinh.vn, one of the main obstacles is logistics, because 34.1% of consumers are not satisfied with the delivery service of commercial enterprises. e-commerce in Vietnam.

Secondly, the benefit of efficient logistics in e-commerce has been identified as a source of competitive advantage, and today it is a prerequisite in businesses (Arkadiusz Kawa, 2017).

Thirdly, according to (Duong Ngoc Hong, 2020) in the article "E-commerce in economic development in Vietnam", the author pointed out that dissatisfaction in the delivery experience is a common thing that is happening. In terms of e-commerce activities, the transaction speed in our country is the second slowest in Southeast Asia.

2. Literature Review

2.1. E-commerce

E-commerce refers to a wide range of online business activities including the activities of products and services. It can take the form of "any form of business transaction" in which parties interact via electronic devices instead of face-to-face exchanges. E-commerce is typically associated with buying and selling over the Internet or conducting any transaction involving the transfer of ownership or right to use goods or services through an intermediate computer network. E-commerce is the use of electronic communications and digital information processing technology in business transactions to create, transform, and redefine relationships to create value between or between organizations and between organizations and individuals (Anjali Gupta, 2014).

According to (Anjali Gupta, 2014) B2C is a business model, used exclusively in the field of e-commerce (e-commerce). B2C is an acronym for business-to-consumer, is a commercial activity between companies and consumers, individuals, after collecting information about customers buying physical goods (such as books or consumer products) or information goods (or goods of electronic documents or digitized content, such as software, or e-books); and sales transactions are done through the electronic network.

2.2. Logistics models in e-commerce

According to (Kawa 2014), there are four logistics models in e-commerce:

(i) Insourcing logistics: this model is the most popular, especially in Poland. Accordingly, small, and medium-sized e-commerce businesses will have their own logistics process, not outsourcing, they can better control the business and be independent from subcontractors. However, it is important that they prepare in advance for sudden growth when the number of orders increases, when they need to hire more warehouses or need to increase staff.

(ii) Drop shipping: drop shipping involves shipping goods directly from the warehouse (manufacturer, distributor) to the customer without using the supplier's warehouse (Zajac, 2014).

(iii) Fulfillment: the e-commerce business will delegate part of the logistics processes to an external supplier.

(iv) One stop–ecommerce: in addition to logistics, there are additional services. This concept implies the logistics process not only in the logistics sector but also in the areas of customer service, marketing, information technology, solutions and finance and accounting of a company (Ciechomski 2014). For example, call centers, where inquiries, complaints, etc., integrate processes in one location, the process is delegated to a partner.

2.3. Last mile delivery

According to Morganti et al. (2014b) and Gevers et al. (2009), there are many descriptive terms about last mile delivery such as: last mile delivery, home delivery, door-to-door delivery. They all emphasize certain aspects of last-mile delivery, direct-to-consumer service delivery(B2C).

In U.S.A

Punakivi M (2001) identified the factors contributing to the success of last-mile e-commerce grocery delivery in the US. Weigel D. et al. (1999) showed that algorithms for vehicle routing and scheduling can be used to improve costs in the home delivery business.

In Italy

Maliheh Ghajargar and Giovanni Zenezinib (2017) in the study pointed out the evolution of demand and the need of customers for "last mile delivery" services. In addition, the research team also shows that "last mile delivery" increases the safety of the package and the reliability of the order. The goods are very diverse including: Clothing, Food and Beverage, Entertainment, Electronics, Editorial, Health and Cosmetics and Insurance.

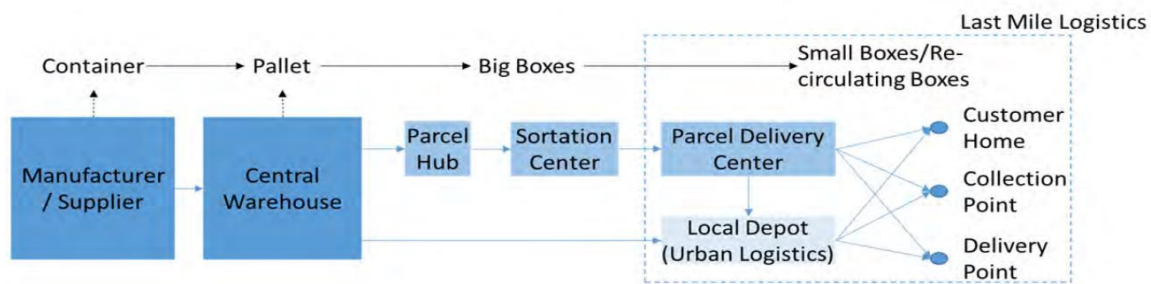

Figure 1. E-commerce logistics activities

Source: TLI The Logistics Institute Report (2016)

Avinashi Unnikrishnan & Miguel A. Figliozzi (2020) also researched and found that COVID-19 has a direct impact on home delivery, nearly 55% have ordered extra “last mile delivery” during the COVID lockdown. -19 in the US. More than 60% of households have “last mile delivery” more one to two times in the 30 days than before COVID-19, the customer’s order products with more “last mile delivery” after COVID-19.

2.4. Order management

John J.Coyle (2016) in Supply chain management - A logistics perspective showed that order management refers to the management of various activities related to the order cycle; order cycle refers to the time from when a customer places an order to when it is received. The final stage of the order cycle is delivery, which refers to the time from when the carrier arrives to receive the shipment until when the customer receives the goods.

Figure 2. Major components of the Order Cycle

Source: Supply chain management - A logistics perspective, John J. Coyle (2016)

2.5. Relationship between order management, last mile delivery and customer service

Order management or order fulfillment is the interface between buyers and sellers in the market, specifically here in B2C e-commerce is the relationship between the e-commerce company and the customer buying the goods. Therefore, order management in e-commerce will directly affect customer service. While last mile delivery is a part of “order management”, good management of last mile delivery will contribute to customer satisfaction.

Perceived order fulfillment services have significant positive associations with customer satisfaction (Daugherty et al. & Frank Biocca, 1998). Thus, studies show that it is necessary to improve service quality (process and results) to satisfy customers, thereby creating customer trust, so that customers have trust and loyalty to return.

It is very expensive to change the whole thing, the whole process of order management (John J. Coyle, 2016), so changing and improving last mile delivery and customer service at last mile delivery will be a better choice for an organization.

3. Method

3.1. Study overview

The logistics model is applied popularly in e-commerce. Last-mile delivery is available in many regions around the world for a wide variety of items. In addition, theories also show that last-mile delivery brings advantages to businesses and determines the success or failure of that business. Especially when the economic situation is unstable due to the Covid pandemic, the need for "last mile delivery" is even more important.

3.2. Research gaps

In the TLI Report of the Logistics Institute (2016), it was said that one of the key challenges in e-commerce logistics is that the current practice for last mile e-commerce logistics is mostly inefficient. The main factors contributing to the inefficiency such as high delivery failure rate, increasing the logistics cost due to unconsolidated services, waiting time in delivery due to low utilization of critical logistics resources in dense cities.

Mikko Punakivi and Juha Saranen (2001) in Finland show that one of the important factors for the success or failure of e-commerce is "last mile delivery". Logistics plays an important role in e-commerce. However, there is no study to point out the importance of customer service in last mile delivery or the improvement of customer service on last mile delivery to improve obstacles in e-commerce. A gap still exists today how to link between e-commerce logistics performance and customer's expectation.

3.3. Objectives and research questions

Question 1: So, what is the difficulties of the logistics model in e-commerce in Vietnam, can "last mile delivery" be applied to e-commerce in Vietnam?

Question 2: Develop customer service in "last mile delivery" can improve these difficulties in e-commerce Vietnam?

3.4. Research method

To ensure comprehensiveness, objectivity and accuracy, the research uses a combination of both primary and secondary data research methods:

(i)Secondary data for the research paper includes data, journals, annual reports on the development of e-commerce in Vietnam and worldwide. They are published on the website of the Vietnam E-commerce Association, Specialized journals of the e-commerce of Vietnam by foreign and Vietnamese authors, or from national and international scientific conferences related to e-commerce and economy in Vietnam then analyzing data according to defined goals.

(ii)The primary data to be collected and analyzed is the data that reflects the current situation of Vietnam e-commerce. Primary data is collected by interviewing methods on delivery methods in logistics at organizations or discussing with experts of logistics.

4. Results

4.1. Customer service in e-commerce in Vietnam

In any form of business, customer satisfaction plays an important role in the success of the business because it enhances customer confidence (María Fuentes Blasco & nnk., 2012), plays a role as original for word of mouth and to ensure repeat purchases (K.K. Kyung & Bipin Prabhakar, 2004).

The trust of customers when buying online is a factor to create a sustainable role of B2C e-commerce in Vietnam, responsiveness is clearly shown to have a direct impact on customer loyalty. customers (Yongrok Choi & Do Quynh Mai, 2018).

Thus, the customer service relationship will contribute to creating trust and determining customer loyalty in e-commerce, which will bring profits to the business.

In the TLI Report of the Logistics Institute (2016), customer service is a challenging element in ecommerce logistics delivery

The key elements of customer service are time, reliability, communication and convenience (John J.Coyle, 2016).

Customer Service Dimension	Measure
Time	Order cycle time
	Inquiry response time
Dependability	Perfect order
	On-time delivery
Communication	Customer complaints
	Order status information
Convenience	Returns process
	Response to emergency situations

Figure 3. Customer Service Dimension

Source: Supply chain management - A logistics perspective (John J. Coyle)

4.1.1. Time

Lead Time or Order cycle time refers to the time from when a customer places an order to when it is received (John J. Coyle,2016). In Vietnam, studies show that, on average, it takes 5-6 days for products to be delivered to buyers (TLI Report of the Logistics Institute (2016).

4.1.2. Dependability

The reason why customers do not shop online is because it is difficult to verify the quality of goods (47%), they do not trust the seller (40%), fear of revealing personal information (38%), and the second slowest transaction speed in Asia (Vietnam E-Commerce Association, 2019).

4.1.3. Communication

Three types of communication exist between buyer and seller: (i) pre-transaction, (ii) transaction, and (iii) post-transaction. Pre-Transaction information includes product availability and delivery dates. Transaction information includes order-specific details. Post Transaction information regarding repair, assembly, or return.

Obstacles to online shopping mainly occur in post-transmission information, specifically poor products, quality compared to advertising accounts for 72% (Vietnam E-Commerce Association, 2019), so it is necessary to focus on the final delivery stage in order management in e-commerce. In addition, poor delivery service accounted for 23%, complicated payment accounted for 12%.

4.1.4. Convenience

(i) Flexibility in service level policies should be ensured and is a factor in determining how buyers perceive “ease of doing business” with sellers. Convenience is another way of saying how flexible logistics should be. Basically, the logistics requirements are different regarding the packaging, shipping method and carrier required by the buyer, routing and delivery times routing, and delivery times (John J. Coyle, 2016).

According to the report of the Ministry of Industry and Trade (2019), in Vietnam 11% think that shopping at a convenience store, 47% think it is difficult to check the quality of goods, 40% do not trust the seller, 38% are afraid of revealing personal information, 23% do not have enough information. For decision making, 13% do not have any kind of payment, 11% think that ordering online is troublesome.

(ii) The service of return or recovery concept is being used by organizations today to help identify service failure areas in their order management process and develop plans to resolve them quickly and exactly and includes all activities that affect information, product, and cash flows between the organization and its customers (John J. Coyle, 2016).

In Vietnam, 72% think that the product is of poor quality with advertising, 47% think that it is difficult to check the quality of the goods, so the role of return service in logistics and customer service at the last mile delivery stage is very important.

Although the level of satisfaction with online purchases increased to 55% (2020) compared to 48% (2018), very satisfied 16% (2019) while only reaching 7% (2018), but customers still have problems and hesitate to buy goods online, in which customer service, ordering method, shipping service, website form, payment method ranges from 12-27 %, most of them think buying at convenient stores. more convenient (55%), (according to the Ministry of Industry and Trade, Department of E-commerce, and Digital Economy, 2020).

Thus, customer service in ecommerce in the Vietnam market is not good. The report also showed that 27% said that customer service was poor. 67% buy online through friends' recommendations, and 56% look at online reviews to decide whether to buy e-commerce or not. Therefore, the element of customer service management in order management of e-commerce in Vietnam is important.

4.1.5. Last mile delivery

Using the logistics model is a trend in e-commerce. The logistics model depends on the company's size and strategy, but there is no theory that proves that geographical factors must be like use a similar logistics model. Use existing models depending on the strategy and size of the company. The common point is that these e-commerce companies all tend to use their own fulfillment centers to bring goods closer to consumers or called as last mile delivery.

In the Report of TLI The Logistics Institute (2016), in Vietnam, customers want the company to bring goods closer to consumers. According to VECOM, 26% customers use online shopping more than before Covid-19 period, these are essential consumer goods groups during the epidemic period. The COVID-19 epidemic quickly changed consumption and shopping habits. Consumers prefer to shop online. In 2019, according to Nielsen's research on the impact of Covid on Vietnamese people, 45% more food is stored at home, 50% reduced the frequency of visits to supermarkets, shops, grocery stores, markets, 25% increased online shopping activities, and 25% reduced outside dining activities. It means that consumers and buyers want to be provided the last mile delivery after Covid period.

5. Discussion and Conclusion

5.1. The necessity of Vietnam e-commerce last-mile delivery logistics model

Firstly, e-commerce makes a significant contribution to promoting the flow of goods and services, supporting businesses, in the context of deep integration and the spread of the Industrial Revolution 4.0, according to the Ministry of Industry and Trade, Department of e-commerce and digital economy. According to the Vietnam E-commerce Department, B2C revenue (billion USD) contributes to quite high economic growth of 23% (2016), 25% (2019), of which the total revenue of B2C brings to the economy was 10.1 billion USD in 2019.

Secondly, for many years, the percentage of businesses that sell goods on social networks tends to increase gradually, 28% (2015) and 41% (2017) (Vietnam E-commerce Association, 2019). The return of e-commerce floors has become more and more obvious. Accordingly, in 2020 up to 22% of enterprises participating in the survey will have an e-commerce exchange up 5% compared to 2019.

Thirdly, the screening, harsh competition of Vietnamese e-commerce companies with foreign e-commerce companies. In 2019, the market has witnessed the "departure" of many online sales brands such as Robins.vn, Adayroi.vn (of Vin group) (according to tapchitaichinh.vn).

Fourth, the benefits of the logistics model and "last mile delivery" to improve the customer service in e-commerce B2C.

(Sunil Chopra and Meindl, 2011, p.80) discovered that last mile delivery response times are very fast, given the variety of products. Very good customer service, especially for bulky items. Time-to-market is much faster than a distributor's pre-shipment storage time when using a carrier's package service. Order visibility is less of an issue and easier to fulfill. Returns are easier to implement than using carriers when outsourcing. Thus, door-to-door delivery is an indispensable part of e-commerce, the whole process of delivering orders to customers will go through many steps, even orders are returned to the business after being delivered. Therefore, Vietnamese commercial enterprises cannot help but focus on the after-delivery service, also known as the 'last-mile delivery' process, to be effective because last-mile delivery brings benefits to customers businesses, overcome the current situation of e-commerce in Vietnam.

5.2. Emphasis on service quality improvement in order management at last mile delivery

Order management can be measured in a variety of ways. Traditionally, however, buyers would measure the effectiveness of order management using order cycle time and reliability as metrics, while sellers would use order cycles (John J. Coyle, 2016).

Dina Ribbink & nnk., (2004), customer satisfaction is expected to have a positive influence on customer trust and loyalty. From a business perspective, trust is a consumer's expectation that a supplier will keep its word or promise and will not cause any harm to the consumer in the future (Inge Geyskens & nnk., 1999).

E-commerce in Vietnam is also very suitable for last-mile delivery because of the variety of products and goods. The current situation of e-commerce in Vietnam as mentioned above is that customers lack trust and safety in transactions, while the use of the logistics model with last-mile delivery as demonstrated above is increasing trust. customers, thereby increasing the opportunity to develop e-commerce in Vietnam, thus consistent with the studied theories.

However, in Vietnam, winning in e-commerce depends on many other factors such as (i) information flow (ii) coordination between infrastructure, resources, information, and communication. Information creates efficiency in the implementation model (iii) delivery location because of the current situation of e-commerce development in Vietnam, there are many factors hindering the purchase that the author has not considered in this article such as: payment methods, information technology, website form. In addition, it is also necessary to study more about the "trade off" trade-off when applying logistics models in Vietnam and improving customer service at the expense of businesses.

TRADE RELATION BETWEEN VIETNAM AND THAILAND: EVIDENCE FROM TRADE INDICES

MSc. Le My Linh

linhlm@due.edu.vn

*Faculty of International Business, University of Economics,
The University of Danang, Danang, Vietnam*

Abstract

This study explores the trade relation between Vietnam and Thailand based on the calculation for the period 2010 - 2020 a number of indicators commonly used in international trade studies, namely the revealed comparative advantage index (RCA), the export similarity index (ES), the trade intensity index (TI) and the trade complementarity index (TC). The data used for the calculation is collected from the UNcomtrade database. Trade analysis tools on the one hand help each country review the products they have comparative advantage when exporting, on the other hand determine whether these two economies are competitors or complements in their trade.

Keywords: *export similarity, comparative advantage, Thailand, Vietnam*

1. Introduction

Vietnam and Thailand are two close neighbors in Southeast Asia, which own similar political, economic, social and technological aspects (Quynh, 2021). They are two economies of scale and dynamic development in the Asia-Pacific region, with much potential to further promote bilateral trade as well as cooperation in various related fields. These countries are also members of many free trade agreements within the framework of the Association of Southeast Asian Nations (ASEAN) and ASEAN +1, the Regional Comprehensive Economic Partnership (RCEP). Noteworthy, Thailand is Vietnam's largest trading partner in ASEAN, is Vietnam's largest export market in ASEAN, and is the 9th largest investor in Vietnam. Statistics show that their bilateral trade turnover is estimated at about 10 billion USD in the first six months of 2021 (Phan & Viet, 2021) and is expected to achieve the goal of 25 billion USD (Bao Chinh Phu, 2022). Meanwhile, Vietnam is Thailand's second largest trading partner in ASEAN (Ngoc & Huu, 2022).

The existing free trade agreements (FTAs) are creating advantages for Southeast Asia in general as well as Vietnam and Thailand in particular to attract and receive investment flows. However, this 45-year-strategic-partnership is facing with profound changes in the region and the world, namely the trade tensions between major countries, the conflict in Ukraine, the unfavorable energy market, the restructuring of the production network in the Asia-Pacific region, the trend of digital transformation, energy transformation and the development of the Industrial Revolution 4.0. Thus, these factors are currently posing both opportunities and challenges for the two economies of Vietnam and Thailand to strengthen

their economic connectivity and cooperation in the framework of supply chains and regional production networks to effectively exploit FTAs (Ngoc & Huu, 2022).

Prior studies discover economic factors of Vietnam and Thailand from diverse perspectives, but they often observe two countries' characteristics together with other members of associations like ASEAN (Van Hoa, 1997). When it comes to the bilateral partnership, authors often select single factors to examine such as trade linkages in shrimp exports (Kagawa & Bailey, 2006), trade barriers (Doanh & Heo, 2007) and products mapping (JDE, 2017). However, to the best of authors' understanding, up to now there are no studies about the current trade relation between Vietnam and Thailand from trade indices. The potential in their bilateral trade requires deeper analysis into the two countries' export structures and export patterns to take full advantage of each side. This paper, therefore, aims to evaluate the most up to date situation of trade relation between Vietnam and Thailand using generalized potential indicators. By this way, outcomes of trade policy could be forecasted in advance. While the approach cannot be exact given the complexity of the Vietnamese economy, it is important to warn policymakers or negotiators about what general economic trends may be led by the implementation of FTAs regarding efficient resource allocation. This information can help determine which industries deserve special attention in negotiating market access in an FTA (Cassing et al., 2010).

The paper is structured as follows. Section 2 examines methodology and data collection. The empirical results are presented in Section 3. Section 4 summarises some concluding remarks and further discussion.

2. Method

Generalized potential indicators are considered as efficient tools to evaluate the trade relation between two countries or groups of countries (Cassing et al., 2010). Particularly, generalized potential indicators include multiple trade flow metrics at the aggregate level based on highly detailed data, which likely provides a clue whether a condition is more or less favorable for a successful FTA. These indicators are also implemented in the study of Hoekman et al. (2002) and other studies (Mikic, 2005). Additionally, a number of more detailed industry-level indicators such as revealed comparative advantage are often used as indicators of industry potential or challenges in trade liberalization (Balassa, 1965; Iapadre, 2001).

Therefore, this paper uses four trade indices to examine the trade relation between Vietnam and Thailand. First, the revealed comparative advantage index is applied to determine comparative advantage export products of the two countries and any changes in their trade structure. Second, the export similarity index is employed to describe the degree of similarity in terms of export between Vietnam and Thailand in the world market as well as in the US market. Third, the trade intensity index helps figure out whether the value of trade between Vietnam and Thailand is larger or smaller than expected on the basis of their importance in world trade. Finally, the trade complementarity index is a useful tool to assess the compatibility between two studied countries' trade structures as an exporter and importer, then diagnose if the prospect of their trade expansion is favorable.

Data for analysis in this paper are completely collected and processed from the UNcomtrade database for the period from 2010 to 2020 using the Standard International Trade Classification Revision 3 (SITC Rev.3). The export data extracted is analyzed at 1-digit SITC level. SITC0-4 are primary products, SITC5-9 are manufactured goods, SITC5 and SITC7 are almost capital or technology intensive manufacturing products, and SITC6 and SITC8 are almost labor-intensive manufacturing products (Wang & Liu, 2015).

2.1. Revealed Comparative Advantage Index (RCA)

First coined by Balassa (1965), the revealed comparative advantage is intended to measure a country's comparative advantage pattern by analyzing its export structure because trade performance of a nation is commonly dominated by the commodities in which it has comparative advantages. In symbols, the formula is:

$$RCA_{ij} = \frac{x_{ij}/X_{it}}{x_{wj}/X_{wt}}$$

Where:

RCA_{ij} : reveal comparative advantage of country i with respect to product j;

x_{ij} : export value of product j for country i;

x_{wj} : export value of product j for the world;

X_{it} : total exports of country i;

X_{wt} : total export of the world.

The RCA index illustrates the comparative advantages (and disadvantages) of a particular product for a country and is applied to evaluate the potential of the country' export in those products. If $RCA > 1$, country i tends to be a competitive producer and exporter of commodity j while $RCA < 1$ means that country i is at a comparative disadvantage or does not have an export strength in commodity j. In case $RCA > 1$, the higher the index is, the more relative advantages the country enhances in product j (Sejkora & Sankot, 2017).

If countries share similar values of RCA, they are unlikely to witness a high bilateral trade intensity without the involvement of intra industry trade (L. H. Tran, 2017); as a result, the trade between them would be less affected by FTA (Cassing et al., 2010). By computing this index, trade structure and changes in trade structure between Vietnam and Thailand will also be observed (Nguyễn, 2016).

2.2. Export Similarity Index (ES)

In order to identify the degree of similarity in terms of export between two countries or more in the world market or the third market, Finger & Kreinin (1979) put forward the calculation formula of export similarity. It is defined by the formula:

$$ES(ij, k) = \left\{ \sum_l \min \left(\frac{x_{ik}^l}{x_{ik}}, \frac{x_{jk}^l}{x_{jk}} \right) \right\} \times 100$$

Where:

$ES(ij, k)$: export similarity between country i and country j in market k;

- x_{ik}^l : export value of product l from country i to market k;
- x_{jk}^l : export value of product l from country j to market k;
- x_{ik} : total exports of country i to market k;
- x_{jk} : total exports of country j to market k.

The ES index provides an indication of the export structure between one country and its trading partners. It takes on values from 0 to 100. When $ES = 0$, country i and country j are totally different in terms of exporting commodity i to market k, while $ES = 100$ implies that these two countries are perfectly the same when exporting that product to market k. The higher the value of ES is, the harsher the two countries' competition is in the third market (Finger & Kreinin, 1979).

Accordingly, when an economy has a low index of export similarity with a trading partner, that economy has an increased potential to export to the partner's market in the future. On the contrary, if the index of export similarity between that economy and the partner is high, or the export structure is similar, then the export ability of that economy to the partner is limited (Tran et al., 2020). In other words, ES could provide a realization whether one nation can become another country's opponent within a certain FTA (Cassing et al., 2010).

A merit of this index over other applications is that ES demands only international trade statistics, which is available and accessible for all countries on a standardized basis. By taking ES into consideration, two partners countries or groups of countries' tendency to be more similar or more divergent with regard to their export structure could be revealed (Yihong & Weiwei, 2006), and the rapid economic growth of a country can also be reflected (Bang & Tuo, 2013).

2.3. Trade Intensity Index (TI)

The trade intensity index is used to identify whether the value of trade between two countries is greater or smaller than would be expected on the basis of their importance in world trade. The formula for the TI index is:

$$T_{ij} = \frac{x_{ij}/X_{it}}{x_{wj}/X_{wt}}$$

Where:

- T_{ij} : trade intensity between country i and country j;
- x_{ij} : export value of country i to country j;
- x_{wj} : export value of the world to country j;
- X_{it} : total exports of country i;
- X_{wt} : total export of the world.

When $TI > 1$, bilateral trade flows are greater than expected while $TI < 1$ indicates that bilateral trade flows are smaller than expected. In this sense, the larger the value, the better for the FTA (Cassing et al., 2010).

2.4. Trade complementarity (TC)

The potential and prospects for expanding trade between countries depends on the degree of complementarity between countries. When two countries have complementary economic structures, they have greater potential to expand trade and vice versa (Nguyễn, 2016). Complementarity in the structure of trade between countries is often assessed through the index of trade complementarity assert by Michaely (1996). This index determines the degree of compatibility between a country's export structure and a partner country's import structure:

$$TC_{jk} = 100 - \sum abs(m_{ik} - x_{ij})/2$$

Where:

TC_{jk} : complementary level of trade between country j and country k;

x_{ij} : share of product i in country j's exports;

m_{ik} : share of product i in country k's imports.

TC outlines the outlook for intra-regional trade by showing how a country's export and import structure fits together. It ranges from 0 to 100. If $TC = 0$, country j exports products that country k does not import, or none of the goods exported by one country are imported by another, which means that the trade structure between the two countries is not complementary at all. On the contrary, $TC = 100$ implies that country j has the same export structure as the partner country k, or the proportions of exports and imports match. The higher the value, the greater degree of compatibility between the trade structures of the exporting country and the importing country, and therefore the greater the prospect of trade expansion (Nguyễn, 2016) or the better the FTA proposal is (Cassing et al., 2010).

3. Results

3.1. Revealed Comparative Advantage of Vietnam and Thailand

According to Table 1, two out of ten Vietnam's commodity codes at 1-digit SITC level have, on average, value larger than 1, which reveal Vietnam's comparative advantages in those two sections. The two sections are SITC0 Food and live animals with a mean of 2.16 and SITC8 Miscellaneous manufactured articles with a mean of 2.56. This high value of RCA reflects the fact that Vietnam has usually been the main exporter of food and some traditional labour-intensive products such as wearing apparel, footwear and furniture as reported by Tran (2017) and Phan & Le (2018). Vietnam also has strong potential in SITC7 Machinery and transport equipment as its RCA value is nearly 1. Whereas, Thailand owns comparative advantages in four sections, namely SITC0 Food and live animals, SITC2 Crude materials, inedible, except fuels, SITC6 Manufactured goods classified chiefly by material and SITC7 Machinery and transport equipment. For the full statistics RCA indices for Vietnam and Thailand's commodities at 1-digit SITC Rev.3 level (2010 – 2020), see Appendix A and Appendix B.

Generally, the overlap in comparative advantage between Vietnam and Thailand is low, only in section Food and live animals. In detail, the two countries' most noticeable products in this commodity section are fish fillets, crustaceans, molluscs and processed fish.

Table 1. Mean RCA indices for Vietnam and Thailand's commodities at 1-digit SITC Rev.3 level (2010 – 2020)

Commodity Code	Commodity	Vietnam	Thailand
0	Food and live animals	2.16	2.04
1	Beverages and tobacco	0.40	0.81
2	Crude materials, inedible, except fuels	0.79	1.33
3	Mineral fuels, lubricants and related materials	0.36	0.36
4	Animal and vegetable oils, fats and waxes	0.26	0.47
5	Chemicals and related products, n.e.s.	0.24	0.91
6	Manufactured goods classified chiefly by material	0.87	1.01
7	Machinery and transport equipment	0.97	1.21
8	Miscellaneous manufactured articles	2.56	0.79
9	Commodities and transactions not classified elsewhere in the SITC	0.12	0.48

Source: Authors' computation based on UNcomtrade database.

In order to review changes in trade structure of products that have comparative advantage of Vietnam and Thailand, three mentioned commodity codes for Vietnam and four mentioned commodity codes for Thailand as indicated in Table 2 are chosen for a deeper analysis.

Table 2. RCA indices for selected Vietnam and Thailand's commodities at 1-digit SITC Rev.3 level (2010 – 2020)

Commodity Code	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	Mean
Vietnam												
0	3.28	3.14	2.85	2.34	2.31	1.94	1.86	1.80	1.65	1.40	1.22	2.16
7	0.46	0.60	0.82	1.01	0.96	1.03	1.07	1.13	1.15	1.17	1.27	0.97
8	3.16	2.96	2.57	2.56	2.57	2.43	2.44	2.42	2.47	2.37	2.17	2.56
Thailand												
0	2.16	2.28	2.19	2.01	2.05	1.98	1.88	1.91	1.98	2.06	1.90	2.04
2	1.41	1.77	1.37	1.36	1.21	1.23	1.25	1.47	1.29	1.21	1.07	1.33

7	1.23	1.16	1.24	1.29	1.28	1.23	1.22	1.21	1.21	1.12	1.13	1.21

Source: Authors' computation based on UNcomtrade database.

As shown in Figure 1, despite their current high value in terms of RCA, Vietnam's comparative advantage in Commodity Code 0 and 8 have decreased remarkably over the period studied and express a tendency of declining constantly for coming years. In contrast,

the RCA value of Vietnam's commodity code 7 increased at a steady rate and literally reached 1 for several years. This sign is supposed to base on the event that Vietnamese manufacturing industries have been better linked to global production networks since Vietnam's participation in WTO in 2017. As a result, Vietnam has engaged in small fragments of the production process such as component and final goods assembly and becomes one of the biggest electronic processing centers in the world (Phan & Kieu, 2017).

On the other hand, the RCA values of all Thailand's four Commodity Code maintain their comparative advantage position during the period 2010 – 2020 with section 0 being the leading one among the country's exports. Specifically, except SITC6, the three other sections all experienced a downward trend. However, despite their negligible decline, their indices have always been stable and above 1.

To sum up, while Thailand has kept the stability in comparative advantage, Vietnam has witnessed the fluctuation over time, which is in line with the previous studies (Tran, 2017).

3.2. Export Similarity between Vietnam and Thailand

Apart from the world market, this paper chooses the US as the third market because this developed country has consecutively been the largest export destination of both Vietnam and Thailand (Observatory of Economic Complexity, 2021) and has a relatively good representative of their export condition (Wang & Liu, 2015).

Figure 2 illustrates the export similarity index of Vietnam and Thailand in the world market and the US market. From a broad perspective, Vietnam and Thailand possess a high level of ES which is beyond 50. This outcome confirms that these two ASEAN countries share many similarities in their export commodities and their export structure, which typically proposes an export competition between two nations. For full ES indices between Vietnam and Thailand in the US market and in the world market (2010 – 2020), see Appendix C and Appendix D.

Figure 2. ES indices between Vietnam and Thailand in the US market and in world market (2010 – 2020)

Source: Authors' computation based on UNcomtrade database.

In the US market, the ES index of Vietnam and Thailand observes an upward trend during the period 2010 – 2020. From the value of 52.59 in 2010, this index grows firmly and then rises moderately in 2018 before reaching its peak at 73.74 in 2020. On average, SITC7 Machinery and transport equipment escalated noticeably and accounts most of the similarity, followed by SITC8 Miscellaneous manufactured articles, SITC6 Manufactured goods classified chiefly by material and SITC0 Food and live animals.

The same situation can be viewed in the case of the world market as the third market. However, values of the ES index in this circumstance are significantly higher, which are always above 60 and sometimes even 80 or more. The trend of export similarity between Vietnam and Thailand developed gradually during the period 2010 - 2020 with a mild drop in recent years and eventually finished at 77.91 (2020). The most similar export products of Vietnam and Thailand are also commodity code SITC0, SITC6, SITC7 and SITC8. To sum up, this figure demonstrates a fierce competition of products from Vietnam and Thailand to the US and even a more intense scenario when the two countries' export destination is the world as the whole market. Interestingly, the level of competition shows no sign of easing recently.

3.3. Trade Intensity between Vietnam and Thailand

It is illustrated from Table 3 that Vietnam's trade intensity with Thailand is above one for the whole studied period, from 2010 to 2020. This finding implies the importance and influence of Thai markets for Vietnam as the value of trade between Vietnam and Thailand is larger than expected on the basis of their importance in world trade. The value of TI index increased consecutively from 1.62 in 2010 to 2.27 in 2014 but then fluctuates moderately to finally get 1.61 in 2020. The outcome can be partly explained by the suggestion that countries have a tendency to trade more with their neighbors and close proximate partners. Likewise, the TI index probably reduces once the geographical distance is adjusted (Tran, 2017).

Table 3. TI indices between Vietnam and Thailand (2010 – 2020)

	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020
TI	1.62	1.99	2.21	2.15	2.27	1.81	1.91	1.99	1.91	1.72	1.61

Source: Authors' computation based on UNcomtrade database.

3.4. Trade Complementarity between Vietnam and Thailand

The trade complementarity of Vietnam and Thailand with Vietnam as the exporter and as the importer is depicted respectively in Table 4. Overall, the degree of complementarity between Vietnam's exports and imports from Thailand is high, with values above 55. Meanwhile, the import complementary index shows that the degree of complementarity between Vietnam's imports and Thailand's exports is much greater, with values above 70 over the period from 2010 to 2020. Accordingly, in both cases, Vietnam's trade structure is increasingly compatible with Thailand's trade structure, which means that the goods exported by Vietnam are imported by Thailand and vice versa.

Table 4. TC indices between Vietnam and Thailand (2010 – 2020)

	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020
Vietnam as the exporter	55.79	59.05	64.67	66.82	66.83	69.52	69.95	67.17	66.64	68.76	70.26
Vietnam as the importer	74.47	77.48	81.37	85.57	83.77	86.37	85.54	87.49	87.98	87.85	85.52

4. Discussion and Conclusion

With the approach of using trade indicators currently being widely applied in international trade studies, this study has illustrated the existing trade relationship between Vietnam and Thailand during the period 2010 – 2020. First, the revealed comparative advantage index concludes that on average of 11 years, Vietnam has comparative advantages in exporting products belonging to SITC0 Food and live animals and SITC8 Miscellaneous manufactured articles while Thailand owns comparative advantages in SITC0, SITC2 Crude materials, inedible, except fuels, SITC6 Manufactured goods classified chiefly by material and SITC7 Machinery and transport equipment. However, each country has experienced such a different trend in comparative advantage. While Thailand has kept the stability in comparative advantage, Vietnam has witnessed the fluctuation over time, which is in line with the previous studies (Tran, 2017). Moreover, the overlap in comparative advantage between Vietnam and Thailand is low, only in section Food and live animals. Second, the export similarity index proposes that there is a fierce competition of products from Vietnam and Thailand to the US and even a more intense scenario when the two countries' export destination is the world as the whole market. Interestingly, the level of competition shows

no sign of easing recently. Third, the trade intensity index implies the importance and influence of Thai markets for Vietnam as the value of trade between Vietnam and Thailand is larger than expected on the basis of their importance in world trade. Finally, the trade complementarity index shows that Vietnam's trade structure is increasingly compatible with Thailand's trade structure, which is a promising premise of their trade expansion.

This paper's empirical results suggest that within bilateral trade, Vietnam and Thailand both play the role of each other's core export destinations, with a high degree of compatibility between the trade structures of the exporting country and the importing country, and therefore the prospect of trade expansion is promising. However, when the two Southeast Asia close neighbors export to a third market, which is the world market or the US market, there will certainly be fierce competition as Vietnam and Thailand share a highly similar export structure and have comparative advantage in some popular export products.

In conclusion, the present paper seeks to contribute to the international trade literature through an analysis based on four trade indices: the revealed comparative advantage index, the export similarity index, the trade intensity index and the trade complementarity index. However, the research approach is limited at providing trend impact analysis. This research needs to be developed and combined with quantitative methods such as the SMART (Single Market Partial Equilibrium Simulation Tool) Model and the CGE (Computable General Equilibrium) Model to show specific quantifiable impact results.

IMPACT OF FOREIGN DIRECT INVESTMENT ON EMPLOYMENT AND WAGE GAP BY GENDER IN VIETNAM

Doan Thi Kim Tuyen

dkimtuyen@gmail.com

Institute of World Economics and Politics (IWEPP)

Vietnam Academy of Social Sciences (VASS), Hanoi, Vietnam

Abstract

Foreign direct investment is one of the most important private financial flows that plays a key role in strengthening economic growth of a country. When economic development has reached a certain level, the quality of FDI inflows or the impact of FDI on sustainable development have attracted more attention from scholars and policy makers. Many recent studies show that FDI can support a country in achieving sustainable development goals, including gender equality. The study uses regression and decomposition methods to examine impact of FDI on the employment and wages of both male and female workers in the period 2008-2018 in Vietnam. Results show that FDI inflows play a positive role in creating jobs and improving workers' incomes in the country. Notably, women are the beneficiaries of this capital flow more than men. In addition, FDI inflows also contribute to reducing the gap in access to employment opportunities and wages between the sexes. Although this contribution is still relatively small, it tends to increase in recent years. Based on these results, the paper proposes some policy recommendations to reduce the gender gap in Vietnam's labor market through foreign direct investment in next time.

Key words: *FDI, gender, employment, wage, inequality*

1. Introduction

As international economic integration deepens, foreign direct investment (FDI) is considered to be one of the important drivers of economic development. Most studies show that FDI helps to supplement capital sources for countries, create jobs, break the vicious cycle of low savings - low income, and promote countries to join the global production network, etc. (Chaudhuri & Mukhopadhyay, 2014). In recent years, when economic development has reached a certain level, the quality of FDI inflows or the impact of FDI on sustainable development have attracted more attention from scholars and policy makers. Many studies have begun to examine the impact of FDI on narrower aspects of sustainable development such as environment, human resource development, innovation and gender equality.

Regarding the gender aspect, studies on the impact of international economic integration on women or gender effects of transnational companies, export processing zones or the effects of structural adjustment have been existing around for decades. However, there has not been a common theory or model used to explain the impact of FDI on the difference between men and women so far. Several studies have attempted to include gender dimensions

in production and income distribution in terms of the relationship between globalization and inequality or between FDI and the labor market. For example, research by UNCTAD (2014) has incorporated gender-related effects in the effects of FDI on the host country. Economic studies on the labor market by gender often emphasize supply-side determinants of employment and wages inequality, including gender differences in human capital (human capital theory). Meanwhile, a number of other studies approach the impact of FDI on gender inequality from theories on the impact of globalization on gender issues such as Heckscher-Ohlin's theory and Becker's theory of discriminatory (1957) (Niklas Potrafke & Heinrich W. Ursprung, 2012; Aguayo-Tellez, 2011).

Based on the above theories, a number of studies have proposed mechanisms through which FDI can influence the difference between men and women in the labor market such as Siegmann (2006), Chen et al. (2013) or Ouedraogo and Marlet (2017). Siegmann (2006) argues that FDI can affect the gender dimension of the labor market through three characteristics: export orientation, mobility and technological progress. Similarly, Chen et al. (2013) show that globalization in general and FDI in particular can affect gender inequality in the labor market in many ways: offers more employment opportunities for women; increases competitive pressure, thereby reducing gender discrimination in wages and employment; and other channels through which globalization can indirectly affect gender inequality in the labor market, such as economic growth, investment in girls' human capital, technology innovation and decisions in the household. On a broader scale, two authors Ouedraogo and Marlet (2017) mentioned four main channels through which FDI can affect gender issues, including: government revenue, the demand for female workers, technology spillovers to local partners as well as suppliers, and corporate social responsibility.

Regarding empirical studies, many publications on the impact of FDI on gender development and gender inequality have been published; however, the number of studies is quite limited. Most of these studies focus on female employment and gender pay gaps (Oostendorp, 2004; Siegmann, 2006; Rasekhi & Hoseinmardi, 2012; Chen et al, 2013; Helble & Takeda, 2020;) On a broader scale, some studies focus on the impact of FDI on women's economic and social rights (Eric Neumayer & Indra de Soysa, 2011) or on gender development (Ouedraogo and Marlet, 2017). More particularly, as follows:

At the global level, the publication of Oostendorp (2004) is one of the few studies that uses multinational data to assess the impact of globalization on gender and industry wage disparities. The study used survey data on wages in 83 ILO countries for the period 1983-1999 and used both the OLS method and the instrumental variable method for estimation. Research results show that the gender wage gap by occupation tends to decrease as the economy is growing, at least in richer countries, and tends to decrease with trade and FDI in rich countries, but no clear effect was found in poor countries. Research by Rasekhi & Hoseinmardi (2012) using panel regression with a sample of 21 developing countries from 2000 to 2007, shows that FDI inflows reduce gender wage gaps. However, the authors also warn that the gender pay gap could widen as some companies seek to benefit only from female workers, who have lower wages and weaker bargaining power.

At the country level, Siegmann (2006) uses both qualitative (focus group discussions) and quantitative methods (OLS regression and Oaxaca decomposition techniques) to assess the impact of FDI on the labor market by gender in rural Indonesia. Research results show that FDI positively affects employment of female workers in the agricultural sector, but negatively affects this group of workers in the manufacturing and hotel sectors. Chen et al. (2013) using China's 2004 national economic census data also found that foreign and export-oriented firms create more job opportunities for female workers and help to reduce gender pay gaps. Also studying China, Braunstein and Brenner (2007) examine the impact of FDI on the wages of women and men in urban areas at two different time points, 1995 and 2002. After controlling for individual, corporate and provincial characteristics, the study found that FDI benefits both men and women in provinces with higher levels of FDI in total investment. However, this changes over time. Specifically, in 1995, women received higher wages than men; but, in 2002, the gender wage advantage was reversed due to upgraded occupations and gender discrimination in employment.

Using household data from the Cambodia Socio-Economic Survey and FDI data from the Central Bank of Cambodia, Helble & Takeda (2020) applied the instrumental variable method to study the impact of FDI inflows on women's wages in relation to men's in manufacturing. The two authors use exogenous changes in FDI inflows into provinces related to spatial differences as a tool to determine the causal effect of FDI on labor market output. The results show that FDI increases wages and employment probability in the formal sector, both in the garment sector and in all other manufacturing sectors, but there is no evidence that FDI reduces the gender pay gap. One reason for the higher wages may be that foreign companies tend to be more productive than their domestic counterparts. Therefore, attracting FDI can help Cambodia increase overall productivity and promote growth. Sharma (2020) in her study used both household-level and plant-level data to estimate the impact of industry-level FDI inflows on employment, wages, and gender wage gap among unskilled and skilled female workers in India. In addition, the study also examines whether there are any "cultural transfers" or spillover of gender norms from more gender-equal countries through this FDI. The main finding of this study is that FDI contributes to job creation of unskilled female workers, but this capital inflow widens the gender wage gap. Furthermore, there is no firm evidence of cultural spillovers for highly skilled female workers.

With regard to Vietnam, research on the gender impact of FDI on employment and wages has been interested by some authors, but the number is very small. The study by Anh Pham et al. (2020) used data from the Household Survey and the annual new foreign investment (greenfield) data from UNCTAD to examine how the interaction between foreign direct investment and technology availability affects labor market outcomes for women in Vietnam. Research results show that FDI is associated with increased employment and wages in high-tech sectors. In sectors with weak technology, foreign investment is associated with fewer jobs and lower wages, especially for men. These results demonstrate the importance of absorptivity; that is, in order to really benefit from foreign investment, the domestic economy needs a good education system and technology background. The study also finds that the increase of foreign investment in high-tech

provinces leads to higher wage growth for men than for women; in other words, foreign investment can increase the gender wage gap.

Also taking Vietnam as a case study, Coniglio et al (2017) analyze the difference in employment and wages of female workers between domestic and foreign firms using an enterprise-level dataset of UNIDO and Industry Investor Survey in Vietnam. This study also examines the creation of employment opportunities for female workers at different levels in foreign enterprises. The results show that foreign enterprises tend to hire more female workers in low-skilled positions. In other words, FDI in developing countries contributes mainly to job creation for low-skilled women in labor-intensive and export-oriented manufacturing industries, with a relatively limited impact on demand for highly qualified labor.

Through the literature review of domestic and foreign works, it can be seen that the studies on the impact of FDI on gender inequality mainly use the gap in employment and wage as variables representing gender inequality. However, the number of studies is small and certain disadvantages exist. Therefore, this study will contribute more evidence on the impact of FDI on gender differences in employment and wages in a developing country with large FDI inflows like Vietnam by using the Oaxaca regression and decomposition method - Blinder (1973) - is a widely used method in analyzing the difference between the two groups, specifically in this study is the difference between males and females based on data set of household survey in Vietnam from 2008 to 2018. This has great significance in formulating or adjusting policies to attract FDI in the coming time because it is time for Vietnam to focus on the social and environmental impacts of FDI, not just pay attention to economic impact of this capital inflow.

2. Method

The study uses regression and decomposition methods to examine the direct and spillover effects of FDI on the employment and wages of male and female workers in Vietnam. First, based on the Mincer wage model and research by Sharma (2020), Helble and Takeda (2020), the article uses the following regression model:

$$Y_{i,p,t} = \alpha + \beta X_{i,p,t} + \gamma FDI_{p,t} + \theta(FDI_{p,t} * X_{i,p}) + \varepsilon_{i,p,t} \quad (1)$$

Where: Y is the wage of individual i in province p and in year t (years 2008, 2012, 2016, 2018); FDI is the variable representing foreign direct investment registered in each province in year t; X are the control variables representing the demographic characteristics of each individual (such as age, sex, education, marriage); and ε are the standard errors.

The Oaxaca-Blinders method was then used to examine whether foreign direct investment would help reduce gender wage disparities. Accordingly, the regression models for men and women are respectively:

$$Y_M = \alpha_M + X_M \beta_M + \gamma_M FDI_M + \varepsilon_M \quad (2)$$

$$Y_F = \alpha_F + X_F \beta_F + \gamma_F FDI_F + \varepsilon_F \quad (3)$$

The model to estimate the wage gap between men and women has the following form:

$$\begin{aligned} \Delta \hat{E}[Y] &= \hat{E}[Y_M] - \hat{E}[Y_F] = (\hat{\alpha}_M + \bar{X}_M \hat{\beta}_M + \overline{FDI}_M \hat{\gamma}_M) - (\hat{\alpha}_F + \bar{X}_F \hat{\beta}_F + \overline{FDI}_F \hat{\gamma}_F) \\ &= (\bar{X}_M - \bar{X}_F) \left(\frac{\hat{\beta}_M + \hat{\beta}_F}{2} \right) + (\hat{\beta}_M - \hat{\beta}_F) \left(\frac{\bar{X}_M + \bar{X}_F}{2} \right) + (\overline{FDI}_M - \overline{FDI}_F) \left(\frac{\hat{\gamma}_M + \hat{\gamma}_F}{2} \right) + (\hat{\gamma}_M - \hat{\gamma}_F) \left(\frac{\overline{FDI}_M + \overline{FDI}_F}{2} \right) + (\hat{\alpha}_M - \hat{\alpha}_F) \end{aligned}$$

Where: $\hat{\alpha}$, $\hat{\beta}$, and $\hat{\gamma}$ are estimates of the parameters in the model (2) and (3)
 \bar{X}_M , \bar{X}_F are the mean values of the explanatory variables for men and women, respectively.

Table 1. List of variables used in the model

	Name of variable	Meaning
1	<i>lnWage</i>	Logarithm of wages of members participating in the labor market
2	<i>Lnfdipercapita</i>	Logarithm of foreign direct investment per capita
3	<i>Age</i>	Age of members
4	<i>Marriage</i>	The member's marital status (= 1 currently married; = 0 other)
5	<i>Education</i>	The member's highest degree (=1 elementary school; =2 junior high school; = 3 high school; =8 college; = 9 university; = 10 masters; = 11 doctorate; = 12 others)
6	<i>Gender</i>	Gender of household member (=1 if member is male; =0 if member is female)
7	<i>Lnfdipercapita_Gender</i>	The interaction variable between the variable <i>Lnfdipercapita</i> and the variable <i>Gender</i>
8	<i>Lnfdipercapita_Age</i>	The interaction variable between the variable <i>Lnfdipercapita</i> and the variable <i>Age</i>
9	<i>Lnfdipercapita_Marriage</i>	The interaction variable between the variable <i>Lnfdipercapita</i> and the variable <i>Marriage</i>
10	<i>Lnfdipercapita_Education</i>	The interaction variable between the variable <i>Lnfdipercapita</i> and the variable <i>Education</i>

Based on the VHLSS dataset of 2008, 2012, 2016, 2018

To conduct research, the topic exploits two main data sources, which are: Household Living Standards Survey (VHLSS) in 2008, 2012, 2016 and 2018; and provincial FDI data from the Statistical Yearbooks of the respective years. The Household Living Standards Survey (VHLSS) is conducted by the General Statistics Office every two years to monitor the living standards of households and basic socio-economic conditions. The survey was conducted nationwide with a sample size of 9189 households in 2008 and 9399 households in 2012. The dataset provides complete demographic information of household members (such as age, gender, ethnicity, marital status) as well as information on employment, education, health care, income, spending, etc. In addition, the study also uses the data of foreign direct investment at the provincial level and the population of the provinces in the respective years from the Statistical Yearbook to calculate the data on FDI per capita in 63 provinces and cities across the country.

3. Results

Using probit regression model to consider the impact of FDI on employment, the study got the results as shown in the table below. Accordingly, the results show that most of the variables mentioned in the model are statistically significant and have certain effects on the employment status of individuals. Specifically, table 2 shows that FDI has a positive

effect on employment, but this effect is quite limited (a 1% increase in FDI per capita increases the probability of having a job by 0.0818). The variable *Education* has a positive coefficient, which means that the more qualified an individual is, the greater the probability of having a job. Similarly, the variable *Age* has a positive coefficient and is statistically significant, implying that the older an individual is (with more working experience), the greater the chance of getting a job.

Regarding the gender aspect, it is worth noting that FDI has a positive effect on both male and female workers, but the employment probability of women is higher than that of men. This proves the point stated above that foreign investment contributes to more employment opportunities for women (a 1% increase in FDI per capita increases the probability of women having more jobs 0.0774 compared to just 0.00467 for men). In addition, female workers with higher qualifications have more job opportunities than men, as shown by a positive and statistically significant coefficient of the variable *Education* for women.

Table 2. Probit regression results on the impact of FDI on employment

Employment (yes =1; no = 0)	Total	Male	Female
<i>Lnfdipercapita</i>	0.0818*** (0.0062)	0.00467*** (0.0075)	0.0774*** (0.0083)

Source: Author's calculation from VHLSS data for the years 2008, 2012, 2016, 2018

Note: **, *** are statistically significant at 5%, 1% levels, respectively.

Similar to the analysis above, the study conducts OLS regression to examine the impact of FDI on wages of both male and female employees. The regression results presented in Table 3 show that most of the coefficients are statistically significant and affect wages. The variable FDI has a positive coefficient for both men and women, implying that foreign investment contributes to the increase in average wages in general and the wages of both male and female workers in particular, but the increase in women's wages is higher than that of men (0.0746 versus 0.0668). Moreover, the wage is directly proportional to the education level of the workers, in which women with advanced degrees will receive a higher increase than men.

Table 3. OLS regression results on the impact of FDI on wages

Wage	Total	Male	Female
<i>Lnfdipercapita</i>	0.0697*** (0.0022)	0.0668*** (0.0029)	0.0746*** (0.0035)
<i>Gender</i>	0.2266*** (0.0097)

Note: *** is statistically significant at the 1% level.

Next, the estimation results from the Oaxaca-Blinder decomposition show the difference in wages between male and female workers over the years. The decomposition results show that the average wage of male workers is always higher than that of female workers during the whole study period but tends to decrease. Analyzing the detailed decomposition results, it can be seen that the E component contributes to reducing the difference between the sexes; while component C widens the wage gap between men and women.⁵ Among the factors that can be explained, the factor of education has the largest contribution to reducing the wage gap between the sexes; followed by the factor of foreign investment capital (in the period 2012-2018).

⁵ Factors causing this difference include: E (Endowment) is observable characteristics account for the difference; C (Coefficient) is the unobserved characteristics such as social prejudice on gender, stratification in the labor market, institutions and policies, discrimination,...; EC is the interaction component between the two components (due to the difference in both observable and unobserved characteristics).

Table 4. Wage disparity decomposition results between men and women, 2008-2018

Wage	2008	2012	2016	2018
Difference				
Male	9.6247***	8.0180***	8.3388***	8.5672***
Female	9.4576***	7.8263***	8.2088***	8.4108***
Gap	0.1671***	0.1917***	0.1299***	0.1564***
Decomposition				
E	-0.0175	-0.0483***	-0.0793***	-0.0772***
Lnfdipercapita	-0.0023	-0.0077***	-0.0082***	-0.0114***
Age	0.0384***	-0.0010	-0.0075***	-0.0050**
Marriage	-0.0015	-0.0042***	-0.0091***	-0.0054**

C	0.2154***	0.2478***	0.2145***	0.2269***
EC	-0.0307***	-0.0079	-0.0052	0.0066
Number of observations	4,790	7,181	7,792	8,453

Source: Author's calculation from VHLSS data for the years 2008, 2012, 2016, 2018

*Note: *, **, *** are statistically significant at the 10%, 5% and 1% levels, respectively.*

In general, the regression results show that FDI inflows play a positive role in creating jobs and improving workers' incomes in our country in the period 2008-2018. Notably, women are the beneficiaries of this capital flow more than men. In addition, FDI inflows also contribute to reducing the difference in access to employment opportunities and wages between the sexes. Although this contribution is still relatively small, it tends to increase in recent years. Another noteworthy point is that unobserved factors such as gender stereotypes, discrimination in the labor market, or policy institutions, etc. have a major impact on the gender gap in terms of employment and wage in Vietnam.

4. Discussion and Conclusion

Through analysis above, it can be concluded that FDI inflows contribute to job creation and income growth for workers across the country (especially female workers) in the period 2008-2018. However, the impact of this capital inflow is still very limited, reflected in the coefficient of impact of FDI on employment and wages (FDI per capita increase by 1% increases the probability of having a job by 0.0279 and wages increased by 0.0748%). This means that the number of jobs created from FDI inflows is very small.

Regarding indirect as well as spillover effects, it is difficult to accurately assess the number of jobs created in the economy according to the backward and forward linkage or vertical and horizontal linkages with the FDI sector, but the quantitative analysis shows that overall results are positive. This implies that FDI inflows create positive spillover effects in

creating job, but the effect is still limited. The first reason must be mentioned is that the capacity of domestic enterprises is still low. Most of the domestic enterprises are small, with low innovation capacity, and the workforce is not fully equipped with knowledge and skills in foreign languages, management, technology, etc. This limitation makes it difficult for domestic enterprises to meet the requirements of product quality, price as well as reliability. Although, the government has introduced many policies to support domestic enterprises from technological innovation, skills training to market development, helping them to join cooperation with FDI enterprises, but the programs, policies are overlapping and have not yet yielded clear results due to the lack of monitoring mechanisms and a comprehensive evaluation system (Ninh Thi Hoang Lan, 2019).

In addition to the issue of the quantity of jobs and wages, there are many other issues worth noting in creating decent jobs and reducing gender inequality such as issues of working conditions, social security, etc. In fact, in Vietnam today, the quality of workers is generally still low, although it is improving. The number of qualified and skilled workers or high-quality workers is far short of the demand. The proportion of workers without a degree or training certificate in FDI enterprises accounts for 80% of the total number of employees and this number has remained almost unchanged from 2011 to present (Dang Thi Ngoc Anh et al., 2020). Low qualification and skills make it more difficult for workers to implement new technology and grasp new knowledge. In addition, the behavior and labor discipline of a large part of employees is still weak, forcing FDI enterprises to take a long time to re-train before being officially recruited.

In the coming time, in order for FDI inflows to create more jobs and improve the living standard of workers, especially female workers, and at the same time contribute more to the goal of reducing gender inequality in the labor market, the study proposes the following recommendations:

Firstly, it is necessary to further promote the attraction of quality FDI projects to the provinces and cities but need to be managed in such a way as to obtain as many positive benefits as possible. Theoretical and empirical studies as well as practices in Vietnam have shown that foreign investment inflows play a certain role in promoting gender equality, not only as an important source of additional capital, but also in creating more jobs and improving living standards for workers, especially female workers. Therefore, attracting many quality FDI projects is a prerequisite for the country to be able to take advantage of foreign capital as well as the benefits generated from this capital towards achieving the desired goals in the socio-economic development of the country. Along with attracting FDI in terms of quantity, the government needs to manage and direct this capital flow into industries, sectors or localities so that it not only meets economic development goals but also ensures social and environmental goals at the same time. For example, setting up policies to attract FDI inflows to industries that need a lot of female workers or environmentally friendly industries with certain requirements will contribute to providing more jobs and a better working environment for women.

Secondly, the government needs to mainstream gender provision in strategies and policies, from education, health care, infrastructure development to trade and investment. These policies need to be approached in a coordinated and integrated manner to ensure the achievement of development goals relevant to women. Policies and mechanisms also need to be developed in the direction of encouraging employment to benefit female workers, contributing to promoting gender equality in the labor market. More specifically, the government can enhance opportunities for female workers in FDI enterprises through a number of policies such as: providing adequate, accessible and affordable infrastructure and social protection (transportation, education, health care, child care, maternity benefits, ...) to create favorable conditions for women; ensure that minimum labor standards and working conditions are consistent with ILO conventions and applied to all workers, in particular vulnerable workers; encourage companies to appoint a special inspector (or female inspector) to oversee gender equality issues in the workplace. In addition, as mentioned above, the export sector will affect gender equality in the labor market. Therefore, policymakers need to incorporate a gender perspective into strategies to negotiate with foreign investors or support export strategies.

Thirdly, strengthen training and enhance the quality of the female workforce regularly. The above quantitative analysis shows that the qualification of workers has a positive relationship with job opportunities, especially the probability of employment and wage growth is higher among educated women than men. Therefore, the Government should pay more attention to human resource development in general and women in particular; there are appropriate investment in training, skill improvement, human resource development and prepare for both quantity and quality of the next class. With good policies, foreign investment will be a strong catalyst providing more job opportunities as well as better employment conditions for workers. Currently, the development of technology and the knowledge economy, associated with an increasing dependence on automation, will help to blur the line between men and women, creating conditions for high qualified workers. Therefore, women who already have higher education will benefit from this trend. The increasing participation of women in science and technology industries is the basis for them to diversify their labor fields, exploit opportunities from industries that are usually dominated by men, and at the same time help them to better prepare for knowledge-intensive labor markets.

Finally, making use of corporate culture, social standards and labor laws to eliminate gender stereotypes and encouraging men to play a more active role in the family. When men participate more in household chores and share responsibilities, it helps to reduce the burden on women and promote gender equality. Although changing gender stereotypes as well as social notions about women is a long process, it is a goal that policy makers and governments need to pay attention to. In addition, promoting a working environment where women hold senior and managerial positions will also put pressure to change gender norms in the workplace and create models for the future female workers to follow./.

Abstract

In the context of economic integration and Global Value Chain participation, domestic supporting industry has played a crucial role for the Vietnam economy. Improving productivity of domestic supporting industry firms is in dire need to promote the supporting industry development. The paper is aiming at investigating the determinants of TFP of domestic supporting industry firms. There are three groups of the determinants as internal and external and firm characteristic factors. After estimating TFP ($\ln TFP$) of domestic supporting industry firms, a panel model of TFP and the determinants is run. The findings show that internal factor such as labor quality and capital intensity have opposite impacts on TFP. While FDI customers have helped the domestic firms increase the TFP, FDI competitors have negative impacts. Domestic demands have also negative impacts. Other findings on institutional environment factors and firm characteristic factors also provide further insights on domestic supporting industry firms.

Keywords: *FDI, institutional environment, supporting industry, TFP*

1. Introduction

Supporting industry (SI) is the industry that provides components, spare parts and inputs for the production of finished products. SI has played an important role in industrial development in particular and economic development in general, especially in the context of economic integration and promotion of participation in global value chains (GVC).

Given the importance of SI, the Government has issued policies to promote the development of SI. Some important policies of the Government can be mentioned such as the Strategy on Industrial Development of Vietnam to 2025, with a Vision to 2035 (Prime Minister, 2014); the Master plan on the development of SI to 2020, vision to 2030 (Ministry of Industry and Trade; 2014); Decree of the Prime Minister (Prime Minister, 2015) on the development of SI and the recent resolution of the Government on measures for SI development (Government of Vietnam, 2020). These policies have introduced many specific measures to support SI firms, which are expected to create a push to promote SI's development.

With the wave of foreign investment and support from the Government, Vietnam's SI has made its improvements. The number of SI firms has been constantly increasing. According to the Report of the Ministry of Industry and Trade based on the survey results in 2019 (MOIT, 2019), the majority of SI firms are located in the Southeast region and the Red River Delta with a ratio of 51% and 34% respectively. The number of SI firms in the mechanical industry accounted for a large proportion, over 60%; followed by a number of firms in the textile, leather and footwear industries (22%), electronics (10%). Domestic SI firms account for more than 70% of the total number of firms, in which most are small and medium firms. Currently, SI firms accounted for 4.5% of the total number of enterprises in the processing and manufacturing industry, creating jobs for about 600,000 employees, accounting for 8% of employees in the whole processing and manufacturing industry with their net revenue of more than 900,000 billion VND, contributing to 11% of the revenue of the whole industry. Some local SI firms have good capacity in such fields as manufacturing molds, components for motorbikes and bicycles; electrical cables, plastic components - technical rubber, tires. These products partly meet the market demand and exports. The development of SI firms also contributes to an increase in the localization rate of a number of products such as household electronics (30-35%), electronics for cars and motorbikes (40%); some types of cars such as trucks (55%), buses (40%) (Nguyễn Đình Quyết, 2021).

However, domestic SI firms still have many weaknesses. The majority of domestic SI firms are small and medium-sized (accounting for 88%), with low production capacity and efficiency, limited financial capacity, low technological level, and unsatisfactory human resources. Currently, there have been 2,000 firms producing spare parts and components, of which only about 300 enterprises can participate in the production network of multinational corporations. Therefore, although attracting many FDI firms, inputs, components for the final products producing FDI firms are mainly imported or supplied by FDI SI firms. The low localization rate is the weakness of Vietnam's SI. Specifically, the textile and garment sector has a localization rate of about 40%-45%, that of the leather and footwear sector is also only 40%-45%; in electronics, informatics, telecommunications; specialized electronics and high-tech industries, the localization rates are much lower at 15% and 5%, respectively (Nguyễn Văn Nhật, 2021).

It can be seen that domestic SI firms mainly produce simple components with low value, and only receive contracts from FDI SI firms. It means that the domestic SI firms have mostly participated in the second or third-tier suppliers for FDI exporting firms which are usually multinational companies and corporations (MNCs) (WB, 2017). Therefore, it is difficult for domestic supporting industry enterprises to receive technology spillover from MNCs.

Improving Total Factor Productivity (TFP) of domestic SI firms is in dire need, especially in the context of integration to promote Vietnam's participation in global value chains. It requires a deeper understanding of the determinants of the TFP of these firms.

SI is a multidisciplinary and relatively complex concept and has not yet been defined uniformly. In this study, we use the concept of SI as mentioned in Decision 9028/QĐ-BCT. Accordingly, supporting industries are divided into 7 sub-sectors, which are (1) Textile,

garment, and footwear supporting industry (Textile SI); (2) Plastic-rubber components (Plastic-rubber SI); (3) Fabricated metal mechanical components (Fabricated metal SI); (4) Electronic components (Electronic SI); (5) Electrical components (Electrical SI); (6) Machine-transportation components (Machine-transportation SI); (7) High-tech supporting industry (High-tech SI).

Currently, there have been a few studies on TFP and determinants of TFP of domestic SI firms, but there have been studies on factors affecting the development of SI firms, as well as studies on factors affecting TFP of enterprises in general. TFP is an important factor in promoting firms' development. Therefore, it can be seen that the factors affecting TFP are also the factors promoting the development of local SI firms. Some determinants of TFP of domestic SI firms are summarized as follows:

Market demand: according to Ohno (2007), market size plays a decisive role in the existence and development of SI, because SI firms must have a large enough amount of orders to participate in the market. Huyèn (2018) demonstrates the positive impact of market size on revenue growth of electronics SI.

Human resources quality: labor quality is confirmed to be an important factor affecting TFP of all firms (Newman, Rand, Talbot, & Tarp, 2015); (Moralles & Moreno, 2020); including SI firms (Ohno, 2007). SI firms use a lot of machines, requiring skilled workers to be able to effectively use the machine's capacity (Ohno, 2007). Therefore, due to the characteristics of SI firms as being small and medium-sized enterprises, the human factor plays an even more important role in improving firms' productivity. The skills and experience of workers have a positive influence on the development of SI firms in Bac Ninh province (Nhạn, 2019)).

Capital intensity: initial heavy investment is one of the requirements for many SI firms. The capital intensity measured by capital per worker also shows the firms' capacity and competitiveness (Ohno, 2007).

The link between domestic SI firms and FDI firms: Ohno (2007) pointed out that narrowing the information gap between the domestic SI firms and FDI customer firms would boost domestic SI development. FDI in the downstream market is one of the factors contributing to the development of domestic SI. Information is a factor also mentioned in many studies such as Huyèn (2018), Nhạn (2019). Besides, linkages with FDI firms also create spillover effects on TFP productivity of firms in general (Newman et al., 2015; Sari et al., 2016; Sur & Nandy, 2018).

Institutional environment: This factor includes a stable policy environment, preferential policies, and narrowing the gap in awareness and information between domestic SI suppliers and foreign enterprises. These are the factors that ensure comprehensive SI development (Ohno, 2007). Huyèn (2018) affirmed that policies and information systems are the factors that create a favorable business environment for SI firms in Vietnam's electronics industry. Information connection and tax policy are also confirmed to have a positive impact on the development of SI firms in Bac Ninh province (Nhạn, 2019).

In addition, other factors affecting the performance of enterprises in general and SI enterprises in particular should be mentioned such as firm size, firm age, geographical location of operation, typical feature of particular sub-sector.

In this study, the determinants are categorized into three groups such as internal, external and firms characteristic factors to get insights of TFP of domestic SI firms. Internal factors are labour quality and capital intensity; external determinants include FDI presence, market demand and institutional environment; and firms characteristic factors are firm size, geographical location of operation and typical feature of particular sub-sector.

2. Method

2.1. Method of TFP estimation

TFP derived from the Cobb-Douglas production function was initiated by Solow in 1957 and developed into many different schools. Solow (1957) with three assumptions about the production function: (i) economies of scale; (ii) capital and labor are exogenous and (iii) production is efficient, all firms are on the production frontier. With these three assumptions, TFP is the residual of the production process after accounting for the contribution of labor and capital inputs.

With the parametric approach, the Cobb-Douglas production function of the form CES (constant elasticity of substitution production function) is a production function with constant input substitution elasticity. The CES production function is a linear homogeneous function with constant input substitution elasticity. The CES function satisfies the condition (i) of Solow. To relax this condition, the transcendental logarithmic production function (translog function) developed since 1967 (Kmenta, 1967) has the advantage of more flexible assumptions. The translog function does not assume constant input substitution elasticity and converts from a linear relationship between output and input to a non-linear relationship. There are studies that estimate TFP growth from the transcendental logarithmic production function (Francis, Karalashvili, Maemir, & Meza, 2020); (Le, Nguyen, & Do, 2020). Canh & Phúc (2022) found out that the forecast results of Vietnam's GDP using the Translog function is more reliable results than the forecast using the Cobb-Douglas function.

Besides, realizing that inputs such as investment capital and raw materials are endogenous with TFP, Solow's hypothesis (ii) is violated, economists continue to develop semi-parametric methods to estimate quantity of TFP with two main representatives, Olley & Pakes (1996) and Levinsohn & Petrin (2003). Olley & Pakes (1996) developed a semi-parametric method to overcome the endogenous phenomenon of investment capital, while Levinsohn & Petrin (2003) overcame the endogenous phenomenon of input materials. Following this approach, Wooldridge (2009) proposed a method of using instrumental variables to estimate the coefficients of the production function. In these methods, past input decisions (for instance the choice to invest in capital) are used to proxy for the current production and use of inputs. However, lagged variables requires balanced panel data which is difficult to have in firms' data base from survey.

Therefore, in this paper, with the data availability, we use the translog production function to estimate TFP.

A Cobb-Douglas production function in the log-linear can be written as follows:

$$\ln VA_{it} = \beta_0 + \beta_1 \ln K_{it} + \beta_2 \ln L_{it} + \varepsilon_{ijt} \quad (1)$$

and for the case of the trans-log production function, we employ:

$$\ln VA_{it} = \beta_0 + \beta_1 \ln K_{it} + \beta_2 \ln L_{it} + \beta_3 (\ln K_{it})^2 + \beta_4 (\ln L_{it})^2 + \beta_5 (\ln K_{it})(\ln L_{it}) + \varepsilon_{it} \quad (2)$$

In which,

- VA_{it} is the value-added of the firm i of the subsector j in year t , and it is measured in millions of Vietnamese Dong (VND). VA is estimated by income method, in which VA of a firm consists of 4 components (i) labour income, (ii) firm profit, (iii) depreciation, and (iv) indirect taxes minus subsidies

- K_{it} is the net capital of the firm i in time t . It is measured in VND million and estimated by the fixed asset of the firm.

- L_{it} is labour, which is measured in person, representing the total employment in the firm i in year t .

- ε_{it} is an unanticipated shock or random error term, assuming to follow the normal distribution

In order to decide whether the translog form is better, F-test for joint significance of translog terms (all interaction and square terms) are conducted.

From the production functions, Firms' (logged) TFP is estimated as a sum of the constant and the residual:

$$\ln \widehat{TFP} = \widehat{\beta}_0 + \widehat{\varepsilon}_{it} \quad (3)$$

2.2. Determinants of TFP

The equation for TFP determinants can be as follows:

$$\ln TFP_{it} = \delta_0 + \delta Z_{it} + \omega_{it} \quad (4)$$

In which Z_{it} is a vector of determinants to TFP ($\ln TFP$), including:

- (1) Internal factors: Labor quality, capital intensive
- (2) External factors: FDI horizontal effect, FDI backward spillover effect, domestic market demand, business environment
- (3) Firm characteristic factors: firm geographic location, firm size, sub-sector of firm

Variable construct:

(1) Internal factors

Labor quality ($\ln Hum$) is proxied by the firm's labor cost per worker as proposed by (Le HQ, 2011). In the model, we use natural logarithm of labor cost per worker

Capital intensive ($\ln Cl$) is measured by natural logarithm of the value of fixed asset per worker

(2) External factors

FDI horizontal effect ($HFSpill$) is the horizontal spillover effects from FDI to domestic firms' productivity in the same market. It is calculated as follows:

$$HFSpill_{jt} = \frac{\sum_{i \in j} FSh_{it} * L_{it}}{\sum_{i \in j} L_{it}}$$

In which FSh_{it} is the foreign equity share of firm j at time t , j describes the sub-sector of supporting industry

FDI backward effect ($BFSpill$) measures the backward spillover effects of FDI firms in the upstream industries that are supplied by one industry. FDI backward effect is calculated as follows:

$$BFSpill_{jt} = \sum_k b_{kl} * HSpill_{jt}$$

$BFSpill_{jt}$ is FDI Spillover effect of sub-sector j captures the presence of FDI firms from other industries which have firms in j sub-sectors as their suppliers. b_{kl} is drawn from IO-tables showing the backward linkages of other sectors on sector j .

Domestic market demand ($BSpill_ratio$) describes the impact of backward linkages of all firms in other sectors which have firms in sector j as their suppliers. The variable is calculated as follows:

$$BSpill_ratio_{jt} = \frac{\sum_k b_{kl} * L_{jt}}{\sum_{i \in j} L_{it}}$$

For business environment variables, we have two variables. They are competition variable and informal (charges) variables. The two variables are taken from sub-indices of Provincial Competition Index (PCI). Competition variable (*competition*) is the policy bias sub-index and the Informal variable (*informal*) is the Informal charges sub-index

(3) *Firm characteristic factor variables:*

Region variable (*Region*) is a dummy variable, receiving nominal value from 1 to 6 corresponding 6 regions in Vietnam. They are 1 "Red River Delta" 2 "Northern Midlands and Mountainous" 3 "Central region" 4 "Central Highlands" 5 "South East" 6 "Mekong River Delta"

Size variable (*SIZE*) is also a dummy variable with nominal values from 1 to 4, corresponding micro-firms (with number of workers less than 10), small firms (with number of workers ranging from 10 to 100), medium firms (with number of workers ranging from 100 to 200) and large firms (with number of workers more than 200)

Firm sector (*supind*) is dummy variable with nominal values from 61 to 67, corresponding to 7 sub-sectors of supporting industry as followa

- (1) textile-leather
- (2) rubber-plastic
- (3) fabricated mental
- (4) electronics
- (5) electrics
- (6) machine-transportation component
- (7) hightech component

The foundation for identifying the seven subsectors can be found in Appendix 1

2.2. Data

Vietnam General Statistics Office (GSO) conducts the annual enterprises survey (VES) every year from 2000 which comprise key information of firms such as fixed assets, number of workers, labour wage, net turnover, firm ownership, and other firm's economic activities. In this study, we use panel data in 5 years from 2014 to 2018.

In order to estimate backward linkage effect, we use IO table 2016.

3. Results

3.1. Descriptive statistics

After cleaning data, we have sample of 60,812 observations of domestic supporting industry firms in five years, in which 11,560 observations in 2014; 15,981 observations in 2015; 5,967 observations in 2016; 12,161 observations in 2017 and 15,143 observations in 2018.

Majority domestic SI firms in the sample located in the Red River Delta (40%) and South East Region (40%). 95% firms are micro-small and small firms. Around 60% number of firms are in the sub-sector of fabricated metal, followed by rubber-plastic and textile-leather firms

Descriptive statistics of variables in the model are as follows:

Mean = average, SD = standard deviation

3.2. Production function

(1) Linear Cob-Douglas production function or Translog production function

Running the OLS regression for the equation (2), then conducting F-test for joint-significance of three variables $[(\ln K_{it})^2; (\ln L_{it})^2; (\ln K_{it})(\ln L_{it})]$, we have the result of the F-test as follows:

$$F(3, 60806) = 219.90$$

$$\text{Prob} > F = 0.0000$$

With that result, we can conclude that with the significance level of 1%, we can reject the null hypothesis that one of the three coefficients equals zero. Accordingly, the translog-production function is proved to be better.

(2) Fixed effect or Random effect for the production function

We have unbalance panel data from 2014 to 2018, to consider firm-specific observable component, we use Hausman test to select fixed effect or random effect model. The Hausman test is as follows:

```
//chi2(5) = (b-B)'[(V_b-V_B)^(-1)](b-B)
// = 475.62
// Prob>chi2 = 0.0000//
```

Therefore, we can reject the null hypothesis of the random effect model and select the fixed effect one.

(3) TFP estimation

Running fixed effect panel model (2) with robust standard errors, we get residuals and the constant-coefficient. Then LnTFP estimate for each firm is the sum of the firm’s residual from the production function and the constant-coefficient

3.3. TFP determinant model

In the equation (4), Z_{it} is a vector of determinants, including some variables of firm characteristics that are time-invariant. Therefore, we specify the random-effect panel model for equation (4) (rather than a fixed-effect model which takes into account time-invariant components). Running the random effect model with robust standard error for equation (4), we have the results are as follow:

Dependent variable: Ln(TFP)

Variable	Coefficient	Variable	Coefficient	Variable	Coefficient
lnHum	0.86*** (0.01)	62.supind	-0.25*** (0.07)	2.Region	0.01 (0.01)
lnCI	-0.01*** (0.00)	63.supind	-0.68** (0.31)	3.Region	-0.01 (0.01)
HFSpill	-0.23* (0.13)	64.supind	0.42*** (0.14)	4.Region	0.01 (0.03)
BFSpill	3.31** (1.38)	65.supind	-0.08 (0.27)	5.Region	0.05*** (0.01)
BSpill_ratio	-0.17*** (0.02)	66.supind	0.42* (0.25)	6.Region	0.12*** (0.01)
Informal	0.05*** (0.00)	67.supind	0.45 (0.45)	2.SIZE	0.10*** (0.00)
Competition	-0.01 (0.00)			3.SIZE	0.35*** (0.01)
				4.SIZE	0.49*** (0.02)
				Constant	-0.14 (0.27)

Standard errors in parentheses *** p<0.01, ** p<0.05, * p<0.1

The result shows that labor quality (LnHum) have significantly positive impact on TFP (LnTFP), whereas investment in capital per worker (LnCl) has negative impact. For impact of foreign firms, while the backward-spillovers are significantly positive, the horizontal impact (HFSpill) is negative. Domestic demand (BSpill_ratio) has negative impact as well.

For business environment variables, informal charges (informal) have helped domestic SI firm to improve their TFP, whereas policy bias (competition) is insignificant.

For firm characteristic variable of sub-sector, firms in sub-sectors of electronics (64) machine-transportation components (66) have higher TFP, while firms of rubber-plastic (62) and fabricated metal (63) have lower TFP than that of textile-garment firms. Firms in South East Region (5.Region) and Mekong River Delta (6.Region) have higher TFP than firms in Red River Delta Region. TFP of micro-firms is the lowest.

4. Discussion and Conclusion

As mentioned in the results, internal factors have significant impacts on TFP of domestic SI firms. Firms with higher quality workers would have higher TFP while capital intensity have negative impact. One main feature of SI is that investment in machinery plays important role, the results may lead to the fact that domestic SI firms have not efficiently invested in machinery. With majority of micro-small and small domestic SI firms, they face a lot of difficulty in financial access. Inefficiently using capital may make the problem even worse.

FDI Horizontal effects is negative, showing that FDI SI firms put competitive pressure on their domestic counterparts, making the latter less efficient. It may be explained by the fact that the FDI SI firms are more competitive than the domestic ones, receiving more contacts from FDI customer firms in downstream industries. The result is shared by other studies about the FDI horizontal spillovers on domestic firms in manufacturing (Huynh, Nguyen, Trieu, & Tran, 2021) as well as other industries (Ni, Spatareanu, Manole, Otsuki, & Yamada, 2017); (Thang, Pham, & Barnes, 2016). On the other hand, foreign presence in backward linkages has positive impacts on domestic SI firms. It can be interpreted that FDI firms in downstream industries have promoted the productivity of domestic SI firms. Positive backward effects are found in manufacturing sectors (Huynh, Nguyen, Trieu, & Tran, 2021) and some services like retails, wholesales sectors (Rahman & Inaba, 2021). Among foreign firms in downstream markets, those from Asia, especially Taiwan and China bring more benefits to domestic suppliers (Ni, Spatareanu, Manole, Otsuki, & Yamada, 2017).

Domestic market demand has negative impacts, showing that increasing demand for supporting industry products reduces the productivity of domestic SI firms. As mentioned in the literature review, market demand is crucial for the development of SI. However, in the case of Vietnam's domestic SI, domestic market demand even impose negative impacts. That elaborates the fact that the increased domestic demand is met by FDI SI firms or imported inputs. This conclusion is also consistent with the negative horizontal impact from FDI SI firms.

For business environment, positive impact of informal charges on TE shows that informal charges are really a "lubricant" cost that helps domestic SI firms to be more favorable in production and business.

Among 7 sub-sectors of SI, firms of electronics and machine–transport components have higher productivity than firms of other SI sub-sectors. According to Eurostat indicators on the High-tech industry and Knowledge-intensive services (High-tech aggregation by NACE Rev.2), electronics and machine–transport components are categorized as sub-sectors of high-technology level. With many FDI projects in electronics and transport vehicles and the positive backward spill-overs show that electronics and machine-transportation sub-sectors are those which have made the most use of FDI/

Although many domestic SI firms are located in the Red river delta region and the South East region which are the two economic centers of Vietnam, the results show that those in the South would have higher efficiency than those in the North. The findings trigger further study to learn more about the situation of SI firms in the two economic centers.

PROMOTE ECONOMIC COOPERATION WITH THE ASIA-PACIFIC REGION IN THE PROCESS OF VIETNAM'S ECONOMIC INTEGRATION

Dr. Ngo Tuan Anh

ngotuananh@neu.edu.vn

National Economics University, Hanoi, Vietnam

Abstract

The Asia-Pacific region has always been playing a particularly important role in the integration and development of Vietnam. A substantial number of Vietnam's main trading partners are mostly countries in this region. Therefore, promoting Vietnam's economic cooperation with countries in this region should be the first priority in the upcoming time. This study has assessed Vietnam's economic cooperation with countries in the Asia-Pacific region through multilateral and bilateral cooperation as well as cooperation through the signing and implementation of FTAs, thereby recommendations to boost Vietnam's economic cooperation with the Asia-Pacific region in the coming time are suggested .

Keywords: *Economic cooperation, Asia - Pacific region, Economic integration.*

1. Introduction

The Asia-Pacific region is a large area, with the country ending in the North being Mongolia, South is New Zealand, East is the islands of Oceania and West is Pakistan. Asia-Pacific is a region of strategic importance. Asia - Pacific currently includes 21 countries, which are: (Australia, Brunei, Cambodia, China, Hong Kong, Macau, Taiwan, East Timor, Fiji, Indonesia, Kiribati, Laos, Nepal, Russia, Japan. , Malaysia, Micronesia, Mongolia, Myanmar, Nauru, New Zealand, PalauPapua New Guinea, Philippines, Marshall Islands, Solomon Islands, Samoa, Singapore, Thailand, North Korea, South Korea, Tonga, Tuvalu, Vanuatu , Vietnam, American Samoa, Guam, Northern Mariana Islands). This area is well-known for its incredibly richness in natural resources, especially oil, which accounts for more than 65% of the world's reserves, and is opened for many of the world's arterial roads passing through. In addition to its physical vastness, the region exhibits historical, cultural and ethnic diversity as well as many stages of political development and economic development.

Geographically and politically speaking, Vietnam has always maintained an important position in the Asia-Pacific region, which is a leading strategic region in the world. Southeast Asia is located on the most important transportation routes, maritime routes, and is one of the busiest areas in Asia, a land of great potential and one of the most dynamic development areas in the world. Vietnam is located at the lifeline of the regional economy where there are strong and dynamic economies that are the growth engine of the region and the world. Furthermore, Vietnam is the main bridge connecting the two continental economies of Southeast Asia and Asia. It is the gateway to the sea of Laos, Northeast Cambodia and Thailand, and Southwest China. Vietnam has favorable conditions to strengthen connectivity, promote cooperation and development in the region. Vietnam's

geographical position has always been the gateway to the region, making our country an area of geopolitical competition, establishing, and expanding influence among major powers. In the current new context, Vietnam's values and strategic role are meaningful to major countries in implementing and realizing the strategies of major powers in the region. This strategic value is an advantage for Vietnam to promote its strengths and potentials, attract a lot of investment capital, and at the same time, it is also a challenge in the economic development of the country and in the pursuit of sustainable development and protect national sovereignty.

Nowadays, as a common voice among the developed countries is nowhere to be found in multilateral forums (WTO, APEC, etc.), the globalization process is facing many new challenges. Particularly speaking, in the Asia-Pacific region, the risk of instability and fierce competition among great powers is on another level of complication. Changes in policies of some major countries in the field of cooperation, international economic integration changed, protectionism and populism rose. The Covid-19 epidemic has also severely affected the economy of all countries, interrupting the global supply chain, requiring countries in the Asia-Pacific region to cooperate in putting an end to this global disease, promoting economic development. Today's main trading partners of Vietnam are mostly major powers located in the Asia-Pacific region (China, the United States, Russia, Japan, South Korea...). These countries are holding some unreplaceable positions in the economic development of Vietnam in recent years and will remain unchangeable in the upcoming time. Therefore, grasping the relationship and cooperating with these countries in order to promote the economy should never be out of Vietnam's league.

2. Results

2.1. The importance of the Asia-Pacific region to Vietnam's economy

2.1.1. The world's manufactory

As the mention above, With the geographical and economic advantages, it is inevitable that countries should consider investing capital in the Asia-Pacific region. Currently, Asia - Pacific accounts for about 61% of world GDP; 48% of international trade; over 48% of the world's foreign direct investment. For developed countries, especially the United States, manufacturing enterprises are always looking for a variety of options to minimize the cost for labor and equipment, in order to maximize profits. Therefore, countries in the Asia-Pacific region, especially Vietnam and China, have been an ideal place for large enterprises to build up the workshops and factories. The trend of shifting manufacturing industry from China to Vietnam is taking place more and more clearly. Since before the China-US trading war, in fact some manufacturing in China has moved to Vietnam. As early as 2010, Vietnam, based on its cost advantage, replaced China as the world's largest production base for Nike sports shoes. Samsung's manufacturing industry has been "rooted" in China for many years, but soon built many manufacturing plants in Vietnam. In 2018, Samsung closed factories in Shenzhen and Tianjin, (China); In 2019, Samsung closed its Huizhou electronics factory - the last one in China. So far, Samsung's manufacturing industry has completely withdrawn from China, moving to Southeast Asia and South Asia. The

production shift within Southeast Asian countries shows that the prospects of the manufacturing industry in this region are still very large.

2.1.2. Exploitation potential in the East Sea

In the Asia-Pacific region, the importance of the East Sea area is well-known in the economic development of bordering countries in particular and in the region in general. The East Sea area also has important straits for many countries and with 4 out of 16 strategic roads of the world located in Southeast Asia. These straits' names are Malacca, Luzon, Lombok, Sunda, Makascha and Ombai-Wetar. Thanks to its strategic location, the East Sea helps maintain import and export activities between countries in the region and around the world.

2.1.3. Gateway to international trade

The international shipping route through the East Sea is considered to be the second busiest in the world. There are, every day, about 300 transport ships of all kinds pass through the East Sea, including 200 oil tankers, 50% of these ships have a tonnage of over 5,000 tons, more than 10% are from 30,000 tons or more. The sea lanes in this region are "most" for the exchange of goods of many Asian countries with a trade value of about 5.3 trillion USD. According to statistics from the US Energy Agency, one third of crude oil and more than half of liquefied petroleum gas are transported through the South China Sea. The amount of oil and liquefied petroleum gas transported through this sea is 15 times greater than that transported through the Panama Canal in Central America. There are about 70% of the volume of imported oil and about 45% of the volume of Japan's exports are transported through the East Sea annually. China has 29/39 maritime routes and about 60% of import and export goods, 70% of imported oil are transported by sea through the South China Sea. Countries located in this region, represented by Vietnam, hold a lifeline position with a thriving and dynamic economy, being the growth engine of the region and the world. Vietnam is a bridge between two maritime economic zones and continental economies of Southeast Asia and Asia, with favorable conditions to strengthen connectivity, promote cooperation and development in the region. Additionally, Vietnam is located on the Trans-Asian Road route in the project to build a highway, connecting the countries of Eurasia and Asia, approved by the United Nations Economic and Social Commission for Asia and the Pacific (ESCAP) initiated. The contribution from this route in trade, transportation of goods and tourism between the two regions of Europe and Asia is known to be magnificent. With those advantages, the Asia-Pacific region increasingly attracts the attention and investment of many countries inside and outside the region.

2.2. Economic cooperation between Vietnam and the Asia-Pacific region through multilateral cooperation frameworks

2.2.1. Economic cooperation with the Asia-Pacific region through the framework of ASEAN, ASEAN+

ASEAN has long taken a central role in the Asia-Pacific regional architecture. It lies at the heart of the regional architecture and plays a leading role in many mechanisms. However, the structure of the Asia-Pacific region is changing in many ways. ASEAN is considered a launching pad to help Vietnam integrate into the regional and global playing

field. Therefore, Vietnam has already had a humongous number of chances to participated in many regional cooperation mechanisms, from ASEAN+ to regional free trade agreements (FTAs) in which ASEAN is the center... Up to this present day, Vietnam has built up many trade relations with most countries in the world, has a very large economic openness with an import-export turnover/GDP ratio of more than 200%. Vietnam has become a middle-income country for more than 10 years and the per capita income is nearly 3,000 USD. Additionally, Vietnam has always shown its activeness in promoting the joint cooperation mechanism.

Besides, Vietnam and ASEAN member countries also promote cooperation outside ASEAN with China, Japan, Korea, India, Australia, New Zealand. Along with continuing the implement and upgrade the FTAs signed with partners, Vietnam and its member countries negotiate and sign the Regional Comprehensive Economic Partnership (RCEP) - an agreement on economic cooperation, modern, comprehensive, high-quality, and mutually beneficial economy; establish an open trade and investment environment to facilitate the expansion of trade and investment in the region; contribute to enhancing ASEAN's role and contribution to global economic growth and development.

2.2.2. Economic cooperation with the Asia-Pacific region through the framework of APEC

APEC is a forum that brings together 15 out of 30 strategic partners, comprehensive partners and the leading economic and trade partners of Vietnam, accounting for more than 77% of trade and nearly 81% of direct investment and more than 85% tourism. Thirteen of the 16 Free Trade Agreements (FTAs) that we are implementing/ negotiating/ waiting for ratification are with APEC members. In which, 17 out of 20 APEC members are FTA partners of Vietnam. Joining APEC creates a premise for Vietnam to participate in larger and more committed playgrounds such as WTO and FTAs, including new generation FTAs with high standards. The implementation of international commitments is also a lever to realize the determination to build an incorruptible government, to create and act to serve people and businesses. As a developing member of APEC, Vietnam has proposed implementing and benefiting from technical assistance and capacity building programs. One of the three main pillars of APEC is economic and technical cooperation (ECOTECH), supporting developing economies to improve their capacity, economic reform, and regional integration, contributing to narrowing the gap between the development of the two countries.

2.2.3. Economic cooperation with the Asia-Pacific region through participation in regional FTAs

Facing the trend of international economic integration of the world and the region, as well as based on the need of integrating and developing the economy, Vietnam has actively promoted economic cooperation with countries around the world. many channels, many different fields, including the negotiation and participation in free trade agreements. This process begins with the process of joining international and regional organizations. Immediately after joining ASEAN, Vietnam also participated in the Common Effective Preferential Tariff Agreement (CEPT) to establish the ASEAN Free Trade Area (AFTA). As being one of an ASEAN members, Vietnam has in turn participated in the negotiation and signing of a Free Trade Agreement between ASEAN and its partners: China (ACFTA), Korea (AKFTA), Japan

(AJCEP), India (AIFTA), Australia and New Zealand (AANZFTA). Most recently, Vietnam and ASEAN members signed an FTA with Hong Kong (AHKFTA) in September 2017.

Currently, ASEAN and 6 partner countries: China, Japan, Korea, India, Australia, and New Zealand have signed the Regional Comprehensive Economic Partnership (RCEP) Agreement and will take effect on January 1, 2022, with a view to achieving a high-quality comprehensive agreement and contributing to deepening ASEAN's integration into the Asia-Pacific region. In addition to signing and participating in free trade agreements as an ASEAN member, Vietnam has gradually actively negotiated and signed FTAs as an independent party. The first free trade agreement that Vietnam negotiated and signed as an independent party was the Vietnam - Japan Economic Partnership Agreement (2008), followed by the Vietnam Free Trade Agreement. South – Chile (2011). In order to further promote the participation in FTAs, in August 2012, the Prime Minister issued a Decision to promulgate the Strategy on Participation in Free Trade Agreements until 2020, which clearly defines the views on negotiating FTAs is to "continue and actively participate in FTAs to integrate with countries in the region and the world, seize new opportunities for rapid and sustainable development".

Table 1. Regional and bilateral free trade agreements Vietnam has joined

Free Trade Agreements (FTAs) that Vietnam has joined			
No.	Abbreviations	Full name	Year of active
1	AFTA	ASEAN Free Trade Area	1993
2	ACFTA	ASEAN–China Free Trade Area	2003
3	AKFTA	ASEAN-Korea Free Trade Agreement	2007
4	AJCEP	ASEAN-Japan Comprehensive Economic Partnership	2008
5	VJEPA	Vietnam-Japan Economic Partnership Agreement	2009
6	AIFTA	ASEAN-India Free Trade Area	2010
7	AANZFTA	ASEAN-Australia-New Zealand Free Trade Area	2010
8	VCFTA	Vietnam-Chile Free Trade Agreement	2014
9	VKFTA	Vietnam-Korea Free Trade Agreement	2015
10	Vietnam-EAEU FTA	Vietnam-Eurasian Economic Union Free Trade Agreement	2016
11	CPTPP	Comprehensive and Progressive Agreement for Trans-Pacific Partnership	2018
12	AHKFTA	ASEAN – Hong Kong, China Free Trade Agreement	2019
13	EVFTA	EU-Vietnam Free Trade Agreement	2020
14	RCEP	Regional Comprehensive Economic Partnership	2022
15	Vietnam-EFTA FTA	Vietnam- European Free Trade Association Free Trade Agreement	Negotiating
16	VIFTA	Vietnam-Israel Free Trade Agreement	Negotiating

Source: Ministry of Industry and Trade (2022)

The participation of convention CPTPP is a stimulus for Vietnam to dev/improve the intrinsic value, diversify market (in order to/for the purpose of) compensating/coping with the impacts of the complicated world economy in which, currently following the direction of increasing commercial protectionism of major economies. Adapting the agreement, the growth of Vietnam's GDP in 2035 will be anticipated with 1,32%, in case of tariff reductions and service liberalization concurrency, there could be the upturn of 2,01% in GDP. With the commitments of CPTPP's participations, Vietnam's major export commodities: agricultural products, aquatic products, electricity and electronic should be tax-free after the agreement's legitimation. The total of Vietnam export values and imports values might grow up to 4,04% and 3,8% respectively with the sum of 20,000 and 26,000 employees in added-career.

The RCEP Agreement was signed by 10 ASEAN members and 5 ASEAN partner countries, namely China, Japan, South Korea, Australia and New Zealand on November 15, 2020, on the sidelines of the 37th ASEAN Summit. chaired by Vietnam. The Agreement will officially take effect 60 days after, at least, 6 ASEAN countries and 3 partner countries complete the ratification/approval of the Agreement and deposit with the ASEAN Secretary-General. As of November 2, 2021, 6 ASEAN countries (including Vietnam) and 4 partners: China, Japan, Australia, and New Zealand, have submitted their instruments of approval/ratification of the RCEP Agreement. country to the Secretary-General of ASEAN. Thus, the RCEP Agreement will officially take effect from January 1, 2022. The RCEP Agreement, when implemented by 15 members, will form a large market with 2.2 billion consumers, accounting for about 30% of the world's population, with GDP of 26.2 trillion USD, which constituted by 30 % of global GDP and will become the largest free trading area in the world. As such, ASEAN will have more accessibility of huge commodity trade markets in China, Japan, and Korea, far beyond from what ASEAN+1 FTAs have achieved. Additionally, the potential benefits of ASEAN are still at large, especially related to the field of e-commerce. Participation in FTAs is a great opportunity to promote Vietnam's economic growth as well as its position in the Asia-Pacific region, an essential link for Vietnam to integrate deeply into world economy.

The process of negotiating and signing FTAs is a part of Vietnam's current policy for opening and participating profoundly into the regional and world economy. Vietnam actively participates in and selectively negotiates FTAs to protect and promote the interests of the economy, ensuring FTAs have a higher and deeper level of integration than the WTO, in which the focus is on entering markets that have a complementary relationship in terms of imports and exports, limiting competition and exclusion each other. The country's enforcement capacity is the determining factor in what will be gained from the FTA. The development of resources and strengthening national competitiveness associate with FTAs to promote internal factors. FTAs are used not only as a tool to realize trade policy objectives, but also a mean of adjusting international market strategy and as a tool to implement the international competition strategy (in bilateral, regional and global levels) of the country.

2.3. Consideration on new international contexts that will affect Vietnam's economic integration in next period

Peace, cooperation, association, and development are still the major trends, but strategic competition among strong countries is complex and fierce; multipolar situation is becoming more notorious. Globalization and international integration are continuing to progress but faced many obstacles and challenges; the rise of protectionism and the threat of trading retaliation could negate severely the positive impact of fiscal policy initiatives on individual and world growth. As world economic growth and international trade, investment tend to decrease, global public debt increases, risks in financial markets and international currencies rise.

In the coming period, the trend of implementing application of assessment and technical barriers in trade are intended to protect trading and domestic manufacturing industries, with uncertainty in tendency of comprehensive adjustment of trade policy is expected; Trade in the direction of increasing trade protectionism of some major countries, especially the increased instability surrounding the US and EU's trade policies, will lead to negative effects on global trade growth. More and more countries are returning to the policy of promoting the production of industrial goods to replace imports, tightening regulations on localization rates and subsidizing export prices, and tighten trade barriers to protect goods and services, protect domestic productions.

The trend of increasing linkages and cooperation in production networks or regional/global value chains, with shifts in two main directions, namely: (i) Relocation of production chains and global supply to the member countries that have signed the FTA Agreement to take advantage of incentives, especially in tax and the removal of non-tariff technical barriers, along with the formation of multinational corporations of industrialized countries in developing countries in order to take advantage of and promote their comparative advantages in terms of labor and natural resources in each industry, leading to the displacement of production factors. Exports such as capital, labor and technology between regions, thereby forming and developing production, distribution and supply chains networks in the region; (ii) Ascended to higher value-added, in other words, it is the trend of adjusting the production structure from simple processing, preliminary processing, raw material supply to coordinate producing raw materials, participate in the processing and distribution of final products, thereby gain a solid position in the regional/global value chain.

The movement of shifting production out of China of the world's economies is boosted by the Covid-19 pandemic with three main scenarios: (i) Shifting production to domestic; (ii) Bring production activities to neighboring countries in the region (for example, the US brings production to Mexico, EU countries bring production to other countries in the alliance block); (iii) Continue to globalize production, but shift manufacture to countries other than China (such as ASEAN).

In summary, in the coming period, economic-trade association will continue to be the dominant trend, strongly promoted, devoted in the foundation for the development of the Asia-Pacific region. ASEAN continues to assert itself as an important unit, continues to be

enlisted by major countries to exert influence and be able to play as a central role, linking economies in the evolving regional structure. Economic cooperation in the Asia-Pacific region will continue to grow strongly, encouraging regional and global economic cooperation and connection. Vietnam and other economies in the region will continue to build a tranquil, stable, dynamic, creative, cohesive, and sustainable Asia-Pacific region.

3. Discussion and Conclusion

First of all, promote digital technology in commercial activities: The pandemic has also accelerated the shift to the digitization of trade, so member countries also need to make more efforts to take advantage of digital technology, to streamline customs procedures and electronic information exchange, simultaneously implement national and regional single-window mechanisms for document submission and clearance. Digitization and trade facilitation will make trade more sustainable and inclusive, leaving no one behind, especially for SMEs. The pandemic has highlighted the role of trade facilitation in ensuring the rapid delivery of medical and other essential goods. Trade facilitation has been known as an effective tool for mitigating negative impacts. It is also necessary to further develop digital infrastructure, accelerate digital transformation, strive to close the digital divide, and promote the development of a comprehensive digital economy. With the increase of digital competitiveness, digital risk management is also a matter of concern for countries. Digitization can add value, but only when applied in the right processes, at the right time, and in the right department of the organization, with special attention to cyber security to managing threats, which are foreseen to increase as more consumers and businesses adopt digital technology.

Second, focus on effectively exploiting international commitments, building mechanisms and policies for trade remedies, prevention, and settlement of international disputes; have appropriate policies to support areas with low competitiveness to rise; strengthen training, improve staff capacity, international law qualifications, build technical barriers, and take appropriate proactive defense measures. Continue to improve and expand the network of links and economic integration bilaterally and multilaterally with partners and organizations around the world, making Vietnam become the center of global economic linkages, in line with international standards, foreign policy of independence, self-reliance, peace, friendship, cooperation and development, diversification and multilateralization of foreign relations of the Party and State. Effectively implementing Directive No. 25-CT/TW, dated 8/8/2018, of the Secretariat, on "Strengthening and raising the level of multilateral the foreign relations to 2030" once again emphasized the need to "Continue to develop effectively mobilize and exploit its membership of the ASEAN Economic Community", "Promoting Vietnam's position in building the ASEAN Political-Security Community 2025, strengthening ASEAN's central role in the region". region and enhance the position and presence of the Community in the international arena". Closely combining multilateral cooperation and bilateral cooperation, while participating in ASEAN cooperation, we simultaneously promote bilateral cooperation relations between us and countries in ASEAN as well as ASEAN's partners, especially neighboring countries, and major countries. Currently, Vietnam has relatively fully signed up with the main trading partners in the region. However, with the United States, Vietnam has just signed a trade agreement. In the coming

period, if possible, Vietnam can negotiate to upgrade the above agreement. During the proposal process, it is necessary to strengthen coordination between ministries and branches in selecting fields and developing negotiation plans. Enhance opportunities for enterprises to participate in the process of developing plans and negotiating through a consultation mechanism between state management agencies and the business community.

Third, take full advantage of the Joint Statement on "Overcoming Covid-19 and Accelerating Economic Recovery" unanimously adopted by APEC Economic Leaders in July 2021 to quickly bring Vietnam to overcome the pandemic and move towards recovery and development of domestic production. Strengthen the implementation of macroeconomic policies, policies to support women, micro, small and medium enterprises, respond to climate change... to create jobs, improve economic productivity, and renovate the creativities, which contributes to facilitating the economic recovery process.

Fourth, the international trade policy needs to be planned in the direction of maximum support for export activities, this is because, in the past period, Vietnam's economy has grown and developed heavily based on export activities. We should choose the most beneficial products and markets to develop and expand international trade relations. Restructuring exports in the direction of reducing exports of raw materials, agricultural and aquatic products, increasing the proportion of industrial goods, especially manufactured goods such as electronics, telecommunications, construction materials, and furniture. ... Focus on developing the market for products with great competitiveness, high added value, or product groups with a large proportion of turnover. Exploiting market-opening opportunities from international economic integration commitments to boost exports and major markets such as the United States, Japan, China, Korea, ASEAN...

Fifth, on the side of businesses: Vietnamese businesses need to be better prepared for the changing dynamics of the industry and consumer demand to bring greater added value to brands that establish new supply chains in the area. This requires a greater focus on innovation that enhances agility and productivity while meeting the changing needs of Asia Pacific. Businesses need to take advantage of the opportunity provided by Covid-19 to redesign legacy systems and build innovative new solutions that enable stronger growth. While businesses need to foster an innovation agenda, government support will also be crucial in building a stronger innovation ecosystem by strengthening infrastructure and improving support policies to promote the cooperation of related members.

Abstract

Seafood is one of Vietnam's leading export products, and the European Union (EU) is one of the five most important markets. The successful signing of the EU-Vietnam Free Trade Agreement (EVFTA) has opened up many opportunities for Vietnamese seafood in this market, along with difficulties, notably illegal, unreported and unregulated fishing (IUU) yellow card, and food safety and hygiene regulations. Hence, this research aims to clarify the situation of Vietnamese seafood in the EU market and offer solutions to mentioned difficulties. This is a qualitative secondary research, based on data, information and figures provided by official sites and previous researches in order to reach further conclusions. Predictions about the market trends were involved, emphasizing the outstanding challenges and opportunities in the seafood industry, which leads to recommendations for four main targets: removing IUU yellow card, ensuring food safety standards, encouraging green business strategy and products promotion.

Keyword: *European Union (EU), Vietnam seafood export,, Illegal unreported and unregulated fishing activities (IUU), Sanitary and Phytosanitary Measures (SPS).*

1. Introduction

In recent years, trade liberalization has been developing strongly in the world. The quick advancement in worldwide trade contributes to economic development and welfare advantage in all members, particularly the developing countries. However, the disparity of distribution of the profit from global trade in different countries could lead to tensions in international trade. It could prompt protectionism policies to maximize trade benefits at the cost of loss in trade partners. Although, in theory, the WTO only recognizes tariffs as the

only legal protection tool, the reality has proven that governments are constantly using new non-tariff measures. The appearance of environmental standards and sanitary and phytosanitary requirements in trade agreements is partly due to the relationship between trade and the environment. The clause paved the path for future trade agreements to include commitments and requirements on environmental issues. Up to the present time, the world's trade and environmental issues focus mainly on technological aspects, sanitary and phytosanitary measures, tariffs, and primarily technical elements.

There have been studies on the export status of agricultural products of different countries and the technical barriers imposed on products from these countries. In the same year of 1998, Calvin and Krissoff investigated the role of TBs in the highly contentious U.S.-Japanese apple trade dispute, and James and Anderson chose to research Australia's prohibition on banana imports. With the same issue of agricultural product import and export, Weyerbrock and Xia studied the case of the US/Europe and the SPS and technical barriers applied in these markets. For the recent research, Yao et al. (2021) evaluated the impact and coping strategy of technical obstacles on China's exports from different types of technical barriers in different industries and countries. Vietnam has also conducted several studies on this issue, including Thu and Phuong's (2014) detailed research about the sanitary and phytosanitary measures and technical barriers to trade that Vietnam's essential commodities face in some Asian countries and two studies by Nguyen and Hoa et al. (2012) on the technical barriers applied by Japan to Vietnam's seafood products and the current situation of Vietnam's seafood exports. The listed studies all have in common that they all focus on critical national commodities and assess technical barriers and sanitary and phytosanitary requirements for these commodities. Some of the above articles also mention why importing countries apply non-tariff measures on imported goods and then explain the necessity of such policies. However, until now, studies have not deeply assessed the regulations applied to export products, the impacts, and solutions to overcome these regulations. This article analyzes the current situation of Vietnam's seafood exports to EU countries, challenges, and recommendations to remove barriers imposed by these countries. Aside from the literature review on the relationship between trade and the environment and non-tariff barriers, the content of the article will focus on four main groups, including the current status of Vietnam's seafood exports to the EU, Regulations on food safety and environment of EU in seafood import hygiene and food safety, Challenges for Vietnam's seafood export industry facing with EU regulations and Solutions recommended for Vietnam.

2. Method

This study includes an overview of Vietnam's seafood exports to the world markets in general and the EU market in particular, through which there can be a correlation, comparison, and difference between markets. Other markets and the EU market. This study focuses on the EU market, so other aspects of this market are also analyzed. The method used in the research process is the method of analysis and synthesis. The authors have made every effort to look at different aspects, going from the general context to each problem, from which it is possible to draw correct conclusions and reasonable solutions—small sections into a complete study, ensuring the connection between the sections.

3. Result

3.1. Current status of Vietnam's seafood exports to the EU

For many years, the European Union (EU) has always been known as one of Vietnam's leading seafood export markets. In 2016, the total export turnover of Vietnamese seafood to the EU reached 1.16 million USD and until 2019, it reached 1.29 million USD (VASEP, 2020). The growth of Vietnam's seafood export turnover to the EU from 2016 to 2019 is shown in the following graph

Figure 1. Total seafood exports of Vietnam to the EU (Million USD)

Source: MOIT, 2020

On August 1, 2020, the Vietnam - European Union Free Trade Agreement (EVFTA) officially took effect, which is expected to create a breakthrough opportunity for Vietnam's seafood exports to the market (Tuan & Trang, 2020). Thanks to a series of commitments on preferential tariffs, the EU has made Vietnamese seafood more competitive in price than similar products in neighboring countries. FDI attraction is expected to increase, production technology and product quality are focused on improving to meet EU standards; The business and institutional environment is ensured in a more stable and transparent direction because the legal system has also been adjusted and supplemented with regulations to be consistent with the signed FTA. In the first six months of 2021 alone, Vietnam's seafood was exported to 25/27 EU markets with a total export volume of 104.3 thousand tons, worth \$485.3 million, up 16% in volume (MOIT, 2021), which is 20% higher than the same period last year. Export turnover to the EU market accounted for 11.8% of the total seafood export turnover of the country. The largest export markets in this market block are the Netherlands, Germany, Italy, Belgium, and France. This is a relatively positive result, especially in the context that the global economy was severely affected by the Covid-19 pandemic, freight rates increased to record highs while exporting Vietnamese seafood. Vietnam's seafood exports to the EU have faced many difficulties, including food safety standards and import tariffs (Duijn, Beukers, & Pijl, 2012).

3.2. Regulations on food safety and environment of EU in seafood import hygiene and food safety

Regardless of the E.C. Europe and the Council of Ministers. Finally, the new regulation is published in the official European Union journal and influential. The scientific research and assessment of Food Safety threats are increasingly guiding the creation of novel measures in Food Safety and Hygiene. Before drafting a legislative proposal, the European Commission usually requests that the European Food Safety Authority conduct a risk study. The General Food Law is based on the framework of European food regulation. It stipulates that all food sold in the European Union must be hygienic. Other E.U. food regulation is built on these principles, which constitute a horizontal framework. The new legislation on importing new food goods in general, fisheries or agricultural commodities in particular, is mirrored in four E.U. legal systems, with the dominating law, law 178/2002/E.C., and four supplementary laws, including 852/2004/E.C., 853/2004/E.C., 882/2004/E.C., and 854/2004/E.C (VASEP, 2013).

a. Regulation 882/2004/EC: Official Control Procedures

Control procedures to guarantee that food and feed regulation is followed. Developing countries that export food to the E.U. must disclose details on how their national food inspection systems are organized and administered and ensure legal conformity. Food additive requirements (Directives 89/107/EEC and 95/2/EC); Labeling requirements (Directive 2000/13/E.C.); Animal health standards for goods of animal origin imported from foreign countries (Directive 2002/99/E.C.); Maximum permitted residue levels (Regulation 396/2005/E.C.; Regulation 2377/90/E.C.; Regulation 2073/2005, as revised by Regulation 1022/2008/E.C.; Directive 96/22/EEC and Directive 97/98/EEC); Chemical residue control programs for aquaculture (Directive 96/22/E.C. and Directive 96/23/E.C.) (E.C, 2004).

b. Regulation 852/2004/EC: Regulation of general hygiene requirements for all food business establishments

Update food hygiene standards to provide a consistent and comprehensive policy covering all farm food to the customer's point of sale. It excludes topics such as nutrition, food components, and food quality. Community or similar hygienic standards will prepare food imported into the Community. Animal-derived foods exported outside the Community must at the very least meet the rules that would apply if they were sold in the Community, as well as any additional restrictions that may be imposed. The importing country has placed an order. Basic food hygiene requirements include basic production requirements, technical requirements, HACCP standards for food handling and processing, registration/licensing for establishments that manufacture food, and national guidelines for good practice. Regulation (E.C.) 852/2004 specifies requirements based on the HACCP standard but does not mandate its application to primary production; however, the mandatory HACCP standard applies to packers in the case of a recall. Ho Chi Minh City meets the fundamental standards for food safety and hygiene under E.U. laws for processing, registration, inspection, and trade. HACCP for pre-processing, processing, and packing (852/2004/E.C.) – optional for pre-processing (E.C, 2004)

c. Regulation 853/2005/EC: Specifies additional requirements specific to establishments that process food of animal origin, including raw bivalve mollusks and aquatic products

Animal-derived foods specified in this regulation may pose microbiological and chemical risks. These rules go hand in hand with Regulation 852/2004 on food hygiene, essentially concerned with operator approval. This regulation applies to unprocessed and processed animal-derived goods, except foods containing a component of plant-derived products (E.C, 2005).

d. Regulation 854/2004/EC: Regulations for the control of food of animal origin by authorities

Specific rules for organizing official controls on products of animal origin were intended for human consumption. Sets specific requirements to organize official control of products of animal origin for human consumption. Regulatory organization for products of animal origin intended for human consumption. The Community of establishments and importers is under control and set forth this regulation. The competent authorities approve establishments that comply with the Community Official Control for Feed and Food regulations.

Food business operators must provide the competent authority with all necessary assistance in implementing controls, particularly regarding access to the establishment and presentation of documents or files. Formal controls include testing good hygiene practices and HACCP principles and are region-specific (fresh meat, bivalve mollusks, fishery products, dairy, and other milk products) (E.C, 2004).

3.3. Challenges for Vietnam's seafood export industry facing with EU regulations

3.3.1. Illegal, Unreported, and Unregulated (IUU) Fishing

In October 2017, Vietnam's seafood industry was issued a yellow card by the European Commission (E.C.) IUU for illegal fishing practices IUU. In order to remove the E.C.'s IUU yellow card, in 2017, the Fisheries Law was born, along with a series of different efforts based on the E.C.'s request to remove the IUU yellow card. Many provinces and cities simultaneously deployed synchronous solutions, focusing on implementing four recommendations of the E.C., including that Vietnam's sea fishing fleet does not meet standards, ensuring conditions for participating in exploitation: At seas, such as the mismatch between the size of the ship and the actual resources at sea; The system of inspection and supervision of fishing activities at sea for fishing vessels is too lacking and inefficient; Lack of a system to confirm the origin of seafood caught at sea, leading to the fact that most of the seafood caught by fishermen is of unknown origin; There is also a situation where Vietnamese fishers exploit and steal seafood in the waters of other countries.

3.3.2. Food hygiene

In recent years, Vietnam's seafood export industry faced problems with those regulations, especially the antibiotic residues in seafood products. The E.U. has been a challenging market for Vietnam's exporting seafood because of its stringent SPS standards. E.U. rules and regulations prohibit the use of ten antibiotics in the seafood sector (zero

residues is permitted) and set maximum residual limits (MRL) for the use of ten other antibiotics. Some of these antibiotics impair human health and poison the environment. As a result, food imported into the E.U. must be rigorously inspected for antibiotic or chemical residues (under E.U. regulation No. 96/23). The use of food additives in food and seafood processing is likewise restricted in the E.U. (Truong, 2006).

The E.U. has warned about antibiotic residues in seafood products in Vietnam various times in recent years. According to the Department of Agriculture, Forestry and Fisheries Quality Management, on May 13, 2016, the General Department of Health and Food Safety, the European Commission issued a circular Areas 2253381 sent to the Department to notify the Vietnamese side that it has not been able to overcome the abuse of antibiotic chemicals in aquatic products effectively. The E.U. has announced that Vietnamese seafood processing facilities will be removed from the list of seafood processing facilities allowed to import into this market if the shipment of seafood is exported. This school is warned of banning antibiotic chemicals specified in Annex 2, E.U. regulation No. In addition, on May 24, 2016, the E.U. competent authority issued a warning document No. 16-814 to E.U. member countries about the unusual death of fish in Vietnam and suggested that the countries strictly control the batches of fish. In October 2019, several shipments of frozen pangasius fillets with added water from Vietnam were found to have higher chlorate levels and were placed on the RASFF rapid alert. 6353/BCT-AM dated October 12, 2021, on warning of residues of harmful substances in some agricultural and aquatic products of Vietnam exported to the E.U. market, Health authorities of E.U. countries detected undeclared Sulphites for export shipments of crustaceans and seafood of Minh Chau Import and Export Seafood Processing Co., Ltd. They banned the substance Profenofos in seafood shipments of SAKA SAKA Co., Ltd.

3.4. Solutions of Vietnam

3.4.1. Solution against Illegal, Unreported and Unregulated (IUU) Fishing

In order to overcome IUU's "yellow card", several solutions have been practiced. After more than two years of efforts to implement measures to remove the E.C.'s yellow card, Vietnam has completed the legal framework, including Law on Fisheries 2017; 2 Decrees, 1 Decision of the Prime Minister; 8 Circulars of the Ministry of Agriculture and Rural Development guiding the Law on Fisheries... Along with that, the Vietnam Association of Seafood Exporters and Producers (VASEP) has established the IUU Executive Board, in collaboration with 28 provinces, coastal cities, businesses, and fishermen join hands with the State agency to overcome the IUU yellow card in the shortest time, proceed to implement a long-term program against IUU fishing, maintain the reputation and market for seafood products for export of Vietnam. Up to now, there have been 62 enterprises participating in the program "Seafood enterprises committed to combating IUU fishing" with the commitments: Only purchase seafood raw materials from legally fishing vessels with export origin. Clear origin, import only caught seafood with the

legal fishing origin; resolutely do not buy seafood from fishing vessels that illegally catch, exploit without permits, do not log and do not report according to regulations, fishing with prohibited fishing gear; say no to rare seafood species, catches of smaller sizes than regulated. Especially, on March 11, 2021. The strategy for the development of Vietnam's fisheries by 2030 with a vision towards 2045 No. 339/QD-TTg was approved by the Prime Minister, which provides specific strategies to improve and develop Vietnam's seafood industry in different fields. VASEP has also released the "White Book on Efforts against IUU Fishing in Vietnam" and produced tens of thousands of leaflets to propagate to fishermen, captains, and businesses about IUU fishing (Giang, 2021)

3.4.2. Solutions against food hygiene problems

In order to avoid the E.U. Competent Authority gradually eliminating enterprises on the list of allowed exports to this market, the Agro-Forestry-Fisheries Quality Management Department has issued Official Dispatch No. 1041/QLCL-CL1 dated May 30, 2016, sent to seafood processing enterprises alternatively, producing in the E.U. and relevant units to implement necessary control measures for antibiotic chemicals fully. In order to avoid being taken off the list of E.U. exports to this area, seafood processing facilities need to take samples for inspection before exporting to the E.U. proactively. Up to now, there have been more legal efforts to prevent the abuse of antibiotics in seafood exports, including Official Letter No. 952/QLCL-CL1 on developing MRPL regulations for antibiotic chemicals. In fisheries, Official Dispatch No. 966/QLCL-CL1 dated May 30, 2019, on VASEP's action plan on antibiotic chemicals until 2020

4. Discussion and Conclusion

4.1. Discussion

With the successful signing of the EVFTA, the export of seafood to the EU market will have many advantages and prospects in the future. However, due to the complicated development of the COVID-19 situation, seafood exports will still face difficulties due to the affected supply chains. Hence, the growth and recovery of the economy in general and the seafood industry, in particular, will not be as expected. In addition, it can be expected that the consumption habits of the EU market will experience some changes during the pandemic. Therefore, if Vietnamese exported seafood is expected to meet the requirements of the EU market, Vietnam needs to pay more attention to food safety and hygiene as well as sustainability. Along with success in signing the EVFTA, the IUU yellow card has not been removed, and that is the greatest obstacle in promoting consumption in the EU market. If the situation is not controlled, Vietnamese seafood will be banned from import into the EU market. There are remaining difficulties: lack of knowledge about IUU of fishers and enterprises, lack of cooperation between the Government and local authorities, and technology is not fully equipped and applied in inspecting and controlling ships. In addition, within the EU, Vietnamese seafood is still relying on large markets, such as the Netherlands, Germany, Italy, etc.

4.2. Recommendations

The Vietnamese government needs to take stricter measures to remove the IUU yellow card. The Stations and the Information and Monitoring System need to be upgraded and operated 24 hours daily. It is necessary to ensure that monitoring equipment is fully installed on fishing vessels, storing information on the system, and sharing data agencies between localities. Functional forces such as the Navy, Coast Guard, Inspectors, etc., need to link and coordinate in inspecting and reviewing violating fishing vessels, reporting and storing information promptly to issue sanctions.

Local authorities need to propagate and guide fishers about legal fishing. There should be direct working sessions with anglers, raising self-discipline, self-monitoring, raising awareness about the importance of the safe fishery, and analyzing the harmful sides of illegal fishing. Next, it is necessary to guide and help anglers use cruise monitoring devices and sanctions when intentionally disconnecting the device.

Businesses need to be aware of the importance of combating IUU. Resolutely do not buy products of unknown origin, do not cooperate with illegal fishing vessels, terminate contracts, and report to local authorities if violations are detected.

Food safety issues need to be ensured. According to law, appropriate authorities need to actively inspect aquaculture processing and aquaculture enterprises and adequately handle any violations. It is necessary to disseminate to businesses to understand the EU's food safety and hygiene regulations in all stages. Companies should have seminars to discuss business difficulties and share experiences to avoid violations of food safety and hygiene.

encourages businesses to follow green business strategies. Accordingly, the state needs to organize training sessions to propagate the benefits of this strategy, have supporting policies for enterprises that apply green business strategies, and listen to the difficulties and barriers of enterprises in using green technology to production. Businesses also need to update with the trend of the green industry and improve the competitiveness of products in the international market.

4.3. Conclusion

Vietnamese exported seafood in the EU market face both opportunities and challenges. It can be seen that exported turnover in this market has had significant increases in recent years, contributing a high proportion to Vietnamese exported seafood in all markets. The pandemic has been controlled, consequently, activities such as fishing and manufacturing will be assured to recover and develop. Furthermore, the most considerable opportunity is the successful signing of EVFTA which removes tariffs and reduces non-tariff barriers. On the contrary, combating IUU yellow card of Vietnam has made little progress. The Vietnamese Government should put more effort and apply tougher measures to this problem. In addition, Vietnam should focus more on assuring the products qualified for EU food safety regulations. It is undeniable that the EU market is a notably potential market which opens up more opportunities for Vietnamese exported seafood.

Ho Chi Minh City, Vietnam*

Abstract

The paper is to examine the impact of economic growth and financial development on carbon dioxide (CO₂) emissions in Vietnam. As one of the world's largest energy consumers and CO₂ emitters, Vietnam is currently facing the dual challenge of reducing CO₂ emissions while continuing to drive economic growth. To overcome this problem, comprehensive economic, financial and energy policy reforms are needed to promote sustainable development. The objective of this paper is to examine the economic growth and financial development behaviors for CO₂ emissions in Vietnam with quarter from 2000 to 2020. Research and application of Johansen cointegration test and Vector Error Correction Model (VECM) to investigate long-run and short-run equilibrium causal relationships between the three variables. Financial development and economic growth have a statistically significant impact on CO₂ emissions.

Keywords: *financial development; carbon dioxide emissions; economic growth; VECM.*

1. Introduction

Environmental pollution is becoming more and more serious with the development of the global economy. In particular, the greenhouse effect caused by carbon dioxide (CO₂) has become one of the most concerned environmental problems in the world. The greenhouse effect has become an extremely serious threat to human existence and sustainable socio-economic development. The globally supplied energy is still growing to support the global economy, but the world is also facing the challenge of reducing greenhouse gas emissions. The International Energy Agency (IEA) predicts that by 2030, the world's energy demand will increase by about 60% compared to 2000 and the increase in energy demand in developing countries will make These countries account for most of the increase in CO₂ emissions. According to the analysis, developing countries will account for about 85% of the increase in CO₂ emissions between 2000 and 2030. Accelerating greenhouse gas emission reductions remains an important human task to deal with warming, climate change and promote sustainable use of resources. A series of negotiations and commitments to limit global warming through global cooperation such as the International Climate Convention initiated in 1990; Kyoto Protocol (2005); Bali Route (2007); The Copenhagen Agreement (2009) and the Paris Agreement (2015).

To achieve sustainable development, we must consider the relationship between economic activities and environmental quality. Much research has been done on the relationship between economic growth, financial market development, and carbon dioxide emissions. There are three research directions: the first focuses on the relationship between economic growth and carbon dioxide emissions; the second section focuses on the relationship between the development of financial markets and carbon dioxide emissions; the third part puts the three variables under the same framework to study its dynamic causality. However, although many scholars have conducted numerous studies over the past 30 years, the relationship between the three factors has not been consistently concluded.

This study selected Vietnam is motivated by the fact that Vietnam is already a large emitter and one of the developing economies, the level of development of the financial market is still limited. In fact, the level of environmental pollution in Vietnam has increased significantly due to high energy consumption for activities aimed at economic growth over the past decades. High CO₂ emissions into the environment have been recorded to increase by an average of 15% per year over the past decades. Air pollution is mainly caused by civil industries, construction works, industrial activities, means of transport, and the main source of pollution comes from high construction density, rapid urbanization and high production capacity. industrial production as well as craft and service villages. The important feature is that these socio-economic activities make the greatest contribution to the growth of industrial zones, economic restructuring, labor restructuring and job creation, the factors that promote growth. general for the whole country. In addition, the need to improve agricultural productivity and output requires increased use of pesticides, fertilizers and growth stimulants. However, efficiency in the application of agricultural inputs may be related to economic growth outcomes. In some places, they can be reflected in the trade-off between job creation and rapid growth on the one hand and environmental degradation on the other. Therefore, the rapid increase in CO₂ emissions is mainly the result of human activities due to development and industrialization. It also relies heavily on energy consumption, which is inevitable for economic growth. Therefore, Vietnam is a subject to study the interaction relationship between financial development, carbon dioxide emissions and economic growth, which has important policy implications for Vietnam in reducing carbon dioxide emissions.

This study is carried out with the structure as follows: Section 1 explains the objectives of the study. Section 2 discusses previous studies related to the relationship between economic growth, financial development and carbon dioxide (CO₂) emissions. Section 3 introduces the data collection and research model, especially the VECM model. Subsequently, the results and discussions are proposed in Section 4, and finally, Section 5 is for conclusions.

2. Literature Review

Current research on the relationship between carbon emissions and economic growth mainly includes linear relationships (Iwata et al, 2011; Li & Leung, 2012), N-curve relationships (Friedl & Getzner, 2003) and shape-curve relationships. inverted U (Grossman

& Krueger, 1995). Although most scholars favor an inverted U-curve relationship (Selden & Song, 1994; Holtz-Eakin & Selden, 2006; Galeotti et al, 2006), specifically the environmental Kuznets curve (EKC), the findings of Robalino-López et al (2014) and Baek (2015) show that the inverted U-shaped curve does not stay the same, while Moomaw and Unruh (1997), Martinez - Zarzoso & Bengochea-Morancho (2004) find that there is an N-type relationship between economic growth and CO₂ emissions. The per capita income corresponding to the inflection point of the EKC curve varies widely, ranging from \$13,260 to \$80,000. and linear. Some scholars (Shafik & Bandyopadhyay, 1992; Wagner, 2008) find that per capita carbon dioxide emissions increase monotonically with real income per capita, and there is no inflection point. However, Lantz & Feng (2006) found that there was no significant relationship between GDP per capita and carbon dioxide emissions. There is no consensus on the relationship between carbon emissions and economic development (Hamit-Hagggar, 2012). Lin and Jiang (2009) used a traditional environmental Kuznets model to simulate and predict the Kuznets curve of carbon dioxide in China on the basis of carbon dioxide emission predictions, and found that the results were quite different. together. The difference in the above literature conclusions is mainly due to the significant difference between the study area and the choice of experimental method (Coondoo & Dinda, 2002). Henisz (2000) pointed out that it is more reasonable to discuss the relationship between them from a causal perspective than the EKC hypothesis. Since then, an increasing number of scholars have chosen to use the causality test to explore the feedback mechanism on the interaction between economic growth and carbon dioxide emissions.

Ang (2007) examined the association between variables in France for the period 1960–2000 by co-integration analysis and error correction model (VECM). The results show that economic growth and carbon dioxide emissions have a U-shaped relationship in the long run, and that economic growth contributes to an increase in energy consumption, while an increase in energy consumption leads to an increase in energy consumption. increase in carbon dioxide emissions. Soytas & Sari (2003) used the co-integration and VECM methodology in Turkey and the results indicated that a one-way causal relationship exists from CO₂ emissions to GDP and that energy consumption increases emissions. positive effect on economic growth. Tao and Song (2010) measured the dynamic relationship between carbon dioxide emissions, energy consumption, gross national income per capita and trade openness in China using sample data of 1971. -2008 in China. The results show that there is a long-run equilibrium relationship between them, while there exists a Granger causality relationship in the long run and the short run. Arouri et al (2012) investigated the relationship between economic growth, energy consumption and carbon dioxide emissions in 12 Middle Eastern and North African countries in the framework of panel and co-integrated unit tests. As a result, there is a bidirectional causal relationship between energy consumption and carbon dioxide in the long run. Chandran - Govindaraju and Tang (2013) applied Granger causality approach in China and India, the results showed a long-run relationship between the variables in China but not in India. Cowan et al (2014) studied the relationship between economic growth and carbon dioxide emissions in the BRICS from 1990 to 2010 in the framework of a panel causal analysis. Asongu et al (2016) investigated

the causal relationship between carbon dioxide emissions, energy consumption and GDP and there is a strong causal relationship between these variables.

In recent years, with the deepening of the development of finance, more and more scholars have paid attention to the relationship between financial development and economic growth (Gurley & Shaw, 1955; Lucas, 1972). In the modern economy, finance is the lifeblood and accelerator of the economy, it embodies the basic characteristics of energy consumption from multiple paths, thus conserving energy and reducing emissions. On the one hand, financial development will increase energy consumption. As the scale of development finance continues to expand and the efficiency of development finance continues to increase, consumers and businesses can obtain loans at a lower cost and in a more convenient way. Sadorsky (2010) studied the impact of financial development on CO₂ emissions in 22 new economies from 1990 to 2006 based on the generalized timing method (GMM). Empirical results show that when financial development is measured by stock market indices, there is a significant positive relationship between financial development and CO₂ emissions. Sadorsky (2011) applied a similar approach to study nine economies along Europe's east-central border, and found that when using banking indices to measure financial development, the relationship between financial development and CO₂ emissions is remarkably positive. On the other hand, financial development will reduce CO₂ emissions. Financial development encourages enterprises to introduce high technology and equipment to save energy and protect the environment, financial support to develop high-tech industries that use a lot of knowledge and technology. Thus, financial development can reduce energy consumption and reduce CO₂ emissions. Tamazian et al (2009) found that financial development and economic growth can have an impact on environmental quality, contribute to reducing carbon dioxide emissions, and play a positive role in improving environmental quality. Tamazian & Rao (2010) studied the relationship between financial development and environmental pollution in 24 countries in transition based on the generalized timing method (GMM) for endogenous control. They believe that foreign investment found to measure financial development helps reduce per capita carbon dioxide emissions. Furthermore, in addition to combining financial development with economic growth, energy consumption and carbon dioxide research, the researchers also added variables such as foreign direct investment (FDI), open trade and urbanization. Farhani and Ozturk (2015) empirically examined the linkages between CO₂ emissions, economic growth, energy consumption, financial development, commercial openness and urbanization in Tunisia between 1971-2012 using the ARDL-ECM method. Furthermore, they find that financial development has a positive and significant impact on environmental pollution. A monotonous positive relationship was also found between GDP and CO₂ emissions.

3. Method

3.1. Data

This study includes three variables: financial development (financial market index), economic growth (proxied by gross domestic product per capita) and environmental pollution (proxied by CO₂ emissions). The requirement of the Vector Error Correction

Model (VECM) is the need for an effective number of observations to perform the estimation. The scope of this study is the impact of financial development and economic growth on environmental pollution in the case of Vietnam, with quarter data collected from 2000 to 2020. More specifically, gross domestic product, financial market development index, and Vietnam's CO2 emissions calculated from the World Bank's World Development Indicators. LNEP is taken as the logarithm of CO2 emissions respectively.

Table 1. Data Sources and Description

Variables	Variables Description	Units of Measurement	Data Sources	ExpectFd Relationship
FMI	Financial development	Index	World Bank	Negative
GDP	Economic growth	%	World Bank	Negative
EP	Environmental pollution	Logarithm	World Bank	

Source: Sumarized by authors

3.2. Empirical Model

VECM Model Forming:

$$y_t - y_{t-1} = (A_1 + A_2 + \dots + A_p - I) y_{t-1} - (A_2 + \dots + A_p) (y_{t-1} - y_{t-2}) - (A_3 + \dots + A_p) (y_{t-2} - y_{t-3}) - \dots - A_p (y_{t-p+1} - y_{t-p}) + u_t$$

$$\Delta y_t = \Pi y_{t-1} + C_1 \Delta y_{t-1} + C_2 \Delta y_{t-2} + \dots + C_{p-1} \Delta y_{t-p+1} + u_t$$

$$\text{Whereas: } \Pi = -(I - A_1 - A_2 - \dots - A_p); C_i = -\sum_{j=i+1}^p A_j, i = 1, 2, \dots, p-1$$

The model contains Πy_{t-1} is the correct part of errors in ECM

If y_t and k are cointegration then Π has form:

$$\Pi = \alpha \times \beta$$

$$(k \times r) \quad (r \times k)$$

$$\text{Then: } \Delta y_t = \alpha \beta y_{t-1} + C_1 \Delta y_{t-1} + C_2 \Delta y_{t-2} + \dots + C_{p-1} \Delta y_{t-p+1} + u_t$$

Set $EC_{t-1} = \beta y_{t-1}$: non-stop series combos in y_t to become a stationary series and EC_{t-1} is the redundancy of those combinations. And EC_{t-1} indicates an imbalance in period $t-1$, then α indicates the correction coefficient of Δy_t when an imbalance occurs.

4. Results

4.1. The tests of model

Unit root test

Table 1 presents the unit root test of our selected variables to check the stationary for variables. With the significance level $\alpha = 0.05\%$ in the unit root test results, author all accept the H_0 hypothesis about the existence of a unit solution that is EP, FMI, GDP do not stop at the difference $d = 0$. Applying Dickey - Fuller and Phillips-Perron unit root test method to test stationarity for EP, FMI, GDP in the difference level of 2. Researchers all reject the H_0 hypothesis about the existence of a unit solution due to the significance level $\alpha = 0.05\%$ of the root test, which means EP, FMI, GDP stop at the difference level of 2. Thus, the data series have stopped at the same degree of difference.

Table 1. Unit Root Tests

Variables	Unit Root at Level I(0)	Unit Root at Level I(2)
Augmented Dickey-Fuller test statistic - t-Statistic (P - Value)		
EP	-2.166 (0.220)	18.727 (0.000)***
FMI	-1.796 (0.379)	-13.386 (0.000)***
GDP	-2.645 (0.088)	-15.010 (0.000)***
Phillips–Perron test statistic (P - Value)		
EP	12.872 (0.000)***	
FMI	5.286 (0.000)***	
GDP	11.655 (0.000)***	

Notes: With significance level $\alpha = 0.05$, if null hypothesis is accepted, the time series is not stationary, if null hypothesis is rejected, the time series is stationary. Then applying the Augmented Dickey-Fuller and Phillips–Perron unit root test methods to test the stationarity for the data series: EP, FMI, GDP respectively.

, **, * refer to level of significance of 10%, 5%, and 1% respectively.*

Source: Analyzed by authors

Co-intergration Test

The Engle – Granger test (1987) shows that EP, FMI, GDP all stop at the level of 2: I(2). Then using Johansen test to check if EP, FMI, GDP have co-intergration or not.

Table 2. Co-intergration Test

Hypothesized	Trace	0.05		
No. of CE(s)	Eigenvalue	Statistic	Critical Value	Prob.**
None *	0.934	286.625	29.797	0.000
At most 1	0.481	79.279	15.494	0.000
At most 2	0.320	29.374	3.841	0.435

Trace test indicates 2 cointegrating eqn(s) at the 0.05 level

Source: Regression's result

The results obtained from Trace test show that EP, FMI, GDP have cointegration, at the significance level $\alpha = 0.05$, when $k = 0$ (None), p -value = $0.000 < \alpha$ should reject the hypothesis $H_0: r = 0$ (non cointegration between variables), when $k = 2$ (At most 2), p -value = $0.435 > \alpha$ should accept the hypothesis $H_0: r \leq 2$.

The stability test of the model

The AR Root Test is applied to test the stability of the VECM model by considering whether the test or the individual values are less than 1 or are in the unit circle, the VECM model achieves stability. The estimation show that the solutions with solutions are all less than 1 or are in the unit circle, so the VECM model is stable.

Figure 1. The stability test of the model

Source: Regression's result

Thus, the tests show that the stationary chains are at the same level of difference, the test of cointegration has 2 cointegration, this ensures that the VECM model selection is reasonable. With 2 appropriate latency selected and the VECM model is guaranteed to be stable which is suitable for regression. From there, the author conducted analysis of variance decomposition and impulse response functions as the basis for the conclusions.

4.2. Research Results

After testing the VECM model, the results of the VECM regression model are obtained as follows:

EP, FMI, GDP do not stop at I (0) and have co-intergration. The cointegration equation shows a long-term relationships between variables in the form:

$$u = - EP + 0.0006FMI - 0.036GDP - 0.0005$$

$$EP = - 0.0005 + 0.0006FMI - 0.036GDP - u$$

The combination of nonstationary sequences into one stationary sequence, and ECT_{t-1} is the residual in that association. $ECT_{t-1} = \alpha$ indicates imbalance in period $t-1$, α is the correction coefficient when imbalance occurs in the short term.

Table 3. VECM Regression Results

Vector Error Correction Estimates			
	Cointegrating Eq:		CointEq1
	DEP(-1)	1.000000	
	DFMI(-1)	0.0006	
	DGDP(-1)	-0.036	
	C	-0.0005	
Error Correction:	D(DEP)	D(DFMI)	D(DGDP)
CointEq1	-2.110	-96.539	41.692

Source: Regression's result

ECT-1 = -2.110 shows that if there is an imbalance in the previous period by 1 unit, the dependent variable will adjust in the same direction with the equilibrium of 2.110% in the first period.

Impulse Response Function

Variance decomposition functions and impulse response functions will be performed to examine the causal relationship between the factors of financial market development, economic growth and environmental pollution. These functions help to analyze the direct and indirect effects of the shock of one factor on the other factors. This allows us to fully appreciate their dynamic linkage.

Economic growth volatility shocks lead to a negative response to environmental pollution, which has a positive impact and especially strongly affects environmental pollution in the long run. This is explained by the fact that Vietnam is a developing country, when the economy grows rapidly, it means more economic activities, more energy consumption and increased CO2 emissions, leading to an increase in environmental pollution.

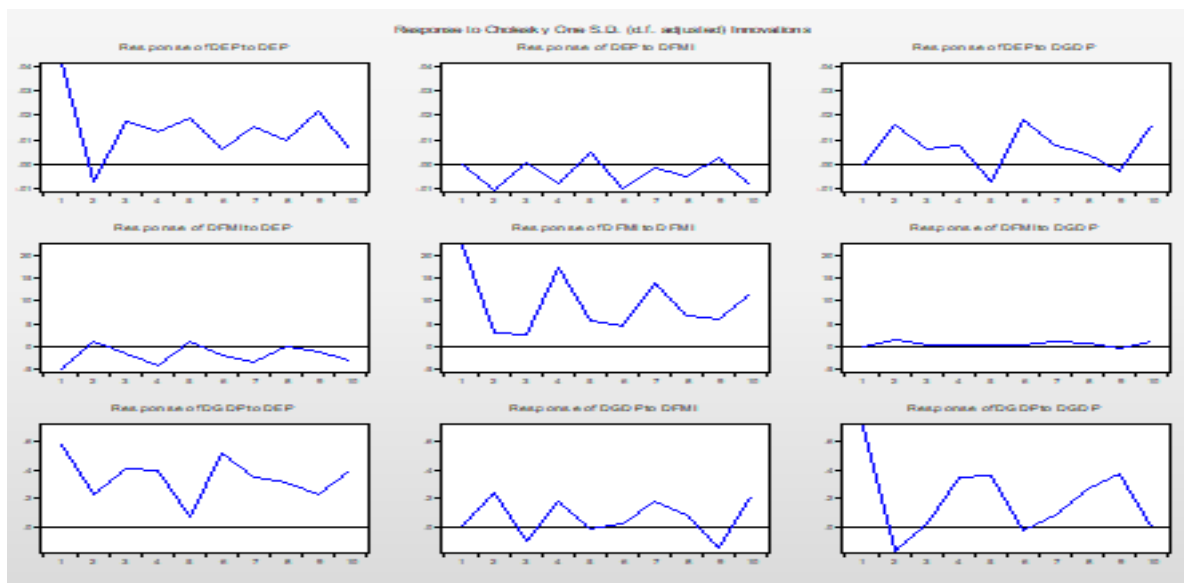

Figure 2. Impulse Response Function of EP, FMI, GDP

Source: Regression's result

EP's reaction continuously reversed when there were FMI shocks right from the first period. The development process of the financial market will help businesses effectively use resources in production and business, innovate and improve technology to help limit the generation of CO2 emissions. environmental pollution. Therefore, when the financial market develops, it will help improve environmental pollution in Vietnam.

Variance Decomposition

Table 4. Variance Decomposition of EP, FMI, GDP

Variance Decomposition of EP:				
Period	S.E.	EP	FMI	GDP
1	0.040962	100.0000	0.000000	0.000000
2	0.045828	82.52993	5.137650	12.33242
3	0.049359	83.38591	4.435310	12.17878
4	0.052191	81.07233	6.090501	12.83717
5	0.056255	81.33523	5.948059	12.71671
6	0.060411	71.61599	8.060379	20.32363
7	0.062736	72.21349	7.565913	20.22060
8	0.063824	72.15624	7.931279	19.91248
9	0.067556	74.81981	7.208103	17.97208
10	0.070200	70.03663	8.228582	21.73478

Source: Regression's result

The variance decomposition of error when forecasting variables in the VECM model aims to separate the contribution of other time series as well as the time series itself in the variance of the forecast error. The results of the variance decomposition are consistent with the results of the impulse response function and more importantly, determine the importance of the factors, the level of financial market development, economic growth for environmental pollution. field of practice in the country. The forecast error in the EP due to the volatility of the development of the financial market is about more than 8%, but it is maintained over the next and extended periods after that, showing no signs of fading. Although, the degree of influence of the development of the financial market on environmental pollution is not too much, because Vietnam has a low developed financial market, this response direction has not been clearly seen. However, the results of the study are consistent with the actual situation and previous experimental studies. As financial markets develop, more advanced production techniques are applied to improve environmental pollution.

On the other hand, the degree of influence of economic growth on environmental pollution is quite clear. When economic growth fluctuates by 1%, the forecast error in environmental pollution is over 20%. This result is consistent with the actual situation and previous experimental studies. For developing countries like Vietnam, when the economy grows, production and business activities increase, leading to the use of a lot of energy and CO2 emissions, causing environmental pollution.

5. Discussion and Conclusion

This study investigates the impact of financial market developments and economic growth on CO₂ emissions in Vietnam over the period 2000–2020. The experimental results show that there is a long-term cointegration relationship between the three variables. Impulse response function and variance decomposition show that financial development will reduce CO₂ emissions and reduce environmental pollution. Economic growth can increase CO₂ emissions due to high energy consumption in production, leading to increased environmental pollution. These results have several policy implications for Vietnam. First, we should steadily promote financial innovation, low-carbon finance and the green energy business. It is necessary to raise the level of development of the financial market, strengthen supervision and guidance of the capital market system, improve information disclosure and other related systems in the capital market, and actively promote the role of financial markets. of the stock market in promoting green energy. Energy consumption in Vietnam is exacerbating carbon dioxide emissions as the energy consumption structure is still dominated by high-carbon energy such as coal. Therefore, the government should optimize the energy structure, increase energy efficiency and implement sustainable energy development in Vietnam.

Faculty of Economics - National Economics University, Ha Noi, Vietnam

Abstract

2021 is considered a year of great difficulties and challenges for the world economy in general, including Vietnam. The world economy is forecasted to have the most severe recession in history. The growth of major economies all are deeply decreased due to the negative impact of the Covid-19 epidemic. In addition to the growth achieved in 2021, the Vietnamese economy still has many problems that need to be resolved. With great expansion and deepening international integration, all fluctuations in the world economy have an impact on the socio-economic sectors of our country. Although Covid-19 is still under control in Viet Nam, there are complex developments in the world. The activities of production, commercial supply and circulation, aviation, tourism, labor, and employment are suspended and interrupted. Besides, exports have grown but not yet ensured sustainability, labor productivity remains low... Therefore, our country still needs to focus on implementing the double goal of "both effectively preventing epidemics and taking full advantage of opportunities to strive for socio-economic recovery and development in a new normal state" while exploiting the full potentials and advantages to bring the economy to the highest growth level in 2022. In this article, the author refers to economic growth and the economic achievements in 2021. Through that, it is possible to know the opportunities as well as challenges that the economy will face in 2022.

Keywords: *Growth, opportunities, challenges, Covid-19*

1. Introduction

“Economic growth is a sustained increase in output per capita,” Simon Kuznet (1966). Classical economists used two indicators: gross national product (GNP) and gross domestic product (GDP) to measure the growth rate of an economy. There are many factors affecting the economic growth of the country, but the overall achievement includes the following basic factors:

- *Human resources: Many economists considered human resources or human capital to be the most important factor in economic growth. According to Schultz (1961), human capital includes physical condition, education level, skills, experience, sense of organization and labor discipline. It can be seen that "human resources are the resources of all resources". Therefore, people with good health, intelligence, high skills, motivation, enthusiasm, and good organization are the basic factors of economic growth.*

- *Investment capital: Investment capital is one of the important factors in the production process.* Investment capital includes private investment, government investment and foreign investment. The whole society's investment capital is not only machinery and equipment used for production, but also the amount of investment capital to develop the general interests of the whole society. It is the amount of capital invested in the development of the national infrastructure, which is largely funded by the government. In addition, foreign investment also plays an important role.

- *Technological progress: Technological progress promotes growth because it contributes to increasing labor productivity, improving capital efficiency, saving labor and capital on products, so that for the same amount of cost, more products are created, and it opens up new industries and products.* Nowadays, the development momentum of technology, especially information technology, biotechnology, new material technology... has rapidly increased productivity.

Export: Export can have an impact on economic growth directly because it is a component of the total product or indirectly through its influence on growth's factors. Export increases demand in the economy. Export orientation and trade openness improve the process of resource reallocation, increasing the capacity of using resources and competitiveness of the country. Export increases domestic investment as well as attract foreign investment. Export promotes technological change and improves human resources, thereby increasing productivity and ultimately creating more job opportunities and increasing income.

- *Natural resources: Despite the progress of science and technology, it is constantly developing and being applied extensively in production.* However, many natural resources still play a decisive role in the production of national and industry products (agriculture, mining, etc.). The practice demonstrates that a country with rich and diverse natural resources, also rich in reserves and quality, will have many advantages in attracting FDI and vice versa.

2. Method

The article researches the current situation of production and consumption of some agricultural products along the value chain in order to contribute to sustainable economic development in Vietnam following the integration trend. The article also evaluates the advantages and disadvantages to find solutions for sustainable development.

This paper uses the methodology of dialectical and historical materialism; Using the main research methods in economics including methods of statistics, analysis, synthesis, expert, data analysis and processing...

The paper also collects data related to it from secondary documents such as textbooks, books, reports on socio-economic development, and Vietnam in particular, etc.

The essay uses the method of synthesizing and analyzing information, documents, reports of competent agencies, Ministries and branches on issues related to the research field.

3. Results

3.1. Vietnam's Economic Achievement in 2021

2021 was the first year of implementing 5-year Socio-economic Development Plan 2021-2025, our country is making efforts to accomplish the goals set out in the plan. But the Covid-19 continues to have complicated developments, causing negative effects on economic activities, in which import, and export are seriously affected. These fluctuations and difficulties have made countries tend to use domestic products instead of imported products when implementing border closure measures to prevent epidemic. Therefore, many countries have used the measures of trade protectionism and technical barriers to enhance the protection of domestic products, especially agricultural and fishery products.

GDP growth for the whole year was only 2.58%, the lowest level in recent decades. In which, GDP growth in the third quarter recorded a negative number for the first time.

Vietnam Economic Growth from 2011-2021

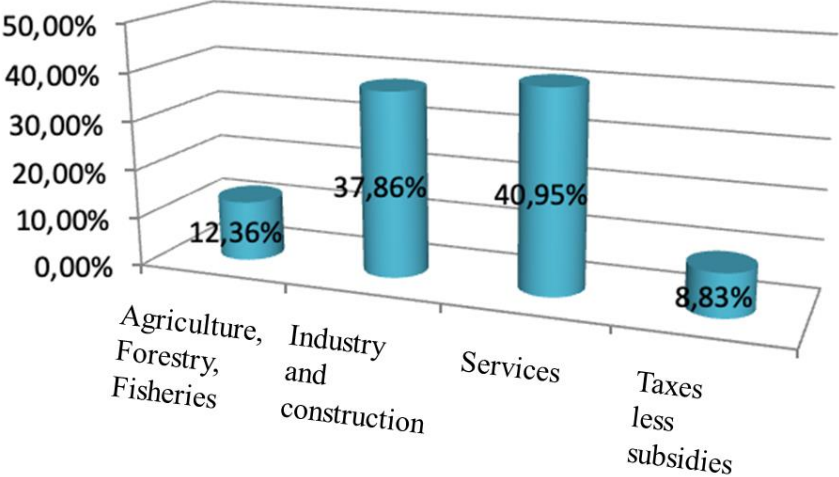

Source: General Statistics Office

In the overall growth rate of the economy in 2021, the agricultural, forestry and fishery sectors contributed 13,97% to the growth rate of the total added value of the economy; the industrial and construction sectors contributed 63,80%; the service sector contributed 22,23%. In terms of the economic structure in 2021, the agricultural, forestry and fishery sectors accounted for 12,36%; the industrial and construction sectors accounted for 37,86%; the service sector accounted for 40,95%; product taxes except for product subsidies accounted for 8,83%.

The situation of business registration in the fourth quarter showed a clear flourish. Specifically, in the last 3 months of 2021, the number of newly registered enterprises reached

31,400 with a registered capital of 415,300 billion VND and the number of registered employees was 205,100 employees, - an increase of 70.4% in the number of enterprises, an increase of 64.1% in registered capital and 24.7% in number of employees compared to the third quarter of 2021.

GDP structure in 2021

Source: GSO

Overall, in 2021, the country had 116.800 new registered enterprises with a total registered capital of 1,61 million billion VND and total registered labor of nearly 854.000 employees. The average registered capital of a newly established enterprise in 2021 reached 13,8 billion VND.

In addition, in the fourth quarter of 2021, domestic trade and transport activities, and international tourists gradually recovered. Total retail sales of goods and revenue from consumer services in the fourth quarter of 2021 increased 28,1% compared to the previous quarter - estimated at 1,3 million billion VND. In general, in 2021, the total retail sales of goods and revenue from consumer services was estimated at 4,79 million billion VND.

The fourth wave of COVID-19 outbreak has disrupted the global supply chain, negatively affecting Vietnam's export operations. At that time, many experts and specialized agencies expressed their "impatience" for the growth target of the whole year. However, those worries were replaced by shattered feelings at the end of 2021, export once again made miracles.

With the annual export turnover of goods was estimated at 336,25 billion USD, an increase of 19% compared to the previous year, not only did export "break" the record of 282.65 billion USD of the whole year of 2020, but also brought Vietnam to become the 22nd largest export economy in the world. According to many economic experts, with this encouraging result, exports will continue to be a growth engine for the Vietnamese economy in 2022 and create more potential for enterprises to promote exports in the coming time.

Figure 1. Value of export, import and trade balance in 2020 and 2021

Source: General Department of Vietnam Customs

Export and import of goods were considered one of the brightest points of the economy in 2021 when the total turnover reached 668,5 billion, an increase of 22,6% compared to the previous year. With this result, Vietnam was among the top 20 economies in international trade.

Overall, in 2021, the trade balance of goods was estimated at 4 billion USD (19,94 billion USD last year) in which, the domestic economic sector had a trade deficit of 25.36 billion USD; FDI sector (including crude oil) had a trade surplus of 29.36 billion USD.

Despite being heavily affected by the epidemic, businesses, especially in the industry, have built a scenario to proactively adapt to the "new normal" state, ensuring production and business stability and striving to complete the planned schedule. Thanks to the efforts of enterprises and the effects of supportive policies of the Government and Ministries, businesses have been helped to overcome difficulties, restore production, and have positive business results. This also helps to collect the State budget early.

Total state budget revenue in 2021 was estimated to reach 1,523,400 billion VND, equaling 113.4 % of the yearly estimate (an increase of 180,100 billion VND), of which domestic revenue was equal to 110.4% of the annual estimate (an increase of nearly 118,000 billion VND); revenue from crude oil was 197.4% (up 22,600 billion VND); balanced income from import and export activities was 122.1% (increasing 39,500 billion VND).

Besides, other large balances of the economy were maintained stable. The average core inflation in 2021 increased by 0,81% compared to the average in 2020. The Consumer Price Index (CPI) in 2021 increased by only 1,84% compared to the previous year and it was the lowest increase since 2016, this had contributed to macroeconomic stabilization, and creating conditions for the Government to implement many financial and fiscal policies in supporting people, businesses, and the economy. Stable macroeconomics, controlled

inflation, less volatile exchange rates have helped Vietnam continue to be an attractive destination for foreign investors with a total investment capital of over 31 billion USD, up 9,2% compared to 2020.

3.2. Opportunities and challenges for Vietnam

With the achievements and results achieved in 2021, Vietnam's economy has many new opportunities to recover in 2022, there are many new opportunities for the recovery of the Vietnam's economy in 2022.

Firstly, Vietnam will have many improvements in both the dynamics and the results of economic recovery and development. With improved experience, capacity, and ability to cope with epidemic, the ability to proactively produce a vaccine against Covid-19 will soon ensure the goal of vaccinating the entire population, the country will return early to normal, and the economy will recover quickly. Completion of vaccine coverage by the end of 2021, or by early 2022 at the latest, is one of the prerequisites for economic recovery and development.

In general, the economic recovery process in 2022 will face many challenges and bottlenecks that need to be resolved. Vietnam continues to face increasing inflationary pressure, public debt and non-performing loan, limitations on the ability to meet human resources, equipment, and infrastructure of the grassroots health system, while the number of people needing medical assistance and social security is huge. The recovery of production and business can be hindered by financial difficulties and consumption market. The ratio of credit to GDP remains high, the medium and long-term capital of the economy still mainly relies on the banking system.

Domestic consumption, which contributes about 68-70% of GDP, is likely to recover due to market sentiment and improved income. In addition, the private sector and FDI have the opportunity to recover production and business thanks to the recovery of both supply and demand sides, the adaptation of the business sector and support measures of the Government.

Secondly, the direct impact of economic support packages is strengthened. Vietnam needs to strengthen resilience through a robust and flexible social assistance system based on allocating additional capital to social assistance programs; building a large-scale social registry and digital adoption to quickly identify vulnerable people; scaling up electronic payments to effectively reach identified beneficiaries.

The Government has set out the overarching goal of "safely and flexibly adapting, effectively controlling Covid-19, maximum protecting the people's health and life", along with "making good use of opportunities". to promote socio-economic recovery and development with comprehensive solutions". The next goal is to maintain macroeconomic stability, improve the economy's autonomy, resilience, and adaptability; strive to increase GDP by 6-6.5%, average CPI growth rate of about 4%; State budget deficit is about 4% of GDP... throughout 2022.

Thirdly, many solutions are implemented synchronously. In the context that the epidemic can be prolonged, the main tasks and solutions are to focus on flexibly and effectively implementing the goals of preventing and controlling epidemic while recovering and developing economy and society, ensuring people's health and life and social security. In

addition, it is necessary to control inflation, limit arising bad debts, maintain the internal bad debt ratio below 3%; accelerate production, business, export, and the disbursement of public investment capital. Development assistance policies should pay attention to creating stimulus for both total supply and total demand; consolidating macroeconomic foundations and promoting more far-reaching economic institutions, creating more "resilience" for enterprises.

4. Discussion and Conclusion

In 2022, Vietnam remains an attractive destination for investors in the medium term with many strong foundation conditions. In order to take advantage of the new opportunities to revitalize Vietnam's economy by 2022, a number of solutions need to be implemented as follows:

Firstly, Vietnam needs to implement well and safely a large-scale vaccination campaign for the entire population. The Government, ministries, departments, and localities shall urgently complete the vaccination for the entire population within the prescribed age range in order to soon achieve the rate of herd immunity; give priority to the labor force of the enterprise sector and individual business households so that these two areas will soon return to production and business.

Secondly, it is necessary to harmoniously combine fiscal and monetary policies, focusing on fiscal policies to support businesses and individual business households to overcome difficulties. At the same time, we should use reasonable monetary policy, not focusing too much on monetary policy to remove difficulties and promote growth because credit support and lowering interest rates for businesses will lead to increase inflation and risks to the banking system.

Thirdly, it is vital to improve the capacity of disbursement and efficient use of investment capital: Carrying out key investments in key sectors, dynamic regions, growth poles, large and important national projects, inter-regional connectivity projects. In particular, our country should improve the efficiency of using public investment capital to create spillovers to private investment and the FDI sector; exploit the strengths of signed Trade agreement in order to improve the efficiency of international trade activities and boost exports; enhance opportunities to attract and utilize FDI inflows.

Fourthly, rapid and effective implementation of the economic restructure. Internal restructuring of each sector towards promoting comparative advantage and participating in global value chains; focusing internal resources, promoting the motivation to develop products with comparative advantage, competitiveness, and high added value.

Fifthly, we should proactively prepare sufficient conditions to promote production and business, ensure supply and circulation of goods, and reduce inflationary pressure. For deficient goods in the short term, it is necessary to have policies and solutions to reduce production costs, timely import raw materials; strengthen inspection, examination and resolute handling when detecting speculative behavior, hoarding and price manipulation; implement solutions to connect and ensure appropriate labor supply for people; proactively provide labor market information, develop plans and programs for coordination among localities in the supply and recruitment of labor to create connections and interconnections in the labor supply chain between localities...

Sixthly, it is very important to strengthen the implementation of digital transformation in institutional reform and administrative procedures. Digital transformation in institutional reform and administrative procedures are very important. Meanwhile, traditional administrative procedures and the application of technology in resolving administrative procedures currently do not meet the requirements of people and enterprises in the new context. There are many support packages that are stuck with administrative procedures. Procedural barriers are not only causing difficulties, but also creating unfairness for the business community in accessing policies and distorting the business environment. Besides, it is necessary to have cooperation and coordination among agencies, ministries, departments, and localities and to establish a decentralization mechanism for the creation of favorable condition not only in the country, but also in the international arena.

Seventhly, creating an inter-connection policy, connecting the supply chains of goods and services with consensus at local governments, solving the situation of local inconsistency. In order to restore supply chains, production and export activities, it is necessary to maximize the circulation of goods and labor to serve the recovery of production after the epidemic, to avoid the local inconsistency. At the same time, our country should ensure adequate supply of raw materials, materials, and energy.

Regarding import and export, it is crucial to continue to closely monitor the epidemic situation and the exchange of goods between countries to advise the Government on management solutions to deal with adverse factors. Emphasis will be placed on the implementation of the Free Trade Agreements in general, especially the new generation FTAs. Organizing online trade promotion, focusing on logistics...

Promoting circulation and distribution of goods among localities to ensure the supply of essential goods to serve people's needs. Implementing programs to stimulate domestic consumption such as: organizing promotional months nationwide, mobile sales programs, market stabilization programs... Strengthening activities to connect supply and demand and promote trade domestic market trade. Promoting the application of e-commerce in the circulation and distribution of goods.

Abstract

Global greenhouse gas emissions have been accelerating alarmingly. Many states came up with different stringent climate policies in response to this. These unilateral climate change policies might reduce emissions in one region; however, it would cause the international transfer of carbon emissions due to international trade. The spillover of emissions is also referred to as “carbon leakage”. In a bid to fulfill goals set out in Paris Agreement and move forwards to the 2050 net-zero commitment made by more than 100 countries, several anti-carbon leakage approaches have been proposed, including border carbon tax adjustments (BCAs) recognized by three models: import tax and export rebate and emissions trading scheme (ETS). These are also one of the most controversial topics in the debate on reconciling international trade and the environment. To the extent of this paper, the only carbon tax on imports will be scrutinized.

Keywords: *Carbon leakage; Border carbon tax adjustments, GATT, Vietnam.*

1. Introduction

In response to the 21st Conference of Parties (COP 21) which was signed in November 2021, numerous states are raising the idea of imposing carbon-related border tax adjustments to fight climate change. This hotly-debated topic caught unaccountable public and scholars’ encouragement and their critics alike. There are strong rationales for implementing BCAs: (1) BCAs help to protect domestic industries from competitive disadvantages due to the disparities in carbon policy in different regions; (2) BCAs prevent domestic industries to move outside of the regulatory zone, causing transnational carbon leakage and (3) imposing BCAs would encourage the participation and compliance of international regime.⁶ Despite advantages thereof, scholars and politicians are questioning the effectiveness of carbon border tax in practice and particularly its compliance with World Trade Organization (WTO) rules. The paper will take the focus on the merit of carbon border tax by scrutinizing three aspects: its compliance with WTO rules, its effectiveness, and its

⁶ Pauwelyn, J. (2013). Carbon leakage measures and border tax adjustments under WTO law. In *Research handbook on environment, health and the WTO*. Edward Elgar Publishing.

practicability to see whether or not we should apply BCAs and how to apply BCAs appropriately. The paper will also mention the impact of BCAs regime to Vietnam and last but not least give some proposals about the design and implementation of the BCAs applied to Vietnam.

2. Method

The paper will use some primary methodologies below:

- Case study: This method is applied to examine whether carbon border tax can be considered as complying with WTO law. Put in detail, some WTO cases presenting fundamental principles of WTO will be used to examine the compliance to WTO rules of carbon border tax.

- Law analysis: This method is applied to analyze some specific provisions of the international agreements relevant to BCA, especially the General Agreement on Tariffs and Trade 1994 (GATT 1994).

From the expected findings, it is necessary to draw conclusions and propose some recommendations used in the context of Vietnam in this regard.

Research Questions

1. What is the merit of BCAs?
2. How would imposing the BCAs scheme affect the economy and trade of Vietnam?

3. Results

3.1. The merit of BCAs.

3.1.1. Is BCAs admissible under WTO rules?

WTO rules do not contain any provision dealing directly with border (carbon) tax adjustments. By virtue of Article II.1 (a) of the GATT 1994, WTO parties are prohibited to impose a custom duty or a “charge imposed on or in connection with importation” (import duty) that is in excess of limits they made the commitment in the tariff schedule. However, an import duty such as BCAs will be allowed to exceed these limits if BCAs are considered as a “charge equivalent to internal tax equivalent to Article III.2”.⁷ In this case, a BCA must be tested under the same criteria as the test of Article III of the GATT to determine whether or not BCA is in excess of “internal tax”. On the other hand, if BCAs are considered as “internal tax or internal charge” because it is paid upon the resale in importing countries, BCAs will be subject to Article III: National Treatment of GATT 1994.⁸ Simply put, imposing BCAs is allowable provided that they satisfy two tests: (1) BCAs are imposed on products that are “like” domestic products that are subject to tax in the first place, and (2) BCAs must not be in excess of the amount of tax on “like” products in importing countries.⁹

⁷ WTO Appellate Body Report, *India - Additional Import Duties*, WT/DS360/AB/R, 30 October 2008, adopted November 17, 2008

⁸ WTO Appellate Body Report, *China – Measures Affecting Imports of Automobile Parts*, WT/DS339/AB/R, adopted January 12, 2009.

⁹ Hillman, J. A. (2013). Changing climate for carbon taxes: who’s afraid of the WTO?.

✚ **‘The tax are imposed on products that are “like” domestic products that are subject to tax in the first place’**

To satisfy the first test, it is compulsory to prove that (1) the carbon border tax is a type of indirect tax (tax imposed on the product) and not direct tax (tax imposed on a producer or manufacturer or their income) and (2) the imported products and the domestic products are ‘like’ products.¹⁰

➤ *Article III: National Treatment on Internal Taxation and Regulation and the distinction between indirect tax and direct tax.*

The language of the Agreement on Subsidies and Countervailing Measures (ASCM) and the 2009 Report of WTO-UNEP¹¹ state that ‘indirect tax’ includes all taxes that are not ‘direct tax’. Put it plainly, a tax on products, including a tax on inputs (energy) that are not physically incorporated into final products, as long as it is not listed specifically as “direct tax” (a tax on a producer or manufacturer or their income or wage), should fall into “indirect tax” category.

To be adjusted at the border, the tax must be a type of indirect tax. Countries can easily offset taxes charged on products (such as sales tax, VAT, and exercise duties) when assessing similar taxes on imported products and domestic products. Such taxes would level the competitive playing field.¹² On contrary, direct tax (such as Payroll tax or property tax) cannot be offset or assessed due to the fact that it is impossible to know if producers or importers bear similar costs in production or allocate the taxes on producers on products.¹³ In the case of carbon border tax, it is assessed on the product itself, such as a tax on fossil fuel producers based on the carbon content of their products and a tax on producers and consumers based on the carbon content of products they make purchases.¹⁴ For the reason above, the carbon tax could be considered an “indirect tax” and fully eligible for border adjustment for imports, in accordance with Article III.2 of the GATT 1994.

➤ *Article III: National Treatment on Internal Taxation and Regulation and the likeness concept*

The second requirement is challenging to satisfy. Based on the 1970 Report of Working Party adopted on 2 December 1970 on Border Tax Adjustments,¹⁵ with regard to the interpretation of the term “like or similar products”, the likeness of products should be examined by a case-by-case basis. Some criteria were suggested for determining whether a product is “similar”, namely the properties, nature and quality of the products; the end-uses; consumers’ tastes and habits and the tariff classification of products... Indeed, these criteria were reaffirmed in several WTO cases, like *Japan - Taxes on Alcoholic Beverages* and *EC - Abestos*.¹⁶

¹⁶ Cossy, M. (2006). Determining Likeness under the GATS: Squaring the circle?.

In the light of BCAs, process and production methods (PPMs), specifically non-product related process and production methods (NPR-PPMs) deserves to be mentioned because it is primarily associated with carbon emissions emitted during production which will be used to calculate carbon tax. The debate over NPR-PPMs has centered on whether or not products are “like” under the concept of Article III of the GATT if NPR-PPMs used to produce are not similar.¹⁷ Another question is whether NPR-PPMs based border measures are compatible with WTO law.

The existing WTO cases suggest that NPR-PPMs cannot make products different and any NPR-PPMs based border measures can be considered discriminatory measures without reservation of the GATT. This traces back to *Tuna-Dolphin I and II* cases. It indicates that different non-product related PPMs do not make products “unlike” under Article III - GATT”.¹⁸ In this case, Appellate Body noted that consumers’ tastes and habits could be a determining factor to assess the likeness of products. In other words, NPR-PPMs can be used to support the finding of differentiation between products if different NPR-PPMs may have a sufficient impact on consumers’ tastes and consequently on competitiveness in importing country’s market.¹⁹ With the rising environmental protection awareness among the public, more and more consumers are inclined to choose environmentally-friendly products over other non-environmentally friendly products. This could mark a paradigm shift in consumer’s preferences, making less embedded carbon content products more competitive in the market. In most cases, however, as a general rule, products with physically identical or very similar characteristics will be considered as “like” from the consumer’s perspective.²⁰ If no factor points out the difference between products, the second requirement fails and as a result of this Article III of the GATT 1994 will be violated.

3.1.2. ‘BCAs must not be in excess of the amount of tax on domestically-produced “like” products’

The second test requires an appropriate system that does not violate any WTO rules to calculate the embedded carbon content in products. There are plenty of methods to measure this amount of carbon dioxide, such as certification or labeling showing information about production methods and the amount of carbon dioxide used.²¹ Some scholars suggest that the amount of carbon dioxide in each product should be measured at the manufacturing level as the difference in process and production method in manufacturing plants lead to the difference in the amount of carbon dioxide in products.²² This method would be less likely to run afoul of the non-discrimination principle set out in GATT 1994.²³ However, governments might find calculating carbon content at the manufacturing level challenging to

²³ Ibid

administer. The same goes for the certification and labeling itself. It needs not be an administrative burden on importers and domestic producers alike. This seems worse when companies, producers, and importers are not willing to provide the necessary information to assess carbon content in products all the time. It is an urge to seek other alternatives. One of the alternatives is the “predominant method of production” or “best available technology” that had been regulated in the Superfund Act in *US-Superfund* case.²⁴ Based on the Superfund Act, imported products produced with less carbon content than those produced by “predominant method of production” or “best available technology” are subject to pay less tax.²⁵

Nevertheless, in order to satisfy the non-discrimination principle set out in GATT 1994, the carbon tax on imported products shall not be “in exceed of” that applied to domestic products under Article III.2 or equivalent to a charge applied to domestic products under Article II.2²⁶ despite the difference in carbon content due to process and production methods and the amount of border tax adjustment assessed. The main arguments here are any difference in tax on domestic products and imported products would run afoul of the non-discrimination principle. Many nations, therefore hold the argument that the carbon tax imposition on imported steel produced by low-carbon source energy must be taxed in the same way as domestic steel produced by high-carbon source energy.²⁷ It appears to be hard to keep BCAs under the amount of tax imposed on domestic products in any circumstance except for Article XX of the GATT 1994.

Pursuant to Article XX GATT 1994, WTO members can still justify their carbon tax imposition under this Article, as long as the tax satisfies two conditions that are (1) the chapeau of Article XX and (2) the subsections of Article XX, namely Article XX (b) or Article XX (g).

Article I - General Most-favored-nation Treatment

Article I GATT 1994 requires “*any advantage, favor, privilege or immunity granted by any contracting party to any product originating in or destined for any other country shall be accorded immediately and unconditionally to the like product originating in or destined for the territories of all contracting parties.*”²⁸ Many argue that applying the carbon tax on imported products may cause the problem of favoring products from countries with stringent climate policies and penalizing products from those with weak or no climate policies who are mostly developing countries and least developing countries.²⁹

²⁹ Cosbey, A., Droege, S., Fischer, C., & Munnings, C. (2020). Developing guidance for implementing border carbon adjustments: lessons, cautions, and research needs from the literature. *Review of Environmental Economics and Policy*.

In fact, the 1979 Enabling Clause made exemptions to the most-favored-nation principle for developing countries and least developed countries.³⁰ The imposed measures on these countries must “respond positively to development, financial and trade needs of developing countries”.³¹ In the context of BCAs, the BCA measures must demonstrate the nexus between preferential treatment and the developing, financial, and trade benefits of developing countries, meaning that part of BCAs revenue must be allocated to developing countries, particularly the least developing countries. Hence, it constitutes a breach of the most-favored-nation principle set out in GATT 1994.³²

Otherwise, states can justify their measure under Article XX Chapeau and Article XX (a) to (g) of the GATT 1994.

Environmental concern and Article XX - General Exceptions

Pursuant to Article XX(b) and XX(g), WTO members can justify their carbon border adjustment measures if they aim to protect the life of humans, plants, and animals (Article XX(b)) or are related to the conservation of exhaustible natural resources (Article XX (g)). Past WTO cases demonstrate that a carbon tax would fit the scope of Article XX (b) or (g).³³ For example, in the *US-Gasoline* case, it is recognized that clean air is an exhaustible natural resource under the concept of Article XX (g) of the GATT because it could be exhausted due to pollutants released from burning gasoline.³⁴ Likewise, it is easy to argue that carbon dioxide emission causes detrimental effects on the health of humans, plants, and animals under Article XX (b) therefore carbon tax is allowed to apply for protecting these subjects.

The hardest part here might be to demonstrate that border carbon tax passes the Chapeau test under Article XX. Put it plainly, the measure must not be “*applied in a manner which would constitute a mean of arbitrary or unjustifiable discrimination between countries where the same conditions prevail, or a disguised restriction on international trade.*” In *US-Shrimp* case, the Appellate Body emphasized that a measure constituting a mean of arbitrary or unjustifiable discrimination is the measure coercing exporting parties to adopt the same policy mandating the specific use of PPMs.³⁵ In addition to that, it is inconsistent with the Chapeau if measures require exporting countries to adopt “a comparably effective policy” to achieve the level of protection of importing country’s policy without mandating the use of any specific PPMs.³⁶ Such case remains less clear in WTO cases. We also need to justify two below circumstances: (1) measures requires producers in exporting country to use

³⁶ Ibid

certain PPMs whether this exporting country mandate to use this type of PPMs and (2) measures requires producers in exporting country to achieve a similar standard of protection whether either importing country's government or producers use certain PPMs.³⁷ As we see, the carbon tax would be least coercive in the latter circumstance, particularly assessing the BTA on imported products from energy-intensive trade-exposed (EITE) sectors.

The Appellate Body also emphasized that a measure should be aimed at the environmental goal, rather than the application of specific methods or standards.³⁸ However, the lack of flexibility in defining a mean of arbitrary or unjustifiable discrimination has been an obstacle for countries to demonstrate that measure is not arbitrary. The Appellate Body in that *US-Tuna case* pronounced that “an arbitrary measure” is a capricious, unpredictable (or) inconsistent and “discrimination” and must have been foreseen, not merely inadvertently or unavoidable.³⁹ To be acceptable, members should build a comparable program that achieves the same environmental objectives. To do this, it is necessary for members to join in multilateral and bilateral agreements to ensure achieving the same environmental goal and to apply the flexible measure.⁴⁰

3.1.2. Mitigation effectiveness

Although there is no reliable data regarding the effectiveness of applying BCAs in real life, some *ex-ante* research shows the findings that BCAs could reduce carbon leakage by up to 15 percent globally.⁴¹ In addition, BCAs can also prove their effectiveness in addressing concerns regarding economic competitiveness. Nevertheless, others argued that the effectiveness in reducing carbon leakage is much less clear due to the reasons below:

Firstly, carbon leakage is not reduced at all, they shift around instead.⁴² Producers may sell less carbon-intensive goods to territories with a carbon price scheme and in reverse, more carbon-intensive goods to territories without a carbon price scheme.⁴³

Secondly, BCAs cannot be able to address all kinds of carbon leakage.⁴⁴ In fact not all factors are counteracted by BCAs. For example, in the energy market channel, due to domestic climate change policy, the demand for domestic fossil fuel reduces, hence the demand for fossil fuel abroad increases.⁴⁵

⁴⁴ Ibid

⁴⁵ Böhringer, C., Fischer, C., Rosendahl, K. E., & Rutherford, T. F. (2022). Potential impacts and challenges of border carbon adjustments. *Nature Climate Change*, 1-8.

Thirdly, as carbon leakage is a large-scale problem, this requires collective effort and international cooperation to eliminate carbon leakage.⁴⁶ The reality proves that not all states are interested in BCAs. There are plenty of countries, such as China and other developing countries, Vietnam included have proposed to not use BCAs due to the concern of the burden-shifting and Green Protectionism.⁴⁷ While the international community seems hard to reach a mutual consensus as to the application of a global BCAs, several unilateral BCAs adoptions (for example European Unions have adopted the ‘Green Deal’ enacted from 2023 onward) just are capable of reducing carbon leakage in a very limited extent.⁴⁸

Finally, not all sectors can apply BCAs. Some scholars suggest BCAs should be applied only in energy-intensive trade exposure sectors, such as steel, aluminum, electricity, etc because this can reduce carbon leakage and lower administrative cost.⁴⁹ If applying BCAs to all sectors, the increasing administrative cost would outweigh the benefit of carbon emissions reduced.⁵⁰ It is necessary to determine which sectors have the highest risk of carbon leakage. There are two criteria proposed by scholars: carbon exposure and trade exposure.⁵¹ Put in detail, it is important to find the answers to two questions that are whether BCAs would increase the production cost and how international trade can prevent the cost from being passed on to customers.⁵²

3.1.3. Practicality

The actual application of BCAs will defer from the theoretical solution. It faces a number of challenges. The most challenging could be the assessment of product-specific emissions. There are two approaches determining the embedded carbon content in a product, namely, (1) a bottom-up approach which requires information during the production process from producers in exported country and information from suppliers in other countries, and (2) a top-down approach which requires to calculate the total amount of embedded carbon content in products in a sector and set a standardized benchmark for carbon intensity for products from this sector.⁵³ Both approaches face the complexity of obtaining information from foreign companies due to the limited jurisdictional power.⁵⁴ Furthermore, this will require massive monitoring and taxing of a great number of products that come from different global supply chains.⁵⁵ It will result in a dilemma in administrative actions and

⁵⁴ Ibid

⁵⁵ Ibid

costs. A more practical approach is focusing on a small number of sectors where the product characteristics - carbon cost, are reasonably standardized.⁵⁶

Another problem arising when executing the second approach is that due to the WTO non-discrimination principle, the imported products must be charged the same as domestic products, therefore BCAs would be likely to “best available technology”.⁵⁷ However, “best available technology” is criticized as being against environmental effectiveness since it fails to penalize unclean industries and reward clean industries;⁵⁸ and also fails to provide producers incentive to encourage to lower carbon footprint.⁵⁹ Industries also have to shoulder the production cost to comply but this will have an impact on the product price and demand for the product.⁶⁰

3.2. The impact of imposing BCA on the trade and economy of Vietnam

In the case of Vietnam, it would be considered a new opportunity for Vietnam. The application of carbon tax would encourage domestic manufacturers to replace non-environmentally-friendly energy sources and shift to environmentally friendly sources, such as wind or solar energy. As a result of this, the economy of Vietnam would make a huge shift to sustainable development in the economy, meaning promoting the usage of sustainable and renewable energy in long term, rather than repairing environmental damages. Sweden is a concrete and successful example of increasing economic growth by 78 percent and reducing carbon emissions by 26 percent in the last twenty seven years by applying carbon border tax.⁶¹ Thus the carbon emissions level in Vietnam has been 20 percent higher than the average level.⁶² By following and applying carbon border tax regulations, Vietnam hopefully would witness a paradigm shift in achieving sustainable economic development and environmental protection.

Despite long-term advantages, shifting to renewable energy would lead to an increase in the cost of final production, causing a direct negative impact on the low-income groups in society. Additionally, the increase in production cost would put Vietnam in a weak position, compared to domestically-produced products in other trading partners' markets. For example, European Union has introduced the “EU Green Deal” for the purpose of fulfilling the climate change goals set out in the Paris Agreement.⁶³ Based on this deal, the

carbon border taxes will start in 2023 with a transition period until 2025, when importers would be subject to significant reporting obligations. In terms of carbon customs duty, this will be applied to all sectors, focusing on EITE sectors, such as cement, iron, steel, aluminum, fertilizer, and electricity, etc.⁶⁴ Some of Vietnam's products that are subject to carbon border tax are textile, steel, coal, paper, and paper-based products. If carbon border tax were applied, Vietnam's GDP would decrease because revenues from exporting to EU markets account for 10 percent of the total GDP per year.⁶⁵ In "Green Deal", the EU will exclude carbon border tax for producers from countries applying the same effective climate policy.⁶⁶ If Vietnam implements a similar climate policy, Vietnam cannot possibly face hurdles coming from the public and producers when implementing a carbon tax.

As analyzed above, the imposition of carbon border tax would be at risk of violating WTO rules and face difficulties, such as calculating embedded carbon content in products and administration costs and procedures. This controversial measure must attract as much attention as possible in the near future. Vietnam, in this context, must be well-prepared, meaning adjusting our climate policy and regulation to eradicate carbon emissions. Below are some notices Vietnam needs to take into consideration in terms of practicing carbon border tax:

Unilateral border measures are usually used as a tool of powerful trading states and are not available to small and economically vulnerable states with little market power. That is why since the EU introduced the Green Deal, China and other developing countries have shown their vigorous objection to it.⁶⁷ They hold the idea that 'Green Deal' is a tool used to recover and strengthen the EU's economy in the post-pandemic era.⁶⁸ Therefore, an effective carbon border tax scheme requires a collective effort. Put in detail, the carbon border tax will urge other countries to join in bilateral and multilateral agreements in order to achieve common climate goals. These agreements are meant to prevent retaliation and protectionism along with achieving environmental goals. In this case, we should consider joining these agreements upcoming.

Vietnam should encourage domestic producers to replace nonrenewable energy and shift to environmentally friendly sources of energy. For example, give producers/companies incentives to reshuffle emissions. Exported products from countries with stringent and effective climate policies should be excluded from being subject to carbon border tax imposed by other trading partners, particularly the EU or the United States. The implementation of the carbon tax in the territory must face public objection, nevertheless, we should make sure the carbon tax is implemented in accordance with the consultation and

involvement of those states affected by the policy. Vietnam also need to consider which method is appropriate and effective and fair to all producers.

Based on distributional principles set out in Paris Agreement and Kyoto Agreement and the Enabling Clause, developed countries are responsible for helping developing countries in terms of technology. Since decarbonization requires modern and complex technology, Vietnam and other developing countries need financial and technical aid from developed countries to keep up with the constant changes in global climate policy. Revenues gained from developed countries and domestic carbon tax must be devoted to climate change mitigation or actors being made worse off by policy.

4. Conclusion

Carbon emission reduction to protect the environment has taken the attention of many countries. Carbon border tax has been imposed as means to attain reduction of carbon emission. However, there has been several issues that has been raised in the imposition of BCA. Under WTO, BCAs are allowable if the tax are imposed on “like” domestic products and it must not exceed the tax on ‘like’ products in importing countries. But the application of carbon tax causes dilemma. It can favor products from countries with established climate policies and punish products from countries that have yet to develop environment protection policies.

As to effectiveness, BCA has not reduced carbon leakage. Rather, it made producers shift and sell to territories with less carbon-intensive goods. In order for BCA to work there is a need for cooperation or consensus of the international community in the implementation of the tax. BCA also faces challenges on its actual implementation like in the assessment of product specific emissions. It is good to focus on industries with which the carbon cost of the products can be standardized.

Lastly, BCA will have an impact to the economy of Vietnam. The application of the tax will affect the revenues of the country as it is not yet ready to comply with requirements of BCA. Currently, the country will be burdened in shifting to environmentally friendly sources and means of production. There is a need for developed countries to provide aid and assistance to Vietnam and other developing countries for the implementation of BCA to be effective.

FRAUD RISK FACTORS AFFECTING FRAUDULENT FINANCIAL REPORTING: THE ANALYSIS OF FRAUD CASES

Dr. Doan Thanh Nga
doanthanhnga@neu.edu.vn

Dr. Ta Thu Trang
trangtt@neu.edu.vn

School of Accounting & Auditing, National Economics University, Hanoi, Vietnam

Abstract

The paper investigated fraud risk factors affecting fraudulent financial reporting by studying fraud cases that have occurred of 12 large economic corporations in the world and in Vietnam. Through the collection of data from previous studies, the results of investigations by regulation agencies and the evaluation and analysis of experts on fraud cases, the authors synthesize and analyse to identify 3 groups of factors of fraud risk factors affecting fraudulent financial reporting. In particular, for the group of pressure factors, the pressure of the Board of Management to achieve the financial goals from the Board of Directors when operating poor business performance or financial crisis is the factor with the highest frequency. For the opportunity group, the weakness of internal control and the overriding of internal control from Board of Directors and Board of Management are the strongest factors that create opportunities for corporations to commit fraud. For the attitude group, the maintenance of stock prices and corporate profits, the lack of professional ethics of managers are the factors that appear most and have a great impact on fraudulent financial reporting.

Keywords: *fraud risk factors, fraudulent financial reporting, fraud cases*

1. Introduction

The development of the market economy, especially the financial market, requiring the transparency and honesty of financial information with high quality plays an important role to attract investors and creditors to make their financial, economics and commercial decision (Wang, 2018). According to Association of Certified Fraud Examiners, fraud causes an annual loss to the total value of world product of more than US\$3.6 billion (ACFE, 2020). Therefore, fraud detection is a challenge for independent auditors in comparison with error detection. According to ISA 240, in order to detect fraud in the audit of financial statements, the auditors identify the fraud risk factors and assess the fraud risks during the audit plan.

International and Vietnam researches have studied the fraud risk factors in the financial audit as following aspects: identification of risk factors affecting fraud in the preparation of financial statements and assessment of fraud risks as follows:

To commit fraudulent financial reporting, the theory of Fraud Triangles (Cressey, 1953) and red flags (Romney et al., 1980) are the main theory to explain the reasons for the

conditions to predict fraud. In generally, literature review of the causes of fraudulent behavior in financial reporting includes 3 groups of fraud risk factors (pressure/motivation, opportunity and attitude) and red flags alerting in 3 groups of fraud risk factors. Following researches on red flags, Albrecht et al. (1986) performed the first empirical study on the usefulness of red-flags to predict fraud. The author used 87 signs to design the questionnaire and conduct interviews with the independent auditors. The research results show that important red flags in predicting fraud are groups of pressure/motivation factors and managers' attitudes. Heiman-Hoffman et al. (1996) conducted a study on 30 red flags in SAS 53. The authors surveyed 130 independent auditors in the US and found that the group of attitude factors predicts fraud higher than the groups of pressure/motivation and opportunities. Because of the insufficient fraud risk factors in the modern economy, AICPA continued to amend SAS No. 53 and issued SAS No. 82 with clear instructions in comparison with SAS No. 53. After a series of accounting scandals in the US in 2001 and 2002, AICPA decided to continue to replace SAS 82 with SAS 99, adding suitable fraud risk factors for the changes of the international economy. SAS 99 did not present red flags because of the ineffectiveness of the red flags (Owusu-Ansah et al., 2002). AICPA grouped fraud risk factors based on the Fraud Triangle theory into three groups (pressure/motivation, opportunity, and attitude/justification). In 2004, the International Auditing and Assurance Standards Board revised and issued ISA No. 240. In 2009, ISA 240 continued to be revised and supplemented (IAASB, 2009). After the issuance of SAS 99 and ISA 240, studies continue to be studied on the predictability of the fraud risk factors affecting fraudulent financial reporting (Moyes et al., 2005; Skousen & Wright, 2006; Moyes, 2007; Gullkist & Jokippi, 2013; Abdullatif, 2013, Le Nguyen The Cuong, 2013; Tran Thi Giang Tan et al., 2014; Zaki, 2017, Ulfah et al., 2017; Devy et al., 2017; Mardianto & Tiono, 2019).

The researches on fraud risk factors affecting fraudulent financial reporting were carried out in many different countries and regions around the world, carried out in different periods and associated with changes in formation and development of the international auditing standard system (SAS No. 16, SAS No. 53, SAS No. 82, SAS No. 99, ISA No. 240). The author found that a group of factors on managers' attitudes have the most important influence on fraud in financial reporting such as the works of Albrecht et al. (1986), Heiman-Hoffman et al. (1996), Apostolou et al (2001), Gramling and Myers (2003), Graham and Bedard (2003), Moyes et al (2005), Smith et al (2005), Moyes (2007), Gullkist and Jokippi (2013) and Abdullatif (2013), Devy et al., (2017). Specifically, managers' attitude factors include the Board of Directors and the Board of Management with a history of violating securities laws or related laws, dishonest managers and weak ethics, the Board of Directors monopolized and override the internal control of the company, restricted access to employees and information. Next, the second group that affects fraud in financial reporting is an opportunities due to studies Bell and Carcello (2000), Graham and Bedard (2003), Gramling and Myers (2003), Moyes et al (2005), Skousen and Wright (2006), Moyes (2007); Gullkist and Jokippi (2013), Abdullatif (2013). Specifically, the group of opportunity factors that mainly affect fraud in the preparation of financial statements include the weakness of internal control, existence of important or unusual transactions with related parties, arising

transactions at the year-end date of the accounting period, lack of supervision activities for managers. The last group of factors is the pressure/motivation affecting fraudulent financial reporting due to the studies of Albrecht et al. (1986), Bell and Carcello (2000), Graham and Bedard (2003), Gramling and Myers (2000). 2003), Moyes et al (2005), Smith et al (2005), Skousen and Wright (2006), Moyes (2007); Gullkvist and Jokipii (2013), Abdullatif (2013), Zaki (2017). Specifically, the main group of pressure/motivational factors affecting fraud in preparing financial statements including enterprises having difficulty in financial situation, solvency and capital mobilization, bankruptcy pressure, achieving financial results. financial targets (sales, profit targets,...), the income of the Board of Directors or the Board of Management depends on the stock price, business results. The majority of researches are performed in developed countries, few studies are in Asia and developing countries (Maylaysia, Jordan). In addition, the articles are mainly researched through interview techniques to identify fraud risk factors affecting fraudulent financial reporting. Therefore, the authors conduct research on fraud risk factors in terms of famous accounting fraud cases in the world and Vietnam, from which the identification of fraud risk factors has a great influence on fraudulent financial reporting.

2. Method

The authors use the method of synthesizing and analyzing 12 fraud scandals in the preparation of financial statements of large corporations in the world and in Vietnam, including 10 large international corporations and 2 Vietnamese companies corresponding to 12 observations). The author collects data on previous studies and results of fraud investigations, evaluation and analysis of experts on fraud cases. The paper summarizes the methods of fraudulent financial reporting and the scale of frauds affecting financial statements. Next, the author collects data from the accounting scandals of 12 companies to list the risk factors that affect fraud in the preparation of financial statements of 12 companies on 3 groups of factors including: pressure, opportunities and attitudes; examine the perpetrator who commit fraud in preparing financial statements (Table 1).

3. Results

From the table 1, the authors have the following analytical results:

For the pressure/motivation group, the pressure of the Board of Management to achieve the financial goals from the Board of Directors when operating poor business performance or financial crisis is the factor with the highest frequency of 10 times in 12 observations, followed by the factor of financial benefits from the Board of Directors and the Board of Management holding shares of listed companies which is 8 times, the pressure to maintain and increase the stock price is 6 times, the factors of rapid growth and market leadership, the pressure of loss from business activities, the pressure of the need to raise capital all appear with frequency of 4 times, the pressure to meet the listing requirements is 3 times. The remaining factors have little impact on fraud in preparing financial statements of companies accused of fraud.

For the opportunity group, the weakness of the internal control leading to the Board of Directors and the Board of Management overriding the internal control is the most

opportunity for managers to commit fraud in the preparation of financial statements with 11 times out of 12 observations. Weakness of the Board of Directors in supervising the activities of the Board of Management is the second factor (frequency of occurrence is 9 times). Next, the existence of significant transactions or transactions outside the normal course of business with related parties is 8 times; the valuation of assets, liabilities, expenses and revenues are based on significant accounting estimates which are 6 times; unusual and complicated transactions at the end of the accounting year are 5 times; establishing special purpose entities for unknown reasons as low as 3 times.

For the attitude group, the Board of Directors focus on too much about maintaining the stock price or the company's profit trend (12 times) and the weak ethics of the members of the Board of Directors and the Board of Management (11 times) which are two highest factors impacting on fraudulent financial reporting. This is followed by members of the Board of Management who do not have sufficient financial expertise but interfere or unduly influence the choice of accounting policies or significant accounting estimates are 6 times.

The individual committing fraudulent financial reporting are mainly members of the Board of Directors and the Board of Management. Specifically, the members of the Board of Directors in 7 companies all committed fraud in 12 observations, especially with the participation of the Chairman of the Board of Directors and Vice Chairman of the Board of Directors of 5 companies in 12 observations; The members of the Board of Directors of 12 companies all made (12/12 observations) mainly the Senior Manager or CEO, the CFO (Table 1). Thus, fraud in the preparation of financial statements of 12 companies were performed by Senior Manager, so the behavior of overriding internal control of senior Manager occurred in 11 companies/12 observations.

4. Discussion and Conclusion

The research results show that the the pressure on the Board of Directors and Board of Management to achieve the financial targets set by the Board of Directors when operating poor business performance or financial crisis have the strongest impact on fraud in preparing financial statements. This result consistent with the results of Albrecht et al. (1986), Bell and Carcello (2000), Apostolou et al (2001), Graham and Bedard (2003), Gramling and Myers (2003), Moyes et al (2005), Smith et al (2005), Moyes (2007), Gullkvist and Jokipii (2013), Abdullatif (2013), Le Nguyen The Cuong (2013), Tran Thi Giang Tan et al (2014), Zaki (2017). Next, the second group of factors affecting fraudulent financial reporting are attitude factors. Board of Directors is too concerned to maintain or increase the stock price and company's profit, weak ethics of the members of the Board of Directors and the Board of Management which agree with the research results of Heiman-Hoffman et al. et al (1996), Bell and Carcello (2000), Gramling and Myers (2003), Moyes et al (2005), Abdullatif (2013), Devy et al., (2017). Finally, the group of opportunity factors related to the weakness of internal control and the management's overriding of internal control has the strongest impact coincides with the research results of Apostolou et al. (2001), Gramling and Myers (2003), Moyes et al (2005), Moyes (2007), Gullkist and Jokipii (2013), Abdullatif (2013), Zaki (2017).

From the research results, the author offers some solutions as follows:

Firstly, auditors should focus on assessing the common risk factors that affect financial reporting fraud: auditors and audit firms need to focus on risk factors in 3 groups of pressures/motives, opportunities and attitudes. Auditors need to pay attention to signs or indicators related to great pressure (pressure on financial targets; pressure of losses from business activities that threaten the possibility of bankruptcy; pressure on profit performance or expectations of the investors); Management's attitude (excessive concern about stock prices) and favorable opportunistic factors (weakness of internal control and BOD & BOM's overriding of internal control) are important fraud risk factors affecting fraudulent financial reporting at financial statement level and assertion level, especially affecting the type of fraud related to overstating profits/assets. Secondly, from the factors of risks of fraud appearing, auditors and audit firms are cautious in assessing who is most affected by these fraud risk factors to perform fraudulent financial reporting, especially members of the entity's Board of Directors and Board of Management.

However, the research results also have some limitations as the research results focus on large economic groups and companies listed on international and Vietnamese stock markets. In the future, the research continues to expand to analyze fraud cases of small and medium-sized enterprises and diverse business fields such as banks, credit institutions, and insurance.

ATTRACT HIGHLY-SKILLED FOREIGN WORKERS IMMIGRANTS TO VIETNAM: SOME POLICY IMPLICATIONS

Nguyen Phuong Trang

fuongtrang.nguyen@gmail.com

Ministry of Labour Invalids and Social Affairs, Vietnam

Abstract

This article will conduct a review of policies to attract highly-skilled foreign workers in Vietnam. It focuses on the analysis of current policies on Vietnam labour market policy which including foreign workers recruitment, work permits and recognition of vocational skills; protect the labour rights of foreign workers; as well as entry, stay and exit policy for foreign workers and special attraction policies. It is showed that curenly policies have clear stance on creating opportunities to attract foreign workers. They welcome foreigners who come to work in all fields but at the same time ensure jobs for domestic workers. However, curenly policies still have many challenges, especially provide no criteria to distinguish the levels of skilled workers, to identify jobs that Vietnamese workers cannot do, leading to difficulties in implementation. Based on analyzing and evaluating the achievements and challenges of these policies, the article proposes some solutions to improve these policies to attract highly-skilled foreign labour to Vietnam.

Key words: *highly-skilled foreign workers; work permits policies; foreign workers recruitment policies; attract foreign workers policies.*

1. Introduction

International integration has promoted cross-border trade and investment. Along with the international expansion of transnational corporations and the activities of recruitment agencies and organizations, the trend of international labour mobility is increasing. According to the International Labour Organization (ILO), from 2013 to 2017, the number of international migrants of working age increased by 13% and the number of international migrant workers increased by around 9% (ILO, 2017). By 2019, there were 169 million international migrant workers in the world, accounting for about 69% of the international migrant population of working age (aged 15 and over) (ILO, 2021).

In addition, the process of international integration also accelerates capital mobilization, redistribution of labour, and the process of global connectivity, promotes science and technology transfer and application. Especially, the Industry 4.0 has created an impact on the restructuring of the world labour market with various new jobs and occupations that require new digital skills such as technicians, engineers, technicians, information technician (Manpower Group, 2018), as well as STEM skills (science, technology, engineering, and math). This has led to an increase in the demand for highly skilled labour. Some other countries, especially those with developed economies such as the

US (Šárka Prát et al., 2016.), Canada, Singapore (Sumathi Bala, 2008), Japan and China (ILO, 2017), have taken action to attract highly skilled foreign workers to work in their countries in some professions that they actually lacked, such as information technology, software design through immigration policies, labour-management relations, active labour market policies including loosening barriers for highly skilled workers and at the same time tightening entry rules for low-skilled workers (Weinar et al., 2020)⁶⁹ and different tools to attract skilled foreign workers coming to work in their own country.

Along with solutions to attract skilled foreign workers, countries also have policies to protect domestic workers through a system of policies and appropriate interventions related to conditions on foreign workers coming to work in their countries; for example, foreign workers were only allowed to work in specific jobs or certain professions (ASEAN Secretariat, 2020). They actively seized the shortage of labour market skills, training and developing human resources, assessing labour supply and demand through policies to support the labour market, effectively managing foreign workers working in their countries.

In the general trend of international integration, Vietnam positively and actively participates in extensive international integration on a global and regional scale. Foreign investment in Vietnam increased significantly, creating favorable conditions for the labor flow of investors to expand in Vietnam⁷⁰. Foreign investment inflows have had a significant impact on the development of Vietnam's labor market in promoting labor restructuring from labour-intensive industries to industries requiring high-skilled labour. In the same process, the number of foreign workers moving into Vietnam increases. If in 2016, the number of workers eligible for a permit was 73,119, the figure in 2019 has increased to more than 109,660 international workers from more than 100 countries and territories; working in positions of managers, chief operations officers, experts, and technical workers⁷¹.

Foreign workers working in Vietnam are expected to provide high-quality human resources, contribute to improving social labor productivity, and promote rapid economic growth; create human resources to meet the needs of foreign investors in Vietnam; create a competitive environment between Vietnamese and foreign workers; contribute to on-site human resource training through osmotic interaction (Nguyen, 2015). Attracting highly-skilled foreign workers is necessary to promote supply and demand in the labor market and protect domestic jobs, so that Vietnam can take advantage of opportunities and avoid falling behind. On the other hand, the attraction of highly-skilled labor must also ensure its effectiveness in protecting domestic workers.

⁶⁹ Switzerland has a selective immigration policy (Becker et al., 2008); Germany and the EU applied a "Blue Card" program targeting highly-skilled international migrant workers, especially in the fields of science and technology (Reymen et al., 2015)

⁷⁰ As of April 20, 2020, the total amount of newly registered capital, additional capital, contributed capital, and share purchase rights of foreign investors reached 12.33 billion USD, equivalent to 84.5% of the same period in 2019. Source: Statistical Yearbook 2020 of the Ministry of Labor, Invalids and Social Affairs

This article will conduct a review of policies, measures, and current policies to attract highly-skilled foreign workers in Vietnam compared to actions and policies of other countries. Based on analyzing and evaluating the achievements and challenges of these policies, the article proposes some solutions to improve these policies to attract highly-skilled foreign labour to Vietnam.

2. Method

The qualitative and descriptive research technique is used.

Literature review for labor market policies; policies to protect the labour rights of foreign worker; policies on entry, stay and exit for foreign worker and other related policies to immigrant workers are made. Official policy data is obtained from Ministry of Labour Invalids and Social Affairs.

The result would be fulfilling in labor market policy for Vietnam in general and policy for attracting skilled immigrant workers on purpose.

3. Results

3.1. Policy to attract skilled international migrant workers – a combination of solutions

Attracting skilled international migrant workers includes a variety of solutions covering their entire migration process before entry, entry, working time, length of stay, and departure. While it is a common perception that migration policies are often a barrier restricting the access of immigrants to the labor market in developed countries, in fact,

countries have gradually implemented many selective policies to attract skilled labour (M Czaika, H De Haas, 2014). The primary objective of the policy of attracting skilled international migrant workers is to meet the labor shortage needs in the country without creating a negative impact on the labor market for people (OECD, 2009). Whether the system is driven by supply or demand, highly-skilled migrants are seen as a resource to promote national development. They are considered less welfare-dependent and more relevant to the needs of the labor market than manual labor (Boucher & Cerna, 2014). Based on its priorities and needs, each country chooses to develop and implement appropriate policies, including determining skilled labor conditions and identifying skills for foreign workers to be eligible for working in the country.

There is no uniform definition of “skill”. In many countries, “skills” are defined as occupational skills and/or education level. Similarly, there is no single methodology for analyzing skills needs. That requires a holistic approach: a combination of qualitative analysis and quantitative data. Long-term skills foresight is usually done at the national level. In contrast, short-term skills foresight is done at the regional or local level, often through the Public Employment Service network (PES) (ILO, 2013). To promote skilled international migrant workers, according to the ILO, countries are making broader efforts to strengthen coherence between employment, skills, and migration policies. This includes the use of national qualifications frameworks (NQFs) as a tool to harmonize heterogeneous skill development systems; promote the recognition of skills and qualifications of migrant workers in bilateral and multilateral cooperation frameworks; creating mechanisms and tools for the glory of skills and capabilities of migrant workers (ILO, 2013) are methods that are encouraged to apply.

The points-based employment standards regulations are the orientation system that is said to have attracted more desirable immigration candidates in the long run (Tani, 2014), while the demand-driven systems satisfy short-term economic needs, in which immigration mainly helps to reduce the current labor market shortage (Chaloff & Lemaitre, 2009; Parsons et al., 2014). Today, most countries use a demand-driven system; even countries with a long history of point-based systems have moved in that direction by favoring immigrants having job offers (Gelatt, 2017). Besides immediately addressing shortages in the labor market, immigration policies often target longer-term economic goals such as balancing demographic development or stimulating innovation and investment.

Koslowski, 2014 in his research on *Selective Migration Policy Models and Changing Realities of Implementation*, has conducted a review of selective migration policy models in several countries, including Australia, Canada, and the US. Research showed that selective migration policies rose worldwide as governments tried to attract highly-skilled scientists, engineers, healthcare experts, and information technology experts. Selective migration policies can be grouped into three ideal-typical models: Canada's “human capital” model is based on the state's choice of permanent immigrants through immigration using a point system; Australia's “new company” model is based on state selection using a point-based system with broad business and labor participation; and market-oriented, demand-driven

models based mainly on employer choice for migrants, as the US has done. Policy implications: The Canadian and Australian governments select immigrants using a points-based system based on human capital criteria of higher education and common experience. US employers select economic migrants and most initially arrive on temporary visas. More highly skilled foreigners go to the United States than Canada, Australia and other countries that use the points system combined. The governments of Canada and Australia have shifted policy to a US demand-driven model, with increasing preference given to employer-sponsored immigrants and those already worked with a temporary visa. The Government of Canada has moved the points system criteria from human capital to specific occupations and may eliminate the points-based system.

Countries in the ASEAN region are following the policy of selection requiring only foreign workers to work in certain professions (ASEAN Secretariat, 2020), such as Indonesia, which stipulates that foreign workers only work in 18 fields; Malaysia appoints that foreign workers could only work in 6 sectors (manufacturing, construction; agriculture, forestry, mining, and services). These countries also synchronously implement policies on labor recruitment, immigration and stay for foreign workers, work permit requirements, protection of interests of foreign workers, and requirements of skills recognition for foreign workers. These are policy models that can be used as a reference for Vietnam in finalizing policies to attract foreign workers to work.

Therefore, it can be seen that the policy for highly-skilled foreign workers in countries is based on the demand for skilled labor of that country in which labor market requirements are the dominant factor. Policies on recruitment and employment of foreign workers are presented in three forms (i) allowing foreign workers to work in certain occupations (job positions) with required skills and specific qualifications; (ii) allowing foreign workers to work in several fields in all employment positions with specific qualifications and skills required; and (iii) a combination of both types mentioned above that allows foreign workers to work in certain occupations (job positions) and specific fields. Of the three types above, the third is considered the most restrictive. It is important that these policies all identify skilled foreign workers according to international practices and national needs. Regardless of the approach, the attraction of highly-skilled workers to a country must be carried out synchronously with policy measures to ensure the effective use of professional resources from foreign workers and protect the positions of domestic workers, step by step, improving the quality of human resources.

3.2. Policies to attract skilled foreign workers to work in Vietnam

3.2.1. Policy on Labour market

According to Vietnam Law on Employment, approaching labor market policy including all kinds of adjustment policies affecting the interaction between labor supply and demand, with information on employment trends, labor supply and demand, employment volatility in the labor market, labor market policies to attract foreign workers include recruitment policies, requirements for foreign workers on work permits and other policies on skill requirements.

Policy on foreign workers recruitment

Foreign workers working in Vietnam are identified with the factors: they are foreign nationals and meet the requirements of age, have civil act capacity, are healthy, without violation of law, have a work permit and have proper professional qualifications, techniques, skills and work experience (Article 23 Law on employment 2013). In which, the two most important requirements are that they must have professional and technical qualifications, skills, work experience and work permits. They will come to work in Vietnam in different forms such as contract service providers participating in the implementation of bidding packages and projects in Vietnam⁷².

Employers of foreign workers are only allowed to recruit foreign nationals for four positions: manager, chief operation officer, expert, and technical worker, which Vietnamese workers cannot meet the demand of production and business⁷³ and must explain the need to use foreign workers as well as get approval from the competent authority before recruitment.

The requirements of this policy show that the characteristics of foreign workers entering Vietnam must be workers with professional and technical qualifications, who are highly-skilled workers and are defined to work only in those four types of occupations. Workers coming to work must have a work permit, and the application for this permit is explained by the employer and applying for the permit on behalf of the worker. This clearly shows the critical role of the employer in the process of recruiting and using foreign workers.

Policy on work permits

Foreign workers entering Vietnam legally include two categories: (i) employees who must have a work permit and (ii) employees who are not required to be granted a work permit as prescribed. Work permits are granted to foreign workers who work in positions that Vietnamese workers cannot meet the demand of production and business. Currently, Vietnam laws only allow workers to work in high and middle-level jobs that Vietnamese workers cannot meet the demand of production and business.

For those who are not required to be granted a work permit, there are 20 cases specified⁷⁴. This is one of the extended regulations to encourage highly-skilled foreign workers to work in Vietnam. In which, it is noteworthy that the group of intra-enterprises within 11 service industries in the Schedule of Specific Commitments in Services of Vietnam with the World Trade Organization (WTO) includes: business, information, construction, distribution, education, environment, finance, health, tourism, culture, entertainment and transportation. In addition to the above twenty specific cases, Vietnamese law also stipulates other fields that are not required to issue work permits⁷⁵. This is a reasonably flexible regulation in Vietnam's legal system on licensing to ensure practical implementation and meet the rapidly changing requirements of jobs and occupations in the labor market.

⁷² Clause 1, Article 151 of the Vietnam Labor Code 2019 and Sections a, b, c, d, Clause 1, Article 151 of the Vietnam Labor Code 2019

⁷³ Clause 1, Article 152, the Vietnam Labor Code 2019

⁷⁴ Clauses 3, 4, 5, 6, 7 and 8 Article 154 of the Vietnam Labor Code and Article 7 of Decree No. 152/2020/Government Decree

⁷⁵ Article 154 of the Vietnam Labor Code 2019

The work permit applies to all foreign workers regardless of nationality or ethnicity and applies to all occupations. Foreign workers accepted to work with a work permit do not need to prove their financial self-sufficiency and do not require to know Vietnamese to be granted a work permit. In fact, in some cases, knowing Vietnamese can be a recruitment advantage for employees, but it is not a compulsory requirement for a legal work permit. The maximum term of a work permit is 2 years⁷⁶. In the case of extension, it can only be extended once for a maximum period of 2 years. There is no current law limiting the total number of years a foreign worker can enter the country using a work permit.

Regarding the authority to issue work permits, according to the provisions of Vietnamese law, the state agencies that issue work permits are the Ministry of Labor, Invalids and Social Affairs, the Department of Labor, Invalids and Social Affairs⁷⁷. In which the Ministry of Labor, Invalids and Social Affairs accepts the need to use foreign workers; confirm cases where foreign workers are not eligible for work permits; issue and re-issue work permits; revoke the work permit, and confirm the revocation of the work permit; propose the police agency to deport employees working in Vietnam without a work permit, working for the employer. The Department of Labor, Invalids and Social Affairs confirms cases where foreign workers are not eligible for work permits; issue and re-issue work permits; revoke the work permit and confirm the revocation of the work permit; propose the police agency to deport employees working in Vietnam without a work permit, working for the employer.

Regarding the regulations on the annual quota of foreign workers who can enter and exit with a work permit, in the Vietnamese legal system, there are no regulations on quotas or limits on the number of foreign workers in Vietnam. However, Vietnamese law requires foreign enterprises, agencies, organizations, individuals, and contractors, to explain their need to use foreign workers and have written consent from a competent state agency before recruiting foreign nationals to work in the Vietnamese territory⁷⁸. They need to explain the needs of workers for approval, that is a way for the State labor administration to allow the use of foreign workers based on actual demand instead of granting a quota and without the explanation of practical use.

Policies on Recognition of vocational skills

Regarding the certification of skills, foreign workers subject to work permits need to have skills and qualifications that are certified, confirmed, or recognized by the sending country as required. This regulation shows that Vietnam has the policy to acknowledge skills and experiences that foreign workers have been trained in other different countries.

Regarding labor market assessment requirements, the issuance of work permits for foreign workers requires a labor market assessment to ensure that foreign workers will be recruited only when they cannot find domestic labour to meet the position's demand. Localities often publish newspapers to recruit or through employment service centers to assess their local labor market requirements.

⁷⁶ Article 155 of the Vietnam Labor Code 2019

⁷⁷ The Vietnam Labor Code 2019, Decree No. 152/2020/Government Decree

⁷⁸ Article 152 of the Vietnam Labor Code 2019

3.2.2. Policies to protect the labour rights of foreign workers

Foreign workers in Vietnam are guaranteed their labor rights following Vietnamese Labor Code. Foreign workers in Vietnam are subject to the provisions of the Vietnam Labor Code⁷⁹. Accordingly, the Labor Code 2019 stipulates labor standards; rights, obligations and responsibilities of employees, employers, representative organizations of employees at grassroots, representative organizations of employers in labor relations and other relations related directly to labor relations; State's management of labor.

Vietnam's employment policy encourages agreements that guarantee employees more favorable conditions than those prescribed by the Labor Code (Clause 1, Article 4 of the Vietnam Labor Code 2019). No provision in the Vietnamese legal system that stipulates that the rights of foreign workers are equal to or higher than that of domestic workers. Therefore, the two parties in the labor relations can negotiate better terms, as in fact, in terms of benefits, especially the salary issue, there may be cases where the foreign worker has a higher salary than domestic workers and vice versa.

Foreign workers are provided with information regarding working conditions. Foreign workers subject to work permits are protected against the confiscation of identity documents; are treated equally compared to Vietnamese citizens before the criminal court. They have the right to access social insurance and several other benefits as prescribed by the law. Theoretically, these benefits are provided, but only if Vietnam and the sending country have a bilateral agreement on mutual insurance. However, currently, no employee who pays social insurance premiums in Vietnam can enjoy related benefits because Vietnam has barely implemented the bilateral signing, except for the completed Agreement with the Republic of Korea. Still, it has not been specified in the law due to some technical problems.

Foreign workers subject to work permits can have access to academic institutions and services; access to public health services without restrictions.

3.2.3. Policies on entry, stay and exit for foreign workers

Foreign workers subject to work permits need to apply for an entry visa to enter Vietnam. Visas for foreign workers are designated as LD1 and LD2 – issued to people entering the workforce⁸⁰. Specifically: LD1 is granted to foreigners working in Vietnam with confirmation that they are not eligible for work permits unless otherwise provided for by an international treaty to which Vietnam is a signatory; LD2 is issued to foreigners working in Vietnam who are required to have work permits. After being granted a visa with the symbol LD1 or LD2 (Issued to employees), the foreign workers will carry out procedures to apply for a temporary residence card according to the issued visa symbol.

Foreign workers subject to work under work permits are not required to obtain approval (in the form of an exit visa or an exit permit) before returning to the sending country. Foreign workers who enter under work permits before leaving the country and

⁷⁹ Clause 3, Article 2 of the Labor Code 2019

⁸⁰ Article 1 (amendment to Article 7 of Law 47 at Points e, g, Clause 3) of Law No. 51/2019/QH14 amending and supplementing a number of articles of Law No. 47

returning to the sending country are not required to apply for an exit visa, but must satisfy all exit conditions prescribed in law. Accordingly, the conditions for foreigners to leave the country are clearly regulated, creating favorable conditions for foreigners in general and foreign workers in particular (Article 27 Law No. 47/2014/QH13).

Currently, Vietnam does not have any reintegration program for foreign workers when they return to their home countries, such as support for repatriation and follow-up measures to promote reintegration. As mentioned above, foreign workers working in Vietnam under work permits are skilled workers with good income. They are only recruited into management positions such as executive directors, experts and technical workers, which Vietnamese workers cannot take up according to production and business needs. Therefore, there is no reintegration program for foreign workers when they return to their home countries.

3.2.4. Some special attraction policies

Foreign experts participating in science and technology activities in Vietnam are entitled to priority in recruitment, labor, and study according to the attraction policy specified in Decree 87/2014/ND-CP dated September 22, 2014⁸¹. Conditions to enjoy preferential policies include patents; having appropriate scientific research works; holding a doctorate degree, having been teaching, doing scientific research, and transferring technology at reputable overseas research institutions; having a doctorate degree, having worked for more than 3 years in a scientific research position at an international cooperation program or project on science and technology or a research department of a reputable overseas enterprise⁸². Specifically, during their working time in Vietnam, they are appointed or hired to hold the position of leaders of a science and technology organization assigned to assume the prime responsibility for performing science and technology tasks at all levels; be considered for recognition and appointment of scientific research titles and technological titles according to the provisions of the Law on Science and Technology; be hired to hold the title of leaders of a science and technology organization; be assigned to assume the prime responsibility for performing science and technology tasks⁸³.

Preferential policies include Policies on immigration and residency (multiple visas are granted); Policies on recruitment, labor and learning; Policies on housing; Policies on access to information; Policies on reward and honor; Other policies.

4. Discussion and Conclusion

The policies to attract skilled foreign workers to work in Vietnam, especially the policy on the labor market, demonstrate the Vietnamese government's clear stance on creating opportunities to attract foreign workers. They welcome foreigners who come to

⁸¹ Decree No. 87/2014/ND-CP dated September 22, 2014 of the Government on attracting individuals in science and technology activities who are overseas Vietnamese and foreign experts to participate in scientific and technological activities in Vietnam.

⁸² Ibid 13.

⁸³ Ibid 13.

work in all fields but at the same time ensure jobs for domestic workers by stipulating that foreign workers can only stay in Vietnam in positions requiring skills, qualifications, and positions that domestic workers cannot satisfy. Compared with the policy system of countries in the world and in the region, Vietnam's regulations on foreign labor conditions in Vietnam are relatively open. Accordingly, foreign workers working in Vietnam are categorized in the occupations of managers, executives, experts, and technical workers that Vietnamese workers cannot take up according to production or business needs. Vietnam's regulations have restrictions on some occupations and positions in which foreign workers can work but are not limited to fields. Employers can recruit foreign workers in the above occupational positions in any field that suits their needs as well as production and business capabilities.

Table 1. Distribution of skilled foreign workers by types of occupation (%)

	Management		Technical workers	
	Manager	CEO	Expert	Technical worker
2019	12.00	8.83	56.58	22.54
2020	10.49	8.59	63.33	17.31

Source: Authors' calculations from the source of Ministry of Labour Invalids and Social Affairs's Statistical Yearbook 2020 of the Ministry of Labor, Invalids and Social Affairs

The policy on foreign labour entering Vietnam to work requires the recognition of qualifications of trained foreign workers. Accordingly, foreign workers can submit their training degrees abroad certified by a competent authority. This regulation creates good conditions for foreign workers to access the labor market. The policy of foreign workers to work in Vietnam sets out the process of requesting the skill level of foreign workers to be considered in terms of both professional qualifications and work experience. Correspondingly, experts are defined as foreign workers who have a university degree or higher or equivalent and have at least 3 years of working experience in a specialized field, trained in accordance with the job position they expect to take in Vietnam; or who have at least 5 years of work experience and have an appropriate practice certificate. Technical foreign workers are the ones who were trained in technology or other majors for at least 1 year and have worked for at least 3 years in the trained professional; or who have at least 5 years of work experience in accordance with the job position that they expect to take in Vietnam. This is an overarching regulation that approaches both work experience and training levels.

Regulations for skilled foreign workers have covered and adjusted the process of foreign workers working in Vietnam with policies including policies on labour recruitment, granting work permits, and protecting labour rights of workers and their families; policies on entry, stay and exit; special preferential policies for workers with special skills, policies on labour management. These are regulations that ensure the smooth movement of skilled workers.

However, there are a number of problems with the policies for skilled foreign labour working in Vietnam, which are:

There are no criteria to identify jobs that Vietnamese workers cannot do, leading to difficulties in implementation. Similarly, there are no specific criteria for experts, good managers, and highly qualified technical workers that Vietnam really needs and Vietnamese workers have not yet met (except for the implementation of commitments and international treaties to which Vietnam is a signatory). At the same time, there have been no specific instructions on managing and using this skilled foreign labour force for the right purposes and effectively.

The licensing process is cumbersome and requires a higher level of information technology application. Attracting skilled foreign workers involves a variety of policies that require close linkage among different policies and coordination of competent authorities.

There are no criteria to distinguish the levels of skilled workers, such as skilled workers, medium-skilled workers, and highly-skilled workers. Currently, Vietnam has only one type of work permit that applies to skills at all levels. There are special preferential policies such as policies on immigration and residency (multiple visas are granted); policies on recruitment, labor and learning; policies on housing; policies on access to information; policies on rewards and honors and policies which have been issued with the clear aim of attracting individuals who are foreign workers to participate in technology activities in Vietnam. However, the subjects to whom those policies apply are limited and the preferential policies have also not been explicit, especially the work permit process.

In conclusion, to effectively attract and use skilled foreign workers in Vietnam, it is necessary to consider the outstanding issues analyzed above, especially the need to define the criteria for skilled labor clearly. A proper process should be developed and labor market assessment should be carried out before recruiting foreign workers. In addition, it is necessary to continue to revise the policy, reduce the procedures for granting permits and re-granting permits, to shorten the time to carry out consular legalization procedures. Besides, it is a must to perfect policies on social insurance, health insurance, unemployment for foreigners to participate while working and also to perfect policies on recognizing the number of years of participation/contribution when returning home. At the same time, in the context of international integration, in order to encourage foreign investment and create favorable conditions for skilled foreign workers to work in Vietnam, there should be more explicit preferential policies in the procedures for foreign investment. It is also required to amend and supplement the Law on Enterprises and the Law on Investment, including the content on labour management. For instance, when establishing an enterprise and going into operation, there must be a plan to use Vietnamese and foreign workers which the authority approves. There should be specific regulations on the appropriate level of capital contribution for foreign investors and business owners, who are not eligible for work permits for foreign workers, in accordance with international practices. In particular, it is necessary to develop policies to attract talents and improve labor quality.

Attracting and effectively using skilled foreign labour is defined in the guidelines of the Party and the State of Vietnam as an important task in promoting the development of the labour market, employment, and improving the quality of the domestic labor market; Skilled

labour also plays an essential role in applying and transferring advanced and modern science, technology and management skills in the world to localities, contributing to the achieving socio-economic development goals effectively, ensuring national defense and security throughout the country, expanding Vietnam's cooperation relations with other countries⁸⁴. Therefore, policies to attract skilled foreign workers to work in Vietnam need to be promulgated. They should be flexible and appropriate, ensuring the harmonious interests between the state - enterprises - foreign workers; ensuring a balance between attracting skilled foreign workers and securing jobs in the country.

Abstract

Hanoi capital is one of the localities leading to the developing Vietnam's night-time economy (NTE). Space for NTE development concentrated in the old town and around Hoan Kiem lake has been placed for promoting the night-time economy in Hanoi city. Many models of NTE development have been implemented, such as pedestrian streets, art performance spaces, night markets, and food streets. However, NTE growth is still mainly concentrated in the old town, and the models are not diversified. The research studies the current situation of growing NTE models in Hanoi city, thereby proposing solutions to develop NTE models in Hanoi city.

Keyword: *Night economy; night service; tourism*

1. Introduction

The concept of night-time economy first appeared in the 1980s; the phrase "Night-time economy", in its most primitive form, is used synonymously with the concept of "24-hour city".

The nature of the NTE and the trends in night-time consumption behaviour vary widely among countries and even among different areas within a country. Consequently, determining the scope and limits of the current night economic fields is also diverse. In countries defining NTE in a broad sense, it is all the social, cultural and productive activities during the night-time. On the other hand, in countries defining NTE in a narrower sense, it is a collection of activities of the cultural economy that take place at night, mainly recreational activities such as bars, discos, karaoke facilities, music venues and nightlife entertainment forms (such as night markets, night malls) ...

In Vietnam, the Prime Minister recently issued Decision No. 1129/QĐ-TTg approving the Project of growing NTE in Vietnam. Accordingly, the Project's objective is to exploit the potential of NTE development to make the most of new economic development opportunities, improve incomes and living standards of locals as well as minimise risks and negative impacts on the work of ensuring political security and social order and safety. In

the immediate future, growing the NTE is to promote domestic consumption and tourism development by focusing on developing the fields of cultural services, entertainment, food and beverage services, shopping services, and travel, taking place from 6 pm to 6 am.

This economy must ensure the following requirements: (1) Priority needs to be given to economic growth, job creation and community cohesion, and social exchanges among Vietnamese people, between Vietnamese people and foreigners, especially tourists. 2) Encourage the development of a variety of new industries/activities, especially creative industries, tourism, retail, food and beverage, etc. (3) Encourage effective participation of businesses in consulting and implementing policies on NTE development. (4) Create impetus to promote the development of public services and optimize public services, significantly reducing infrastructure overload during the day. (5) Identify and effectively handle risks and negative consequences from night economic activities.

In summary, the definition of NTE is specific business activities aiming to promote consumption and develop tourism by focusing on developing the fields of cultural services, entertainment, dining, shopping, and travel taking place from 6 pm until 6 am.

2. Method

2.1. Data collection methods

About survey subjects: 4 groups of subjects were selected including residents, tourists, business establishments and managers.

Regarding the scope of the survey: people, businesses and managers in Hanoi City, while tourists are nationwide but have been to night tours in Hanoi.

Regarding the form of distributing/sending survey forms: due to the impact of the COVID-19 pandemic, the authors conducted an online survey through the Google Form platform.

About sample size: In this study, the number of observed variables is 43 variables, so the minimum sample size is $5 \times 43 = 215$ survey participants.

About sampling method: select districts with potential for night economic development including Hoan Kiem, Tay Ho, Dong Da, Nam Tu Liem, Ha Dong and Gia Lam.

- For households and businesses: 100 votes.

- For residents and tourists: 300 votes, randomly selected.

- For experts and scientists: 100 votes (subjects are experts and scientists in departments and research institutes of Hanoi city). The total number of survey questionnaires is expected to be 500 according to the design. But in the process of statistical data processing, the total number of votes actually collected was 463, with the specific numbers as follows: Tourists: 147 votes; People: 110 votes; Manager: 104 votes and business 102 votes.

2.2. Data processing method

Team cleaned up and retained 463 satisfactory votes. Data were processed and analyzed using SPSS Statistics software.

3. Results

3.1. Night economic products and services

For many years, NTE has been formed in Hanoi city, especially in Hoan Kiem, Ba Dinh and Tay Ho districts. On weekends from Friday to Sunday, some night activities have become cultural activities of the locals and a must-go destination for tourists when going to Hanoi:

i) Organize a pilot to extend the business time limit to 2 am

Implementing the policy of the Party Committee and People's Committee of Hanoi City on piloting service business activities until 2 am from 7 pm on Fridays to 12 am on Mondays. In September 2016, Hoan Kiem District People's Committee implemented a pilot organization to extend the business time limit to 02 am for service businesses, attracting the participation of 65 qualified businesses.

This has created more entertainment space, attracted tourists when coming to the capital and Hoan Kiem district; met the needs of entertaining, exchanging the cultures, discovering the nightlife of tourists, especially international tourists, increased the length of stay, and increased the spending level of tourists. As a result, the average contracted revenue per month in 2017 of participating establishments increased by 55% compared to 2016, increased by 30% in 2018 compared to 2017, in 2019 increased by 10% compared to 2018.

ii) Organizing the Walking Space

To implement the policy and direction of the Standing Committee of the Hanoi City Party Committee; Plan No. 159/KH-UBND dated August 24, 2016, of the City People's Committee on organizing the pilot implementation of pedestrian space in Hoan Kiem Lake and its vicinity, from September 1, 2016, Hoan Kiem District People's Committee has been nominated as the host institution coordinating with City Departments to organize the implementation of walking space in the Hoan Kiem Lake area and its vicinity, with a range of 16 streets around Hoan Kiem Lake area during the period from 7 pm on Fridays to 12 am on Mondays every week.

Until now, the walking space in Hoan Kiem lake area and its vicinity has become a destination, rendezvous point and highlight of the capital; creating a space for entertainment and relaxation for the residential community, domestic and foreign tourists; an interesting meeting place for all residents and visitors; effectively promoting the values of cultural heritage, water landscape, and green trees of Hoan Kiem Lake (a special national relic), making contribution to the promotion of the image of Hanoi Capital - City for Peace, Creative City; stimulating the development of trade, services, tourism, promoting the economic development of Hoan Kiem district and the capital. The number of new business shops, as well as stores changing their business purposes into serving services and tourism, is 53 establishments. The number of domestic and foreign tourists visiting and participating is huge (on average, there are about 3,000 to 5,000 people during the day, about 1.5 to 2 thousand people at night).

Pedestrian streets Hang Dao - Hang Giay combining commercials and Dong Xuan night market: has been organized since 2004 (including streets of Hang Dao - Hang Ngang

- *Hang Duong - Dong Xuan - Hang Giay*) from 6 pm (7 pm in the winter) to 12 am on Fridays, Saturdays and Sundays; the total number of household businesses in the street area is 301 households (in which, there are 143 business establishments with facades, doing business in the evening); the total number of families doing business on the roadbed is 405; the total number of business households at Dong Xuan night market is 230.

Extended pedestrian streets of Grade I Conservation Area - Hanoi Old Quarter: has been organized since 2004 (including streets of Hang Buom, Ma May, Dao Duy Tu, Hang Giay, Luong Ngoc Quyen, Ta Hien) from 6 pm (7 pm in the winter) to 12 am on Fridays, Saturdays and Sundays. Currently, the total number of business households in the street area is 489, the total number of business households doing business at night is 373, in which the figure for doing business on the roadbed is 127.

Expanded pedestrian streets to the South of the Old Quarter connecting to the North of Hoan Kiem Lake area: organized and deployed from December 25, 2021, including Dinh Liet, Gia Ngu, Cau Go, Hang Be streets, Hang Dau, Hang Bac, Dao Duy Tu (section from Cho Gao to O Quan Chuong), O Quan Chuong (including O Quan Chuong street and the area of Hang Chieu - Thanh Ha intersection), Cau Go alley, Trung Yen alley, Phat Loc alley from 6 pm (7 pm in the winter) to 12 am on Fridays, Saturdays and Sundays. The number of households doing business on the street side is 384 households. The number of families doing business in the evening is 144 households, of which 89 households use the sidewalks (46 restaurants and 45 shops trading in clothes and shoes...).

In addition, to the pedestrian space of Hoan Kiem Lake and the Old Quarter, Hanoi City continues to deploy pedestrian streets such as Trinh Cong Son Street (Tay Ho District), Son Tay Ancient Citadel (Son Tay Town), Walking Street around Ho Ngoc Khanh (Ba Dinh district), a pedestrian street in Hoang Mai district.

iii) Organizing night food spaces

Food space at Dong Xuan Night Market: Implemented in 2003 in the area next to Dong Xuan market (Hang Khoai Street) from 6 pm (7 pm in the winter) to 12 am tomorrow on weekdays with 11 food stalls at night. At the time of implementation, it attracted a lot of attention from visitors; even customers needed to book in advance or queue to enjoy food at Dong Xuan market.

Culinary space at Tong Duy Tan street - Hang Bong alley: started in 2003. As of March 1, 2018, the District People's Committee has built and implemented Project No. 34 on building a model of a "Food safety street with the control of commercial civilization Tong Duy Tan - Hang Bong Alley (Cam Chi)". This is the typical food street of the district, a unique destination that well serves domestic and foreign tourists. Through implementation, the food safety and quality of food service in these establishments (54 establishments, including 08 restaurants, hotels, 31 shops and 15 street food establishments) are improved, attracting tourists, especially after 6 pm every day.

The City continues to deploy the night food street Ngoc Island - Ngu Xa, Truc Bach ward, Ba Dinh district.

iv) Organizing museum spaces and historical sites for night tourism

At Thang Long Imperial Citadel, Thang Long Heritage Conservation Center - Hanoi has re-launched the night tour "Decoding the Thang Long Imperial Citadel". The tour focuses on special historical and cultural values of the world cultural heritage Thang Long Imperial Citadel, giving visitors different and attractive experiences, and highlighting relics and relics. Precious uniqueness of the heritage site.

v) Model of organizing night art performances

Hanoi has made art as a part of tours for a long time. Hanoi Cheo Theatre, Hanoi Cai Luong Theatre, Thang Long Puppet Theater, and even Hanoi Drama Theater each has their own shows to serve visitors. The Hanoi Cai Luong Theater also applies a bilingual stage model, and translates a lot of Vietnamese excerpts into English... With the indoor stage model, Hanoi has had a number of famous shows, such as: "Jonah" with a harmonious combination of various types of circus art, dance, drama... on a stage with eye-catching effects, taking place at Galaxy Lang Ha theater; Circus "My Village" at the Opera House, etc.

With a realistic stage model, the play "The Essence of the North" also resonated with many domestic and international awards, attracting the attention of a large audience. However, those who work in the field of tourism also feel that those products are not attractive enough compared to the great cultural potential of the *Capital*, a lot of works have short lifespan. The catchphrase of tourists, "sang roi, toi pho" also partly reflects this.

3.2. Quality of the night- time economy

Regarding the level of satisfaction with the quality of NTE services: through analysis of both growth and changes in the structure of NTE in Hanoi, we can make some comments that: although the night economy in Hanoi has grown rapidly in recent times, in terms of its quality, it is still at a low average level. This is clearly shown through the survey results of the authors' group with 200 tourists in Hanoi city.

Table 1. Actual situation of night economic service quality as assessed by tourists

Unit: percent (%)

Service	Very unsatisfied	Unsatisfied	Normal	Satisfied	Very satisfied	Total
Restaurants, bars,	2.7	0.0	34.2	57.5	5.5	100.0
Coffee and beverage service	2.1	0.7	28.3	60.0	9.0	100.0
Supermarkets, convenience stores	2.1	0.0	36.1	52.8	9.0	100.0
Walking street, night market	1.4	2.1	49.0	41.3	6.3	100.0
Hotels, motels	2.8	2.8	43.0	45.1	6.3	100.0
Sightseeing transportation services by boat, tram, cyclo, bicycle, bus, city tour	2.2	8.6	60.4	28.1	0.7	100.0
Bars, discos, karaoke	2.2	5.2	67.2	23.1	2.2	100.0

Service	Very unsatisfied	Unsatisfied	Normal	Satisfied	Very satisfied	Total
Museums, exhibitions, cultural and historical sites	2.9	6.5	49.6	36.7	4.3	100.0
Entertainment programs, festivals, events	2.8	2.1	47.5	43.3	4.3	100.0
Theatre and music activities	2.9	2.2	46.3	41.2	7.4	100.0
Massage, beauty and health care services	3.0	3.8	49.2	38.6	5.3	100.0
Sports and exercise	5.2	2.2	53.0	30.6	9.0	100.0
General service area	3.6	4.4	52.6	36.5	2.9	100.0
Casino services and other services	8.1	10.5	62.1	17.7	1.6	100.0

Source: Author's survey results

The survey results show that most of the services are rated as "normal" by around 50% of tourists, the services at the restaurant are the most satisfied by tourists (57.5%); while the figures for some other services are as follows: restaurants serving coffee and refreshments (60%), supermarkets, convenience stores (52.8%) and hotels and motels (45.1%) in Hanoi. A few services are rated at a very good level by 9% of tourists, such as coffee and refreshment services, a system of supermarkets, convenience stores and fitness centres.

Unit: percent

Figure 1. Satisfaction with the quality of night economy services of tourists

Source: Author's survey results

Other services such as services at bars, discos (67.2%), casino services (62.1%), sightseeing transportation services (60.4%), sports and exercises (53%), general services area (52.6%), museums, exhibitions, cultural and historical relics (49.6%), beauty massage

services, health care (49.2%), services on pedestrian streets, night markets (49%), entertainment programs, festivals, events (46.3%), ... mainly rated at the medium level of quality. Some services are rated as "poor" by some tourists, such as casino services (10.5%), sightseeing transportation services (8.6%), museums and exhibitions, cultural relics, history (6.5%), and sightseeing transportation services (5.2%). Meanwhile, casino services (8.1%) and sports and exercise activities (5.2%) are rated as "very poor".

4. Discussion and Conclusion

4.1. Some general assessments of the night- time economic growth in Hanoi city

+ Positive points

Along with the rapid development of socio-economic and international integration, NTE in general and NTE activities in particular in Hanoi are also increasingly developed and diversified.

Firstly, Hanoi city initially succeeded with supporting policies, contributing to the development of the NTE, and helping it to increase in size and quality. For example, the People's Committee of Hoan Kiem District organized the expansion of operating hours to 2 am during three days of weekends for business and service establishments in the district in combination with many planned streets, such as Hang Khay, Le Thai To, Dinh Tien Hoang, Nguyen Xi, Trang Tien, ... Hoan Kiem pedestrian street and surrounding areas, which has contributed significantly to promoting the City's development of tourism, trade and service. Of course, it is a place for walking and chatting, but the pedestrian street is also where hundreds of large and small cultural events, spontaneous art performances and folk games take place, attracting many special people's attention, especially tourists.

Secondly, thanks to the development of the night economy, Vietnam's tourism industry has made positive contributions to the GRDP of Hanoi city over the past time. Specifically, in 2017, the tourism industry contributed 8.07% to the City's GRDP, of which the direct contribution was 3.24%, the indirect contribution was 4.83%; the figure for 2018 was 10.15%, of which the direct assistance was 4.12%, and the indirect contribution was 6.03%. In particular, with many tourists flocking to the old town, it has created significant job opportunities for workers, increased income for small businesses, and attracted tourists. Having consulted with restaurants, big hotels in the City, and big travel companies that have brought international and domestic tourists to Hanoi from 2017 to the present, most of the comments support the development of the night economy with the aim of attracting tourists, providing services to serve guests' needs, increasing revenue for the unit and increase the economic effectiveness for the city.

Thirdly, Hanoi city has formed typical destinations of the NTE, such as Ta Hien Street, the old town night market, etc. These areas have contributed significantly to the increase in quality and diversity of Hanoi's tourism industry, creating a premise for the city to pilot night economy spots larger in scale and richer in genres. On weekends, with the presence of pedestrian streets, business and entertainment activities are becoming very active around the Hanoi Old Quarter area. In addition to the main business activities: dining, clothing, convenience stores, hotels, spas, bars, karaoke..., there are many other types of

follow-up businesses such as Taxi, cyclo, dancing and music on the pedestrian street, etc. All of these create a very typical night space in Hanoi.

Negative points

In general, Hanoi city has changed to exploit the potential of the NTE. However, there are still limitations that the city needs to overcome to take advantage of and promote these potentials better in the future. Specifically, some rules that we can see when studying the NTE of Hanoi are, such as:

First, the quality of the NTE is still low. Although the number of businesses and households has increased rapidly, the quality has not been improved much. The poor quality of services means that the revenue of companies and business households will be less, leading to negligible contribution to the City's GDP growth. The most active is in the informal sector. This makes it difficult for Hanoi to promote the development of the night economy.

Second, services and products are not diversified: The number of entertainment and festival activities to serve tourists in Hanoi is also relatively modest. Apart from traditional theatre-like Vietnamese Drama theatre or Thang Long Puppet theatre...., Some other traditional art activities are almost only seasonal or on holidays. This makes the NTE in Hanoi "boring" for a part of foreign tourists.

Third, business activities are still "grabbing". In many tourist spots in Hanoi, especially in the establishments providing food and beverage services and transportation, there are still unprofessional activities and, in many cases, "hacking" tourists. They only look at the short-term benefits, ignore the long-term benefits to invite guests to return in the future, and create a bad impression on visitors. In addition, standards of food quality and safety and urban hygiene standards have not been strictly followed, and the service style for tourists is still unprofessional.

Fourth, the business scale is microscopic; night economic activities are still poor and monotonous with unclear economic effectiveness. Hanoi does not have quality and regional nightlife entertainment complexes. The development of Tourism products and services is still boring, lacking in identity, small in scale, and mainly concentrated on culinary activities, night markets or walking streets. Meanwhile, Entertainment activities, art performances at night, shops, supermarkets, and busy night shopping areas have not been synchronously formed.

Reasons

Objective reasons

Firstly, the State's mechanisms and policies are still inadequate, reflecting the imposition of managers' thinking on economic activities, not matching the needs of tourists. The policy mechanism has not been completed, so many problems have not been resolved, and there are no effective policies to support NTE. According to the research team's survey, up to 72% of night-time businesses and households in Hanoi complain that the City's current policies do not support business well. The policy is rigid, failing to classify businesses and households doing business at night, which leads to equating and not promoting the full potential of the NTE in Hanoi.

Second, the policy's awareness and logical thought are not compatible with the importance of NTE development. This is shown when the night economy has not yet become an economic sector with an essential contribution to GDP growth. There are no specific reports and statistics on the contribution of NTE to socio-economic development.

Third, the legal framework and management of NTE growth are not good. The services, time, area, and participants in those fields... have not met the standards of noise, light, and the distance from residential areas, hospitals, and schools. Many business establishments night business; many restaurants, and coffee shops that use high-powered music ("bars") are located in the residential area. This affects the noise to the lives of people in the surrounding area. People have petitioned not to grant business permits until 2 am for restaurants and bars too close to residential areas.

Fourth, the spatial planning policy is still inadequate. In fact, due to the lack of planning, many night business establishments are positioned next to the residential area; many restaurants and coffee shops that use high-powered music ("bars") are located in the residential area. This affects the lives of people in the surrounding area negatively. People have petitioned not to license restaurants and bars too close to residential areas to operate until 2 am.

Some development areas lack planning, so they have not yet attracted tourists. Lack of synchronous and clear planning, so the pedestrian streets lack cultural and art programs, street vendors pulling and slashing tourists, and indiscriminate littering have adversely affected the environment. Because of not being properly planned, many streets became chaotic. Shops overflowed into the street, taking up space while the wider streets, suitable for services, were empty.

Fifth, public transport services and transport infrastructure are still weak. This is one of the reasons why Hanoi's night economy cannot develop quickly. Up to 49% of tourists find it difficult to have access to means of transportation such as taxis, buses, and motorbike taxis when participating in night economic activities, especially after 12 pm. Without good infrastructure, the attraction of tourists will be much less. Moreover, traffic infrastructure and public transport in urban infrastructure conditions is sometimes overloaded.

Subjective reasons

Regarding The organization and planning of ministries, Hanoi city and especially the 3 districts: Hoan Kiem, Ba Dinh, Tay Ho have not yet concretized the policy of developing the night economy.

Firstly, Hanoi does not have policies to support and encourage enterprises to do business in the night economy. Therefore, the provision of night products is still limited, leading to an unfavourable business environment and not attracting many domestic and foreign investors.

Second, public policy is still limited. Few policies are put in place to address the problems of residents as well as visitors: noise problems, environmental pollution, the ability to access the information, neighbourhood security and other public services. For example,

the street light system has been improved in Hoan Kiem pedestrian street. However, the camera system is still not enough, leading to pickpocketing, theft and unwanted problems with visitors.

Third, although there are many opportunities from globalization integration and urbanization, Hanoi has not yet grasped and taken full advantage. The number of visitors to Hanoi tends to increase, but the area has not yet created many products and services to attract tourists. Night activities are not diverse, and there are few places for entertainment and experience tourism.

Fourth, the management level of the enterprise is not effective. Specifically, the capacity and working skills of the business owner are not professional.

Fifth, enterprises and business households have not built up a high reputation and have not made a difference in attracting domestic and foreign investment capital. That has led to inadequate facilities, inadequate security camera systems and an unscientific layout, causing difficulties and feelings of insecurity for visitors.

Sixth, the number of night services to serve tourists is relatively small, as well as the quality of the service is not safe.

Seventh, the sense of self-discipline, civility and politeness of a part of the people is not high, leading to indiscriminate littering. As a result, after every night of events, the roads and sidewalks are full of garbage, slick sewage, etc very unsightly urban. In addition, the limited ability to communicate in foreign languages of some individuals and units participating in night economic activities affects the attraction of foreign tourists to use night services.

4.2. Solutions to develop the night-time economy in Hanoi city

Firstly, it is necessary to have a clear direction for building and completing the legal framework for night economic activities in Vietnam. Accordingly, mechanisms and policies for the development and management of the night economy must be built based on clarifying the current status, causes, obstacles and advantages and suitable to Vietnam's conditions. Furthermore, to encourage large private sector enterprises to participate in the construction and development of the NTE and to build the technical infrastructure for night operations.

Separate planning of economic zones at night but not too far from the centre, ensuring connection with the urban centre. Strict management and supervision to ensure security and safety for people.

Developing mechanisms and policies for NTE development. It is necessary to develop stable and appropriate mechanisms and policies to encourage the private sector, including business households, small and medium-sized enterprises and large enterprises. In addition, focus on management mechanisms and investment in fundamental infrastructure for NTE.

Second, the improvement of mechanisms and policies for the NTE must be consistent with the national legal framework for economic development. However, the development of

the night economy depends on the needs, strategies, plans and goals of each locality and does not have to be developed simultaneously in all 63 provinces and cities. Therefore, the legal framework for NTE must be based on the existing legal framework. Review, evaluate and perfect mechanisms and policies to be suitable for NTE's activities and to be consistent with the principles of the socialist-oriented market economy in Vietnam.

Third, ensure principles when developing or perfecting the legal framework for NTE activities. In particular, preferential and supportive policies for businesses operating in NTE industries and fields must be equal, fair and non-discriminatory. In addition, the design of the legal framework for NTE should be based on the consideration of the financial flows that need to be invested in for implementation.

Fourth, for financial support policies: Only provide financial support to businesses, business households and employees participating in NTE activities in special cases or when it is necessary to create provide initial financial leverage. Do not apply widespread support policies, ensure compliance with international commitments and ensure equality among economic sectors.

Fifth, focus on perfecting mechanisms to manage NTE activities well and exploit the maximum potential of this model, including: type of business; business area, restricted area; curfew; operating time; operating license; performance standards (noise, light...); policy on night traffic; public infrastructure; security policy; policies to encourage and support consumers and tourists to participate in NTE activities. Strong decentralization for localities in the management and development of NTE.

For regulations of sensitive entertainment industries, it is necessary to consider loosening regulations from entertainment fields that have little negative impact on security, safety, crime such as karaoke services, casino discotheques, etc. In addition, reviewing, adjusting and supplementing regulations, strictly handling individuals and business establishments that commit acts of violating public order, security and hygiene food safety, frauds, criminal acts to ensure the rights and safety of consumers and visitors. Legalize licensing regulations to control and manage sensitive activities while ensuring the maintenance of the NTE operating environment and ensuring safety for participants.

Sixth, Hanoi city must coordinate with ministries to develop policies to encourage enterprises and business households to participate in the NTE activities.

Through the above analysis, it can be seen that the development of the night economy of Hanoi city is necessary and is the driving force to promote the economic development of Hanoi to become more diversified and more efficient and creates attractiveness for international visitors after the Covid19 pandemic. However, the development of the night economy will also generate negative effects, especially regarding security, order and social issues... Therefore, it is necessary to have synchronous solutions to develop and exploit the great potential of Hanoi city and minimize the negative effects of the NTE.

Abstract

Night-time economy is playing an increasingly greater role in the economy of many countries. The coronavirus pandemic has made Vietnam adopt a new approach to the development structure, in which the night-time economy is expected to be a new driver of growth. This paper aims at exploring and analyzing young people' awareness and behavior towards night-time economy as well as their contribution to the to the development of night-time economy, thereby proposing some solution to encourage their participation into the activities. To achieve the research purposes, both secondary and primary data were used. Primary data were collected based on a survey 336 young people living, studying and working in Hanoi, one of the most vibrant cities in Vietnam. The results show that the night economy has made a certain contribution to the development of Hanoi, which is reflected in the expansion of the night-time economic activities, the level of interest of the youth, and diversity service type. In addition, the survey results also show that the perception, attitude, and perceived behavioral control affect the ability of young people to participate in the night economy, thereby providing a framework of influencing factors. On that basis, some implications are proposed to improve the attraction of the destination, create a non-stop rotation for commercial activities, and bring maximum benefits to the night economy in particular. and the country's economy in general.

Keywords: *behavior, Hanoi, night-time economy, young people.*

1. Introduction

The concept of the night economy has become increasingly popular since the 1990s as it seeks to cover the changes to the organization and participation of life as night falls, especially in urban areas. The different tempo of work and leisure, as well as the growing economic importance of the service industry (especially tourism), have promoted the idea of a 24-hour city with plenty of leisure activities which should be more flexible and diverse,

especially "cultural-intellectual" (Rowe, 2007). The night economy is the services, business models, and activities held between 6 p.m and 6 a.m. Commercial and entertainment activities are aimed at satisfying the needs of tourists, in addition, they also take place at night to serve the needs of local people for trading, consumption, and entertainment (Huong, 2021).

Over the years, the value of the night-time economy has been constantly growing, starting to attract special attention from researchers as well as from practitioners. The activities that take place at nightfall have brought huge revenue to the developed countries, the table below lists some of the leaders in this field and their contribution to the GDP of the night economy.

Table 1. Night-time economy's contributions to some countries

Content	England	America	Australia	France	Japan	Thailand	China
Contribute to GDP	Average revenue of 66 billion pounds a year Contribute 6% to GDP	Revenue of 6 billion USD in San Francisco (2015) and 10 billion USD in New York	Revenue nearly 134 billion USD (2018) is about 4% of GDP	Revenue about 2 million euros in France	Estimated at 3.7 billion USD (2020)	About 5.5 billion USD/ year	Market scale is estimated at 2,400 billion USD (late 2020)
Number of jobs created	1.3 million jobs	300,000 jobs (New York)	1.1 million jobs	3.5 million jobs	No figures available	No figures available	No figures available

Source: Industry and Trade Magazine

Vietnam also has the advantages to develop a "night economy", thanks to natural factors such as rich tourism resources and is increasingly becoming a favorite destination for many international tourists. Besides, Vietnam has many advantages such as having a young population that prefers to live in cities, typically in Hanoi. Hanoi is also considered an attractive destination for international tourists, the capital's night service resources are diverse, an opportunity to develop a lot of night service products to attract tourists, In addition to factors such as unique culture, art, and cuisine, there is a high degree of integration and globalization as well as relatively pleasant night weather.

Theoretically, there are still not many studies on the behavioral aspect of participating in the night economy, especially in Hanoi. Some new studies stop at development policies without systematic studies to identify the factors affecting the behavior of young people participating in the night economy in particular and the entire population in general. To contribute to filling the research gap mentioned above, the authors focus on analyzing the current awareness and participation behavior of Hanoi youth in night economic activities and assess the factors affecting their decision to participate in the future.

The remainder of this paper is organized as follows: The second part presents literature and reference research. The third part focuses on the method. The fourth part focuses on the situation of the night-time economy in Ha Noi. The fifth part presents survey results and implications. The final part is for the conclusion and future research.

2. Theoretical basis and Literature review

This study will use the combined theoretical foundation of TPR, TRA, and TPB, and also refer to several foreign and domestic researches.

2.1. Theory of Perceived Risk (TPR)

Risk is an abstract concept, which is trying to make the future visible in advance of the current state of a topic, by predicting adverse circumstances and their negative impact on the future. Bauer (1960) asserts risk does not come from the "real world" but rather from the subjective perception of consumers that affects their behavior. Participants begin to feel it when they are faced with uncertainty and (negative) consequences (Cox & Rich, 1964). The higher the uncertainty and negative results, the higher the perceived risk (Hong & Cha, 2013). The higher the perceived risk, the more likely the consumers will need more information about the product, so it will influence consumption decisions. This tends to be more complex and prolonged and can ultimately be a decision to get rid of consumption. As a result, the perceived risk becomes one of the most important and powerful concepts in explaining consumer behavior.

2.2. Theory of Reasoned Action (TRA)

The Theory of Reasoned Action (TRA) was developed in 1967 and has been extensively calibrated over time since the early 1970s by Ajzen and Fishbein. In the TRA model, attitude is measured by the perception of the attributes of a product or service. Participants will pay attention to attributes that provide essential benefits and have varying degrees of importance. If the weights of those attributes are known, it is possible to predict the outcome of the participant's choices very closely. Subjective normative factors can be measured through people involved in participation (such as family, friends, and colleagues); these people like or dislike their participation in night economic activities. The degree of impact of the subjective norm factor on the propensity to buy and use services of the participants depends on: (1) the level of support/opposition to participating in the night economy and (2) the motivations of the participant according to the wishes of the influencer. The greater the participant's trust in the stakeholders, the greater their propensity to participate. Participants' intention to purchase products, entertainment, and relaxation will be affected by these people with different strong and weak influences.

2.3. Theory of Perceived Behavior (TPB)

The Theory of Perceived Behavior (TPB) is an extension of the theory of rational behavior (TRA) (Ajzen and Fishbein, 1980; Fishbein and Ajzen (1975). However, the TPB model is considered to be more optimal than the TRA model in predicting and explaining consumer behavior in the same research content and context. Because it overcomes the shortcomings of the TRA model by adding the element of "behavior control", the central factor in the theory of planned behavior is a person's intention to perform a certain behavior.

The intention is believed to be the motivating factor that leads to behavior, it is a predictor of how much effort people will put or how much effort they plan to put into performing a particular behavior. In this theory, the "intention to perform the behavior" is strongly influenced by three factors: (1) attitude - as a general rule, the more favorable the attitude towards the behavior and the stronger intention, (2) subjective norms, (3) perceived and controlled behavior. If there are enough resources to ensure the success of participation, they can fulfill their intentions as soon as they have chances. The importance of each factor above is not completely the same in each research context. In this study, we focus on the attitudes towards the behaviors.

2.4. Literature review

Thanawadi & Veerisa (2021) applied The theory of Reasoned Action and The theory of Planned Behavior to develop a model about intention to participate in the nightclubs and bars at Bangkok, Thai Lan - ranked 10th in the list of destinations with the best nightlife cities all over the world and located five of renowned Asia's Best Bars in 2020 (Manson, 2014; Sgarbi, 2020). The authors proposed five factors which affect the consumption intention, include: atmosphere; drinks and variety; accessibility; price and service crew. Thanawadi & Veerisa approached 310 respondents with convenience sampling technique through online distribution channels. Analyzing and data processing concluded that four out of five factors, except price, have a great influence on the intention of participating consumers.

M. Chew's qualitative research on four dilemmas in nightlife in China: The social costs of the night economy, the impact of nightlife participation, night labor, and issues of sex theme at night. M.Chew evaluated and compared the differences in night economic models and night culture between China and Western countries. Many entertaining activities that are considered normal for the United Kingdom but there are only consumed by the lavish Chinese elite. Moreover, gender and the issues surrounding it are also not culturally appropriate within China. The four fields explored are not meant to be comprehensive. However, there are premises for adjustment and new development directions.

The study "Development of night economy tourism in An Giang" by Pham Dinh Long and Nguyen Huynh Mai Tram emphasizes that the night economy plays an important role in economic growth, culture and tourism, but it is a complex and multi trend and creates certain risks. The study uses a descriptive statistical method by collecting data from night economic models of successful countries in the world, then assessing the benefits and risks if An Giang applies the three-group model (core group, non-core group, supply group). And finally to produce a development model oriented towards sustainable tourism development to help improve competitiveness, and provide more innovative and quality tourism products and services including human resources, investment, implementation organizations, capacity building awareness, and investment for businesses and local people.

Vu Hoang Duy et al with "Policies for night economic development in Ha Noi" overview development policies as well as management and the growth of night economy in Ha Noi through current situation of implementing mechanisms and laws of the government; policies to promote the merchants and consumers participation and policies to expand a variety

of night economic products. Through the method of collecting primary data by surveying 130 participants including 40 international guests and 90 domestic guests, the authors have identified the activities that attract the most participants, thereby providing the following functions: ideas for regulators and businesses to promote participation of consumers.

Through literature review and relevant research, this article will focus on surveying and evaluating some of the following criteria: attitudes (impressions and feelings); perceived benefits, perceived risks of taking part in night economic activities and actual participation behavior.

3. Method

Data collection

Survey participants are young people. Depending on socio-economic conditions, countries and organizations have different regulations on youth age. The Vietnamese government defines "youth" as those between the ages of 16 and 30, as outlined in the 2005 Youth Law (Vietnamese Ministry of Home Affairs, 2012). The population aged 15-29 makes up about 25% of the country's population, according to the 2017 census, and is the largest group of young people in Vietnam. In this study, the research team took the age group from 15 to 32 years old as the age to express the characteristics of young people, including 3 main periods: 15-18 years old (students), 19-25 years old, and 26-32 years old (students and working people). The research team used a convenient sampling method based on Google forms and questionnaires. The team approached schools and workplaces in Hanoi. The survey is designed to determine the current general perception, risk perception, actions, and behavior of young people when participating and the night economy. The study obtained 377 valid respondents. Demographic characteristics of the participants included gender, income, and age.

Data Analytics

All survey data is copied and archived verbatim. We classified and compared the data of the samples using the Microsoft Excel 2019 tool. The study data revealed the frequency and percentage of the participant's socioeconomic status, perception of risks, and benefits as well as the behavior of using services, and activities among 377 survey questionnaires. Combining available literature research and descriptive statistical methods to examine the association between sociodemographic characteristics (gender, age group, income level) and participant's level of knowledge about the night economy. In addition, the author group statistics on the importance and influence of risk perception, and perceived benefit on the participation behavior of young people according to their education level and age group from which to analyze how many participants (frequency, percentage) perceiving the importance of understanding night economic activities in their decision to participate.

4. Results

4.1. The situation of the night-time economy in Hanoi

The night economy in Hanoi after a period of development has created some initial foundations and stepping stones for stronger development later. That is reflected in the following statements:

The area where night economic activities take place is widely organized.

Seizing this opportunity, on July 27, 2020, the Prime Minister issued Decision 1129/QĐ-TTĐ 2020 approving the "Project on night economic development in Vietnam" to exploit the potential for night economic development to make the most of new economic development opportunities. Most recently, in 2021, the district submitted a "Project on piloting night economic development in Hoan Kiem district". This is one of the leading districts of the city to concretize the orientation of night economy development and identify specific plans and tasks for implementation. For Tay Ho district, develop the night economy with performing arts space, and street food at Trinh Cong Son street. In addition, Hai Ba Trung district has the policy to develop a project to form a pedestrian street in the gate area of Thong Nhat Park and Thien Quang Lake; Long Bien district with rapid urbanization, urban technical infrastructure planning is quite complete..., currently has Ngoc Lam food street; Ba Dinh district is piloting a pedestrian street at Ngoc Khanh lake. In general, the area where night economic activities take place in Hanoi is tending to expand, which gets the attention from the Government, and has a clear development plan.

The types of services of the night economy are diverse and abundant.

Hanoi has about 10 large and small night markets, such as the Long Bien wholesale market, the Old Quarter night market, the Dong Xuan night market, etc. Souvenirs, consumer products, agricultural products, and food are sold in the night market. There are also free and organized performing arts programs, inviting famous artists to attract tourists in general and young people in particular. One of the other forms of entertainment is at bars, pubs, and cafes. Currently, our group has not collected data on the number of shops, but it is easy to see that these shops are being expanded more and more in Hanoi. Just stepping outside and we can see cafes with various styles and varied kinds of drinks for all ages. Food is the beauty and the feature of Hanoi, the famous night food areas in Hanoi can be mentioned as Dong Xuan market, Ta Hien beer street, Tong Duy Tan street. It is diverse and easy to access and experience Hanoi's food for a reasonable amount of money. In short, night service products in Hanoi are now abundant, diverse and imbued with identity as well as absorbing new things while still retaining the cultural quintessence of Hanoi. But besides that, there are many spontaneous shops and restaurants that are not strictly managed, which can easily cause consequences later.

Night economy attracts people's attention

When we look up the term "night economy" on Google Trends and select the city of Hanoi, we can see that the interest in this term has gradually increased over time, especially from the beginning of May 2021 (interest level is 30) until late 2021 or early 2022 (interest level is 100).

This proves that people have started to pay more attention to this phrase and have a more certain understanding of it.

According to the survey results on customer's demand for night products and services in Hanoi (Vu Hoang Duy. 2020), 90% of tourists participated in the survey (40 international guests and 60 domestic guests) tends to participate in tourist activities at night in Hanoi and the area around the Old Quarter is the most popular.

Negative things still exist

It is easy to experience prolonged traffic congestion with a large number of participants gathering at one location. Currently, Hanoi city has taken measures to control the number of people participating in traffic on key roads. For example, on weekend evenings, arranging police to regulate traffic on roads that are often congested. In addition, it is a social evil because there is not much experience in managing and operating the night economy, so it is difficult to avoid the risk of increasing social evils such as prostitution, drugs, gambling. Drug traffickers can take advantage of the excitement and crowding of the night economy and expand their market. Besides, the alcoholic beverage business is always present in the night economy, it can lead to loss of control, from a small degree causing a few scuffles, quarrels, to a larger extent that may occur acts of violence, intentionally causing injury or disrupting public order. The problem of theft and pickpocketing is always a burning problem, causing fear for those involved in the night economy. This can happen anytime and anywhere, from crowded places to deserted places, they can be individuals or organized criminal gangs. Finally, noise pollution from activities such as music, art performances, night markets, karaoke walks, etc. can affect the activities of the surrounding residents, especially at night - the rest period for labor workers to rest and recover after their workday.

4.2. Survey result and implication

Survey result

The demographic characteristics of the participants in this study were gender, age, and occupation. Out of a total of 377 participants, 29% were male and 71% female, the age group was divided into three age groups, of which 13% of participants were in the 15 to 18 years old group, 86% were in the 19 to 25 years old group, the rest group is 25 to 30 years old. Most of the participants were college students (94%), working people and students 3% and 2% respectively (Table II).

All scales of the concepts in the research model are the scale multi-variables use the form of Likert with five levels from 1 is strongly disagree to 5 is strongly agree. The concept Intention (YD) includes 5 components: Normative beliefs (AL), Attitude toward the behavior (AT), Perceived behavioral control (CH), Perceived Benefit (GT), Perceived Risk (RR).

Table 2. Demographic characteristics of participants

Code	Describe	SDA	DA	N	A	SA	Score
I. Normative Beliefs							
AL1	The encouragement from friends	3,45%	10,88%	51,72%	31,03%	2,92%	3,190
AL2	The encouragement from family	10,08%	24,67%	44,83%	16,18%	4,24%	2,798
AL3	The encouragement from society	6,37%	17,77%	49,07%	20,95%	5,84%	3,021
AL4	The influence of the trend leader (KOLS, blogger)	3,71%	7,96%	36,34%	41,11%	10,88%	3,474
II. Attitude Toward the Behavior							
AT1	The night economic activities are very interesting	1%	4%	29%	48%	18%	3,78
AT2	Bring a lot of physical and mental values	1%	7%	36%	46%	11%	3,62
AT3	Feeling favorite when participating in night economic activities	2%	12%	42%	32%	11%	3,35
AT4	Feeling good when participating	1%	12%	47%	32%	8%	3,34
AT5	Having knowledge about night economy	4%	18%	46%	27%	5%	3,11
III. Perceived Behavioral Control							
CH1	Having financial capability	3%	12%	46%	31%	7%	3,24
CH2	Having time to participate	3%	14%	44%	31%	8%	3,27
CH3	Having vehicles to participate	3%	12%	35%	41%	10%	3,46
CH4	Having information	4%	12%	44%	33%	7%	3,27
CH5	Can keep themselves safe	3%	10%	38%	40%	9%	3,42
IV. Perceived Benefit							
GT1	Relieving stress	1,59%	3,45%	29,44%	46,42%	19,10%	3,779
GT2	Contributing to the country's economy	1,33%	6,90%	37,93%	42,97%	10,88%	3,552
GT3	Creating income for many people	1,59%	3,71%	22,55%	51,46%	20,69%	3,859
GT4	The night economy is helpful	1,59%	5,31%	43,50%	39,79%	9,81%	3,509
GT5	Bringing new and interesting experiences	1,86%	2,39%	27,06%	47,48%	21,22%	3,838

Code	Describe	SDA	DA	N	A	SA	Score
V. Perceived Risk							
RR1	Social evils, potential risks	1.59%	2.12%	19.63%	46.68%	29.97%	4,012
RR2	Issues of public security	1.33%	3.18%	21.22%	48.81%	25.46%	3,938
RR3	Body problems such as kidnapping, metamorphosis, etc.	1.59%	3.45%	19.36%	40.58%	35.01%	4,039
RR4	Customers are coerced into purchasing things.	1.59%	4.51%	28.12%	43.50%	22.28%	3,803
VI. Intention							
YD1	Will participate in night economic activities in the future.	2.65%	5.57%	36.07%	43.24%	12.47%	3,573
YD2	Will participate in night economic activities.	2.92%	6.63%	40.32%	39.26%	10.88%	3,485
YD3	Want to introduce night-time economic activities to everyone around	3.98%	6.37%	45.09%	35.54%	9.02%	3,392
YD4	Will invite friends and relatives to join	4.77%	8.22%	37.40%	39.79%	9.81%	3,416
VII. Behavior							
HV1	Regularly participate in more night-time economic activities	6,10%	19,10%	45,89%	25,20%	3,71%	3,013
HV2	Will participate in well known activities	5,31%	10,34%	39,52%	38,73%	6,10%	3,299
HV3	Will participate when have companion	2,39%	7,43%	31,56%	45,09%	13,53%	3,599
HV4	Will participate when have financial	2,12%	6,10%	33,42%	42,18%	16,18%	3,642

Normative Beliefs (AL): The survey result shows that encouragement from friends (AL1) (3,190 scores) and the trend leader (AL4) (3,474 scores) are more influential than others. Normative Beliefs reflect the perceived pressure to engage in a certain behavior exerted by such significant referent individuals or groups as the person's spouse, family, and friends. For young people, friends and social media are indispensable things in life that have a strong impact on their intentions. Besides, the encouragement from society is only less than friends' 0.169 scores, this small difference also shows that they feel welcomed by society when participating in night-time economic activities and the family one gets the lowest score, only 2,798 scores. But overall, it's all in favor of Neutral with all tiles getting more than 35% there shouldn't be much resistance from the aforementioned groups.

Attitude Toward the Behavior (AT): the degree to which performance of the behavior is positively or negatively valued. In general, all scores are greater than 3, showing that

young people have a positive view when participating in night-time economic activities. Especially, they find these activities interesting with the votes “agree” and “strongly agree” getting 48% and 18% respectively, and have a total score of 3,78. Besides, the survey results show that they all feel that the night economy brings a lot of physical and mental values. However, the lowest score of 3,11 on young people's knowledge of the night economy with 46% of the votes “neutral”.

Perceived Behavioral Control (CH): The survey results confirm the importance of means of transportation (CH3) and the ability to protect themselves (CH5) with the participant's perception of controlling behavior expressed with 3,46 and 3,42 points respectively. Cognitive behavioral control is seen as the participant's beliefs about whether performing a certain behavior is favorable or difficult. It is undeniable that young people perceive owning a vehicle will be an opportunity for them to easily participate in night economic activities. Along with that, being able to protect themselves is a solid resource that makes them not afraid of the dark sides of the night economy. Besides, having the same time (CH2) and information (CH4) with 3,27 points; financial capacity (CH1) at least with a score of 3,24 - clearly the level of agreement accounts for the highest proportion. The highest in all 5 variables are above 30%. The minor difference between the scores of the variables determines that the more chances or resources young people have, the greater the degree of behavioral control, so there will be fewer obstacles in forming the intention to take part in the consumption and the use of services in the night economy.

Perceived Benefit (GT): Two of the three variables of perceived risk have the highest scores for all variables given in the article with an average total score of RR3 of 4,039 and RR1 of 4,012. Furthermore, RR2 and RR4 both have total scores above 3,8. This can be clearly seen in four factors related to risk perception, the large level of consent, the highest is 48,81% for social evils and potential risk, and the lowest is for social evils. 40,58% agree on danger related to abduction, metamorphosis, abuse... This is also a factor accounting for 35,01% at “strongly agree” – a rating of 5 points on a scale Likert. In addition, there is a small percentage - 1,59% of people who “strongly disagree” with these risk perceptions. The sharp contrast between the two extremes of respondents proves that they highly appreciate these negative issues when considering attending the night economy.

Perceived Risk (RR): Behavioral intention has a fluctuating score in the range of 3,3 to 3,5 but the evaluation level of the variables is different. If the intentions of being ready to participate in the night economy in the future (YD1) and YD2 are regularly inviting friends and relatives to participate in night economy activities, the number of respondents focused on “agree”, then in two factors, the remaining variables YD3 and YD4 move towards the “neutral” with 40,32%; 45,09% and 37,40% respectively. The gap between “agree” and “strongly agree” amounted to 29,98% of the factor “want to introduce night economy activities to people around”. Through the results of the survey, it can be seen that although they have the intention of being and will continue to participate in night economic activities, it is not large enough to increase the number of respondents concentrated to a large amount - 3 points. Another feature is expressed in the large difference between 4 and 5 points in all four variables.

Implication

For regulators, policymakers

Research results show that developing specific industries only at night helps the economy to operate smoothly, making full use of the opportunities and strengths of Hanoi in particular and Vietnam in general. From the perspective of an administrator, we need to strengthen propaganda to raise awareness and awareness of people, especially young people and tourists, about night economic activities through multimedia channels. media such as social networks, newspapers, television, etc., thereby spreading attitudes about the positive effects of participating in night economic activities. Departments, agencies and localities need to strictly control the situation of prices, and further strengthen the control of security, order, and social safety with the participation of police forces and militia in the area, building a favorable and appropriate legal corridor, focusing on regulations on operating time, business license, etc. may consider loosening some operating conditions to services such as bar, discotheque, casino, etc. develop more strongly. At the same time, the capacity of regulatory agencies should be strengthened to reduce negativity and evils. Moreover, perfecting management policy, investing in the public transport system, synchronous infrastructure including social security system, health care system, ect. to improve comprehensive access and safety operate at night as well as to avoid bad risks that may arise that negatively affect the participant's experience.

For businesses, business households.

The night economy has many potential risks in terms of order and safety, so businesses need to strictly comply with the law for the benefit as well as to protect themselves, consumers. Above all this is for social protection and creating a healthy night-time economic environment, along with sustainable development. With a large population and young people that are very sensitive to catching the trends and the increasing of consumers' consciousness, businesses need to combine many approaches and study customer needs to avoid making products not meeting the needs will cause a huge waste. Putting yourself in youth, paying attention to what is happening and the trends to lead the movement. Besides, there must also be a long-term plan and sustainable development for long-term survival, helping the whole society. To materialize that, the human resource factor cannot be ignored, businesses need to have clear and effective directions. Enterprises need to strengthen human resource training, and set requirements for certain skills and knowledge. More specifically, attention should be paid to train specific occupations of the night economy such as bartenders, performance artists, security guards, etc. Besides, it is also necessary to focus on attracting human resources, selecting and screening according to the requirements of the quality of the night economy. Human resources can come from outside the province or abroad. For such high-quality human resources, it is possible to offer salary policies, travel support, meals, etc.

5. Conclusion

In general, the young people have had certain knowledge and understanding about the night economy. When catching this term, more or less participants will imagine the activities taking place, the benefits to be obtained or some barriers that may be encountered. In addition, the positivity is clearly shown in the attitudes and intentions of young people, although they are afraid of some possible risks, this is insignificant and the encouragement of everyone around them is absolutely important. Surrounding especially influential people play an important role in the participant's choice. The opportunities and available resources are the driving force for the respondents to participate with more frequency, making them believe that using products and services in the night economy is easy and convenient. This study has found a number of gaps in cognitive and behavioral aspects that need to be focused on in campaigns to develop an effective night economy, suitable for Vietnam, especially Hanoi. In summary, more efforts are needed, awareness-raising programs, attractive activities for all ages, and measures to ensure safety, security and order, and prevention of social evils. help strengthen participants' intentions.

The research is only conducted in the scope of young people, but in fact, many middle-aged people participate in the consumption of night economic activities. The possibility of generalization will be higher if the following studies continue with an expanded sample structure in terms of age groups or proceed with a more representative sample. On the other hand, future studies can also continue to expand the research direction by supplementing and editing the research orientation that the group has built up to suit the specifics of not only Hanoi but also other cities.

Abstract

Following Viet Nam's increasing integration to international markets, and a global concern for timber legality, the country's wood-related exports must comply with strict requirements from international agreements such as EVFTA. Domestic timber legality-systems (e.g. VNTLAS) play a key role by ensuring legality from imported wood products. Given that Viet Nam imports timber from countries classified as high-risk with respect to timber legality, it is therefore important to understand the recent development of imported timber and to identify possibilities for improving domestic systems and regulations. Through data collection and interviews, this paper provides an overview of imported timber in Viet Nam between 2015 and 2020 and presents recommendations for strengthening policies and regulations related to the VNTLAS. These include adjusting the criteria for risk-classification and clarifying global timber certification schemes. We also call for strengthening bilateral relations with low-risk countries, using IT to support compliance mechanisms, and identifying additional low-risk countries from where to secure timber imports.

Key words: *Imported timber raw materials, Legal timber, Domestic market, Risk timber region, Low-risk timber region*

1. Introduction

Viet Nam has continued to increase its integration into the world economy. As of January 2022, Viet Nam has signed 15 Free Trade Agreements (FTA) with 53 economic partners, all of which are currently effective and significantly account for the country's international trade (Handbook "Rules of origin in FTAs to which Viet Nam is a signatory", 2022). Viet Nam's timber industry has also integrated into the global supply chain of timber and timber products. The country imports large volumes of timber from various countries. Between the 2016 – 2020 period, the volume and value of imported timber ranged from 7 to 9 million m³ of equivalent round timber, with imported value to 2.2 – 2.5 billion USD. However, while imported timber accounted in 2010 for 70% of the raw materials used in the wood processing industry, it only accounted to 25% in 2010 (*Viet Nam Administration of Forestry, 2022*).

Major export markets, such as the United States, Japan, China, EU and Korea, all have put in place timber legality systems. Viet Nam has also enforced legal timber requirements under the Decree No. 102/2020/NĐ-CP dated 1 September 2020 of the Government promulgating the Viet Nam Timber Legality Assurance System (VNTLAS). In accordance with the Decree (*Clause 1, Article 3*), legal timber is defined as "*timber or timber products that are harvested, imported, confiscated, transported, traded, processed, exported in accordance with Vietnamese legal regulations, regulations of international treaties to which Viet Nam is a signatory and relevant legal regulations of the country in which timber is harvested*".

Moreover, the VPA/FLEGT between Viet Nam and the European Union (EU), which entered into force since June 2019, is a legally binding agreement aimed at strengthening forest governance and promoting trade in legal timber and timber products exported from Viet Nam into the EU market. In addition to the opportunities, the agreement also presents challenges for the timber industry of Viet Nam, including (i) higher competition (there are 53 economic partners within the scope of the signed agreements), and (ii) more strict regulations for controlling the legality of timber origin (Ministry of Agriculture and Rural Development, 2022). As a result, Viet Nam has implemented policies to achieve better control and management of imported timber.

According to Decision No. 4832/QĐ-BNN-TCLN in 2020 of the Ministry of Agriculture and Rural Development, countries from where Viet Nam imports timber can be classified as either positive (low-risk) or non-positive (high-risk) with respect to timber legality concerns. While the former includes United States, Chile, and New Zealand, the latter includes Laos, Cambodia and various African countries. Non-positive countries require special attention with respect to risk control and management must be placed to timber from high-risk countries.

The objective of this paper is to assess the situation of imported timber between 2015 and 2020, focusing on the risk-based controls and management mechanisms instituted by VNTLAS. We provide an overview of imported timber in Vietnam, and recommend solutions for supporting timber legality requirements in Viet Nam. These recommendations include adjusting the criteria for classifying low-risk countries, providing more details on requirements for conducting due diligence studies on timber legality, and clarification on the national timber/forest certification schemes used globally. We also call for strengthening of bilateral relations with low-risk countries, the use of IT to facilitate procedures, and furthering market research studies to identify new low-risk countries from where to procure timber in the future.

This paper is based on the results of a project named “*Research on development of domestic timber and timber products for realization of restructuring of Viet Nam’s forestry sector*”.

2. Method

✚ Collection of secondary information and data

Data and information was compiled from reports on import and export of timber and timber products published by the Viet Nam Timber and Forest Products Association (VIFOREST); statistical data on import and export announced by the General Department of Viet Nam Customs in the 2015 – 2020 period; and comprehensive reports produced by Forest Trends. Moreover, data was collected and summarized from scientific reports and other materials related to imported timber and policies on management of legal timber.

Lastly, we consulted experts in multiple fields (incl. agro-forestry and fishery market management, agro-forestry and fishery processing, customs, forest protection) in order to supplement and finalize solutions to manage imported timber to ensure the legality of timber.

✚ Data processing

Excel software is used to process and analyze data and calculate volume, value, proportion of imported timber. Moreover, we collected major timber exporters of Viet Nam which are classified by risk geographical regions as follows:

- Major timber exporters of Viet Nam (round timber and sawn timber) to countries having the largest volume of timber exporting to Viet Nam in the 2015 – 2020 period.

- Major timber exporters of Viet Nam that are classified by risk geographical regions in accordance with the Decision No. 4832/QĐ-BNN-TCLN in 2020 of the Ministry of Agriculture and Rural Development announcing the list of timber species having been imported into Viet Nam and the list of positive geographical regions exporting timber to Viet Nam between low risk and risk geographical regions. Low-risk geographical regions include 51 countries/regions on the list of positive geographical regions exporting timber to Viet Nam.

The categorization of risk geographical regions helps assess the risk levels of timber raw materials imported into Viet Nam, as a basis for recommendation of solutions to manage this timber inputs.

3. Results

3.1. The current situation of imported timber raw materials

3.1.1 The current situation of imported round timber

a) Volume and value of imported round timber

The volume of imported round timber has increased from 1.69 million m³ in 2015 to 2.32 million m³ in 2019, equivalent to an increase of 37% compared to 2015. The value of imported round timber has also increased from 511 million USD in 2015 to 698 million USD in 2018. In 2020, due to impacts of the Covid-19 pandemic, volume of imported round timber slightly decreased, reaching 2.02 million m³, equivalent to a value of 563 million USD. The average annual volume of imported round timber is about 2.07 million m³, equivalent to 604.7 million USD. The volume and value of imported round timber are detailed in Figure 1.

Figure 1. Volume and value of imported round timber in the 2015 – 2020 period

b) Main countries exporting round timber to Viet Nam

Round timber is imported into Viet Nam from more than 100 countries and territories. However, only few countries have large volume of round timber exported to Viet Nam. Table 1 below lists countries having large export volume of round timber to Viet Nam which accounts for about 65 – 70% of total volume of imported round timber and these countries are classified into two categories, namely positive or low-risk geographical countries, and non-positive or high-risk geographical countries

Table 1. Volume of round timber imported into Viet Nam from major exporting countries (2015-2020)

Unit: 1,000 m³

No.	Country	2015	2016	2017	2018	2019	2020	Total
I	Low-risk countries	420.16	419.95	639.27	734.62	834.62	680.67	3,729.29
1	USA	65.70	76.70	145.79	198.37	245.79	214.10	946.46
2	Belgium	74.30	92.90	145.79	173.68	256.25	188.19	931.11
3	Germany	77.20	76.20	112.50	96.95	115.11	78.06	556.02
4	France	32.52	36.59	59.92	60.85	70.52	73.68	334.08
5	The Netherlands	56.24	60.16	115.01	81.22	96.73	63.34	472.69
6	Uruguay	114.20	77.40	60.27	123.55	50.23	63.30	488.94
II	High-risk countries	806.07	797.14	857.93	813.51	803.64	701.11	4,779.40
7	Cameroon	314.70	420.70	507.39	513.86	495.53	393.67	2,645.85
8	Papua New Guinea	105.20	183.10	123.03	195.16	236.86	228.57	1,071.92
9	Cambodia	59.30	139.30	163.07	38.26	10.55	1.50	411.98
10	Laos	321.70	36.20	7.11	2.44	5.68	12.82	385.95
11	Republic of Congo	5.17	17.84	57.33	63.79	55.03	64.55	263.70

Source: Data summarized from reports on import and export of timber and timber products produced by VIFOREST, Forest Trends and statistical import and export data of the General Department of Viet Nam Customs from 2015 to 2020

Positive or low-risk geographical countries include USA, Belgium, Germany, the Netherlands and Uruguay. USA is the largest round timber exporter to Viet Nam with an average of 157,000 m³ per year and about 946,460 m³ for in the whole 2015 – 2020 period. Non-positive or high-risk geographical countries include Cameroon, Papua New Guinea, Cambodia, Laos and Republic of Congo. Cameroon is the largest round timber exporter to Viet Nam with an average of 0.4 – 0.5 million m³ per year and 2.6 million m³ for the whole period. The volume of round timber imported from Laos and Cambodia has sharply decreased between 2016 to 2020 despite both countries being the largest timber exporters of Viet Nam in the past, before 2015.

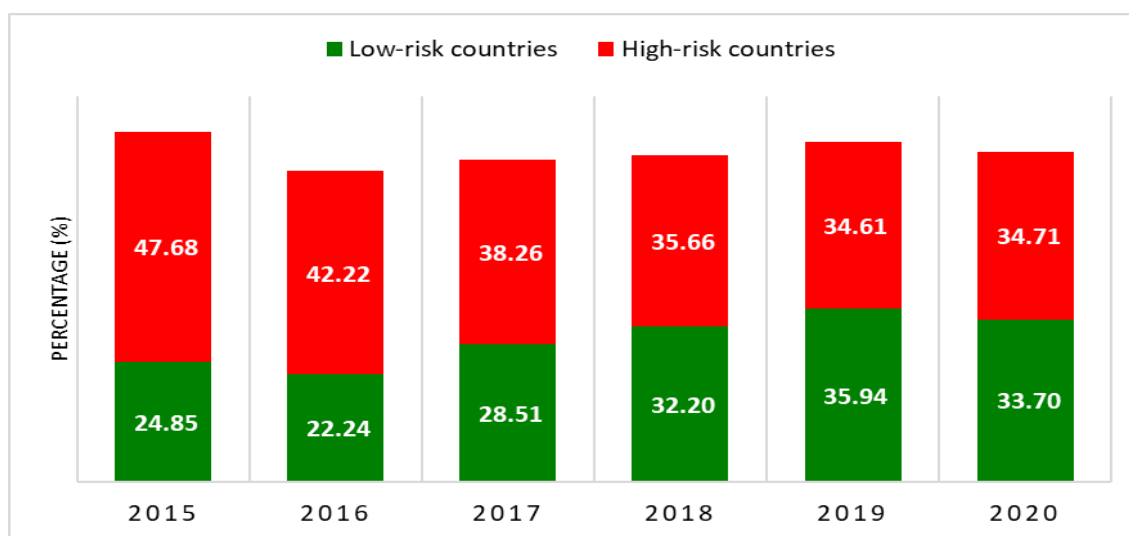

Figure 2. Proportion (%) of round timber imported into Viet Nam from major exporting countries by risk geographical countries in the 2015-2020 period

Table 1 and Figure 2 show that in 2015, the volume of timber imported from major exporting countries categorized as high-risk geographical regions totaled 806,070 m³, nearly double the volume of timber imported from low-risk geographical countries, accounting for 47.68% of total round timber supplies of Viet Nam. However, by 2020, the volume of timber imported from high-risk geographical countries decreased to about 701,110 m³, accounting for 34,71% of total volume of imported timber, while the volume of timber imported from low-risk geographical countries increased to 680,670 m³, accounting for 33.7%. The volume of round timber imported from USA and Belgium has rapidly increased over the years. The volume of round timber imported from USA alone increased from 65,700 m³ in 2015 to 214,100 m³ in 2020. In contrast, the volume of round timber imported from some countries such as Laos and Cambodia has rapidly decreased because these countries have implemented policies to restrict the export of round timber. The volume of round timber imported from Laos decreased from 321,700 m³ in 2015 to 12,820 m³ in 2020, down 96% compared to 2015.

Table 2 summarizes the value of round timber imported from low-risk and high-risk geographical countries. Cameroon, USA, Belgium, Papua New Guinea are leading with respect to the value of round timber exported to Viet Nam. Particularly, Cameroon has high export value with an average of 150-200 million USD per year, reaching over 1 million USD during in the 2015 – 2020 period. The value of timber imported from these countries accounts for 65-75%

of total import value of round timber. Moreover, in this period, the value of round timber imported from low-risk geographical countries has increased whereas the value of round timber imported from high-risk geographical countries has decreased from 55.06% in 2015 to 38.41% in 2020 (Figure 3). This is considered as a positive signal of the implementation of VPA/FLEGT and policies to control and manage timber imported into Viet Nam.

Table 2. Value of round timber imported into Viet Nam from major exporting countries (2015-2020)

Unit: Million USD

No.	Country	2015	2016	2017	2018	2019	2020	Total
I	Low-risk countries	99.53	99.04	146.43	175.41	204.23	169.60	894.23

Figure 3. Proportion (%) of round timber imported into Viet Nam from major exporting countries by risk geographical countries compared to total import value of round timber in the 2015 – 2020 period

3.1.2. The current situation of imported sawn timber

a) Volume and value of imported sawn timber

The import volume of sawn timber increased from 2.22 million m³ in 2015 to 2.54 million m³ in 2020 (the annual average import volume is about 2.3 million m³). However, the import value of sawn timber decreased from 1,147 million USD in 2015 to 749.01 million USD in 2016. The average import value is about 912 million USD with small yearly fluctuations likely influenced by the decline of rare and precious timber species imported from Laos and Cambodia. The change in volume and value of imported sawn timber is summarized in Figure 4 below.

Figure 4. Volume and value of imported sawn timber in the 2015 – 2020 period

b) Major countries supplying sawn timber to Viet Nam

Viet Nam imports sawn timber from various countries including USA, Chile, Brazil, New Zealand and Cambodia (hereinafter referred to a “main import countries”). USA is the largest supplier with volumes increasing from 474,000 m³ in 2015 to 597,000 m³ in 2020. Between 2015 and 2020, the total volume of sawn timber imported from the main import countries accounts for 75-80% of the total import volume of sawn timber, equivalent to about 7.74 million m³. As can be observed in Table 3, the volume of sawn timber imported from low-risk geographical countries is strongly increasing. In 2015, the volume of sawn timber imported from the main import countries in low-risk and high-risk geographical regions amounted to approximately 850,000 m³, accounting for 38% and 40% for the low-risk and high-risk categories. However, these proportions have changed in recent years. In 2020, the volume of sawn timber from main import countries in low-risk geographical regions increased by 1.53 million m³, nearly double the import volume in 2015, accounting for 68.99% of total import volume of sawn timber. Meanwhile, the volume of sawn timber imported from main import countries in high-risk geographical regions only accounts for 14.12% of total import volume of sawn timber in 2020.

Table 3. Volume of sawn timber imported into Viet Nam from main import countries in the 2015 – 2020 period

Unit: 1,000 m³

No.	Country	2015	2016	2017	2018	2019	2020	Total
I	Low-risk geographical countries	892.30	936.70	1,130.40	1,222.41	1,442.74	1,529.66	7,154.21
1	USA	474.30	460.40	496.63	541.51	562.55	597.54	3,132.92
2	Chile	163.60	187.90	246.43	209.35	322.12	284.61	1,414.01

10	Gabon	51.00	58.70	105.78	79.85	76.33	50.74	422.39
11	Cambodia	375.00	171.40	272.70	219.91	79.61	27.50	1,146.12

(Source: Data summarized from reports on import and export of timber and timber products produced by VIFOREST, Forest Trends and statistical import and export data of the General Department of Viet Nam Customs from 2015 to 2020)

Figure 5. Proportion (%) of sawn timber imported into Viet Nam from major exporting countries by risk geographical regions compared to total import volume of sawn timber in the 2015-2020 period

Table 4 presents the value of imported sawn timber from main import countries which accounts for 75-85% of the total import value of sawn timber. The import value of sawn timber from USA amounts to 200-250 million USD per year. Noteworthy is the decrease of import value of sawn timber from Laos and Cambodia (e.g. in Cambodia the value decrease from 362 million USD in 2015 to 7.17 million USD in 2020). The total import value of sawn timber from countries in high-risk geographical regions clearly decreased

from 655.9 million USD in 2015 to around 150.4 million USD in 2020. Thus, as of 2020, the import value of sawn timber from high-risk geographical countries only accounted for about 17.86% while the import value of sawn timber from low-risk geographical countries (472 million USD) accounted for 56.1% of total import value of timber in 2020.

Table 4. Value of sawn timber imported into Viet Nam from main import countries (2015 – 2020)

Unit: Million USD

No.	Country	2015	2016	2017	2018	2019	2020	Total

Table 6. Proportion (%) of value of sawn timber imported into Viet Nam from major exporting countries by risk geographical regions in the 2015 - 2020 period

3.2. The current situation of management of imported timber

3.2.1. Promulgation and implementation of policies on managing imported timber to ensure the timber legality

Key legislation with respect to timber legality includes the following:

- The Decision No. 1624/QĐ-TTg dated 14 November 2019 of the Prime Minister on approving plan for implementation of the Voluntary Partnership Agreement between the Socialist Republic of Viet Nam and European Union on Forest Law Enforcement, Governance and Trade (VPA/FLEGT) in order to assign specific tasks and responsibilities to relevant agencies and organizations so as that these agencies and organizations can decide on direction and management measures to fully and effectively implement the VPA/FLEGT.

- The Decree No. 102/2020/NĐ-CP dated 1 September 2020 of the Government on promulgating the Viet Nam Timber Legality Assurance System (VNTLAS). The Decree has internalized main contents of the VPA/FLEGT, including management of imported timber and supply chain control, in accordance with the context of Viet Nam. Accordingly, enterprises importing timber into Viet Nam from high-risk geographical regions are subject to due diligence with provision of legal evidence to demonstrate the legality of timber.

- The Decision No. 4832/QĐ-BNN-TCLN dated 27 November 2020 of the Minister of Agriculture and Rural Development on announcing the list of timber species having been imported into Viet Nam and the list of positive geographical regions exporting timber to Viet Nam. According to the Decision, the number of timber species which are allowable to be imported into Viet Nam has been added up to 322 species and there are 51 countries having classified as positive or low-risk geographical regions. Imported timber species and timber exporting countries that are not in these lists will be considered as risk timber species and high-risk geographical regions, respectively.

3.2.2. Control and management of imported timber to ensure legal timber requirements

Chart 1 describes the procedure and responsibilities of relevant stakeholders to ensure legal timber requirements for imported timber.

Although VNTLAS supports already existing timber policies, new regulations have been promulgated. For example, in accordance with the Decree No. 102/2020/NĐ-CP, for the management of imported timber, risk management measures must be applied to prevent, detect and timely handle violation acts, as well as to encourage and create favourable conditions for organizations and individuals to comply with the law. Imported timber is controlled and managed according to criteria of positive geographical regions to determine whether timber is imported from low- or high-risk geographical regions. Timber importers must comply with regulations on provision of dossiers, declaration of origin of imported timber, and take responsibilities for the accuracy of provided dossiers and declared information (Clause 4, Article 4, Decree No. 102/2020/NĐ-CP).

Accordingly, in order to manage imported timber, the Ministry of Agriculture and Rural Development collaborated with other agencies (incl. the General Department of Customs, Ministry of Industry and Trade, Ministry of Natural Resources and Environment, Ministry of Foreign Affairs) to agree on the list of positive geographical regions/countries

exporting timber to Viet Nam for each period in accordance with the international treaties to which Viet Nam is a signatory.

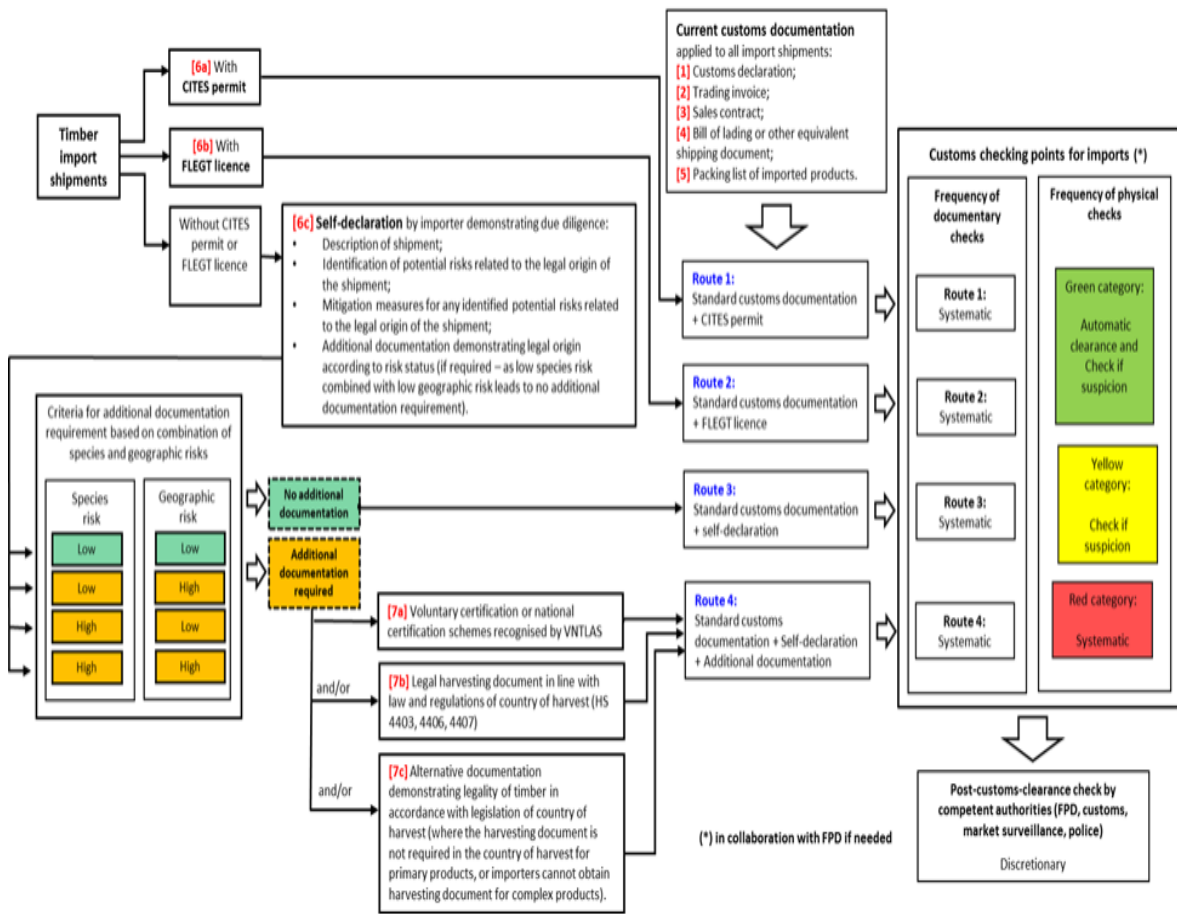

Figure 1. Imported timber control and management of VNTLAS

Source: VPA/FLEGT

Lastly, customs authorities and forest protection agencies shall be responsible for managing the imported timber, as well as coordinating the verification of the legality of imported timber shipments (incl. certification of the packing list of imported timber).

4. Discussion and Conclusion

4.1. Success and challenges to ensure the legality of timber

4.1.1. Success

One of the most important benefits of the extant timber legality system is the increase of imported timber from low-risk countries in the 2015 – 2020 period. This reduction is likely associated to the system’s capability to support the adaptability and competitiveness of the timber industry and institutionalizes the correct regulations. These policies specified in the aforementioned legal documents have reduced numerous administrative procedures for enterprises to help improve the effectiveness of control and management of imported timber to meet the VNTLAS requirements. Moreover, timber processing and trading enterprises have actively sourced timber raw materials from low-risk geographical regions while reducing volume and value of timber imported from high-risk geographical regions.

4.1.2 Challenges

Some challenges remain with respect to the legality of imported timber. First, the proportion of imported from non-positive or high-risk geographical regions remains high, accounting from 14% to 38.4% of total volume of timber imported into Viet Nam, especially with respect to imported round timber. Second, the standardization and synchronization of the national TLASs of different countries is complex because these systems are developed on the basis of independent national legal systems. Lastly, many countries have not developed legal regulations for the whole supply chain, especially the supply chain in which timber is transported or traded through middlemen.

4.2. Recommendations for managing imported timber to ensure the legality of timber

4.2.1. Completion of criteria for positive geographical regions/countries exporting timber to Viet Nam in order to ensure legal timber requirements

- The categorization of countries/regions in accordance with criteria specified in the Decree No. 102/2020/NĐ-CP and Decision No. 4832/QĐ-BNN-TCLN results in a low number of low-risk countries. We suggest that countries that have signed VPAs but have not reached the stage of FLEGT licensing, or countries that have been negotiating VPAs with EU, can also be considered low-risk countries.

- Conducting due diligence studies for timber legality covering the whole supply chain is a complex and resource consuming task. Our paper calls for more well-defined regulations in relation to the realization of due diligence studies which ultimately serve as a key criterion for being recognized by VNTLAS.

- With respect to the criterion specifying that a country needs to have a national regulatory timber certification scheme recognized by Viet Nam (aligned with VNTLAS requirements), there is a lack of information identifying the countries that already have national timber/forest certification schemes. Moreover, we recommend for the contents of these schemes to be more readily available. If followed, these recommendations would ensure the accuracy of risk geographical categories.

4.2.2. Control and management of legal timber requirements imported into Viet Nam

- In accordance to VNTLAS, Viet Nam needs to strengthen bilateral relations with low-risk countries in order to stabilize the supply of imported timber and satisfy wood processing demands for export.

- The national legal framework for each risk geographical category needs to be finalized in order to facilitate the management of imported timber.

- Strengthen the application of information and technology to better link data between agencies (e.g. forest protection agencies and customs authorities), facilitate one-door procedures, and optimize the speed of import and export procedures.

- To satisfy the VNTLAS requirements, enterprises importing timber from risk markets need to comply with additional due diligence requirement as specified in the Decree No. 102/2020/NĐ-CP. At the same time, new market research studies should be conducted to select additional low-risk countries from where to import timber – all of which must provide transparent evidence of legal timber origin.

4.3. Conclusion

Imported timber raw materials play important role in Viet Nam's wood processing industry. Our results present positive signals with respect to the origin of timber by highlighting an increase both in volume and value of imports from low-risk countries. We argue that the national legal system is a key driver of these results through the VPA/FLEGT implementation and, moreover, the compliance of Vietnamese timber processing enterprises in seeking legal timber sources. However, although timber imported from high-risk geographical regions is on the decline, the annual import volume is still high. Moreover, a significant percentage of imported timber is represented by species from natural forests, which are mostly used for domestic consumption. Therefore, in order to ensure the legal origin of timber, Viet Nam needs to adjust the criteria for categorization of low-risk countries and introduce mechanisms to effectively control and manage the timber origin through the coordination between State management agencies and the application of information and technology in the traceability of timber origin.

Abstract

Green logistics has been a trend in the world. This research evaluates the impact of green logistics on international trade among APEC nations over the period of 9 years (2010 - 2018). The research uses an augmented gravity model to investigate the effects of green logistics on international trade through the Environmental Logistics Performance Index (ELPI). The results show that exporting countries applying green logistics increase the export volume to other members of APEC. In the long term, importing countries engaging in green logistics increase trade volume with green logistics countries in APEC. With the aim of enhancing international trade, APEC countries must improve domestic logistics performance. Through those analyses, research proposes several recommendations to encourage nations and enterprises to apply green logistics effectively.

Keywords: *APEC, FGLS, green logistics, international trade*

1. Introduction

Logistics has been being developed, which plays an essential role in the economic development of many countries, including international trade competitiveness (Bensassi et al., 2015). However, the logistics industry consumes a large number of energy resources and generates

high carbon emissions. The estimated level of CO₂ from the logistics accounts for 13% of total global emissions (World Economic Forum, 2016), causing negative impacts on the environment and society. Therefore, applying green logistics is the solution to solve these problems.

As a global forum, however, APEC's greenhouse gas emissions account for 60% of the world. Not only that, 6/10 of the world's largest GHG-emitting economies were APEC members (APEC Policy Support Unit, 2021). To achieve the goal at COP 26, APEC needs to make a lot of effort including applying green logistics, solving the APEC's emissions problem. Therefore, it is necessary to research and make assessment of green logistics' impacts on international trade within APEC.

The research uses the quantitative research method by ordinary least squares regression (Pooled OLS), fixed-effects model (FEM), random-effects model (REM), and feasible generalized least squares (FGLS). From that, the research proposes recommendations for governments and enterprises to apply green logistics effectively.

2. Literature Review and Theoretical Framework

2.1. Literature review

The studies on logistics have been being conducted primarily from a macro viewpoint to improve the business environment for the global supply chain and from a micro to evaluate the impact of "green" regulations on the region, industry, or business.

It has been suggested that logistics has a wide-ranging impact on trade. Bilateral trade is connected to Logistics Performance Index (LPI). Efficient logistics services minimize the effect of geographical distance but do not completely eliminate it (Arvis et al., 2007). GDP and geographical distance between two nations are followed by LPI which has a significant influence on trade, mainly of the exporting country (Puertas et al., 2014). Using data from 112 countries and Hong Kong from 2007 to 2014, Wang et al (2018) discovered that the export and import country LPI is positively correlated with trade; green logistics in exporting countries is positively correlated with export volume; green logistics in importing countries has an negative relationship with export volume.

Green logistics and economic development are inextricably linked to each other (Arvis et al., 2007; Marti et al., 2014; Bensassi et al., 2015; Adalkhil et al., 2018). The environmental issues generated by logistics drive governments to impose additional rules on the exchange of products. The selling commodities to foreign nations are certain to deal with regulatory issues (Ojala & elebi, 2015; Omar et al., 2016; das Chagas et al., 2018). The "non-green" logistics system limits the chances for products exported and customs cleared (Werikhe et al., 2016). Green logistics solutions alleviate social problems and have a favorable association with economic indicators and environmental sustainability (Khan & Qianli, 2017; Wang et al., 2018; Nassani et al., 2017). The increase in emissions leads to the increase in volume of commodities and logistical services exchanged (Zaman & Shamsuddin, 2017).

In Vietnam, there have not been many studies on green logistics. Most of them use qualitative methods and have not been in-depth in relation between green logistics and international trade. Five groups of factors affect logistics development in Vietnam, including

legal framework, and administrative procedures; human resources; infrastructure; logistics enterprises; technology, and commodity exchanged (Nga, 2021). Vietnam has its own potential to develop green logistics and become a regional logistics center, but there are several limitations such as small business size, shortage of capital, lack of high-quality human resources; weak retail supply services; poor infrastructure conditions; ... (Bac, 2015). Green logistics development is an inevitable trend; and modern information technology system has a significant contribution to logistics and the level of logistics greening (Anh, 2020).

Green logistics studies are numerous in general, but they all focus on examining the correlation between logistics and environmental sustainability, as well as logistics and per capita income or FDI. They are constrained by a group of physically proximate nations such as the South Asian Association of Regional Cooperation (SAARC) and the European Union (EU), notwithstanding international trade expansion, which provides an opportunity for research to inherit the scientific value of such efforts while also broadening the scope to include APEC nations.

2.2. Theoretical framework

2.2.1. Logistics and green logistics

“Logistics is understood as a network of services that support the physical movement of goods, trade across borders, and commerce within borders. It comprises an array of activities beyond transportation, including warehousing, brokerage, express delivery, terminal operations, and related data and information management.” (World Bank, 2018).

Logistics plays an important role in trade which reduces transportation costs and stimulates growth (Bugarčić et al., 2020). The combination of logistics and economic liberalization increase the trade volume (Hausman et al., 2013). Logistics has a positive effect on economies of scale, production and growth (D’Aleo, V., & Sergi, BS, 2017).

Green logistics is environmental-friendly, including greening of various processes in logistics such as transportation, warehousing, distribution, waste treatment and green recycling (Wu, H. J. & Dunn, S. C, 1995). It strictly adheres to green consumption and production standards, to a greater extent the national capacity index for environmental protection. The purpose of green logistics is to achieve a sustainable balance among economic, environmental and social benefits (Dekker et al., 2012).

Green logistics is an important and ideal policy choice to promote global sustainability by assessing the environmental impact of logistics on sustainability (Chunguang et al., 2008). Better green logistics efficiency reduces transaction costs and eliminates inefficiencies in traditional shipping and handling operations.

2.2.2. International trade and APEC

International trade is a trade of goods and services in which the exchange takes place between entities from foreign countries (Đurović et al., 2010). The four major areas of international trade are goods, services, investment, and intellectual property rights. It plays an important role in the development and the growth of the world economy. In international specialization and division of labor, countries can make efficient use of the resources derived

from international trade. International trade increases production capacity and stimulates consumption, technology transfer, and investment, which supports growth.

APEC is an economic cooperation forum between countries in the Asia-Pacific region to strengthen economic and political ties (Canada and the Asia-Pacific Economic Cooperation (APEC), 2021). Established in November 1989, APEC has 21 members, including Australia, Indonesia, Malaysia, South Korea, Thailand, Brunei Darussalam, United States, Japan, Singapore, New Zealand, Canada, Philippines, China, Peru, Hong Kong, Taiwan (ROC), Mexico, Chile, Papua New Guinea, Russia and Vietnam. According to the APEC in Chart 2021 report, APEC accounts for 38% of the global population (in 2020), 62% of global GDP, and 48% of total trade in goods and services (in 2020). The top six economies in the region include the United States, China, Japan, Canada, Russia, and South Korea.

3. Method

3.1. Research model and hypothesis

3.1.1. Gravity model

Tinbergen (1962) firstly introduced a gravity model with three variables affecting trade between any two economies as follows:

- 1) The export turnover of a country is determined by its economic size (its GDP)
- 2) The turnover sold to a specific country varies with the size of that country's market (GDP of the importing country)
- 3) The trade turnover is affected by transportation costs (corresponding to the geographical distance between the two countries)

The equation is written as follows:

$$EXP_{ei} = \alpha_0 GDP_e^{\alpha_1} GDP_i^{\alpha_2} D_{ei}^{\alpha_3} \quad (*)$$

in which EXP_{ei} is the export turnover from the exporting country to the importing country. GDP_e and GDP_i are the GDP of the exporting and importing country, respectively. D_{ei} is the geographical distance between 2 countries. α_0 is a constant and $\alpha_1 \alpha_2 \alpha_3$ are the parameters.

The linear form of the equation (*) is as follows:

$$\ln EXP_{ei} = \alpha_0 + \alpha_1 \ln GDP_e + \alpha_2 \ln GDP_i + \alpha_3 \ln D_{ei} + \varepsilon$$

with ε is the random error.

3.1.2. Proposed research model

Developed from the gravity model, two regression models evaluating the impact of LPI and green logistics on international trade, sequentially is:

$$\ln EXP = \beta_0 + \beta_1 \ln GDP_e + \beta_2 \ln GDP_i + \beta_3 POP_e + \beta_4 POP_i + \beta_5 D + \beta_6 \ln LPI_e + \beta_7 \ln LPI_i + \beta_8 \ln RQ_i + \beta_9 PS_i + \beta_{10} BOR + \beta_{11} LANG + \varepsilon \quad (1)$$

$$\ln EXP = \beta_0 + \beta_1 \ln GDP_e + \beta_2 \ln GDP_i + \beta_3 POP_e + \beta_4 POP_i + \beta_5 D + \beta_6 \ln ELPI_e + \beta_7 \ln ELPI_i + \beta_8 \ln RQ_i + \beta_9 PS_i + \beta_{10} BOR + \beta_{11} LANG + \varepsilon \quad (2)$$

Source: Synthesis of the research team

Regardless of restricted data sources for developing a unified index of measuring the implementation for green logistics, some research employs LPI and environmental indicators such as Kim and Min (2011) who developed the green logistics index (GLPI) based on the ratio of LPI to EPI. Hardly could ratios reflect the efficiency of inputs (total logistical efficiency) and outputs (total environmental performance) (Lu et al., 2019).

Therefore, the research incorporates the ELPI environmental logistics performance index into "eco-efficiency" (Dahlström & Ekins, 2005) as a measure of logistics efficiency and environmental performance. This is an effective scale for evaluating logistics' sustainability and environmental friendliness (Khan et al., 2016). Eco-efficiency is stated mathematically (Verfaillie, 2000):

$$\text{Eco – efficiency} = \frac{\text{Product or service value}}{\text{Environmental influence}}$$

As a result, ELPI is represented in the equation:

$$\text{ELPI} = \frac{\text{Logistics performance}}{\text{Environmental impacts}}$$

LPI indicates logistics efficiency while the logistics CO2 emission index (LCC) shows the negative impact of logistics on the environment, so the ELPI equation has been revised as follows:

$$\text{ELPI} = \frac{\text{LPI}}{\text{LCC}}$$

Transportation accounts for 80-90% of logistics carbon emissions (McKinnon, 2010). For this reason, the study uses CO2 emissions from transportation with secondary data source from Our World in Data as representative of LCC. Because of economic development discrepancies across nations, it is inappropriate to describe logistics' environmental performance by using LCC alone (Lu et al., 2019). Hence, LCC per unit of GDP has been applied to investigate CO2 emission intensity in logistics:

$$\text{Logistics CO2 intensity (LCI)} = \frac{\text{LCC}}{\text{GDP}}$$

In consumption:

$$\text{ELPI} = \frac{\text{LPI}}{\text{LCI}}$$

3.1.3. Hypothesis

There is widespread consensus among researchers that LPI and its components have a positive and significant impact on trade flows across all regions (Marti et al., 2014; Uca et al., 2016; Bugarčić et al., 2020). The logistics performance index is positively correlated with export orientation (exports as a percentage of GDP) (Chakraborty & Mukherjee, 2016), while the quality of logistics infrastructure significantly affects regional export flows (Bensassi et al., 2015). Wang et al. (2018) conclude that the LPI of importing and exporting countries is positively correlated with international trade, in which, the impact of LPI on the international trade of exporting countries is bigger than that for importing countries. Hence, *this research hypothesize the following:*

H1: Logistics performance of exporting and importing countries has a positive impact on international trade.

Companies from different sectors must comply with environmental regulations to remain competitive (Zhang & Xu, 2016). Under pressure from environmental regulations, customers, other stakeholders and internal management, exporters must comply with green logistics practices such as: green purchasing, green transportation, green packaging, etc. achieve ISO14000 certification and reverse logistics, reduce their environmental impact and promote their economic, operational, environmental and social performance. By *practicing* green logistics, exporters better comply with the environmental regulations of the importing country to enhance their competitiveness (building a positive image domestically and internationally to have more export opportunities, increase market share, seek new markets) and lead to an increase in export volume (Lai et al., 2012; Ueasangkomsate P. & Suthiwartnarueput K, 2018). Hence, *this research hypothesize the following:*

H2: The green logistics level of the exporting country has a positive impact on the export volume.

Many studies have shown the relationship between trade and the environment. However, empirical literature on the relationship between the environmental regulation of importing countries and international trade is relatively scarce (De Santis, 2012). Van Beers, C., & Van Den Bergh (1997) based on data of The Organization for Economic Cooperation and Development (OECD), concluding that the stringent environmental regulations of

importing countries have a number of effects negative impact on other countries' exports. Similarly, Wang et al (2018) based their study on data of 112 developed and developing countries plus Hong Kong, indicate that there is a negative relationship between the level of green logistics of the importing country and the export volume of the exporting country. A possible reason for this result is that environmental regulations of the importing countries, such as the End of Life Vehicles (ELV) or Restriction of Hazardous Substances (RoHS), form trade barriers to green trade, which raises the technological threshold and results in reduced export volumes for foreign exporters. Hence, *this research hypothesize the following:*

H3: The level of green logistics of the importing country has a negative impact on export volume of the exporting country.

3.2. Data processing

The study uses green logistics and international trade data for 19 APEC countries from 2010 to 2018, excluding Hong Kong and Taiwan (ROC), since international trade data of these territories is not published. Research data is obtained from some reliable sources, mainly from the United Nations (UN), the World Bank (WB), and Centre d' Etudes Prospectives et d' Informations Internationales (CEPII).

Table 2. Descriptive data statistics

Variable	Obs	Mean	SD	Min	Max
EXP	2,699	1.51e+10	4.37e+10	1	4.80e+11
GDP_e	2,699	2.50e+12	1.14e+10	1.14e+10	2.06e+13
GDP_i	2,699	2.39e+12	4.43e+12	1.14e+10	2.06e+13
POP_e	2,699	1.60e+08	3.11e+08	414.914	1.40e+09
POP_i	2,699	1.54e+08	3.05e+08	414.914	1.40e+09
LPI_e	2,699	3.39	0.44	2.57	4.14
LPI_i	2,699	3.34	0.47	2.17	4.14
ELPI_e	2,699	44,954.92	39,110.34	11,044.67	217,330.40
ELPI_i	2,699	44,264.64	38,339.77	11,044.67	217,330.40
RQ_i	2,699	0.76	0.86	-0.67	2.26
PS_i	2,699	0.12	0.86	-1.65	1.61567
D	2,699	9190.27	5532.75	315.54	19711.86
Bor	2,699	0.06	0.24	0	1
Lang	2,699	0.16	0.37	0	1

Source: Stata statistics

In general, the model's variables fluctuate considerably when a big disparity witnessed between the maximum and minimum values, notably for export volume and GDP. Apart from LPI, all variables have standard deviations greater than the mean.

Table 3. Correlation matrix

Source: Stata statistics

Regarding the relationship between the independent variables, all coefficients have absolute values less than 0.8. The highest correlation coefficient is observed between lnGDP_i and lnPOP_i at 0.7607. The variance inflation factor (VIF) of most variables is less than 10 excluding the VIF coefficient of POP_e at 13.95. However, the mean VIF of the variables is 5.32 less than 10, which illustrates a low multicollinearity in research data.

4. Results

4.1. Results of estimating and hypothesis testing

To analyze panel data, some models such as Pooled OLS model, FEM or REM are taken into consideration. This research uses the Breusch-Pagan LM test to select the relevance between Pool OLS and REM. The Breusch-Pagan test results show $\text{prob} > \text{chibar}2$ less than 0.05, consequently, the REM model is more suitable than Pool OLS.

Then, the Hausman test is run to choose between the FEM and REM, based on the evaluation of the correlation between the error and the independent variable. Hausman test results, $\text{Prob} > \text{chi}2$ is less than 0.05, FEM model results are better than REM. After the Breusch-Pagan test and Hausman test, the results from the FEM fixed-effects model are selected.

Table 4. Technical inspections and model selection – Model 1

After that, technical inspections detect the model's defects. Heteroskedasticity affects the bias of a linear model. However, due to a variety of economic factors, time series data can have heteroskedasticity. In addition, autocorrelation occurs if the random errors correlated with each other across time, which does not affect the bias and stability of the linear model. However, autocorrelation is related to the variance of the estimated coefficients; therefore, detecting heteroskedasticity and autocorrelation is important to implement corrections and ensure the statistical significance of the model.

The heteroskedasticity was detected when the Wald test is taken. With $\text{prob} > \chi^2$ less than 0.05, the model has heteroskedasticity. Wooldridge test detects autocorrelation in the model. With $\text{Prob} > F$ greater than 0.05, the model does not appear autocorrelation. After the Wald test and Wooldridge test, the model has heteroskedasticity and is overcome by the FGLS method. In essence, FGLS uses equivalent transformations to bring about a new model which the random error in the model has homoscedasticity, then uses the OLS method to estimate the new model.

In the FGLS estimation results for the Model 1, only the effect of the LPI on the export volume of the exporting country. The effects of the remaining variables are studied in Model 2.

The coefficients of two variables $\ln LPI_e$ and $\ln LPI_i$ are both positive, showing that the LPI of the two exporting and importing countries have a positive impact on international trade between these two, the conclusion is significant at 1% level. It is consistent with the study of Behar & Manner (2008), Marti et al (2014), Bensassi et al (2015), Chakraborty & Mukherjee (2016), Uca et al (2016), Wang et al. (2018). The LPI of the exporting country will impose greater impacts on the export volume. However, the difference in the coefficients of two LPI variables in the model is not significant. H1 is accepted.

In Model 2, the model selection and technical testing are taken similarly to Model 1. The results from two tests Breusch-Pagan LM and Hausman reveal that the FEM model is suitable. The results from two tests Wald and Wooldridge express that the model has heteroskedasticity defect, and the FGLS estimation method is used to surmount this defect.

The environmental logistics efficiency of an exporting country has a positive effect on that country's export volume, which is significant at the 1% level. Specifically, the coefficient $\ln ELPI_e$ is 0.6519, when the ELPI index of the exporting country increases by 1%, the export volume of that country's goods increases by 0.65%, other factors being held constant. This conclusion is relevant to previous studies (Khan & Qianli, 2017; Wang et al., 2018; Lu et al., 2019). The above conclusion comes from the fact that exporting countries have proactively changed to meet the green logistics regulations issued by the importing country, thereby helping to increase export output in both quantity and quality. H2 is accepted.

The coefficient $\ln ELPI_i$ is 0.4821 opposite the expected side affecting the export volume in Model 2. When the ELPI of the importing country increases by 1%, the export volume of goods of the exporting country increases by 0.48%, *ceteris paribus*. The rationale is strict environmental protection regulations enacted by developed countries in the early stages. In the short term, the lack of ability to meet environmental regulations among

enterprises in developing country leads to trade volume downturn. In the long term, if exporters adapted to environmental regulations and comprehensively apply green logistics standards, they would significantly benefit from improved environmental quality, enhance international competitiveness, and create new comparative advantage which can offset short-term losses in the end (Porter & Van der Linde, 1995). H3 is rejected.

Source: extracted from stata

The size of an exporting and importing country's economy both positively affects the volume of trade between the two countries, which is significant at 1% is relevant to the conclusion in the gravity model. The GDP coefficient of the importing country is higher than that of the exporting country, which means that the quantity of demand has more impact on the trade flow between the two countries.

In geographical terms, the negative coefficient of distance variable suggests that the distance between two countries poses a negative effect on trade. This conclusion is significant at 1%. Two countries with a common border positively affect the volume of trade

between them, which is significant at 1%. Demographic factors such as population and common language have a positive effect on international trade, which is significant at the 1% level. This conclusion is relevant to the study of Puertas et al (2014); Wang et al (2018).

The regulatory quality of the importing country has a positive effect on the export volume of the exporting country, which is significant at the 1% level. Consequently, a change in a government's ability to formulate and implement policy has a significant impact on a country's export. This conclusion is similar to Anderson & Marcouiller (2002) who argued that a strong institution with a complete legal system for commercial contracts enforcement, fair laws and economic policies adopted by the government makes a great contribution to commercial development.

Political stability has a positive effect on export volume, which is significant at 1%. Govindan et al (2014), said that political instability was an obstacle for exporting countries due to a lack of support from the host country. This result is contrary to the conclusion of Wang et al. (2018) who found a negative relationship between the level of political stability of the importing country and the probability of exporting.

Table 6. Result of hypothesis testing

	Hypothesis	Result
H1	Logistics performance of exporting and importing countries has a positive impact on international trade	Accepted
H2	The green logistics level of the exporting country has a positive impact on the export volume	Accepted
H3	The level of green logistics of the importing country has a negative impact on export volume of the exporting country	Rejected

Source: Synthesis of the research team

4.2. Green logistics impact on international trade between group countries

To further investigate the relationship between green logistics and trade flows of economies at disparate economic development levels, the research classified the countries in the sample into two groups: 9 high-income countries and 10 middle-income ones, based on the threshold GNI/capita (value of income per capita in current USD exchange rate) updated by the World Bank on July 1, 2018.

Table 7. Classified countries by GNI/capita

Group	GNI/capita	Countries
High-income countries (HIC)	≥ \$12.055	Australia, Brunei Darussalam, Canada, Chile, Japan, New Zealand, Singapore, South Korea, <i>United States</i>
Middle-income countries (MIC)	\$996 - \$12.055	China, Indonesia, Malaysia, Mexico, Papua New Guinea, Peru, Philippines, Russia, Thailand, Vietnam

Source: World Bank

The research estimated equation (2) with four samples: MIC-MIC (sample 1), MIC-HIC (sample 2), HIC-MIC (sample 3), HIC-HIC (sample 4) to find out whether there is a difference among the variables in the model.

Table 8. FGLS estimation results for four samples

Variable	MIC-MIC	MIC-HIC	HIC-MIC	HIC-HIC
	(sample 1)	(sample 2)	(sample 3)	(sample 4)
lnELPI_e	0,3006*** (4,12)	0,3479*** (4,36)	0,4215*** (6,08)	0,7452*** (17,49)

Source: Stata statistics

For exporting countries, the regression coefficient of ELPI in four samples is positive and statistically significant, green logistics in exporting country is positively correlated with export. The higher the green logistics efficiency of the exporting country, the greater the export probability and export volume. It is consistent with the estimated results for the entire sample of 19 countries. In particular, in sample 4, the coefficient lnELPI_e is 0.7452, recording a rather large influence of green logistics efficiency on export output between the two high-income countries.

For importing countries, the regression coefficients of ELPI in four samples are different, only statistically significant in sample 1 and sample 4. In sample 4, this coefficient has a positive value (consistent with the estimated results for the entire sample of 19 countries). However, in sample 1, this coefficient has a negative value meaning that the green logistics efficiency of the importing country has a negative impact on the export output of the exporting country, between the two middle-income countries. The reason may originate from increasingly strict requirements for environmental regulations set by importing countries, so middle-income countries have to spend much more money on waste treatment, construction investment costs and infrastructure improvement,... to comply with that. In general, the initial adoption of green practices requires heavy investment leading to huge fixed costs in the end-to-end supply chain system, and has a negative impact on the firm's financial performance in the short term (Khan et al., 2019). For middle-income countries, high compliance costs are challenging for exporters to catch up; therefore, green logistics becomes a trade barrier between two countries in the group of middle-income countries.

4. Discussion and Conclusion

The study evaluates the impact of green logistics on international trade through the augmented gravity model, the FGLS technique, and the ELPI index. The study guides countries with different levels of development to regulate green logistics and promotes enterprises to implement the green logistics process.

The estimated model results show that: logistics efficiency of exporting and importing countries is positively correlated with trade, green logistics of exporting countries is positively related to export volume, and green logistics of importing countries is positively related to export volume of the exporting country.

The comparison of the green logistics' impacts on trade between groups of countries with varying levels of economic development on GNI per capita demonstrates that green logistics in exporting countries is positively correlated with export volume across all groups of countries, particularly trade between two high-income countries. In contrast, the effectiveness of green logistics in the importing nation has a negative impact on the export production of the exporting country between the two middle-income countries.

The research proposes APEC governments policies to improve the efficiency of logistics activities, such as improving logistics infrastructure and ensuring system uniformity; strengthening communication to raise awareness of green logistics by programs or campaign; encouraging the use of modern information technology; encouraging enterprises to exchange, learn, and cooperate at home and abroad; strengthening education and training of appropriate human resources, developing appropriate training programs about green logistics; building a set of criteria for green logistics for countries to establish appropriate policies.

In addition, there is a room for governments' measures to protect the environment through green logistics. In the short term, it is needed for the government to build up a green logistics environment by encouraging and supporting enterprises to implement green logistics, increasing the use of green renewable fuels, establishing a market for green logistics and industry. In the medium term, it is necessary to issue specific standards and regulations on carbon emissions; create legal requirements for green logistics; create a domestic market for green fuel resources. In the long term, the consideration of imposing high import tax, environmental tax or penalties on businesses utilizing harmful materials should be taken into.

Enterprises should use means of transport with lower emissions such as clean energy, water transport or use green packaging that is recyclable, biodegradable, and creates green supply chain to maintain and promote domestic and global competitiveness. Enterprises should update information technology to manage system data effectively, improve logistics quality, and save time in the transportation and delivery duration. The community of traditional logistics enterprises need to convert to the new version of green logistics. Import-export enterprises ought to build a reverse logistics system to satisfy consumers' demand and promote sustainable development, improve competitiveness and scale up import and export turnover.

RESEARCH ON THE SUCCESSFUL LEVEL OF THE STATE'S ROLE IN VIETNAM'S TOURISM DEVELOPMENT AFTER FORMING THE ASEAN ECONOMIC COMMUNITY (AEC)

Dr. Nguyen Thi Anh Tuyet

tuyetnta@huc.edu.vn

Hanoi University of Culture, Hanoi, Vietnam

Abstract

At the scene of forming the ASEAN Economic Community (AEC), the State plays a vital role in developing Vietnam's tourism. The State has many mechanisms and policies to encourage and facilitate Vietnam's tourism to develop. However, large numbers of policies and laws on tourism are still lacking and inconsistent, not really clear, and not effective; some regulations are not suitable; Legal documents are promulgated slowly compared to requirements, with low effectiveness and efficiency. Through a survey sent to 112 tourism businesses in the area of Hanoi, Da Nang, Ho Chi Minh City, and 108 managers at all levels, this research determined; to evaluate the success factor of the state's role in tourism development in Vietnam after the AEC was formed. On that basis, the research contributes to theoretically clarifying the state's role in tourism development in Vietnam after the AEC was formed.

Keywords: *State's role, tourism development in Vietnam, AEC*

1. Introduction

Vietnam is a country with advantages in natural resources and cultural resources for tourism development and has a large market of domestic and international tourists. Moreover, Vietnam is rated a safe and friendly destination. In 2019, the World Tourism Organization (UNWTO) ranked Vietnam sixth in the top 10 countries with the fastest tourism growth in the world. However, reality also shows the results that Vietnam's tourism industry has achieved are still modest, and not commensurate with the potential and advantages of the country, the development of Vietnam's tourism still has difficulties, is inadequate, and lacks sustainability. It can be affirmed that Vietnam's tourism is facing a lot of hardships and challenges: low quality of human resources, weak infrastructure, and awareness of the challenges and opportunities of Vietnam's tourism in the face of international integration is still restricted. Vietnam's tourism will have to face fierce competition from tourism in Thailand, Malaysia, Singapore, and Indonesia. These challenges will be even more evident.

There are many reasons that limit the development of tourism in Vietnam in terms of integration, in which the state's role is one of the important reasons. With that approach, the research will evaluate the success factor of the state's role in tourism development in Vietnam after the formation of the AEC.

2. Literature Review

About tourism development

The first group approaches from the perspective of researching conditions and solutions to develop Vietnam's tourism into a spearhead economic sector, as researched by Vu Dinh Thuy (1996). The second group approaches the direction of researching the significance of tourism development for socio-economic development. Some researches such as Reid (2003), Boo (1991), Goh (2017),... Development of tourism in the context of international economic integration, this research direction is also approached by many scientists such as Nguyen Trung Khanh (2012), Nguyen Duy Mau (2012), Nguyen Hong Lam (2013)),... the research often stops at only one area of tourism development, or in localities in international economic integration.

About the ASEAN Economic Community (AEC)

After the AEC was formed, many issues related to AEC were researched in-depth, such as Nguyen Tien Hoang (2018), the research direction goes into service trade in the ASEAN Economic Community. Tran Van Hung and Le Thi Mai Huong (2017), in their research, focused on the opportunities and challenges of Vietnam when joining the AEC. The authors have analyzed 5 opportunities and challenges that Vietnam will face: (i) The economic development is quite different from other countries in the region; (ii) Vietnam's labor productivity is low. From there, the authors propose several macro solutions for the State, and policies for businesses and employees for Vietnam to successfully integrate into the AEC.

Researches on the state's role

A lot of researches confirm the state's role in the process of the international economic integration of Vietnam such as Nguyen Dinh An (2016), Hoang Thi Kim Oanh (2016), Tran Thi Thu Huong (2016), Tran Huy Ngoc (2016). The common point of these researches is the use of analytical and synthesis methods, logic - history; inductive and deductive, and sociological statistics to clarify the theory of the state's role in international economic integration.

Referring to the state's role in tourism economic development, there are plenty of interested researchers such as Elliott (2002), Marzuki (2010), Cheuk et al (2010), Bui Thi Hai Yen (2013), Hall (2000). Also referring to the state's role in the tourism industry, in his research Hall (2000) approached tourism planning with a method somewhat different from other researchers. Through fieldwork, by a series of international examples that reflect the internationally integrated nature of the tourism industry. Approaching from the perspective of the state's role in facilitating tourism development has also been researched by many scientists such as Ho Duc Phuc (2009), Khadaroo and Seetanah (2008),... Research direction on the state's role in tourism crisis management is also interested by scientists, including research by Pforr (2008), Ritchie (2004),... In the research Pforr (2008) has generalized new characteristics of tourism in a changing world.

3. Method

Approach method: When researching the success of the state's role, the author focuses on the functional approach and the institutional approach.

Research objective: Clarifying the success factor of the state's role in the development of tourism in Vietnam after the formation of the AEC

4. Results

4.1. Description of the research sample

The data was collected from 200 survey sent to 112 local tourism businesses in Hanoi, Da Nang, and Ho Chi Minh City. The respondents to the survey are all experienced, holding managerial and executive positions in enterprises. The list of tourism businesses provided by the Vietnam National Administration of Tourism are ensure accuracy and legitimacy. Businesses participating in the survey all have been licensed to do business since 2012, so make sure to have at least 5 years of operation in the tourism sector, in the context before and after the formation of the AEC to be able to provide the information needed for the purpose of the research. At the same time, the author will send survey questionnaires to 108 state managers at all levels and researchers of relevant ministries, branches, and localities.

The author uses a 5-point Likert scale to conduct the research, according to the rating scale increasing from 1 to 5 (from strongly disagree to agree, from very unimportant to most important when considering importance or influence)

Before going to accreditation the value of the scales by the EFA test, the author checks whether the data are fully qualified for analysis by the KMO test and Bartlett test. The results show that KMO = 0.788; Bartlett's test has Sig statistical significance. = 0.000 < 0.05 indicates that the observations are correlated with each other in the population at a 99% significance level. So the author's research model is appropriate. Test extracted variance of factors (%Cumulative), in the table of total variance extracted (Total Variance Explained), the standard accepts extracted variance > 50%. The analysis results show that the total variance extracted with the cumulative variance of the factors is 69,648% > 50% meets the criteria. Conclusion: 69,648% of the change in the factors is explained by the observed variables.

4.2. Exploratory Factor Analysis

Table 1. Exploratory Factor Analysis Rotated Component Matrix

4.3. Research results

The results of EFA analysis for the independent variables of the above factor rotation matrix show that the factor loading coefficients of the observed variables all satisfy the conditions when factor analysis is greater than 0.55 and the number of criteria groups created when factor analysis is 7.

Criteria group 1: "Effective, consistent and preferential tourism development policy" includes 9 observed variables:

ACS1: Financial policy (investment from the state's budget, ...)

ACS2: Credit policy (bank loans, ...)

ACS3: Tax Policy

ACS4: Land Policy

ACS5: Tourism promotion and advertising policy

ACS6: Policy on exit, entry, customs

ACS7: Policy on training and developing tourism human resources

ACS8: Policy on the construction of tourism infrastructure and technical facilities

ACS9: Policy on the application of science and technology

The author sets the criterion group 1, denoted by FAC_ACS , with the equation:

$$FAC_ACS = 0,796 ACS1 + 0,685 ACS2 + 0,629 ACS3 + 0,801 ACS4 + 0,696 ACS5 + 0,503 ACS6 + 0,781 ACS7 + 0,871 ACS8 + 0,830 ACS9$$

With the coefficient of the scale ACS8: Policy on the construction of tourism infrastructure and technical facilities with a score of 0.871, this is the scale with the largest influence, the scale has the most influence. The lowest is ACS6: Policy on exit, entry, and customs with an influence score of 0.503.

Criteria group 2: "Tourism development management"

includes 7 observed variables:

AQL1: The coordination in organizing the implementation of tourism development strategies and planning by ministries, branches, and local authorities united; tight, and efficient

AQL2: Organizing the coordination and implementation of standards and regulations in tourism activities with high efficiency

AQL3: The local government organizations have close links with Tourism Associations and Businesses

AQL4: Local authorities regularly organize conferences, and seminars and share experiences on tourism development.

AQL5: Local authorities support information, develop tourism products, promote tourism

AQL6: Local authorities regularly propagate and raise people's awareness to ensure a friendly, healthy, and civilized tourism environment.

AQL7: Local authorities regularly review, evaluate, draw lessons and set directions in tourism activities. The author sets up the symbol of criterion group 2 as FAC_AQL with the equation:

$$FAC_AQL = 0.721 AQL1 + 0.758 AQL2 + 0.807 AQL3 + 0.739 AQL4 + 0.764 AQL5 + 0.796 AQL6 + 0.748 AQL7$$

The scale group of tourism development management and management, with the score coefficient of the AQL3 scale: The local government organizations have close links with Tourism Associations and Businesses 0.807, this is a scale with an image score of 0.807.

The most influential factor on the tourism development management scale factor, the group with the lowest influence is AQL1: The coordination in organizing the implementation of tourism development strategies and planning by ministries, branches, and local authorities is united; tight and efficient.

Criteria group 3: "International cooperation in tourism development"

includes 4 observed variables:

AHT1: Ministries, sectors, and local authorities actively and effectively participate in tourism development cooperation within the ASEAN framework.

AHT2: Numerous policies and forms of cooperation in developing tourism products

AHT3: Numerous policies to facilitate tourist attraction

AHT4: Numerous policies and forms of cooperation to attract tourism investment

The author sets the three criteria group, denoted by FAC_AHT, with the equation:

$$FAC_AHT = 0.772 AHT1 + 0.753 AHT2 + 0.723 AHT3 + 0.806 AHT4$$

With the coefficient of the AHT4 scale: Numerous policies and forms of cooperation to attract tourism investment, this is the scale with the largest influence, the scale has the lowest influence. is AHT3: Numerous policies to facilitate tourist attraction with an influence score of 0.723.

Criteria group 4: "Developing strategies and planning for tourism development"

includes 3 observed variables:

ACL1: Timely tourism strategy and planning; synchronized; specifically, practical, suitable with the context of Vietnam's tourism development

ACL2: Tourism strategy and planning fully assess the potential and ability of tourism development, high feasibility

ACL3: Tourism strategy and planning propose targets; solutions suitable for practice and each stage of development

The author sets the group of 4 criteria, denoted by FAC_ACL, with the equation:

$$FAC_ACL = 0.902 ACL1 + 0.896 ACL2 + 0.916 ACL3$$

With the coefficient of the scale of ACL3: Tourism strategy and planning propose targets; solutions suitable for practice and each stage of development with a score of 0.916, this is the scale with the largest influence, the scale with the lowest level of influence is ACL2: Tourism strategy and planning fully assess the potential and ability of tourism development, high feasibility

Criteria group 5: "Developing a legal system, mechanism, and policy for tourism development" includes 3 observed variables:

APL1: Documents and policies related to tourism management are synchronous, timely, effective, and efficient.

APL2: Developing and promulgating standards and regulations in tourism activities to meet real development requirements

APL3: Documents and policies on tourism are regularly checked; summarizing for experience

The author sets the criteria group of 5, denoted by FAC_APL, with the equation:

$$\text{FAC_APL} = 0.838 \text{ APL1} + 0.797 \text{ APL2} + 0.750 \text{ APL3}$$

The scale group of developing the legal system, mechanism, and policy for tourism development, with the score of the scale APL1: Documents and policies related to tourism management are synchronous, timely, effective, and efficient is 0.838, this is the scale with the highest score affecting the factor of the scale for building a legal system, mechanisms, and policies for tourism development. The group of factors with the lowest influence is APL3: Documents and policies on tourism are regularly checked; summarizing for experience

Criteria group 6: "Testing and inspecting for tourism development" includes 2 observed variables:

ATT1: The coordination between ministries, branches, and local authorities to check, review and supervise tourism activities is regular and effective.

ATT2: Local authorities receive and promptly handle tourists' complaints

The author sets a group of 6 criteria, denoted by FAC_ATT, with the equation:

$$\text{FAC_ATT} = 0.898 \text{ ATT1} + 0.752 \text{ ATT2}$$

In the group of testing and inspection scales for tourism development, the score coefficient of the ATT1 scale: The coordination between ministries, branches, and local authorities to check, review and supervise tourism activities is regular and effective is 0.898 higher than the ATT2 scale Local authorities receive and promptly handle tourists' complaints

Criteria group 7: "Building an organization of management apparatus" includes 2 observed variables:

ATC1: Building a smooth, unified, and stable state management apparatus for tourism from the central to local levels

ATC2: Building an organizational structure for the state management of tourism is corresponding to the task of managing and developing a spearhead economic sector.

The author sets the 7 criteria group, denoted by FAC_ATC, with the equation:

$$\text{FAC_ATC} = 0.776 \text{ ATC1} + 0.732 \text{ ATC2}$$

The coefficient of the scale ATC1: Building a smooth, unified, and stable state management apparatus for tourism from the central to local levels is 0.776, this is the scale that has the greatest influence on tourism standards. even building up the management apparatus organization after the formation of the AEC.

5. Discussion and Conclusion

5.1. Proposals to improve the state's role in tourism development in Vietnam after the formation of the AEC

Proposal on building appropriate and progressive institutions

Firstly, carry out a far-reaching administrative reform, focusing on reforming the public administration apparatus, streamlining the apparatus, and improving the quality and efficiency of the public administration apparatus

Secondly, continuing to increase the innovation process, and perfect the macroeconomic management mechanism of the economy, the State manages business activities with oriented economic tools and leverage tools for economic management, through tax policy, credit interest rate, exchange rate appreciation policy, and other macro tools... That is effective macro-management in the institutional market economy mechanism.

Proposing the development of tourism development strategy and planning

Firstly, properly assessing the role of investigation and survey work in the planning process can thus improve the planning quality and ensure feasibility.

In the condition of forming AEC, Vietnam's tourism must fulfill the commitments and goals in the ASEAN Tourism Agreement, the ASEAN Tourism Strategy 2016 - 2025. Therefore, in the coming time, it is necessary to continue to promote the construction planning, research, and adjustment; supplementing the Tourism Development Strategy accordingly, the contents needing adjustment focus on the following main orientations: Adjusting the implementation period and vision of the Strategy, Adjusting and supplementing development goals tourism, adjusting and supplementing development solutions in a number of fields.

Proposing to build a system of laws, mechanisms, and policies, creating conditions for tourism development

Firstly, the State needs to soon strengthen the contingent of law-making staff in the direction of professionalism, sufficient quantity, and quality in terms of expertise, and profession

Second, perfect the policy system to remove barriers and create all favorable conditions for tourism development in the context of the formation of the AEC. Promote public-private cooperation.

Proposing to increase initiative and creativity in participating in agreements, agreements, and commitments in international tourism cooperation.

Firstly, in the coming time, it is necessary to strengthen activities related to tourism cooperation in ASEAN, which are being implemented by the Departments under the direction of the Vietnam National Administration of Tourism.

Secondly, the Embassy actively campaigned to expand the market in combination with propaganda about the culture and tourism of the country and the people of Vietnam.

5.2. Conclusion

Tourism is complex, related to many industries, vulnerable, and unlike any other economic sector. This economic industry besides its advantages and achievements, also has various limitations; difficulties, and challenges. Especially when the AEC has been formed, these difficulties become even more obvious. These difficulties and challenges each tourism business, and tourism industry cannot solve by themselves. Therefore, it is urgent for Vietnam to study state's role in tourism development after the AEC is formed.

CURRENCY, FINANCIAL STABILITY IN VIETNAM IN THE PROCESS OF INTERNATIONAL ECONOMY INTERGRATING

Dr. Doan Phuong Thao

doanphuongthao.neu@gmail.com

School of Banking and Finance, National Economics University

Abstract

Currency, financial stability promoting socio-economic development in Vietnam with the participation of the State Bank of Vietnam operating as the Central Bank. In recent years, it can be affirmed that the State Bank of Vietnam has had certain successes in the currency and financial stability, contributing to the realization of the country's macroeconomic goals. However, there are still many potential issues in the implementation process. To clarify this issue, the article focuses on studying future problems for the State Bank of Vietnam, on that basis, proposes some necessary recommendations for the State Bank of Vietnam in the context that Vietnam is in the process of international economic integration.

Keywords: *currency stability, financial stability, international economic integration, State Bank of Vietnam.*

1. Introduction

Vietnam's economy is integrating more and more deeply into the world economy. Along with the development of the financial market, in the context of the volatile global economy, economic and currency transactions are becoming more and more complicated. The State Bank of Vietnam has gradually innovated in operating the money supply mechanism, currency regulation, financial system management, etc..., thereby promoting currency and financial stability, bringing certain successes in macroeconomic development. Pointing out issues to support the State Bank of Vietnam's operations in ensuring currency and financial stability for the operation of the economy in the context of international economic integration is necessary. Therefore, the challenges facing the State Bank of Vietnam will be presented in this article in order to draw the necessary recommendations.

2. Method

The article uses the method of synthesis, statistics, describes, analysis and comparison. Based on research data on currency financial stability published in articles, scientific journals or by reputable organizations in the field of finance – banking, some necessary recommendations for the State Bank of Vietnam in the context that Vietnam is in the process of international economic integration are proposed.

3. Theoretical basis

Based on the research of Thammarak Moenjok (2014) and Frederic S. Mishkin (2016), central banking has evolved considerably since its start about 400 years ago. Starting

with coin sorting and storing, and in certain cases war financing, central banks have taken on the functions of banknote issuers, banker to the government, banker to banks, protector of the financial system, bank supervisor, as well as conductor of monetary policy. Currently, there are commonalities as well as diversity in modern central banking. Commonalities include (1) *the focus on monetary stability*. Currency stability is the stability of the value of currency expressed through inflation. To support long-term economic growth, Central Banks carry out to provide a stable currency environment by maintaining low and stable inflation. Under such conditions, households and firms have more capacity to optimize investment and consumption. According to the Bank of England, currency stability is defined as "stable prices and confidence in the currency" as one of its core purposes. The US Federal Reserve Act has also set stable value for currency as a target for the US Federal Reserve. The European Central Bank and the Central Bank of Japan also consider stable value for currency as one of their goals; (2) *the focus on financial stability*. Financial stability refers to the state of the economy in which the financial system (including financial intermediaries, markets and financial infrastructure - special focus on financial intermediaries) is able to withstand shocks and risks caused by financial imbalances. Experiences from various financial crises around the world, suggest that in order to ensure long-term economic growth, Central Banks should have a direct role in maintaining financial stability and this role should apply regardless of whether the central bank has a banking supervisory function. Central banks can help maintain financial stability, either as a regulator helping to ensure that the system is resilient to the past, or acting as a lender of last resort helping to prevent complete collapse of the financial system. A well-functioning financial system ensures that capital is allocated efficiently, and is therefore vital to the long-term, sustainable growth of an economy. Therefore, Central banks are extremely important tool. Paiman Ramazan Ahmad (2016) argued that Central banks can be considered as the engine of the economy, where like the engine the power is controlled and regulated, any malfunction in the engine creates a risk and problem in the system. However, in the context of the global economy, in order to maintain currency and financial stability, the Central Bank always has to make appropriate adjustments in the face of many challenges such as globalization, development of financial activities, impact of industrial revolution 4.0, post-crisis issues.

4. Results

In recent years, the Government and the State Bank of Vietnam (SBV) have always paid special attention to currency and financial stability in macroeconomic management. In terms of currency stability and inflation control, the SBV has operated a proactive and flexible currency policy in close coordination with fiscal policy and other macroeconomic policies to control inflation, stabilize the macro-economy, contributing to supporting economic growth. In the period 2015-2021, our country's inflation is always at a single-digit level, always below 5%, reaching the target set by the National Assembly. Inflation is controlled thanks to the SBV's synchronous implementation of currency and credit solutions. In addition to keeping inflation under control, the interest rate level in recent years has also been maintained stable by the SBV in the context of increasing interest rates in the world. By the end of 2021, lending interest rates of credit institutions will be around 6%-9% per

year for short-term loans and 9%-11% per year for medium and long-term loans. In addition, in recent years, the way the State Bank's exchange rate is managed has also undergone many changes. The SBV has used market-based tools rather than administratively imposed tools. This shows the determination to pursue a flexible and market-oriented central exchange rate mechanism. This has impacted the Vietnamese exchange rate to remain relatively stable.

Figure 1. Vietnam's inflation in the period of 2015 - 2021

Source: General Statistics Office

The VND/USD exchange rate in the period 2015-2021 tends to increase slightly to stimulate import and export activities. If the exchange rate in 2015 is at 22,547 VND, by 2021, the exchange rate will increase about 23,200 VND, equivalent to an increase of 10.29% per 6 years, it shows a high level of stability of VND compared to some other currencies in the world. The SBV's exchange rate management method is said to be suitable for the money market, contributing to stabilizing the macro economy, reducing import pressure on inflation, and supporting businesses.

Regarding financial stability, according to Article 2, Point 20 of Decree No. 16/2017/ND-CP defining the functions, tasks, powers and organizational structure of the SBV, the SBV has the task of stabilizing the currency system - financials including summarizing, analyzing and forecasting currency and financial position; propose measures to prevent systemic risks in the currency and financial sector and develop policies and measures to respond to crises, ensuring the stability of the currency, banking and financial systems. In Circular 36/2014/TT-NHNN on regulations on prudential limits and ratios in operations of credit institutions, foreign bank branches must comply with: Minimum capital adequacy ratio (CAR) at 9% to ensure the ability to cover unforeseen losses with equity; Credit limit to limit the risk of credit concentration for one customer and related persons; The solvency ratio to ensure the bank has sufficient liquidity when risks arising from the imbalance in terms of term, capital source and use of capital; The maximum ratio of short-term funds used for medium and long-term loans to limit liquidity risks; Limit capital

contribution and share purchase to ensure that the bank avoids expanding its operations into non-banking sectors; Ratio of outstanding loans to total deposits to avoid the risks of lending exceeding the deposit level of commercial banks. It can be considered that these are the first tools that the SBV has implemented to stabilize the financial system. In addition, the SBV also enforces macroprudential supervision by limiting investment in government bonds as prescribed in Circular 09/2017/TT-NHNN and Circular 06/2016/TT-NHNN to replace and supplement a number of articles of Circular 36/2014/TT-NHNN. According to this Circular, credit institutions can buy and invest in Government bonds compared to the average short-term funds of the previous month, specifically these limits: 25% for the State Commercial Bank, 30% for joint stock commercial banks, joint venture banks and 100% foreign owned banks; 30% for foreign bank branches, 10% for non-bank credit institutions, 35% for cooperative banks. With the implementation of macroprudential supervision, banks will minimize systemic risks, avoid unexpected shocks from the economy, and maintain and increase stably.

However, in order to maintain currency and financial stability in Vietnam in the coming time, the SBV will have to pay attention to issues arising in the process of international economic integration, specifically:

Firstly, the impact of globalization. In economic terms, globalization involves the reduction and removal of cross-border barriers to trade, production, investment and international labor. The dramatic increase of globalization has brought about changes in terms of politics, technological progress and trust in market mechanisms. Even when a crisis occurs, the trend of globalization continues. Through globalization, countries have become so interdependent on international trade and investment that any attempt to break the dependence is too difficult and costly.

External factors will have an increasing influence on financial and currency stability in Vietnam as the intensification of globalization will lead to freer international capital flows. This could put pressure on the domestic exchange rate and inflation, as well as trigger an asset price bubble. If international capital flows are not controlled, a large inflow of capital into a small open economy can easily lead to a sharp appreciation of the exchange rate. When these capital flows work their way into the economy, it can lead to an increase in economic activity, an increase in speculative activities that cause asset price bubbles as well as inflation. Conversely, a sudden reversal in capital flows can lead to a sharp drop in the exchange rate, a slowdown in economic activity, and a sharp drop in inflation and domestic asset prices. Thus, increasing globalization and increasing international capital flows have the potential to destabilize both currency and financial stability, and freer cross-border flows of goods and services. Globalization also allows countries to reap the benefits of comparative advantage, greater reliance on imports and exports of goods and services, and global supply chains that affect domestic economies. For imports, changes in the international price level are likely to affect domestic inflation through the import prices of inputs. Especially for Vietnam, which imports energy, oil price fluctuations affect not only the domestic energy price but also the general price level because of cost inflation. For exports, changes in global demand also affect economic activity, domestic inflation, and the development of

international intermediaries. As financial liberalization took place around the world, financial intermediaries began to expand internationally. The growing importance of international banks and their implications for global financial stability has been partially recognized in the Basel Committee guidelines on common standards in the operation of the global banking system.

Secondly, the development of financial activities. The increasing degree of globalization, the continuous development of financial services will create changing requirements in the management activities of the SBV. The development of financial activities includes:

- The increase in market-based financial activities always poses challenges to the SBV in terms of financial stability due to the lack of supervision or strict management by the SBV.

- The increase of electronic payments: With the advancement of information and communication technology, new electronic payment methods have become more popular and to some extent, have replaced coins, banknotes and even checks, specifically. It can be card payment, payment by "payment gateway" such as Payoo, Vnpay, Vtcpay, etc... appearing on e-commerce sites, paying by "e-wallet" as a form of payment is quite convenient. , quite popular, not only used in large commercial centers, electronic trading floors but also can be used for any restaurant, cafe, etc... that have a contract with an e-wallet like Momo , Smartpay, Airpay, etc..., pay by "smartphone" to transfer money from one bank account to another by mobile phone. The development of new forms of payment also creates financial risks due to cyber security.

- The development of digital currency. Along with the strong development of the Industrial Revolution 4.0, digital money was born and is used as a means of payment increasingly popular in many countries around the world. Digital currency is an invisible currency that is stored in a distributed database on the internet, an electronic computer database, in a digital file, or in tokens of store value. Digital currency is not physical, meaning there is no physical equivalent in the real world, but it has almost all the characteristics of traditional money. Digital currency is used as a means of payment when buying goods, services, etc., it can even be transferred or exchanged for another currency. In particular, digital currency has no geographical and political limitations, can be used as a means of payment for all transactions taking place anytime, anywhere in the world. With the participation of Central Bank Digital Currency (CBDC), the birth and strong development of private digital currencies are also significant challenges in terms of currency management of SBV. Many are concerned that private digital currencies can interfere with the national currency system and national currency policy. Private digital currencies backed by tech giants could also quickly establish a dominant position in the global financial system. In the context that the global acceptance of private digital currencies continues to increase, there will also be great pressure on the SBV in the process of currency management as well as the implementation of international currency policy.

Thirdly, the impact of the industrial revolution 4.0. Some of the typical technologies of the industrial revolution 4.0 are new technologies including blockchain, automated robots, and Big Data. These specific technologies have been and will be the application trend of the global banking system, causing a strong impact on financial - banking - currency activities in countries around the world. Blockchain technology is making transactions faster, cheaper, safer and transparent. Blockchain technology acts as a ledger for all transactions, with the ability to share real-time transparent data information, save storage space and high security. Blockchain is a technology that stores and transmits information using blocks that are linked together and expand over time. Each block contains information about the time of creation and is linked to previous blocks, in the field of banking and finance, with blockchain, the participants only need to build a ledger network that shares all transaction information, when one member updates the information, all other members are allowed to view, read, etc... Before the wave of impact of the industrial revolution 4.0, Robotic process automation, a form of process automation by software- Robotic process automation (RPA) was invented and used to automate processes, support for the management, information and data searching, processing transactions and communicating with other digital systems is done quickly, efficiently and uniformly. The use of RPA can create a more transparent environment as data for each transaction is easily and quickly recorded, categorized and stored for search and review at any time as required. Big data is getting more attention and application both for Central Banks in many countries as well as for financial institutions. New big data sources can support services such as data sources from exchanges, credit card payment transactions, mobile banking data, records related to systems for cash settlement, securities settlement, clearing and derivatives as well as commercial and retail transactions. Big data can assist Central Banks in capturing real-time movements of the economy as well as providing early warning indicators to help identify turning points in the economic cycle. Thus, when applying advances in technology, it will change the structure, operation method and provide many modern services of the banking system, forming new financial products and services, such as M-POS, Internet banking, Mobile banking, chip card technology, e-wallets, etc.. The technology platform to exchange information and perform transactions between banks and customers takes place entirely on the internet environment, helping customers not have to go to the bank as well as the bank to not have to meet customers in person to complete the transaction. Each bank will become a direct bank, and the operations of the branches must change. As technology increasingly directly affects all activities and the need to use cash, paper money and coins will plummet, replaced by crypto currencies. Industry 4.0 will bring opportunities for the application of intelligent management technology, artificial intelligence, and automation in business processes, accelerating progress towards the future standard model, including non-cash payment activities. In addition, digital technology associated with the 4.0 industrial revolution has created an important infrastructure foundation in asset transformation, from using traditional bank staff to increasing the use of artificial intelligence. Digital identification becomes the basis of basic identification and is secured through biometric factors such as voice or fingerprint. This revolution not only helps to shift the distribution channels of traditional banking

products and services from physical branches, transaction counters, ATMs to digital channels, helping customers interact more and more effectively, It also has the ability to change business models, business processes, product and service structures towards digitization, helping banks to gradually become digital banks, providing new conveniences, experiences and services, bring real benefits to customers. The application of technology helps banks simplify processes, procedures and papers. Simultaneously with the use of distribution channels, access to users on digital platforms, points of interaction with customers via smartphone applications, social networks, etc., and the application of digital technologies in improving By improving the efficiency of internal system operations, optimizing business processes, banks can improve customer relationship management capabilities, helping banks gain a deeper understanding of customer habits and preferences to provide suitable products and services, to support the management of risk portfolios. Therefore, the SBV must make changes in the way it manages the operations of commercial banks in the future.

Fourthly, post-crisis problems. Post-crisis problems always leave heavy consequences for the economy, specifically:

- The financial debt burden, especially the financial debt burden in major economies, will have an impact on the global economic context and global financial markets.
- Impact of currency policy implementation of the SBV: The SBV will be under great pressure to determine when to withdraw from the quantitative easing strategy.
- Push the reform process to take place: The crisis exposed structural weaknesses in an increasingly complex global financial system.

The weaknesses reflected the fact that the regulations in force at the time did not keep up with the changes in the global financial environment. Whether the reforms proposed by the State Bank of Vietnam are approved or not will have a strong impact on economic activities, economic actors, and the behavior of banks and non-banking financial institutions as well as the governing bodies themselves. Therefore, regulatory reforms may also pose new challenges for the SBV.

4. Discussion and Conclusion

From the above analysis, in line with the SBV's management requirements for currency and financial stability in the future, the recommendations include:

Recommendation 1: Completing the legal framework to better strengthen the management of the SBV, specifically:

- Continue to research, issue, amend and supplement the legal framework to adapt to Industry 4.0, support digital transformation in the banking industry; strengthening the standard of connection and sharing of data (open API) between credit institutions and between credit institutions and other organizations;
- Continue to improve the management of banking and financial services on the technology platform; continue to build and complete the infrastructure of the interbank electronic payment system (IBPS), the automatic clearing house for low value retail transactions (ACH), the common data sharing system banking industry (CIC), etc..

- Expanding international cooperation in digital banking, Fintech; apply digital technology to enhance management, supervision and operational efficiency (SupTech).
- Continue to improve the contents of banking inspection and supervision activities; regulations related to currency management with entities in the economy.

Recommendation 2: Improve the real initiative and capacity of the SBV to manage currency policy. The SBV currently follows the model of a Central Bank dependent on the Government. In the management of currency policy, the National Assembly and the Government determine the objectives of the currency policy, and the SBV actively uses the tools of currency policy to achieve the set goals. Therefore, the SBV needs more sensitivity according to economic developments to effectively handle temporal issues of currency policy. This can only be done well when the planners must have basic macroeconomic knowledge of the market economy, be able to analyze and forecast macroeconomic indicators. In addition, the SBV should further strengthen the transparency of mechanisms and policies, provide clear information on policy directions for the market, and enhance self-responsibility for decision-making. And in order to ensure the maximum effectiveness of currency policy, the suitability of the objectives and solutions of macro policies such as fiscal policy is an important condition to enhance the ability to plan and implement the quality economic and financial policies.

Recommendation 3: Improve the quality of banking inspection and supervision activities on the basis of perfecting and synchronizing a system of mechanisms and policies sufficiently suitable to reality and international practices in order to improve the quality of inspection activities. Implement the model of banking inspection and supervision in the direction of ensuring the uniform direction of inspection and supervision activities of the inspection agency, avoid overlapping or omitted tasks, build a mechanism for decentralization, and clear division of responsibilities. Strengthening the coordination and information sharing between banking inspection and supervision agencies and law enforcement agencies and functional agencies in inspection and supervision of the financial system to ensure safety and stability of the financial system.

Enhance the effectiveness of the risk monitoring, assessment and early warning system with the "Macro prudential supervision" system that provides all the specific information about the credit institution in the system.

Recommendation 4: Ensuring the quality of statistical analysis and forecasting activities to enhance the value of statistical information, making "statistics really speak", helping the SBV use statistical information to understand know more fully and deeply about statistics for currency and financial management of the economy. The requirements for statistical analysis and forecasting are the honesty, objectivity and comprehensiveness of the data and data to be analyzed. This activity is maintained regularly through in-depth analysis, reporting and forecasting topics with close coordination between units in the SBV.

Recommendation 5: Improve the information system to support predictive analysis according to econometric models and quantitative analysis. A standardized database is a necessary condition in management. Therefore, with the current dispersion of data as well

as the untimeliness of data for analysis, it will be necessary for coordination between data management agencies such as the General Statistics Office, Ministry of Finance, Ministry of Planning and Investment, Securities Commission, SBV to have a complete national market information system – a national data warehouse with a complete, consistent and scalable database and application of modern monitoring technology ensure the connection of regulatory agencies in general and in particular for the SBV with this data warehouse.

Recommendation 6: Strengthen the strategy to develop high-quality human resources. The SBV needs to proactively build high-quality human resources to meet long-term and sustainable development goals, implement human resource management according to best practices, and maximize human resources to promote management activities. The SBV needs to be consistent on the policy framework, manage human resource risks well, enhance specialization in human resource work, and optimize the effective value of human resource management on the basis of improving staff capacity ministry, develop talents, maintain a professional working environment.

Recommendation 7: Promote information and communication on mechanisms and policies in the currency and banking sector to all social groups to orient the market and create a high consensus in society, contributing to bring mechanisms and policies to life quickly, have a more positive effect in operating the economy.

The State Bank of Vietnam, Hanoi, Vietnam

Abstract

Economists and central bank policymakers agree that “getting the exchange rate right” is essential for economic stability and growth in developing countries. This paper attempts to examine the recent evolution of exchange rate policies in Vietnam. The paper applies several models to analyze impacts of the exchange rate to macroeconomic variables. We use the Threshold Vector Autoregression (TVAR) model to study the exchange rate pass-through to domestic prices in different inflation regimes. In addition, we apply structural macroeconomic approach, the Dynamic Stochastic General Equilibrium (DSGE) model, to examine the effects of introducing exchange rate flexibility to macroeconomic variables and to study how central bank’s approach to exchange rate stability can affect potential macroeconomic volatility. We argue that the models’ results corroborate the State Bank of Vietnam’s gradual and cautious move toward exchange rate flexibility.

Keywords: *exchange rate, macroeconomic stability, structural macroeconomic model.*

1. Introduction

Central banks employ monetary policy as a tool to influence and control monetary aggregates to achieve the goals of macroeconomic management such as full employment, price stability, sustainable growth and healthy balance of payments. In the pursuit of these goals, central banks set intermediate objectives for monetary policy such as interest rates, money supply, bank credit, exchange rate, which are regarded as channels through which monetary policy is transmitted to the macroeconomy.

Among these intermediate objectives, the exchange rate plays a dual role in the macroeconomic adjustment process. Firstly, the exchange rate plays a critical role in international macroeconomic theories and monetary practices because it lies at the core of the transmission mechanism of monetary policy, especially in the case of small and open economies. Changes in the exchange rate might induce changes in the relative prices of goods and services, affecting the level of consumption, production, and resources distribution in the economy. Thus, the exchange rate can influence important macroeconomic variables such as output gap and inflation. Secondly, the exchange rate can

serve as shock absorber, accommodating domestic and external shocks through changes in real exchange rate. Over the past several decades, during a period of rapid economic growth, driven by the forces of globalization and market liberalization, many countries have moved toward more flexible exchange rate regimes. Among other factors, greater exchange rate flexibility is expected to provide a greater degree of monetary policy autonomy and flexibility in responding to external shocks, including large and volatile capital inflows. In small open economies, given the central bank enjoys credibility, by allowing the exchange rate to adjust in response to exogenous shocks, impacts on output and inflation can be mitigated while the volatility of interest rate is attenuated. Edwards and Levy-Yeyati (2005) provides empirical evidence on the relative benefits of exchange rate flexibility regimes to cope with terms of trade shocks. Reflecting in part the rationale and belief, many countries have gradually, albeit with varying degree of difficulty and success, shifted away from fixed or “pegged” exchange rates and moved toward more flexible exchange rates.

On the other hand, in central banking practice, there is often a reluctance to adopt flexible exchange rate regimes despite theoretical benefits (fear of floating) (Calvo and Reinhart, 2000). The reluctance to accept greater flexibility stems from concerns about costs of exchange rate volatility which may trigger: (1) losing policy credibility; (2) inflationary pressures associated with high exchange rate pass-through effect; (3) adverse effects of over-appreciation of currency on external balances and economic growth; and (4) impact of exchange rate fluctuations and unhedged FX positions of domestic agents on financial stability. Beyond the fear of floating, many developing and emerging market economies have relied on the exchange rate as nominal anchor in monetary policy framework to curtail inflationary pressures.⁸⁵ These countries attach their exchange rate to that of a larger economy to borrow the monetary policy credibility or to compensate for underdeveloped monetary policy framework (when institutional capacity to implement flexible exchange rate regimes is inadequate) (Levy-Yeyati and Struzenegger 2010, and El Hamiani Khatat and Veyrune 2019). Furthermore, as pointed out in the Integrated Policy Framework (IPF) of the International Monetary Fund, the presence of market frictions and imperfections (export prices being sticky in dollars – Dominant Currency Paradigm (Gopinath, 2015); currency mismatches on borrowers’ balance sheet) reduce the automatic stabilizer role of the exchange rate. That is, external shocks are not easily absorbed by financial markets’ adjustment, amplifying their impact on the domestic economy. For example, the exchange rate depreciation following an adverse shock can increase burden of unhedged foreign currency debt liabilities, worsening balance sheet and increasing borrowing costs. This rationale serves as a basis for the IPF proposal for deploying alternative policy tools such as foreign exchange intervention, capital flow managements and macroeconomic prudential measures instead of solely relying on exchange rate flexibility (IMF, 2020).

These considerations illustrate both the importance of the exchange rate in monetary policy and the challenges of exchange rate policy formulation in practice. Economists and

⁸⁵ According to the AREAER, an exchange rate anchor is a monetary policy framework where “The monetary authority buys or sells foreign exchange to maintain the exchange rate at its predetermined level or within a range. The exchange rate thus serves as the nominal anchor or intermediate target of monetary policy.”

central bank policymakers agree that “getting the exchange rate right” is essential for economic stability and growth in developing countries. Therefore, this paper attempts to examine the recent evolution of exchange rate policies in Vietnam.

2. Literature Review

The monetary economic literature has been prolific on topics related to monetary policy frameworks, inflation targeting, and other related topics such as monetary policy transmission mechanism, prerequisite conditions for monetary regime changes, and forecasting and policy analysis systems (Svensson, 1997; Clinton, Laxton and others, 2015; Mason and others, 1997; Freedman and Otker-Robe, 2010; Laxton and others, 2009). There also exists a plethora of studies discussing and analyzing exchange rate regimes, monetary dynamics under different exchange rate regimes, transition from a fixed to a more flexible exchange rate arrangement (Otker-Robe and others, 2007; El Hamiani Khatat and Veyrume, 2019). Economists and central bankers have also explored the topic of FX interventions, importance of exchange rate stabilization in open economies (Ostry and others, 2012). With respect to literature on exchange rate regimes from country experience, Otker-Robe and David Vavra and others (2007) presents steps several countries (Chile, Israel, Poland, Brazil, Czech Republic, Uruguay) took in transitioning to greater exchange rate flexibility, elaborating on attributes of order and disorder transitions. Rojas-Suarez (2003) studies alternative exchange rate regimes from Latin America, identifying the necessary preconditions to make alternative regimes sustainable of proposing policy recommendations.

The literature also discussed the topic of exchange rate pass-through on domestic prices (Campa and Goldberg, 2006; Gagnon and Ihrig, 2004). Regarding relationship between exchange rate pass-through and inflation environment, Takhtamanova (2008) employs Phillips curve framework to analyze exchange rate pass-through and focusing on the link between the real exchange rate and inflation, suggesting that the reduction in responsiveness of CPI inflation to real exchange rate can be in part explained by the low-inflation environment of the 1990s. Taylor (2000) shows the degree of exchange rate pass-through depends positively on the level of inflation. Baqueiro et al (2003) studies the exchange rate pass-through in different countries in high and low inflation regimes. Aleem and Lahiani (2014) applies TVAR model to examine exchange rate pass-through in Mexico, showing that the response of inflation to exchange rate shocks will be statistically insignificant when annual rate of inflation is less than 9,48%.

The past three decades have witnessed the development of modern macroeconomics and a new class of models (DSGE) that are useful for macroeconomic policy analysis. With that development, there has been a significant evolution in the conduct of macroeconomic research in academia as well as in the formulation and communication of monetary policy at advanced central banks around the world. Obstfeld and Rogoff (1995) introduces the novel model framework open-economy macroeconomics to study a two-country open economy with exchange rate, expanding the scope of DSGE literature. Gali and Monacelli (2005) studies monetary policy and exchange rate volatility in a small open economy using DSGE model. Marcos (2006) built a two-country version of Gali and Monacelli (2005), allowing nominal rigidities of foreign country to affect domestic variables.

3. Method

The paper applies several models to analyze impacts of the exchange rate to macroeconomic variables. Firstly, we use a multivariate process, the Threshold Vector Autoregression (TVAR) model, to study the exchange rate pass-through to domestic prices in different inflation regimes. Secondly, we apply structural macroeconomic approach, the Dynamic Stochastic General Equilibrium (DSGE) model, to examine the effects of introducing exchange rate flexibility to macroeconomic variables and to study how central bank's approach to exchange rate stability can affect potential macroeconomic volatility. We argue that the models' results corroborate the State Bank of Vietnam's gradual and cautious move toward exchange rate flexibility.

4. Results

4.1. Recent evolution of exchange rate policies in Vietnam

4.1.1. Background on Vietnam's monetary and exchange rate regime

This section reviews background on the role of State Bank of Vietnam in formulating exchange rate policies and the operation of Vietnam's exchange rate regime. As elaborated upon the Law on the State Bank of Vietnam (2010), the tasks and powers of the State Bank of Vietnam include, but not limited to, the following:

(i) To conduct operations for the purpose of currency stability; to assure the safety for banking operations and the systems of credit institutions; to assure the safety and effectiveness of the national payment system; and to contribute to accelerating socio-economic development along the socialist orientation.

(ii) To perform the state management of foreign exchange, foreign exchange and gold trading activities.

(iii) To manage state foreign exchange reserves.

As such, the State Bank of Vietnam pursues multiple policy objectives. However, from a purely monetary perspective, it has a triple final objectives, inflation, economic growth and macroeconomic stability. To implement the national monetary policy, the Governor of the State Bank of Vietnam is empowered to “decide on the use of tools for the implementation of the national monetary policy, including re-financing, interest rates, exchange rates, compulsory reserves, open-market operations and other tools and measures as prescribed by the Government”. The State Bank of Vietnam administers the exchange rate regime in Vietnam and announces exchange rates. Specifically, according to Vietnamese law, exchange rate regime is a managed floating system; and exchange rates of Vietnam dong shall be determined on the basis of the foreign currency supply and demand in the market regulated by the State.⁸⁶

Vietnam is a small and highly open economy while financial and monetary markets are still at early stage of development. Financial dollarization, although has declined in

⁸⁶ According to the Annual Report on the Exchange Arrangements and Exchange Restrictions in 2019 of the IMF (AREAER), 34.4% of the IMF member countries conduct floating and free floating exchange rates. The majority or 65.6% apply either fixed or managed exchange rate regime.

recent years, still exists; the foreign exchange market stability is heavily influenced by market's sentiments and expectations. These include characterized factors of Vietnam's market such as the expectation over currency's depreciation (the nominal value depreciation of the dong) as well as over high inflation due to past events. Therefore, exchange rate fluctuations could significantly impact macroeconomic stability. As such, the State Bank's exchange rate policy aims at mitigating excessive fluctuations of the VND so as to achieve macroeconomic stability and price stability.

4.1.2. Introducing exchange rate flexibility

The State Bank of Vietnam has started to gradually and cautiously introduce exchange rate flexibility. Since January 2016, the State Bank of Vietnam announces a central parity exchange rate against the U.S. dollar on a daily basis. There is a trading band for the interbank exchange rate of +/- 3 percent around the official rate:

(i) Central exchange rate mechanism: According to Decision No. 2730/QĐ-NHNN dated 31/12/2015, the central exchange rate of USD/VND is determined on the basis of reference to the movements of weighted average exchange rate on the interbank foreign currency market; exchange rate movements of some currencies on international markets that having significant trade, borrowing, debt repayment, and investment relations with Vietnam; macro-economic balance; monetary and monetary policy objectives.

(ii) Exchange rate band: According to Decision No. 1636/QĐ-NHNN dated August 18, 2015, banks, non-bank institutions and foreign bank branches are allowed to conduct and provide foreign exchange trading services. The institutions could provide spot buying and selling rates between VND and other foreign currencies under the following principles: (1) For USD, not exceeding the band of $\pm 3\%$ against the central exchange rate announced by SBV applicable to that transaction date; (2) For other foreign currencies, determined by permitted credit institutions.

(iii) FX intervention: The interventions in the foreign currency market is a measure in managing the State Bank of Vietnam's exchange rate policy in order to achieve monetary policy objectives. The central bank intervenes foreign exchange market in both buying/selling directions.

(iv) Regarding the process of increasing exchange rate flexibility: The State Bank of Vietnam's exchange rate management has undergone transformation and reform in 2016. Compared to the past, the SBV has widened the exchange rate band from $\pm 1\%$ to $\pm 3\%$, also flexibility managed the central rate (midpoint) on a daily basis instead of making a few adjustments per year as in the period before 2016. In recent years, the monetary policy framework with the current exchange rate management mechanism has helped the State Bank to generally achieve the ultimate objectives of macroeconomic stability and inflation control.

Adjustments and changes in the management framework must be carefully and prudently considered. Any adjustments and changes must synchronize with the modernization of the monetary policy framework, policy managing capacities (system, procedure of management, forecast and analysis capabilities), the improvement of policy communication, and the gradual liberalization of international capital accounts (coupled with

the development of macro safeguards), along with the development of the capital markets and modernization of the banking system, thereby promoting the effectiveness of monetary policy transmission.

Strengthening the policy managing capacity and reforming the monetary policy framework is a continuous and long-term cumulative process. The success of this process depends on the existing monetary policy framework foundation, the specific macroeconomic conditions of each country and the international economic conditions. International experience shows that this process should be done systematically, carefully and may take a long time.

4.2. Exchange rate pass-through in different inflation regimes

4.2.1. TVAR model and data

Movements in the nominal exchange rate are transmitted directly to tradable goods prices and inflation. Indirectly, there is an effect on the economy and prices through changes in real exchange rate and impacts on the output gap. In addition, the exchange rate can get involved in expectation channel of transmission mechanism by affecting the process of expectations formation. In high inflation environment, if economic agents and firms perceive any increase in the cost of production to be more persistent, they adjust inflation expectations and choose a higher frequency of price adjustment for a given menu cost. As such, there exists an interaction between exchange rate channel and expectation channel in monetary policy transmission mechanism. Ceteris paribus, we expect that the exchange rate pass-through to inflation should be higher during high inflation environment than low inflation environment. As the exchange rate plays a dual role of monetary policy transmission channel and shock absorber, policymakers should consider both costs and benefits of exchange rate flexibility (i.e, benefits of allowing exchange rate flexibility to be a policy tool to buffer adverse external shocks and costs of cost-push shocks from exchange rate fluctuations). Aleem and Lahiani (2014) maintains that the credibility of monetary policy to stabilize inflation in the economy determines the degree of exchange rate pass-through. As such, it is important to consider nonlinearity of exchange rate pass-through in formulating exchange rate policies.

We use TVAR model to investigate the nonlinear responses of domestic prices to an exchange rate shock by using a threshold level of inflation which is determined endogenously. The general TVAR model is presented as follows:

$$Y_t = \begin{cases} (I \otimes X_t)\beta_1 + u_t, & Eu_t u_t' = \Sigma_1 \text{ if } T_{t-d} \leq \lambda \\ (I \otimes X_t)\beta_2 + u_t, & Eu_t u_t' = \Sigma_2 \text{ if } T_{t-d} > \lambda \end{cases}$$

In this paper, we estimate the following two regime TVAR model with a threshold level of inflation:

$$Y_t = \begin{cases} c_1 + \Pi_{11}Y_{t-1} + \Pi_{12}Y_{t-2} + \dots + \Pi_{1p}Y_{t-p} + u_{1t}, & Eu_t u_t' = \Sigma_1 \text{ if } Inf_{t-1} \leq \lambda \\ c_2 + \Pi_{21}Y_{t-1} + \Pi_{22}Y_{t-2} + \dots + \Pi_{2p}Y_{t-p} + u_{2t}, & Eu_t u_t' = \Sigma_2 \text{ if } Inf_{t-1} > \lambda \end{cases}$$

Where the vector of endogenous variables Y_t consists of the rate of inflation, the growth rate of GDP, the nominal effective exchange rate (NEER) and the interest rate.

$$Y_t = [Inflation \quad GDP \quad NEER \quad IR]'$$

Inf_{t-1} indicates inflation rate in the previous period and λ indicates the threshold level of inflation. Intuitively, the TVAR model consists of two separate VAR models corresponding to two inflation regime. Thus, it is possible to estimate each equation using OLS as in the case of standard VAR models. Following previous work, we use 4 as the lag for the TVAR model.

Table 1. Data for TVAR model

Variable	Data transformation	Source
GDP	$d1gdp = 400(\log(gdp)/\log(gdp(-1)))$	GSO
Inflation	$d1cpi = 400(\log(cpi)/\log(cpi(-1)))$	GSO
NEER	$d1neer = 400(\log(neer)/\log(neer(-1)))$	GSO; IFS; Reuters; Calculated by authors
Interest rate	ir	Reuters

Augmented ADF test shows that transformed variables are stationary:

Table 2. Augmented ADF test

Variable	Critical Value	Stationary
d1gdp	-7,40**	I(0)
d1cpi	-4,667**	I(0)
d1neer	-9,244**	I(0)
ir	-3,626*	I(0)

4.2.2. Identifying the threshold level of inflation

The threshold level of inflation in the TVAR model is determined maximum likelihood estimation following Balke (2000) methodology and algorithm. The algorithm loops over the usable values of the threshold (the rate of inflation) and computes the log likelihood of the model with a break at the value of threshold, identifying the threshold value to be 4,7% (annualized rate of inflation). The likelihood ratio is graphed against the threshold value as follows:

Figure 1. Likelihood ratio and threshold value

4.2.3. Empirical results

Table 3. Estimation results of the TVAR model

17. Constant	-5.394.976.198	9.493.427.167	-1.490.868.086	749.051.967

Note: * represents the 10% level of significance.

Table 3 reports the results of the TVAR model with the rate of inflation (4,7%) as a threshold variable. The exchange rate pass-through is negative and statistically significant only in the upper regime (the rate of inflation is greater than 4,7%) at the fourth lag. In the lower regime (the rate of inflation is smaller than 4,7%), the exchange rate pass-through is statistically insignificant.

Impulse responses conditional on inflation regimes of macroeconomic variables to exchange rate shock are obtained by bootstrap algorithm (generalized nonlinear impulse responses as defined by Koop, Pesaran and Potter (1996)). Figures 2 and 3 illustrate impulse response of the rate of inflation, GDP and interest rate to exogenous exchange rate shock in standard deviation unit (+1SD, +2SD, -1SD và -2SD). Impulse response results are in line with monetary economic theories: negative exchange rate shock (VND depreciates) creates inflationary pressure. Specifically, in the high (low) inflation regime, in response to one unit standard deviation negative exchange rate shock, inflation increases 2,5 (1) percentage point in the first quarter and gradually declines toward 0 in sixth (third) quarter.

Response of Inflation to Shocks, Conditional on High Inflation Regime

Figure 2. Impulse responses of inflation in the high inflation regime

Response of Inflation to Shocks, Conditional on Low Inflation Regime

Figure 3. Impulse responses of inflation in the low inflation regime

Empirical results from TVAR model corroborate theoretical hypothesis that the exchange rate pass-through to inflation should be higher during high inflation environment than low inflation environment. The clear policy implication is that the authority should implement the shift toward more flexible exchange rate in the low inflation regime and avoid it in the high inflation regime. Hence, we argue that the State Bank of Vietnam’s gradual move toward more flexible exchange rate since 2016 is well timed and auspicious as it coincides with a regime switch of inflation (as shown in Figure 4).

Figure 4. Inflation development (% yoy)

4.3. Exchange rate in monetary policy framework from structural models

Lucas “critique” (1976) states that traditional Keynesian macroeconomic models – relying on historical data and ad hoc theorizing about the relations between macroeconomic aggregates – would lead to incorrect answers about policy questions as their parameters are time-invariant conditionally upon policy or regime changes. In response to the critique, the efforts of many researchers to understand the relationship among the business cycle, inflation, and the monetary policy have led to the development of the New Keynesian DSGE framework which is a synthesis between new classical macroeconomics and New Keynesian modeling approach (Goodfriend and King, 1997).

As it would be challenging and inconsistent to investigate impacts of alternative exchange rate regimes and monetary policy approaches to the economy using macroeconomic models and historical data (Lucas critique), the paper applies structural models in the New Keynesian framework.

4.3.1. Semi-structural model

The International Monetary Fund has also proposed the Forecasting and Policy Analysis System (FPAS) which consists of methodologies developed in the modern dynamic macroeconomic literature. Berge, Karam, and Laxton (2006a, b) developed a semi-structural DSGE model-based approach to monetary policy analysis, which has been adopted by many developing countries’ central banks. For instance, based on such a framework, Anand et al. (2011) proposed a quarterly projection model for India; Dizioli and Schmittmann (2015) developed a macro-model approach to monetary policy analysis and forecasting for Vietnam. FPAS models have been completed and applied in Australia, Brazil, Canada, Singapore, and Thailand and under construction for many countries.

Following Berge, Karam, and Laxton (2006 a,b), a standardized semi-structural FPAS model consists of four equations: (1) an aggregate demand (IS curve) equation that relates the output gap to expected and past real activity, real interest rate, real exchange rate; (2) Phillips curve equation that relates inflation to expected and past inflation, the output gap and the exchange rate; (3) an uncovered interest parity condition for the exchange rate with certain degree of backward-looking expectations; (4) central bank's policy rule in setting the interest rate as a function of the output gap, expected inflation and other objectives. The model explains movements of deviation of each macroeconomic variables from equilibrium (i.e., in gap terms).

(a) Output gap equation

$$\hat{y}_t = \beta_1 \cdot \hat{y}_{t-1} - \beta_2 \cdot (\beta_4 \cdot \hat{r}_t + (1 - \beta_4) \cdot \hat{z}_t) + \beta_3 \hat{y}_t^* + \epsilon_t^{\hat{y}}$$

(b) Phillips curve equation

$$\pi_t = \alpha_1 \cdot \pi_{t+1} + (1 - \alpha_1) \cdot \pi_{t-1} + \alpha_2 \cdot (\alpha_3 \hat{y}_{t-1} - (1 - \alpha_3) \hat{z}_{t-1}) + \epsilon_t^{\pi}$$

(c) UIP condition

$$s_t = \lambda_1 \cdot E_t s_{t+1} + (1 - \lambda_1) \cdot (s_{t-1} + \frac{\Delta \bar{z}_t + \pi_t^4 - \pi^*}{2}) + (i_t^* - i_t + prem_t)/4 + \epsilon_t^s$$

(d) Policy rule

$$i_t = \gamma_1 i_{t-1} + (1 - \gamma_1) [i_t^{neutral} + \gamma_2 (E_t \pi_{t+1}^4 - \pi_{t+1}^{tar}) + \gamma_3 \hat{y}_t + \gamma_4 (\Delta s_t - \Delta s_t^p)] + \epsilon_t^i$$

Where \hat{y}_t is the output gap; \hat{r}_t is the real interest rate gap; \hat{z}_t is the real exchange rate gap; \hat{y}_t^* is the foreign output gap; π_t is the rate of inflation; s_t is nominal exchange rate; and i_t is policy interest rate.

If another objective of a central bank is to smooth exchange rate movements, monetary policy can aim to influence exchange rate (IMF, 2018). Following previous work regarding exchange rate policy in FPAS literature, we assume the central bank has objective (policy) for exchange rate movement represented as follows:

$$\Delta s_t^p = p_1 \Delta s_{t-1}^p + (1 - p_1) [\Delta \bar{z}_t + \pi_t^{tar} - \pi^* - p_2 (E_t \pi_{t+1} - \pi_{t+1}^{tar}) - p_3 \hat{z}_t] + \epsilon_t^{\Delta s^p}$$

Where Δs_t^p is objective of exchange rate movement (policy), consisting of exchange rate smoothing (Δs_{t-1}^p) and others such as long run equilibrium real exchange rate ($\Delta \bar{z}_t + \pi_t^{tar} - \pi^*$), inflation target and real exchange rate gap. As such, the exchange rate equation can be restructured as weighted function of UIP condition and exchange rate policy objective as follows:

$$s_t = \lambda_1 \cdot \left(s_{t-1} + \frac{\Delta s_{t-1}^p}{4} \right) + (1 - \lambda_1) [\lambda_2 \cdot E_t s_{t+1} + (1 - \lambda_2) \cdot (s_{t-1} + \frac{\Delta \bar{z}_t + \pi_t^4 - \pi^*}{2}) + (i_t^* - i_t + prem_t)/4 + \epsilon_t^s]$$

It is worth noting that parameter λ_1 represents the importance of exchange rate policy management (or its effectiveness). If $\lambda_1 = 0$, the exchange rate equation represents uncovered interest parity condition for the exchange rate with certain degree of backward-

looking expectations. If $\lambda_1 = 1$, the exchange rate equation represents tightly managed (or fixed) exchange rate regime.

Figure 5 compares impulse responses of macroeconomic variables to a foreign demand shock in a managed exchange rate regime (as modeled above) (blue impulse responses) and in a floating exchange rate regime ($\lambda_1 = 0$) (orange impulse responses). Allowing the nominal exchange rate to adjust flexibly as a tool to buffer adverse foreign demand shock leads to lower volatility in the rate of inflation and the output gap. This result supports the case that the exchange rate can serve as shock absorber, accommodating domestic and external shocks. Hence, we argue that the State Bank of Vietnam’s gradual move toward more flexible exchange rate since 2016 is in line with its overarching objectives of prices and macroeconomic stability.

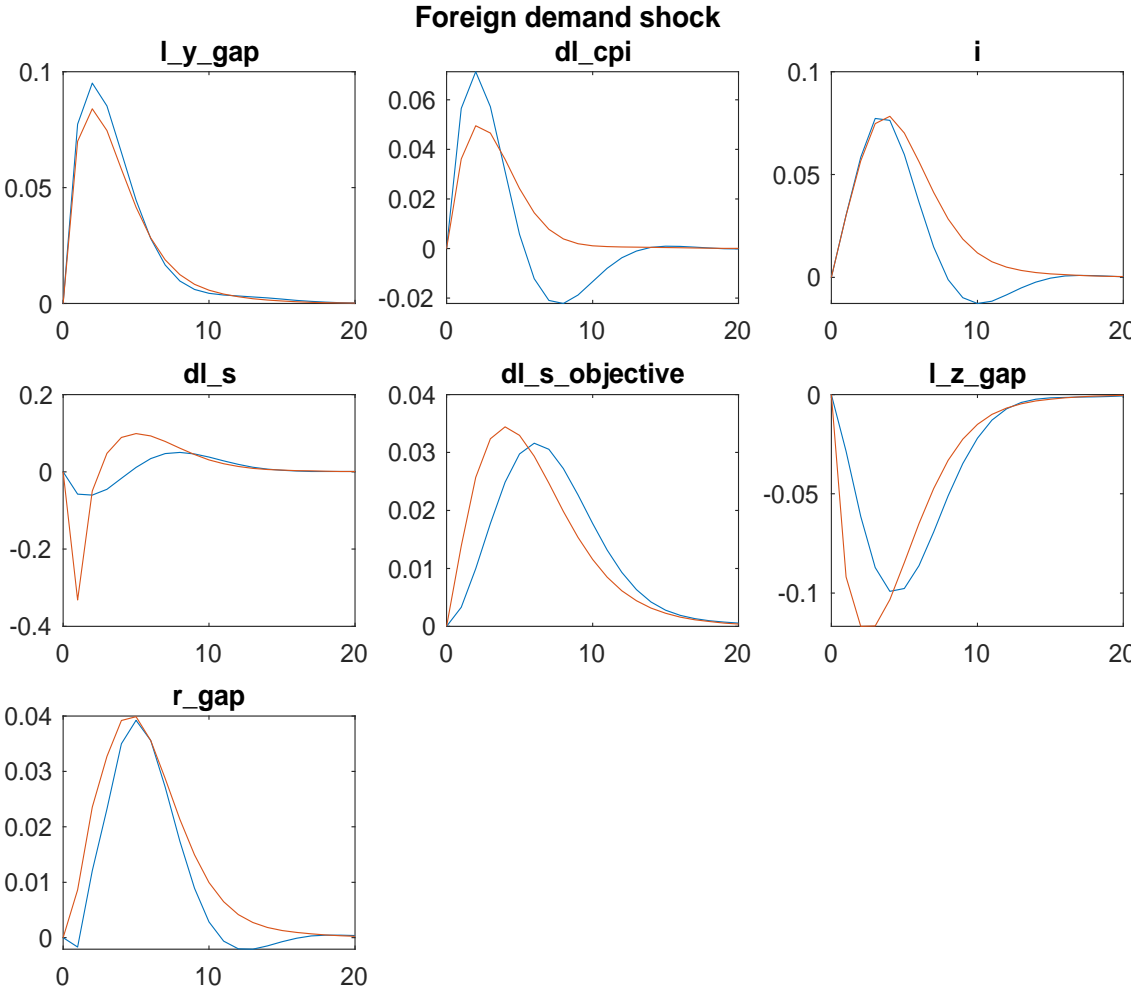

Figure 5. Impulse responses in different exchange rate regimes

4.3.2. Policy function in DSGE model and theoretical economic volatility

Further, we estimate a New Keynesian open economy DSGE model and apply a counterfactual exercise to central bank’s policy function to assess importance of policy objectives with respect to macroeconomic volatility. Monetary policy function in the DSGE model is presented as follows:

$$i_t = (1 - \rho)(\alpha_\pi \pi + \alpha_y y + \alpha_s s) + \rho i_{t-1}$$

Where α_π , α_y , and α_s represent policy weighted in corresponding monetary objectives such as inflation, output and exchange rate; ρ is interest rate smoothing parameter.

Table 4 reports theoretical variance of imacroeconomic variables (inflation, output, nominal exchange rate) in different sets of monetary policy function. Without the exchange rate stabilization objective ($\alpha_s = 0$) – that is, the central bank doesn't adjust the nominal interest rate to influence exchange rate with a view to smooth movements of the exchange rate, macroeconomic variables' variances are significantly larger compared to the baseline scenario (estimated model), implying higher economic volatility (scenarios (1) and (2)). Even when the central bank focus more on inflation objective (higher weight on α_π), the exchange rate stabilization objective plays critical role in reducing macroeconomic volatility (scenarios (3) and (4)).

Table 4. Theoretical economic volatility in different policy scenarios

	(1) $\alpha_\pi = 1,2425$ $\alpha_y = 0.4639$ $\alpha_s = 0.5407$	(2) $\alpha_\pi = 1,2425$ $\alpha_y = 0.4639$ $\alpha_s = 0$	(3) $\alpha_\pi = 2,5$ $\alpha_y = 0.4639$ $\alpha_s = 0$	(4) $\alpha_\pi = 2,5$ $\alpha_y = 0.4639$ $\alpha_s = 0.5407$
Variance	Estimated model	Without exchange rate stabilization objective	Without exchange rate stabilization objective; more weight on prices stability objective	With exchange rate stabilization objective; more weight on prices stability objective
π	21.661	27.941	17.554	16.376
y	46.636	128.440	62.119	42.816
s	26.352	61.426	83.956	38.158
y (<i>observed</i>)	0.6036	0.6870	0.6551	0.5957
π (<i>observed</i>)	21.661	27.941	17.554	16.376
s (<i>observed</i>)	26.352	61.426	83.956	38.158

These results correspond with preceding evidence by the IMF's application of DSGE model with respect to exchange rate stabilization using FX intervention. According to the IMF's model, without FX interventions, Vietnam would have experienced significantly larger volatility (the red lines in Figure 6) (IMF, 2019).

Figure 6. Vietnam counterfactual simulation under a new policy framework

As such, these results show the importance of exchange rate stabilization in monetary policy framework, reinforcing the role of exchange rate stabilization policies in Vietnam and supporting the gradual and cautious move toward more exchange rate flexibility of the State Bank of Vietnam.

5. Conclusion

The exchange rate plays a dual role in the macroeconomic adjustment process. Firstly, the exchange rate is at the core of the transmission mechanism of monetary policy. Secondly, the exchange rate can serve as shock absorber, accommodating domestic and external shocks. Greater exchange rate flexibility is expected to provide a greater degree of monetary policy autonomy and flexibility in responding to external shocks, including large and volatile capital inflows in small open economies. On the other hand, in central banking practice, there is often a caution to adopt flexible exchange rate regimes with concerns about costs of exchange rate volatility and with the critical role of exchange rate stabilization in monetary policy frameworks. Using models' results, the paper argues that the State Bank of Vietnam's gradual and cautious move toward more flexible exchange rate since 2016 is well timed and auspicious as it coincides with a regime switch of inflation. There exists evidence of both benefits of more flexible exchange rate and critical roles of exchange rate to

macroeconomic stabilization. As such, the road to flexibility should be gradual and supported by institutional, policy and operational measures. As pointed out in the Integrated Policy Framework of the International Monetary Fund, the presence of market frictions and imperfections reduce the automatic stabilizer role of the exchange rate. That is, external shocks are not easily absorbed by financial markets' adjustment, amplifying their impact on the domestic economy. Thus, in response to adverse external shocks, central banks should deploy alternative policy tools such as foreign exchange intervention, capital flow managements and macroeconomic prudential measures instead of solely relying on exchange rate flexibility.

Abstract

This study aims to analyze the impact of green marketing strategy on green food purchase intention as well as evaluate the current green marketing strategy at Winmart supermarket chains (previously known as Vinmart). The survey was conducted on 260 consumers aged 18 and over, with a variety of occupations and income levels. This study is one of the first quantitative studies to examine the impact of green marketing mix on Vietnamese consumers' intention to buy green food. The results show that all of 4Ps in the green marketing mix have positive impact on green food's purchase intention. The green product and green place variables have been shown to have positive influences on attitudes towards green food. Meanwhile, except for green place, the environmental knowledge variable has a moderating effect on the relationship between other elements of green marketing mix and green food purchase intention. This study provides useful information for WinMart supermarkets and other businesses in the industry of green food in Vietnam. Additionally, the study also proposes solutions for the government to support these businesses as well as stimulate consumer demand for green food.

Keywords: *Attitude Towards Green Food, Environmental Knowledge, Green Food, Green Marketing*

1. Introduction

Vietnam has been a potential market for green and organic food for some recent years. According to a report from Nielsen in 2019, health is the top concern of Vietnamese people, confirmed by 43% of people surveyed, while this number is 40% in 2020. In the context of the Covid-19 pandemic, consumers have gradually changed their shopping behaviors with increasing attention to "green" consumption channels and they have risingly prioritized health and environmental benefits. Green consumption is a goal in the Green Growth Strategy for the period 2011-2020 and a vision to 2050 of Vietnam, showing the government's interest in this new consumption trend.

In Vietnam, VinMart (renamed to WinMart since April 2021) is a big supermarket chain providing a variety of products, in which food is one important item of the company. In November 2017, VinMart supermarket chain and VinMart+ retail stores were in the top 2 favorite retailers voted by consumers. In recent years WinMart has focused on building a green marketing strategy to catch up with the current trend. Perceiving its ideal position and condition in the market, we decided to choose Winmart supermarket to be analyzed in this study.

For the purpose of studying the impact of green marketing strategy on green food purchase intention, we chose to investigate customers at Winmart supermarket chain. The study will clarify specifically the role of four elements in green marketing mix strategies affecting green food purchase intention at Winmart supermarket chain as well as green food purchase intention of Vietnamese consumers in general.

2. Literature review and Theoretical background

2.1. Literature review

Green food

Green food is produced under farming practices that use only natural ingredients, complied with certain production standards, which is, they are grown without the use of conventional pesticides, artificial fertilizers, human waste or sewage sludge and they are not treated with radiation or food additives. Green food refers to controlling and limiting the use of synthetic fertilizers, pesticides, growth regulators, additives, and genetic engineering (Liu et al., 2013).

Green Marketing

Since the 1970s, the concept of green marketing had been widely introduced, but in the late 1980s, green marketing was highly interested because at that time, consumers were paying more attention to green products. Hennion and Kinnear first introduced the concept of green marketing in 1976, indicating that green marketing is the implementation of marketing towards the customer segments that care about the environment. Till 1995, Peattie stated that period as the first era of green marketing. Since that milestone, the theoretical background for green marketing has been significantly developed and many definitions have been proposed. At the same time, Peattie believed that green marketing is an overall management process, responsible for certain tasks. In context of this study, green marketing is defined as a marketing plan aimed at achieving strategic and financial objectives to minimize negative impacts on the natural environment (Berger et al., 2013).

Green marketing mix strategy (4Ps)

Green Marketing Mix is a concept that denotes a set of marketing tools and elements to achieve organizational goals without harming the natural environment (Al-Salaymeh, 2013). Marketing mix 4Ps model includes: Product, Price, Place, Promotion.

Green product refers to products designed to minimize negative impacts on the environment as well as save energy and natural resources. Green product is not only limited to final goods but involves all elements and factors relating to the product, such as the materials it requires, the manufacturing process, the packaging of the product, etc. (Fan and Zeng, 2011).

Green price refers to a specific price set for green products to induce consumers to buy more. However, green products often cost higher because of environmental factors, but in the long run, they will provide economic benefits (Fan and Zeng, 2011).

Green place is the management of the logistics and distribution of a product from its place of production to its place of sale and finally to the customer, with an aim of optimizing distribution efficiency under conditions of strict environmental requirements.

Green promotion is the communication with customers via different channels and methods to convey the company's environmental messages as well as promote its products to encourage customers to make purchase decision.

Green food purchase intention

Intention is a factor used to evaluate an individual's ability to perform a behavior, in marketing field, it is a customer's willingness to buy and use a product (Tirtiroglu and Elbeck, 2008). According to TPB theory by Ajzen (1991), purchase behavior can be predicted from purchase intention with considerable accuracy. Many studies have confirmed that there is a strong correlation between purchase intention and purchase behavior (Ajzen, 2006) and that this is also true in research on purchase behavior of green products (Kumar et al., 2012). The difference between the intention to buy green food and regular food lies in the features of environmental friendliness and safety for customer health, which are considered as top priority by consumers.

2.2. Theoretical background and hypothesis development

Based on the theory of green marketing, integrating the theory of reasoned action (Fishbein and Ajzen, 1970), and the theory of planned behavior (Ajzen, 1985; Ajzen, 1991), as well as regarding previous studies, we build a conceptual model to evaluate the impact of green marketing mix on consumers' intention to buy green food and expect the following hypotheses:

Green Product

Prior research (Siddique and Hossain, 2018) has found that green product is an important, far-reaching factor affecting consumers' purchasing decisions. If consumers perceive product quality such as freshness or assurance of safety, their purchase intention will positively influenced (Manget et al. 2009).

Previous studies confirm that green product element has an impact on consumer attitudes (Bhal and Chandra, 2018; Jain and Kaur, 2006). Environmental issues are always

associated with green products that are made environmentally friendly, not harmful to the nature, without toxic gas emissions and are designed to be recyclable (Ramayah et al., 2010). This has had a stronger impact on consumer attitude towards green consumption.

Therefore, the study proposes the following hypothesis:

H1a: Green product has an impact on green food purchase intention

H1b: Green product has an impact on attitude towards green food

Green Price

Pricing green products is an important issue for businesses because it will influence costs that these businesses need to spend and affect consumer intention to buy green food (Hashem and Al- Rifai, 2011). Lower price will motivate customers to buy more green products, and vice versa. Enterprises need reasonable green pricing to stay competitive (Soonthonsmai, 2007).

Prior researches show that consumer attitudes vary and depend on a combination of green marketing strategies including green pricing (Bhuiyan and Kim, 1999). Therefore, this study proposes the following hypothesis:

H2a: Green price has an impact on green food purchase intention

H2b: Green price has an impact on consumer attitudes towards green food

Green Place

Several studies have found a positive and significant relationship between green marketing mix including green place and purchase intention (Wanninayake and Randiwela 2008; Ansar, 2013; Juwaheer et al., 2012; Solaiman et al., 2015). Green place will affect consumer purchase intention because very few customers will spend money to buy green products just for its benefits without accompanying utilities (Sharma, 2011).

Previous studies confirm that green place has a direct impact on consumer attitudes (Bhal and Chandra, 2018; Jain and Kaur, 2006). If green place makes green food more accessible to consumers, consumers will have a more positive attitude about consuming green food. Therefore, this study proposes the following hypotheses:

H3a: Green place has an impact on green food purchase intention

H3b: Green place has an impact on consumer attitude towards green food

Green promotion

The use of advertising and promotional campaigns in promotion strategy will convey effective messages about a company's green attributes, leading to the increase in purchase intention of customers (Ansar, 2013; Hartmann và Apaolaza-Ibanez, 2009).

Some previous studies have also concluded that green promotion has an impact on consumer attitudes (Bhal and Chandra, 2018; Jain and Kaur, 2006). Tanner and Kast (2003) found that green food is strongly and positively influenced by consumer attitudes. Therefore, our study proposes the following hypotheses:

H4a: Green promotion has an impact on green food purchase intention

H4b: Green promotion has an impact on customer attitudes towards green food

Environmental Knowledge

Environmental knowledge is defined as an individual's level of knowledge about an environmental issue that significantly affects their decision-making process (Rashid, 2009). Environmental knowledge is a well-studied variable that has been found to have a positive influence on consumer purchase intention and behavior of green product (Chan et al., 2000; Eze et al., 2013; Joshi and Rahman, 2015). In addition, the study by Mahmoud et al. (2017) found that environmental knowledge moderates the relationship between green marketing and purchase intention. Therefore, the following hypotheses are proposed:

H5a: Environmental knowledge has a moderating effect on the relationship between green product and green food purchase intention

H5b: Environmental knowledge has a moderating effect on the relationship between green price and green food purchase intention

H5c: Environmental knowledge has a moderating effect on the relationship between green place and green food purchase intention

H5d: Environmental knowledge has a moderating effect on the relationship between green promotion and green food purchase intention

Attitude towards Green Food

Attitude is an important predictor of behavioral intention, which has been confirmed in various studies. Research in the field of green food by Chen (2007) has shown that attitude towards product has a positive relationship with consumers' intention to buy green food. Teng and Wang (2015) argued that a positive attitude towards green food is an important premise that promotes the intention to buy green food. Therefore, stated formally:

H6: Attitude towards green food has an impact on green food purchase intention

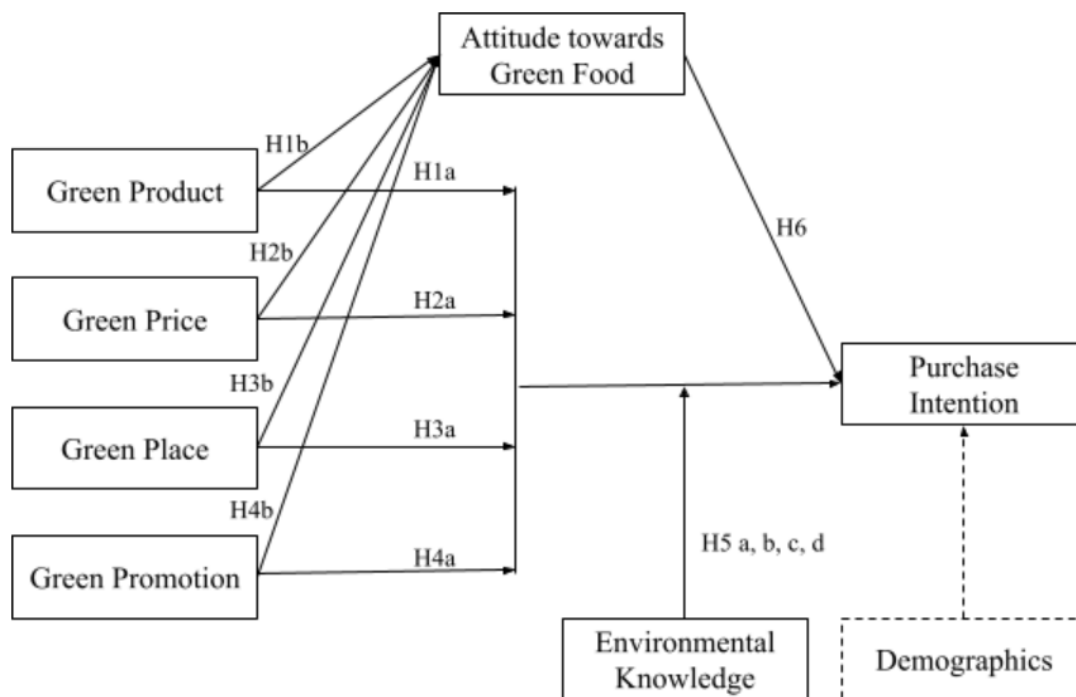

Figure 1. Conceptual Model

3. Method

We researched and collected data through two main sources.

Secondary information: Through the desk-based research method, we searched and collected data through research papers, master's theses, doctoral theses, journals officially published, etc. about green marketing, green purchase intention and green food to build the conceptual model and determine the scale.

Primary information: This source of information was collected through qualitative and quantitative methods. The qualitative method was carried out through an individual survey using a pre-designed questionnaire while the measurement variables were set up to suit the context in Vietnam. Quantitative methods were used to determine variables and test models. Our research model includes 7 concepts - latent variables are measured and evaluated through observable variables. A total of 280 surveys were distributed and 260 qualified samples were collected.

Collected data then were synthesized and analyzed by techniques including: descriptive statistics, confirmatory factor analysis, linear structural model analysis, reliability testing, t test and analysis of variance with the help of data analysis software namely Excel, SPSS and AMOS.

4. Results

4.1. Preliminary test results of the scale

Preliminary assessment of the scale was conducted with 80 survey samples to assess the reliability of the scale and check the convergence of observable variables in measuring 7 latent variables.

Through the analysis of Cronbach's Alpha, it shows that the scale's Cronbach's Alpha coefficient is greater than 0.6 (0.769 to 0.878), the correlation coefficient of the total variables of the scale is larger than the allowed level of 0.3 (the smallest is 0.727). Therefore, 28 factors in this scale are reliable (Hair et al., 2010; Nunnally and Bernstein, 1994) and are used in the EFA factor analysis step.

EFA factor analysis criteria are (1) factor loading larger than 0.5, (2) Eigenvalue index is greater than 1, (3) Kaiser-Meyer-Olkin index (KMO) is greater than 0.5, (4) Bartlett test has p-value less than 0.05, (5) extracted variance is greater than 50%. The research results show that the scale of all 7 factors (green product, green price, green distribution, green promotion, attitude towards green food, environmental knowledge, green food purchase intention) is internally consistent and is a unidirectional scale.

Table 1. Preliminary Test Results of The Scale

Variable	Cronbach's Alpha coefficient	Corrected Item - Total Correlation min	Eigenvalues	KMO	P-value	AVE (%)	Factor loading min
Green Product (5)	0,846	0,604	3,093	0,785	0,000	61,858%	0,770
Green Price (4)	0,794	0,587	2,549	0,778	0,000	63,722%	0,763
Green Place (4)	0,791	0,538	2,471	0,775	0,000	61,765%	0,733

Variable	Cronbach's Alpha coefficient	Corrected Item - Total Correlation min	Eigenvalues	KMO	P-value	AVE (%)	Factor loading min
Green Promotion (3)	0,777	0,544	2,074	0,683	0,000	69,137%	0,781
Environmental Knowledge (3)	0,780	0,567	2,091	0,675	0,000	69,707%	0,798
Attitude towards Green Food (4)	0,769	0,514	2,383	0,705	0,000	59,568%	0,728
Purchase Intention (5)	0,878	0,601	3,381	0,839	0,000	67,626%	0,727

4.2. Scale test results by CFA

The results of the critical model show that the following indexes: Chi - square/df = 1.473 < 3 meet the compatibility requirements, TLI = 0.940, CFI = 0.948, RMSEA = 0.043 < 0.8, although GFI = 0.885 < 0,9 (according to Hair and ctg) but apparently, GFI=0.885 is very close to the requirement. Furthermore, results greater than 0.8 are still accepted (according to Baumgartner and Homburg (1995); and Doll, Xia and Torkzadeh (1994)).

Based on the data in Table 2, we make the conclusion that the impact of green price on attitude, green promotion on attitude, and moderating effect of environmental knowledge on the relationship between green place and purchase intention are rejected (or H2b, H4b and H5c).

The group of marketing mix factors including green product, green price, green place and green promotion have all been proved to have an influence on purchase intention. In details, the strongest influence is green place with estimate of 0.401 and weakest is green price with estimate of 0.110.

In the correlation between marketing mix factors to attitude towards green food, the impact of green price and green promotion was rejected because their P-values are both greater than 0.05; the two other factors, green product and green place have a positive impact on attitude, of which the stronger influence is with green place (0.295). In addition, the attitude factor has a significant influence on purchase intention with a regression coefficient of 0.259.

The group of marketing mix factors moderated by environmental knowledge have impacts on purchase intention, except for the green place with $P = 0.187 > 0.05$. Besides, green product moderated by environmental knowledge have a negative impact (-0.073) on purchase intention.

4. Discussion and Conclusion

Baessed on the results of this research, the following conclusions are drawn:

(1) Green product, green price, green place and green promotion all have positive effects on green food purchase intention, in which green place has the biggest impact and green price has the weakest one.

(2) Green product and green place have positive effects on attitude towards green food. Attitude has a positive effect on the intention to consume green food, so green product and green place have positive effects on green consumption intention through attitude mediating variable.

(3) Environmental knowledge has a positive moderated effect on the relationship between (green price, green promotion) and green food purchase intention. Environmental knowledge has a negative moderated effect on the relationship between green product and green food purchase intention due to $P = 0.073$.

(4) Factors including age, occupation and income have influences on the intention to consume green food. Factors such as gender, education, awareness level, and frequency of consumption do not affect the purchase intention of green food.

On the other hand, the research results lead us to figure out a number of solutions to increase the quality of green marketing campaigns which then will promote consumer buying intention and behavior, as follows:

Recommendations for WinMart supermarket chain

Winmart needs to develop a more complete 4Ps green marketing strategy that is in line with market and consumer condition:

Firstly, regarding green product, green food from Winmart must be of freshness, safety, complying with international standards of production processes. The results of the study that fully-informed and eco-labelled packaging will help increase consumers' intention to consume green food, so the packaging design process should pay attention to the 3R principle (Reduce – Reuse – Recycle) helps to minimize the environmental impact of the product.

Secondly, Winmart can adopt flexible pricing method (Currency) based on market demand and availability. Winmart needs to innovate the mindset to improve productivity, quality and operational efficiency through the application of advanced management technologies into its organization. Moreover, Winmart should work on development of strategies to minimize investment costs. As a result, it is possible to reduce the cost of green food as much as possible but still bring the desired profit.

Thirdly, green place has a great impact on consumer intention, so Winmart needs to develop an effective and optimal green product place strategy such as promoting logistics and environmentally friendly transportation.; There should be priority policies for green food items, for example setting up a priority payment zone for green foods/green products.

Fourthly, green promotion needs to be consistent and in line with WinMart's brand positioning such as providing clear information to customers and creating opportunities for them to participate in activities through green marketing campaign; promoting promotional

programs for customers to buy green food to increase competitiveness against its competitors. In addition, Winmart cannot ignore public relations activities to increase awareness and consumption of green food.

Recommendations for government

Firstly, Vietnamese government needs to develop the policy of green food consumption to help businesses implement better green marketing strategy. Besides, the government should propose policies to encourage and promote the green production through technological innovation; price subsidy policy for this type of food product should be released in order to change consumer behavior; support for businesses in marketing activities can be improved in terms of policy.

Secondly, government should invest in technical and technological infrastructure within areas of green food production facilities; supporting infrastructure for e-commerce to support businesses to keep up with current information technology trends. From management aspect, it is necessary to quickly develop criteria for certification of green food enterprise as well as provide useful information about green food to consumers to enhance demand for this type of food product.

Abstract

The study aims to identify and analyze the influence of internal factors on the capital structure of tourism enterprises. Research data are collected using a sample size of 25 tourism businesses from 2016 to 2020. With the E-view software application in quantitative analysis to construct a table data regression model, the study has designed a regression model to determine the relationship and level of impact of factors which affect the capital structure of tourism businesses. The research results show that the variables: profitability; liquidity; asset structure; growth opportunities have a negative effect, while firm size has a positive influence on capital structure of tourism enterprises.

Keywords: *capital structure; influential factors; tourism enterprises*

1. Introduction

Over the last decades, there have been researches on the capital structure of enterprises. Most of these studies employ modern theoretical models to clarify capital structure models and provide empirical evidence for the power of the models in practice. Studies on factors affecting capital structure have been approached from different angles with the aim of efficiently managing the capital structure of the enterprise by appropriately combining the ratio between debts and equities to increase corporate value. Examining the interrelation between factors affecting capital structure will evaluate whether the enterprise's decisions to apply debt financing or equity financing is reasonable or not, whether any inadequacies and risks can arise in order to propose recommendations to improve the efficient use of financial leverage and maximize the corporate value.

The negative effects of the global financial crisis starting in 2008 began a period of serious recession for the Vietnamese economy. Up to now, the economic recession situation in Vietnam has not completely improved. In particular, since the beginning of 2020, the COVID-19 pandemic has had a heavy impact on the tourism industry, with the number of visitors dropping sharply, tourism activities almost having to hibernate, which has had direct impact on all businesses in the tourism industry. This is the time when tourism businesses need to thoroughly review their capital structure.

Based on this current situation, this study aims at figuring out the factors affecting the capital structure of tourism enterprises in Vietnam, assess the influence level in order to build an effective capital structure in tourism enterprises.

2. Literature Review

Theory of capital structure

M&M Theory: The modern capital structure theory was first put forward by Modigliani and Miller (1958), and there are many definitions of capital structure offered. With two case studies, enterprises operating in a tax-free environment and in a tax-affected environment, M&M has proposed important conclusions about the enterprises' capital structure. Under perfect market conditions (no financial distress costs, no transaction costs) the value of the unlevered and leveraged firms is the same under the no-tax case. In the case of taxes, the leveraged firm's value is higher than the value of the unlevered firm.

Trade-off theory: The trade-off theory was developed by Alan Kraus and Litzenberger (1973). Researchers divide it into two types, including: static capital structure trade-off theory and dynamic capital structure trade-off theory. The trade-off theory of capital structure explains the effects of corporate income tax, personal income tax, and costs related to the use of debts in the capital structure of the firm. Besides, the trade-off theory also explains the difference in capital structure between industries and enterprises. Consequently, businesses with safe tangible assets and high profitability have a high target debt ratio. Businesses with low profitability, mainly invisible assets, have a low debt ratio. However, the trade-off theory of capital structure has limited application since it is not easy to quantify the costs associated with the use of debt.

The pecking order theory: The pecking order theory (Donaldson, 1961) solved one of the irrational assumptions in M&M theory, accordingly capital markets are perfect markets, which do not currently exist asymmetric information. Donaldson's work in 1961 is considered to be the first foundation of pecking order theory related to capital structure. Then, Myers and Majluf (1984), Myers (1984) continued to develop pecking order theory based on the analysis of asymmetric information affecting investment and financing decisions of firms. Myers and Majluf (1984) in the study drew conclusions about the classification of capital types, in which retained earnings are better than debt and debt is better than equity. Therefore, managers will often prioritize the use of retained earnings. If the capital is still insufficient, the management will prioritize using capital financing through debts with fixed interest rates so as not to have to divide profits among new shareholders. Issuing shares is often the last choice of managers when finding funding for projects. In

addition, pecking order theory also states that there is no well-defined target equity and debt mix. Myers (1984) argues that since equity includes both retained earnings and the issue of new shares, it is difficult to determine the optimal capital structure.

Agency Cost Theory: The agency cost theory proposed by Jensen & Meckling (1976) states that an agency relationship is a contractual arrangement in which many owners of the business hire another one acting as a representative and authorized agency to perform transactions on behalf of the owner of the business. As a result, there are agency costs to resolve conflicts of interest used in corporate financing. Agency costs include: (i) Owners' control costs, (ii) Managers' compliance costs, (iii) impaired benefit value due to differences in management decisions and decisions to maximize the interests of the owners. In addition, equity includes capital owned by managers and equity owned by public shareholders outside the business. Therefore, the business must bear the share of agency costs by shareholders and loans from outside the business. To determine the capital structure where agency costs are lowest, Jensen & Meckling (1976) suggests that capital structure should be measured as the ratio of equity held by shareholders outside the firm to total owner's equity outside the business. In his further research, Jensen (1986) argues that conflicts of interest generate agency costs, so the only way to reduce this agency cost is to increase the use of debt by firms. Therefore, according to the agency cost theory of capital structure, an increase in equity will result in a high agency cost; conversely, an increase in the cost of debt will reduce the agency cost. This implies that the agency cost of equity has a positive relationship with capital structure, conversely, the agency cost of debt has a negative relationship with capital structure.

Experimental studies

In addition to the above theories, previous empirical studies have also provided evidence of factors affecting capital structure of firms.

Research results by Chun-Hung (Hugo)Tang & Soo Cheong (Shawn) Jang (2007) on revising determinants of capital structure: A comparison between US lodging and software companies states that fixed assets, growth opportunities and the common influence of those two variables are significant determinants of long-term debt of the accommodation industry. Common effect analysis also shows that fixed assets and opportunities to grow influence each other on the relationship of long-term debt utilization by lodging firms.

Murray Frank & Vidhan Goyal (2009) used a dataset of listed US firms in the period 1950 - 2003 to examine the importance of many factors affecting capital structure. The research results show that the factors of industry average leverage, tangibles, asset size, expected inflation have a positive influence, the factors of market price -to-book ratio, profitability have a negative affect the capital structure of the firm.

Research by Luis Pacheco and Fernando Oliveira Tavares (2015) on the determinants of capital structure of small and medium enterprises in the hotel sector used a sample of 43 hotels in Portugal from 2004 to 2013. The hospitality sector was considered because of its importance in the Portuguese economy and the sector has been largely understudied. The research results show that profitability, asset tangibles, firm size, total liquidity and risk are the main factors affecting the capital structure of SMEs in the hospitality sector.

Research by Ahmad Mohammad Gharaibeh (2015) collected data samples from 49 companies in many industries listed on the Kuwait stock market during 2009 - 2013. By using the Pooled OLS method, the research has shown that the characteristics of industry, age, business size, growth opportunities, liquidity and profitability have an effect on the dependent variable which is total debt/total assets, in which profit has a negative relationship whereas other variables has positive relationship.

In research by Mouna Amraoui, Ye Jianmu, Kenza Bouarara (2018) on the determinants of capital structure of industrial enterprises in Morocco, data were collected from the Moroccan capital regulator and the official website of the Casablanca stock exchange between 2009 and 2016 of 52 companies. The research results show that among the seven variables, there are four more significant ones: return on assets, tangibles of assets, business size and liquidity, in which firm size has a positive impact, while the remaining variables have a negative impact on capital structure.

Research by Beta Budisetyorini (2015) on determining factors affecting capital structure of tourism, hotel and restaurant businesses listed on the Indonesian Stock Exchange. This study analyzes the influence of determinants on capital structure, using trade-off theory and pecking order theory to find out the proportion of debt and equity financing decisions in tourism companies. calendar. The data table includes 26 companies in the tourism industry listed on the Indonesia Stock Exchange from 2008 to 2012. The results show that the decisive factor affecting the capital structure of tourism enterprises is liquidity, profitability and scale.

Research by Jorge HF Mota; Antonio C. Moreira (2017) on the determinants of the capital structure of Portuguese companies investing in Angola. The data is aggregated from 26 major Portuguese companies that invested in Angola between 2006-2010. The research results show that factors affecting capital structure including age of the enterprise, asset structure, profitability ratio and tangibles have a positive effect, while tax shield and liquidity has a negative effect on the capital structure of these firms.

Research by Pham Thi Van Trinh (2020) on capital structure and debt term structure of real estate investment and construction enterprises. Synthesized data of the study are collected from the financial statements of 70 construction investment and real estate businesses listed on the Vietnam stock market in the period 2008 to 2017. The research results show that: Asset structure, corporate income tax, firm size and growth opportunities have a positive influence on capital structure, and liquidity, inversely profitability, financial development have a positive impact on capital structure.

In research by Le Tham Duong, Bui Dan Thanh, Le Thi Han (2020) with financial report data for 52 food companies listed on Vietnam's stock market from 2011 to 2018, the authors have conducted research on the factors affecting capital structure. The research shows that the profitability of food businesses, the ratio of fixed assets plus total assets and the number of years of operation have a negative impact on capital structure. In contrast, size and growth rate are two factors which having a positive effect on the capital structure.

Research by Syeeda Shafiya Mohammadi, Tamanna Dalwai, Dure Najaf, Ashwaq Saif Al-Yaarubi (2020) investigates the factors determining capital structure of Omani tourism companies. The sample in the study includes 9 listed travel companies between 2007 and 2016. The results show that the capital structure of tourism businesses is influenced by size, growth rate and risk.

On the basis of an overview of empirical studies, it shows that the works focus on studying the micro-factors affecting capital structure, but the level of impact of these factors is not the same among countries. This depends on the economic characteristics of each surveyed country. The research results provide evidence that factors including profitability, liquidity, firm size, asset structure and growth opportunities affect capital structure. The obtained research results are quite consistent with theories of capital structure such as MM theory, trade-off theory, pecking order theory.

3. Method

Hypotheses

Based on theoretical and empirical research on factors which affect capital structure of enterprises, the author has hypothesized about specific factors that affect capital structure of listed tourism enterprises on the Vietnamese securities market as follows:

Capital structure (TDR)

The capital structure variable is measured by liabilities over total assets, reflecting the firm's use of debt. This is the basic measure of the enterprise's choice of capital structure and is a suitable variable used to evaluate the impact of factors on the choice of capital structure. This indicator is widely used in experimental studies of Beta Budisetyorini (2015) Luis Pacheco and Fernando Oliveira Tavares (2015); Mouna Amraoui et al (2018); Syeeda Shafiya Mohammadi et al (2020); Nguyen Thi Van Trinh (2020); Le Tham Duong, Bui Dan Thanh, Le Thi Han (2020).

Inheriting the above studies, the author used TDR as a dependent variable to include in the model.

Profitability (ROE): The trade-off theory states that firms with high profitability tend to use a lot of debt to receive the benefit of the tax shield of interest and low risk of bankruptcy. In contrast, according to the pecking order theory and research by Obeid Gharaibeh (2015); Luis Pacheco and Fernando Oliveira Tavares (2015); Mouna Amraoui et al (2018); Beta Budisetyorini (2015); Syeeda Shafiya Mohammadi et al (2020); Nguyen Thi Van Trinh (2020); Le Tham Duong, Bui Dan Thanh, Le Thi Han (2020), researchers argue that there is a negative relationship between profitability and debt use. Indeed, according to their argument, the more profitable a firm is, the more likely it is to retain earnings for reinvestment, the more likely it is to use low financial leverage. Therefore, the factor of profitability is included in this research model and is determined by profit after tax on equity.

Hypothesis H1: Profitability has a negative (-) effect on capital structure

Liquidity (LIQ): Liquidity reflects the solvency of a business. According to pecking order theory and agency cost theory, firms with high liquidity will have no need to raise capital from outside. In contrast, according to trade-off theory, firms with higher liquidity, lower costs of financial distress, and lower risk of bankruptcy tend to maintain a higher debt ratio due to easier access to and mobilization of long-term capital. Empirical studies which have supported this view include studies by Obeid Gharaibeh (2015); Beta Budisetyorini (2015); Pham Thi Van Trinh (2020). Therefore, the liquidity factor is included in the research model and is measured by the ratio of current assets to short-term liabilities.

Hypothesis H2: Liquidity has a positive (+) effect on the capital structure of the firm

Firm size (SIZE): According to the trade-off theory, large firms are generally expected to have high debts and leverage. Accordingly, large enterprises usually have low bankruptcy risk and bankruptcy costs, and therefore, have high negotiating power with credit institutions. Studies supporting this view include those by Murray Frank & Vidhan Goyal (2009); Luis Pacheco and Fernando Oliveira Tavares (2015); Mouna Amraoui et al (2018); Obeid Gharaibeh (2015); Beta Budisetyorini (2015); Pham Thi Van Trinh (2020); Le Tham Duong et al (2020). Therefore, the firm size factor is included in the research model and is measured by the logarithm of the total book value of assets.

Hypothesis H3: Firm size has a positive (+) effect on the capital structure of the firm

Asset structure (TANG): According to the trade-off theory, businesses can use tangible fixed assets as collateral when borrowing, so a business has a higher proportion of tangible fixed assets in total assets can borrow easier. Therefore, businesses with high tangible fixed assets tend to have high financial leverage. Tangible fixed assets used as collateral are an important basis for commercial banks to consider when approving credit. Experimental studies of Chun-Hung (Hugo) Tang & Soo Cheong (Shawn) Jang (2007); Murray Frank & Vidhan Goyal (2009); Obeid Gharaibeh (2015); Jorge HF Mota; Antonio C. Moreira (2017); Pham Thi Van Trinh (2020); Le Tham Duong et al (2020) are also consistent with this statement. Therefore, the asset structure factor is included in the research model and is measured by the ratio of net fixed assets to total assets.

Hypothesis H4: Asset structure has a positive (+) effect on the capital structure of the enterprise.

Growth Opportunity (GRO): The higher the growth opportunity, the more investors appreciate the growth opportunity and potential of the business in the future. According to the trade-off theory, the ability to grow will reduce the level of debt use of firms. This is supported by Chun-Hung (Hugo) Tang & Soo Cheong (Shawn) Jang (2007); Le Tham Duong et al (2020); Syeeda Shafiya Mohammadi et al (2020). Therefore, the growth opportunity factor is included in the research model and is measured by the ratio between liabilities and the market value of capital to the book value of total assets of the enterprise.

Hypothesis H5: Growth opportunity has a negative (-) effect on the capital structure of the firm.

Table 1. Summary of research hypotheses

Variables	Symbol	Measurement	Effect on capital structure
1. Profitability	ROE	$\frac{\text{Profit after tax}}{\text{Owner's equity}}$	Negative (-)
2. Liquidity	LIQ	$\frac{\text{Current assets}}{\text{Short-term liabilities}}$	Positive (+)
3. Enterprise size	SIZE	Ln(Total assets)	Positive (+)
4. Asset structure	TANG	$\frac{\text{Net tangible assets}}{\text{Total assets}}$	Positive (+)
5. Growth opportunity	GRO	$\frac{\text{Liabilities} + \text{Market value of capital}}{\text{Book value of total assets}}$	Negative (-)

Research Model

Based on research by Murray Frank & Vidhan Goyal (2009); Obeid Gharaibeh (2015); Beta Budisetyorini (2015); Pham Thi Van Trinh (2020); Le Tham Duong et al (2020); Syeeda Shafiya Mohammadi et al. (2020), econometric models selected to test the impact of factors influencing capital structure of tourism businesses listed on Vietnam's stock market are:

Overall regression model:

$$Y = \beta_1 + \beta_t X_t + u_i$$

In which:

Y : Dependent variable

X_t : The independent variable influencing the dependent variable

β_1 : Coefficient of freedom

β_t : Regression coefficient ($t = 2 \div n$)

u_i : Random error

In the specific regression model of the study, the dependent variable is the capital structure of the TDR firm. The independent variables include: (1) Profitability (ROE); (2) Liquidity (LIQ); (3) Enterprise size (SIZE); (4) Asset structure (TANG); (5) Growth Opportunity (GRO)

Model building and testing

The parameters of the regression model are estimated by E-view software.

The overall regression model:

$$\text{LOG(TDR)}_i = \beta_1 + \beta_2 \text{ROE}_i + \beta_3 \text{LOG(LIQ)}_i + \beta_4 \text{LOG(SIZE)}_i + \beta_5 \text{LOG(TANG)}_i + \beta_6 \text{LOG(GRO)}_i + u_i$$

Overall regression function:

$$\text{LOG(TDR)}_i = \beta_1 + \beta_2 \text{ROE}_i + \beta_3 \text{LOG(LIQ)}_i + \beta_4 \text{LOG(SIZE)}_i + \beta_5 \text{LOG(TANG)}_i + \beta_6 \text{LOG(GRO)}_i$$

Research Method

The article runs the model with E-view software and uses the least squares method (OLS) to determine the regression coefficient β_i . On the basis of the results obtained when running the program, we will write equations of the factors affecting the business performance of the enterprise. Then test the fit of the model, that is, test β_i to know whether the independent variable can explain the dependent variable or not. Evaluate the fit of the model through the adjusted coefficient of determination R_2 (Adjusted R Square) to determine the explanatory ability of the model in practice.

4. Results

Scale test

The statistics are presented in the table below:

Table 2. Descriptive Statistics

Variables	Observation	Minimum	Maximum	Mean	Std. Deviation
TDR	125	0,0286402	2,386035	0,449387	0,428563
ROE	125	- 0,4571053	0,467895	0,033643	0,157779
LIQ	125	0,007012	31,875498	3,870240	5,757194
SIZE	125	24,094622	32,200360	26,783053	1,525805
TANG	125	0,006554	0,964394	0,441298	0,291533
GRO	125	0,011592	7,557271	1,236190	1,313720

The data in Table 2 show that the mean value of capital structure (TDR) is 0.449387, that is, 25 enterprises of tourism enterprises listed on the Vietnam stock market during the research period during the period 2016-2020 has an average debt-to-asset ratio of 44.9%. This shows that tourism businesses use less debt than equity.

Table 2 also shows that profitability (ROE) has an average value of 0.033643 (3.36%). This is a relatively low level, showing that for every 100 dong of equity put into the business, the enterprise earns a profit after tax of 3.36 dong. Liquidity (LIQ) has an average value of 3.870240, which means that tourism businesses are 3.8 times more likely to pay short-term liabilities with short-term assets. Enterprise size (SIZE) is calculated using the natural logarithm of total assets, with an average value of 26,783053 equivalent to total assets of more than VND 428 billion. This shows that tourism businesses are mostly large-scale. The proportion of fixed assets (TANG) has an average value of 0.441298 (44.1%). Thus, in tourism enterprises, the proportion of fixed assets accounts for a relatively large proportion of total assets, which is reflected in the value of facilities that the business has invested. A growth rate (GRO) with an average value of 1.236190 shows that the asset value of the tourism business by market value is about 1.23 times as high as its book value.

Using E-view software to Panel data, to increase the accuracy we put the variables LIQ, SIZE, TANG, GRO in logarithmic form. We get the following results:

Table 3. Regression results with Fixed Effect Model

Use Hausman test to select the model

Hausman test is used to choose between two models Random Effect Model and Fixed Effect Model. This is essentially a test of whether unique errors are correlated with the explanatory variables.

Hypothesis test:

H₀: There is no correlation between the explanatory variables and the random component (choose Random Effect Model)

H₁: There is a correlation between the explanatory variables and the random component (choose Fixed Effect Model)

Table 5. Hausman Test Results

Test Summary	Chi-Sq. Statistic	Chi-Sq. d.f.	Prob.	
Cross-section random	20.288078	5	0.0011	
Cross-section random effects test comparisons:				
Variable	Fixed	Random	Var(Diff.)	Prob.
ROE	-0.336111	-0.321387	0.006134	0.8509
LOG(LIQ)	-0.433988	-0.463106	0.000286	0.0848
LOG(SIZE)	6.508368	4.086491	6.240453	0.3323
LOG(TANG)	-0.302209	-0.140348	0.012237	0.1434
LOG(GRO)	-0.249476	-0.217688	0.000877	0.2830

Prob. = 0.0011 < 5% inferred rejecting H₀. Therefore, this article will use the Fixed Effect Model to regress to find out the key factors affecting the capital structure of tourism businesses in the period 2016-2020.

The sample regression function of the model is:

$$\text{LOG(TDR)} = - 20.84604 - 0.516616\text{ROE} - 0.469907\text{LOG(LIQ)} + 5.807718\text{LOG(SIZE)} - 0.454574\text{LOG(TANG)} - 0.199773\text{LOG(GRO)}$$

With Prob(F-statistic) = 0.000000 < 5% Regression function is suitable.

5. Discussion and Conclusion

5.1. Discussion

$R_2 = 0,977598$ indicates in the regression model ROE variables; LOG(LIQ) LOG(SIZE); LOG(TANG); LOG(GRO) has the ability to explain 97,7598% for the volatility of the variable LOG(TDR), which means that 97,7598% of the change in capital structure of Vietnamese tourism businesses is due to the impact of 5 ROE variables; LOG(LIQ); LOG(SIZE); LOG(TANG); LOG(GRO) triggers. Only the remaining 2,2402% were influenced by other determinants that were not considered in this study.

Among the 5 factors, there is a factor of firm size LOG(SIZE) that has a positive influence and the remaining factors have a negative influence, specifically:

+ $\beta_2 = - 0,516616$ means that return on equity (ROE) increases by 1 unit, then TDR decreases by 0.516616%. Thus, ROE has a negative impact on capital structure, meaning that when tourism businesses operate effectively, they will tend to use less debt and will use retained earnings to supplement business capital. The use of external sources of capital such as borrowing more debt can increase the financial burden. Instead of borrowing, they often use retained earnings to finance their capital needs. Tourism businesses with low profitability should raise the amount of loans to ensure business operations. This result is consistent with research hypothesis, pecking order theory and research by Luis Pacheco and Fernando Oliveira Tavares (2015); Beta Budisetyorini (2015); Obeid Gharaibeh (2015); Mouna Amraoui et al (2018); Pham Thi Van Trinh (2020); Le Tham Duong et al (2020).

+ $\beta_3 = - 0,469907$ means that when LIQ increases by 1%, TDR decreases by 0.469907%. Thus, liquidity (LIQ) has a negative effect on capital structure, because the highly liquid assets of tourism enterprises have been used to pay for investment or production activities, there is no need to raise capital from outside. Travel businesses with high liquidity will use less debt because they do not need to take out debt for their current payments. This result is supposed to be consistent with pecking order theory, agency cost theory and with empirical studies such as Luis Pacheco et al (2015); Mouna Amraoui et al (2018); Jorge HF Mota; Antonio C. Moreira (2017); Pham Thi Van Trinh (2020).

+ $\beta_4 = + 5,807718$ means that when SIZE increases by 1%, TDR increases by 5.807718%. Thus, firm size (SIZE) has a positive relationship with capital structure, the larger the enterprise, the more debt it tends to take. This result is consistent with the proposed hypothesis, trade-off theory, agency cost theory and previous studies such as Murray Frank & Vidhan Goyal (2009); Luis Pacheco et al (2015); Mouna Amraoui et al (2018); Obeid Gharaibeh (2015); Beta Budisetyorini (2015); Pham Thi Van Trinh (2020); Le Tham Duong et al (2020).

+ $\beta_5 = - 0,454574$ shows that when TANG increases by 1%, TDR decreases by 0.454574%. Thus, fixed assets (TANG) have a negative relationship with capital structure. Normally, businesses with a high ratio of fixed assets will increase their debt because they increase their assets to secure loans, but in fact, the results show that tourism businesses do not give priority to using loan capital. This result is contrary to the proposed hypothesis, consistent with the study of Mouna Amraoui et al (2018); Le Tham Duong et al (2020).

+ $\beta_6 = - 0,199773$ means that when GRO increases 1%, TDR decreases 0,199773%. Thus, growth rate (GRO) has a negative impact on capital structure. If the market appreciates a company's stock relative to its book value, the firm uses less debt and mainly uses equity to build assets. If the tourism business is in a growth period and there are many good investment opportunities, the conflict of interest between managers and shareholders will be less tense, so the business tends to use more equity. This result is consistent with the research hypothesis, trade-off theory, agency cost theory and previous studies such as Le Tham Duong et al. (2020); Syeeda Shafiya Mohammadi et al. (2020).

5.2. Recommendations

The results of analyzing factors affecting the capital structure of tourism businesses are based on historical financial data, so the choice of capital financing form is suitable for the characteristics of each tourism business and need to be adjusted to suit reality. Managers need to consider the order of priority in analyzing the factors affecting capital structure, which factors have a strong impact and are the main and important factors in choosing a target capital structure in each stage of business development. Besides, the experimental research results show that the pecking order theory is based on the problem of information disparity, the trade-off theory explains the firm's financing decisions. Capital structure decisions must be based on the conditions and assumptions of modern theories of capital structure.

Based on the research results on the factors affecting the capital structure of tourism enterprises listed on the Vietnam stock market, the author proposes some solutions associated with determining the capital structure as follows:

- Improving business efficiency: Research results indicates that business efficiency has a negative relationship with capital structure. When tourism businesses have effective business operations, they tend to use less debt, businesses can take advantage of internal capital obtained from retained earnings and issue new shares instead of using debt. Besides, when operating effectively, tourism businesses will be more appreciated by creditors as well as more trusted by investors in the financial market. Therefore, a reasonable solution for businesses to improve business efficiency is to combine factors that increase business efficiency with investment opportunities in the market. On the contrary, if the tourism business encounters a difficult period, its business performance is poor, and the pressure to repay loans increases rapidly, the optimal solution is to prioritize the use of equity financing, following the pecking order theory in fundraising. Therefore, tourism businesses need to maintain business efficiency, control incurred costs, lower product costs, improve product quality, accelerate project completion to reduce costs, minimize costs incurred..., especially restructuring debt portfolios in order to minimize financial costs for businesses.

- Taking advantage of asset size when using debt and taking advantage of business growth when using equity: Based on the research results, it can be seen that between the size of tourism enterprises and the use of debt capital has a positive relationship with each other. The larger the enterprise size, the more businesses should promote their strengths and seek commercial credit capital to bring high efficiency to the business. However, managers should also be careful in increasing debts because it can lead to spreading loans and high business risks. On the other hand, when the market is appreciating the enterprise value, tourism businesses can take advantage of this when raising capital by issuing shares, increasing the debt guarantee ratio and increasing the credit rating, reduce the financial risk of the business.

- When enterprises have high liquidity, they should use retained earnings, equity financing instead of debt. Decisions on increasing the liquidity of enterprises need to be made such as boosting business activities, reducing inventory, controlling and strictly managing incurred expenses that do not bring profits and revenue, regularly review the norms of material consumption ... these solutions also contribute to improving business efficiency and enhancing the management capacity of enterprises.

- It is necessary to pay attention to the value of fixed assets of the tourism business, and at the same time consider the appropriateness between the asset term and the debt maturity. Since most tourism businesses have large fixed assets, there will be many opportunities to access easy long-term loans compared to other businesses. Tourism businesses should take advantage of this feature to build debt policies with long debt maturities.

- Improving the role of financial managers in tourism businesses: To be able to implement the above proposals, financial managers play an important role. Therefore, improving the quality of human resources must be given comprehensive attention. Financial managers need to constantly improve their knowledge, apply modern financial management models, and risk measurement models of corporate financial activities in financial decisions. The choice of capital structure must be properly acknowledged and paid much attention by the managers, to develop a specific plan, especially a financial plan (based on the revenue and profit development goals of the enterprise, determining capital needs and plan capital sources along with mobilization policies). Then, new tourism businesses plan to choose the appropriate capital structure to achieve the target capital structure, and at the same time forecast development trends, problems arising from the business environment, changes in physical structure, etc. economic mechanisms benefit, identifying strengths, weaknesses as well as opportunities and potential risks in business activities in the future.

5.3. Conclusion

In summary, the article has studied the factors that affect the capital structure of tourism enterprises in Vietnam through data collected from 25 tourism enterprises during the period 2016-2020. The empirical model indicates that the correlation between intrinsic factors and capital structure including profitability, liquidity, asset structure and growth rate has a negative impact on capital structure, and the firm size factor has a positive impact on the capital structure of the firm. Based on the above research results, the author proposes some solutions associated with determining the capital structure of tourism enterprises. The results of the study have supplied useful information in determining the capital structure for tourism businesses.

Abstract

Prioritizing customer requirements is an important task that can decide the success or failure of a project in general and a software project in particular. In Agile software development project, MoSCoW is an analytical technique commonly used to prioritize customer requirements. In fact, despite applying the above technique, many projects are still not as successful as expected. Few reports suggest a 60% rate of MUST Haves for project success, but this figure has not been proven to ensure a certain customer satisfaction level besides time & budget constraints. In this study, we propose a combination of Kano model and MoSCoW technique which we call the MoSCoW-integrated Kano model to measure customer satisfaction. Our empirical research was conducted on three Vietnamese enterprises. The paper aims to shed light on the priority given to customer requirements that the project must fulfill, aimed at increasing customer satisfaction. Research results show that the results are contrary to the above rate, the high-level requirements ratio of the effective MUST is at about 20-30%.

Keywords: *Project management, software project, MoSCoW technique, satisfaction.*

1. Introduction

A project usually ends in failure or unexpected outcomes. Projects in general, technical projects in particular, only 2.5% of projects reach success, the rest either failed to meet some of their user's requirements or missed the original budget or deadlines (Andriole, 2020). According to Andriole (2020), in software projects, the issue happens frequently, and these failed IT projects cost the United States \$50-\$150B in lost revenue and productivity. Successful projects need desired outcomes or customer expectations. Indeed, most software projects fail because of misunderstanding customers' requirements (Reel, 1999). As a matter of fact, a project fails because, the accuracy and quality of requirements immensely contribute to the success of a project (Krauss, 2012), quality requirements are pivotal and key to customer or user product satisfaction (Hussain et al., 2015; Serrador & Turner, 2015).

In order to enhance communication with customers and their expectations, especially focusing on the time and value of products delivered to customers, the Agile approach in software project management is increasingly being applied. For a project to be as successful as expected, user's requirements need to be prioritized appropriately, thus the technique of Agile-Moscow which is an effective prioritization technique has been applied widely.

MoSCoW technique begins from software process management that can be applied to any kind of situation or project management for managing requirements (Hatton, 2007). A software product can go wrong or fail if the right requirements are not prioritized at right time. MoSCoW revealed weaknesses in the accuracy of time estimates and low customer satisfaction (Mohamed et al., 2015; Rida et al., 2017); Literature review shows that there has not been any empirical research demonstrating the design requirements breakdown for the MoSCoW classification to guarantee project success and satisfy customers.

The Kano Model is an approach to assessing the impact of services or product features on customer satisfaction, it is also therefore an insightful way of prioritizing customers' requirements. No comparison has been made in previous studies, however, MoSCoW and Kano share comparable similarities. We are going to research on MoSCoW rules requirement prioritization ratio in a software project to increase customer satisfaction based on the Kano model

2. Literature Review

In software projects, Agile is a 'flexible' approach that has been widely adopted in recent years. This comment sounds reasonable as Agile is a conventional approach that is believed to be able to solve complex, uncertain, and heavy time-limited issues (Daniel & John, 2008; Serrador & Pinto, 2015; Kowalczyk, Marcinkowski & Przybyłek, 2022). There are not many large-scale empirical studies confirming that Agile can improve the likelihood of project success, therefore Serrador and Pinto (2015) surveyed 1002 projects across multiple industries and countries, and the authors examined the effectiveness of using Agile in organizations on two aspects of project success: efficiency and satisfaction. The above findings suggest that Agile methods have a positive impact on both aspects of project success, however, they do suggest the need for future research on defining the "quality of the vision/goals".

It can be said that Agile project is suitable for changes as Agile project requires us to break down the requirements of customers. It is necessary to prioritize requirements to help react quickly to changes, and identify value-adding (high-level requirements) through Agile tool-MoSCoW (Mohamed et al., 2015; Wińska & Dąbrowski, 2019 because changes in product requirements are not a matter, the problem is an unnecessary effort (handling unnecessary functions), which leads to waste of resources and certain risks. (Mohamed et al., 2015). The MoSCoW rules are commonly used when prioritizing stakeholder requirements in the area of business management (Shafiee et al., 2018), however, MoSCoW method is the prioritization technique that is beginning from the dynamic software development method (Hatton, 2007). MoSCoW, the first letter of each of the four prioritization categories stands for:

- *M (MUST)* - Crucially, the absence of any requirement in this group results in a high probability of project failure;
- *S (SHOULD)* - High-priority requirements (less important than Must) that should be included if it is possible.
- *C (COULD)* - Not as important as Should have. These can be left out but still are significant.
- *W (WON'T)* - All requirements have been recognized as not a priority for the project time frame.

Gaining the advantage in terms of delivery time and product quality, MoSCoW can be considered a superior technique, which in itself achieves 2/3 of the criteria, because the success of the project is usually assessed through 3 criteria: time, cost, and quality (Atkinson, 1999). According to the above research result, quality will be the most important criterion, the goal is to complete the product that can fulfill user requirements, time, and cost otherwise become secondary criteria. Determining user requirements effectively is one of the factors that make “high-quality software” (Tiwari, Rathore & Gupta, 2012). However, the project management literature emphasizes the importance of on-time delivery (Atkinson, 1999; Chan and Chan, 2004). A great many projects run late, the delay can cause costly and operational problems for clients, resulting in the conclusion that the project was not successful. Thus, in comparison with the level of success of the two projects, first of all, it is necessary to consider whether these two projects meet the conditions of the project's allowable time limit or not. To evaluate the quality of the project, the satisfaction index is used to measure the high-level requirements, because, with the project on schedule, there is a positive relationship between quality and satisfaction. (Williams et al., 2015). Relationship quality is a crucial driver of satisfaction which reinforces the work of other researchers in the project management domain.

There has not been an official study giving the safe percentage of MUST requirements. Some guides show the 60/20/20 proportion of MUST, SHOULD, and COULD requirements in MoSCoW prioritization, but there has been still no verification on this issue, and the time estimation accuracy is not high (Tufail et al., 2019), there is even an opinion that MoSCoW is not useful for adapting customer satisfaction (Mohamed et al., 2015; Rida et al., 2017). Therefore, the question is how to divide the requirements ratio so that the project not only ensures the project has an acceptable probability of success but also improves customer satisfaction.

In fact, customer satisfaction assessment is often quite difficult. Bhardwaj et al. (2021) suggest Kano model analysis is a technique to guide us to make decisions regarding requirements based on predictions of user satisfaction. Kano Model has become one of the most popular quality models that analyzes the key features of a product or service and how they affect customer satisfaction, it adopted the Kano model to examine perceived user satisfaction levels of the various system features on a software project. Consequently, there has been research exploring the impact of persuasive features on customer satisfaction levels of e-commerce websites based on the Kano (Alhammad, Wiafe, & Gulliver, 2021).

There are four levels of customer requirement characteristics (Matzler et al., 1996; Alhammad et al., 2021):

- *Threshold attributes*: ‘Must haves’ requirements, the absence leads to total dissatisfaction. If any requirement is absent, the customer will be extremely dissatisfied. However, their presence on the product does not increase customer satisfaction as this is the minimum requirement the system needs to meet.
- *Performance attributes*: absence of requirements may lead to customers being dissatisfied. The more requirements belonging to this group are fulfilled, the higher the customer satisfaction.
- *Excitement attributes*: The more these requirements are fulfilled, the more satisfied the customer is. However, dissatisfaction is not affected if requirements are not met.
- *Indifferent*: Whether or not this kind of requirement exists does not affect the state of satisfaction or dissatisfaction.

Figure 1. MoSCoW-integrated Kano model proposal for requirement prioritization (Authors edit)

There has never been a previous study comparing, and combining Kano model and MoSCoW, in our opinion, because MoSCoW is often applied by engineers while Kano model is used by researchers and practitioners working in the management field. It is recognized there's a general equivalence between the two measurements, so we propose a combination of MoSCoW and Kano model to classify user requirements which we call MoSCoW-integrated Kano model (Figure 1). Based on MoSCoW-integrated Kano model, we are going to conduct research on the requirement prioritization ratio in software project to increase customer satisfaction, and guarantee the possibility of success.

2.1. Steps in the research process

Our empirical observation took place in the condition that we developed a mobile application to manage online ticket sales of cinemas (family scale) of 3 businesses in 2 months. According to Agile, we have to work with customer requirements that user requirements are not clear, but to be able to evaluate objectively, we think it is necessary to examine the same standard measure. Specifically, when working with clients, we presented our research and recommended the same high-level requirements available to all three companies. The recommended High-level requirements are as follows (Table 1):

Table 1. Comprehensive list of requirements for timeboxing

No.	High-level requirements	Estimated time for completion
1	As a managerial staff, they want automated movie scheduling	4 days
2	Customers need to be able to real-time choose their seats when making the booking.	2 days
3	The system allows users to see upcoming attractions.	4 days
4	The system can trigger notifications when new movies come out.	3 days
5	The app can generate a digital ticket	3 days
6	Users can deposit via an online payment method	7 days
7	User can vote favorite movie	3 days
8	As a user, they want a virtual room to deliver a fully immersive adventure.	15 days
9	As management staff, he needs monthly automated reports.	5 days
10	As a managerial staff, he wants a reward system	12 days

In order to avoid the influence of the skill factor, we have practiced in advance to ensure that the ability to execute projects A, B and C is relatively the same. In addition, the projects were implemented according to the available scenario, that is, the High-level requirements are predefined proportionally to the MUST; Customers can manually adjust the SHOULD and COULD, in addition, they can add the WON'T requirements to the COULD. An overview of the study design is depicted in Figure 2.

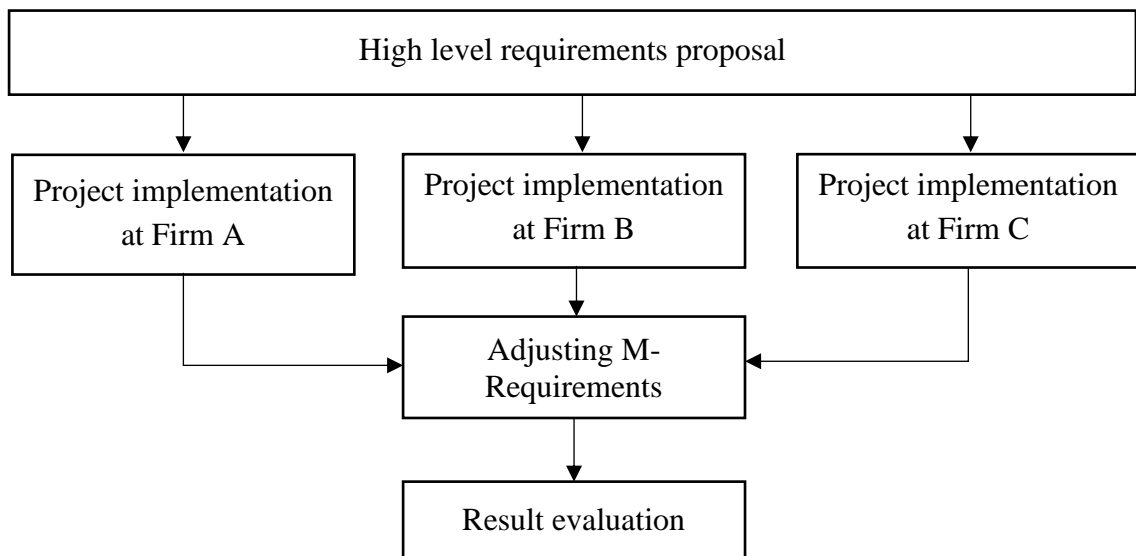

Figure 2. Research design

2.2. Built-in evaluation

The calculation of this customer satisfaction is as follows:

Satisfaction: (Excitement attributes + Performance attributes) / (Excitement attributes + Performance attributes + Threshold attributes)

3. Results

Table 2. Time, cost, and satisfaction level after adjusting the MUST

	Firm A (M: ~20%)	Firm B (M: ~30%)	Firm C (M: ~40%)
Schedule	On schedule	On schedule	Overdue (6 days)
Cost	Within budget	Within budget	Within budget
Satisfaction	I	II	III

A successful project is recognized as successful when it meets the customer's requirements and completes on time. At the end of the project, initially, we should evaluate the project success in terms of time, cost, and output, however, for discriminant validity, project success is measured by whether the organization has achieved its higher-level customer satisfaction.

Compared to the theoretical basis, the project meeting the deadline is a prerequisite before considering the quality and customer satisfaction factors, while the product quality and customer satisfaction are positively correlated if the project is achieved. Realized, SHOULD, COULD do not give equal satisfaction, so the proposed ratio of 60/20/20 is not reasonable. Table 2- Company A has the highest rate of satisfaction when the MUST requirements are set at 20%, and the satisfaction level decreases as we gradually increase the time spent on the MUST.

3. Conclusion

The discussed method is frameworks that put the most emphasis on the delivery model, and requirement prioritization ratio result. Some reports suggest that while using MoSCoW technique, MUST requirements should be kept within 60%, our research results based on Kano model (Proposed MoSCoW-integrated Kano model) disagree with the result. At this point, we recommend 20-30% of the total high-level requirement for MUST, the rest of the time focus on solving requirements that can achieve performance attributes to increase satisfaction. We acknowledge limitations to our study however. We point out that, to lessen bias, future research could have been tested with a larger sample size to verify our research results.

FACTORS AFFECTING THE QUALITY OF AUDIT SERVICES OF FINANCIAL STATEMENTS IN VIETNAM, RESEARCH FROM THE PERSONAL PERSONALITY OF AUDIT CUSTOMERS

Pham Huy Hung

phamhuyhung0302@gmail.com

*PhD student, National Economics University, Hanoi University of
Natural Resources and Environment*

Abstract

This study was conducted to evaluate the influence of these factors on the quality of the audit of financial statements from the perspective of audit clients in Vietnam. The article uses qualitative and quantitative research methods. The results of analyzing 160 survey samples from audit clients, performing regression analysis, show that there are 3 factors affecting the quality of financial statement audit services arranged in descending order, including: Adaptation; Social Exchange and Service Exchange. Based on the research results, a number of recommendations are made to stakeholders to improve the quality of audits of financial statements for independent auditing firms in Vietnam.

Keywords: *Audit clients, audit quality, financial statements, service quality.*

1. Introduction

The quality of financial reporting audit services in recent years has received a lot of attention from stakeholders, especially the audited units themselves. Because, the audited entity or the audit client (KHKiT) is the party that directly covers the audit costs, so they want to balance the costs and benefits. In particular, the increase in the position, credibility and quality of information on the financial statements or in other words, they expect the audit to be conducted with high quality. However, CLDVKT financial reporting is a multidimensional concept, difficult to observe and measure because it depends on the impact of many factors and more importantly, CLDVKT financial reporting depends on the perception of each object of interest (DeFond & Zhang, 2014). Therefore, in order to be able to measure and evaluate the accounting records from the perspective of each stakeholder, it is necessary to understand and master the factors affecting the accounting records in the financial statements.

Many researches on accounting management in both the world and Vietnam in the past years have been carried out to identify the factors that determine accounting management and financial reporting so that there are specific solutions to improve accounting management. Along with the studies of academia such as: Carcello et al., (1992); Francis (2011); Knechel et al., (2013); Phan Van Dung (2015)... planning organizations such as FRC, IAASB have also issued a template on CLDVKT to identify important factors and attributes of CLDVKT.

In Vietnam, in the context of economic transformation, international integration in the field of accounting and auditing is deepening, audit quality has become a topic that has received the attention of many scholars. However, research on the factors that affect the audit quality of financial statements from the perception and evaluation of audit clients seems to be very limited. Most of the previous studies focused on the attributes of auditors, audit firms, or external factors to measure the quality of audit services from the perspective of auditors.

Therefore, this study was carried out as an attempt to fill the previous research gap, while providing empirical evidence in Vietnam on this issue. The research results contribute to increasing the understanding of the factors and the level of influence of each factor on the accounting policy of financial reporting in the perspective of science and technology. Since then, helping enterprises have suitable solutions to increase the level of satisfaction and satisfaction of customers, a very important party participates directly and actively in the process of implementing audit services.

2. Literature Review

2.1. Audit service quality and satisfaction from the customer's perspective

Quality of Service (CLDV): CLDV differs from product quality because of its unique feature (Parasuraman et al., 1985). Also because of the unique feature of the service when compared to the product, the concept of CLDV is very different. Research by Zeithaml (1987) has shown that CLDV is the assessment of customers about the outstanding characteristics and general excellence of an entity. In addition, Lehtinen & Lehtinen (1982) argue that CLDV must be evaluated on two aspects (1) the process of providing services and (2) the results of services. Also, in Gronroos' (1984), the definition of CLDV consists of two elements: (1) technical quality and (2) functional quality, in which CLDV relates to what is served and functional quality indicates how they are served. CLDV is the factor that most impacts customer satisfaction (Cronin & Taylor, 1992; Yavas et al., 1997). Within the scope of this study, from a customer-centric point of view, CLDV means the satisfaction of the expectations and needs of customers. Therefore, CLDV is decided by customers when the service provided by the business meets the satisfaction of customers.

Satisfaction: Customer satisfaction is the overall attitude of the customer to the service provider or an emotion that responds to the difference with what the customer anticipates and what they receive, to the fulfilment of some needs, goals or desires. It is the customer's assessment of whether a product or a service has met their needs and desires (Zeithaml & Bitner, 2000). Thus, it can be understood that customer satisfaction is based on their understanding of the product or service that forms subjective judgments or judgments. It is formed on the basis of the experience gained in purchasing and using products or services. After purchasing and using the product, customers can compare between reality and expectations, thereby assessing satisfaction or dissatisfaction.

The relationship between CLDV and satisfaction: Although these are two different concepts, they are closely related in the research on services (Parasuraman et al., 1988).

Customer satisfaction is a general concept, expressed their satisfaction when using a service. Meanwhile, CLDV focuses only on service-specific components (Zeithaml & Bitner, 2000). Although CLDV and satisfaction are interrelated, there are few studies focusing on testing the level of interpretation of CLDV components for satisfaction, especially for each specific service sector (Lassar et al., 2000). Cronin & Taylor (1992) examined this relationship and came to a conclusion, sensing that CLDV leads to customer satisfaction. Some studies argue that CLDV is a precursor to satisfaction (Spereng, 1996) and a major factor affecting satisfaction (De Ruyter et al., 1997).

In the field of auditing, Carcello et al., (1992); Behn et al., (1997); Boon. et al., (2008) define CLDVKT based on the level of satisfaction on objectivity, truthfulness and reliability of audit reports of users of information, audit results. Research by Duff (2004) has shown that accounting records should be considered on both technical, professional and service aspects. In terms of service, accounting records are assessed through the level of satisfaction of users of information on financial reporting. Thus, from a customer-oriented point of view, CLDV is synonymous with meeting customer expectations. Therefore, when looking at independent auditing as a professional service business, it is *necessary to assess it based on the level of satisfaction or satisfaction of customers.*

2.2. Factors affecting the quality of audit services

In recent studies, the factors to measure basic CLDV are based on the factors in the SERVQUAL model of Parasuraman et al., (1988). Although widely used, many authors suggest that the five SERVQUAL factors (assurance; trust; interaction; tangibility and empathy) can be very general when evaluated in specific service contexts (Carman, 1990).

To solve the problem of how to best generalize CLDV factors in the context of professional services with enterprises. Woo & Ennew (2005) proposed to re-examine the interaction and relationship in CLDV perception by Industrial Marketing and Purchasing Group – IPM interaction model (Hakansson, 1982). This model identifies four factors of short-term exchange (Service/ Product Exchange; Financial Exchange; Information Exchange; Social Exchange) in a relationship and two longer-term aspects of that relationship (Collaboration and Adaptation). Using this model, the main characteristics of the interaction between enterprises and enterprises have been clarified from systematic empirical studies across different enterprise and business contexts and can be directly incorporated into the concept of CLDV.

Short-term exchange

- *The exchange of products/services:* Demonstrates the core of the interaction process and thus has an important influence on CLDV perception. It includes a range of salient features such as product complexity, specification, frequency of implementation, drop uncertainty (Hakansson, 1982), technical support, and product necessity (Metcalf et al., 1992).

- *Information exchange:* In IMP documents, information exchange consists of two main components: communication method and content. In particular, the method of communication, including: the number of people involved, the frequency of the exchange,

the scope and depth, the extent of the form transferred between the parties, the type of information offered and provided (Hakansson, 1982). According to Gummesson (1978), one of the unique features of professional services is its focus on counseling and problem solving. Therefore, the exchange of information between customers and professional service providers is said to be regular and formal.

- *The financial exchange:* From the point of view of CLDV, it is the elements of the relevant financial exchange process. Prices are explicitly excluded as part of the measure of value rather than as a direct indicator of quality. The financial exchange process includes factors such as the payment on time, the retention of appropriate payment documents. The process of financial exchange like other processes is one of the direct relational functions that make up the quality assessment platform.

- *Social exchange:* The role of exchange is to bridge the space and cultural gap between stakeholders and build mutual trust. Therefore, social exchange includes variables such as openness, mutual trust and trust, reduction of cultural differences in social contact in business (Hakansson, 1982), understanding of issues and ease of making friends (Metcalf et al., 1992). The empathy factor that focuses on ease of access, communication, and understanding in the SERVQUAL scale may only be part of the social exchange factor. To create a stable relationship later, two additional (indirect) factors are required and named “collaboration” and “adaptation.”

Long term relationship

- *Collaboration:* According to Halinen (1996), collaboration refers to the emergence of "different rules, customs and operating procedures, standards in a relationship. Building collaboration will include elements such as solving common technical problems, mutual concessions, continuity (Hakansson, 1982), relevance to benefits, and willingness to make collaborative changes.

- *Adaptation:* Adaptation is defined as the adjustment that one or more parties make to the elements to be exchanged or the process of the exchange. (Hakansson, 1982). Hallen et al., (1991) note that the adaptation between companies is very important because they link companies together through the investment of specific relationships.

Auditing is a special activity, the audit process shows the professional interaction between enterprises and enterprises. From the above analysis, it can be seen that, from the perspective of CLDV, CLDVKT financial reporting is measured through 6 influencing factors, including: Service exchange; Information exchange; Financial exchange; Social exchange; Collaboration and adaptation based on factors in the professional CLDV model of enterprises with enterprises of Woo & Ennew (2005).

3. Method

3.1. Research model and hypothesis

Based on the above theoretical basis and analysis, the theoretical model and research hypotheses are proposed as follows:

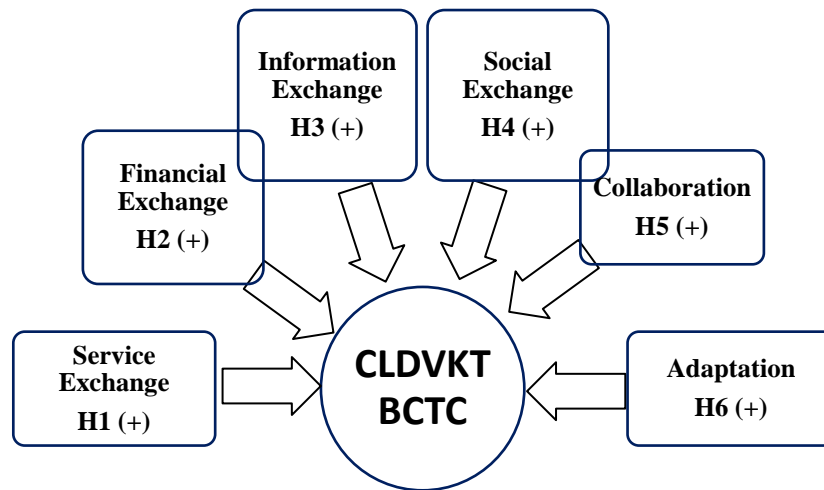

Figure 1. Research model of financial statement audit service quality from the perspective of KHKiT

Source: Recommended by the author

3.2. Data collection and processing

The author collects data through the questionnaire to collect the opinions of directors and accountants of audit clients on the impact of factors on the quality of financial reporting audit services.

The questionnaire was checked and calibrated by sending to 02 experts (one was CPA, senior lecturer of the Institute of Accounting - Auditing, National Economics University; the other was the director of MBbank branch) to assess the relevance to the research objectives. To evaluate audit quality (dependent variable), the author uses the Likert scale of 5 levels of agreement, from: (1) Strongly disagree to (5) Strongly agree. Evaluating independent variable factors, the author uses the Likert scale with 5 levels of influence, from: (1). Very low to high (5). Very high. The number of scales that measure variables is summarized in Table 1 below.

In addition, to ensure the study sample size, based on the minimum sample size requirements for EFA analysis and regression. According to Bollen (1989), the sample size is calculated according to the formula $n = 5 \cdot i$ (i is the number of variables observed in the model), corresponding to this study, the sample size will be $32 \text{ variables} \cdot 5 = 160$. According to Tabachnick & Fidell (2007), the sample size in multiple linear regression analysis is calculated according to the formula $n = 50 + 8 \cdot q$ (q is the number of independent variables in the model), whereby the sample size of the study will be $50 + 8 \cdot 6 = 98$. To improve the reliability of survey information, the study selects the largest sampling for the model according to one of the above principles.

The author uses a convenient sampling method and 160 valid samples obtained through the issuance of direct questionnaires, sending and receiving questionnaires through the Google form tool and email to the directors and accountants of 573 audit clients in 2020 (audit client information is taken from the websites of auditing enterprises and from the website: vietstock.vn). Based on the collected data, the author uses quantitative techniques such as testing the reliability of the scale, exploratory factor analysis... with the use of SPSS software.22 to summarize and present the basic results of the study.

Table 1. Coding attributes of factors affecting the quality of audit services

Factor	Encode	Number of scales	Source
Independent variables			
Service exchange	DV1	Auditing services that meet the specific requirements of the audit	Woo & Ennew (2005)
	DV2	Auditing services are performed by qualified personnel	
	DV3	Auditing services achieve cost-effectiveness	
	DV4	The audit service meets the established schedule for the audit	
	DV5	The audit service meets the budget established for the audit	
	DV6	The audit report is provided on time to the client	
Information exchange	TT1	The audit report includes necessary information and is easy to understand for readers	
	TT2	Adjusting entries are communicated to the client early in the audit	
	TT3	The adjusting entries are reasonably substantiated	
	TT4	Customer inquiries are answered quickly by KTV	
	TT5	Customer's questions are properly answered by KTV	
Financial Exchange	TC1	The audit contract is presented scientifically with full scope of work	
	TC2	DNKT sends payment requests to customers on time	
	TC3	The payment requirements are consistent with the progress of the work performed	
	TC4	Errors in payment requests, invoices are corrected quickly	
Social exchange	XH1	Auditors and audit firms create trust in working relationships with customers	
	XH2	The KTV has a good understanding of the client's operations	
	XH3	Auditors demonstrate independence and compliance with industry standards	
	XH4	KTVs show enthusiasm in dealing with customers	
	XH5	KTVs maintain regular contact with customers	
Collaboration	CT1	The auditors cooperate closely with the client in performing the audit	
	CT2	Auditors and audit firms have the ability to resolve customer complaints	
	CT3	Auditors and audit firms demonstrate cooperation in resolving conflicts arising with customers	
Adaption	TU1	Audit reports are always changed to meet relevant regulations	
	TU2	KTVs always update customers with new regulations of the State	
	TU3	The auditors can adjust the work schedule and schedule due to unexpected problems arising from the client's side	
	TU4	Other departments (such as tax, consulting) are coordinated when required by customers	
	TU5	Management letter provided to the client after the audit	
	TU6	Management letter helps customers improve operational efficiency and management performance	
Dependent variable			
CLDVKT	HL1	Customers are satisfied with the quality of audit services of independent auditors	Carcello et al., (1992); Behn et al., (1997); Woo & Ennew (2005); Boon et al., (2008)
	HL2	Customers continue to use audit services of financial statements performed by independent auditing firms in Vietnam	
	HL3	Customers will introduce audit services of financial statements performed by independent auditing firms to other companies.

4. Results

Among 160 valid answer sheets, 37 came from domestic enterprises, accounting for 23.1%; 52 votes came from enterprises with foreign elements, accounting for 32.5%; 48 votes came from joint stock companies, accounting for 30%; 15 votes came from limited companies, accounting for 9.4% and 8 votes came from joint venture companies, accounting for 5%.

Number of lines of business and business fields: Finance, banking, insurance, securities 13 enterprises (8.1%); footwear, textiles, packaging, printing 16 enterprises (10%); information technology, software 17 enterprises (10.6%); real estate, construction, architecture, building materials 28 enterprises (17.5%); pharmaceutical, food, consumer goods 20 enterprises (12.5%); animal feed, cultivation 12 enterprises (7.5%); fertilizers and chemicals 8 enterprise (5%); petroleum, gas 10 enterprises (6.25%); services, tourism, hotels, restaurants 14 enterprises (8.75%); transportation, warehousing 9 enterprises (5.6%) and the rest are 13 other enterprises accounting for (8%).

The surveyed sample belongs to many types of enterprises, has a diverse structure of business lines and is fairly evenly distributed, and has mainly used audit services for 3-5 years. Thus, the answers can be guaranteed to be reliable and of good quality. The results of descriptive statistics of the scale show that most of the observed variables have the average value around the expected mean value (3.0) and there is no significant difference between the observed variables in the sample same group. That proves that the survey subjects have quite similar opinions and agree with the scale of variables.

4.1. The results of the quality inspection of the scale

This method allows to eliminate inappropriate variables and limit garbage processing in the research model. Accordingly, only variables with the total correlation coefficient (Corrected Item - Total Correlation) greater than 0.3 and the Cronbachs Alpha coefficient of 0.6 or higher are considered acceptable and suitable for inclusion in the analysis the next steps (Nunnally & Burnstein, 1994). The results of Cronbachs Alpha test for the audit quality scale (7 scales with 32 observed variables) are shown in Table 2

Table 2. Results of testing the reliability of the scale of the factors in the model

No.	Factor	Sig	Cronbachs Alpha	N
1	Service Exchange	DV	0.875	6
2	Information Exchange	TT	0.916	5
3	Financial Exchange	TC	0.920	4
4	Social Exchange	XH	0.855	5
5	Collaboration	CT	0.917	3
6	Adaption	TU	0.911	6
7	Auditing service quality	HL	0.856	3

Source: Analytical results from SPSS 22.0

Thus, the model retains 7 factors to ensure good quality, with 32 characteristic variables (the Cronbachs Alpha coefficient of the population is greater than 0.6; the Corrected Item - Total Corelation coefficient of the population). All observed variables are greater than 0.3.

4.2. Exploratory factor analysis (EFA)

After analyzing the reliability of the scale, the next step to determine the necessary set of variables for the research problem, the author uses the EFA exploratory factor analysis method to consider the degree of convergence of the scales observed variable for each component and discriminant value between factors. The process of exploratory factor analysis EFA was performed separately for 02 groups of independent variables and dependent variables by the method of rotation of the whole angle (Varimax). The results obtained after the rotations are as follows.

EFA analysis results for the independent variable (1st time)

Looking at the results of the EFA analysis for the independent variables, it can be seen that the results divide into 6 groups. The criteria to be assessed are as follows.

- KMO = 0.811, so EFA analysis is appropriate with research data.
- Sig. (Bartlett's Test) = 0.000 < 0.05 shows that the observed variables in the population are related to each other and the data used in the EFA analysis are appropriate.
- There are 6 factors extracted at Eigenvalues = 1.152 > 1 representing the variation explained by each factor, only factors with Eigenvalues greater than 1 are kept in the analytical model.
- Total variance explained (total variance explained) of factor analysis is 81.642 % > 50% satisfactory. This means that these six factors explain 81.642% of the variation in the data.
- Variables DV6 and TU1 have factor loadings less than 0.3, so this type of observed variable is used for EFA analysis (2nd time).

EFA analysis results for the independent variable (2nd time):

Looking at the results of the EFA analysis for the independent variables, it can be seen that the results divide into 6 groups. The criteria to be assessed are as follows:

- KMO = 0.808, so EFA analysis is appropriate with research data.
- Sig. (Bartlett's Test) = 0.000 < 0.05 shows that the observed variables in the population are related to each other and the data used in the EFA analysis are appropriate.
- There are 6 factors extracted at Eigenvalues = 1.149 > 1 representing the variation explained by each factor, only factors with Eigenvalues greater than 1 are kept in the analytical model.
- Total variance explained (total variance explained) of factor analysis is 82.316% > 50% satisfactory. This means that these six factors explain 82.316% of the variation in the data.

Table 3. Rotation matrix of factors (the 2nd time)

Rotated Component Matrix^a

	Component					
	1	2	3	4	5	6

TC2	.083	.249	.116	.818	.140	.328
TC3	.015	.226	.069	.916	.092	.067
TC4	.044	.211	.011	.906	.141	.073
XH1	.200	.071	.487	.121	.639	.295
XH2	.377	.246	.436	.015	.548	-.072
XH3	.160	-.016	.316	.199	.768	-.003
XH4	.267	.218	.252	-.029	.774	.307
XH5	.740	.114	.082	.034	.420	.055
CT1	.419	.019	.256	.026	.212	.736
CT2	.399	.223	.429	-.031	.020	.664
CT3	.379	.205	.340	.196	.170	.697
TU2	.776	.181	.059	.068	.263	.120
TU3	.641	-.026	.033	.142	.443	.423
TU4	.774	.056	.303	.229	.167	.300
TU5	.850	.071	.259	.043	.014	.285
TU6	.859	.088	.387	.019	-.006	.099

Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser Normalization.

a. Rotation converged in 8 iterations.

Source: Analytical results from SPSS 22.0

The factor matrix table after rotation will be considered to see which observed variables these 6 groups of factors include, and whether the order of the observed variables is disturbed compared to the scale built at the beginning. The analysis results show that the observed variables have been grouped into 06 groups of variables with the order of the observed variables being kept the same compared to the independent variables that were initially built. Except for the variable XH5, which has been converted to measure the factor "adaptation", the factor loading coefficients are all greater than 0.5, so these 6 groups of independent variables have practical significance.

The fact that the factor TU (Adaptation) converges the observations TU_2,3,4,5,6 and XH5 (Social exchange), we find that XH5 "The auditors maintain regular contact with customers", the main purpose of maintaining a relationship with KHKiT is to develop a relationship to retain clients, which is completely appropriate in the context of the increasingly

competitive audit market and that also is the explanation for the situation that observed variable XH5 of the factor "Social exchange" converges on the factor "Adaptation".

The results of EFA analysis for the dependent variable show that the coefficient $KMO = 0.774$ satisfies the condition $0.5 < KMO < 1$, so the exploratory factor analysis is appropriate for the actual data. Sig quantity. = 0.000 satisfying the Sig condition. ≤ 0.05 , so this test has statistical significance and the observed variables are correlated with each other in the population, proving that the data used in the analysis is appropriate. Analysis of total variance extracted for the dependent variable shows that the percentage of total variance Percentage of variance = 81.793% > 50%, Eigenvalue = 2,364 > 1, so the model is eligible for factor analysis. The discovery and loading coefficients of the observed variables are both greater than 0.5, so the observed variables have practical significance. So, the dependent variable can be kept intact according to the original independent variable and has 3 observed variables.

4.3. Regression analysis results

Pearson's correlation analysis

This step is performed before regression analysis to check the correlation between the independent variable and the dependent variable, when the independent variables are not correlated with the dependent variable, they will be removed from the model (if Sig. > 0.05).

The results of Pearson correlation analysis show that there is a close correlation between the dependent variable and the independent variable in the model due to the Sig value. are all less than 0.05. Meanwhile, between the independent variables, there is a low correlation between the independent variables due to Sig.<0.05 and $r < 0.6$.

In addition, the Pearson correlation coefficients of the independent variables with the dependent variable of audit quality are all positive, so these independent variables are positively correlated with the dependent variable, that is, the factors under consideration are considered more important increased, the higher the financial statement audit service quality.

On the other hand, Pearson coefficient analysis is really just a necessary condition before running the regression to check whether there is a strong linear correlation between the pairs of variables and early identification of the problem of multicollinearity. However, with a specific sample size, it is unlikely that Pearson has reflected correctly, so it is necessary to test through regression analysis to give accurate results.

Regression analysis

Based on the results of EFA analysis, we have the following multiple regression model:

$$CLDVKT = \beta_0 + \beta_1 * DICHVU + \beta_2 * THONGTIN + \beta_3 * TAICHINH + \beta_4 * XAHOI + \beta_5 * CONGTAC + \beta_6 * THICHUNG + \epsilon_i$$

In which: $\beta_0, \beta_1 \dots$ is the regression coefficient β_0 is the intercept, ϵ_i is the residual

Check the goodness of fit of the model

Test for multicollinearity: The variance exaggeration factor (VIF) of all independent variables is less than 10, so multicollinearity in the model is assessed as not serious.

The Durbin - Watson coefficient used to test the correlation of the residuals shows that the model does not violate when using the multiple regression method, because the Durbin - Watson value achieved is 1.874 (ranged from 1 to 3). In other words, the model has no correlation of residuals.

The fit of the model was assessed according to the analysis of variance (ANOVA) table. Results of ANOVA test with Sig significance level. = 0.000 shows that the built multiple linear regression model is suitable for the data set and usable, in other words, this model is meaningful to generalize to the whole.

Evaluate the level of explanation by the independent variables in the model

The adjusted coefficient $R^2 = 0.633 > 0.5$ means that the independent variables explain 63.3% of the change in the dependent variable "Audit service quality", and 36.7% are due to error randomness or other factors outside the model.

The independent variables DICHVU, XAHOI, THICHUNG all have a statistically significant impact (due to Sig.<0.05) on the quality of service. Meanwhile, with the data set obtained, the author has not found a statistically significant impact of variables THONGTIN, TAICHINH, CONGTAC on audit quality (due to Sig. > 0.05), thus rejecting the original hypothesis. (H2, H3 and H5).

The independent variables DICHVU, XAHOI, THICHUNG have coefficients of $\beta > 0$, proving that there is a positive influence with the dependent variable "quality of service". Therefore, accept the initial hypothesis (H1, H4, H6), which are the independent variables that have a linear relationship with the dependent variable and completely fit the model. From there, we have the regression equation with normalized beta coefficients as follows:

$$\text{CLDVKT} = 0,143 * \text{DICHVU} + 0,297 * \text{XAHOI} + 0,307 * \text{THICHUNG}$$

From the results of testing the research model, it shows that the level of impact of the independent variables on the quality of audit services in descending order is: THICHUNG (0.307); XAHOI (0.297); DICHVU (0.143).

5. Discussion and Conclusion

5.1. Policy implications

Adaptation

Research shows that, the higher the "adaptation", the higher the service quality. This implies that improving the factor "Adaptation" will help improve the quality of audit services of financial statements of audit firms. Therefore, managers need to take the following measures:

First, because the components in the adaptation play a role in increasing customer satisfaction and retention. Therefore, audit firms need to constantly update the system of communication channels, especially the email system of customers, so that they can notify them of changes in regulations and policies related to KHKiT, especially especially legal documents related to finance, accounting, tax... *Secondly*, accounting firms need to have reasonable communication between departments to be able to help and advice customers. *Third*, the management letter is a component of adaptation that creates great added value for KHKiT and helps the audit firm build long-term relationships with customers. Therefore, the managers of audit firms need to complete the framework of a sample management letter suitable for different types of enterprises. It also requires all audits to issue Management Letters.

Social exchange

Social exchange, including aspects: enthusiasm, building trust, understanding about KHKiT and maintaining regular contact with customers of the auditors. Research shows that, the higher the "social exchange", the higher the quality of financial reporting services. This shows that the audit firms need to take the following specific measures:

Firstly, before each audit, the staff should carefully study the previous years' audit records to understand the client's business performance. The staff also need to update the customer's activities via the Internet, call before talking to the managers of the client company to get more new information. *Second*, during the audit, the auditors need to clearly demonstrate independence from the emergent interests. This will be appreciated by KHKiT as lack of independence is the cause of audit failure. *The third* is the issue of maintaining contact with KHKiT, the audit firm needs to support the communication costs for the auditors so that they can be proactive in transactional contacts and integrate email in the phones of the auditors.

Service exchange

Research results also show that the increased "service exchange" is the basis for increasing the quality of audit services. Therefore, the implication here is that the services that the audit firm provides and commits to provide in the audit contract must be performed

by skilled, professional and qualified auditors who meet specific requirements of each audit... in order to increase the added value for the client commensurate with the proposed fee. To do that, businesses need to do:

Firstly, regularly organize meetings to update changes of policies and regimes, integrate and exchange professional issues, auditors can bring up situations encountered in KHKiT to discuss and evaluate together price. *Secondly*, after each audit, it is necessary to send an assessment of the spirit and attitude of the auditors to KHKiT soon after each audit. If there is an unsatisfactory appearance from the customer, it is necessary to check, evaluate the cause and propose solutions to handle immediately.

5.2. Conclusion

Through the analysis of 160 survey samples from independent audit firms, it was found that 3 factors that affect the quality of financial statements audit services are "Adaptation"; "Social exchange" and "Service exchange". However, in this study the factor "Information exchange"; "Financial exchange" and "Collaboration" did not have a statistically significant impact on the quality of financial statements audit services. This can be explained because the KHKiT group surveyed in this study are mostly enterprises with foreign elements, the managers are quite qualified, and have good access to information. Future research needs further testing to further clarify this relationship.

5.3. Limitations of the study and directions for future research

The article contributes to expanding research knowledge on the influence of factors on the quality of audit services of financial statements from the perspective of audit clients. However, the study still has some limitations, such as: First, the new model only explains 63.3% of the financial statement audit service quality. Thus, there are still other unresearched factors affecting 36.7% that further studies may explore. Second, the new research only stops at EFA analysis techniques. Therefore, further studies should aim to discover new factors and perform more in-depth analysis techniques. At the same time, it is necessary to increase the sample size and expand the survey scope to have a more comprehensive view of the factors affecting the quality of financial statement audit services.

Abstract

The Balanced Scorecard (BSC) is an important strategic management tool that aligns business goals. BSC aids managers in evaluating and measuring operational efficiency in enterprises based on 4 perspectives: Finance; Customer; Internal process; Learning and growth. To increase the applicability of the BSC, this study was conducted to investigate the factors affecting the application of the BSC in listed companies in Vietnam. The factors included in the study consist of Organizational size, Organizational culture, Manager's awareness, Accountant's capability, Cost of using BSC, Benefits of using BSC. In addition, the study examines the impact of BSC application on the operational efficiency of listed companies in Vietnam. The authors used a mixed research method which included qualitative methods and quantitative methods in the study. Data was collected from June to December 2021 from 274 listed companies in Vietnam (including publicly listed enterprises on HNX and HOSE), which was then used with the Structural Equation Modeling (SEM) to perform the analysis. The research results show that all factors have a positive influence on the application of BSC, and the study also shows that the higher the level of BSC application, the higher the operational efficiency of enterprises. Thereby, the authors give some management implications to support enterprises to implement BSC effectively.

Keywords: Balanced ScoreCard, Listed Company, Operational Efficiency, Vietnam.

1. Introduction

As Vietnam's economy is being integrated and developed due to globalization, the competition between businesses in the Vietnamese market in particular and the world, in

general, is becoming fiercer. Lee (2007) argued that the methods of evaluating business performance using traditional financial indicators had become outdated, only meeting short-term goals and incapable of measuring them in the long-term, when profitable activities are increasingly shifting from being dependent on tangible assets to intangibles, so they cannot fully reflect the enterprise's operational efficiency. To evaluate the business's performance, the enterprise needs a system of indicators associated with its development strategy and accessible to both financial and non-financial aspects. The Balanced Scorecard (BSC) was built with 4 perspectives of Finance, Customer, Internal Process, Learning and growth; all of which along with the development strategy of the business are related causally to measure, evaluate comprehensively all aspects of an organization's performance (Kaplan & Norton, 1992). Martinsons et al (1999) stated that the BSC is a foundation for strategic management of information systems. The success of an organization depends on its ability to turn resources into products and services customers desire. Thanks to mentioned advantages, BSC has emerged as a decision-making support tool at strategic management levels, many enterprises currently evaluate their operational performance by supplementing financial accounting data with other objectives-related measures to the following factors: customers, internal process, learning and growth. As a result, many enterprises in Vietnam as well as in the world have applied the Balanced Scorecard to evaluate their performance.

Around the world, theoretically, many authors have studied the Balanced Scorecard and previous studies have shown that the application of the Balanced Scorecard in enterprises of different organizational sizes differ. In a survey by Silk (1998), up to 60% of companies in the US have applied BSC and considered BSC as an effective management tool. Various studies in Europe and Asia showed that in large-scale enterprises and listed companies, BSC is viewed as an useful strategic management tool and fully implemented with 4 perspectives, non-financial measures also helped businesses benefit and increase financial indicators, such as Blundell et al. (2003), Evan (2005), Jusoh (2008), Anand et al. (2005), Halabi et al. (2009). In addition, BSC is not only applied in large-scale enterprises but also significant in implementing development strategies for small and medium-sized enterprises. However, the application of BSC in small and medium-sized enterprises is not complete, Chimwani et al. (2013), Sofian et al. (2015), Giannopoulos et al (2013) pointed out the indicators used in the Balanced Scorecard are still mainly financial indicators, either due to financial constraints (Sofian et al., 2015) or due to the lack of awareness and understanding of BSC in these firms (Giannopoulos et al., 2015). associates, 2013). Therefore, through research around the world, it can be seen that large-scale enterprises and listed companies will have more favorable conditions to successfully apply the BSC model.

In Vietnam, BSC was initially introduced and mentioned in the early 2000s through seminars on implementing and applying BSC in business management and several articles. Large enterprises such as FPT, Phu Thai, Kinh Do have pioneered in implementing the model; however, the initial implementation has not brought about the expected success. In terms of research, the authors found that there are two main research directions which are qualitative research and quantitative research. Regarding the qualitative research, the authors studied the application of BSC on a small scale and these studies were mainly qualitative,

for instance, the application of BSC to evaluate the organizational performance such as Phong (2013), Hong (2012), Trinh (2020). With the direction of quantitative research, the studies pointed out the factors that have an impact on the application of BSC in enterprises. Van (2009) figured out three factors: perceived benefits to the company, perceived ease of use, and attitudes that can positively affect the intention to use BSC. While database factors, participants' support, and individual perceptions had no significant impact. According to Ngan Ha (2019), factors including Ease of use, organizational size, managers' awareness, cost of using BSC, business strategy, benefits of use have a positive impact on the application of BSC in small and medium enterprises in Ho Chi Minh City. The study by Yen (2019) on Vietnamese hotel service businesses indicated four management factors that positively affect the application of BSC, including the control system that hotel managers used, the hotel manager's ability to receive new knowledge, the hotel manager's perception of the usefulness of the BSC, the hotel manager's perception of ease of use of the BSC, in which the perceived usefulness had the greatest influence on the use of BSC. The study of Giang (2017) provided a model with 6 factors affecting the application of BSC in listed companies on the Ho Chi Minh Stock Exchange, including accountant's capabilities, company scale, managers' perception of BSC, organizational culture, business strategy, cost of using BSC. Research results showed that all factors in the model have positive effects on the application of BSC. These studies initially set the premise for future research directions on BSC in Vietnam.

From practice, the authors found that businesses in Vietnam are increasingly interested in applying management accounting in general, and BSC in particular to improve management efficiency. Thereby, the research group understood that the application of BSC for businesses in Vietnam is essential, contributing to the success of enterprises in Vietnam. For large-scale enterprises with many departments (especially listed companies), it will be more challenging to implement BSC to these companies as it requires higher accuracy due to the large scale and complexity of management accounting. Therefore, the authors realized that it is necessary to do more in-depth research on the factors affecting the application of BSC in listed companies in Vietnam to serve as a basis to support these enterprises in effectively applying BSC. In addition, the authors' use of analytical methods through structural equation modeling (SEM) is also a new approach, when studies in Vietnam on this issue still use traditional analytical methods to perform the analysis.

Understanding the obstacles listed companies are facing, the research team reviewed and compiled factors affecting the application of BSC.

Organizational size (QM)

According to Burns & Stalker (1961) as well as some other similar studies, the scale of the enterprise is closely related to the decentralization and structure of activities because when the size increases, it will place constraints on information processing for senior managers. Moreover, the need to create effective communication methods is emphasized in large firms. Therefore, in large enterprises, many problems of information and measurement will arise, so it is necessary to have a solution to cover information sources and strengthen management (the best solution is the application of complex management systems).

Hoque & James (2000) researched the relationship between the application of BSC, firm size, product cycle, market share of the business, and their impact on performance. Through the research process, the authors concluded that the application of BSC is affected positively by the size of the enterprise.

Koske & Muturi (2015) also investigated the impact of firm size on the application of BSC in non-governmental organizations. The survey results showed that 82% agreed that the larger the business, the higher the need to use complex tools like BSC, 76% believed that businesses providing good products and services have the need to use BSC and 70% thought that businesses with opportunities and potential growth are more likely to apply BSC.

Organizational culture (VH)

Research conducted by Rababah & Bataineh (2016) was based on the organizational culture profile model (OCP) proposed by O'Reilly (1991) to examine the influence of 5 factors of corporate culture on the application of BSC through a survey at businesses in Jordan. However, the research results published by the author showed that only 3 out of 5 factors have a positive impact on the application of BSC, which are team orientation, innovation, and mission. Outcome orientation and attention to detail have little or no effect on the application of BSC. This study had pointed out the significant influence of organizational culture factors on the application of BSC in companies that are rarely mentioned in written research.

In Vietnam, Nhi & Toan (2018) also included the culture factor in their research. According to the authors, a good corporate culture will help businesses attract talents and retain employees' loyalty and enthusiasm. The research results showed organizational culture has a positive effect on the application of BSC in enterprises, and at the same time, when applying new tools such as BSC, it is necessary to have consensus and cooperation for employees to be motivated to overcome obstacles.

Manager's awareness (NT)

Northcott & Taulapapa (2010) studied the use of BSC to manage the operations of local public organizations in New Zealand. Research showed that managers' understanding of BSC is very high (91,67%) but only 8 units use BSC. Through survey and consultation, the authors showed that the application of BSC is more suitable for businesses with strategic orientation and competition in the market, while public entities operate without competitors and long-term strategies are often specified by law, regulations rather than by managers. Therefore, managers believe that applying BSC in public units does not bring many benefits.

Nhi & Toan (2018) explained that a manager's perception of BSC is a manager's understanding of the potential, benefits, and how to use and implement BSC. Since Vietnam's economy is transitioning to a market economy and is still learning a lot from abroad, as well as the new and still researched BSC method, the application of BSC in enterprises is trivial. Therefore, the application of BSC is difficult to succeed if managers do not have a clear understanding of this method and the benefits it brings.

Accountant's capabilities (TD)

According to Hung (2012), accountants are the key human resources in implementing and applying managerial accounting, specifically BSC. If the accountant's professional capabilities do not meet the requirements, the application of BSC in the enterprise is impossible or it can be applied but not fully efficient.

Research by Giang (2017) in listed companies in Ho Chi Minh City considered accounting's capabilities as a factor affecting the application of BSC. Research results showed that the capability of accounting staff has the strongest and most positive impact on the application of BSC.

Nhi & Toan (2018) believed that the BSC method is quite new in Vietnam and not all accountants know how to operate BSC. However, staff with good qualifications and an understanding of managerial accounting including BSC will increase the possibilities to apply BSC in enterprises. The author's research results also showed that accountants' capabilities have a positive influence on the application of BSC of enterprises.

Cost of using BSC (CP)

Hewlett (1999) argued that most business strategies, when implemented, face financial obstacles. Businesses, especially non-governmental organizations, need to use non-financial measures such as market share or market growth to increase their competitiveness. At the same time, businesses need to analyze costs and benefits when implementing the BSC application. Porter (1985) stated that if an organization only looks at costs and financial benefits without considering strategic risks, it will be more likely to pursue less favorable projects.

Giang (2017) examined the influence of the cost of implementing BSC on the application of BSC of listed companies. Through survey and regression analysis, the author concluded that the factor has a positive influence on the application of enterprises; however, application cost has the lowest influence among the surveyed factors. Through the research, the author also proposed that listed companies invest reasonable costs to build and operate the BSC system for businesses, in which it is necessary to apply information technology to the corporate accounting system.

Benefits of using BSC (LI)

In 2014, Islam et al. studied the impact of four behavioral factors on the application of BSC, including the benefit of BSC. Research showed that this factor has a positive impact on the application of BSC and there is a correlation between the factors. According to the authors, awareness of the potential of BSC is a key factor affecting other factors, including the benefits of BSC. Employees' awareness of the benefits and ease of use of BSC makes them more willing to use the tool, thereby improving the enterprise's applicability to use BSC.

Study of Koske & Muturi (2015) also considered the BSC benefits in non-governmental organizations. Through seeking opinions from survey subjects, the author collected the following data: 62% agree that BSC is useful for internal communication and decision making in the enterprise, 60% think that BSC increases the business's competition

and 54% believe that BSC supports service delivery through the customer perspective. At the end of the study, the authors accepted the importance of BSC benefits to the application of BSC, and at the same time, the authors recommended that managers need to be concerned about the benefits of BSC before deciding to apply this tool.

2. Method

2.1. Research model

By reviewing previous studies as well as getting opinions from experts regarding the topic, the authors build a formal research model with 6 factors affecting the application of BSC. At the same time, the authors also put the impact of the Application of BSC on Operational Efficiency into the research model. The research hypotheses are as follows:

H₁: Organizational size has a positive impact on BSC application.

H₂: Organizational culture has a positive impact on BSC application.

H₃: Manager's awareness has a positive impact on BSC application.

H₄: Accountant's capabilities have a positive impact on BSC application.

H₅: Cost of BSC has a positive impact on BSC application.

H₆: Benefits of using BSC have a positive impact on BSC application.

H₇: BSC application has a positive impact on Operational efficiency.

The authors built the official research model as follows:

Figure 1. Official research model

2.2. Research Process

The team of authors built a research process consisting of 4 main stages as follows:

Stage 1: The authors determined the research problem, the research objective of the article. This is the basis for defining research questions. The main purpose of this research is to answer these questions. By inheriting the literature reviews of previous studies, the authors identified the factors that significantly affect the application of BSC. At this stage,

the authors also gave an overview of BSC, its performance, and the background theories used in the research.

Stage 2: The authors conducted qualitative research by collecting opinions of experts on BSC. This provided the authors with an expert perspective on the research problem so that they can build the official model and scale for the research.

Stage 3: At this stage, the authors conducted quantitative research steps. The survey was built using the Google Forms tool based on the official model and scale and then sent to the survey subjects. After collecting enough data, the authors conducted the analysis using AMOS & SPSS tools.

Stage 4: From the results of data analysis, the authors concluded the research problem and provided solutions to increase the level of application of BSC in listed companies in Vietnam.

2.3. Sampling Method

In this study, the authors used the convenient sampling method. The sample size needs to be larger than the minimum sample requirement. Some of the minimum sample requirements in the article are as follows:

- Determine sample size according to population estimate: According to the formula for determining the sample size of Yamate Taro (1967), the minimum sample size for the study was 261.
- Determine sample size for EFA analysis: According to Hair et al (2014), the minimum sample size to use EFA is 50, preferably 100 or more. The ratio of observations to a variable is 5:1 or 10:1. For this study, the number of analyzed variables was 34, with a ratio of 5:1 the minimum number of samples to be determined was 170.
- Determining sample size for SEM model analysis: According to Bollen (1989) for effective SEM model analysis, the sample size must have at least 5 observations per estimated parameter. Accordingly, the minimum sample of the study was 170.

➤ Thus, the authors determined the expected sample size to be 312 and the actual sample size to be 274, both of which met the sample size requirements. Therefore, the sample can be included in the analysis.

3. Results

3.1. Reliability test using Cronbach's Alpha

Table 1 shows the results of reliability testing by Cronbach's Alpha coefficient. All 34/34 observed variables of 8 factors in the research model meet the standard. All factors have a variable correlation with a total variable greater than 0,3. Additionally, the coefficients of Cronbach's alpha of all factors are greater than 0,6, so it can be concluded that the reliability of the scales used in the model ensures the allowed reliability.

For each factor with Cronbach's Alpha coefficient greater than 0,6; If any observed variables in this factor are removed, the Alpha coefficient will decrease, and the total correlation coefficient is greater than 0,3, so all observed variables in the study are kept.

Table 1. Results of Cronbach's Alpha test

Factors	Number of observations	Number of valid observations	Cronbach's Alpha	Corrected Item-Total Correlation (Min)
Organizational Size (QM)	5	5	0,892	0,677
Organizational Culture (VH)	3	3	0,829	0,641
Manager's Awareness (NT)	4	4	0,900	0,763
Accountant's Capabilities (TD)	5	5	0,857	0,646
Cost of using BSC (CP)	5	5	0,866	0,628
Benefits of using BSC (LI)	3	3	0,861	0,721
BSC Application (VD)	4	4	0,861	0,681
Operational Efficiency (HQ)	5	5	0,898	0,715

3.2. Exploratory Factor Analysis (EFA)

The research team conducted the EFA method to analyze separately for each variable in order to check the multidimensionality of the factor and evaluate the scale for the factors.

When analyzing EFA for the scales in the research model, the research team used the Principal Component Analysis method with Promax rotation and the breakpoint to extract factors with Eigenvalue > 1 . According to table 2, Kaiser-Meyer-Olkin (KMO) coefficient = 0,890 $> 0,5$ and the Bartlett test with Sig. = 0,000 ($< 0,05$), which indicates that EFA analysis is appropriate. Factor loading coefficients of all observed variables are greater than 0,5 and only uploaded for 1 factor.

Also, at Eigenvalue = 1,195 > 1 , 8 factors were extracted from 34 observed variables with a total extracted variance of 63,555% ($> 50\%$). It was concluded that no new factors were formed compared to the originally proposed research model. Thus, after analyzing EFA, these 34 observed variables met EFA analysis criteria, no variables were excluded at this stage.

VD3								0,632
Total Variance Explained (%)	27,365	35,320	42,368	47,946	53,148	57,777	61,115	63,555
Eigenvalues	9,659	3,055	2,792	2,225	2,116	1,930	1,483	1,195
KMO coefficient: 0,890	Bartlett's Test sig: 0,000							

3.3. Confirmatory Factor Analysis (CFA)

The model fit indexes illustrated in table 3 are as follows: CMIN/df = 1,159 (between 1 and 3), RMSEA = 0,024 (<0,06), PCLOSE = 1 (>0,05), CFI = 0,985 (>0,95) met the standard and are very good. This result indicated that the measurement model fits the data well. The combined reliability of CR and extracted variance AVE are both greater than 0,5, the scale is considered reliable. The normalized weights of the scales are all high and greater than 0,5, the sig value of each pair of concepts is less than 0,05. On the other hand, the correlation coefficients with standard deviation showed that they are all different from 1. Therefore, the adjusted research model achieved convergent and discriminant values. The model did not correlate the measurement errors of the groups of factors together, so the model achieved unidimensionality.

Table 3. Composite Reliability and Average Variance Extracted

Factor	CR	AVE
Organizational size (QM)	0,903	0,654
Organizational culture (VH)	0,831	0,623
Manager's awareness (NT)	0,900	0,691
Accountant's capabilities (TD)	0,857	0,546
Cost of using BSC (CP)	0,870	0,574
Benefits of using BSC (LI)	0,863	0,677
BSC application (VD)	0,861	0,608
Operational Efficiency (HQ)	0,898	0,639

3.4. Structural Equation Modeling (SEM)

The results in table 4 showed that the model has a good suitability with the data, the indexes are at an excellent level: CMIN/df = 1,177 (between 1 and 3), CFI = 0,983 (>0,95); RMSEA = 0,025 (<0,06) and PCLOSE = 1,000 (>0,05). All regression coefficients have sig values less than 0,05, the coefficients are statistically significant. In conclusion, the theoretical model is consistent with the survey data.

The results of the standardized regression coefficient of the model show that all factors have a positive impact on the application of the BSC method in listed companies in Vietnam, in the order of Organizational size, Manager's awareness, Accountant's capabilities, Organizational culture, Cost of using BSC, Benefits of using BSC. At the same time, the statistics also show that with other factors remaining constant, successful application of BSC will have a positive impact on operational efficiency.

Table 4. Results from SEM model

Relationship			Estimate	S.E.	C.R.	Sig.	Standardized Estimate
VD	←	QM	0,327	0,068	4,814	***	0,270

4. Discussion and Conclusion

4.1. Discussion

The authors summarize the results below:

Table 5. Summary of research results

Factor	Impact level	Correlation	Impact order
<i>Impact on the BSC Application</i>			
Organizational size (QM)	0,270	+	1
Organizational culture (VH)	0,169	+	4
Manager's awareness (NT)	0,268	+	2
Accountant's capabilities (TD)	0,260	+	3
Cost of using BSC (CP)	0,126	+	5
Benefits of using BSC (LI)	0,118	+	6
<i>Impact on the Operational Efficiency</i>			
BSC Application (VD)	0.513	+	

From the table above, the specific study results are as follows:

Organizational size has the strongest influence on the application of BSC in listed companies in Vietnam. The larger the enterprise, the larger the assets and the number of employees, the higher the level of BSC usage. Previous studies have also shared this meaning, such as Hoque & James (2000), Koske & Muturi (2015), Giang (2017) and Ngan Ha (2019).

Manager's awareness has the second level of impact on the application of BSC. Thus, it can be seen that the application of BSC is difficult to succeed if managers do not have a clear

understanding of this method and what it brings. This is also consistent with some previous studies by Islam et al (2014), Northcott & Taulapapa (2012), Tanyi (2011), Nhi & Toan (2018).

The accountant's capabilities have the third level of impact on the application of BSC. However, the level of impact is still quite large because accountants are the key human resources in implementing and applying management accounting, specifically BSC. If the professional qualifications of accountants do not meet the requirements, the application of BSC in the enterprise is impossible or it can be applied but not efficiently. This result is consistent with the expectation of the research team as well as other studies including McCleary et al (2004), Ismail & King (2007), Tri (2015), Hung (2012), Giang (2017), Nhi & Toan (2018).

Organizational culture has the fourth level of impact on the application of BSC, in addition, when applying a new tool like BSC, it is necessary to have consensus and cooperation for employees to be motivated to overcome obstacles. Previous studies also have the same result such as Rababah & Bataineh (2016), Alper Erserim (2012), Nhi & Toan (2018), Hung (2012).

The cost of using BSC has a relatively low level of impact and ranks fifth among the factors affecting the application of BSC in this study. However, it can be seen that the cost factor significantly affects the application of anything in the business. The majority believed that if enterprises realize that when the cost of building and operating the BSC system is higher than the benefits achieved, they will choose to apply other tools. This is also consistent with previous studies such as Koske & Muturi (2015), Giang (2017).

The benefits of using BSC have the lowest impact on BSC usage in this study. However, it still has a significant impact, so this factor cannot be ignored. It can be seen that the awareness of the benefits, as well as the ease of use of BSC, will make businesses more willing to use the tool, thereby helping to improve their applicability to use BSC. This result is also consistent with previous studies such as Islam et al (2014), Koske & Muturi (2015).

Furthermore, the impact of BSC Application on Operational efficiency is also determined to have a positive effect and is consistent with previous studies such as Gupta & Govindarajan (1984); Murphy et al (1996); Hoque & James (2000); Keh et al (2007); Tung & Thao (2020).

4.2. Conclusion

From the research results, the authors deduced that improving the influencing factors will increase the level of BSC application, thereby improving operational efficiency. Therefore, the authors suggested that business managers should pay attention to the following issues:

Firstly, the implementing process of BSC starts with an overall analysis and assessment of the current situation and size of the business... As there appear more and more competitive companies on the market with the same product, enterprises need to improve and develop new products, managers should consider applying BSC to control this matter.

Secondly, with the constant change in the market, businesses need to educate and cultivate the latest knowledge to managers' awareness of each department. Successful BSC communication to each department and division will bring a crucial awareness for each individual. It makes both the Board of Directors and all employees understand and commit to implementation.

Thirdly, a good leader is not only someone with qualifications and skills but also someone who knows how to utilize and promote human resources in the enterprise to help the business survive and thrive. In addition, managers need to pay attention to and listen to the opinions of accountants and at the same time promote potential accountants to learn more about monitoring and applying BSC. Therefore, the awareness and qualifications of accountants valued and invested at the right time will support businesses competing in an increasingly changing market.

Fourthly, an organization with a strong culture means a high level of consensus and mutual support among employees. Therefore, managers need to build a highly connected organizational culture environment, which not only promotes mutual help but also idea communications, grasps situations as well as motivates each other to boost business growth.

Fifthly, managers need to be aware of the necessity and usefulness of applying the BSC method in measuring performance across the enterprise, in each department, and each individual. Managers must have a direction to build a BSC method system for the unit they are operating.

Sixthly, managers also need to accept investment in technology and reasonable costs to deploy the application of BSC. Therefore, managers need to plan, use non-financial measures to assess the feasibility as well as allocate appropriate costs for this application.

In addition, the authors suggested policy implications from the government to enhance the application of BSC as follows:

(1) *The Government needs to enforce specific policy actions to encourage pursuing knowledge and understanding of managerial accounting in general and the BSC model in particular.*

(2) *The Government needs to come up with appropriate policies to support and help listed companies to deploy BSC.*

(3) *The Government should promote and develop plans to introduce the BSC model into state organizations and agencies to serve as a premise to increase the application of this model in Vietnamese enterprises.*

From the research results, the authors have answered the research questions and met the research objectives initially set. Hence, this contributed to the theoretical basis of studies on this issue to support enterprises successfully applying BSC. However, due to limited resources and research time, the study still has certain limitations. Specifically, the number of surveyed enterprises is not large enough, so the representativeness is not high. The convenient sampling method also does not guarantee representativeness, causing the research results to deviate from reality. In addition, the study using the inherited scale may not be suitable for the characteristics of Vietnamese enterprises.

From those limitations, the research team suggested further studies can build more on the survey sample size factor with a larger scale and number of enterprises, and at the same time use the probabilistic sampling method to increase the representativeness and reliability of the study. In addition, in the future, researchers can also study the application of BSC to each field, industry, or in a certain enterprise or department, as well as adjust and build new scales and factors plausible with the characteristics of Vietnamese enterprises.

Abstract

The study examined the impacts of corporate social responsibility (CSR) factors on the customer's brand awareness in a developing country, Vietnam, in the case study at McDonald's in Ho Chi Minh. Following that, the influence level of CSR factors, including ethical, economic, legal responsibility, and customer protection, on customers' brand awareness was also evaluated in the research. The questionnaires were distributed to respondents who were McDonald's customers in Ho Chi Minh City, and the study had a sample size of 385. The findings revealed that aspects of CSR had a positive relationship with customers' brand awareness. The order of influence of CSR aspects was as follows: customer protection, ethical responsibility, economic responsibility, and legal responsibility. In addition, the aspect of CSR that had the highest influence level on customer brand awareness was customer protection. Therefore, the company should develop strategies to enhance customer experience and services.

Keywords: *Corporate social responsibility (CSR), Customer's brand awareness, fast food industry, McDonald's*

1. Introduction

The fast-food industry is growing significantly worldwide and faces stiff competition from other fast-food brands. Due to increased customer brand awareness, they tend to use favourite and familiar brands. Brand plays a crucial role in the success of commercial products in the market. Creating a positive brand image and ensuring brand awareness are two essential aspects of a brand's success (Seturi, 2017). A product's brand name is immediately identified when a customer considers buying a product, reflecting brand awareness significantly affects customer decision-making (Hommerová et al., 2020; Macdonald & Sharp, 2000). Following that, Corporate Social Responsibility (CSR) matters

have received widespread attention in the hospitality industry in general fast food in particular (Martínez et al., 2014; Raub & Blunschi, 2014). A company exercises Social Responsibility, which enhances the corporate image (Boonpattarakon, 2012; Porter & Kramer, 2006)) and helps customers to differentiate a brand from its competitors (Swimberghe & Wooldridge, 2014). Since then, CSR's activities have positively impacted customers' brand awareness, created a competitive advantage, and captured a high market share (Chi et al., 2009). Vietnam is a developing country and a potential market for McDonald's to have the opportunity to expand its market in Vietnam in general and Ho Chi Minh City in particular. According to Vietnam Demographics, in 2020, 37% of Vietnam's population will be urban, and the middle-class accounts for 13% of the population and has a complete education and the integration of the world economy. Therefore, Vietnamese customers have high brand awareness and pay more attention to purchasing social responsibility activities. According to Bui's research on Vietnamese consumer perceptions of CSR and their intention for sustainable consumption, respondents pay attention to three main elements of CSR social responsibility (32%), economic responsibility (59%), and environmental responsibility (54%) (Bui, 2010). Evidence reveals that CSR is the key to enhancing customers' brand awareness and building a competitive position for McDonald's in the Vietnamese market. Therefore, the research paper will present and discuss CSR factors influencing customers' brand awareness in the case study of McDonald's in Ho Chi Minh City.

Customer brand awareness is the probability that a customer is accustomed to the accessibility and availability of a business's products and services (Ehsan Malik et al., 2013). On the other hand, brand awareness can identify or recall a brand within a specific product category (Aaker, 1991). Brand awareness is a continuum, from feeling brand unconsciousness to the belief that it is just one of the products (Aaker, 1991). A significant association in consumer memory of a particular brand is generated by brand awareness (Stokes, 1985). An organization has a high brand awareness, which demonstrates that a company's product or service is of good quality and reputable in the market (Gustafson & Chabot, 2007).

Evidence reveals that Corporate Social Responsibility (CSR) is an initiative that helps organizations improve brand awareness and competitive advantage. According to Davis (1960), corporate social responsibility is 'the businessman's decisions and actions taken for reasons at least partially beyond the firm's direct economic or technical interest... which need to be commensurate with the company's social power'. The definition of CSR is more widespread as there is increasing awareness of the rights of stakeholders (e.g. workforce and customers) and government regulations (Gheribi, 2017). Corporate social responsibility not only contributes to enhancing the life quality of society (Mahmood & Bashir, 2020) but also becomes an effective tool for businesses to build a positive image and enhance customers' brand awareness (Aaker, 1991). In addition, CSR encompasses three main dimensions of ethical, legal, and economic responsibility (Carroll, 1979; Meehan et al., 2006). Therefore, companies need to make an effort to satisfy the needs of their shareholders and customers and their stakeholders.

Ethics is the rules of principles and values that control the actions of a person and a group of people regarding the right and wrong of something (Sexty, 2011). Ethical CSR practices reflect customer fairness, respect, and human rights (Carroll, 1991). In particular, business ethics is a form of professional ethics used to examine ethical principles and issues occurring in the business setting (Stanwick & Stanwick, 2009). Ethical responsibility encompasses a wide range of norms and standards that demonstrate concern for consumers' fairness, the workforce, shareholders, and the community, which contributes to the protection of moral rights. In addition, changes in ethics are also the driving force behind the enactment of new laws and regulations.

On the other hand, ethical responsibility reflects the desire for new values and standards of societies that businesses need to meet (Singh & Singh, 2013). Ethical responsibility refers to activities that are permitted or prohibited in an organization without being bound by law (Mahmood & Bashir, 2020). Ethical issues become the primary concern of most customers. Therefore, organizations are aware of the factors that affect their brand and consider CSR a crucial part of corporate reputation management, especially customers' brand awareness. Some researchers have suggested that ethical responsibility is an appropriate indicator of corporate brand evaluation (Alsop, 2004; Ma, 1999; Tang et al., 2012; Yang & Crowther, 2012). In addition, according to the previous research on the relationship between leadership capacity and CSR in hospitals in Vietnam, leadership has interacted with the relationship between the legal and economic responsibilities of the company. Then, leaders strengthen the company's ethical responsibility, thereby positively affecting brand equity and increasing customers' brand awareness. Ethical branding enhances the company's reputation and credibility, reinforcing the customer's brand awareness (Trong Tuan, 2012). Furthermore, CSR positively impacts brand awareness (Esmailpour, 2016; HOANG et al., 2020). Thus, the following hypothesis can be proposed:

Hypothesis 1 (H1): Ethical responsibility positively affects customer brand awareness.

Society wants businesses to obey the laws and regulations of local nations (Carroll, 1991). Companies conduct business activities within the framework of local laws to ensure the safety of the working class, labour laws, and tax problems (Abdul & Ibrahim, 2002), which have a positive influence on communities and consumers. Following that, the local and central governments will be responsible for issuing and applying legal issues related to all company's operations from production to distribution (Carroll, 1991). An organization complies with the law and participates in the fair and legal business, reflecting the company's respect for the law. Furthermore, it is clear that voluntary compliance with the law has a positive effect on society and its customers and contributes to promoting the corporate image and raising customer brand awareness.

Legal CSR activities positively affect the customer's brand awareness. Many studies of consumer CSR perceptions show that consumers understand CSR in many different ways, and they believe that CSR is a corporate commitment to social responsibility (Nguyen et al., 2019). Therefore, it can be seen clearly that legitimate corporate activities are correlated with the customer's brand awareness. Previous research suggested that legal responsibility may

positively influence customers' brand awareness (Esmailpour, 2016; Hoang et al., 2020). When a company is publicly announced for legal actions, which will significantly develop the company's image and increase brand awareness as customers are always more inclined to be interested in what the company is doing, such as corporate achievements or scandals.

On the other hand, once customers see irresponsible actions of the company, they will have negative behaviours such as contempt boycott the company's products and services, which adversely affects the company's revenue and brand name (Folkes & Kamins, 1999). Therefore, businesses always put legal responsibility first in their business strategies. The hypothesis below describes the relationship between legal responsibility and customer brand awareness.

Hypothesis 2 (H2): Legal Responsibility has a positive effect on customer brand awareness.

Economic organizations are the essential components of any society (Carroll, 1979). The company is responsible for supplying goods and services that suit the needs and desires of the community and making a profit at reasonable prices. In addition, businesses need to create job opportunities, share profits fairly and reasonably between employees and shareholders, and create and develop new products and services for society (Jamali, 2008). Moreover, Consumers' awareness is increasing; they have become increasingly interested in corporate social responsibility activities. This reflects that companies engaged in responsible economic activities to protect resources, communities, and the environment.

Moreover, voluntarily participating in economic responsibility in CSR has a beneficial influence on social members and brand awareness of customers. Economic organizations are responsible for understanding consumer needs such as the quality and price of products, meeting their needs, and making profits. Companies will provide employment and economic activity opportunities to individuals in society, and when businesses make high profits, the workforce will get more benefits and incentives.

Economic responsibility done voluntarily by companies affects customers' brand awareness. Corporate brand awareness and reputation are measured through product quality, customer care, financial profiles, and ethical behaviours (Alsop, 2004; Barnett et al., 2006; Bruwer & Johnson, 2010; Walsh et al., 2009). Moreover, many studies suggest that customers will buy products or use services from companies with practical CSR activities (Brown & Dacin, 1997; Folkes & Kamins, 1999). Companies are therefore forced to engage in responsible social activities to increase profit and brand awareness of customers. Furthermore, the previous research proposed that economic responsibility may positively impact customers' brand awareness (Esmailpour, 2016; Hoang et al., 2020). Therefore, the author hypothesizes that:

Hypothesis 3 (H3): Economic Responsibility has a positive effect on customer brand awareness.

Consumerism is also referred to as customer protection, activism, or the consumerist movement (Makanyeza et al., 2021). As defined by (Kotler 2000), the consumerist movement is an organized social movement of citizens and governments aimed at promoting

the rights and powers of consumers in the relationship between sellers and buyers. Customer protection is being given wide attention, and society has strict action against consumer rights violations (Saeed Althiabi, 2016). As a result, organizations tend to have business operations related to customer protection, accept and comply with their requirements and proposals, and consider consumer rights a critical aspect of their business strategy. Customer Protection is enacted to protect individual rights in the treatment of considerate and dignity. Simply, consumer protection protects buyers from unfair trade practices, contributing to ensuring that the supply and demand sides of the economic market are operated optimally. The government enacted consumer protection laws, including fair trade, information, problem-solving mechanisms, and access to goods.

Customer protection, or consumer law, is part of government legislation protecting consumers from unfair business sales such as poor-quality products or business behaviour. Conducting legal business behaviour by protecting customers' interests is an effective way to avoid legal troubles and build trust with customers about the quality of products or services that the company provides. The research mentioned that customer protection might positively affect brand awareness (Chung et al., 2015). Socially, this also contributes to building a good reputation and improving customers' brand awareness. In addition, the law protects consumers as a commitment that the government makes to customers about the guarantee of their interests when buying. Governments are forcing companies to comply with consumer protection laws. Consumers are increasingly concerned with companies' customer protection practices; therefore, companies are forced to comply with legal regulations, which create a brand impression on potential customers and increase the brand awareness of old customers. This research proposes

Hypothesis 4 (H4): Customer protection positively impacts customer brand awareness.

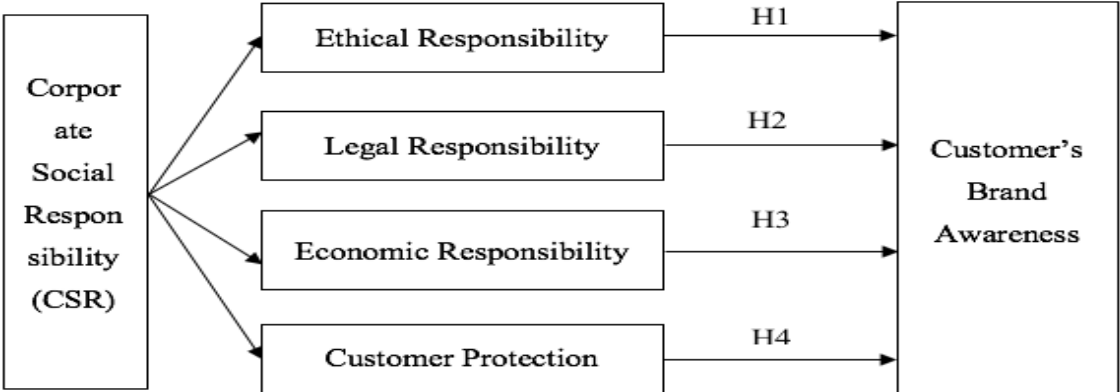

Figure 1. Conceptual framework

Source: Author

2. Method

The questionnaire has two main sections: the respondents' demographic characteristics and a dependent variable (customer's brand awareness), and four independent

variables (ethical responsibility, legal responsibility, economic responsibility, and customer protection). Demographic characteristics include gender, age, education, occupation, income, frequency of using McDonald's and how to know McDonald's.

The items in the research paper measure the customer's brand awareness questionnaire by Switala et al. (2018) and the literature of Gustafson and Chabot (2007). Next, the five ethical responsibility items are modified from a study by Yusof et al. (2015) and Wu et al. (2014). Legal responsibility was assessed using three items developed by Carroll and Shabana (2010). When it comes to economic responsibility, four items are used to measure and draw from the contributions of Yusof et al. (2015), Wu et al. (2014), and Phillips et al. (2014). Finally, customer protection was measured using five questionnaires from Yusof et al. (2015), Wu et al. (2014) and Chung et al. (2015) (Carroll & Shabana, 2010; Chung et al., 2015; Gustafson & Chabot, 2007; Phillips et al., 2019; Świtala et al., 2018; Wu & Wang, 2014; Yusof et al., 2015).

The research samples have been collected from McDonald's customers in Ho Chi Minh City, Vietnam. Simple random sampling is applied to distribute surveys and collect data in the study. After that, the convenience sampling technique is used to select the representative sample of the population. In addition, the exclusion question is created to choose reliable data. In particular, the online survey is created on Google Form with a five-point Likert scale to measure the level of the responses. The questionnaire was used in the research and distributed to 444 respondents. There are 385 valid samples, which gives a valid rate of 86.7%. In addition, 59 responses were eliminated because respondents have never used McDonald's services or products or the concept of corporate social responsibility. The collected data were analyzed in SPSS. The exploratory factor analysis (EFA) was used to test the relationship between independent and dependent variables.

3. Results

Cronbach's alpha is used to measure reliability in research. Cronbach's alpha values in the sound and excellent range should be greater than .70 and less than .95 (Bonett & Wright, 2015). Besides, the Corrected item-total Correlation shows the correlation between each specific item and other items on the scale, and the index should be greater than .04 (Bartlett, 1950). Otherwise, if the Corrected item-total Correlation is less than .30, the Alpha if Item Deleted will highlight Cronbach's alpha if the item is deleted (Bartlett, 1950). The Cronbach's alpha value of customer's brand awareness is .871, ethical responsibility is .859, legal responsibility is .830, economic responsibility is .825, and customer protection is .851. All Cronbach's alpha values are at a good reliability level (between 0.8 and 0.9) and accepted.

Exploratory factor analysis (EFA) has two techniques for testing data, including Bartlett's test of sphericity (Bartlett, 1950) and the Kaiser-Meyer-Olkin (KMO). These techniques test the strength of relationships between variables to perform EFA (Howard, 2016). The KMO of the independent variable is 0.915, and the dependent variable is .870, which is greater than 0.7 and less than 1 and. The Bartlett test has a significant value of 0.000 is less than .05 (Barrett et al., 2005). In addition, eigenvalues represent the variance in the measured variables calculated for each common factor (Fabrigar & Wegener, 2011). All

factors with eigenvalues greater than 1 should be kept (Kaiser, 1960). Finally, the Rotated Factor Matrix has loadings of $|\geq 0.40|$ or greater (Barrett et al., 2005) and factor loadings in the range of .30 to .40 being minimally acceptable (Hair et al., 2006). The study's sample size is 385, so the factor loading is set to 0.3. The results are that all the independent variables' items converge to the exact position of their independent variable because the loading factor of all items is higher than 0.3, and no items are discarded.

When it comes to Pearson correlation, this method values evaluate the strength, significance, and direction of the relationship between CBA and ET, CBA and LR, CBA and EC, and CBA and CP. These values correspond to these pairs of variables as 0.626, 0.569, 0.581, and 0.642, respectively. Pearson correlations are all greater than 0 and towards 1, which illustrates a good relationship between CBA and ET, LR, EC, and CP. In addition, the Correlation table results highlight that the effect is significant at the 99% probability level and allow for 1% error.

The Model Summary has two important values: adjusted R square and Durbin – Watson. The Adjusted R square explains how much the observed variation in the dependent variable is (Sarstedt & Mooi, 2014). The adjusted R square is lower than the unadjusted R square and partly depends on the number of variables (Barrett et al., 2005). The adjusted R square is 0.587, which is greater than 0.5 and less than the value of R Square (0.591), so this value is agreed. Durbin – Watson's value is 1.973, which is close to 2, so there is no residual autocorrelation of the linear regression model (Sarstedt & Mooi, 2014). Following that, the ANOVA table mentions an extraordinary value level (sig.). The value sig. is 0.000 (less than .05) in the research. Hence, null hypothesis $H_0: \beta_1 = \beta_2 = \beta_3 = \beta_4 = 0$ is rejected and H_1 is accepted (Sarstedt & Mooi, 2014). Assumption $H_1: \beta_1 \neq \beta_2 \neq \beta_3 \neq \beta_4 \neq 0$ is correct.

Moreover, the Coefficient highlights that the VIF is used to diagnose multicollinearity. The VIF of ethical responsibility is 1.727, legal responsibility is 1.608, economic responsibility is 1.549, and customer protection is 1.572, all less than 2 (Akinwande et al., 2015; Daoud, 2017). Therefore, there is no multicollinearity between these four variables. Furthermore, the Sig values of four independent variables in the Coefficients table are 0.000 less than 0.05, so ethical responsibility, legal responsibility, economic responsibility, and customer protection have good relationships with customer brand awareness.

4. Discussion and Conclusion

The findings indicate that customer protection significantly influences customers' brand awareness. This is consistent with the findings of Hoang et al. (2020) and Esmaeilpour (2016), who reported that customer protection positively affects customer brand awareness. Besides, this paper corroborates Chung, Yu, Choi, and Shin (2015) that customer protection contributes to Carroll's CSR structure (1999). Vietnamese customers have been interested in protecting the interests of fast-food chains recently, especially McDonald's. The improvement and development of products, service quality and good support that the company gives to customers help improve customers' brand image and brand awareness.

Ethical responsibility positively impacts customers' brand awareness. This conforms to the findings of Mahmood and Bashir (2020), Hoang et al. (2020), and Esmailpour (2016). According to previous studies, ethical responsibility is an appropriate indicator to measure and evaluate a company's brand (Tang, Hull, and Rothenberg, 2012; Yang and Crowther, 2012; Alsop, 2004; Ma, 1999). The findings of this research paper have proven that the ethical activities of the company have a significant influence on the brand identity of the company in general, McDonald's in particular. Surveyed customers support that McDonald's respects its customers and provides high-quality products, demonstrating a positive customer view of the brand. In addition, creating favourable conditions for employees to work and having charitable activities that contribute to the community and society attract public attention and positively influence brand awareness.

Economic responsibility has a positive effect on customers' brand awareness. This finding is consistent with the previous findings of Mahmood and Bashir (2020), Hoang et al. (2020), and Esmailpour (2016), who observed that economic responsibility and customer brand awareness have a significantly positive relationship with each other. Next, the study shows that customers constantly monitor the economic and production activities and the profit contribution of the company to society (Mahmood and Bashir, 2020). McDonald's customers are on the lookout for new product innovations, environmentally friendly packaging, and social contributions.

The legal responsibility of CSR positively affects customers' brand awareness, and this conforms to the findings of Mahmood and Bashir (2020), Hoang et al. (2020), and Esmailpour (2016). It can be seen that Vietnamese customers are not concerned about legal aspects as they believe that compliance with regulations, standards and food laws is something that the companies must do, and this is mandatory, not optional.

The research presented the results by collecting and analysing data on the influence of CSR on customers' brand awareness. With the findings of this research, McDonald's can enhance its brand image through communication activities related to aspects of CSR. It is without a doubt that according to research results, net-working sites and word of mouth are the two most effective advertising mediums for McDonald's because social network accounts for 35.3% and word of mouth accounts for 31.2% of all advertising mediums. As a result, the marketing department has an essential role in promoting the brand. The affective aspects of CSR affecting customer brand awareness are customer protection, ethical, economic, and legal responsibility, respectively. The company needs to continue to develop strategies related to customer protection ethical and economic factors. In addition, McDonald's managers need to improve the activities of the legal aspect and publicize these activities on social networks and in-store message boards. Thus, these activities will be effective word of mouth and increase customers' brand awareness. It appears clear that customers tend to go to high-reputed fast-food restaurants combined with CSR aspects added to the in-store experience, which will increase brand awareness in customers' minds. The results of this research paper will help the company come up with an effective CSR strategy to achieve the set goals. In addition, the company needs to attract employees to participate

in CSR activities, which helps create consistency in goals between the company and employees. They will then share these activities with customers so that customers have a positive perception of the brand and the company's products and services.

There are several limitations in this study outlined below to help the research avoid and improve these limitations. In the questionnaire, there were a total of 30 items, and the content of the items related to respondents' knowledge and the company's CSR policies, which showed that the number of questions was high and the content was difficult for respondents. Therefore, it is difficult to collect data. Next, time and finance are the two limitations of this study. The time spent collecting the data is only one week, so the number of samples is small. In addition, the author does not have enough funds to encourage respondents that all samples collected are free. As a result, many people are not motivated and patient enough to complete the questionnaire table.

The paper has several recommendations for future research. First of all, the adjusted R square value is 0.587, which indicates that many other variables should be added to the study to further investigate and develop predictability about other aspects of CSR affecting customers' brand contribution awareness. Besides, the study's sample size is relatively small, the survey does not diversify in terms of subjects and locations, and the survey only focused on students and young people in Ho Chi Minh City, Vietnam. Therefore, future research papers should have a larger sample size across many cities in the country and survey a variety of subjects and industries to have a more holistic view of CSR aspects. Following that, this study uses a questionnaire that shows the perception of customers' understanding of its CSR policies, making it difficult for survey respondents. Thus, the surveys need to establish items that have a relationship between CSR activities and aspects of survey respondents' attitudes.

Abstract

The study analyzes the factors affecting the success of the eKYC system in the banking system, including factors that are six independent variables: Environment, eKYC implementation strategy, Organization, System quality, Information quality, supplier/consultant quality and dependent variable Satisfaction. Research and collect data from employees, managers, senior leaders in banks in Vietnam. The research results demonstrate the impact of the factors on Satisfaction in descending order: Supplier quality, System quality, Information quality. The factors affecting Success are arranged in descending order: Satisfaction, Organization, Environment, Quality. The factor of eKYC implementation strategy has no impact on the success of eKYC in the banking system. The study also gives scientific and practical significance and offers solutions to deploy the eKYC system in line with reality in Vietnam.

Keywords: *system; eKYC; success; factor; Bank; Vietnam.*

1. Introduction

Along with the strong trend of digital information in many fields around the world, the banking industry itself is also making significant changes on the road to successful digital banking. The first step of this transformation is the application of e-KYC system. With its own pervasive power, this technology quickly entered our country, bringing the winds of change to the customers' experience. Although it is undeniable that the benefits e-KYC brings, however, this system is only at the first phase of implementation in Vietnam banks and still faces many difficulties. Moreover, the system is not fully optimized. So how can we resolve these barriers, therefore improve the efficiency of banks' e-KYC systems?

To answer this question, we must first understand the definition of e-KYC (electronic Know Your Customer). It is the process of collecting and verifying a customer's identity through personal document in the form of electronic data. This process can be partially or fully automated, based on one's individual biological characteristics and other identification technologies, for the purpose of verifying customers in the shortest time as possible, therefore simplifying paperwork.

Facts shown that up to 94% of Vietnam banks have started researching and developing implementation strategies, of which 59% of banks has started to launch this system in practice (Austrade, 2020).⁸⁷Banks such as TPBank, VPBank, MBBank are the leading flags of this new verification system with huge investments in technology and high-quality human resources. However, the implementation of this system in Vietnam banks has not been uniform, not to mention the National Database on Population Management of Vietnam is still incomplete, therefore can't optimize the collection of data on banks' customers information.

2. Literature Review and Research Hypotheses

2.1. System quality, Information Quality, Vendor/Consultant Quality, User Satisfaction impact on the eKYC system success

Realizing the similarities of the successful information system model (proposed by DeLone & McLean, 2003) due to the same system of data collection and management, the team consulted and selected several suitable factors, based on the criteria of the conceptual relevance and affection's ability of the factor.

Compare the objectives of the study (identify the main factors affecting the successful implementation of the e-KYC system in Vietnamese banks along with the impact level of each factor and the relationship between the factors) with the characteristics of each study are often used in the study of the updated information system model of DeLone & McLean as the basis for building the research model. Accordingly, there are four factors that can affect (directly or indirectly) the success of the e-KYC system. These are: "system quality", "information quality", "service quality", "user satisfaction" with the system. "Systems quality" measures technical success; "Information quality" measures semantic success; "Service quality" refers to the level of user support from the IT department, usually measured by response readiness, reliability, and empathy; "User satisfaction" with the system is the degree of acceptance of the system and its outputs.

As for the factor "service quality", the research team found that the concept of this factor is quite broad, misunderstand, and has not fully expressed the proposed meaning and content. Specifically, the "quality of service" element of an information system (IS) only refers to the level of user support and training, while this element of the e-KYC system represents the quality of the product (technology, equipment, machinery), security

⁸⁷ Austrade, 2020

capabilities, operational qualifications, and system adaptation provided by manufacturers and distributors. Therefore, the research team has proposed to temporarily use the name of the factor "quality of supplier" instead of "quality of service" to clearly express the content to be expressed, and then consult experts.

Thus, the three factors "system quality", "supplier quality", "information quality" have a direct, one-way impact on "user satisfaction" and "user satisfaction" has a direct, one-way impact to "The success of the e-KYC system". Therefore, the author proposes the following:

Hypothesis 1a (H1a). *"System Quality" affects directly and positively to "User Satisfaction" for e-KYC system.*

Hypothesis 1b (H1b). *"Information Quality" affects directly and positively to "User Satisfaction" for e-KYC system.*

Hypothesis 1c (H1c). *"Vendor/Consultant Quality" affects directly and positively to "User Satisfaction" for e-KYC system.*

Hypothesis 3 (H3). *"User Satisfaction" affects directly and positively to "e-KYC System Success".*

Next, to consider the relationship between quality factors (system quality, information quality, vendor/consultant quality) and the factor "Success of the e-KYC system", the research team also used the extended ERP systems success measurement model of Ifinedo (2006) to collect information, which is quite similar to how the e-KYC system works.

In this model, Ifinedo also proposes that "System Quality", "Information Quality", "Vendor/Consultant Quality" directly affect the success of the ERP system. This is indeed reasonable because the success of a system, especially a system related to equipment and technology, is strongly and directly affected by technological quality factors, not necessarily only indirectly affected through "Satisfaction". Thus, it can be said that the three technological factors mentioned above both directly affect the "success of the e-KYC system" and indirectly through the factor "Satisfaction". Therefore, the authors also expect that:

Hypothesis 2a (H2a). *"System Quality" affects directly and positively to "e-KYC System Success".*

Hypothesis 2b (H2b). *"Information Quality" affects directly and positively to "e-KYC System Success".*

Hypothesis 2c (H2c). *"Vendor/Consultant Quality" affects directly and positively to "e-KYC System Success".*

To confirm and strengthen the correctness of their point of view, the team consulted experts and the results are summarized in Section 4. Particularly for the proposal to change the variable name, the results show that both 6/6 Experts say that change is appropriate and necessary.

2.2. Strategy affects the “e-KYC Systems Success”

In addition to technology factors, other human and planning factors also have a significant impact on the implementation of the system. Recognizing this, the research team considered the McKinsey 7S model of McKinsey et al (1970). From there, the research team concluded that the factor “Strategy” has a certain relevance to the implementation of the e-KYC systems in the 7 McKinsey’s factors.

Specifically, McKinsey explained: “Strategy” also known as the business’s plans was proposed to make competitive advantages for business, have huge impact on “system”. It is similar to the process of implementing the e-KYC systems, there must be a clear implementation plan, setting each step of the goal and ensuring that the stages are completed on schedule. And clearly, the bank that completes the work on schedule, ensures efficiency and quickly puts the e-KYC systems into use, that bank has a huge competitive advantage. Therefore, deployment "strategy" is also an important factor affecting the success of the e-KYC systems. Of course, to increase the reliability of this factor, the research team also consulted experts (the results are summarized in Section 4 of the study). And to express it most accurately, in the proposed e-KYC system model, the authors used the variable name "e-KYC strategy" to separate it from other strategies of the bank. In conclusion, the authors expect that:

Hypothesis 5 (H5). *“eKYC Strategy” affects directly and positively to “e-KYC System Success”*

2.3. Organization and environmental factors impact on the eKYC system success

Although we have consulted a number of system deployment models that indicate human and environmental factors. However, in order to find a model containing the most suitable factors for e-KYC, the research team chose the model of applying e-commerce technology by M.A. Rasid (2001) from Massey University, New Zealand as a reference.

M.A. Rasid's application model shows four main factors affecting the adoption of e-commerce technology, including factors: "technological (innovation) factors", "organizational factors", "environmental factors", "individual factors". In which, organization and environmental factors are shown that: “Organization” includes size of departments, specialization, and Top Management support; “Environmental factors” includes competitive pressure, Suppliers/ Buyers pressure, Public Policy, Government’s role.

Hypothesis 4 (H4). *“Organization” affects directly and positively to “e-KYC System Success”.*

Hypothesis 6 (H6). *“Environmental Factors” affects directly and positively to “e-KYC System Success”.*

Based on the proposed factors and the relationship between them, the authors have completed the research model "Factors affecting the successful implementation of e-KYC system in banking operations" specifically as follows:

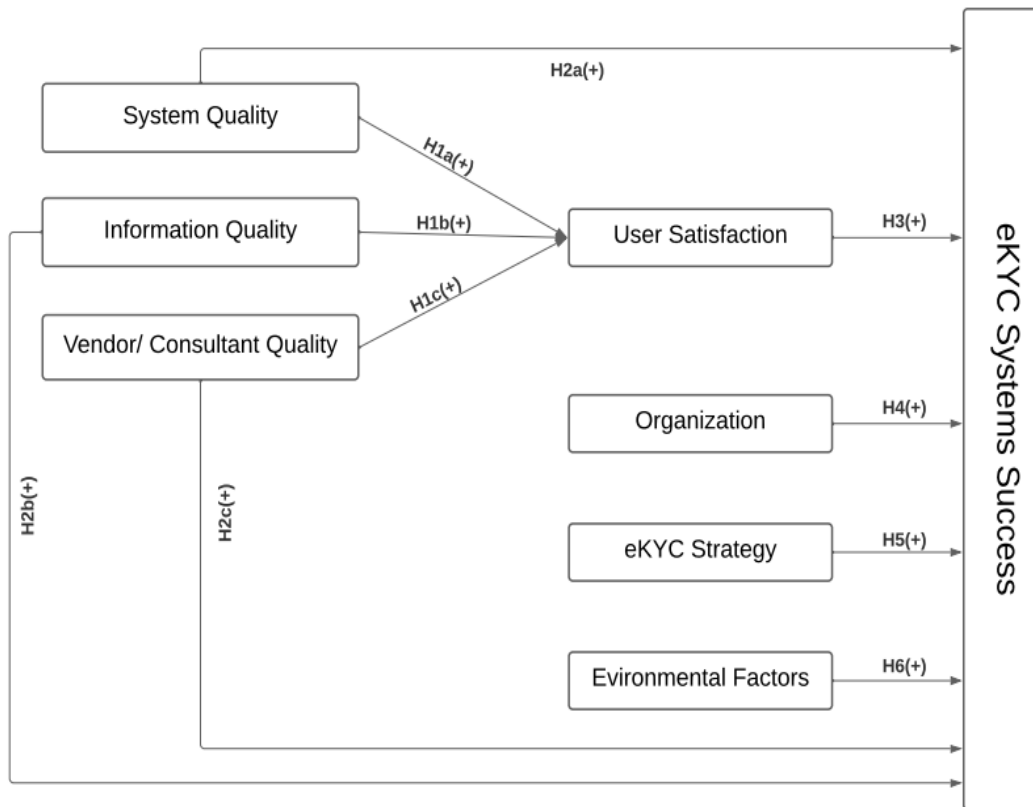

Figure 1. Proposed research model

2.4. Research Sample and Data Collection

This research was conducted from 15/02/2022 to 28/02/2022 and the questionnaire was completed by sending forms and emails online to the staff of commercial banks in Vietnam which already deployed eKYC system. Stratified sampling had been used in order to satisfy samples' overall characteristics. Overall, we collected a total of 211 tables. After filtering, the number of satisfied tables is 211.

Table 1. Summary of Respondents' Profile (n=211)

<i>Demographic</i>	<i>No.</i>	<i>(%)</i>	<i>Demographic</i>	<i>No.</i>	<i>(%)</i>
Age			Position		
< 30 years old	79	37.44	Consultants	34	16.11

			81-90%	74	35.00
			> 91%	39	18.00

Source: Survey data

The results showed that the total number of surveyed subjects was 211 subjects, of which female was 59.25%, male was 40.75%. The subjects ages was from under 30 to over 60, of which from 30-40 accounted for 53.09%. In terms of occupation, most of the subjects are from large banks that have implemented eKYC, namely TPBank, TechcomBank, BIDV, VietcomBank and MBBank, therein the majority are from the IT department with 33.17%, followed by Services 21.8%, Operation Division 12.8%, Business Development 9.95%, and the lowest, the Support Department and the Treasury Department both accounted for 5.69% and the main are Experts with 32.7%.

Considering the implementation time of eKYC, the majority of respondents agreed that the bank's eKYC system has been implemented in 1-2 years with statistics accounting for 50%. Next, the number of choosing the time to deploy and put eKYC into use within 6-12 months accounted for 20%, followed by 16% using less than 6 months. Finally, the lowest is the usage time of over 2 years with 14% selected. The main reason is that the eKYC system has just been implemented, has undergone testing at a number of banks and has just been officially put into use for less than 2 years. As a result, in addition to the leading banks in implementing eKYC, most of the remaining banks have less than 2 years of implementation and running time.

Regarding the technology, out of 211 people who filled out the survey, 155 people confirmed that the bank had applied the Face- matching solution in the e-KYC application (accounting for 84.2%), followed by E-Signature accounts for 69.6%, corresponding to 128 people agreeing to choose. Other technologies is also used as the basis for e-KYC implementation, but they are still not popular enough (only 16.8%). Lastly, the most underused technology at banks is fraud detection, chosen by only 1% of survey respondents.

Assessing the efficiency of the system, up to 35% of bank staff confirmed that e-KYC brings almost maximum efficiency for the bank (81-90%). Next, at a lower level, 26% of the respondents chose the high level, showing that e-KYC brings good efficiency in the process of use (71-80%). Over 91% efficiency of the e-KYC system accounts for 18%, followed by less than 60% with 11% selection. Finally, only 10% of the people surveyed found that the implementation and usage of the e-KYC system at work achieved good results from 60-70%.

3. Result

3.1. Reliability and Validaty

According to the data, the research team applied some corresponding technical analysis as following:

- Data descriptive statistics to determine a number of descriptive related to the characteristic variables in the research sample, including demographics and evaluation of e-KYC deployment process of members participated in the questionnaire.
- Partial Least Square (PLS) to test the overall fit of the research model, as well as to test the research hypotheses about the factors affecting the success of e-KYC system in the banking sector.

The techniques above are performed by using data analyzer software SPSS 20 and Smart PLS. The process includes steps such as:

(1) Testing the quantitative model by Cronbach's Alpha and EFA analysis method to assess the suitability of the scale, eliminate variables that have a weak relationship or have no relationship with factor groups, discover which variables are closely related to which group of factors.

(2) Testing the convergence and the difference through CFA confirmatory factor analysis, also using AMOS software to validate SEM structural model and research hypotheses.

(3) Regression analysis by using divisor-based variable selection to conduct univariate regression analysis, analysis of variance (ANOVA), conduct multivariable regression of 2 dependent variables, therefore determining the multiple regression equation.

The reliability analysis table of the scales (Table 2) showed that all values: Cronbach's Alpha sum > 0.8, Corrected Item-Total Correlation is greater than 0.5 and all Cronbach's Alpha components are > 0.5, which shows a high level of internal consistency. The reliability of the concepts included in the analysis are guaranteed.

Table 2. Reliability Statistics

Variable	Variable definition	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted	Cr_ Alpha
MT1	The regulatory environment in Vietnam is mature enough to facilitate the development of eKYC model.	.762	.862	.884
MT2	The government cares and is well aware of the importance of eKYC system.	.524	.881

3.2. Evaluate the validity of the scale

Based on the results of Cronbach's Alpha, Exploratory factor analysis (EFA) was performed using principal component analysis with varimax rotation. The EFA results are presented in Table 3.

Table 3. Rotated Component Matrix

	Component					Structure
	1	2	3	4	5	
CLHT2	.735					Quality
CLHT1	.714					
CLHT6	.704

MT7		.789				
TC2		.643				
CL2		.613				
CL1		.579				
STM2		.577				
CLNCC3		.577				
TC1		.576				
CL3		.576				
STM1		.521				
STC4			.784			Success
STC5			.782			
STC7			.728			

	Component					Structure
	1	2	3	4	5	
STC6			.711			Structure
STC3			.687			
STC1			.660			
STC2			.614			
TC4				.807		
TC3				.764		
MT2				.700		
MT3				.630		
MT5					.782	Environment
MT4					.605	
Eigenvalue	21.582	2.025	1.512	1.253	1.103	
% of Variance	58.330	5.473	4.087	3.388	2.982	
Cumulative %	58.330	63.803	67.890	71.277	74.260	
KMO = 0,957						
Bartlett's Test: Sig. = 0.000						

Source: Survey data

In general, all observed variables have factor loading > 0.5 . KMO and Bartlett's Test in factor analysis show that $\text{sig.} = 0.000 < 0.005$; high KMO coefficient ($= 0.957 > 0.5$). The final results when analyzing EFA factors from 40 observed variables were reduced to 37 observed variables, which were aggregated into 5 groups of factors. With total variance (conserved variance or extracted variance) = 74.260% ($> 50\%$), it means that 5 factors are able to explain 74.260% (Table 3) the variation of observed variables. The breakpoint when extracting the 5th factor with eigenvalue = 1.013 met the requirements. Therefore, the derived scales are accepted. The independent and dependent variables have gained reliability and validity to use for subsequent analyses.

3.3. Confirmatory factor analysis and linear structural modeling

After exploring factor analysis EFA identified 4 main factors, the authors conducted confirmatory factor analysis CFA, using AMOS software to run SEM model. The results show that the Standardized Regression Weights are all positive, showing that the Quality variable positively affects Satisfaction. The variables Organization, Environment, Satisfaction, Quality positively affect Success. The Standardized Regression Weights (Estimate) of the observed variables are all > 0.5 ; therefore, the scale can achieve Convergent validity. The results of the theoretical model are as shown in Figure 2.

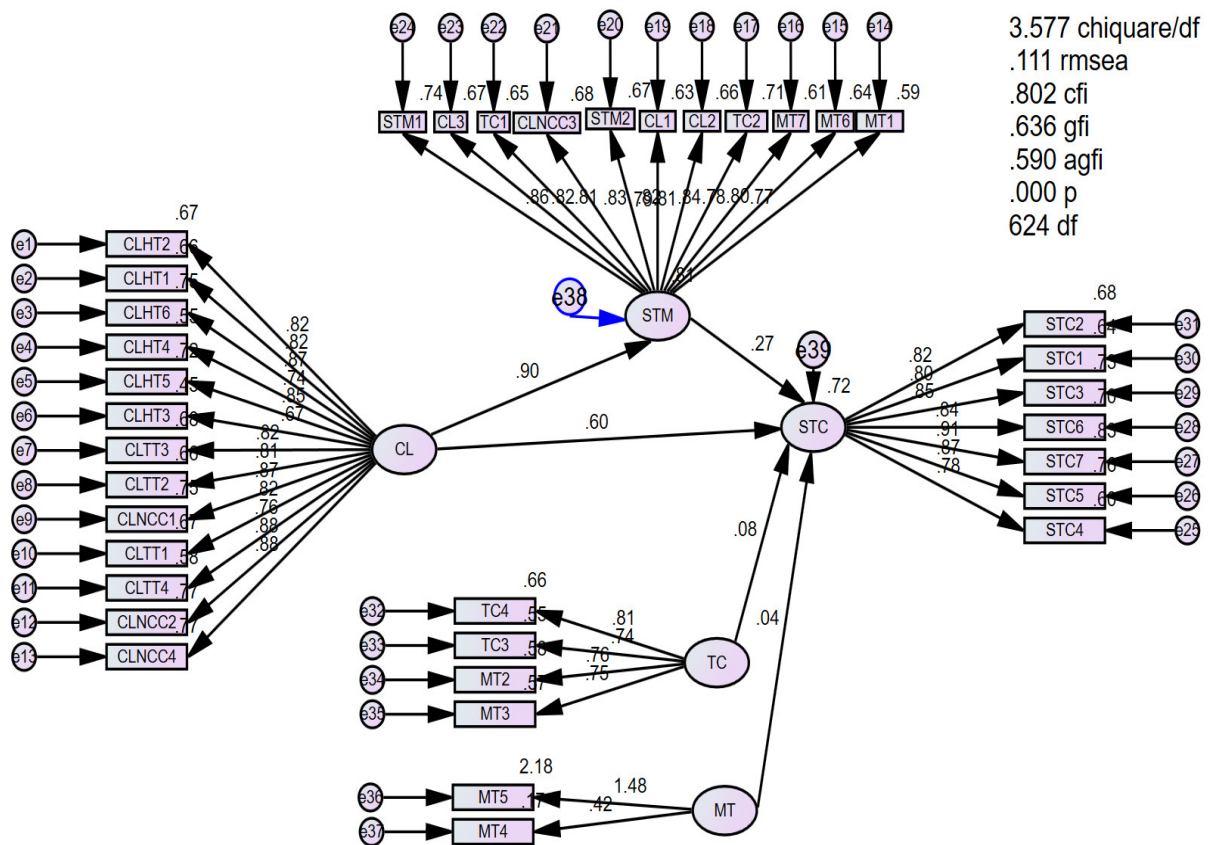

Figure 2: SEM structural model

Note: CL (Quality); STM (Satisfaction); TC (Organization); MT (Environment); STC (Success)

4. Discussion and Conclusion

4.1. Discussion

The survey results collected are mostly employees aged 30-40 and mainly working in the IT department at some large banks that have implemented and used e-KYC. Through surveyed opinions, in general, most of the surveyed subjects agree that the time of using the e-KDYC system at banks is not too long, mainly 1-2 years, there are even banks that only have new products put into use for less than 6 months, and very few banks have used e-KYC for more than 2 years. The main reason is due to the late implementation of e-KYC in Vietnam (it was officially put into use at the end of 2020 according to Circular 16/2020/TT-NHNN issued by the State Bank of Vietnam). However, even though it has only been implemented for less than 2 years, e-KYC still brings positive impacts in banks operation. Most of the individuals participating in the survey affirmed that e-KYC brings about the maximum efficiency for the bank (81-90%), the rest also respond to the positive effects that the bank has received when using e-KYC during operation (60-70%). In particular, based on Hong Kong's e-KYC implementation model, allowing banks to choose and decide their own e-KYC technology, banks that have been implementing e-KYC in Vietnam also choose and use a variety of technologies, of which the most popular is Face-Matching, followed by E-Signature, Liveness detection, and finally, the least popular is Fraud detection.

On the basis of collected data, the study has deeply analyzed 3 aspects: Information quality, Supplier quality, System quality impact on e-KYC user satisfaction and 4 aspects: Quality, Environment, Organization, Satisfaction affecting the success of e-KYC solution implementation at Vietnamese commercial banks. The results show the different effects of each aspect on the Satisfaction and Success of e-KYC. Specifically:

- The satisfaction of the e-KYC system's users is most influenced by the Supplier Quality factor, followed by the System Quality and the least affected by the Information Quality factor.

- The success of implementing the e-KYC system in the operations of banks is mainly influenced by the Satisfaction factor, followed by the Organization, the Environment, and less affected by the Quality.

By the fact of the results of the main factors affecting the success of e-KYC implementation in Vietnamese commercial banks, the research team conducts a practical assessment of the advantages and disadvantages of each aspect, thereby proposing solutions to overcome the problem to improve the efficiency of using e-KYC at banks. First, the team evaluates the advantages and disadvantages of each aspect, specifically:

About quality:

The survey results indicate that the majority of participants agree that the system is fully capable of allowing the bank to integrate with other information systems, the service always meets the needs of updating information timely, completely and accurately. However, in fact, the e-KYC implementation process still has certain limitations that need to be overcome:

- The arising of unnecessary costs due to the application process taking place while the quality of systems and services is not guaranteed, such as the training process of personnel in the bank from the supplier side. not really methodical has caused delays, unplanned and prolonged time, especially for organizations providing traditional financial - banking services.

- Up to now, many commercial banks have only implemented the promotion of e-KYC solutions in payment services, but have not applied this solution intensively in other areas, result in not being able to fully exploit the advantages of an e-KYC solution. strong and long-standing system in countries around the world like e-KYC.

- Regarding customer information security, solving the risk from using deepfake technology to bypass liveness detection - a worrying problem not only for a new market applied using e-KYC like Vietnam but also those of countries that have implemented this system for a long time, typically India.

About the organization:

In fact, although e-KYC has only been implemented for less than 2 years, many Vietnamese commercial banks under the organization, strategic proposals and sensitive technology application of the managers in combination with the employees having high qualifications and skills has created the driving force to promote the success of the e-

KYC system, taking the lead in the digital banking transformation. Besides, although the rate of research and technology application of banks is quite high, the speed of e-KYC implementation is still uneven, there are still many banks that have only begun to research or partially apply it, causing disparities in customer service experience and stagnation in information processing. At the same time, due to the low percentage of time using e-KYC, which leads to some obstacles in adapting to the technology, and the shortage of highly qualified and experienced human resources is also a challenge that the Commercial banks must solve.

About Environment:

In fact, in recent years, the Government has always shown a very timely attention, along with the issued policies that are highly supportive in the digital transformation of banks. At the same time, the development of technology and the influence of the Covid-19 pandemic have led to a sharp increase in the trend of work from home, and the policy of limiting the use of cash has also contributed to promoting the development of e-KYC. However, besides those positive aspects, the implementation of e-KYC also faces obstacles due to:

- The national database system (National Database) is not yet completed, the implementation of e-KYC in Vietnamese commercial banks is inconsistent, the information stored in the system between banks and the national database is not closely connected, leading to difficulties in managing user information data in the banking industry in particular and population management in general.
- Limitations in the process of accessing customer files in rural and remote areas - places where the bank's headquarters is not yet available. While, this is a necessary object for the promotion of the national financial inclusion goal.

On the basis of actual existing limitations, the research team proposes a number of solutions and recommendations, thereby contributing to overcoming the current difficulties and improving the efficiency of e-KYC use of Vietnamese commercial banks. Specifically:

On the State side:

The State needs to implement the following solutions: (1) Building a complete national database; (2) Allow banks to use the same database of e-KYC according to Thailand's digital banking implementation experience; (3) Actively promote international cooperation in the field of e-KYC, creating a premise for allowing foreigners to participate in e-KYC applications of domestic banks.

 **For banks:** in the plan and process of implementing e-KYC, banks need to overcome limitations by:

▪ *Quality solutions:*

First and foremost, banks need to evaluate and come up with a method in the plan to implement e-KYC to overcome unnecessary waste, thereby optimizing features, efficiency and shortening costs. transaction time.

Second, banks also need to flexibly and skillfully deploy e-KYC in accordance with the current socio-cultural situation, thereby improving customer satisfaction and contentment, thus enhancing competitiveness for bank.

Third, Commercial banks need to prioritize finding and choosing a reputable and experienced technology supplier, especially in the matter of ensuring the safety of personal information.

Last, Commercial banks need to equip and regularly upgrade modern biometric systems to meet the needs of perfect security but still bring a friendly experience to customers.

▪ *Organizational solutions:*

Managers need to determine the right and specific strategy and direction: clearly plan the plan, research and select the appropriate technology, promote and ensure the operation activities take place on schedule, ensuring output quality.

Control human resource policies through methods such as: (1) Clearly defining the direction and strategy of developing the e-KYC system; (2) Develop a process and conduct training and employee training activities in a methodical and professional manner; (3) Creating a working environment and culture in the company; (4) Make a clear policy on training and using human resources; (5) Develop a plan for human resource development; (6) Having policies to attract talents, treat and respect employees.

▪ *Environmental solution*

Proposing to amend and supplement policies and complete the legal framework in a timely manner, suitable to information management and network security, and to take measures to deter and sanction impersonation acts; intervene, edit customer information at all times before, during and after the process of opening a payment account.

Completing the National Database by: (1) Proposing the Government to further improve in terms of technology, legal framework, and security to optimize the ability to share and contribute information of the e-KYC system in banks goods into the National Database; (2) Allowing the common use of e-KYC database between banks; (3) Research to establish an online customer identification confirmation center to connect Vietnamese banks with banks in the world.

Promote the implementation of the e-KYC system nationwide: (1) Carefully study the socio-economic situation in some localities; (2) Propagating and mobilizing people to change the method of cash payment to payment by credit card; (3) Actively promote preferential policies and financial services to local people and businesses through various forms of advertising; (4) Coordinate research on mobile banking and internet banking technologies to suit each locality; Regular maintenance of ATMs and good service attitude of bank staff to enhance customer experience.

4.2. Conclusion

Based on the collected data, the research has deeply analyzed 3 aspects: Information Quality, Supplier Quality, System Quality which impact on e-KYC user satisfaction and 4 aspects: Quality, Environment, Organization, Satisfaction affecting the success of implementing e-KYC solution to Vietnamese commercial banks, thereby confirming the influence of factors on the deployment of e-KYC in banking.

This study agrees with many studies - which share the same topic “research on factors affecting the success of the system/solution” - about the importance of the following variables: Satisfaction, Quality, Organization. On the other hand, the study results are significantly different from previous studies on the same topic about the impact of “Environment” variable to the success of e-KYC. However, due to limited resources, the study only surveyed a few well-known banks in Vietnam, mostly in Hanoi and the study did not consider the influence of demographics to the successful implementation of e-KYC. This opens the door for further studies to test and conduct this connotation in other areas and fields of research.

FINANCIAL INCLUSION DEVELOPMENT IN SOME COUNTRIES AND VIETNAM

Truong Thi Hoai Linh

linhth@neu.edu.vn

School of Banking and Finance, National Economics University, Hanoi, Vietnam

Abstract

Financial inclusion means that individuals and businesses have access to useful and affordable financial products and services that meet their needs – transactions, payments, savings, credit and insurance – delivered in a responsible and sustainable way. There are many indicators used to assess the level of financial inclusion development in theoretical and empirical studies. This study introduces the models that measure the level of financial inclusion development including comprehensive financial inclusion index, traditional financial inclusion index and fintech-driven financial inclusion index. Additionally, based on the data on the above indicators, the study analyzes the state of financial inclusion development in Vietnam and of 51 developed countries and emerging economies in the world.

Keywords: *financial inclusion, financial service, Fintech.*

1. Introduction

In the group of developing countries, Vietnam has been considered as a country with a large and young population and the increase in the demand for financial services of individuals and businesses as well. However, according to Merchant Machine's statistics introduced in 2021, Vietnam ranked second in the list of countries with the lowest percentage of individuals accessing banking and financial services worldwide with 69% of the population inaccessible to financial services and unbanked, and 26% of cash transactions. The Government of Vietnam has set up many regulations to promote financial inclusion such as the project project on boosting noncash payments from 2006; the project on building up and developing a microfinance system in Vietnam by the year 2020 approved in 2011; the project on enhance the public's accessible capacity to banking services by the year 2020 in order to improve ability to reach basic banking services in to meet the needs of adult population and businesses in terms of quality and cost, especially consumers in rural and remote areas, small and medium-sized enterprises. Those banking services will be provided by sound and reputable credit institutions. On February 20, 2020, the Prime Minister signed Decision No. 149/QD-TTg approving the National financial inclusion Strategy to 2025 with orientation to 2030. Besides, the Government has implemented a number of initiatives to enhance the availability of financial services including national target programs on poverty alleviation, policy credit programs for target groups and priority areas.

Based on data on the comprehensive financial inclusion index, traditional finance inclusion index and fintech-driven financial inclusion index of Vietnam and 51 developing countries and emerging markets calculated by Khera et al. and Sahay et al. (Khera et al., 2021; Sahay et al., 2020), the study analyzed and evaluated the state of financial inclusion development in these countries. Fintech results in the change in the way financial services delivered to small businesses and low-income households. Traditionally, financial services have been provided by banks, microfinance institutions, and informal channels (e.g., relatives, friends, micro-lending clubs or loan sharks) carrying complex procedures or expensive costs. They are mainly built on cash transactions and face-to-face interactions with the financial service provider. Those interactions are the basis for monitoring creditworthiness; they are also often the way customers become financially educated. Fintech has been changing traditional financial markets with the development of digital financial instruments that allow individuals to access services from a mobile phone or a computer, lead to reducing the need for face-to-face meetings to conduct transactions. The development of digital platforms also enables the offering of a variety of financial products that maximize value for customers by allow users to compare price and procedures associated with products and services offered by different providers.

Thereby, this study provides empirical evidence of financial inclusion status quo driven by tradition and Fintech in Vietnam and also compared to other countries.

2. Method

2.1. Data

The study was conducted on data from 52 developing countries and emerging markets including Vietnam. The original data on comprehensive, traditional and Fintech driven (digital) financial inclusion indices spanning across two years 2014 and 2017 were calculated by Sahay et al. (2021) based on up-to-date the World Bank's Global Findex database.

2.2. Measuring financial inclusion indexes

Sahay et al. (2020) and Khera et al. (2021) built up and calculated financial inclusion indicators for 52 developing countries and emerging markets (including Vietnam) in 2014 and 2017 based on the three-stage principal component analysis (PCA) methodology. Specifically, they calculated traditional and Fintech driven financial inclusion indicators from related indicators. In particular, the traditional index reflects financial inclusion through traditional financial institutions such as banks, microfinance institutions. The Fintech-led index reflects financial services provided through digital channels including "mobile money" providers, Fintech companies, online or mobile banking services provided by traditional banks. According these two indicators, the authors calculated the comprehensive financial inclusion index for each country. The process takes three steps as follows:

- **Step 1:** the sub-indices for "access" and "usage" categories in both traditional (FI_T^a, FI_T^u) and Fintech driven component (FI_F^a, FI_F^u) are constructed based on selected variables and the weights assigned to each variable listed in Table 1.

Table 1. Selected variables for financial inclusion indices

Traditional financial inclusion index			Fintech-driven financial inclusion index		
Access	Source	Weight	Access	Source	Weight
<i>Access to the bank infrastructure</i>		<i>0.25</i>	<i>Access to Fintech infrastructure</i>		<i>0.125</i>
Number of ATMs per 100,000 adults	IMF FAS		Number of mobile subscription per 100 people	ITU	
Number of branches per 100,000 adults	IMF FAS		% of the population access to the internet	ITU	
			Number of registered mobile money agents/accounts per 100,000 adults	GSMA, IMF, FAS	0.25
<i>Usage</i>		<i>0.25</i>	<i>Usage</i>		<i>0.125</i>
% of adults with financial institution account	WB Findex		% of adults have a mobile account	WB Findex	
% of adults with savings at financial institutions	WB Findex		% of adults who use the internet to pay	WB Findex	
% of adults with debit cards	WB Findex		% of adults who use mobile phones to receive salary or wages	WB Findex	
% of adults who receive salaries through financial institution account	WB Findex		% of adults who use mobile phones to make utility payments	WB Findex	
% of adults who use financial institution accounts for utility (electricity and water bills)	WB Findex				

Source: Sahay et al (2020) and Khera et al. (2021)

- **Step 2:** The second step in PCA is to combine indicators of access and usage to calculate the traditional financial inclusion index (FI_T) and Fintech-driven financial inclusion index (FI_F). α and β are weights associated with each index, i is the country and t is the year.

$$(FI_T)_{it} = \beta_1 FI_{T_{it}}^a + \beta_2 FI_{T_{it}}^u + e_{it}$$

$$(FI_F)_{it} = \alpha_1 FI_{F_{it}}^a + \alpha_2 FI_{F_{it}}^u + u_{it}$$

- **Step 3:** The comprehensive financial inclusion index (FI) is calculated by applying PCA on the two indices, traditional financial inclusion index (FI_T) and the Fintech-driven financial inclusion index (FI_F), where θ is the weight attached to these two components.

$$FI_{it} = \theta_1 FI_{T_{it}}^a + \theta_2 FI_{F_{it}}^u + \theta_{it}$$

All indices will then be standardized to receive values between 0 and 1 for all countries and years. In particular, the value of 1 means that the country in that year had the highest level of financial inclusion among countries and across all years.

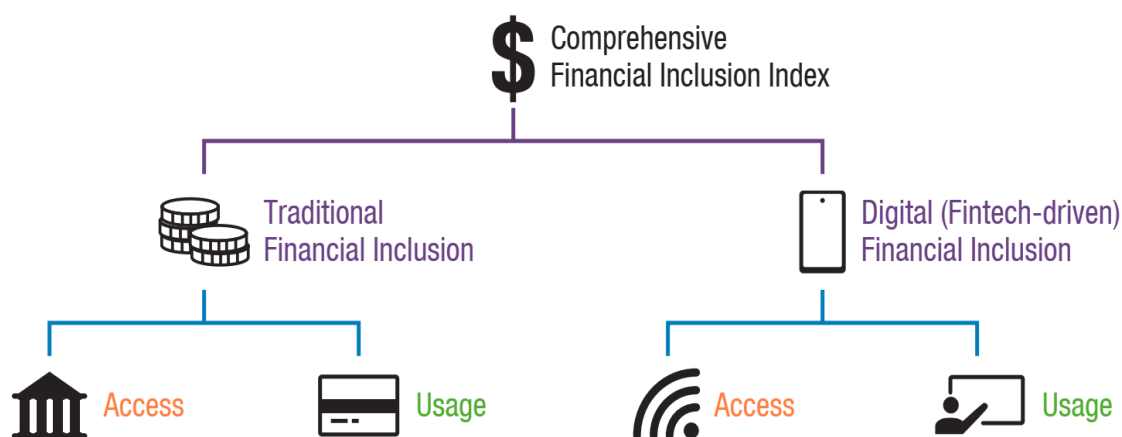

Figure 1. Comprehensive Financial Index

Source: Sahay et al. (2020)

3. Results

Table 2. Comprehensive financial inclusion index of Vietnam and regions in 2017

Area	Number of countries	Comprehensive financial inclusion index		Traditional financial inclusion index		Fintech-driven financial inclusion index	
		Average	Standard deviation	Average	Standard deviation	Average	Standard deviation
East Asia and the Pacific	9	0.588	0.302	0.476	0.324	0.441	0.165
Europe and Central Asia	3	0.68	0.104	0.647	0.12	0.42	0.075
Latin America and the Caribbean	13	0.512	0.126	0.457	0.141	0.343	0.104
Middle East and North Africa	2	0.4	0.028	0.35	0.042	0.28	0
South Asia	5	0.384	0.216	0.254	0.193	0.338	0.225
Sub-Saharan Africa	20	0.486	0.237	0.201	0.169	0.538	0.286
Vietnam		0.35		0.21		0.33	
Sum	52	0.508	0.219	0.349	0.236	0.437	0.223

Source: Author.

Table 2 summarizes comprehensive, traditional and Fintech driven financial inclusion indices of 52 developing countries and emerging markets located in 06 regions in 2017. Compared among regions, Europe and Central Asia were the leaders in comprehensive and traditional financial inclusion with the average of these two indices of 0.68 and 0.647 respectively. East Asia and the Pacific were followed with the average of 0.588 and 0.476 respectively. Despite being in second place, the region carried the highest level of volatility in these two indicators around the average compared to the rest with a standard deviation of 0.302 and 0.324 respectively. This numbers indicated that there are significant differences in level of development of comprehensive financial inclusion in general and traditional

financial inclusion in particular among countries in the region. For instance, Vietnam is located in East Asia and the Pacific but the country's two indices (0.35 and 0.21) were much lower than the regional average and of other countries. South Asia carried the lowest level of comprehensive financial inclusion.

Although Europe and Central Asia, East Asia and the Pacific are the two leading regions in comprehensive and traditional financial inclusion, they ranks behind Sub-Saharan Africa in terms of Fintech-driven financial inclusion. Surprisingly, Sub-Saharan Africa carried the lowest traditional index. Seven of the 20 countries located in Sub-Saharan Africa (including Kenya, Ghana, Senegal, Uganda, Rwanda, Zimbabwe, Cote d'Ivoire) are also the top seven countries of Fintech-driven financial inclusion in 2017 among 52 countries. However, the majority of the countries in Sub-Saharan Africa stood at the bottom place in terms of traditional financial inclusion. Obviously, traditional financial channels prevailed over Fintech in Europe, Central Asia, East Asia and the Pacific. Vice versa, in sub-Saharan Africa, traditional finance was gradually declined by Fintech to drive financial inclusion.

Figure 2.a, 2.b, and 2.c illustrates the relationship among comprehensive, traditional and Fintech-driven financial inclusion indices of 52 countries located in 06 regions. There was significant differentiation among regions. Figure 2.a shows comprehensive and traditional indices across the countries in 2017. Sub-Saharan Africa was mainly placed on the left side of the graph, indicating the its very low level of traditional financial inclusion while others reached to the relatively high level in comprehensive inclusion thanks to positive impact of Fintech. Regions such as Europe, Central Asia, East Asia and the Pacific, Latin America and the Caribbean are placed in the middle and upper parts of the graph, indicating the moderate and high levels in traditional and comprehensive inclusion.

Figure 2.a: The relationship between the traditional and comprehensive financial inclusion indices

Figure 2.b: The relationship between Fintech-driven and comprehensive financial inclusion indices

Figure 2.c: The relationship between the traditional and Fintech-driven financial inclusion indices

Figure 2. The relationship among comprehensive, traditional and Fintech driven financial inclusion in 52 countries in 2017

Source: Author.

Figure 2.b shows the correlation between Fintech-driven and comprehensive inclusion. There was close relation between Fintech and financial inclusion in Sub-Saharan African countries compared to other regions. Meanwhile, although comprehensive financial inclusion was generally better than in Sub-Saharan Africa, the rest was placed mainly in the middle of the graph indicating the moderate level in development of digital inclusion. Figure 2.c illustrates the correlation between the traditional and Fintech-driven financial inclusion. There was a obvious differentiation among regions. Sub-Saharan Africa had underdeveloped in traditional finances, but Fintech had strongly developed in many countries while in other regions traditional inclusion dominated and Fintech playing a modest role.

Vietnam is located in East Asia and the Pacific, but Vietnam's financial inclusion was quite limited compared to the regional average. Vietnam ranked 41st out of 52 countries in terms of comprehensive inclusion in 2017. Vietnam's comprehensive financial index in 2017 was 0.35 compared to the regional average of 0.588, significant lower than other countries in the region such as Malaysia (4th), Thailand (8th), Indonesia (16th). Vietnam had dropped 10 places compared to 2014. Vietnam's traditional and digital financial inclusion indices were also grouped in the low index group with traditional inclusion ranked 34th out of 52, down 2 places compared to 2014 and fintech-driven inclusion ranked 33rd out of 52, down 12 places from 2014. Fintech began to emerge in Vietnam in the 2000s, but Fintech market has rapidly grown since 2015. According to the Vietnam Fintech Report 2020 (Fintech Singapore, 2020), the number of Fintech companies has increased from 44 companies in 2017 to about 120 in 2020. Fintech companies in Vietnam operate across a variety of services including digital payments, alternative finance, financial management and blockchain. Payment sector dominates, accounting for 30% of Fintech in Vietnam. Besides, Fintech technology has been also widely applied in the field of banking and finance, helping financial institutions to implement the digital transformation, boosting the access of customers as well. As Figures 2.a, 2.b and 2.c show, Vietnam's current position equaled to the low-level group of financial inclusion of sub-Saharan Africa and has not yet reached to the level of other regions in financial inclusion. Thus, compared to other countries, Vietnam was behind most of other countries in promoting financial inclusion in terms of both traditional and Fintech-driven inclusion. Although these indices were only the up-to-date until 2017, Vietnam has not yet gained any significant steps in expansion of financial inclusion.

4. Conclusion

Designing and developing an effective national financial inclusion strategy is key for a country to be able to successfully implement envisioned reforms, as it essentially provides a roadmap for the authorities to follow to achieve their financial inclusion objectives. Comprehensive financial inclusion index including its components of traditional and Fintech-driven index are an effective measure for countries to assess the results of their strategies and efforts of financial inclusion.

Vietnam like other countries ranked low in financial inclusion continuously develop its infrastructure for delivering financial services combined with increasing the number and value of financial services used by individuals and businesses. Not only taking advantage of

traditional financial providers such as banks, microfinance institutions..., the country also need to pay special attention to Fintech companies. Digital financial services are faster, more efficient, and typically cheaper than traditional financial services and, therefore, increasingly reaching lower-income households and small- and medium-sized enterprises.

Abstract

This study aims to determine the impact of belief, attitude and subjective norm on OCOP (one community one product) products purchase intention of Vietnamese consumers. OCOP is abbreviated in English as One commune one product. In Vietnamese sense, each commune (ward) has a product. More specifically, the goal of the program is to develop the form of organization of production and trading of traditional and advantageous products in rural areas. Having tested with the fixed effects model (FEM) and random effects model (REM), we discovered that belief, attitude and social influence impact positively on the products purchase intention. Specifically, belief has the greatest impact on OCOP purchase intention of Vietnamese consumers.

Key word: *OCOP, belief, attitude, social influence, purchase intention.*

1. Introduction

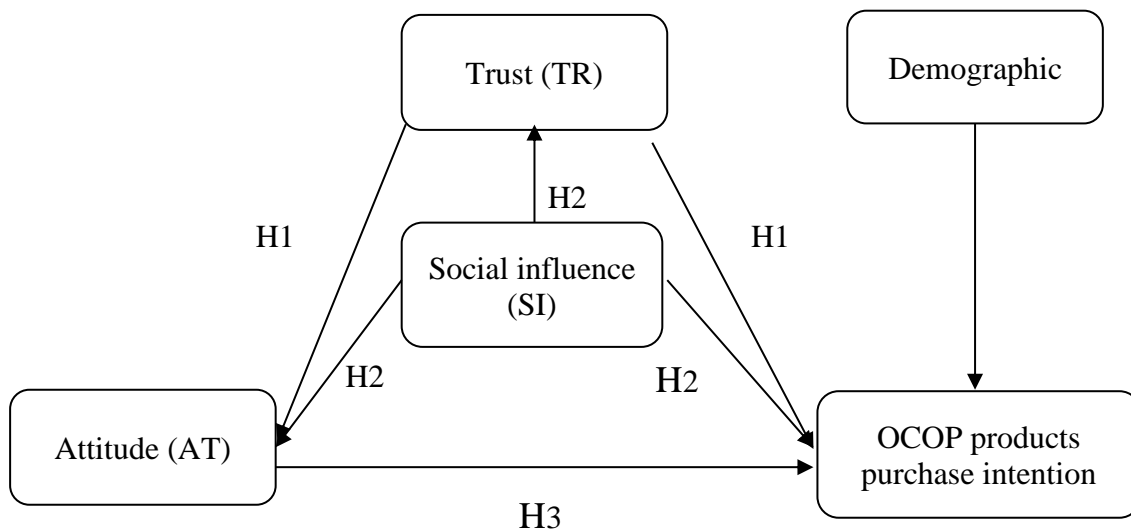

The OCOP program is an economic development program in rural areas aiming for developing internal resources and adding value. The program is the solution and task in implementing the national target program on building new rural areas. The focus of the OCOP program is to develop agricultural, non-agricultural products and services that have advantages in each locality along the value chain, driven by private economic sectors (enterprises, producers).

The State plays a constructive role, promulgates the legal framework and policies for implementation; plans orientations for production areas of goods and services; manages and supervises product quality standards; supports the following stages: Training, coaching,

technical guidance, application of science and technology, branding, trade promotion, product promotion, credit.

To have a better view of OCOP products purchase intention of Vietnamese consumers, we base on Theory of Reasoned Action TRA (Ajzen and Fishbein, 1975) and The Theory of Intentional Behavior TPB (Ajzen, 1991). Theory of Intended Behavior TPB is the development and improvement of the Theory of Rational Action TRA.

Research model is below:

The main objective of the study is to study and test the impact of trust and social influence on the intention to buy OCOP products of Vietnamese consumers. Before this research, trust, social influence and attitude have been studied in many works.

According to Böcker and Hanf (2000), trust has been identified as a necessary way to reduce uncertainty to an acceptable level and to simplify decisions. Research results of Lobb et al (2007) show that trust in the source of information affects the intention to buy chicken meat in the UK. A recent study by Muringai and Goddard (2018) in Canada, USA and Japan also found that beliefs influence beef and pork consumption. The research results of Stefani et al. (2008) show that general trust positively affects trust in the food supply chain, trust in policy makers and trust in government in schools. Consumption of chicken in Italy. People with high beliefs have more positive attitudes. Research results of Donthu (2001), Elliott and Speck (2005) show that trust positively affects attitude. Research results of Limbu et al (2012) also provide a proof for a positive relationship between beliefs and attitudes.

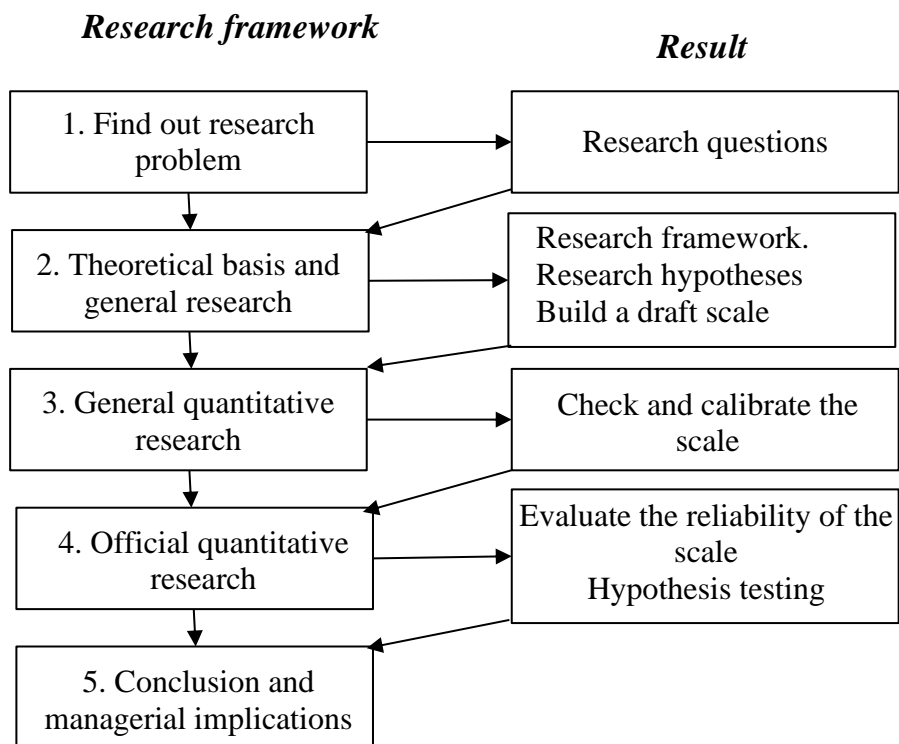

Ajzen (1991) states that the subjective norm for behavior is the social influence of stakeholders (friends, family, co-workers) of an individual on the performance of a particular behavior. According to TPB theory, subjective norm has a strong and positive influence on action intention (Ajzen, 1991). In a 2012 study, Ha & Janda showed that subjective norm has positive and moderate effects on green product purchasing behavior. Saleem & Gopinath (2013) studied the impact of subjective norm on behavioral intention to buy green products. The results show that subjective norm has a positive effect on behavioral intention to

purchase green products (Saleem & Gopinath, 2013). Thus, most of the studies suggest that subjective norm has a positive impact on behavioral intention to purchase green products. However, in a very elaborate study, Kumar (2012) argues that subjective norms do not affect the behavioral intention to buy green products. This is contrary to the TPB theory, but the author does not give specific reasons. From the above analysis, it is shown that the subjective norm for green industrial product purchasing behavior (SNP) has a positive impact on the behavioral intention to purchase green industrial products. According to Truong Dinh Chien (2015), the subjective norm expressing the level of consumer desire for domestic products depending on the structure of the community or society is collectivism or individualism. In Asian countries, including Vietnam, collectivism plays a key role, individuals influence each other strongly and the tendency is often concentrated and easily spreads from person to person. The stronger the degree of intimacy of the stakeholders with the consumer, the greater the influence on their purchasing decision. The greater the consumer's trust in the relevant people, the more their purchasing propensity will be affected.

According to Philip Kotler, the attitude describes good or bad evaluations based on persistent perception, these feelings and the tendency of a man's actions to a single person or an idea. The attitude led them to decide whether or not to like someone. According to Ajzen's research (1991), the attitude is the desired process or wish, but from which man gives specific behavior. The attitude is defined as measuring the perception and assessment of the consumer's product, the trades and the properties. According to Schiffman and Kanul (2000), attitude consists of three basic components: (1) cognitive component, (2) emotional component, (3) behavioral tendency component. The cognitive component in the model represents consumers' awareness and knowledge of a certain product, and this awareness comes from their own experiences, collects information from different sources, and thereby forming beliefs about the product and believing that the product will bring some benefits. The emotional component refers to the degree of satisfaction or dissatisfaction, like or dislike, expressed in evaluation. Consumers will rate that product as good or bad, friendly, aversion, etc. And the component of behavioral trends shows the consumer's tendency, intention to act towards the product in the direction that has been perceived and felt. Another study by author Lobb et al (2007) introduced the SPARTA model, which is an acronym for the following factors: subjective norm (S), perceived behavioral control (P), attitude (A), perceived risk (R), trust (T), and others (A) or other variables such as socio-demographic factors. The proposed model presents the interaction between these factors for purchase intention. Research results have demonstrated that purchase intention is mainly influenced by attitude. Therefore, the results of this study support quite positively that attitude serves as an important determinant of purchase intention. Some other research results also show that when the consumer's attitude towards environmentally friendly products or green products is positive, the consumer's purchase intention will be more likely to be positive. (Mostafa, 2006 and Mostafa, 2007) and in previous case studies, attitude was found to be the most influential factor in predicting intention (Bagozzi et al., 2000). The relationship between attitude and intention to buy is also studied by many Vietnamese authors. Research by Nguyen Phong Tuan (2011) also shows that there is a high correlation between attitude

towards organic food and purchase intention. This study was conducted in two cities, Hanoi and Ho Chi Minh City, and showed the influence of factors such as attitude towards the environment, perceived value, interest in health, and knowledge about safe food and subjective norms have a clear relationship with the intention to buy safe food of consumers in the South and the North. According to Le Thuy Huong (2014), Attitude is an individual's positive or negative feelings about performing a certain behavior. Attitude describes the degree to which an individual views the outcome of an action as positive or negative.

The framework of the study is presented below:

Source: Author's own compilation

2. Method

The main research method used in the model is econometric regression with the general model as follows:

$$YDTD = 0.514 + 0.351NT + 0.218TD + 0.306AHXH + e$$

In which:

YDTD: Dependent variable “OCOP consumption intention”

NT: Independent variable “Belief”

TD: Independent variable “Attitude”

AHXH: Independent variable “Social Influence”

Formal research is a quantitative study. The process of preliminary theoretical research determines the content of issues to be researched, forms research questions and research objectives. From research objectives, research theoretical basis, identify research concepts, develop research hypotheses and research models, then design scales

based on research concepts; Research hypotheses and research models are carried out through two preliminary and formal research steps. Preliminary research includes a qualitative study to adjust the scale and a preliminary quantitative study to preliminarily evaluate the scale and adjust the scale accordingly. Formal quantitative research to test the scale and theoretical models.

The overall research is all Vietnamese consumers living and working in cities. They can be students or those who do many different jobs. Due to limited resources, the author chose 3 big cities representing 3 regions of the country to survey including: Hanoi, Da Nang and Ho Chi Minh City, in which Hanoi and Ho Chi Minh City are the two largest cities and have the highest per capita income in the country.

OCOP businesses always choose Hanoi and Ho Chi Minh City as the place to consume their latest products because these are the two largest consumer markets in Vietnam. In addition, these are also two localities with a large number of immigrants from provinces and cities across the country to live and work, the agility and ability to receive new products are always appreciated.

Due to the large scale of the study, the diversity of classification criteria is limited, in terms of resources (financial, time, accessibility...). the group cannot use random sampling method but use random sampling method but use convenience method. Although the sample was selected by a convenient method, in order to ensure representativeness, the team tried to evenly distribute the expected number of questionnaires according to 3 localities representing 3 regions of the country, namely Hanoi, Ho Chi Minh City and Hanoi. Ho Chi Minh City and Da Nang. In addition, the group also surveyed consumers by occupation, age, and income level to be able to indicate consumers' intention to use OCOP products.

Having collected data, the authors conducted screening, statistics, coding and processing through SPSS 24.0 and AMOS 24.0 software, and analyzed Cronbach's Alpha coefficients to assess the reliability of the scales., thereby removing the variables that do not match. Steps of factor analysis to explore EFA and confirmatory factor analysis of CFA are applied to draw conclusions about the quality of the scale, to prepare for testing the research hypothesis. Using the linear structural model SEM to test the research hypotheses. Reaffirm the model's reliability by Bootstrap method and finally analyze ANOVA and T - Test ...

3. Results

The research results show that “Trust” is the factor with the greatest influence (standardized Beta coefficient is 0.32) on “OCOP purchase intention” in the group of 3 extracted factors within the scope of the study.

The program "One Commune One Product - OCOP" is currently one of the levers to promote economic development in rural areas, contributing to speeding up the process of building new rural areas in many provinces and cities. Currently, consumers are more careful in choosing consumer products, in addition to design and durability, they are also especially interested in safety for health, especially in the time of widespread epidemic.

Trust in a product is one of the important factors that determine whether consumers buy and use that product or not. It is not by chance that any business today, whether newly

established or has existed for many years, must build and keep consumers' trust in that product or brand. If there is any scandal related to product quality, this will quickly reduce consumer confidence in that product. If product quality always meets the requirements of consumers, customers will trust, create brand loyalty and long-term use for the products.

In order to build trust with consumers, the OCOP product evaluation criteria are increasingly strict. OCOP products are evaluated carefully and professionally in many aspects. The evaluation board consists of experts in related fields such as health, environment, ... Not only that, the assessment also goes through many different levels, from district to provincial level, then from province to center OCOP products that meet 4-star standards have important certificates such as VietGap, ISO, ... Consumers are still unfamiliar with the term "OCOP certification", but certifications such as VietGap, ISO, or GlobalGap have been trusted by consumers. Certified products like these help consumers feel secure when shopping.

Currently, the government, ministries and businesses are propagating more about OCOP so that consumers are more familiar with OCOP products, OCOP certified, and trust in the quality of OCOP products. Once consumers put their trust, they are willing to spend money to buy products. From here, it can be seen that the positive impact of trust on OCOP product consumption behavior.

Research results show that "Social influence" is the factor with the second level of influence (Standardized Beta coefficient is 0.227) on "Intent to consume OCOP program" in the group of 3 influencing factors cited within the scope of the study. OCOP products are products that "require" consumers to also have a certain level of knowledge. Therefore, the "participation", "consultation", "sharing" of family or important people will affect consumers' intention to buy OCOP products.

Social influence has a positive effect on the intention to purchase OCOP products. A typical example is in Thanh Hoa province. Along with the implementation of mechanisms and policies to encourage agricultural and rural development and new rural construction, in recent years, Thanh Hoa province has implemented the Program OCOP submission. Accordingly, departments, branches and localities have flexibly used funding sources to support producers to wake up traditional occupations and develop more new ones, and at the same time strengthen promotion and support for products that are born from the village to reach customers in many difficult markets. Phu Quang lam tea products have appeared and existed on Vinh Loc land for hundreds of years, associated with the life and spirit of the people of Cao Mat village, old Vinh Thanh commune, now Vinh Loc town. Lam tea in Phu Quang land of Vinh Loc also has a brand name on the market, but the annual consumption is quite modest. Since 2018, when provinces and districts have propagated and supported producers under the OCOP Program, families have realized that this is an opportunity to give wings to traditional products to "reach out". Consumption volume reached 25 tons/year, revenue was about 1.5 billion dong, profit was 400 million dong/year, an increase of 20% compared to before participating in the program. However, the highlight that marks the transcendence of space of Phu Quang blue tea products is that Co.opMart Thanh Hoa Supermarket has selected and put the product "on the shelves" for consumers. Mr. Bui Cong

Anh, Deputy Chief of the Office of Coordination of the New Rural Program in the province, said: In order to bring OCOP products to the market, especially into the retail channel system, The office has coordinated with localities, the subject launched 14 points of display, introduction and sale of OCOP products and typical goods from regions and regions. At the same time, fairs have been organized to promote, connect and trade OCOP products, attracting the participation of many cooperatives, businesses, craft villages and farms in the province. Through promotional fairs, dozens of OCOP products that meet the requirements and criteria have been selected and sold at reputable supermarkets and e-commerce platforms. This is the initial success in expanding the consumption market for the province's OCOP products... From the example in Thanh Hoa province, it shows that, after the OCOP program was implemented, with the attention and encouragement of the leadership of the province local leadership, sales and propaganda programs are widely deployed and product quality is improved,

From the above analysis, it is shown that the subjective norm for OCOP product purchasing behavior has a positive impact on behavioral intention to purchase OCOP products.

Research results show that “attitude” is the factor with the lowest influence (standardized Beta coefficient is 0.203) on “Intent to use OCOP program” in the group of 3 extracted factors within the scope of the study. People's attitudes always have many changes over time, at the time of the study, the team analyzed the data and found that this is the least influential factor.

4. Discussion and Conclusion

Theoretically, the topic identifies the factors affecting the "OCOP consumption intention" of Vietnamese consumers. Those factors include: “Trust”, “Attitude”, “Social influence”. At the same time, the study also determined the intensity and direction of impact of these factors on consumers' intention to use OCOP products. The topic has built and supplemented the basic theory on consumer behavior and OCOP consumption intention of Vietnamese people such as: "Concepts of beliefs, attitudes, social influence". The concept of intention, intention to use OCOP of Vietnamese people. In Conclusion, the factor that has the strongest influence on “OCOP consumption intention” is “Trust”. In addition, it also supplements and develops methodology for future studies as well as proposes practical solutions.

In practice, the research results of the topic also suggest to state management agencies, localities and businesses new directions in applying measures to increase trust and popularization to the people to have a more positive and in-depth view of the OCOP program. Specifically, the state management agency has strengthened the implementation of the campaign "Vietnamese people give priority to using Vietnamese goods", and at the same time introduced policies and plans to increase consumers' confidence in OCOP, thereby increasing the intention to purchase OCOP products. Enterprises will have positive changes, transformations and self-improvement from organization, activities to products, thereby actively participating in and contributing to disseminating the image and characteristics of OCOP to friends and partners. For people who intend to use OCOP or who intend to establish businesses participating in OCOP) they will have confidence in the quality and value that OCOP brings.

STUDY ON THE EFFECTS OF CORPORATE GOVERNANCE ON ENTERPRISE EFFICIENCY: EXPERTIVE EVIDENCE FROM NON-FINANCIAL ENTERPRISES LISTED ON THE VIETNAM STOCK MARKET

PhD. Nguyen Thi Hong Nham

nhamnth@ueh.edu.vn

School of Finance, University of Economics Ho Chi Minh City, Vietnam

Abstract

The study provides empirical evidences on the effects of the elements that comprise the corporate governance mechanism on the performance efficiency of non-financial enterprises listed in Vietnam between the period from 2016 and 2020. To overcome the defects in the regression model, the author uses a panel data regression model with a data sample of 200 non-financial enterprises and the FGLS method. The size of the board of directors (BOD), the size of the supervisory board, and the CEO all have a positive influence, according to the regression results; opposite, ownership concentration and independent board of directors have a negative impact on enterprise performance. Based on the study's findings, the author proposes a number of solutions for effective enterprise governance in order to optimize enterprise operations.

Keywords: *Corporate governance, Performance efficiency, Enterprise, Vietnam, FGLS method.*

1. Introduction

Vietnam is one of Southeast Asia's emerging markets. It is also known as one of the most appealing markets for investment capital in the region, with numerous investment opportunities with attractive returns. However, because it is an emerging market, information transparency on the Vietnamese stock market is still quite poor, partly due to potential risks in the governance of enterprises. This has had an impact on the enterprise performance as well as the investment capital of investors who have participated, are participating, or are about to participate in the Vietnamese stock market. As a result, international investors recognize that improving the quality of corporate governance is one of the important factors that comprise the triangle of sustainable development (environment, society, and corporate governance) and this is also of particular interest to international investors.

Corporate governance is a system of monitoring and management that has a direct impact on the identification and achievement of enterprise goals. It is a method of assessing and controlling the enterprise's risk and ensuring that its implementation is successful. A good governance structure encourages an enterprise to generate more profits through business, research, and innovative development. The Asian financial crisis of 1997 swept many countries, including Vietnam, into a spiral of crisis, sounding the alarm for domestic enterprises in maintaining and building a better corporate governance system. Enterprises must first create a conscious, transparent, and accountable corporate culture, which will lead

to long-term value creation and generate profits for both the enterprise and its shareholders. Since the financial crisis, Vietnamese enterprises have become more conscious of absorbing economic shocks while also using them as a driving force to improve corporate governance practices and create value through sustainable treatment. Connelly et al. (2012) and Mak and Kusnadi (2005) conduct studies to determine whether corporate governance has an effect on enterprise performance efficiency. The goal of this study was to find empirical evidence on the influence of corporate governance on the efficiency of enterprises listed on the Vietnam Stock Exchange, thereby contributing to improving the quality of operations and increasing the market reputation of enterprises, improving the overall creditworthiness of the Vietnamese stock market in the eyes of international investors.

2. Literature Review

Many studies on the impact of corporate governance on enterprise performance efficiency have been conducted both globally and in Vietnam. These studies, however, reach disparate conclusions. This section of the study will review the directions of impact of corporate governance components on enterprise performance efficiency.

Size of Board of Directors

When studying a sample of 452 large industrial corporations in the United States from 1984 to 1991, Yermack (1996) discovers a negative relationship between board size and performance efficiency. Similarly, Eisenberg et al. (1998) and Mak and Kusnadi (2005) find a negative relationship between board size and performance efficiency in a sample of Finnish enterprises. In contrast, Coles et al. (2008) discover that board size increases enterprise performance efficiency. Jackling and Johl (2009) discover that the size of the board of directors has a positive effect on the performance efficiency of Indian market enterprises. This is due to the Board of Directors with a large scale will better support and advise the Board of Directors when the complexity of the business environment and organizational culture is increasingly diverse (Klein, 1998).

Independent Board of Directors

According to Agrawal and Knoeber (1996), board independence has a negative effect on enterprise value as measured by Tobin's Q. In contrast, Jackling and Johl (2009) discover that board independence has a positive impact on the value of Indian enterprises, which is similar to Muniandy and Hillier (2015), who believe that board independence has a positive effect on the performance efficiency of enterprises in South Africa. Haniffa and Hudaib (2006) find that the independence of the Board of Directors has no effect on the enterprise performance in Malaysia.

Size of supervisory board

According to Aldamen et al. (2012), the size of the supervisory board has a negative relationship with performance efficiency. In particular, enterprises with smaller-scale supervisory boards and more financial experience and expertise, tend to be more active and productive during global financial crises. However, in theory, joint-stock companies with competent supervisory boards are less likely to encounter scandals, thereby limiting the possibility of business performance reduction.

Female member of the Board of Directors

Many studies have been conducted to investigate the relationship between female board members and enterprise performance efficiency. Erhardt et al. (2003) investigate the impact of board gender diversity on enterprise performance efficiency and discovered that gender diversity is positively related to performance efficiency. Carter et al. (2003) also demonstrate that board gender diversity is associated with higher financial value in a sample of US enterprises. Garca-Meca et al. (2015) find that the presence of female directors improves enterprise performance efficiency in a sample of banks in nine countries (Canada, France, Germany, Italy, Netherlands, Spain, Sweden, the United Kingdom, and the United States). Furthermore, Hutchinson et al. (2015) demonstrate that gender diversity on the board of directors is related to enterprise performance efficiency.

Dual CEO

Previous studies on this topic has yielded conflicting results. For example, Boyd (1995) shows that the impact of the dual CEO and the enterprise performance efficiency is dependent on the environment. Haniffa and Hudaib (2006) discover a negative relationship between dual CEO and Malaysian enterprise performance efficiency. Chen et al. (2005) also demonstrate a negative relationship between dual CEO existence and enterprise performance efficiency in a sample of Hong Kong enterprises from 1995 to 1998. When studying a sample of enterprises in the US market, Bhagat and Bolton (2008) argue similarly.

Ownership concentration

Previous study has found two opposing views on the impact of ownership concentration on enterprise performance efficiency. For starters, corporate performance suffers as a result of ownership concentration. The existence of agency costs associated with major shareholders explains this. Managers will not be flexible and proactive, resulting in less initiative in their decisions and, ultimately, lower enterprise performance efficiency (Myers, 2000).

Agrawal and Knoeber (1996), on the other hand, suggest that ownership concentration can help strengthen management supervision and thus improve enterprise performance efficiency. According to Nguyen (2011), ownership concentration increases both unsystematic risk and enterprise performance efficiency. When studying the Thailand market, Wiwattanakantang (2001) discover that ownership concentration is positively related to enterprise performance efficiency. Despite differing viewpoints, many researchers recognize the importance of major shareholders. They are particularly important in the corporate governance system because they have a wealth of skills, knowledge, time, and attention to management quality.

Auditing enterprise's reputation

An enterprise whose financial statements are audited by well-known auditors will be able to reduce information asymmetry and signal the enterprise's prospects to financial markets. According to a study conducted by Defond and Lennox (2011), many small auditors (those with fewer than 100 clients) left the market following the implementation of the Sarbanes-Oxley Act in 2002. Many people believe that one of the main reasons for hiring a large audit enterprise is that the enterprises are of international stature and thus require international auditors (Big4

auditors) to audit them. Furthermore, improved audit quality is expected to improve enterprise decision-making (operating and investment decisions). This study anticipates a positive relationship between audit reputation and enterprise performance efficiency.

3. Methods

3.1. Data

The study uses secondary data for listed enterprises in Vietnam from 2015 to 2020. After excluding enterprises with insufficient observation data for 6 years and those with unreasonable information, the number of remaining enterprises is 186, corresponding to 930 observations. Furthermore, the data is derived from a collection of annual reports of enterprises that are widely distributed in the media, such as financial statements, summary reports, operational directions, and other relevant accounting figures and operating data.

3.2. Research model

Based on the theoretical foundation and empirical research mentioned above, the study proposes to construct the following model based on Umawadee et al. (2017) study as the following:

$$ROE_{i,t} = \alpha + \beta CG_{i,t} + \gamma Z_{i,t} + \eta_i + v_t + \varepsilon_{i,t} \quad (1)$$

In there:

- $ROE_{i,t}$ is the rate of return on equity, measuring the efficiency of enterprise I at time t;
- The independent variable representing corporate governance (CG) includes the size of the Board of Directors, the independent Board of Directors, the size of the control committee, the number of female members in the Board of Directors, the dual CEO, the concentration of ownership and the reputation of the auditing enterprise;
- Z is a vector of enterprise control variables including enterprise size, enterprise age, capital expenditure, current solvency, market value to book ratio, cash flow ratio operations to total assets, fixed assets ratio.

Table 1. Description of variables in the model

Sign	Variable name	Definition
<i>Corporate governance</i>		
BD_SIZE	Size of Board of Directors	Number of members in the Board of Directors, including the chairman of the Board of Directors and independent members of the Board of Directors
BD_IND	Independent Board of Directors	Percentage of independent members in the Board of Directors
BD_AUDIT	Size of supervisory board	Number of members in the supervisory board
BD_WOMEN	Female member of the Board of Directors	Percentage of female members in the Board of Directors
CEO_DUAL	Dual CEO	Dual CEO is a dummy variable with a value of 1 if the CEO is also the chairman of the board and if not equal to 0
OWN_TOP3	Ownership concentration	Percentage of common shares held by the three largest shareholders

Sign	Variable name	Definition
BIG4	Reputation of the auditing enterprise	A binary variable, equal to 1 if the audit enterprise is in BIG4 including KPMG, Deloitte, PwC and EY, and if not equal to 0
Capital Structure		
LEV	Financial leverage	Total debt/Total assets
Enterprise efficiency		
ROE	Return on equity	After-tax return on equity
Control variable		
LNTA	Quy mô doanh nghiệp	Natural logarithm of total assets
LNFACE	Enterprise age	Natural logarithm of the number of years since the enterprise was listed
CAPEXTA	Capital expenditure	Ratio of investment spending to total assets
CACL	Current Ratio	Short-term assets/short-term liabilities
MBV	Market-to-book ratio	Ratio of market value of common stock to book value of common stock
NCFOTA	Cash flow to total assets ratio	Ratio of net cash flow from operating activities to total assets
PPETA	Fixed Asset Ratio	Ratio of fixed assets to total assets
ROA	Return on total assets	Ratio of profit after tax to total assets

3.3. Research methods

Panel data regression can be used to estimate the impact of working capital management on the performance of publicly traded enterprises. Panel data have the advantage of making regression models more efficient, informative, and variable by combining cross-sectional and time-series data.

The following estimation methods are used in the study for the panel data regression model: The least squares estimation method – Pooled OLS; fixed effects model – FEM; random effects model – REM. Following the selection of a suitable model, the study employs the FGLS method to overcome the defects in the regression model.

4. Results

4.1. Result of Tests

The F test used to compare the Pool OLS and FE estimation models reveals that the FE model is superior. The Hauman test results between FE and RE show that FE is a suitable model. The FE model is found to be the most appropriate through testing.

The Chi-square test is used in the study to test endogenous variables in the model with the hypothesis: H0: The model has no endogenous factors, obtained p-value = 0.1023 < 0.05. As a result, rejecting hypothesis H0 implies that the models lack endogenous factors.

The model regression results show that the Board size variable (BD SIZE) has a positive relationship with performance efficiency, which is consistent with the findings of Coles et al. (2008), Jackling and Johl (2009), Klein (1998), and Dalton et al. (1999) who advocate for larger board sizes to improve performance efficiency. The fact also shows that an enterprise with a large board of directors will better support and advise the board of directors as the complexity of the business environment and organizational culture grows. Furthermore, the large size of the board of directors will support a multi-dimensional and more informative data system, resulting in the Board's autonomy in decisions.

The percentage of independent members on the BOD, or the independent BOD variable (BD IND), has a negative relationship with performance efficiency. Many previous studies support this viewpoint, such as Agrawal and Knoeber (1996), who demonstrate that board independence has a negative impact on enterprise value in the United States, Scott and Kleidon (1994) also argue that enterprises with a high percentage of independent directors perform worse than enterprises with a low percentage of independent members.

At the 1% significance level, the control board size variable (BD AUDIT) also has a positive relationship with performance efficiency. As a result, an increase of one member on the supervisory board will result in an increase of 1.34 percent in ROE, supporting the view that joint stock companies with a competent supervisory board are less likely to face scandals, thereby the possibility of a drop in business performance is reduced.

In contrast, an increase in female board members will result in a drop in enterprise performance efficiency. Studies that support this opposing viewpoint include Rose (2007), who stated that female members of the Board of Directors positively affect performance efficiency, or Erhardt et al. (2003), Carter et al. (2003), Hutchinson et al (2015). Gender diversity has brought harmony to the way the Board of Directors views issues, allowing for more comprehensive decisions and increasing enterprise efficiency. Fairlie and Robb (2009) argue that enterprises run by women will be less successful than those run by men because female founders or executives are scarce, as is experience, women's experience is frequently restricted to family businesses. The findings also reveal a link between dual CEO (CEO DUAL) and performance efficiency. Peng et al. (2015) conduct a study based on data from 403 Chinese listed enterprises that strongly supports management theory and argue that the presence of a dual CEO has a positive effect on enterprise performance efficiency.

Ownership concentration (OWN TOP3) also has a negative relationship with performance efficiency. The existence of agency costs associated with major shareholders can explain this. Minority shareholders will bear the consequences of large shareholders misusing corporate assets for personal gain. Furthermore, strict control of business activities by major shareholders will reduce the effectiveness of the board's operations. Managers will be rigid and proactive, reducing initiative in their decisions and, as a result, business performance (Burkart et al., 1997; Myers, 2000).

The variable BIG4 has no statistical significance, which is similar to the findings of Detthamrong et al. (2017) when studying the DNNY sample in Thailand (The results show that all corporate governance variables have no impact on performance efficiency).

Control variables included in the model include LNTA, LNFAGE, CAPEXTA, CACL, MBV, NCFOTA, PPETA, all of which have very high statistical significance (significant level 1 percent), with LNTA, LNFAGE, CACL, PPETA variables having a negative impact on performance efficiency, while CAPEXTA, MBV, and NCFOTA having a positive impact.

5. Conclusion

This study provides empirical evidences on the relationship between corporate governance and performance efficiency of non-financial enterprises listed in Vietnam from 2016 to 2020. Corporate governance has a positive impact on the performance efficiency of the variables BD SIZE, BD AUDIT, and CEO DUAL, while the variables BD IND, BD WOMEN, and OWN TOP3 have a negative impact on enterprise performance efficiency.

The performance efficiency of an enterprise depends heavily on corporate governance factors (Board size, percentage of independent BOD members, number of members of the Supervisory Board, female members of BOD, dual CEO, ownership concentration), so to improve performance efficiency, businesses in general and policy makers in particular can, through study, devise management strategies suitable to the situation of the enterprise in order to maximize performance efficiency and help increase the enterprise's value and reputation. To accomplish this, there is no governance mechanism known as a "template" that brings absolute efficiency to the majority of enterprises in Vietnam, depending on the situation of each enterprise, qualifications, and culture, so that each enterprise can create its own flexible, dynamic, and effective governance mechanism in order to transform the enterprise. Enterprises can also use the evaluation criteria of the ASEAN Corporate Governance Scorecard developed over time as a foundation for developing a standard governance mechanism based on international best practices./.

DETERMINANTS OF BUSINESS PERFORMANCE OF THE FIRMS: A CASE OF VIETNAM LISTED BANKS

Dr. Vu Ngoc Xuan

xuanvn@neu.edu.vn

Faculty of Economics, National Economics University, Hanoi, Vietnam

Dr. Nguyen Tuan Anh

tuananhck@yahoo.com

Project Management Unit, Ministry of The Ministry of Labor,

Invalids and Social Affairs, Vietnam

Abstract

The study was meant to investigate factors affecting the business performance at Vietnam listed joint stock commercial banks. The study aimed at finding out how clientele, source of funds, leadership and promotional strategies, government regulations, macroeconomics factors influenced the business performance of Vietnam listed commercial banks. The study adapted a descriptive research design as a major method of research where questionnaires were used to collect data from a sample of Vietnam listed joint stock commercial banks. Data collection was both primary and secondary data. Primary data was collected using questionnaires distributed to the banks' employees. They were designed to obtain broad range of answers from respondents which were used to answer the research questions. They comprised of close ended questions and secondary data was gathered from previous studies and annual reports of banks. Descriptive statistics was used to analyze data and the statistical package for social sciences (SPSS 21.0) and advanced Excel were used. Reports were tabulated using frequency tables for clarity. The results established the relationship between business performance as a dependent variable and the independent variables including clientele, and source of funds, promotional strategies and leadership. The study findings showed a great influence of funds and clientele on the performance of commercial banks, followed by promotional strategies. Leadership was found to have less influence on performance of the bank. The study suggests to the financial sector players to maintain a sufficient clientele base and embrace healthy competition. The findings should draw the attention of scholars, the government and the private sector to help in ensuring economic stability of this country as banking is a major sector of the economy.

Key words: *Business Performance (BP), Enterprises (ES), Small and Medium Sized Enterprises (SMES); Vietnam Listed Banks (VLB)*

1. Introduction

Speaking of SMEs refers to the ability to create jobs and income, improve business management skills, and promote entrepreneurship and creativity. In particular, SMEs play an

important role in honing Es administration skills and promoting innovation. In addition, SMEs also help build a flexible industrial production system, with close links, exploiting and mobilizing all potentials of localities, creating a healthier competitive market and there are positive spillover effects on the economy. Therefore, promoting the development of SMEs is considered an effective means to mobilize capital as well as other resources for production and business activities, contributing to economic growth and stability socialization.

In the context of today's fiercely competitive market, in order to survive and grow, Es needs to be proactive and actively seek ways to increase profits in a reasonable manner. To do so, the Es owner first needs to have a basic awareness of the factors that affect his Es's performance. Specifically, profitability is the ratio to measure Es's performance, which is the main aspect of Es's financial statements. Profits of an Es show that Es's ability to generate income over a given period. Profitability is the deciding factor that helps managers develops an effective profitability strategy for Es.

2. Literature Review

When conducting research on investment, Lei and Chen (2011) said that enterprises make direct investment when it meeting 03 conditions. This is: (i) enterprises must own advantages compared to other businesses: such as scale, technology, marketing network, access to capital with low productivity; (ii) localization: it is more advantageous to use those advantages within an enterprise than to sell it to other businesses or to other businesses; (iii) production in the host country has lower costs than production in the host country.

Lei and Chen (2011) also show the choice decision of Taiwan firm's investment in Vietnam. Jabri et al (2013) and (2015) also show the determinants of investment in MENA region. This is the basis for my research in this paper. The theory of investment behavior of Jensen (2003) and Jouili (2018) shows that investor behavior is directly affected by: (i) changes in demand; (ii) interest rates; (iii) the level of development of the financial system; (iv) public investment; (v) human resources; (vi) other investment projects in the same industry or in connected industries; (vii) the situation of technology development, the ability to absorb and apply technology; (viii) the stability of the investment environment; (ix) procedural regulations and (x) completeness of information.

Kumar (1994) referred the determinants of export of foreign product in United States of America. Kwiatkowski, Philips, Schmidt, and Shin (1992) used the time series to test the null hypothesis. Tran (2009), Parker, Phan, Nguyen (2005) shows the relationship between the infrastructure and Investment attraction in Vietnam. There are some research related to Investment in the world such as Loree and Guisinger (1995) showed the determinants of United State FDI. Louail (2019), Mina (2007), Mina (2012), Moosa (2009) refers determinants of foreign direct investment in Arab countries. Nnadi and Soobaroyen (2015) show the financial statement standards and FDI in the Africa. Pricope (2017), Rogmans (2013) refer the FDI and adoption of international financial report standards in poor countries. Pesanran and Shin et al (1997), (1998), (1999) shows that business satisfaction indicates the level of satisfaction of businesses when investing in a country affected by three factors: (i) attribute group about the infrastructure; (ii) attribute group of

business policy, service support (SS); (iii) attribute group of living and working environment, also mentioned the impact of national small and medium-sized enterprises on FDI attraction in developing countries.

Nguyen et al (2020) refer the impact of working capital on profitability of Vietnam firms. Nguyen et al (2020) also note the determinants of enterprises listed on Vietnam Stock Exchange. Xuan (2020), Factors affecting foreign direct investment: Evidence at foreign technology enterprises in Vietnam, referred the main factors influenced the FDI in Vietnam and have evidence from the technology FDI firms. Models enterprise size is a category that reflects the size of the enterprise and the way to organize and arrange the parts that constitute the enterprise. There are many criteria for assessing the size of an enterprise, namely: Scale by capital, scale by number of employees, scale by turnover, scale by profit and so on. In Vietnam, the determination of scale enterprises comply with the provisions of the Government's Decree No. 56/2009 / ND-CP of June 30, 2009, on assistance for the development of small and medium-sized enterprises, which determines the size of enterprises mainly based on Two factors are capital and labor.

A study by Fausto et al. (2013) showed that type of business, age of business owner, number of capital contributors is factors affecting firm size. Meanwhile, Mssimo & Colombo (2015) said that the business activities, the type of import-export business, the number of founding members have significant explanations in the model of factors affecting the size of enterprise capital. The further pointed out that the size of firm capital is affected by the organization's capital contribution, number of employees and the rate of return on total assets of the industry. The gender and age of the person who has the decisive role in the enterprise also has a certain impact on the size of the business.

With studies in Vietnam, Xuan et al (2020) firms the business sector, type of export business or domestic, the form of business registration has a close relationship with the size of the capital of the business. The factors of business lines, type of business registration, location of production and business establishments, operating time of enterprises, percentage of capital contribution of the organization in the capital structure of the business is the factors that affect the size of the business capital of the business. Through a review of several studies shows, there are many factors affecting the business performance of Es in general and SMES in particular. Baard, VC and Van den Berg, A. (2004), Ari Kokko and Fredrik Sjöholm (2004), Henrik Hansen, John Rand and Finn Tar (2002) have shown that Es size is one of the factors influencing Es business results. According to the studies of Panco, R. and Korn, H. (1999), Henrik Hansen et al (2002), the age of an Es is a factor affecting the survival and development of an Es. Henrik Hansen et al. (2002), showed that the education level of the Es owner and the Government support policy has an impact on the business performance of SMES. In addition, once again demonstrated the level of access to government support policies affecting the business performance of Es, and the author shows the concern. Social system, revenue growth are also factors affecting business performance.

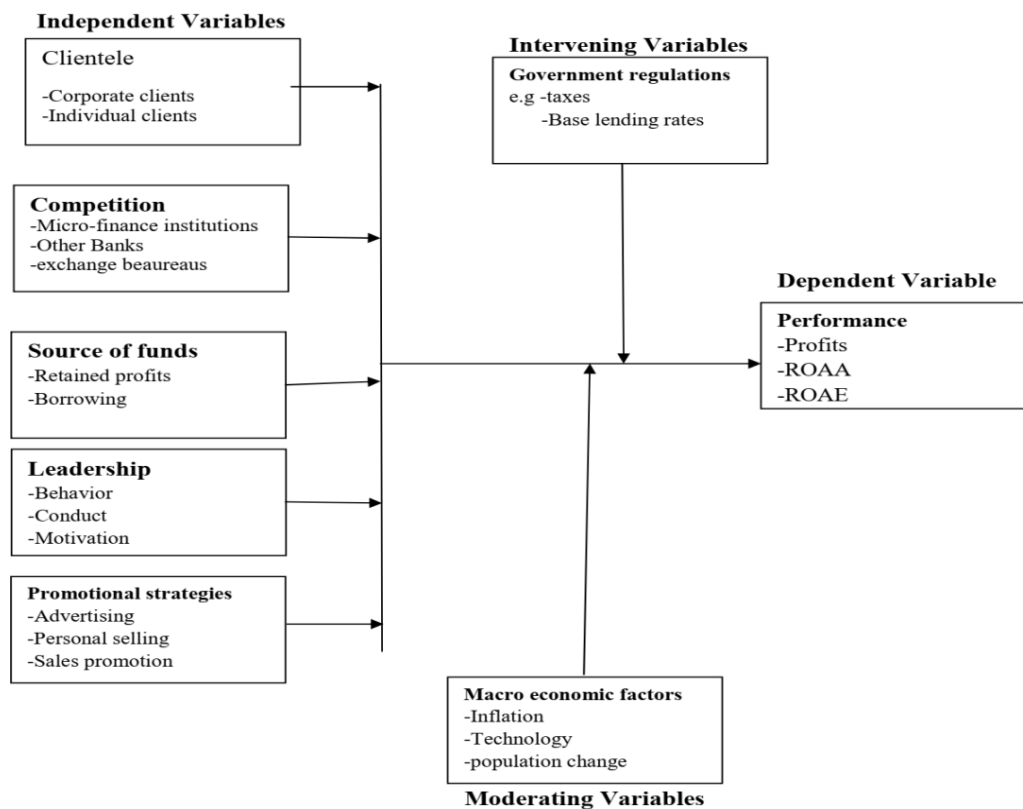

Figure 1. Conceptual framework

Source: complied by authors

Therefore, in this study, the above factors were put into the analysis model by the author to determine the factors affecting the business performance of Vietnam Listed Banks. The research model is as follows:

$$Y = B_0 + B_1X_1 + B_2X_2 + B_3X_3 + B_4X_4 + B_5X_5 + B_6X_6 + \varepsilon$$

Where: The dependent variable Y is rate of return / revenue (ROS - return on sales) of Vietnam Listed Banks. Variables X1, X2, X3, X4, X5, and X6 are independent variables (explanatory variables).

Specifically, the research conducted tests of the following hypotheses:

H1: The number of Clients that VLB has been received that affects the profitability of the VLB.

H2: The sources of funds of VLB affect its profitability.

H3: The ability of leadership of VLB affects profitability.

H4: The promotional strategies of VLB affect the current profitability.

H5: The regulation government affects the profitability rate.

H6: The macroeconomics factors affect the profitability.

From the nature of the independent variables, the model that tests the influence of factors on the performance of VLB, the author expects the sign of the variables in the model Table 1.

Table 1. Interpretation of independent variables in a linear regression model

Variable	Explanations	Expected
X1	The number of Clients	+
X2	The sources of funds	+
X3	The ability of leadership	+
X4	The promotional strategies	+
X5	The regulation government	+
X6	The macroeconomics factors	+

Source: compiled by the authors

3. Method

Objectives

This study conducted to solve two objectives: (1) Analyze the current situation of business and production activities of the listed banks in Vietnam; and (2) Identify the factors that affect the performance of the listed banks in Vietnam.

Data collection

To conduct an estimation of the factors affecting the performance of small and medium-sized Enterprises (SMEs), use secondary data using convenient sampling techniques from the 2021 Financial Statements of 20banks and the database based on the ES listed on Vietnam's stock market, with the selected analysis criteria in the model. This study uses SPSS 21.0 software to support data analysis. Descriptive statistical methods with criteria such as average, rate, frequency, standard deviation are used to analyze the current situation of production and business activities. Multivariate linear regression analysis was used to identify the factors affecting the performance of banks in Vietnam.

4. Results

4.1. Factors affecting the business performance of VLB

The results of the linear regression analysis are as follows: (1) Observed significance level Sig. very small (Sig. = 0.00) shows that the security level rejects the Ho hypothesis, which means that there exists a linear relationship between the business performance of VLB (measured by the rate of profit) with at least one of the factors being an independent variable, such a linear regression model is given in accordance with the data;

(2) The R^2 value is adjusted smaller than the R^2 , so it should be used to evaluate the model as more suitable and it does not inflate the model suitability, so R^2 the adjusted= 0.861 meaning that 86.1% of VCLE's business performance can be explained by the linear correlation between the profit margin and the independent variables included in the model. The Durbin-Watson coefficient of the model is 1,936, indicating that the model has no autocorrelation phenomenon. In addition, the variance magnification (VIF) of the variables

in the model is much smaller than 10, so we conclude that the variables included in the model do not have multi-collinear phenomena.

Table 2. Results of the analysis model of linear regression

Criteria	Variables	Coefficient (B)	Level of significance (Sig.)	VIF
Constant		0.398	0.000	
The number of Clients	X1	0.50	0.000	1.105
The sources of funds	X2	0.60	0.005	1.061
The ability of leadership	X3	0.40	0.000	1.203
The promotional strategies	X4	0.52	0.008	1.084
The regulation government	X5	0.39	0.002	1.091
The macroeconomics factors	X6	0.32	0.004	1.052
<i>Sig. F coefficient</i>		<i>0.000</i>		
<i>coefficient R² adjustment</i>		<i>86.10</i>		
<i>Durbin-Watson coefficient</i>		<i>1,936</i>		

Source: survey data, 2021

Of the 6 variables included in the model, all 6 explain the change in business performance of VCLE as the following functions:

$$Y = 0.398 + 0.5X1 + 0.6X2 + 0.4X3 + 0.52X4 + 0.39X5 + 0.32X6 + Ei$$

The number of clients

In particular, the variable X1 (the number of clients) has a positive effect on the business performance of VLB, showing the importance of this factor to business activities. VLB's business is huge, which fits perfectly with the argument that the author originally made. In fact, the more the banks have clients, the more profit it can get.

The source of funds

In addition to the impact of source of funds, the variable X2 is also an important factor positively affecting the efficiency of business activities. Banks that have the huge funds can accumulate a lot of capital to finance their business activities as well as new investment projects. At the same time, because they have a large funds, these have a lot of advantages, so the performance are also high.

The ability of leadership

The variable X3 (the ability of leadership) is also positively correlated to the performance of VLB. The higher the leadership level, the more owners are able to access modern management science methods to help the banks grow more and have more

opportunities, while having a broader, more knowledgeable relationship about institutions, more policy regulations.

✚ The promotional strategies

When the banks invest more in advertising, they will get more business performance. The variables X4 is positively to the performance of VLB.

✚ The regulation of government

The coefficient of factor X5 (the regulation of government) bearing a positive sign (+) indicates that banks has better business efficiency when the Vietnam government have the support regulations. The reason is that banks have monitored by the state and when banks received the better regulations, which contributes to good business performance.

✚ The macroeconomics factors

Similarly, the X6 variable also has a positive coefficient with the performance of banks. This proves that sustainable macroeconomics factors also affect VLB's business performance.

4.2. Factors affecting the performance of VLB

The statistical value F in the model has a very small significance level, which is 0.000, showing that the safety level refutes the Ho hypothesis, meaning that the relationship exists. The linearity between the performance of VLB (measured by the ratio of profit/total assets ROA) with at least one of the factors is the independent variable, so the linear regression model is given in accordance with data.

The coefficient of determination of R² is 86.1%, which is quite reasonable, showing that the general fluctuations of the affecting factors explain about 86.1% of the VLB performance.

Specific results of each variable are as follows:

Number of Clients - X1

X1 with an estimated value of β_1 of 0.50 (sig. 0.0000) shows that, when the number of clients increases by 1%, the ROA will increase to 0.5%. The results of this study of the authors are consistent with the studies of B. Ramasamy (2005). The larger banks will have more clients compared to the small banks. Therefore, the more the clients the bank have, the more the ROA they have.

The Sources of funds - X2

The source of fund does significantly affect returns when the value of β_2 is very large as 0.6 with the value of sig. (0.005) is much higher than the 5% significance level. This result is consistent with collaborative research between D. Mehari and T. Aemiro (2013). Research shows that banks do mean higher profits when they have the large funds. In contrast, the banks have the small funds that cannot create the large ROA.

The ability of Leadership - X3

The ability of leadership has mostly positive effects on profitability with an estimated value of β_3 of 0.40 (sig. 0.0000). That is, when the ability of leadership increases by 1%, the ROA will increase to 0.40%. The results of this study are in line with the studies examined by A. Vijayakumar (2011).

According to the World Bank, also in line with modern economic theory, banks are very important for a country's economic growth and development. Banks can promote more jobs than the big firms can. Banks have a smaller scope so it is easier to set up and organize activities. The more effective the banks are, the more likely it is to increase profits.

The promotional strategies - X4

The promotional strategies of VLB have a positive impact on profitability at the present time with a β_4 coefficient of 0.52 (sig. 0.008). That is, when the promotional strategies banks increases by 1%, the ROA will increase to 0.52%. The results of this study are consistent with the studies of A. Stierwald (2009).

The regulation government - X5

The results indicate that the regulation government does affect the profitability of VLB when the significance level (sig. 0.002). Of the estimated value of X5 of this variable is quite large at 0.39. It means that when the regulation government increases 1% and then the ROA of banks will increase 0.39%. This research is different from the one tested by A. Stierwald (2009), AK Salman and D. Yazdanfar (2012) and the research of D. Yazdanfar (2013) shows that the bank's regulation government has negative impact on profits.

The macroeconomics factors - X6

The macroeconomics factors that affects profitability with an estimated value of β_6 is 0.32 (sig. 0.004). That is, when the VLB macroeconomics factors increases by 1%, the ROA will increase to 0.32%. The results of this study are consistent with previous studies that have been verified by A. Vijayakumar (2011), AK Salman and D. Yazdanfar (2012) and individual research by D. Yazdanfar (2013).

5. Discussion and Conclusion

VLB with the level of investment is large, flexible and very suitable for support the capital for developing economy. VLB is an appropriate and effective way to mobilize resources for the firms and individuals for economic development. Particularly for Vietnam, the development of the current VLB does fully meet the requirements of socio-economic development; VLB often operate with the goal of long term, within a large space. The competitiveness is also very good. The results of the study show that factors such as source of funds, the number of clients, promotional strategies mostly affect to the business performance of VLB. Through the research results, the author expects that the concerned departments and agencies will soon implement action programs to more develop VLB, contributing the capital to the country's socio-economic development.

Using the least squares estimation method in the multivariate regression model, the study estimated and identified the factors affecting the performance of banks including source of funds, number of clients, promotional strategies, ability of leadership, government regulations, and macroeconomics factors. The research results show that the more VLB has funds, the more effective the activities are. The research results have helped the authors synthesize a number of solutions to enable VLB to improve business performance in the current.

THE EFFECT OF POLITICAL CONNECTION ON FIRM'S OPERATIONAL EFFICIENCIES: THE CASE OF SMES IN VIETNAM

Duong Thuy Linh

linhthuy@neu.edu.vn

National Economics University, Hanoi, Vietnam

Abstract

This paper examines the effect of political connection on operational efficiencies of Small and Medium Enterprises (SMEs). I employ an unbalanced panel dataset from 2005 to 2015 in Vietnam. The results suggest that political connection has a significantly negative effect on both investment efficiencies and employee productivity. Significantly, the impact of political connection on employment decisions is more significant than it is on investment decisions. Furthermore, the findings also indicate that high-growth firms experience the interference of political connection on the decision-making process less often than their low-growth peers.

Key words: *Small and Medium Enterprise (SME), political connection, operational efficiency, Vietnam.*

1. Introduction

The relationship between political connections and firm operation attracts the attention of many scholars. Some evidence shows that political connections can bring economic benefits and advantages to connected firms (Khwaja & Mian, 2005; Li et al., 2006; Boubakri et al., 2013). Significantly, this phenomenon is more prevalent in developing economies where political connections play an essential role in improving firm operational efficiency (Chen et al., 2011). In contrast, some studies indicated that political connections lower the business performance, such as reducing firm profit or investment returns (Faccio, 2006; Boubakri et al., 2008). The mechanism through which the political connections affect firm performance and lead to operational inefficiency still needs to be explored.

Political connections benefit connected firms such as access to bank loans, receiving government subsidies, get tax reductions and exemption (Li et al., 2008; Boubakri et al., 2012; Li & Zhou, 2015). These advantages may influence connected enterprises to increase investment and employment. Considering corporate investment perspective, firms seek political networks to enhance the physical and human capital essential to a firm's competitive advantages by obtaining preferential treatments. Therefore, this paper aims to explore the effect of political connections on firm operational efficiencies in terms of investment and employment. This study follows the view of Shlefer and Vishny (1994) that political connections hamper the operational efficiencies of connected firms. Two possible phenomena have been proposed to investigate the channels through which political networks distort firm performance, including inefficient investment and excessive employment.

This study focuses on small and medium enterprises in Vietnam, providing an emerging economy's unique database and circumstances. The sample contains more than 14000 firm-year observations from 2005 to 2015. The estimation results suggest that political connection lowers the investment efficiencies of connected firms by providing evidence of the low sensitivity of investment expenditure to growth opportunities in connected enterprises. Besides, the results also indicate that political connection has a significantly negative effect on employee productivity, confirming the hypothesis that politicians affect employment decisions in connected firms to achieve their political objectives. Especially, the impact of political connection on employment decisions is much stronger than on investment decisions.

This study contributes to the literature in some aspects: first, unlike other previous studies that focus on the benefits of political connection, this paper provides some empirical evidence of the negative impact of political connection on a firm's operational efficiencies (Khwaja & Mian, 2005; Faccio, 2006; Li et al., 2008; Boubakri et al., 2012). Second, the findings contribute to corporate investment literature regarding the agency problem. Third, the political connection is considered a factor that influences connected firms to make inefficient investment decisions. From an economic perspective, firms seek profit maximization while the objectives of politicians may contrast with the wealth purpose of firm owners. Therefore, politicians may force connected firms to invest in inefficient projects or hire more employees. Finally, it analyzes the channels through which political connection influences a firm's operational efficiencies. Providing empirical evidence demonstrates a dimension to capture the negative side of the political link on small and medium enterprises in developing economies.

This paper has the structure as follows. Section 2 provides theoretical background and hypotheses development: section 3 details data and econometric models. Section 4 presents empirical results and further discussion. The last section offers a conclusion.

2. Literature Review

In the viewpoint of political economy, there are two possible ways political connections may influence firm performance, including the costs and benefits to a firm. First, most previous studies on political networks show evidence of a positive effect on firm performance. For example, Li et al. (2008) argued that when owners of private firms become members of the Chinese communist party, this membership has a positive effect on firm performance and facilitates them to obtain bank loans. Similarly, Ling et al. (2016) also indicated that firms with political connections could get more long-term bank loans and are more likely to overinvest than their peers.

However, there are also many studies to discuss the disadvantage of political connections. Faccio (2006) employed a cross-country database to analyze the impact of political connections on firm performance. It shows that besides the considerable benefits that political connections can provide to firms such as credit access, government subsidies, tax reduction and exemption, politically connected firms have lower performance than their non-connected peers on an accounting basis. Bertrand et al. (2007) indicate that the

connected firms in France tend to have higher employment rates but lower performance than the non-connected enterprises during the election cycles. Similarly, in the context of China, Fan et al. (2007) argue that after three years of post-IPO, political networks lower the performance of connected firms compared to the non-connected enterprises.

Excessive employment is the factor that causes the political cost to connected firms. When politicians run the electoral strategy, they may ask connected businesses to hire more employees to help them achieve their political goals and receive more votes. Thus, the surplus of employment will increase operating costs and reduce the profitability of connected enterprises. For instance, Bertrand et al. (2007) observe the effect of political connections on a firm's employment rate during the election period in France. They show that connected firms are more likely to hire more employees by creating new plants during the electoral cycle. Therefore, according to the economic perspective, businesses will try to reduce excessive employment to achieve better performance.

In contrast, a high employment rate will help politicians gain their political objectives and receive more political support for their careers. The contradiction between profit maximization objectives and political support objectives may lead connected firms to experience a lower performance than the non-connected ones. Thus, the first hypothesis that will be examined in this study is:

Hypothesis 1: Political connection is positively associated with excessive employment in connected firms.

Besides, another factor that is considered the cost of political connection is the investment strategy that serves as a tool for politicians' enrichment. When a firm pursues the profit maximization objective, its investment behavior is based on the net present value principle. However, the intervention of politicians to achieve their political goals may lead to investment inefficiencies (Chen et al., 2011). There are two possible ways that political connections affect the investment efficiency of connected firms. First, connected firms must choose to fulfill the political objectives instead of following the profitable investment opportunities. Second, it is difficult for connected firms to terminate or cut off the investment in unsuccessful projects if they do not meet the net present value principle. Because the termination action may cause conflict with the political objectives (Saeed et al., 2017).

Furthermore, the negative effect of political networks may become stronger on inefficient investment when the connected enterprises can get preferential treatment on access to bank loans (Chen et al., 2011). There are some studies providing evidence that connected firms receive benefits from political connections such as credit access, tax exemption, and reduction, government subsidies, which may worsen the investment inefficiency issue (Khwaja & Mian, 2005; Faccio, 2006; Claessens et al., 2008; Yeh et al., 2013). More importantly, even though the investment projects underperform as expected, connected firms continue doing it without the fear of being bankrupt. Because politicians can use their political power to bail out the debt for connected firms by using the public budget. This kind of relationship will be maintained until firms are valuable for politicians

to help them achieve political objectives and support. In contrast, connected firms can receive economic benefits and market power from politicians (Saeed et al., 2017).

According to agency theory which indicates the moral hazard issue between managers and stakeholders, when connected firms seek political connections, it may conflict with the profit maximization objective of other shareholders (Jensen, 1986). Empirical studies also argue that managerial sub-optimal decision plays an essential role in firm performance (Blanchard et al., 1994). For example, Aggarwal et al. (2007) explores the donation of connected firms to politicians in the US from 1991 to 2004. They find that political connection is associated with agency problems which contribute to weaker governance and lower returns. Considering both theoretical and empirical perspectives, it shows that political connections may instigate agency problems, affecting operational performance efficiency and hampers shareholder value. Thus, this study examines how political connections influence the decision-making process in connected firms and how it affects operational efficiencies. The second hypothesis that will be examined in this study is:

Hypothesis 2: Political connection negatively affects investment efficiency in connected firms.

3. Method

3.1. Empirical strategy

a. Excessive employment

As mentioned above, when politicians try to achieve their political objectives, they may use their political power to influence connected firms' decisions in order to facilitate them to achieve more political support. Typically, connected firms will hire more employees to help politicians achieve social objectives during the electoral period. However, it will lead to lower employee productivity in the connected firms being lower than the non-connected peers (Saeed et al., 2017). Following Saeed et al. (2017) study, this study uses low labor productivity to measure excessive employment. Because if considering employment as value-added of a firm, when the number of employees increases, it will lead to higher profit, which means that the employment rate has a positive effect on profitability. Thus, the variation in labor productivity would be smaller.

In contrast, if employment is not value-added, the employment level will lower the profitability. Resulting in a larger variation in labor productivity. Therefore, to test the first hypothesis, I use the following equation that follows the study of Bartel & Harrison (2005):

$$Emp - Pro_{it} = \beta_0 + \beta_1 growth - opp_{it} + \beta_2 PC_{it} + \beta_3 growth - opp_{it} \times PC_{it} + \beta_4 cashflow_{it} + \beta_5 firmsize_{it} + \beta_6 leverage_{it} + \varepsilon_{it} \quad (1)$$

Whereas the dependent variable ($Emp - Pro_{it}$) is labor productivity of firm i in year t . it is calculated as the ratio of firm profit to the total number of employees. The independent variables are growth opportunities, political connection, cash flow, leverage, and firm size.

The popular measurement of growth opportunities is the prices/earnings ratio (or Tobin's Q). However, this study is not applicable as our interest is in SMEs, which are not listed in the financial market. Therefore, the alternative methodology is employed by following the study of Abel and Blanchard (1983) and Fukuda et al. (2005). To estimate

Tobin's Q, I first assume that the first difference of after-tax profit follows an AR process. After checking the stationarity, lag 1 to 3 are used to estimate the future after-tax profit. Then, future after-tax ordinary profits will be estimated based on the AR process. Finally, the forecasted value of future after-tax profit leads to the present discount value of the profit for each firm as the following equation:

$$V_t = \sum_{i=0}^{\infty} \left(\frac{1}{1+r} \right)^i E\pi_{t+i}$$

Whereas r is the discount rate which is calculated by taking the total interest payment divided by total debt outstanding. Following the study of Hayashi and Inoue (1990), Tobin's Q is obtained by dividing the present discount value by the market value of the capital stock. At the same time, the market value of capital stock equals the total assets of building and structure, machinery and equipment, vessels and vehicles, and land plus the total gross investment (which are all reported as the market value in the survey).

PC_{it} is a dummy variable to describe politically connected firms, and it takes 1 if the owner/manager of the firm is the Communist Party member and 0 otherwise.

b. Investment efficiency

When the firm invests efficiently, it will only undertake the projects with positive net present value. Besides, there is a positive relationship between the firm's investment decision and its growth opportunities (Tobin, 1969; Jiang et al., 2011; Foucault & Fresard, 2012). However, in the imperfect market condition with the problem of agency cost and information asymmetry, firms do not respond well to the information of growth opportunities when making an investment decision. The relationship between market frictions and investment decisions has attracted many scholars' attention, and growth opportunities play an essential role in investment efficiency (Bushman et al., 2011). Thus, to measure the investment efficiencies, this study also uses the sensitivity of investment rates to growth opportunities.

To test hypothesis 2, the underlying institution is that politically connected firms are less sensitive to growth opportunities than non-connected firms. This approach is closed to the studies of Hung et al. (2008), Bushman et al. (2011), Chen et al. (2011), and Chen et al. (2017). The econometric equation to test hypothesis 2 is as follow:

$$Investment_{it} = \beta_0 + \beta_1 growth - opp_{it} + \beta_2 PC_{it} + \beta_3 growth - opp_{it} \times PC_{it} + \beta_4 cashflow_{it} + \beta_5 firmsize_{it} + \beta_6 leverage_{it} + \varepsilon_{it} \quad (2)$$

Whereas the dependent variable $Investment_{it}$ is the investment rate of firm i in year t . It is measured as the ratio of investment expenditure over the total assets. Following the study of Ratti et al. (2008), Saeed et al. (2017), the measurement of investment expenditure can be calculated as the change in fixed assets of year t and $t-1$, plus the depreciation of year t . The independent variables are growth opportunities, political connection, cash flow, leverage, and firm size.

3.2. Data description

The panel data was collected from the Small and Medium Scale Manufacturing Enterprises (SMEs) survey in Vietnam. The survey was carried out every two years from 2005 to 2015, under the collaboration of the Central Institute for Economic Management (CIEM), the Institute of Labor Science and Social Affair (ILSSA), and the Development Economics Research Group (DERG) of the University of Copenhagen (Denmark). The survey was conducted in nine provinces, including Hanoi, Ha Tay, Ho Chi Minh, Hai Phong, Phu Tho, Nghe An, Quang Nam, Khanh Hoa, Lam Dong, and Long An. However, the sample is still good enough to represent Vietnam because those cities and provinces are located in different areas of Vietnam, describing each region's unique characteristics. Besides, the survey was funded by the Royal Embassy of Denmark in Vietnam (Danida); thus, the choices also depend on funding-related issues.

The survey was collected in June-August by face-to-face interviews with the enterprise's owner/manager, including the main questionnaire, employee questionnaire, and financial account. The survey consists of enterprise characteristics, history, economic structure, sale structure, employment, and personal background. Unlike the lending side, borrowing behavior rarely involves criminal concerns underreporting financial sources' structure. Three types of enterprises participated in the survey: repeated enterprises, not previously surveyed enterprises, and repeated enterprises but no longer in operation in which the repeated enterprises but no longer in the process will be collected separately for another purpose that will not be discussed in this paper. Moreover, as the purpose of the dimensional tracer of the data over time, all firms that were only surveyed in one year or discontinuously surveyed will be excluded to minimize the estimation bias. There are 14351 observations in the sample size. Although some variables contain missing values, they do not have many, so we keep using the whole sample. Table 1 presents the data description of all variables that will be used in this paper.

Table 1. Data description

Variable	Obs.	Mean	Std. dev.	Min	Max
Party membership	14,351	0.13323	0.33984	0	1
Investment rate	14,239	0.11472	0.14474	-0.90532	0.98684
Employment productivity	14,221	5.76981	5.83104	-14.842	20
Leverage	14,206	0.29781	0.23343	0.00135	5.67351
cashflow	14,239	0.32586	0.88153	-3.79524	18.58989
Firm size	14,241	9.54728	9.07909	2.302585	49.97212
Tobin'q	8,094	2.62281	2.66993	0.10016	12.049
Employment	14,242	13.83738	26.40844	1	300

Besides, another comparison between the connected and non-connected firms in terms of financial structure and firm's characteristics is also conducted and presented in Table 2.

Table 2. Summary statistic: connected and non-connected firms

Variable	Connected firms				Non-connected firms				Mean difference (t-statistics)
	Mean	Std. dev.	Min	Max	Mean	Std. dev.	Min	Max	
Investment rate	0.0814	0.1765	-0.9053	0.7961	0.1198	0.1385	-0.01	0.9868	-0.0384***
Employment productivity	5.1291	6.2698	-13.708	20	5.8674	5.7552	-14.842	20	-0.738***
Leverage	0.3113	0.2713	0.0047	4.3552	0.2958	0.2270	0.0014	5.6735	0.0156***
Cashflow	0.3052	0.8158	-3.3931	15.1515	0.3290	0.8911	-3.7952	18.5899	-0.0237***
Firm size	9.3821	8.2425	2.5649	49.7673	9.5725	9.2001	2.3025	49.9721	-0.1904
Tobin'q	2.5222	2.62246	0.1006	11.6027	2.6376	2.6767	0.1002	12.049	-0.1153*
Employment	20.1187	35.7656	1	300	12.8780	24.5295	1	300	7.2407***

The size of connected and non-connected firms is almost the same, but the leverage of connected firms seems to be higher than non-connected firms. By contrast, the percentage of investment expenditure to total assets of connected firms is much lower than that of non-connected peers. Similarly, there is also a difference between the two groups in terms of employee productivity. All result is significant at 1% level. This phenomenon may be an indication of operational inefficiency.

4. Results

4.1. The effect of political connection on excessive employment

A panel regression with fixed effect is employed to test hypothesis 1. The regression results are reported in Table 3. Column 1 reports the regression result of the simple specification, which describes the relationship between political connection and employee productivity. In addition, it shows the comparison of the effect between the connected and non-connected firms. The result indicates that political connection negatively affects a firm's employment productivity, suggesting the phenomenon of excessive employment. The estimated coefficient is statistically significant at a 1 percent level. More specifically, politically connected firms have 2.7 percentage points lower employment productivity than non-connected firms. This estimated result holds even when adding a firm's growth opportunities in the model, which is reported in column 2 and column 3 with other control variables in the model.

Table 3. The effect of political connection on employment productivity

VARIABLES	Emp-Pro	Emp-Pro	Emp-Pro
	(1)	(2)	(3)
PC	-2.703*** (0.362)	-2.481*** (0.595)	-2.493*** (0.599)
Growth-opp		0.143*** (0.0346)	0.130*** (0.0351)
PC*Growth-opp		-0.0582 (0.111)	-0.0516 (0.111)
Cash flow			-0.124 (0.107)
Leverage			-0.980** (0.412)
Firm size			0.0261*** (0.00987)
Constant	6.127*** (0.0676)	5.590*** (0.137)	5.708*** (0.202)
Observations	14,221	7,478	7,461
R-squared	0.005	0.009	0.012

Standard errors in parentheses *** p<0.01, ** p<0.05, * p<0.1

The other estimated coefficients also indicate that political connection significantly negatively affects employee productivity. In column 3, it shows that politically connected firms have a 2.493 percentage point of productivity lower than their non-connected peers. The negative coefficient of employment productivity confirms the first hypothesis that political connection leads to excessive employment in the connected firms. This result is supported by a similar finding in Bertrand et al. (2007) study.

The regression results also indicate that growth opportunities positively affect employee productivity. When a firm obtains 1 percentage point high growth, it increases productivity by 0.13 percentage points. This result supports the view that growing firms are more likely to have higher employee productivity related to better resource management. Although the interaction terms between political connection and growth opportunities are insignificant, the negative sign of its coefficient somehow illustrates that the effect of growth opportunities on employment productivity in connected firms is lower than in non-connected firms. While firm size has a significantly positive impact on productivity, leverage has the opposite sign. All results are statistically significant at 1 percentage level.

The regression results reported in Table 3 support that political connections lower a firm's operational efficiency. Besides, in some cases, it also indicates that political connection may lead firms to make an inefficient business decision in order to support politicians achieve their political objectives or political support during the electoral period. In other words, this study discovers the channel that connected firms may bear the political cost if they want to receive economic benefits from the connections.

4.2. The effect of political connection on investment efficiency

To test hypothesis 2, a panel regression with fixed effect is adopted. The estimation results are presented in Table 4.

Table 4. Impact of political connection on investment efficiency

VARIABLES	Investment rate	Investment rate	Investment rate
	(1)	(2)	(3)
PC	-0.0995*** (0.00914)	-0.0501*** (0.0139)	-0.0434*** (0.0131)
Growth-opp		0.0181*** (0.000808)	0.0152*** (0.000768)
PC*Growth-opp		-0.00903*** (0.00260)	-0.00759*** (0.00243)

Leverage			-0.0280*** (0.00901)
Firm size			0.00508*** (0.000216)
Constant	0.128*** (0.00171)	0.0773*** (0.00320)	0.0425*** (0.00441)
Observations	14,239	7,487	7,471
R-squared	0.011	0.116	0.223

Standard errors in parentheses *** p<0.01, ** p<0.05, * p<0.1

Column 1 reports a simple regression to describe the relationship between the political connection variable and investment expenditure among the connected and non-connected firms. It indicates that politically connected firms are 9.95% lower than non-connected firms in terms of investment efficiency. The estimation result is significant at 1 percent level. When discussing investment decisions, one of the most important factors that should be concerned is the firm's growth opportunities. Column 2 reports regression results regarding the sensitivity of investment to growth opportunities without control variables. It shows that growth opportunities have a significantly positive effect on investment decisions. More specifically, when a firm gets 1 percentage point higher growth opportunities, its investment efficiencies will increase 1.81 percentage points.

In contrast, the political connection shows a significantly negative effect on investment efficiencies. Especially, the coefficient of interaction terms between political connection and growth opportunities indicates that political connection lowers the impact of growth opportunities on investment efficiencies. The connected firms, on average, have 0.903% lower investment efficiencies than their non-connected peers. All results are significant at 1 percent level.

Even when adding other control variables in the estimation model, the results are held, as it is shown in column 3 of Table 4. The effect of growth opportunities on investment efficiency remains positive and significant at 1 percent level. While political connection, in contrast, harms investment expenditure. In detail, the efficiency of investment in politically connected firms is 4.34% lower than the non-connected firms. In addition, political connection even lowers the effect of growth opportunities on investment efficiency in connected enterprises. Therefore, the estimation results confirm the hypothesis that political connection leads to operational inefficiencies in connected firms.

The effect of control variables on investment decisions supports firm investment literature's prediction. First, cash flow shows a positive but insignificant impact on investment expenditure, which means that internal capital is not a significant predictor of investment decisions of Vietnamese enterprises. Second, firm size is found to correlate with investment expenditure positively. It can be explained by the fact that large firms often have advantages to access knowledge and capital intensity, which can help them make a better investment decision. Finally, leverage harms the investment rate. It may be seen as an adverse effect on firm investment due to the increasing cost of capital when leverage increases. All results are significant at a 1 percent level.

In summary, all estimation results confirm that political connection and investment efficiency have a negatively significant correlation. In other words, it indicates that political tie increases the agency cost and influences connected firms to make inefficient investment decisions. It is consistent with other previous studies that concluded that political connection is significant for investment allocation but not for investment expenditure (Claessens et al., 2008). The findings are understandable when the connected firms can make an inefficient investment decision without worrying about bankruptcy because they can get bailed out through the political connection.

4.3. Robustness check

There is a potential endogeneity issue that some unobserved variables related to firm investment efficiencies and excessive employment may also explain the political connection. Thus, the estimation results can be biased and inconsistent. Heckman's two-stage methodology is adopted to re-estimate the model for dealing with this endogeneity issue. The first stage of the estimation procedure involves a probit estimation. The dependent variable is the political connection which is a dummy variable with 1 if the owner/manager of the firm is the party member and 0 otherwise. Independent variables are the same as equations (1) and (2) and add one additional variable that must be strongly correlated with political connection but uncorrelated with investment and employee productivity. Following

the studies of Bertrand et al. (2007) and Boubakri et al. (2008), the firm's location can be employed as an instrumental variable for political connection. They provide evidence to show a relationship between the a firm's location and political tie but no correlation with the outcome of political connection. Therefore, this study uses a firm's location as an instrument variable, which takes 1 if the firm is in the two biggest cities of Vietnam (Hanoi and Ho Chi Minh city) and 0 otherwise. The regression in the first stage is the same for both investment and employment productivity models. In the second stage, the political connection is replaced by the inverse Mills ratio obtained from the first step with the probit model. Then the panel regressions with fixed effects are estimated following equations (1) and (2).

Table 5. Heckman two-stage: effect of political connection on investment efficiencies and employment productivity

Panel A		
VARIABLES	PC	
Location	0.1003*** (0.005)	
Growth-opp	-0.0086 (0.213)	
Cash flow	-0.02198 (0.315)	
Firm size	-0.00097 (0.637)	
Leverage	0.2306*** (0.002)	
Observations	8,015	
Pseudo R2	0.0035	
Panel B		
VARIABLES	Investment rate (1)	Emp-Pro (2)
PC	-0.0433*** (0.0146)	-2.517*** (0.668)
Growth-opp	0.0151*** (0.00277)	0.140 (0.126)
PC*Growth-opp	-0.00759*** (0.00243)	-0.0517 (0.111)
Cash flow	0.000849 (0.00722)	-0.0984 (0.330)
Firm size	0.00508*** (0.000369)	0.0272 (0.0169)
Leverage	-0.0268 (0.0710)	-1.241 (3.245)
Inverse Mills ratio	0.00650	-1.401

	(0.378)	(17.27)
Constant	0.0316	8.045
	(0.630)	(28.79)
Observations	7,471	7,461
R-squared	0.223	0.012

Standard errors in parentheses *** p<0.01, ** p<0.05, * p<0.1

All regression results are reported in Table 5. The first part of the table presents estimation results of the first stage, while the second part illustrates the second stage regression. The coefficient of interaction terms between political connection and growth opportunities for the investment model indicates is negative and significant at 1 percent level. It confirms that political connection negatively affects investment efficiency, and connected firms have lower investment efficiency than non-connected enterprises. In the employment productivity model, the coefficient of political connection variable is also negative and significant at 1 percent level. One more time, the results confirm that political connection relatively lowers labor productivity and leads to excessive employment in connected firms. Significantly, the inverse Mills ratio is insignificant in both estimation models, meaning that all results are not biased and inconsistent. Therefore, there is no endogeneity issue in these estimation models, and the effect of political connection is confirmed.

5. Conclusion

Unlike a previous study focusing on the benefit of political connection to a firm, this paper explores the negative impact on the firm's operational efficiencies. More specifically, this study analyzes two possible aspects of operational efficiencies that political connection may affect, including investment efficiencies and excessive employment. The estimated results support hypotheses that political connection significantly affects a firm's operational efficiencies. More specifically, political connection influences investment decisions, leading to lower investment efficiencies measured as the sensitive investment expenditure to growth opportunities in connected firms. Furthermore, concerning the excessive employment problem, political connection harms labor productivity in connected firms. This is because politicians use their power to influence connected firms to hire more employees than needed to achieve their political objectives or political support. Especially, the effect of political connection on a firm's employment decisions is much stronger than it is for investment decisions. Therefore, this study illustrates an adverse impact of the political tie to operational efficiencies among connected SMEs.

Abstract

The purpose of this study is to identify the main factors determining the entrepreneurial intentions of students in Hanoi in the field of clean agriculture - an advantageous business field of Vietnam. Data was collected from a questionnaire survey with 324 university students in the city. The research results show that there are four main factors, which include "Educational environment", "Perception of entrepreneurship", "Perception of clean agriculture's benefits" and "Business opportunities", that have an influence on student entrepreneurial intention. Based on these results, some recommendations are proposed: Students themselves need to actively cultivate knowledge about clean agriculture. Families, universities and society should seek to support students with entrepreneurial intentions, promote development of fundamental knowledge and skills, and provide students with practical experience. The business community and the Government should develop effective support policies to stimulate student entrepreneurial intentions in the field of clean agriculture.

Keywords: *Entrepreneurial Intention, Clean Agriculture, Factors, Students, Hanoi*

1. Introduction

Vietnam is considered to have advantages in agricultural development thanks to its favorable natural conditions. In the current context of international integration and increasing competition, investment and start-up activities in the field of "clean" agriculture have been encouraged by Vietnamese Government to speed up agricultural growth (Hien, N.V. & et al, 2020), of which promoting youth entrepreneurship is one of the top priorities (Shapero & Sokol, 1982).

Entrepreneurship is a process of creating and realizing values for entrepreneurs (Morris and Jones, 1999); is the initiation of new business ventures (William B. Gartner, 1989) by dedicating the necessary time and effort, taking on the associated financial, mental, and social risks and, as a result, receiving monetary rewards, personal satisfaction, and independence (Hisrich, Peters & Shepherd, 1998). Intention is assumed to capture the

motivational factors that influence behavior; is an immediate antecedent of behavior and an indication of how willing people are to try, in terms of the level of effort they intend to exert (Ajzen, I., 1991). A business intention is the subjective thinking and mental state of entrepreneurs before they engage in entrepreneurial behavior (Shepherd & Krueger, 2002).

The previous research by Ambad & et al. (2016) has shown three factors including “Individual Attitude”, “Cognitive Behavioral Control” and “Cognitive Relationship Support” that significantly influenced the entrepreneurial intention of university students in Malaysia. According to research by Lien, N.T.B (2020), the five factors of “Entrepreneurship education”; "Capital"; "Personality traits"; “Perceived feasibility” and “subjective standards” impact the entrepreneurial intention of students in Ho Chi Minh City. In the agriculture sector, the research by Abdullah, A. A., & Sulaiman, N. N. (2013) has identified three factors of “Attitude”, “Acceptance”, and “Knowledge” that affect young people’s participation in agricultural entrepreneurship. Novanda, R. R. & et al. (2020) have pointed out that “Family” is the most dominant factor, with family expectations encouraging young people to become agricultural entrepreneurs.

Starting a business in the field of clean agriculture includes all of the activities associated with different stages in the supply chains of producing safe agricultural products, from providing agricultural inputs and services, farming, processing, trading to distributing agro-products to the end consumers. "Clean" agriculture in Vietnam can be simply understood as including organic agriculture and good agricultural practices (GAP) standard agriculture (Vu Thi Minh, 2013). “Organic Agriculture is a production system that sustains the health of soils, ecosystems, and people. It relies on ecological processes, biodiversity and cycles adapted to local conditions, rather than the use of inputs with adverse effects. Organic Agriculture combines tradition, innovation, and science to benefit the shared environment and promote fair relationships and good quality of life for all involved” (IFOAM, 2008). GAP is a set of principles to be applied to on-farm and post-production processes to create safe and healthy food and non-food agricultural products while at the same time to promoting socio-economic and environmental sustainability” (FAO, 2016). Developing clean agriculture is considered inevitable to meet the increasing demands of the market. However, entrepreneurs seeking to attract investment and start a clean agriculture business in Vietnam still face many barriers. The number of newly established enterprises doing business in clean agriculture remains very small compared to other economic sectors.

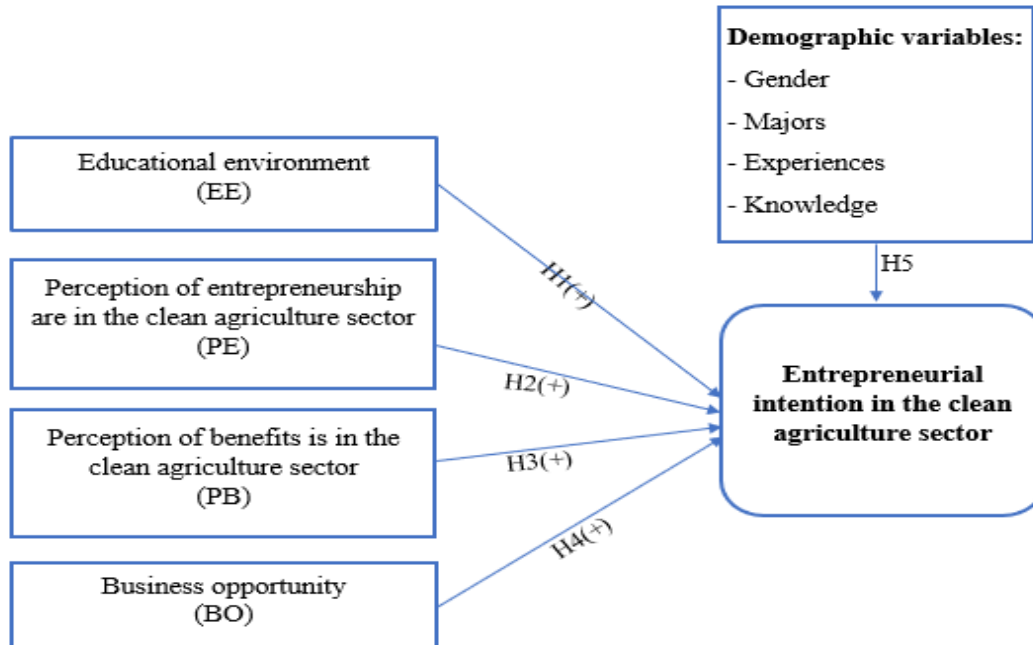

This study aims to identify the significant factors that influence students in their intention to start a clean agriculture business, as an attempt to understand and promote youth entrepreneurship in Vietnam.

2. Methods

Data was collected through an online survey using a structured questionnaire, with a 5-level Likert scale of “Strongly disagree”, “Disagree”, “Neutral”, “Agree”, “Totally agree”. The survey was carried out from November 2011 to January 2022 and obtained 350 answers, of which 324 were valid and usable. The questionnaire sought information on demographic characteristics and student perception on issues related to clean agricultural start-ups as well as whether students intended to set up a clean agriculture business.

Scale reliability test (Cronbach's Alpha), exploratory factor analysis (EFA), correlation analysis and linear regression analysis were all used to identify the factors that affect the entrepreneurial intention of students in Hanoi.

The research model and assumptions are indicated in the figure below.

3. Results

Table 1. Research Sample Description

Sample information		Percentage
Gender	Male	35,19%
	Female	64,81%
Education level	Freshman	23,15%
	Sophomore	23,15%
	3rd year student	36,42%
	4th year student	12,04%
	Others	5,25%
Work experience	Experience	69,44%
	Inexperienced	30,56%
Specialization related to the agriculture sector	Yes	73,46%
	No	26,54%
Interested in products from clean agriculture	Yes	94,14%
	No	5,86%
Willing to pay more to use products from clean agriculture	Yes	91,05%
	No	8,95%

Table 2. Descriptive statistics of variables

Sign	Explanation	Min	Max	Mean	Std. Deviation
EE1	The teachers' lectures provide me with knowledge about clean agricultural entrepreneurship.	1.00	5.00	3.4877	1.06877
EE2	My knowledge of clean agricultural entrepreneurship is largely provided by my family and people around me.	1.00	5.00	3.5278	1.03012
EE3	My knowledge of clean agricultural entrepreneurship is largely provided by extracurricular activities.	1.00	5.00	3.5741	1.01265
EE4	Growing up in a farming place fueled my entrepreneurial intention in the clean agriculture sector.	1.00	5.00	3.4660	1.12657
PE2	Entrepreneurship in the clean agriculture sector brings higher income than other sectors.	1.00	5.00	3.4568	1.01749
PE3	Entrepreneurship in the clean agriculture sector is more difficult than in other sectors.	1.00	5.00	3.7006	1.02290
PE4	Entrepreneurship in the clean agriculture sector contains more risks than other sectors.	1.00	5.00	3.5062	1.04539
PE5	The activities that can be entrepreneurship in the clean agriculture sector are those that grow crops and raise livestock to create clean products.	1.00	5.00	3.3025	.08024
PE6	I will only do entrepreneurship in the clean agriculture sectors if I am unemployed.	1.00	5.00	2.8179	1.24699
PB1	I believe that using products of clean agriculture helps protect the health of myself and those around me.	1.00	5.00	3.9568	1.17164
PB2	I believe that clean agricultural production ensures food security.	1.00	5.00	3.7377	1.11658
PB3	I believe that clean agricultural production helps protect the environment and biodiversity.	1.00	5.00	3.8549	1.13784
PB4	I believe that clean agricultural production ensures food with clear origins and transparency in the production process.	1.00	5.00	3.9475	1.11576
BO1	Vietnam's natural conditions are favorable for clean agriculture	1.00	5.00	3.9352	.96957

Sign	Explanation	Min	Max	Mean	Std. Deviation
BO2	Access to resources (land, water, fertilizer, labor, technology) for farming is not too difficult.	1.00	5.00	3.7284	1.00170
BO3	Policy support and encouragement of the Vietnamese government for clean agricultural products is more than before.	1.00	5.00	3.7931	.91622
BO4	Clean agriculture with safe products is increasingly becoming a global trend.	1.00	5.00	4.0895	.91497
BO5	People are increasingly willing to pay more for clean agricultural products to protect their health.	1.00	5.00	3.9846	.96201
BO6	The supply of clean agricultural products in the market is still limited.	1.00	5.00	3.8704	.93530
BO7	The development of science and technology is a favorable condition for the entrepreneurship of clean agriculture.	1.00	5.00	4.1235	.94273
EI1	I would rather be an entrepreneur in the clean agriculture sector than an employee in a company/organization in the same sector.	1.00	5.00	3.2963	1.13971
EI2	I always try to realize my entrepreneurial intention in the clean agriculture sector as soon as possible.	1.00	5.00	3.2809	1.06948
EI3	I am ready to face the challenges of entrepreneurship in the clean agriculture sector.	1.00	5.00	3.4846	1.06292
EI4	I can only make a lot of money if I am self-employed.	1.00	5.00	3.4599	1.10792

Source: Data analysis results of the authors (2022)

Through Cronbach's Alpha Analysis to test reliability of scales, the results of Cronbach's Alpha of the independent variables show that scales of EE, PE, PB, BO have Cronbach's Alpha coefficients of 0.839; 0.833; 0.925; 0.917 respectively; Corrected Item – Total Correlation is higher than 0.3. Cronbach's Alpha coefficient of dependent variables of entrepreneurial intention (EI) is 0.843 and Corrected Item – Total Correlation is also greater than 0.3. Thus all scales are satisfactory for performing further analysis of EFA.

EFA for independent variables in a first iteration (with 4 factors and 21 observed variables) gives the following results: KMO is equal to 0.926 (≥ 0.5); sig Bartlett's Test is equal to 0.000 (< 0.05); Total Variance Explained 68.744% ($> 50\%$); Eigenvalue is equal to 1.326 (≥ 1); Factor loading coefficients are higher than 0.5 except the observed variable PE1 of *starting a clean agricultural business brings a better future for me, my family, society*

and the country. The variable has the factor loading coefficient under 0.5, so it does not load up in any factor and it should be eliminated.

After removing the PE1 variable, in a second iteration EFA is carried out with 4 factors and 20 observed variables. The results obtained are as follows: KMO is equal to 0.923 (≥ 0.5), factor analysis is accepted with the research data set. Sig Bartlett's Test is equal to 0.000 (< 0.05), factor analysis is appropriate. Eigenvalue is equal to 1.325 (≥ 1) and extracted 4 factors that have the best information summary meaning. Total Variance Explained of 69.708 ($\geq 50\%$) show that the EFA model is suitable. The results of the Rotated Component Matrix in the table 3 show that 20 observed variables are grouped into 4 factors, the factors are redefined as follows: The factor “Educational environment” includes 4 variables EE1, EE2, EE3, EE4; The factor “Perception of entrepreneurship in clean agriculture” includes 5 variables PE2, PE3, PE4, PE5, PE6; The factor “Perception of benefits in clean agriculture” includes 4 variables PB1, PB2, PB3, PB4; The factor “Business opportunity” includes 7 variables BO1, BO2, BO3, BO4, BO5, BO6, BO7.

Table 3. Rotated Component Matrix

	Component			
	1	2	3	4
BO4	.830			
BO7	.813			
BO5	.788			
BO1	.717			
BO6	.705			
BO3	.683

The results of EFA for the dependent variable of entrepreneurial intention in the field of clean agriculture show Factor Loadings are higher than 0.5, so the observed variables are important in the factor and are of practical significance. With KMO is equal to 0.797 (≥ 0.5), factor analysis is accepted for the data set. Sig Bartlett's Test is equal to 0.000 (< 0.05), showing that observed variable are correlated with each other in the total and therefore factor analysis is appropriate. The Eigenvalue is equal to 2.763 (≥ 1). Total Variance Explained is equal to 69.070 ($\geq 50\%$) which shows that the EFA model is suitable. The dependent factor of entrepreneurial intention in the clean agriculture sector (EI) includes 4 variables EI1, EI2, EI3, EI4 (see table 2 for explanation).

The results of Regression analysis are indicated in the tables 4, 5 and 6. The coefficient Adjusted R Square of 0.510 in the table 4 show that the linear regression model is suitable for the data set of 51%. In other words, 51% of the variation of the dependent variable of entrepreneurial intention in the clean agriculture sector is caused by the independent variables. The remaining 49% is due to unobserved variables outside the model or random error.

Table 4. Model fit

R	R square	Adjusted R Square	Std. Error of the Estimate
0.718 ^a	.516	.510	.63277

Source: Data analysis results of the authors (2022)

In the Table 5, the model's F-value is equal to 84.885 and the observed significance level is very small (Sig value is 0.000) showing that the given linear regression model is suitable for the data set.

Table 5. Model fit test

	Sum of Squares	df	Mean Square	F	Sig
Regression	135.951	4	33.988	84.885	.000 ^b
Residual	127.727	319	.400		
Total	263.678	323			

Source: Data analysis results of the authors (2022)

The regression results of the factors in the table 6 show that, with the 95% significance level, all factors of EE, PE, PB, and BO have an impact on the entrepreneurial intention in the field of clean agriculture (due to all of them have Sig values less than 0.05). The variance magnification coefficients VIF are all less than 2, showing that there is no multicollinearity phenomenon. All factors are qualified.

Table 6. Meaning of partial regression coefficients in the model

	Unstandardized Coefficients		Standardized Coefficients	Sig	VIF
	B	Std. Error	β		
Constant	.153	.196		.435	
EE	.247	.052	.239	.000	1.672
PE	.194	.053	.178	.000	1.567
PB	.308	.048	.349	.000	1.935
BO	.131	.064	.113	.040	1.970

Source: Data analysis results of the authors (2022)

The regression models of the impact of factors on Hanoi students' entrepreneurial intention in the field of clean agriculturer are drawn as follows:

Regression equation with unstandardized coefficients:

$$EI = 0.153 + 0.131*BO + 0.308*PB + 0.194*PE + 0.247*EE$$

Regression equation with standardized coefficients:

$$EI = 0.349*PB + 0.239*EE + 0.178*PE + 0.113*BO$$

The regression results in the table 6 show that the “Perception of benefits in clean agriculture PB” is the most influential and positive factor on Hanoi students' entrepreneurial intention in the field of clean agriculture, with significance level Sig is equal to 0.000 (< 0.05) and the the coefficient β_3 is 0.349 (> 0). According to the results of above descriptive statistics, it can be seen that the perception of benefits related to clean agriculture such as “*protection of health*”, “*ensure food security*”, “*protection of the environment and ecological diversity*”, “*transparency of origin, production process*” is perceived very well with quite large mean values of 3.9568, 3.7377, 3.8549 and 3.9475 respectively, approximately at level 4 (equivalent to the meaning of “*agree*”). Current students are gradually having the right interest and awareness of the benefits that clean agriculture brings to themselves, their families and society. According to the sample description results, up to 91.05% of students are willing to pay more to use products from clean agriculture. However, the entrepreneurial intention in this sector is still quite low (mean value is equal to 3.3804), which proves that many young people in addition to being aware of the benefits are also aware of the difficulties in this sector when embarking on the entrepreneurial process. Maybe they don't know what to do or where to start, have difficulty in accessing capital, resources, attracting customers, and distributing products to consumers. Those problems make students worry, leading to a decrease in entrepreneurial intention.

“Educational environment EE” is the second most influential and positive factor to Hanoi students' entrepreneurial intention in the field of clean agriculture (with the significance level Sig is equal to 0.000 (< 0.05) and the coefficient β_1 is 0.239). According to the results of above descriptive statistics, there is a quite new finding: students think that they acquire knowledge about clean agriculture more from “*extracurricular activities*” than from “*knowledge from school*” and “*family, society*”. Contrary to the initial thought that

schools help students acquire more knowledge, the research shows that students tend to receive knowledge more easily through practical activities than more theoretical lectures. This finding of the research will help schools to adjust their training programs to be more suitable for students. EE4 of *“Growing up in a farming place fueled my entrepreneurial intention in the clean agriculture sector.”* has mean value of 3.4660. Many students said that when they were born and raised in a place with a tradition of agricultural production, being exposed to agriculture for a long time helped them have more knowledge of agriculture compared to students with an environment that lives differently. This result show that if students are exposed to agriculture for a long time, this will promote their entrepreneurial intention in the clean agriculture sector. Therefore, the authors will make some recommendations to help students be exposed to clean agriculture from an early age to promote their passion and entrepreneurial intention.

“Perception of entrepreneurship PE in clean agriculture” has a positive impact and is the third influencing factor to Hanoi students’ entrepreneurial intention in the clean agriculture sector, at significance level Sig is equal to 0.000 (< 0.05) and the coefficient β_2 is 0.178 (> 0). According to the results of descriptive statistics, most students think that *“Entrepreneurship in the clean agriculture sector is more difficult (Mean = 3,7006) and contains more risks (Mean = 3.5062) than in other sectors”*. The reality reflects that starting a business in any industry or field contains risks. So having chosen the path of entrepreneurship, people must have great confidence and determination. The independent variable of PE5 *“The activities that can be an entrepreneurship in the clean agriculture sector are those that grow crops and raise livestock to create clean products.”* (Mean = 3.3025) received the majority of the agreement of the students. Although this is considered a correct it represents an incomplete understanding of the breadth of clean agriculture. Clean agriculture is a large field, students can choose an enterprise in any stage of the supply chain: producing products according to the requirements of clean agricultural products (according to GAP, organic ingredients or high technology); processing clean agricultural products; trading clean agricultural products for domestic consumption and for export etc. Most of the students disagreed with *“I will only do entrepreneurship in the clean agriculture sectors if I am unemployed.”* (Mean = 2.8179). This shows that clean agriculture is an area in which respondents are thinking of starting their own business. However, the percentage of students actually starting a business in clean agriculture is still very low. A possible reason for this is that there is still limited exposure to the idea of entrepreneurship in agriculture and especially in the clean agricultural subsector. These findings will help the authors draw solutions to help students increase exposure to the idea of entrepreneurship in the clean agriculture sector.

“Business opportunity BO” has a positive effect and is the factor that has the least impact on Hanoi students’ entrepreneurial intention in the clean agriculture sector (with the significance level Sig is equal to 0.04, less than 0.05, and the coefficient β_4 is equal to 0.113, higher than 0. According to the results of descriptive statistics above, the students all said

that business opportunities in the field are very high (mean coefficients ranged from 3.7284 to 4.0895 meaning “agree”). However, this is the least influential factor for entrepreneurial intention in the clean agriculture sector. This could explain that while most students have awareness of existing business opportunities, the attraction of the profession is not high or some do not have the capabilities to access those business opportunities. Therefore, the authors will propose some recommendations to expand access to business opportunities for young people in the clean agriculture sector.

In addition, the research used the mean test (Independent Sample T-Test) and One Way ANOVA) to measure the “Demographic” factor affecting surveyed students’ entrepreneurial intention in the clean agriculture sector. The results obtained are as follows: There was no difference in the intention of students to start a business in the clean agriculture sector between the male and female genders (Sig T-Test = 0.594 > 0.05), between those with experience and no experience (Sig T -Test = 0.393 > 0.05), between people with different education levels (Sig T-Test = 0.461 > 0.05). In contrast, between people with related and not related to agriculture majors (Sig T-Test = 0.02 < 0.05), between those interested and not interested in clean agriculture products (Sig T-Test = 0.00 < 0.05), and between those who are willing and unwilling to pay more to use products originating from clean agriculture (Sig T-Test = 0.001 < 0.05), there is a significant difference in perceived clean agricultural entrepreneurial intention. From the above results, it can be seen that academic major has an important influence on students’ entrepreneurial intention in the field of clean agriculture. Unfortunately, the number of students with majors related to agriculture in Hanoi and Vietnam is still quite small. According to the survey results, about 26.54% of students have majors related to agriculture, and the remaining 73.46% of students have majors not related. Therefore, increasing the number of students majoring in agriculture may be considered.

4. Discussion and Conclusion

This research has pointed out four factors affecting Hanoi students' entrepreneurial intentions in the field of clean agriculture. Based on these results, recommendations to promote the development of clean agricultural start-ups are as follows:

Firstly, each student himself needs to understand the importance of health, food security and the value of the living environment, and not to be indifferent or insensitive to agricultural products for daily consumption. Students should have their own orientations from an early age, actively learn, practice skills from studying at school, actively participate in extracurricular activities and competitions in order to accumulate knowledge and understanding of entrepreneurship, especially in clean agriculture, to support the start-up process later.

Secondly, universities should research to adjust and expand the training program, or establish more branches of universities and colleges in different disciplines in the clean agricultural subsector with the goal of modern and advanced direction in applying science and technology in the 4.0 revolution period. In addition, it is necessary to organize more

extracurricular activities such as talk shows, contests, or picnics, or study tours to businesses and farms doing organic or GAP standard agriculture. This will help students have more experiential opportunities.

Thirdly, family and friends should be more open-minded, guide and support students in career choice decisions, support and encourage them to be motivated to achieve their goals. Anyone who shares the same interest in clean agriculture, please create social networking sites to share connections.

Fourthly, the State needs to have policies which encourage and orient the progressive ideas about clean agriculture as well as create favorable conditions for young people who have entrepreneurial intention in the field of clean agriculture, including supporting and financing start-up program projects where students can effectively apply their knowledge into practice.

Finally, businesses operating in the field of clean agriculture should cooperate with universities to create programs that combine study and work, create opportunities for students to gain practical knowledge as early as possible in their working lives in line with the German model (Michael Gessler, 2016), promote a wide understanding of the virtues of their trade, and directly provide capital and expertise to students who seek to start clean agriculture enterprises.

This research still has limitations relating to focusing factors influencing only students' entrepreneurial intention in the clean agriculture sector. Thus subsequent researches could study the factors affecting the transition from entrepreneurial intention to start-up behavior in this field. The study showed that 51% of the variation in the entrepreneurial intention in the field of clean agriculture is caused by the four factors in the research model. The remaining 49% is due to other factors that have not been observed yet, so further studies could add new factors into the model. In order to increase the generalizability of the model, subsequent studies should expand the research area to different provinces and larger sample sizes representing the North - Central - South regions of Vietnam and at the same time expand the research object to other age groups.

Abstract

This paper will discuss the impacts of agency cost on the performance measured by ROA, ROE and Tobin'Q of real estate firms in Vietnam. By applying the model of pooled OLS, random effects and fixed effects, the results show the positive impact of agency cost using a proxy called asset utilization on firm performance. Meanwhile, firm performance is negatively affected by agency costs using administrative expenses to net sales ratio and short-term debt to total assets ratio. Moreover, the study also found the optimal agency cost for real estate businesses to achieve the best business performance.

Keywords: *agency cost, firm efficiency, pooled OLS, random-effects model, fixed-effects model.*

1. Introduction

The agency theory was first introduced in 1976 by Jensen and Meckling - two American economists and since then, more and more scholars have investigated this issue. However, in enterprises in Vietnam, the issue of agency costs has not yet been mentioned much. Moreover, the application of all models and studies of foreign documents to the current Vietnamese market situation is not feasible and impractical.

With a sample of 117 real estate companies listed on Vietnam's stock market, empirical research results show that agency costs are measured by four performance proxies of asset utilization (NSTA), General and administrative expenses on net sales (AENS), free cash flow (FCF) and short-term debt (STDTA) have a negative impact on corporate performance as assessed through 3 variables ROA, ROE, and Tobin's Q. The

results of the study show that agency costs have a significant impact on business performance through the variables ROA and ROE. However, when measuring efficiency by Tobin's Q, the AENS and FCF indicators have no statistical significance. Besides, in the next part of the study, our team measures the optimal cost of agency costs so that real estate enterprises can achieve the best efficiency.

The remainder of this article is structured as follows. Section 2 discusses old hypotheses to develop our hypothesis. Section 3 presents our data and methodology. Our experimental results are provided in Section 4. Section 5 concludes.

2. Literature Review

Agency costs are understood as costs incurred when there is a lack of agreement between the goals of managers and owners or the goals of managers and creditors in an enterprise. Many studies show that agency cost has a negative impact on firm performance.

However, it is difficult to measure the level of agency costs directly. Given that it is difficult to measure agency costs, some studies attempt to propose several proxies for agency costs. In the study of Ang et al. (2000), it is believed that agency cost has a negative effect on Total Assets Utilization (measures how efficiently a company's managers use their assets). According to G. T. Akinleye (2018), the efficiency of using assets has a positive impact and affects significantly the performance of manufacturing enterprises. It means that the lower the agency cost can lead the higher efficiency and better firm performance. Rakesh H M, Lakshmi P (2013) used the ratio of operating expense to revenue to measure and also demonstrate that financial leverage and agency costs also have a negative effect on each other. They argue that this measure better reflects the “managerial discretion in spending company resources” (Singh & Davison (2003) than the counterpart measure in Ang et al (2000). A higher ratio of operating expenses indicates higher agency costs. Jensen (1986) also pointed out that when firms possess a lot of free cash flow, they often face problems between managers and owners. According to Ismail Kalash, an increase in a firm's free cash flow leads to an increase in the firm's financial leverage. Financial leverage has a strong negative impact on business performance as measured by two indicators ROA and ROE. In addition, Rakesh (2013) also used the debt ratio to demonstrate that financial leverage and agency costs also affect each other. The results are compatible with the results of assessing the impact of agency costs through the debt index, which is also mentioned by Lee (2010).

Besides, research on the relationship between agency costs and ownership structure and between structure and performance of the firm is also mentioned (Ang et al., 2000; Singh & Davidson, 2003; Fleming et al., 2005; McKnight & Weir, 2009; Black & Kim, 2012; Liu, 2015; Chen, 2015). On the other hand, an ownership structure that comes with low agency costs can lead to an increase in firm performance. The reason is that as the size of the board increases, agency cost problems will arise more because conflicts between owners occur more.

3. Method

✚ Data Sources

Data for the research comes from two sources which is Vietdata system and the public financial statement of Vietnamese real estate firms on the two current stock exchange in Vietnam, namely: Ho Chi Minh Stock Exchange and Hanoi Stock Exchange. Finally, the dataset has 1281 firm-year observations of 117 Vietnamese listed real estate firm in 2007-2020 period.

✚ Methodology

To examine the impact of agency costs on business performance, the study uses the following regression model:

$ROA_{it} = \alpha_0 + \alpha_1.NSTA_{it} + \alpha_2.AENS_{it} + \alpha_3.FCF_{it} + \alpha_4.STDTA_{it} + \alpha_5.SIZE_{it} + \alpha_6.AGE_{it} + \alpha_7.LEV_{it} + \varepsilon_{it} \quad (3.1)$
$ROE_{it} = \beta_0 + \beta_1.NSTA_{it} + \beta_2.AENS_{it} + \beta_3.FCF_{it} + \beta_4.STDTA_{it} + \beta_5.SIZE_{it} + \beta_6.AGE_{it} + \beta_7.LEV_{it} + \mu_{it} \quad (3.2)$
$Q_{it} = \gamma_0 + \gamma_1.NSTA_{it} + \gamma_2.AENS_{it} + \gamma_3.FCF_{it} + \gamma_4.STDTA_{it} + \gamma_5.SIZE_{it} + \gamma_6.AGE_{it} + \gamma_7.LEV_{it} + v_{it} \quad (3.3)$

(In which: i represents the enterprise i and t represents the research period, ROA_{it} is the ratio of profit after tax to total assets of enterprise i in year t , ROE_{it} is the ratio of profit after tax to the equity of enterprise i in year t , Q_{it} is the tobin's Q coefficient, equal to the sum of the market value of capital over the book value of total assets of enterprise i in year t , $NSTA_{it}$ is the asset utilization efficiency, equal to net sales over total assets of enterprise i in year t , $AENS_{it}$ is the administrative expenses on net revenue of enterprise i in year t , FCF_{it} : Free cash flow of firm i in year t , $STDTA_{it}$ is the ratio of short-term debt to total assets of enterprise i in year t , $SIZE_{it}$ is the enterprise size, equal to the base e logarithm of total assets of enterprise i in year t , AGE_{it} is the age of firm i in year t , LEV_{it} is the financial leverage of the enterprise, equal to total debt to total assets of enterprise i in year t , ε_{it} is the residual of the 3.1 model, μ_{it} is the residual of the 3.2 model, v_{it} is the residual of the 3.3 model)

To estimate the above regression equations, we apply ordinary least squares (OLS) model, the random effects model (REM) and the fixed effects model (FEM) for the regression equations to evaluate the impact of agency costs on firm performance. To choose an appropriate model between the pooled OLS model, the RE model, or the FE model, Wooldridge (2010) proposes employing the Breusch and Pagan Lagrangian multiplier test and the Hausman test. However, since the Hausman test cannot be used when standard errors are adjusted for heteroskedasticity and clustered at the firm level, we employ a test of overidentifying restrictions to choose between RE model and FE model (Schaffer & Stillman, 2010). After using the Breusch and Pagan Lagrangian multiplier test and the test of overidentifying restrictions, the FE model should be used to estimate 3.1, 3.2, 3.3 model. As a result, the results estimated from the FE model in this paper is the most optimal.

4. Results

4.1. Descriptive statistics

The descriptive statistics of all the variables used for the regression presents in Table 4.1. Both ROA and ROE, the gap between the mean value and the minimum value as well as the maximum value is quite large. The mean value of the firm's free cash flow (FCF) is negative and equal to -1.25%. This specified that real estate enterprises have difficulty in investing in new projects, paying employees' salaries, paying dividends and paying debts in the period 2007 to 2020. The value of TOBIN Q is 0.730 (73%), which means that on average, real estate businesses in Vietnam are currently undervalued compared to their intrinsic value.

Table 4.1. Descriptive statistics of all variables

Variable	Obs	Mean	Std.dev	Min	Max
ROA	1,281	0.0365	0.0743	-0.853	0.481
ROE	1,267	0.0868	0.195	-2.104	1.021
AENS	1,249	0.203	0.402	0	4.896
FCF	1,277	-0.0125	0.135	-0.924	0.689
STDTA	1,272	0.331	0.203	0.000259	0.971
SIZE	1,281	27.81	1.599	21.07	33.68
AGE	1,281	2.603	0.664	0	4.205
LEV	1,268	0.515	0.220	0.00141	0.989
TOBIN Q	889	0.730	0.625	0.000531	6.366
NSTA	1,266	0.284	0.288	0.000256	3.861

4.2. Correlation matrix analysis

Table 4.2. Correlation coefficient matrix

	ROA	ROE	Q	NSTA	AENS	FCF	STDTA	SIZE	AGE	LEV
ROA	1									
ROE	0.7678	1								
Q	0.1273	0.1356	1							
NSTA	0.2393	0.2046	0.032	1						
AENS	-0.3115	-0.2287	-0.0514	-0.264	1					
FCF	0.0715	0.1163	0.0145	0.0475	-0.0201	1				
STDTA	-0.1033	0.0153	-0.0049	0.2806	-0.0245	0.0133	1			
SIZE	0.0064	0.0423	0.2667	-0.1976	0.1128	0.1128	0.0312	1		
AGE	0.0025	0.0469	-0.0364	0.168	-0.0606	0.0864	0.095	0.1926	1	
LEV	-0.097	0.0628	0.1474	0.1301	-0.0696	0.0906	0.6201	0.2703	0.1358	1

Table 4.2 shows the correlation matrix of all the estimated variables. The results show that most of the coefficients are quite small (the absolute value of the data is less than 0.3), which can prove that our model has no plurality collinear problem.

4.3. The effect of agency cost on return on assets (ROA)

4.3.1. Linear impact of agency cost on return on assets (ROA). Linear impact of agency cost on return on assets (ROA)

Table 4.3 shows that when others are not changed, ROA increased 0.05% for each increasing percent of NSTA, ROA and total asset turnover (NSTA) have a positive relationship. This result supported *hypothesis 2*. The table also showed that free cash flow (FCF) had a positive impact on ROA, opposed to *hypothesis 3*. However, ROA decreased 0.0412% and 0.0239% respectively for each increasing percent of AENS and STDTA. This means the relationship between ROA and AENS is negative. This result supported *hypothesis 1*. The negative relationship between ROA and STDTA had supported *hypothesis 4*.

The outcome of REM showed the same results as the OLS regression. Except, STDTA had no impacts on ROA. Moreover, FEM also indicates the same results as the OLS regression in which NSTA had a positive impact on ROA and AENS had a negative impact on ROE. However, in FEM, both FCF and STDTA had no impact on ROA.

Table 4.3. The linear effect of agency cost on ROA

4.3.2. Evaluate optimal level of ROA through agency cost

By using OLS regression, REM, FEM, we evaluated the linear impact of NSTA, AENS, STDTA and FCF on ROA. The result in three model showed that NSTA and STDTA had an optimal level to the firm efficiency (through ROA).

The nonlinear impact of NSTA on ROA are shown in Table 4.4, in OLS regression, REM and FEM; NSTA and NSTA2 both have P-value of 1%, and the coefficient of NSTA2 is negative (-0.0368, -0.0238 and -0.0207 respectively) which means that the impact of NSTA to the form efficiency have a reversed U shape with the highest efficiency when NSTA= 1.965, 2.2689 and 2.6816 respectively in three model.

Table 4.4. Non-linear effect of asset utilization on ROA

Through the Breusch Pagan and Hausman test, the results of the FEM give the most optimal results with the NSTA asset utilization efficiency of 2.8616, the firm's efficiency is the highest.

The nonlinear impact of STDTA on ROA are shown in Table 4.5. In OLS, STDTA have negative impact on ROA. In REM and FEM, the impact of NSTA to ROA have a reverse U shape with the highest efficiency when NSTA equal $-\alpha_4/2\alpha_5=0,0596/2*0,0826 = 36.08\%$ and $-\alpha_4/2\alpha_5=0,0802/2*0,0959 = 41.81\%$ respectively

Table 4.5. Non-linear effect of short-term debt to total assets on ROA

By using Breusch and Pagan Lagrangian and Hausman test, we can see that the results of FEM give the most optimal results. With the ratio of short-term debt to total assets (STDTA) accounting for 41.81%, the business performance is the highest.

4.4. The effect of agency cost on return on equity (ROE)

4.4.1. Linear impact of agency cost on return on equity (ROE)

The regression results of equation (3.2) in OLS, REM, FEM shown in Table 4.6 shows the effect of agency cost on ROE. When others are not changed, ROE and total asset turnover (NSTA) have a positive relationship which has appeared in some previous studies. This result supported *hypothesis 2*. The table showed that free cash flow (FCF) had a positive impact on ROE. This result is opposed to *hypothesis 3*. However, ROE decreased 0.0859% and 0.0707% respectively for each increasing percent of AENS and STDTA. This means the relationship between ROE and AENS is negative. This is supported *hypothesis 1*. The negative relationship between ROE and STDTA had supported *hypothesis 4*.

The outcome of REM showed the same results as the OLS. Except, STDTA had no impacts on ROE. Moreover, FEM also indicates except FCF and STDTA had no impact on ROE.

Table 4.6. The linear effect of agency cost on ROE

Dependent variables: Return on equity (ROE)			
VARIABLES	(1)	(2)	(3)

4.3.2. Evaluate optimal level of ROE through agency cost

By using OLS regression, REM, FEM, we evaluated the linear impact of NSTA, AENS, STDTA and FCF on return on equity (ROE). The result in three model showed that only NSTA had an optimal level to the firm efficiency (through ROE).

The nonlinear impact of NSTA on ROE are shown in Table 4.7. In OLS, REM and FEM, the coefficient of NSTA2 is negative (-0.0368, 0.0417 and 0.0447 respectively) means that the impact of NSTA to the form efficiency have a reversed U shape with the highest efficiency when NSTA equal to 2,5543, 2,2689 and 0.4664 respectively.

Table 4.7. Non-linear effect of asset utilization on ROE

Dependent variables: Returns on Equity (ROE)			
VARIABLES	(1)	(2)	(3)
	Pooled OLS	Random Effects	Fixed Effects
NSTA	0.188*** (0.0350)	0.224*** (0.0374)	0.0417*** (0.0451)
NSTA2	-0.0368** (0.0149)	-0.0417*** (0.0157)	-0.0447* (0.0246)

SIZE	0.00655* (0.00373)	0.0120** (0.00514)	0.0331*** (0.00870)
AGE	-0.00741 (0.00862)	-0.0436*** (0.0114)	-0.111*** (0.0180)
LEV	0.0514 (0.0329)	-0.0170 (0.0406)	-0.0835* (0.0507)
Constant	-0.106 (0.101)	-0.168 (0.136)	-0.578*** (0.218)
Observations	1,238	1,238	1,238
R-squared	0.094		0,113
Number of firmid		117	117

Standard errors in parentheses

*** p<0.01, ** p<0.05, * p<0.1

The results of Breusch and Pagan Lagrangian and Hausman test shown FEM is the most optimal. In fixed effect model, the result shown that P-value of NSTA and NSTA2 is at 1% and 10% with the coefficient of $\beta_1=0.0417$; $\beta_2=-0.0447$. The coefficient of NSTA2 is negative means that the impact of NSTA to ROE had a reversed U shape with the highest efficiency when NSTA equal to $-\beta_1/\beta_2=0,0417/2*0,0447 = 0,4664$.

4.3. The effect of agency cost on Tobin's coefficient Q

4.3.1. The linear effect of agency costs on Tobin's coefficient Q

The regression results of equation (3.3) in OLS, REM and FEM are shown in Table 4.8, OLS regression was calculated to estimate Tobin's Q. In OLS model, when others are not changed, Tobin's Q increased 0.274% for each increasing 1 percent of NSTA means that Tobin's Q and total asset turnover (NSTA) have a positive relationship which has appeared in some previous studies. This result supported *hypothesis 2*. The table also showed that administrative expense ratio affects positively to Tobin's Q but not having statistically significant. This correlated with free cash flow variable. STDTA is negative with statistically significant at 5%, means that STDTA affects negatively to Tobin's Q. This result supported *hypothesis 4* talking about relationship between STDTA and firm performance.

Table 4.8. The linear effect of agency costs on Tobin's coefficient Q

Dependent Variables: Tobin's coefficient Q			
VARIABLES	(1) Pooled OLS	(2) Random Effects	(3) Fixed Effects
NSTA	0.274*** (0.0951)	0.219** (0.0920)	0.200** (0.0965)
AENS	0.00982 (0.0495)	-0.0168 (0.0438)	-0.0155 (0.0446)
FCF	0.106 (0.168)	-0.180 (0.147)	-0.306** (0.150)
STDTA	-0.334** (0.148)	0.226 (0.179)	0.573*** (0.205)
SIZE	0.108*** (0.0147)	0.166*** (0.0251)	0.169*** (0.0400)
AGE	-0.0856** (0.0383)	-0.0668 (0.0592)	-0.0362 (0.0832)
LEV	0.396*** (0.131)	-0.153 (0.180)	-0.557** (0.218)
Constant	-2.248*** (0.410)	-3.707*** (0.661)	-3.862*** (1.003)
Observations	872	872	872
R-squared	0.094		0.049
Number of firmid		110	110

Standard errors in parentheses

*** p<0.01, ** p<0.05, * p<0.1

The outcome of REM indicates that with statistically significant at 5%, NSTA affects positively to firm performance and FCF in this model correlated to the OLS model. However,

STDTA effect is different from OLS result when showing no statistical significance and little impact on Tobin's Q. FEM has same results as the REM except both the FCF and STDTA affect the Tobin'Q coefficient with the significance level of 5% and 10%, respectively.

4.3.2. Evaluate optimal level of Tobin' coefficient Q through agency cost

By using OLS, FEM, and REM regression methods, we have measured the non-linear impact of agency costs indicators on business performance (in terms of Tobin's Q). Experimental results from the three methods show that no optimal level is detected.

5. Conclusion

When investigating the agency costs in corporate governance, most of the studies assume that agency costs have a negative impact on firm performance (Singh & Davidson, 2003; Hermalin & Weisbach, 2003; Morck & Yeung, 2004; Fleming et al., 2005; Wang, 2010; Lakshmi P, 2013; Khidmat, 2014; Le Duc Hoang, 2019, Vu Thi Khuyen, 2021, etc). However, there are also some studies that show a positive impact of agency costs on firm performance (Chen, 2006; Chrisostomos Florackis and Aydin Ozkan (2008); Iran Pouraghajan, 2012; Abdulrahman, 2014; Wonyonyi, 2016). The aim of this paper is to investigate the impact of agency costs on the performance of Vietnamese firms, especially listed real estate firms, a field where agency costs are currently high-rise.

Our sample consists of 117 Vietnamese listed real estate firms over the period from 2007 to 2020. Our results show that agency costs, measured by asset utilization ratio, administrative expenses to net sales ratio and short-term debt to total asset ratio, exert a negative impact on firm performance, measured by return on assets, return on equity and Tobin'Q. Additionally, we also use free cash flow to measure agency costs, but the results from our test show that agency costs measured in free cash flow will have a negative or positive effect depending on its degree. Finally, we have proven that there is an optimal agency cost so that real estate businesses can achieve their best firm performance.

Abstract

The purpose of this study is to investigate the relationship between Human Resources Management (HRM) and the Innovative Work Behavior of employees (IWB), and consequently measure Employees' Performance (EP). Questionnaires were collected from 329 leaders and followers working within the Banking sector in Hanoi, Vietnam. The results indicate that human resources management positively impacts employees' innovative work behavior, and there is a strong positive influence of innovative work behavior on employees' performance. This study also suggests a mediating role of innovative work behavior in the correlation between human resources management and employees' performance.

Keywords: *Commercial banks, Employee performance (EP), Innovative work behavior (IWB), Human resources management (HRM).*

1. Introduction

Banking is considered the lifeblood of the national economy, so improving the operational capacity of the banking system is always a top priority (Vu Van Thuc, 2015). In the context that industrialization, modernization, and international integration are inevitable development steps, along with the prospects of the Industrial Revolution 4.0 in Vietnam, human resources are considered the sustainable foundation of development in any industry, especially the banking industry (Vo Thi Phuong, 2019). In a business environment that is constantly applying technology and innovative development, businesses need to adapt and create competitive advantages (Ramamoorthy et al., 2005). Meanwhile, the human resources department, employees, and managers are the factors that contribute to the company's results. (Barney, 1991). What is more, innovative work behavior in enterprises has not only been considered to "play an important part in the development of enterprises" (De Jong and Den

Hartog, 2010) but has also been evaluated to promote the capacity of individuals or firms (West and Farr (1989), West (1989), Janssen (2000, p. 288)).

This study will evaluate and demonstrate the impact of Human Resource Management, or HRM (as measured by the variables Recruitment & Selections, Training and Development, Performance Appraisal, and Pay & Rewards system) on Innovative Work Behavior (IWB) through research in the banking industry in Vietnam, and at the same time, the study also investigates how IWB influence the Employee Performance (EP) of employees in commercial banks in Hanoi city (the capital city of Vietnam). The results of this study will contribute to an overview of research related to Innovative Work Behavior.

1.1. Human Resources Management and Innovative Work Behavior

Dorenbosch et al. (2005) stated that HRM includes all decisions and actions influencing the relationship between enterprises and employees to enhance employees' innovative work behavior. Based on previous studies on the related topics, the authors agree that HRM includes the following four components: Recruitment and Selection, Training and Development, Performance Appraisal, and Pay and Reward system (Prieto, 2014, Singh, 2004, De Jong, J. & Den Hartog, D., 2010). On the other hand, Innovative work behavior (IWB), is to generate and apply advanced ideas to one's job intentionally (Janssen, O., 2000). De Jong and Den Hartog (2010) also defined IWB as the act of coming up with new and practical solutions (Farr and Ford, 1990) and implementing such ideas (Amabile, 1988).

Many previous studies focused on the relationship between HRM and IWB. The design of a comprehensive HRM system to build high-quality relationships with the workforce will positively influence the employee's working attitude and encourage the development of innovative behavior (Sun et al., 2007). Research by Prieto and Pérez-Santana (2014) showed a highly effective HRM system according to the AMO (Ability - Motivation - Opportunity) has a positive influence on the employee behavior change process. Most findings mentioned above establish the relationship between HRM and innovation at only the organizational level. Based on previous studies, Janssen (2004) asserted that HRM can influence innovation behavior at work at the individual level, which is completely reasonable and well-founded. Therefore, the authors have come up with the following hypotheses.

Hypothesis 1: Recruitment and Selection have a positive effect on Innovative Work Behavior.

Hypothesis 2: Training and Development as a positive effect on Innovative Work Behavior.

Hypothesis 3: Performance Appraisal has a positive effect on Innovative Work Behavior.

Hypothesis 4: Pay and Reward system has a positive effect on Innovative Work Behavior.

1.2. Human Resources Management and Employee Performance

Previous studies have shown that the four basic contents of HRM, which are Recruitment and Selection, Training and Development, Performance Appraisal, and Pay and Reward system, are important means of promoting employee performance. Employee performance (EP), according to Anitha J (2014), refers to results and achievements achieved at work. Hameed and Waheed (2011) stated that the employee's job performance is the employee's productivity and output, which is the result of that employee's development process.

Previous research about the relationship between HRM and EP proved the existence of a positive correlation between them (Gerhart et al., 1992; Haddock-Millar et al., 1992, Tabiu & Nura, 2013). The social exchange theory (SET) argues that human resource management contributes to a positive exchange relationship between employers and employees - especially when the needs of individual employees are considered - to which employees respond with positive, cooperative attitudes and behavior (Gould-Williams & Davies, 2005). After synthesizing, the researchers put forward the following hypotheses:

Hypothesis 5: Recruitment and Selection has a positive effect on Employee Performance.

Hypothesis 6: Training and Development has a positive effect on Employee Performance.

Hypothesis 7: Performance Appraisal has a positive effect on Employee Performance.

Hypothesis 8: Pay and Reward system has a positive effect on Employee Performance.

1.3. Innovative Work Behavior and Employee Performance

Janssen (2000) proved that innovation is beneficial to every individual and group in a working environment. De Jong and Den Hartog (2007) pointed out a way for organizations to stimulate innovation better, which is by making use of employees' innovative behavior. "Employees can help to improve business performance through their ability to generate ideas and use these as building blocks for new and better products, services and work processes". Aryee, S. et al, (2012) surveyed a large Chinese telecommunication company to discover the link between innovative behavior and task performance, since innovative employees gather and consider a broad range of information to generate new ideas and improve existing processes, Tesluk, Farr, & Klein, 1997. In the banking sector, as the growth speed is getting faster and faster, the relationship between IWB and EP needs deeper investigations. Therefore, the authors have come up with the following hypothesis.

Hypothesis 9: Innovative Work Behavior has a positive effect on Employee Performance.

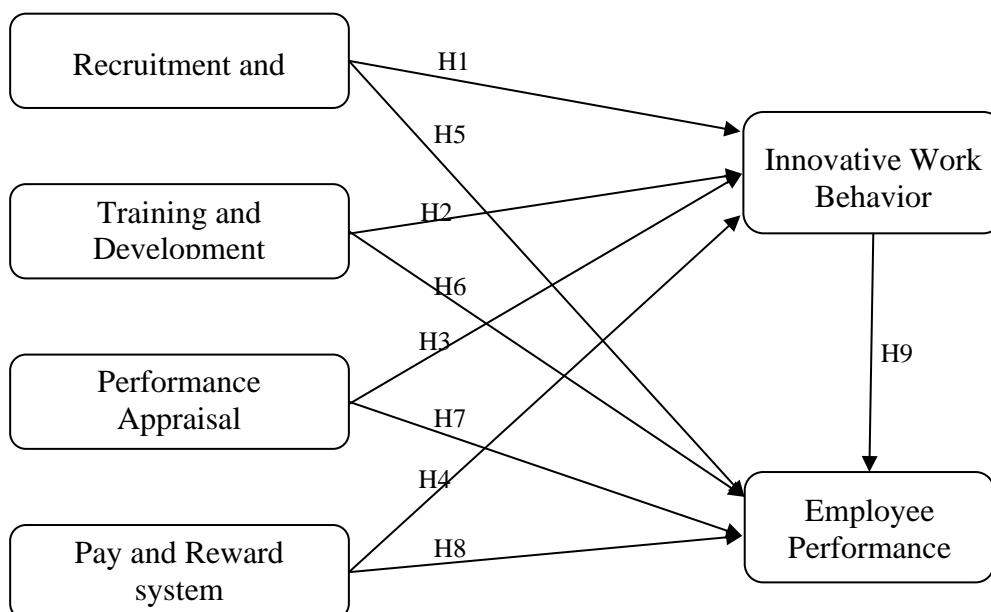

Figure 1. Proposed research model

2. Method

The study used different methods to test the hypothesis. In the scope of the topic, all raw data has been collected from the managers and employees of commercial banks in Hanoi city. 30 staff members at commercial banks in Hanoi were invited to participate in in-depth interviews. The content of the in-depth interview focused on the participants' personal views on the current situation of HRM, IWB, and individual work results at their workplace. In-depth interviews are divided into two main stages: (1) the phase before the quantitative research and (2) the phase after the quantitative research.

With the COVID-19 epidemic remaining complicated, raw data has been collected from an online survey. The questionnaire with 47 observed variables and 5 open-ended questions (including 2 multiple-choice questions and 3 essay questions) was sent to staff at more than 20 commercial banks in Hanoi. The survey received 329 valid responses, reaching a statistically valid rate of 96.76%. The structure of the survey sample by the banking agency is described in detail in Table 1.

Table 1. Analysis of Sample structure by banking agency

Commercial banks	Sample: 340	
	Number (of respondents)	Ratio (%)
Agribank	21	6.4
BIDV	42	12.8
Vietinbank	33	10.0
Vietcombank	24	7.3
MB Bank	28	8.5
VP Bank	32	9.7
TP Bank	16	4.9
Techcombank	35	10.6
ACB	23	7.0
HD Bank	13	3.9
Others	62	18.9

3. Results

3.1. Measure Reliability

Cronbach's Alpha is used to evaluate the reliability of each factor and to assess their relationship. According to Hair. et al (2009), the factor is considered reliable once its Cronbach's Alpha exceeds 0.7. The collected Cronbach's Alpha results of all the factors are shown in Table, ranging from 0.912 to 0.944, therefore satisfying the requirement above.

Table 2. Reliability analysis results

Factor Code	Construct	Number of observed items		Cronbach's Alpha
		Before	After	
RS	Recruitment and selection	8	8	0.917
TD	Training and Development	9	9	0.938
PA	Performance Appraisal	8	8	0.943
PR	Pay and Reward structure	6	6	0.915
IWB	Innovative Work Behavior	9	9	0.944
EP	Employee's Performance	7	7	0.912

Source: Quantitative research results

3.2. Measure Validity

Following an evaluation of each factor's reliability, the authors performed a validity test using Exploratory Factor Analysis (EFA), utilizing the Principal Components and Varimax rotation method. If the loading factors of each factor exceed 0.5, the items in that factor will be kept; otherwise, the factor will be rejected. After all, there are a total of 41 factors are kept for the analysis (PA4, TD9, RS1, RS8, RS3, IWB1 were rejected due to not meeting the loading factor requirements), while KMO test = 0.952 and the Barlett's test with Sig. = 0.000. What is more, the factors RS and TD were accumulated into 1 factor during the validity test, so the authors decide to name it TDRS and continue to the next step in the analysis. The Exploratory Factor Analysis will be shown in **Appendix 1**.

3.3. Confirmatory Factor Analysis

The authors use Confirmatory Factor Analysis for model fit. The CFA findings show that the hypothesized model proposed fits with the data shown. Specifically, the result of the significant Relative Chi-square or CMIN/df is $1.930 \leq 2$, the compatibility tests such as CFI is $0.819 \geq 0.9$, TLI is $0.931 \geq 0.9$, RMSEA is $0.053 \leq 0.06$; PClose is $0.096 \geq 0.05$ (Hair et al., 2010; Hu & Bentler, 1999; Baumgartner & Homburg, 1995; Doll, Xia & Torkzadeh, 1994).

Moreover, the factor validation analysis of Maximum Likelihood Estimates shows that the values of C.R for regression are greater than 0.9, ranging from 0.912 to 0.948. The values of AVE are also bigger than 0.5, from 0.587 to 0.676; and all the values of MSV are smaller than AVE, which proves the reliability validity, convergent validity, and discriminant validity (Hair et al., 2010)

3.4. Structural Equation Modelling

After testing CFA, the authors continue using SEM to evaluate the model. The results include CMIN = 4876,461; CFI = $0,937 > 0,9$; CMIN/df = $1,930 \leq 2$ and RMSEA = $0,053 < 0.06$. Hence, the hypothesized model proposed fits with the data as shown.

Figure 2. SEM result

Source: Quantitative research results

Table 3 depicts that the P-value of the impact of TD, and PA on EP is greater than 0.5; others are smaller than 0.5, therefore, the test accepts the hypotheses H1, H3, H5, H7, H8, H9 and oppose H2, H4, and H6.

Table 3. The result of analyzing SEM

The relationship of indicators			Estimate	S.E.	C.R.	P	Standardized Estimate
IWB	<---	TD	-0.293	0.103	-2.839	0.005	-0.250
IWB	<---	PA	0.418	0.097	4.325	***	0.441
IWB	<---	PR	0.298	0.102	2.929	0.003	0.269
EP	<---	TD	0.053	0.063	0.844	0.399	0.063
EP	<---	PA	0.008	0.059	0.133	0.894	0.012
EP	<---	PR	0.142	0.062	2.285	0.022	0.179
EP	<---	IWB	0.424	0.045	9.431	***	0.593

Source: Quantitative research results

In addition, based on the regression value, Performance Appraisal (PA) impacted IWB at 0.44, representing that the indicator PA has the biggest impact on IWB. Meanwhile,

the regression value of IWB impacting EP is quite large, 0.593. Besides, a contrasting trend has been observed in the relationship between Recruitment & Training (TD) and (IWB).

3.5. Intermediate variables testing

Table 4. Normalized indirect effect coefficient

	PA	TDRS	PR	IWB	EP
IWB	0.000	0.000	0.000	0.000	0.000
EP	0.261	-0.149	0.160	0.000	0.000

Source: Quantitative research results

The research team used the intermediate test method to analyze the influence of variables PA, TD, and PR on EP through the variable HRM, leading to the conclusion that the variable PA has the strongest influence on EP with a value of 0.261 through the intermediate variable HRM. This is followed by the PR variable, with the value of 0.160, having a partial effect, and finally, the variable TD has the least influence (with the value of -0.149).

3.6. Test for differences by multi-group analysis

The authors have used multi-group analysis by positions, and ranks (employees and managers) of those who have participated in the survey.

Table 5. Multi-group analysis results

	Chi-square	df
Constrained model	2773.551	1525
Unconstrained model	2765.649	1518
Differences	7.902	7
P-value	0.34131479	

Source: Quantitative research results

Both the groups partial invariant and variable models of ministry fit the actual data. The results of testing the difference of the compatibility criteria between the variable and partial invariant models for p-value are $0.34 > 0.05$ (95% confidence level), accepting the hypothesis H_0 , thus There is no Chi-square difference between the variable and invariant models. The study chooses the invariant model to read the results because it has higher degrees of freedom. This allows the authors to conclude that there is no difference in the impact of the variables in the model between employee and management ranks in assessing the relationship between HRM activities, and IWB.

4. Discussion and Conclusion

Regarding direct effects: The research results accept H1, H2, H3, H4, H8, H9, and reject the hypotheses H5, H6, and H7. Research shows that Performance Appraisal has the strongest impact on IWB. Meanwhile, Recruitment and Training with IWB are negatively related, and the Pay and Reward system has a negligible effect on IWB. Regarding the impact on Employee Performance: The Pay and Reward system factor partly influences, while the Recruitment and Training, and Performance Appraisal have a feasible impact on Employee Performance. IWB is also a factor that has a strong impact on EP.

Regarding indirect effects: The research results accept hypotheses H7, H8, and reject hypothesis H5. Performance Appraisal factor has the strongest impact on Employee performance, followed by the Pay and Reward system, while Recruitment and Training have a negative indirect effect on the Employee Performance.

Based on the research results, some recommendations are given to the commercial bank industry.

Firstly, in terms of performance appraisal, commercial banks should have their own set of evaluation criteria, specific to each position group as well as focus on the process of innovative employees to complete the assigned work. In which, there is an adjustment of the weighting of the criteria based on the job requirements and the total amount of time allotted to perform the work. Banks also should commend and reward individuals who apply innovative behaviors at work. In addition, a competitive salary and bonus system should be developed proportionally to the level of dedication of staff, which will create an open atmosphere among employees, a will for the development of the organization, and for the sake of their own benefit. Banks also need to set out clear and reasonable recruitment criteria with innovative guidelines and goals. The selection process should be done carefully and focus on selecting the right people for the bank with the ability to innovate. Besides, the banking industry needs to regularly foster, and update knowledge and skills on business and technology for staff. The training process should also not be stereotyped, but most importantly, helps bankers to improve their soft skills, logical thinking skills, and the ability to solve problems in a flexible and timely manner.

Second, the commercial banking industry needs to actively promote and encourage IWB. These financial institutions should emphasize the importance of innovative behaviors in every department, especially those that need creative ideas and contributions to develop and keep up with the trends of the age. Individuals with creativity and innovative behaviors need to be provided with a favorable set of working conditions to enhance their own creative capacity and apply such ideas to work, directly contributing to the development of the banks.

Third, to improve employee performance, Vietnam commercial banks need to build a proper scale to evaluate the level of work completed according to the set goals suitable for each department. In addition to letting managers directly evaluate the level of employees' job completion, each worker should also have the opportunity to self-recognize and self-evaluate their own performance to make suitable changes and adjustments. Moreover, such an opportunity would enable them to find out more practical solutions for their own department to continuously improve and enhance employee performance results.

Marketing Faculty, National Economics University, Hanoi, Vietnam

Abstract

This study was carried out with the aim of discovering the factors that influence the attitude legal and behavioral loyalty of personal customers with quality banking services in Ha Noi. This research used the combination of qualitative and quantitative methods. The result indicated 6 factors related to research object in total, namely trust, commitment, word of mouth, customer insight, customer experience and loyalty attitude. From there, the research pointed out the potential for development and find solutions to maintain customer loyalty to banking services in Hanoi.

Key words: *behavioral loyalty, Ha Noi, personal customers, quality banking services.*

1. Introduction

Today, the role of the customer is very important to the bank's business. And in order to attract new customers and retain old customers, banks need to ensure good service quality and constantly improve. In addition, for customers to approach and recognize the quality of the bank's services, promotion is an indispensable form in attracting customers to the bank. It is thanks to this marketing media that customers know about new products and services as well as promotions, customer care... of the bank and also creates a good image of the bank in the future. customer's mind, helping customers to remember the first bank when there is a transaction need. At the same time, it will strengthen the customer relationship with the bank because the bank understands the needs of customers better and customers trust the

bank more. That is the problem that runs through the research topic: “Factors affecting customer loyalty, attitude and behavior towards the quality of banking services in Hanoi.”

2. Method

2.1. Theoretical basis

2.1.1. The impact of factors affecting the loyalty attitude of individual customers

Based on published studies, the study has drawn the conclusion that: The expression factors of loyalty are trust, commitment, word of mouth, understanding, and experience all have an important and positive impact on customer loyalty

2.1.2. The impact of loyalty attitude affects the behavioral loyalty of individual customers

Studies have tested that the direction of attitudinal loyalty and behavioral loyalty are closely related. Caruana (2002) shares the same opinion and adds that once customers have a positive attitude towards a product or service, a need will arise for the service, thereby making repeat purchases from the brand. many times. The impact of loyalty attitude has a positive influence on behavioral loyalty.

2.2. Suggested model

This model has variables considered for different effects. In the study of the impact of factors affecting the loyalty of individual customers. Independent variables are belief, commitment, word of mouth, customer insight, customer experience, and dependent variable is loyalty attitude.

In studying the impact of attitude loyalty on individual customers' behavioral loyalty. Independent variable is loyalty attitude and dependent variable is behavioral loyalty.

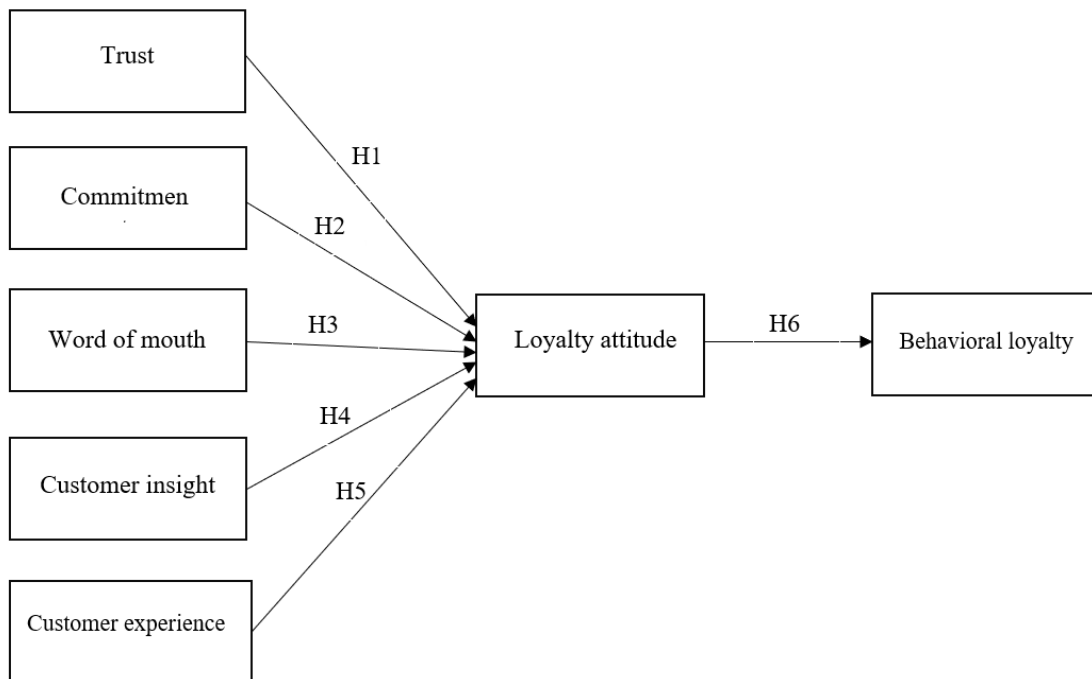

Figure 1. Theoretical model of factors affecting loyalty attitude and behavioral loyalty customers' quality of banking services in Ha Noi

Source: The research team

Behavioral loyalty: the customer's continued repurchase at the same brand, revealed based on future repeat purchase behavior along with the number of customers.

Loyalty attitude: an approach to customers' attitudes, perceptions, and strongly influences customer actions.

Trust: the deep commitment and promise of one party and will fulfill obligations in the exchange relationship.

Commitment: the degree to which customers are willing to sacrifice part of their benefits to maintain a long-term, sustainable relationship with a partner.

Word of mouth: the transmission of information orally from one person to another.

Customer insight: the act of deeply grasping the aspirations, tastes, and desires that are deep in the mind of consumers.

Customer experience: refers to the way customers perceive a brand through their use and exposure to that brand.

- Hypotheses:

H1: Trust is positively correlated with loyalty attitude.

H2: Commitment is positively correlated with loyalty attitude

H3: Word of mouth is positively related to loyalty attitude.

H4: Customer insight has a positive correlation with loyalty attitude.

H5: Customer experience is positively correlated with loyalty attitude.

H6: Loyalty attitude is negatively correlated with behavioral loyalty.

3. Method

The study uses quantitative and qualitative methods. The study aims to screen the observed variables, determine the components as well as the value and reliability of the scale, and test the theoretical model and the hypotheses in the scale model. The test of the scale along with the proposed hypotheses by Cronbach Alpha coefficient, EFA factor analysis, and multiple linear regression analysis is based on the results of SPSS statistical data processing.

4. Results

4.1. Descriptive statistics

Gender: The difference is quite high, there are 219 females, account for 62.4% while the number of males is 132, only 37.6%.

Age: People between the ages of 18 and 25 participating in the survey accounted for 75.8%, corresponding to 266 people; followed by the age group over 35 and the age group from 26 to 35 years old, accounting for 9.7% and 9.4%, respectively, with 34 and 33 people respectively; only a small number of people under 18 years old participated in the survey, accounting for 5.1% corresponding to 18 people.

Career: Mostly from "Student" accounting for 72.9%, corresponding to 256 people, and "Worker" with 21.9% in total equal to 77 people. There is also the position "Pupil" with 5.1% corresponding to 18 people.

Monthly income: There are 142 people with income under 1 million, accounting for 40.7%; followed by 100 people with income from 1 to 5 million, accounting for 28.5%; followed by the income of 10 to 15 million there are 39 people, accounting for 11.1; followed closely by 10.8%, corresponding to 38 people with incomes over 15 million, and finally, the income level from 5 to 10 million, corresponding to 31 people, accounting for 8.8%.

4.2. Cronbach’s Alpha reliability test and Exploratory factor analysis EFA (EFA)

4.2.1. Cronbach’s Alpha reliability test

After conducting Cronbach’s Alpha analysis, the result shows that all independent variables of a model have Alpha coefficient which is greater than 0.7, this justifies that the scale of all variables ensures about the coefficient. Of those, a scale of factor Trust has the greatest Cronbach’s Alpha value (0.828) and factor Word of mouth has the lowest value (0.718). With each of the scales, the research group realizes that none of the values of Corrected Item - Total Correlation less than 0.3. Therefore, all 26 observed variables on a table of the notions such as the influence of the people around and society, internal motivation, financial capability, media, attitude, personality and risk perception reach a requirement and continue to be used for analyzing Exploratory factor analysis EFA.

4.2.2. Exploratory factor analysis EFA

EFA result for the first time:

Table 1. KMO Coefficient and Bartlett test first time

KMO Measure of Sampling Adequacy		0.821
Bartlett’s Test of Sphericity	Approx. Chi-Square	4382.043
	Df	276
	Sig.	0.000

Source: The research team

According to table 1, KMO is equal to 0.821 (satisfying $0.5 \leq KMO \leq 1$) which shows the results of analyzing factors that are suitable with the research data. Bartlett’s Test of Sphericity has Sig as equal to 0.000 less than 0.05 which illustrates observed variables have a correlation with each other in the whole. Cumulative of variance reaches 62,727%, satisfyingly higher than 50% that justifies the EFA model is appropriate. In addition, the Eigenvalues value of six factors is higher than 1 so all factors are detained.

The result of research demonstrates TN2, NT1, TH3, CK5 variables have Factor Loading greater than 0.5 on two factors and the difference of Factor Loading is lower than 0.3, so this does not ensure discriminant value. Thus, the research group conducts to eliminate three observed variables (TN2, NT1, TH3 and CK5) and continues to bring 20 remaining variables to do the second of Exploratory factor analysis EFA.

EFA result for the second time:

Table 2. KMO coefficient and Bartlett's test second time

KMO Measure of Sampling Adequacy		0.876
Bartlett's Test of Sphericity	Approx. Chi-Square	2196.292
	Df	190
	Sig.	0.000

Source: the research team

Table 2 shows that KMO is equal to 0.876 (satisfying $0.5 \leq \text{KMO} \leq 1$) and the results of analyzing factors are suitable with the research data. Bartlett's Test of Sphericity has Sig as equal to 0.000 less than 0.05 which illustrates observed variables have a correlation with each other in the whole. Cumulative of variance reaches 60,477%, satisfyingly greater than 50% that justifies the EFA model is appropriate. Besides that, the Eigenvalues value of six factors is higher than 1, so all factors are retained.

4.3. Pearson Correlation analysis

In short, all six independent variables have a correlation with dependent variables.

Table 3. Correlation between variables

		TD	NT	CK	TM	TH	TN
HV	Pearson	0.749**	0.498**	0.421**	0.447**	0.401**	0.376**
	Sig (2-tailed)	0.000	0.000	0.000	0.000	0.000	0.000

***. Correlation is significant at the 0.01 level (2-tailed)*

Source: the research team

The result illustrates that all variables such as trust, commitment, word of mouth, customer insight, customer experience and loyalty attitude are used for Linear Regression analysis.

4.4. Regression analysis

4.4.1. F-statistic

According to the analysis results, "Adjusted R square" reached 0.631, meaning that the independent variables explain 63.1% of the variation of the dependent variable. 36.9% of the variation of dependent variables is affected by variables outside the model and statistical errors. This result indicates a suitable regression model.

Table 4. Model Summary

Model	R	R square	Adjusted R square	Std. Error of the estimate	Durbin-Watson
1	0.798	0.636	0.631	0.41283	2.030
a. Estimate variables: Constant, NT, CK, TM, TH, TN					
b. Independent variables: TD					

Source: The research team

According to the estimation results of behavioral loyalty, “Adjusted R square” is 0.560, meaning 56.0%, proving that the independent variables explain 56.0% of the variation of the dependent variable. The rest 44.0% is affected by variables outside the model and statistical error. This result indicates a suitable regression model.

Table 5. Model Summary

Model	R	R square	Adjusted R square	Std. Error of the estimate	Durbin-Watson
1	0.749	0.561	0.560	0.48612	2.020
c. Estimate variables: Constant, TD					
d. Independent variables: HV					

Source: The research team

The F value equal 120.810 with Sig. by $0.000 < 0.05$, this shows that linear regression model fits the data and can be used.

Table 6. Result of ANOVA analysis with independent variable TD

Model	Sum of Squares	Df	Mean Squares	F	Sig.
Regression	102.949	5	20.590	120.810	.000
Residual	58.799	345	0.170		
Total	161.748	350			
a. Estimate variables: Constant, TN, TH, TM, CK, NT					
b. Independent variables: TD					

Source: The research team

The F value equal 445.603 with Sig. by $0.000 < 0.05$, this shows that linear regression model fits the data and can be used.

Table 7. Result of ANOVA analysis of general linear regression

Model	Sum of Squares	Df	Mean Squares	F	Sig.
Regression	105.301	1	105.301	445.603	.000
Residual	82.473	349	0.236		
Total	187.774	350			
c. Estimate variables: Constant, TD					
d. Independent variables: HV					

Source: The research team

4.4.2. Testing the hypothesis and evaluate the significance of the variable

The values in the Sig column are all less than 5%, so all 5 independent variables are statistically significant to the dependent variable. In other words, 5 hypotheses H1, H2, H3, H4, H5 are accepted.

Table 8. Coefficients with dependent variable TD

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	B	Std. Error				Beta	Tolerance
Constant	-0.611	0.179		-3.416	0.001		
NT	0.268	0.037	0.279	7.228	0.000	0.708	1.413
CK	0.213	0.036	0.222	5.984	0.000	0.765	1.307
TM	0.217	0.038	0.211	5.659	0.000	0.758	1.320
TH	0.242	0.038	0.238	6.366	0.000	0.752	1.329
TN	0.193	0.039	0.189	5.020	0.000	0.745	1.342

Source: The research team

The value in column Sig is less than 5%, so the independent variable H6 has statistical significance to the dependent variable. In other words, hypothesis H6 is accepted.

Table 9. Coefficients with dependent variable HV

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	B	Std. Error				Beta	Tolerance
Constant	0.560	0.144		3.889	0.000		
TD	0.807	0.038	0.749	21.109	0.000	1.000	1.000

Source: The research team

From the result, our research group suggest regression model below:

$$\mathbf{TD = 0.268*NT + 0.213*CK + 0.217*TM + 0.242*TH + 0.193*TN}$$

$$\mathbf{HV = 0.807*TD}$$

$$\mathbf{=0.807*(0.268*NT + 0.213*CK + 0.217*TM + 0.242*TH + 0.193*TN)}$$

Including:

NT: Trust

CK: Commitment

TM: Word of mouth

TH: Customer insight

TN: Customer experience

TD: Loyalty attitude

HV: Behavioral loyalty

4.4.3. Standardized Distribution Residual of Sphericity

To a Histogram chart, if Mean value is approximately equal to 0, standard deviation is close to 1, bell-shaped distribution curves can confirm that the distribution is approximately normal, assuming the normal distribution of the residuals is not violated. The survey indicates the residual has Mean value is $-2.14E-15$ (approximately equal to 0) and standard deviation is 0,993 (close to 1). Therefore, distribution of residuals is approximately normal, the assumption of normal distribution of residuals is not violated.

With a Normal P-P Plot chart, if quantiles in the distribution of the residual are centered on a diagonal, that is, the residuals are normally distributed. The data show that the percentiles are concentrated on a diagonal, so the residuals are normally distributed.

5. Discussion and Conclusion

5.1. Solution

Consumers

First, each consumer should choose reputable banks with high level of information security, ability to fulfill commitments and risk management capabilities.

Second, consumer should consult bank's customers about their service before selecting. In addition, consumers can share their opinions about their experience in banks to others and even bank's staff to help them improve their service quality.

Banks

First, banks need to ensure that they fulfill their commitments to customers, provide high quality services, and especially ensure absolute confidentiality of customers' personal information and transactions.

Second, if errors occur, banks must ensure that they are handled quickly and flexibly. If the bank makes a mistake, there must be an apology and timely correction. If the error originates from the clients, the customer service team should give them deliberate and precise guidance.

Third, Banks should use positive customer feedback to showcase the quality and services your bank offers. In addition, providing special offers for loyal customers will motivate them to tell their friends, family,... about how great the bank is.

Fourth, understand customer's needs actively to give them prompt advise products and services related to the desire of customers is an effective way that banks should focus on to bring better care to their clients

Fifth, it is essential to improve capacity and awareness of staffs, because they have a significant impact on customer evaluation. In addition, banks should improve service quality according to modern technology such as internet banking, mobile banking... as well as the quality of tangible services to bring comfort to customers while working with the bank.

Management Agency

First, the Financial Management Agency needs to have clear regulations and strictly control the activities of commercial banks to ensure the interests of those banks as well as their customers, especially the regulations of information security.

Second, the Financial Management Agency has to adjust procedures and timeframes for approval of promotional and gratitude programs to help commercial banks get closer to their clients.

5.2. Conclusion

Loyal customers play an important role in the development of commercial banks. This research demonstrate that Trust, Commitment, Word of mouth, Customer insight and Customer experience have impacts on Loyalty attitude and Behavioral loyalty. Commercial banks should find the solutions linked with these factors to boost consumer engagement by strengthening the bond between the banks and the customers.

Abstract

In many studies, current documents and regulations of Vietnam, innovation is considered a key weapon for business development and national economic growth. Innovation is not the process that only large enterprises are interested in and have advantageous resources to carry out, but many small businesses also have their own motivations and advantages to invest in innovation activities. This is the premise to create a competitive advantage and be decisive to survival in the market as well as for long-term and sustainable development for any kind of business. Determinants of innovation have been well explored but rare researches have paid attention to the relationship between informal competition and innovation. Therefore, the purpose of this research is to build a model of the impact of informal competition on both product innovation and process innovation of Vietnamese enterprises. Our research uses secondary data on more than 200 Vietnamese enterprises extracted from World Bank's enterprise surveys. As a result, informal competition positively impacts on product innovation and processes of formal Vietnamese enterprises.

Keywords: *informal competition, product innovation, process innovation*

1. Introduction

1.1. Rationale

With the strong impact of innovation in improving the efficiency of the business, the topic of research on factors affecting innovation has received much attention from academic researchers. However, this study has found an important factor variable, which is informal competition for the results of the business innovation. In the last few decades, the informal economy in Vietnam accounted for about 30% of the country's GDP. Firms operated in this economy are often small and unregistered and the firms do not sign for labour contracts with their workers. The existence of the informal economy has a lot of causes divided among

each group of subjects, which can be listed as follows: due to the desire to make a lot of profits, due to the limited legal policies and many complicated administrative procedures, due to the large tax burden, due to the growing social networking, the types of online business are increasingly popular (Vu S. T., 2021). While formal businesses must carry out many administrative procedures to be officially operated, informal firms have stronger motivation to engage in the informal economy to avoid legal requirements such as taxes and regulations for higher profits. This puts a lot of pressure on all formal enterprises in every sector when the same products are sold to customers in the same markets with different prices which are often lower from the informal producers (Heredia et al., 2017). This is called informal competition.

It is pivotal to mention that innovation is the trend of every Vietnamese enterprise in recent years (Techfest, 2021). In 2021, Vietnam ranked first for the achievements in innovation in the groups of lower middle-income countries (Vu S. T., 2021). Especially in the recent Covid period, enterprises have been heavily affected and have to innovate in either new product development or cost-saving processes to survive and grow in the market. Only 11% of businesses said they were "unaffected" and nearly 2% noted a "completely positive" or "largely positive" impact due to the Covid-19 pandemic (Le, 2021). The old business trails and strategies are no longer suitable or not effective enough to revive an entire business. Covid hasn't really gone away yet, but informal competition still exists and even grows up because workers lose their jobs during the pandemic. This really raises the question of whether that informal competition has any impact on the innovation of enterprises. In this regard, there are not many research papers exploring that relationship (Webb et al., 2013) and in particular, there have not been any research papers in the same field conducted in Vietnam recently. Therefore, our research will look for the relationship between informal competition and innovation of enterprises to see the consequence of informal competition in the new lens which is beneficial for the competitive advantage of all kinds of businesses.

The main contribution of this article is to provide the evidence that informal competition spurs formal firms to engage in both product and process innovation in Vietnamese firms. Our research responds to the suggestion of previous research to consider how informal competition impacts other types of innovation besides product innovation.

The following sections are structured as follows: in section 2 we review literature on topics related to relationship of informal competition and innovation; Section 3 presents the research model and hypotheses development. Section 4 describes the data, variable measurement, and data processing methods. The estimation results, model fit analysis, and hypothesis determination are presented in Section 5. In section 6, we explore the findings in further depth and provide managerial implications, conclusions as well as limitations of the research that should be addressed in future research.

1.2. Literature review and empirical review

1.2.1. Innovation

During the recent Covid-19 pandemic, innovation is being talked about more than ever as a driving force to create the next phase of economic growth. However, it has been of

interest for quite some time almost a century ago by many researchers and authors. Regarding the definition of innovation, Varadarajan (2018) finds that it is the use of knowledge and resources to create new value in products and processes. From another perspective, innovation is a prerequisite for creating competitive advantages, reducing costs and improving the quality of new products and services, while providing good business models on how to better distribute goods (Lazzarotti et al., 2010; Lichtenthaler, 2008, 2009; Spithoven et al., 2013). In general, the concepts all imply that the purpose of innovation is to improve labor productivity and develop the economy, so it has been fully summarized in Article 3 of the Law on Science and Technology of Vietnam as follows: "Innovation is the creation and application of achievements, technical solutions, technologies and management solutions in order to improve the efficiency of socio-economic development, improve productivity, quality and added value. increase in products and goods". There are four most common types of innovation, namely: product innovation, process innovation, marketing innovation and organizational innovation (OECD/Eurostat, 2005).

Innovation plays a very important role in the development of countries and businesses. It helps to confirm the competitive position of the enterprise with other competitors in the new market (Becheikh et al., 2006; Edison et al., 2013). Moreover, in the world, the increasing level of competition requires an early focus on investment in developing technological capabilities to enhance position in the era of globalization (World Bank, 2013). Not only in the world but even in Vietnam, the indispensable role of innovation is undeniable while the research on innovation of Vietnamese enterprises is still limited. The reality shows that although many businesses are aware of the role of innovation, very few businesses know how to innovate (Phung & Le, 2013).

There are many different reasons for the inconsistency in the impact of factor variables on innovation such as characteristics, concepts and various measures of innovation concepts or characteristics of firms (Souitaris, 1999). In which, internal factors are factors that enterprises can control and the number of those factors affecting innovation is very diverse and rich, including general characteristics of the business, factors belonging to the management team/leaders, factors belonging to functional resources and strategy. External factors emphasize on external necessary things to promote innovation motivation such as groups of factors belonging to the field of activity, groups of geographical factors, and groups of factors of cooperation and interaction in networks, acquiring knowledge and technology. In our model, we account for both internal and external factors on determining the probability of innovation in businesses with the focus on the informal competition factor.

1.2.2. Informal competition

1.2.2.1. Informal economy and Informal competition

Informal competition is our main external independent variable. Before explaining the relationship of informal competition and other factors on innovation output, this study starts from the origin of the term "informal competition", which is "informal economy". Informal economy can be originated from "informal economic sector" firstly proposed by Hart (1973) to describe a traditional economic sector in a

developing economy in which clearly distinguishes between the informal economy and the formal sector on the basis of paid labor and self-employment. The informal economic sector is the production and business households that do not have legal status, do not have an operating license, but still produce goods and exchange in the market. Recently, the informal economy in Vietnam accounts for about 30% of the country's GDP (Vu S. T., 2021). This figure does not include illegal business activities in Vietnam, indicating the important role other businesses play in the informal economy when it comes to job creation and significantly reducing poverty. In addition, it is also about creating a "safety net" for the economy during recessions when absorbing "economic shocks", which is most evident in the pandemic years 2020-2021.

Currently, the emergence of new professions/ fields such as Youtuber, online sales, e-commerce... are developing strongly, but the concept of "informal" is still quite vague with many definitions of different authors. From the concept and characteristics of the informal economy, the concept of informal competition is understood as competition between companies that have not yet registered for a business license but have income from the production of goods and legal services with formal businesses (Nichter & Goldmark, 2009). The formal firms, who registered for a business licences, face invisible competition from the informal sector due to large price disparities. However, the consequences of this competition are still controversial because it varies depending on the state and characteristics of the economy (Porta & Shleifer, 2008). In Vietnam, the Covid pandemic has caused companies to cut spending, resources and suspend some essential services, making it a good opportunity for informal business to emerge. The fact has shown that the growth in the trend of the informal economy in recent years and probably soon will exist more commonly in rural areas than in urban areas (Vu N. T., 2021). Accordingly, its impact on small and medium enterprises and large enterprises is also different.

1.2.2.2. The relationship between informal competition and innovation

In recent years, innovation has emerged not only as a way for businesses to increase profits or reduce costs, but also as a new approach to improve the economic inclusion of the poor (Meagher, 2018). Or in emerging markets, Juan Bu et al. (2020) especially emphasizes informal costs, which affect both internal and inter-enterprise relationships, limiting the incentives and innovation capabilities of firms. As a result, more and more firms engage in imitation rather than innovation. Externally, in Europe, the threat of informal competitors of firms has been shown to have a direct relationship and a positive impact on product innovation (Miocevic et al., 2022). Another interesting finding in Africa and Latin America shows that there are two directions of interaction between these two concepts. That is, when the intensity of informal competition is low, it will have a positive effect on corporate innovation. On the contrary, if that level of competition exceeds the threshold (located at a high level), it will have a negative impact, inhibiting innovation and creativity (Mendi & Costamagna, 2017). In Vietnam, researchers pay little attention to informal competition. Although some questions are raised regarding the informal economy across the non-farm

sectors and diversification of household income sources, these studies are also limited by the lack of data (Cling et al., 2010).

1.3. Research frame and hypothesis development

Our study uses the theoretical model proposed by McCann & Bahl (2017). This model is used to account for strategic behavior and business results of enterprises across three dimensions: industry-based competition, firm-specific resources and capabilities, institutional context. We use this model to analyse the relationship between informal competition as an industry-based competition factor and product/ process innovation of enterprises in Vietnam.

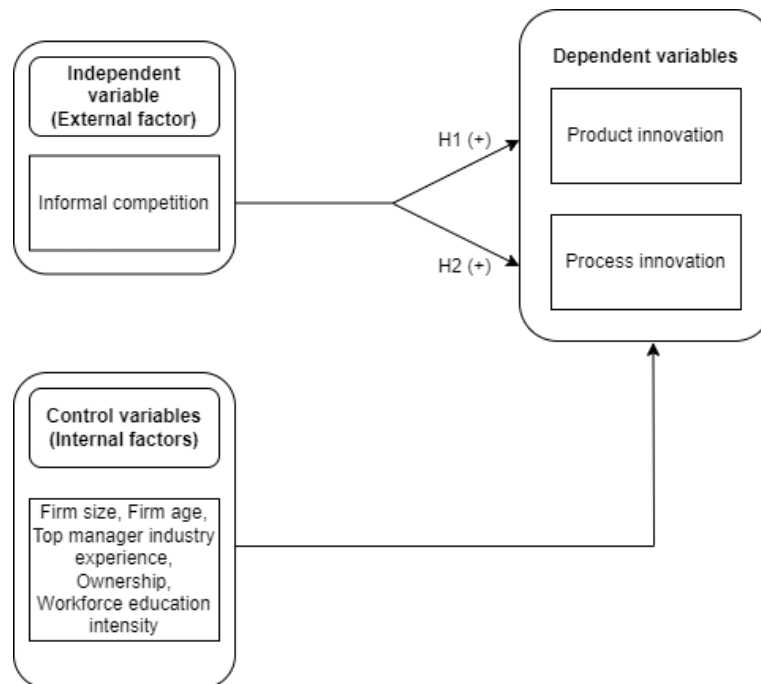

Figure 1. Proposed research model

Source: proposed by authors based on McCann & Bahl (2017).

1.3.1. The influence of informal competition on firm's product innovation

Product innovation is the process of transforming an idea into a commercially viable customer value proposition (Chandy & Tellis, 1998). Firstly, new product development is a method usually used by formal companies to reduce rivalry threats from informal firms. Normally, customers use lower-cost products by informal enterprises rather than formal businesses. Formal firms can exploit their resource advantages to better differentiate themselves from their informal competitors who are unable to adopt similar strategies. Better actions are those that competitors will find difficult to replicate because they help formal firms to gain a competitive advantage and attract customers from competitors' markets who care about low prices of the same products. Second, previous research indicates that informal firms tend to be run by less-educated managers and operate at lower productivity levels (Porta & Shleifer, 2008). With less knowledge to draw upon and inferior productivity, informal competitors are less able to compete with formal ones by product innovation output. Besides, many studies showing that innovation increases in the presence of competition

(Blundell et al., 1999; Kilponen & Santavirta, 2011; Tishler & Milstein, 2009). So, this research hypothesizes that:

H1: Informal competition has a positive impact on the product innovation of formal enterprises.

1.3.2. The influence of informal competition on firm's process innovation

Process innovation is the implementation of a new or significantly improved method of production or distribution (OECD/Eurostat, 2005). Process innovation is more strongly influenced by informality than product innovation. In developing countries, it is often easier to introduce a new product category than to engage in the redesign of production processes, especially if the company lacks the necessary skills to manufacture new technology or to adjust knowledge. Evidence indicates that the main motivation for customers to transact with informal firms is to gain lower priced products (Williams & Martinez-Perez, 2014). Therefore, formal companies have strong motivations to get innovation in their process to enjoy cost-based advantages. In other words, formal enterprises will compete with informal enterprises to reduce price of products (Peng, 2003; Peng & Heath, 1996).

H2: Informal competition has a negative impact on the process innovation activities of formal enterprises.

2. Method

2.1. Data collection

This research utilizes the secondary data from two surveys including the World Bank's Vietnam Enterprise Survey (ES) in 2015 and the Innovation Follow-up Survey of Manufacturing Firms in Vietnam (2016). The ES survey was conducted on a sample of 996 enterprises. The Innovation Capability Survey (ICS) conducted in 2016-2017 surveyed over 300 firms (a subsample of 996 firms from the ES survey). The ES Survey sampling method consists of two ways to produce sample sizes, namely a sample representation of the entire non-agricultural private economy and the composed sample covering both service industries and other related sectors of the economy. Three stratified levels are as follows: field of operation, business size and geographical location. In this study, the research team combined both datasets into one set to facilitate the regression of the main models. The authors use some existing variables of the World Bank's dataset and create some new variables.

2.2. Measurement

Dependent variables

This study handles two dependent variables serving as innovation particularly product innovation and process innovation. The measure of product innovation is referenced from de Jong & Vermeulen (2006); Fritz (1989); Phung Minh Thu et al. (2018); Spithoven et al. (2013). We also created a new variable to measure enterprise process innovation representing three questions related to process innovation. This measure is referenced from the study of (Do & Tran, 2021).

Intermediate variables

To measure the level of informal competition, we appraise the size of impediment from competitors' practice in the informal sector to some extent (Farooq et al., 2019; Heredia et al., 2017).

Control variables

We follow the concepts of definition based on the studies of Farooq et al. (2019) and (McCann & Bahl, 2017). The research team has synthesized and selected the control variables that are most suitable for the existing data set as follows:

Firm size: Size here is defined as the natural logarithm of the total number of employees in the firm (Farooq et al., 2019).

Workforce education intensity: Education intensity here is defined as the percentage of the company's employees who have a university degree or diploma (McCann & Bahl, 2017).

Firm age: Firm age here is the total number of years since the establishment of the firm (Farooq et al., 2019).

Top manager industry experience: Top manager industry experience here is the natural log of the number of years of experience the firm's top manager has in the firm's primary industry (McCann & Bahl, 2017).

Ownership: We also considered the ownership composition of the firm by including controls for percentage ownership that is foreign, government, and other with private being the omitted category (McCann & Bahl, 2017).

2.3. Data analysis

The research team uses Stata software to help analyze the following specific issues:

- Descriptive statistics on the overview of enterprises participating in the survey
- Statistics of survey results on informal competition affecting innovation of enterprises
- Analyze the correlation between factors and innovation of enterprises.

Since the measurement of the dependent variable uses binary questions, the method of least squares (OLS) in the may give false results. The appropriate estimation method is called logistic regression (Long & Freese, 2001). This study will apply binary logit regression to test the hypotheses.

The general formula of logistic regression model:

$$p(PI_i = 1|X_i) = \frac{e^{\beta_0 + \beta_i x_i}}{1 + e^{\beta_0 + \beta_i x_i}}$$

The logarithm of both sides gets the equation:

$$\text{logit} = \ln(\text{odds}) = \ln\left(\frac{p}{1-p}\right) = \beta_0 + \beta_i x_i$$

Replacing the dependent and independent variable names, we get:

$$\ln\left(\frac{p(PI_i/PCI_i=1|X_i)}{1-p(PI_i/PCI_i=1|X_i)}\right) = \beta_0 + \beta_1 \cdot \text{InformalComp} + p_i + \varepsilon_i \quad (1)$$

(1): The equation with only independent variable is "Informal Competition"

In which:

p: Probability for an enterprise to innovate products/processes

p-1: Probability that the enterprise does not have product/process innovation

β_0 : intercept (factor of freedom)

β_k : regression coefficient

InformalComp: independent variable reflecting the level of informal competition

p_i : Fixed effect - controls for unobserved effects of the model and somewhat reduces Omitted variable bias.

ε_i : Remainder

Significance:

Impact direction

β_i has a positive sign: increased informal competition will lead to increased innovation

β_i has a negative sign: increased informal competition will reduce innovation

Impact magnitude

In the Logistic model, we explain the change in the probability of the dependent variable's event occurring due to the influence of the causal variable through the rate of change. Odds ratio (odds ratio - is the ratio of two Odds coefficients)

If x_i increases by one unit, then $\ln\left(\frac{p}{1-p}\right)$ increases β_i times, the odds change $(e^{\beta_i}-1)\times 100\%$

3. Results

Table 3.1 reports descriptive statistics for the variables used in our analyses. Univariate statistics provide some interesting background. Informal competition is a significant issue in our sample with over 63 percent of respondents indicating that they compete against informal firms (177/280). The average perceived obstacle presented by informal competitors is 1.239 (midway between a minor and a moderate obstacle). There is only more than third of the firms report that they have introduced a new or upgraded product or service (0.35) and half of the firms experience process innovation during the reported period

Table 3.1. Descriptive Statistics

Variable	Obs	Mean	Std. Dev.	Min	Max
Product innovation	297	.35	.478	0	1
Process innovation	298	.5	.501	0	1
Informal competition	280	1.239	1.214	0	4
Firm age (logged)	300	13.727	10.329	1	68
Firm size (logged)	300	3.764	1.397	.693	8.854
Top manager industry experience	294	7.599	.005	7.58	7.607
Foreign ownership	300	8.24	26.5	-9	100
State ownership	300	2.143	9.829	0	70
Workforce education intensity	296	24.98	19.953	0	100

Table 3.2 reports the correlation matrix for informal competition, control variables and product innovation. It shows that the individual correlation coefficients of the pairs of independent variables are all less than 0.7, showing that there is no multicollinearity in the

model. For more certainty, the team used the VIF method to calculate the variance and got the mean value of 1.184, which is much lower than the limited value of 10. Moreover, the individual VIF values are also low results, so it is certain that the group's study does not experience multicollinearity in this case.

Table 3.6 illustrates four fixed effect logit models to investigate the direct impact of informal competition to product and process innovation. Model 1 and 2 include only informal competition and product, process innovation. It shows strong positive relationships between informal competition and two kinds of innovation. Model 3 includes product innovation, informal competition and all the control variables; it shows that larger firms, firms that have lower top manager experience are more likely to have product innovation than others. Moreover, informal competition affects product innovation positively. Model 4 includes process innovation, informal competition and all the control variables; it shows that larger firms, firms that have lower top manager experience, firms with higher levels of domestic ownership are more likely to have process innovation than others. Informal competition also positively affects process innovation in this model. Results from logit models can also be interpreted in terms of marginal effects—this calculation indicates that a one-standard-deviation increase in the informal competition rating increases the probability of product and process innovation percentage points. The illustration of marginal effects are presented in appendix.

Based on the results above, Informal competition clearly has positive effects on firms' product and process innovation. Therefore, hypothesis H1, H2 are supported

4. Discussion and Conclusion

This study mainly focuses on analyzing the relationship between innovation of enterprises in Vietnam and informal competition. According to the results in the data set, more than 63% of enterprises face difficulties in competing with informal enterprises; from which it can be seen that informal competition is a very important part of competition in the Vietnamese economy. Furthermore, we apply McCann's theory and Farooq's control variables to enrich the research model by studying the impact of informal competition on product and process innovation (Farooq et al., 2019; McCann & Bahl, 2017). The study has successfully applied the theories of previous studies and added an important theoretical basis for the informal competition and innovation of enterprises in Vietnam.

Furthermore, research has shown that informal competition positively affects a firm's ability to develop new/ significantly updated products or processes. By showing the relationships between informal competition and enterprise innovation, our study provides important recommendations for policies. First, informal competition does not always negatively affect a firm's ability to innovate products and processes in Vietnam. This implies that policies that coerce or attempt to formalize informal enterprises may not be justified and need to be reconsidered in many cases. Our research also shows that 64% of surveyed enterprises did not have any product innovation and 50% did not innovate in the last 3 financial years. From that, it can be concluded that the innovation of enterprises in Vietnam is not common and need to be encouraged by various policies including the regulations on informal economy. Increasing informal competition will help licensed enterprises in Vietnam have the motivation and conditions to innovate, helping them to develop their development potential more.

Our research also has several limitations. First, our study is currently only using cross sectional data, which could not help us to conclude the strong causal relationships between variables. We suggest further studies can employ the panel data to support our findings. Second, we have not taken into account the reversed U-shaped suggested by Mendi & Costamagna (2017) between informal competition and innovation. We invite additional research to provide further theory and evidence for this mechanism.

Abstract

This paper aims to investigate some characteristics of a business network to explore the relationship between such networks and innovation of the small and medium enterprises. This paper uses the survey of small and medium enterprises from 2005 to 2015 and a logit regression is used as the main method to run the data of more than 17,000 observations from SMEs of various sectors in many regions in Vietnam. small and medium enterprises can enhance their innovations by leveraging the relationship with their big customers and other members of their business association in which they participate.

Keywords: *Networking, customer relations, innovation, small and medium enterprises*

1. Introduction

Innovation at firm level has been one of the main themes of economic research for many years. Schumpeter is also known as the first scholar to coin the term “entrepreneurship” to the world (Schumpeter & Backhaus, 2003). For Schumpeter, entrepreneurs are sources of innovation, the driving force of capitalism not just owning, running, or investing in a business. An entrepreneurship has to be proven by new combinations of resources and commercial applications of those combinations (Sobel & Clemens, 2020). The definitions of innovation has changed over time since then. The idea of innovation initially is linked to the role of Research and Development (R&D) activities, that are internal innovation. However, recently, the research trend has shifted significantly to the impacts of external relationships, alliances, networks, and other forms of external interactions of external sources on innovation performance.

There are several studies that show the relationship between network ties and firm innovation performance, emphasizing that networks are valuable tools that foster the innovation performance (Chen et al., 2011; Freeman, 1991; Love & Roper, 2001; Nieto & Santamaría, 2007; Rogers, 2004; Zeng et al., 2010). Nevertheless, most of the studies that examine the use of networks in firm's innovation explore the impact of network structures characterized by strong ties of weak ties on innovation. Our research aims to examine the

relationship between network and innovation of Vietnamese SMEs. In specific, we investigate the impact of network size, number of times of network and network actors on innovation features, innovation activities and innovation capabilities of these SMEs.

By following this aim, our research tends to discover the role of network on activating and supporting innovation in SMEs. Although there are many research about the effects of network on innovation, those mostly focus on large enterprises on developed countries. The contribution of this research to the empirical research is that the model is based on panel data of SMEs in Vietnam which is a developing country. The study is constructed in five parts. The first part that has already illustrated the introductory parts of this study including rationale, research background, aims and objectives, research object and scope, and research methods. The next part will review many literature that investigate the relationship between network and innovation in small-and-medium-sized enterprises. The third part describes the specific method and research model that are used to demonstrate the relationship. The fourth part will present the results and discussion around them. The final part include some conclusions and limitations of this study.

In this research, SMEs is defined based on quantitative approach. Hatten (2011) specifies SMEs are which noted by adjectives indicating size and the most common condition to differentiate between small and medium enterprises and large ones is number of workers. Meanwhile, European Commission claims that SMEs should be defined based on number of workers as mandatory criteria and other two financial criterias (which are annual turnover and annual balance sheet) as optional criterias. In Vietnam, SMEs are characterized by their smaller size in terms of total assets and total revenues of the three previous years which do not exceed three hundred billions VND. Otherwise SMEs have mostly the legal forms of private entity and limited company. SMEs performance depends heavily on the owners characteristics.

Network is the interaction and engaging between people for mutual benefits. According to Snehota and Hakanson (2002) believe that network consists of companies and their relationships with the others. These companies can simply write informal or formal agreements with. Ecorys (2014) defines network as the combination of business relationship. In this paper, network is the relationships between business and other organizations, customers, etc. We measure network by factors include the *size* of the network with each actor (companies in the same and different business lines, bank official, politicians and civil servants), *number of times* firms contact those networking actors, and *the percentage* of those actors attached with the role of suppliers, customers, debtors, and creditors.

The role of network on firms' innovation

There many ways to explain the improvement in innovation performance due to networking. Florin et al. (2003) used the social capital model to state that entrepreneurs can take advantage of opportunities and social resources that are embedded in networks. Jarillo (1989) reasoned that entrepreneurs can use networks to tap needed resources that are “external” to the firm. Lasagni (2012) explains that linkages offer firms easier access to new ideas and can enhance the transfer of knowledge from research units to business activities. The trend of open innovation studies, which initiated by Chesbrough (2003), has

been the hottest research theme in innovation studies recently. The “open innovation” topic has been studied and debated by many management scholars (Chesbrough, 2003; Chesbrough et al., 2006; Huizingh, 2011; Lichtenthaler, 2011). Innovation is traditionally viewed as activities that take place internally in a single firm. However, for Chesbrough (2003), the nowadays increasing availability and mobility of knowledge workers, the flourishing of the Internet and market transformation (Verhees & Meulenbergh, 2004), and the broadening scope of possible external supplier have undermined the effectiveness of traditional innovation system. In the presence of these changes, the term “open innovation” has emerged. Companies now not only want to commercialize their own inventions, but also the external ideas which gained outside of the firm boundary (Lee et al., 2010). Alongside the increasing trend of open innovation, the concern over environmental issues – such as global warming and scarcity of resources – is increasing at an alarming rate over the world (Coenen & Díaz López, 2010; Dahesh et al., 2020; Markard et al., 2012). Recently, there has been a trend toward a sustainable economy in many countries in the world including Vietnam with the introduction of electric car company VinFast that reinforces the importance of innovation in the sustainable development orientation of the society today. In effect, innovation now is increasingly driven by the social and environmental issues rather than the economic issues, meaning that this new trend of innovation will promote the well-being of societies and do not harm the environment (Dahesh et al., 2020).

Despite that there has been a mainstream of research regarding open innovation, those are focused on large technology-based firms, where the first notion of the open innovation started (Lee et al., 2010). The open innovation of Small-and-Medium sized Enterprise is nearly excluded in the mainstream of the theme (open innovation) (West et al., n.d.) for several reasons. Firstly, the open innovation is easier to examine in large firms than in small firms since the lack of resources of SMEs deter these firms from looking outward for new ideas (Spithoven et al., 2013) and fewer technological assets that they can exchange than large firms (Narula, 2004). Secondly, SMEs normally consider non-internal means of innovation such as networking with large firms as a way to boost their technological competences (Rothwell, 1991) and thereby the networking concept for innovation is not new to them. However, their relationship with large firms tends to be constrained to the strategic alliances (Dodgson & Rothwell, n.d.), and SMEs normally outsources through other SMEs (Rothwell, 1991). Therefore, there are many types of ties of SMEs, and it is crucial to examining the different ties of SMEs in the context of innovation. Finally, SMEs use external sources for later stages of innovation, which is the access to the marketing and sales channels to launch their products, while the open innovation concerns the innovation at early stages. The commercialization stage (later stage), however, has not been investigated in the existing studies.

The study scope includes three main parts: the scope of content, the period of time, and the scope of geography. Regarding the content, the study only concerns three aspects of innovation including the introduction of new products, significant improvements, and new processes; and four characteristics of networks such as the number of people a firm has with regard to each of four main actors (business people in the same sector, business people in

different sectors, banks, and politicians and civils); the number of times that firm contact those people in each of the four; and the roles played by all those actors are categorized into four different stakeholders (suppliers, customers, creditors, and debtors). The variables for those roles are calculated in terms of percentage out of total contacts of a firm. The study only examine impacts of above attributes of networking activities to above innovation performance. With the current available data, the study cannot answer the question “*to what degree do the networking activities affect innovation capabilities?*”. Thus, not all the relationships have the same effects on the innovation capabilities. For example, a strong relationship with big customers may help firm to gain information, knowledge and trust which generate innovation. On contrast, SMEs are constrained with their financial resources. A relationship with bankers might not encourage their innovation activities which are financially supported by other resources except bank credit.

The study does not focus on the *structural characteristics* of networks mainly because the data collected from the questionnaires is not suitable for us to follow that direction of research. If examining the relationship between the structural characteristics of networks and innovation capabilities, the study has to use many proxies to represent the unavailable variables. For example, to illustrate the *tie strength* of a network according to the *theory of weak ties*, the study has to use frequency (or number of times a firm contact to its actors) as a proxy. This usage of proxy may lead to the variation in results.

Innovation capability can be considered as a process to improve firms’ performance or as an outcome of some determinants such as internal sources, external sources, and technological intensity (Saunila, 2020). Innovation is the new or improved products or process that are different from the previous products or process which have been brought into use for the customers (Oslo Manual). However, there appears two paths of studying innovation capability. One stream of studies examine determinant of innovation capability and the others studied consequences of innovation capability. This study follows the second path that examine innovation capability as an outcome of networking activities. Therefore, in terms of an outcome, innovation capability is multi-dimensional. Thus, we hypothesize the following:

H1: Big customers have positive impact on the firm’s innovation.

H2: Association membership have positive impact on the firm’s innovation capability

2. Method

Data

In this paper, logit regression is used as the main method to run the data of more than 17,000 observations from SMEs of various sectors in many regions in Vietnam. This method is used to test the model expressing the relationship between network and innovation. The reasons for using this regression method is that all dependent variables are dummies, which generate only 0 for “yes” and 1 for “no” in innovation capabilities. There are totally three innovation variables that are initially in dummy forms including new products, products improvements, and new processes. Because of these dummies variables, it is impossible to use normal regression which is OLS (the ordinary least squared regression) to test since it will cause many problems and the results will not be correct. Also, there are

some limitations of OLS model in explaining the relationship between dependent and independent variables.

There are two models which are logistic and probits models that can be used for these dummies variables and generate mostly the same results. However, this study uses logistic model due to its simple mathematical functions and its popular usage. We use STATA to run data and get the results since STATA is a popular and well-performed application for researchers.

In terms of time period, the data are collected over a period of 12 years from 2003 to 2014 by UNU-WIDER. The data are collected once for two years. Regarding the scope of geography, the UNU-WIDER organization collected data from more than 2,500 Small and medium size enterprises in Vietnam.

Dependent variables

Innovation capability can be considered as a process to improve firms' performance or as an outcome of some determinants such as internal sources, external sources, and technological intensity (Saunila, 2020). The Oslo Manual by OECD and its partner Eurostat also distinguish between the innovation as an outcome and as a process (OECD & Eurostat, 2018). In the other words, there appears two paths of studying innovation capability. One stream of studies examines *determinant* of innovation capability and the others studied *consequences* of innovation capability. This study follows the second path that examine innovation capability as an outcome of networking activities. Therefore, in terms of an outcome, innovation capability is multi-dimensional. It is divided into 3 aspects including new products to firms, new improvement to the existing products, and new process. A dummy variable indicates that firm generates either one of the three above activities or all the three will have value of 1.

Independent variables

Network factors include the *size* of the network with each actor (companies in the same and different business lines, bank official, politicians and civil servants), *number of times* firms contact those networking actors, and *the percentage* of those actors attached with the role of suppliers, customers, debtors, and creditors.

A dummy variable with a value of 1 indicating a big customer was included if the proportion of sales to government, to export, to state-owned enterprise, to FDI is greater than zero. A dummy variable with a value of 1 presenting the association membership if firm stated that it joins an association.

Control variables

We included several control variables at firm level in order to avoid alternative explanations for a relationship between network and innovation. Several studies found that firm performance has influenced a firm's innovation capabilities. We controlled for firm performance by measuring gross profit on assets. Firm age and firm leverage are controlled for by calculating the log value of total years since the firm was founded and the ratio of total liabilities divided by total assets.

3. Results

The unit of analysis for this study was firm-level innovation. Table 1 shows the descriptive statistics and correlation of all variables. The mean innovation was 0.37 with standard deviation of 0.48.

Table 2 shows the results of binomial regression. Model 1 tests the effect of big customer and association membership on innovation. Model 2 through model 6 tests the effect of four network configurations (such as relationship with firms in the same industry, denoted as “netbus”, relationship with firms from different industry denoted as “netdif”, relationship with banks, denoted as ‘netbank’ and lastly the relationship with regulators, denoted as ‘netpol’) on innovation. The hypotheses predicted that a firm’s innovation is positively related to its big customer and its membership in a business association. The results strongly support H1 and H2, showing a positive moderating effect of firm network on innovations.

The results of our study found that big customers have relatively great impact on innovation activities of focal firm. Among various categories of network contacts, firm prefers collaboration with its big customers to gain access to innovative technologies with the network. Banks appeared to have negative impact on the innovation, indicating a possibility of heavier informal financing among the SMEs in the network. It is commonly believed that most of the SMEs in Vietnam still maintain their fundings mostly from their friends and relatives.

4. Discussion and Conclusion

This paper depicts the impact of networking on firms' innovation. Overall, empirical analysis supports the research hypotheses. First, firms participate in a business network could facilitate innovation by increasing their contacts with their big customers and diversifying their contacts with other members in their business associations may bring firms with superior access to important ideas and opportunities, resulting in stronger innovative capabilities.

Abstract

The subject of "Corporate Social Responsibility" (CSR) is becoming increasingly important in the operation of organizations; fulfilling societal duties not only benefits firms financially but also fosters intimate links between CSR implementation and corporate personnel technologies. The goal of this study is to explore how corporate social responsibility affects company performance and how that influence changes between domestic and overseas enterprises. The investigation was conducted using document analysis methodologies and structural equation theory. The findings indicate a link between corporate social responsibility (CSR) and two determinants of company performance (corporate reputation and employee engagement); for companies that have done business and are interested in the Vietnamese market, both social and environmental CSR make positive contributions to the company's performance; and environmental aspects of CSR are most important to the reputation and commitment of employees to the company. This research aims to give additional empirical evidence on how CSR helps to company success. This study aims to give further empirical evidence on how CSR affects company performance. It also suggests theoretical and practical consequences, emphasizing what local and international corporations in developing nations still need to accomplish in terms of CSR. Research supplies policymakers with useful knowledge.

Keywords: *Corporate social responsibility, Firm performance*

1. Introduction

Researchers, scholars, and investors have been actively striving to address the relevance of corporate social responsibility (CSR) in the recent period of creative and competitive technology, devoted to giving a better life to the local community and society. There are multidimensional CSR measurements that capture company actions and goals in order to involve prospective stakeholders worldwide and give different input ways for translation into outputs. This literature focuses on facets of the CSR connection and their financial consequences for businesses and the business environment (Murtaza et al. 2014).

As a result, the emphasis is on comprehending this in connection to various theoretical ideas and presenting the real procedure based on practical findings. Unfortunately, the association does not have a random orientation. This has been proven (Rasheed et al. 2018).

Economists are split on this; for example, the neoclassical theory believes that the directionality of this relationship is minimal and that actual facts are inconsistent. As a result, they say that the ineffective rise in financial expenditures is the outcome of corporate social responsibility initiatives' competitive disadvantage. Instead of just increasing shareholder ratios, current thinkers aim to employ local company resources and the environment to produce management and social benefits for society (as in agency theory). They emphasize that developments in a firm's management and social performance will always result in resource efficiency, improved product marketing, and highly skilled workforces as compared to competitors to capitalize on previously undisclosed market opportunities.

To enhance their financial situation, businesses must cultivate positive connections with their customers, creditors, employees, government authorities, suppliers, local communities, and stakeholders. They want to make the most money possible. Each stakeholder can affect how the company operates during this process. Modern economics regard social responsibility as a key indication of resource choice and profit maximization to attain the aims. According to these academics, socially responsible corporate governance will also assist optimize shareholder return and wealth (Jouini et al. 2018; Thao et al. 2019; Mumtaz 2014). Being environmentally friendly has ramifications for many organizations' business operations and image, and it must be represented in corporate social responsibility (CSR) initiatives (Iram et al. 2019; Baloch et al. 2020; Mohsin et al. 2019b).

It has become an essential instrument for creating a competitive advantage due to its comprehensive approach to CSR. According to Mohamud (2018), CSR may be helpful to a firm since it has a large and favorable impact on revenue. People today have a greater awareness of a company's intellectual talents connected to its organization, product, or organization and services, production, and operations, according to current studies, and they are more careful about how corporations' function for the good of society. However, academics frequently concentrate on measuring the relationship between financial success and corporate social responsibility within an organization to assess whether a key indication would be beneficial. construct or demolish Understanding the financial ramifications of company efforts contributes to the establishment of the relationship between CSR and profit optimization. As a result, this research not only establishes the link between CSR and profitability, but also undertakes an empirical investigation of a firm's performance.

The literature on CSR and corporate performance is developing, with an emphasis on major firms (Jouini et al. 2018; Adeneye and Ahmed 2015; Thao et al. 2019). (Mumtaz 2014). This research did not yield comprehensive findings about the relationship between CSR and corporate performance (Schramm-Klein et al. 2015; Agudo Valiente et al. 2012). As a result, the goal of this research is to highlight the importance of corporate social responsibility in the actions of local and international businesses. This study collected 83 questionnaire responses from small and medium-sized company (SMEs) entrepreneurs to

determine the aim. The research is divided into five sections: (1) introduction, (2) theoretical background, (3) methods, (4) results, and (5) discussion and conclusion.

The remainder of this study is organized as follows. The section that follows analyzes the substantial literature on CSR, while the section that follows describes the sample and methods. The study's findings, as well as a critical examination of the findings, are offered in the last section.

2. Theoretical background

2.1. Corporate social responsibility and corporate performance

The Pyramid of Corporate Social Responsibility

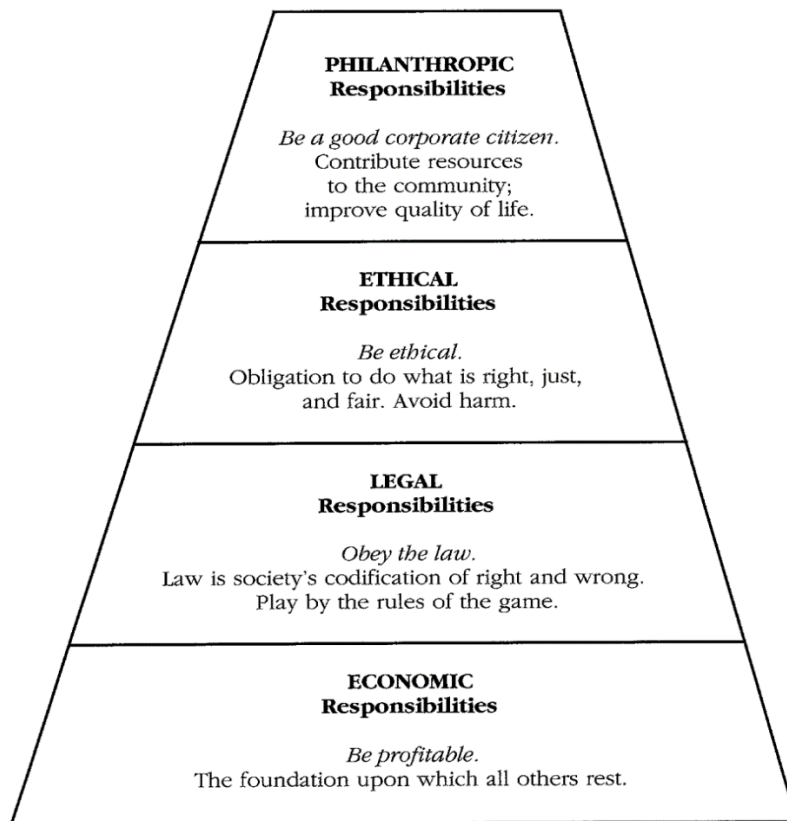

Figure 1. The Pyramid of Corporate Social Responsibility

Source: Carroll (1991, 1999)

The corporate social responsibility pyramid is displayed. It describes the four elements of corporate social responsibility, starting with the fundamental principle of economic accountability success is the foundation of everything else. At the same time, because the law represents society's understanding of what is and is not acceptable behavior, business is required to follow the law. The next step is to keep the business ethics. This person is, At its most basic level, it's about doing what's right, reasonable, and fair, as well as avoiding or minimizing harm to stakeholders (employees, consumers, the environment, and others). Last but not least, firms are likely to act responsibly. responsibly. Thus this issue can be encapsulated in the concept of philanthropy, in which businesses are expected to provide money and human resources to the society in order to raise the level of living

Previous literature reviews on current topics discovered that CSR practices resulted in long-term relationships between firms and communities, owing to the idea that customers buy items from companies that intentionally engage in CSR activities (Mares 2010). Environmental CSR demands improving business performance via waste management, recycling, and energy saving (Moghaddam and Zare 2017; Kakabadse et al. 2008). Being environmentally responsible may provide better advantages and long-term benefits to the SME sector. Companies should analyze their environmental responsibilities in relation to CSR for long-term growth and development, as this will help enhance the favorable effect on corporate performance.

2.2. Environmental and social impacts CSR

The premise that social entrepreneurship, social responsibility, social and environmental responsibility, corporate social responsibility, and the SME sector are linked is supported by the framework model that demonstrates transformation theory, hopeful about the future of the company. Entrepreneurs has a vital role in enhancing business performance and encouraging CSR practices, according to previous studies in this field. Companies that engage in CSR initiatives improve their reputation in society while also increasing market efficiency (Shum and Yam 2011). Furthermore, the SME sector, which includes small and medium-sized businesses, feels that the relationship between corporate reputation and CSR activities is complicated since small-scale businesses are run by a limited number of individuals. Medium-sized firms, on the other hand, will take on a pretty big number of businesses. SME owners are frequently unable to publicize CSR efforts due to a lack of visibility and connection between society and business.

Therefore, the following research hypotheses are established:

H1: CSR has a favorable impact on customer responsibilities.

2.3. CSR and employee commitment have good and significant linkages that help to build strong bonds inside the business

This study shows that a company's reputation is a significant intangible resource that adds to its competitive advantage (Barney, 1991; Deephouse, 2000; Fombrun and Shanley, 1990). ; Roberts and Dowling, 2002; Shamsie,2003), "just because the creation of a product with a solid reputation takes a long period and is more dependent on a steady and constant investment business than on speed" (Roberts and Dowling, 2002). Companies' decisions to engage in or discontinue CSR efforts may boost or degrade their corporate reputation.' Bhattacharya and Sen (2003) have shown that CSR " Builds a source of goodwill without companies can attract in times of crisis ". Correspondingly, McWilliams and Siegel (2001) reported that CSR "creates a reputation that a company is trustworthy and honest". It is not easy to emerge.

Unlike employee involvement, where workers may watch their firm's CSR activities, the influence of CSR on the company's reputation is determined by how the company communicates its CSR activities and how its actions are covered in the national media and other media.Branco and Rodrigues (2006) companies may develop a positive image when they can demonstrate, via effective communication with a wide range of stockholders,

demonstrating that they follow moral and environmental values, whereas neglecting to do so would jeopardize their reputation. As previously mentioned, the two prerequisites for CSR having an influence on a company's reputation – the ability to convey the plan to key stakeholders and media interest in the issue – are not always accessible to enterprises operating in these markets. In emerging economies, organizations' capacity to tell their stakeholders about CSR efforts is hampered by a lack of skills and traditions in communicating internal activities such as CSR initiatives with outsiders. Because of this, the company's capacity to alter stakeholder views in order to improve its image is limited. Furthermore, CSR is not yet a well-established subject in emerging nations; as a result, the media may not provide the required space for firms engaged in CSR activities to create public goodwill, which may eventually convert into a positive corporate reputation. intriguing. We suggest that CSR will have no influence on a company's reputation in emerging markets due to the lack of visibility of CSR efforts.

Therefore, the following hypotheses are developed to measure corporate reputation:

H2: CSR has a positive relationship with a company's reputation.

2.4. Employee commitment and CSR are vital and desirable organizational interactions

Employee commitment is described as "the amount to which workers in a business unit appreciate the company, perceive their ties to it, and are ready to work for it" in a broad sense. Individual sacrifice for the sake of the company" Jaworski and Kohli (Jaworski and Kohli, 1993). Employees make judgements on their bosses, according to Aguilera et al. (2007). The company's CSR activities are based on its observations. Process processing, CSR activities, and the consequences of CSR actions "Socially responsible behavior or irresponsible behavior has substantial ramifications for employees," the authors conclude. Several research have looked into the relationship between CSR and employee commitment (Albinger and Freeman, 2000; Backhaus et al., 2002; Green and the turban, 2000; Maignan et al., 1999; Peterson, 2004; Turban and green, 1997). Past research shows that a company's socially responsible actions problems with its employees (Albinger and Freeman. 2000; Backhaus et al., 2002; Peterson, 2004), and has Trends of Positive Impact on Employee Commitment Branco and Rodrigues (2006) According to the survey, organizations with a high social responsibility image are more likely to be able to attract more job applications.

Better job applications to attract them and sustain employee morale after they are employed. Correspondingly, Maignan et al. (1999) Employee engagement to CSR activities is expected to expand for two reasons: (1) they are committed to guaranteeing the quality of the working experience, and (2) they address societal concerns - such as environmental preservation or community welfare - caring for society in general and therefore for workers. Given that employees' perceptions of the firm are influenced by their evaluations of the company's CSR initiatives, the following argument is consistent with research on employees' perceptions of justice (Rupp et a l., 2006). Furthermore, via equality and socially responsible practices, CSR participants tend to expand their CSR activities inside to their employees (Rupp et al., 2006). As a result, businesses are expected to participate. CSR activities will develop good relationships with workers, and as a consequence, they will be more likely to

acquire employee commitment than companies that do not engage in CSR programs (Aguilera et al., 2007). Furthermore, contrary to popular belief, there is no relationship between CSR and financial incentives. Employees may immediately notice CSR initiatives, which can lead to an immediate positive image of them, boosting their morale and loyalty to the firm. Given that some firms in emerging economies take advantage of a weak institutional environment to create exploitative working conditions in which workers are underpaid and work long hours in hazardous conditions, CSR activities that benefit employees make a difference and are appreciated by employees (Budhwar and Mellahi, 2007).

Consequently, the following study hypotheses were devised to assess employee commitment:

H3: Corporate social responsibility is positively correlated with employee commitment SMEs and is expected to be positively correlated.

The experimental research paradigm displayed in Figure 1 is based on the hypothesis stated above, combined with qualitative research:

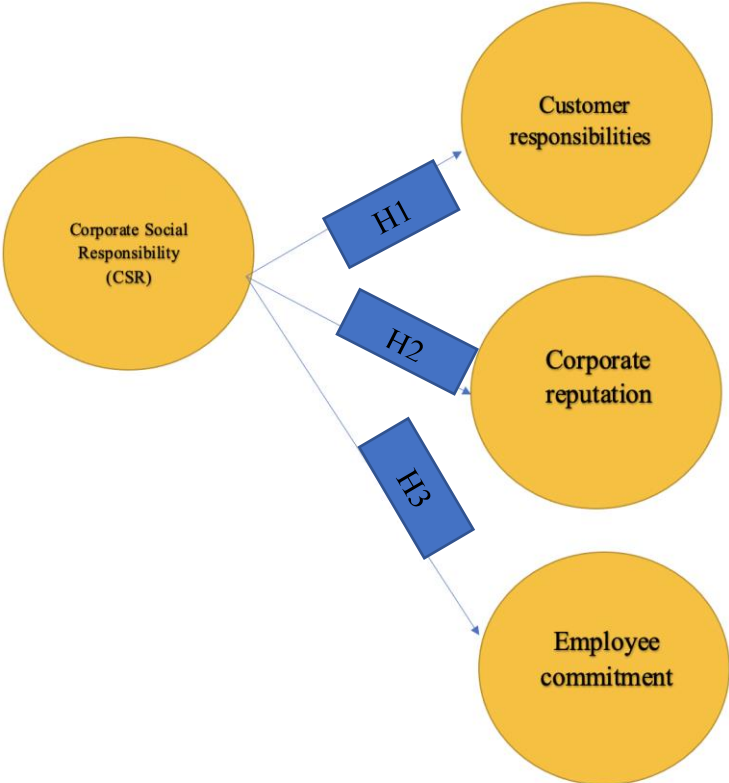

Figure 1. Research models

Source: Authors

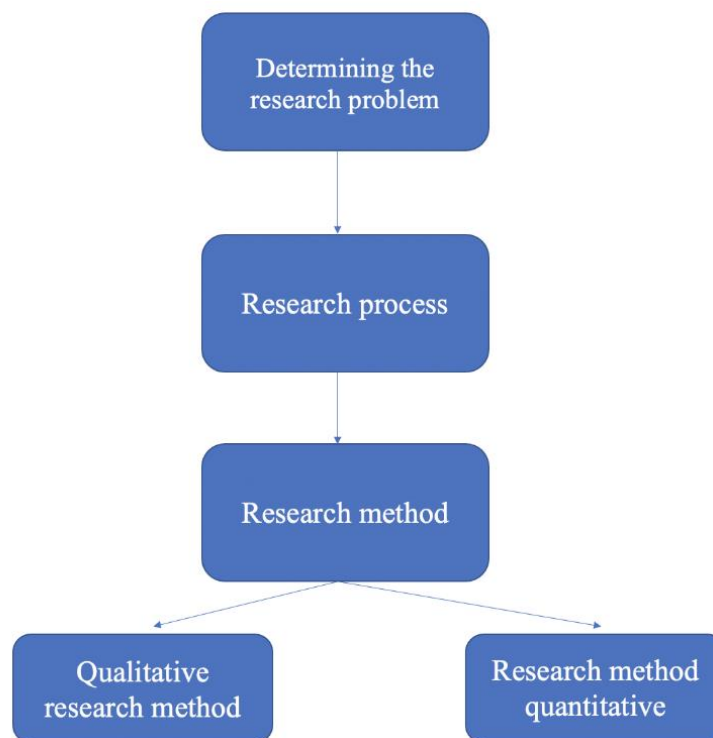

3. Method

3.1. Sample and data collection

To evaluate the performance of small and medium businesses, a questionnaire-based longitudinal research was done (SMEs). Systematic surveys allow for a large number of individuals to be reached, a vast geographic region to be covered, anonymity, and the prevention of influence on responder responses. A sample of 30 companies was used for this purpose.

Larger, more developed economies are seen to have a higher potential for invention, and good copyright policies assist to stimulate patents. As a result, the majority of tiny economies are significantly reliant on foreign innovation. CSR efforts are driven by innovation trends, particularly those that govern time estimations and include cross-border variances and the impact of patent activity trends. In the country, there is a linear patent application. The propensity factors here account for all inter-country differences in terms of innovation and change across time. Changes in intellectual property rules in individual nations can throw economies into disarray. The sum of all patents in a nation, excluding patents for energy, renewable energy, and other endogenous topics, is used to calculate this trend. Energy patents boost environmental CSR performance.

For three key reasons, determining the influence of environmental regulations on innovation is challenging as an endogenous source. First, corporations possessing cutting-edge technology may have government authorities enact regulations that encourage its usage. The second is a lack of difficult-to-control mutations that can contribute to prejudice (discussed in detail in the next section). To overcome innovation gaps or coordinate research initiatives across the innovation process, governments should minimize intermediate-stage investment on top of early-stage R&D financing programs. In this context, the available research suggests three ways for attracting public sector investment in clean energy technology promotion and development. In this chapter, the author will present research processes and methods to achieve the research objectives as well as test the hypotheses mentioned above. The main content of this chapter includes: (1) Determining the research problem, (2) Research process, (3) Research method (4) Qualitative research method and (5) Research method quantitative.

Source: Author

3.2. Defining the research problem

Human needs are, will be, and can be created, thus business is almost all about exploiting them. On Mars, you can't sell computers. Simply, because there is no need up there. As a result, customers are ultimately responsible for a company's prosperity. These clients - elderly, young, females, and boys - formed a community. And it is on the basis of this connection that the question of corporate social responsibility is raised. In reality, we are all suppliers and clients to one another. For example, "How many individuals can generate computer software at the same time?" Despite the fact that social ties are interwoven, and one person is often dependent on the other in this process. As a result, the social responsibility of enterprises is also their obligation. To achieve asymmetry between the two domains, the information gap should first be overcome to offer access to data and knowledge. This knowledge can aid in the development of investment plans aimed at closing innovation gaps and, as a result, lowering emissions and costs. Second, policies that move the focus away from technology and toward the market can assist close the innovation gap in these high-potential technology scenarios. Finally, public-private collaborations offer a lot of promise when it comes to investigating the innovation process. Finally, public-private collaborations offer a lot of promise when it comes to investigating the innovation process. Energy-related research and development, as well as government investment, contribute to the reduction.

3.3. Research method

The first dependent variable is corporate reputation, which consists of three projects (Rettab et al. 2009); the second dependent variable is employee commitment, which consists of three projects used in the study (Rettab et al. 2009); and the third dependent variable is employee commitment, which consists of three projects used in the study (Rettab et al. 2009). (Fombrun et al. 2000). The research looked at corporate social responsibility as a nine-item independent variable. The approaches of corporate social responsibility are examined in two aspects: social corporate social responsibility and environmental corporate social responsibility.

3.3.1. Qualitative method

Using a discussion sheet, line managers of multinational technology companies and experts in charge of talent development adjust the content of the proposed scale to suit the conditions of the technology market situation. In Vietnam, qualitative research results have helped to select and supplement scales from previous studies and form a quantitative questionnaire consisting of observed variables used to measure the influence of factors of corporate social responsibility on employee motivation and job performance.

3.3.2. Quantitative method

Qualitative research was carried out through a large-scale survey using an email questionnaire by an electronic questionnaire designed on Google forms to collect survey data with a sample size of 150. The sampling method was implemented. Is now a non-probability sampling method - convenient for survey respondents who are employees of big and prestigious, country multinational technology companies. Currently, the Vietnamese technology market is an extremely potential market with more than 30 multinational technology companies already

present. In this study, only ten multinational technology companies were selected because they have technology staff. These are also the top 10 companies with the highest revenue of multinational pharmaceutical companies in the Vietnamese market in 2020.

4. Result

4.1. Data Analysis

Would you please tick (✓) on the scale from ① to ③:

① Female ② Male ③ Other

1. Your gender

211 câu trả lời

The first thing we want to categorize is the gender of the respondents. In this sample, 211 respondents (59.7% of whom were women) were interested in corporate social responsibility. On the financial success of technology companies in Hanoi. In addition, men accounted for 39.8% and other genders accounted for 0.5%. Hence Therefore, the proportion of women who are interested is greater than that of men and other genders.

Would you please tick (✓) on the scale from ① to ③:

① 25-30 ② 30-35 ③ 35-40

2. Your age from

211 câu trả lời

The second thing that we are interested in is the age that helps us to most accurately classify the age that is interested in the problem. This age group starts from 25-to 40. This age

group is usually those who are working or have stable jobs. The first age group is from 25-30 years old. This age group accounts for 54.5% of the family members. The second age group is from 30 to 35 years old, accounting for 33.6% of this age group, which is the stage where job stability has begun. The last group is the age group from 35-40, accounting for 11.8%.

Would you please tick (√) on the scale from ① to ⑤:

- ① Less than 3 years
- ② 3-5 years
- ③ 6-8 years
- ④ More than 8 years
- ⑤ Other

Years in business

211 câu trả lời

Third, we are interested in the number of years the business has been in operation. The first column is lesser than 3 years, accounting for 28.4%, the second column is from 3-5 years, accounting for 41.2%, the third column is from 6-8 years, accounting for 20.4%, and the 4th column accounts for 7.6% and the 5th column is 2.4%. According to the percentages seen in the columns, we can see that businesses with 3-5 business experience have many workers. Participants wanted to explore how corporate social responsibility affects corporate performance and how that influence varies between domestic and foreign firms.

Would you please tick (√) on the scale from ① to ⑤:

- ① Industrial
- ② Services
- ③ Construction
- ④ Trade
- ⑤ Agriculture

Industry are you working in

211 câu trả lời

Fourth we are interested you are working in the industry. The five industries that I am interested in are: Industry (11.8%), service (21.3%), construction (27%), Trade (30.3%), Agriculture (9.5%).

Would you please tick (✓) on the scale from ① to ⑤:

① 1-9 ② 10-49 ③ 50-249 ④ 250 or more ⑤ Other

Number of employees

211 câu trả lời

And finally, I am interested in the number of employees. The number of employees is also divided by the level from low to high. Starting from a small business with only 1-9 employees and gradually increasing to a business with more than 250 employees or many times larger. The ratio of 1-9 employees accounts for 7.1%, 10-49 employees accounted for 10.9%, 50-249 employees accounted for 39.8%, 250 or more accounted for 40.3% and a larger number of employees accounted for 1.9%. Thus, the larger the enterprise, the more employees are concerned about how corporate social responsibility affects the company's operations and how that influence varies between domestic and foreign firms outside.

Through the instructions of the lecturer, the group summarized the model and adjusted the variables that were not suitable for the study. The relationship between the latent variables and the observed variables is determined by the measurement model between the variables, and it also provides insights into the measurable quality of the variables we observe, such as reliability, validity, etc.

Research hypotheses:

Hypothesis	Relationship
H1	CSR has a favorable impact on customer responsibilities.
H2	CSR has a positive relationship with a company's reputation.
H3	Corporate social responsibility is positively correlated with employee commitment SMEs and is expected to be positively correlated.

Variable	Items	Source	Scale
Customer responsibilities	Provide all customers with very highquality service	Fombrun et al. (2000)	Likert scale from 1 is absolutely no to 5 is yes and works very well
	Provide all customers with the information needed to make sound purchasing decisions		
	Satisfy the complaints of all customers about the company's products or services		
	Adapt products or services to enhance the level of customer satisfaction		
Corporate reputation	We are widely acknowledged as a trustworthy organization	Jaworski and Kohli (1993)	Likert scale from 1 is absolutely no to 5 is yes and works very well
	This organisation is known to sell high quality products and services		
	Our employees often go above and beyond their regular responsibilities to ensure theorganisation's well-being		
Employee commitment	The bonds between this organisation and its employees are very strong	Jaworski and Kohli (1993)	Likert scale from 1 is absolutely no to 5 is yes and works very well
	Our people are very committed to this organisation		

Factor	Symbol	Statement	Reference
Customer responsibilities	CRS1	Provide all customers with very highquality service	Fombrun et al. (2000)
	CRS2	Provide all customers with the information needed to make sound purchasing decisions	
	CRS3	Satisfy the complaints of all customers about the company's products or services	
	CRS4	Adapt products or services to enhance the level of customer satisfaction	
Corporate reputation	CR1	We are widely acknowledged as a trustworthy organization	Jaworski and Kohli (1993)
	CR2	This organisation is known to sell high quality products and services	
	CR3	Our employees often go above and beyond their regular responsibilities to ensure theorganisation's well-being	
Employee commitment	EC1	The bonds between this organisation and its employees are very strong	Jaworski and Kohli (1993)
	EC2	Our people are very committed to this organisation	

5. Discussion and Conclusion

After analyzing and evaluating the overview of international and domestic documents related to the research topic, the author can confirm that the studies on CSR are relatively diverse in terms of methods and contents. The author finds that there are very few empirical studies on CSR in technology enterprises that have been carried out; There have not been studies on the impact of CSR implementation on employee commitment, business reputation and customer satisfaction in technology enterprises. These are the research gaps in the theory and practice of CSR implementation in Vietnam.

Through synthesis, analysis of theoretical basis and previous studies, the article has proposed a model of the relationship between CSR for employees and employee's commitment to the organization. This model will be the premise for the author to build a theoretical framework of CSR for technology enterprises and use this theoretical framework to analyze and evaluate the current status of CSR implementation in technology enterprises in Vietnam.

At the same time, the author will actually survey about 211 Vietnamese technology enterprises and analyze the results of descriptive statistics. In future research, the author will test existing theoretical issues, then supplement and create a complete theoretical basis for CSR in the technology industry and test research hypotheses.

BOARD OF DIRECTORS AND BUSINESS PERFORMANCE: A CASE STUDY IN THE REAL ESTATE AND CONSTRUCTION SECTOR

Nguyen Van Chien

chiennv@tdmu.edu.vn

Thu Dau Mot University, Binh Duong, Vietnam

Abstract

The objective of the study is to evaluate the impact of the board of directors on business performance in the construction and real estate industries. Using ordinary least squares analysis, random and fixed effects analysis and at the same time performing the model's defects tests, the research results confirm that the board of directors and liquidity has no impact on business performance. However, firm value has a positive effect on business performance whereas capital structure favoring debt is likely to reduce business performance. Finally, the study also discusses managerial implications for the construction and real estate industries.

Keywords: *Board of Directors, capital structure, efficiency, value, liquidity*

1. Introduction

In economic development in each country, businesses are increasingly making important contributions to job creation, productivity improvement and economic growth. To sustain economic growth, enterprises must always maintain business efficiency. When the business remains profitable, the business has the ability to expand and grow, and vice versa.

The construction and real estate industries are considered the main industries in each country. The construction and real estate industries play an important role in infrastructure construction, transport development and meeting housing needs and ultimately improving the quality of life. In Vietnam, the construction and real estate sectors are likely to contribute over 6% to the gross national product. Therefore, businesses in the construction and real estate industries to maintain growth, especially in joint-stock companies, the board of directors in joint-stock companies can express their voice and play an important role in decisions (Fuzi et al., 2016); Hillman & Dalziel, 2003).

Previous studies indicate that capital structure is also assessed to have an influence on business performance (Salim & Yadav, 2012). A business must always balance between equity and debt sources in order to maintain an optimal cost of capital and ultimately improve operational efficiency. Using debt has the ability to help businesses take advantage of tax shields, but conversely, businesses can run the risk of financial distress if the capital structure is too dependent on debt. Therefore, using more or less debt has an impact on the behavior of managers as well as their financial decisions, thereby affecting the performance of the business (Harris & Raviv, 1991; Graham & Harvey, 2000).

The objective of this study is to evaluate the impact of the board of directors on the business performance, especially to study the empirical evidence in the construction and real estate industries. The selected enterprises are large as well as have been listed for many years on the Ho Chi Minh Stock Exchange and the Hanoi Stock Exchange. In addition, the study also evaluates the influence of capital structure choice on business performance. Thereby, the study discusses some managerial implications to improve financial performance of construction and real estate enterprises.

In addition to part 1 explaining the reasons for choosing the research, part 2 discusses the theoretical basis and reviews previous studies. Sections 3 and 4 discuss research methods, data sources and regression results. Finally, the study discusses some governance implications.

2. Literature Review

Previous studies suggested that the characteristics of the board of directors can have an impact on business performance. Fuzi et al. (2016) argued that the board of directors has an important voice to implement for the interests of shareholders. The Board of Directors is established from the executive and non-executive groups in the enterprise with the aim of maximizing the benefits for shareholders. Hillman & Dalziel (2003) argued that the board of directors clearly shows in two functions of operating activities at the request of shareholders and coordinating resources in business activities at the company. In particular, effective supervision has the function of creating incentives for the board of directors.

Merendino & Melville (2019) in the study of board characteristics and business performance in Italy. The authors argued that the board of directors is the representative element of the business and according to the agency theory, indicating that there is a difference in interests between the principal and the agent, which ultimately affects the business value and business performance. Research in Italian companies in the period of 2003 - 2015, Merendino & Melville (2019) suggested that the selected director from minority shareholders has no impact on business performance, while the independent director can have a strong impact on business performance. In addition, small board size has a positive effect on business performance, while companies with large board size do not have this effect because small board size companies are easily managed. Based on the results of this study, the authors believe that Italian companies should orient the selection of independent directors to increase the benefits for the company and the interests of shareholders.

Research by Kanakriyah (2020) at Amman Stock Exchange, Jordan during the period from 2015 to 2019, the author studied based on 85 service and industrial companies. Research suggests that the age of the firm and the qualifications of the board members have a negative impact on business performance. Thereby showing that the old enterprises have lower business efficiency than the young ones, and the enterprises in which the board members have advanced degrees often have low efficiency, which is explained by Jordan's economy that is developing, the opportunity for individuals to start a business is high, so in the early stages of development the leadership class is not highly qualified. Expanding the study, Kanakriyah (2020) also confirmed that the number of board meetings, gender diversity, and board size have a positive impact on business performance, showing that if

the board of directors diversified and operated responsibly, the better business performance will be reached. Similarly, another study in the US, Pearce & Patel (2018) suggested that board stability, board resource provision and CEO influence have a negative impact on corporate performance, in contrast, the independence of the board of directors has no effect on business performance.

Firm-related theories also discuss the influence of capital structure on firms, typically the theory of Modigliani & Miller (1963). Assuming an ideal and tax-free environment, Modigliani & Miller (1958) argued that capital structure has no impact on firm value. However, the trade-off theory has discussed the financial difficulties and costs of firms, as discussed by Kraus & Litzenberger (1973), Jensen & Meckling (1976). The authors argued that there exists an optimal capital structure in which the benefits of the tax shield will best offset the losses from debt. Moreover, Frank et al. (2002) argued that the pecking order theory is also selective in capital structure. Asymmetric information between investors and managers can lead to adverse selection. People know about the real value and risks of enterprises as well as managers, therefore, Myers proposed the pecking order theory to explain the prioritization of capital sources when businesses need to raise capital. Firstly, enterprises prefer internal funding over external sources; second, dividends must be stable over the years; Finally, new businesses seek capital from outside.

3. Method

3.1. Methodology

In this study, the author uses regression analysis of balance panel data to assess the impact of the board of directors on business performance. The study used regression of pooled ordinary least squares (POLS), fixed effects method (FEM) and random effects method (REM). Through the F-test and Hausman test, the study chooses the best regression results. However, regression results according to POLS, FEM or REM often encounter autocorrelation and variable variance, then the feasible least squares method should be applied.

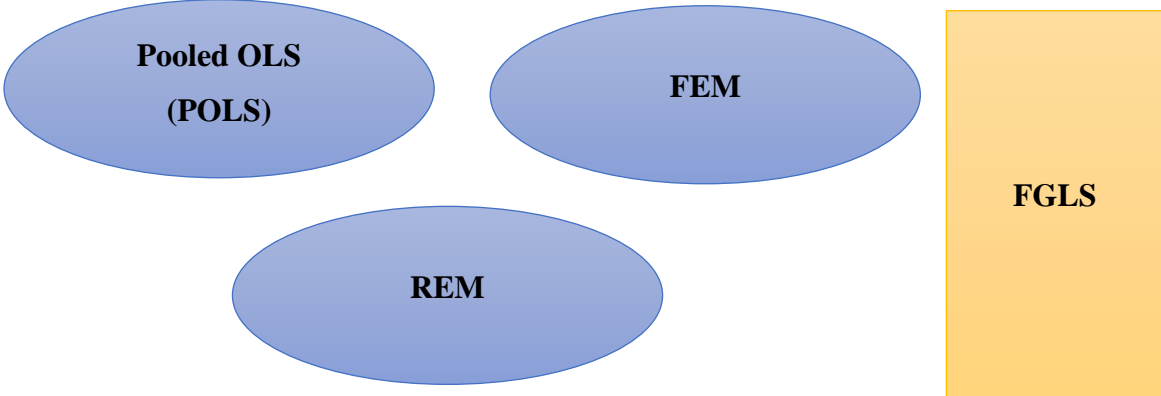

Figure 1. Steps of Analysis

3.2. Data

This study uses data from 52 real estate and construction companies listed on the Vietnamese stock exchange, including on the Ho Chi Minh Stock Exchange and the Hanoi Stock Exchange. The study was carried out over a period of 15 years, from 2006 to 2020.

The enterprises selected in this study are those with large market capitalization, long enough listing period and representative representation. representative for the real estate and construction industry.

3.3. Variables selection

Based on the analysis from previous studies, the selected variables in this research model are presented in the following Table 2:

Table 2. Variables used in the model

Variable	Abbreviation	Calculation	Previous studies
Dependent variable			
Return on total assets	ROA	Profit after tax/total assets	Hillman & Dalziel (2003), Merendino & Melville (2019), Kanakriyah (2020), García Martín & Herrero (2018).
Return on equity	ROE	Profit after tax/Equity	Fuzi et al. (2016), Merendino & Melville (2019), Kanakriyah (2020)
Earnings per share	EPS	(Net income – preferred stock dividend) / Average number of shares in circulation	Kanakriyah (2020)
Independent variables			
Board of Directors	BOARD	Number of board members	Hillman & Dalziel (2003), Merendino & Melville (2019), Kanakriyah (2020),
Firm value	VALUE	Total assets of the business	Graham & Harvey (2000)
Capital structure of the enterprise	LEV	Debt/total equity ratio	Salim & Yadav (2012), Graham & Harvey (2000)
Liquidity	LIQ	Current assets/current liabilities	Nguyen & Nguyen (2020)

4. Results

4.1. Descriptive Statistics

First, the study performs descriptive statistical analysis of variables to evaluate the data's parameters, including mean, standard deviation, minimum and maximum values, statistical analysis results. described in Table 3 below:

Table 3. Descriptive statistics of variables

Variable	Obs	Mean	Std.	Dev.	Min
ROA	780	3.087623	5.97552	-28.0502	83.9056
ROE	780	7.109202	22.04741	-175.5021	149.071
EPS	780	1424.668	3229.82	-19937	46762.7
BOARD	780	6.158974	4.137602	3	24
VALUE	780	10.56148	.8250055	6.429112	12.95517
LEV	780	.6635128	.1660605	.12	1
LIQ	780	1.018154	1.271214	.01	10.95

Source: Stata 15

Through descriptive statistical analysis, the average ROA and ROE of the construction and real estate industries reached 3.09% and 7.10%, while the average EPS reached 1424 VND/share. However, the business performance of enterprises is quite different, with some enterprises falling into losses, and others having high profits.

Regarding the board meetings, there are enterprises with only 3 times, but there are enterprises with 24 times. The average number of board members is 6.15 times. Regarding capital structure and liquidity, the construction and real estate industry currently uses an average of 66% debt capital and 34% equity capital, the average liquidity is 1.02, representing liquidity of firms is still low.

4.2. Correlation matrix

Correlation analysis aims to eliminate the possibility of multicollinearity of the variables that may occur in the estimated model. The results of the correlation analysis in Table 4 show that the largest correlation coefficient for the independent variables is only 0.4225 (occurs between LEV and ROA), confirming the unlikely possibility of multicollinearity. line.

Table 4. Correlation matrix

	roa	roe	eps	board	value	lev	liq

F-test (Prob > F)		4.28 (0.000)			7.48 (0.000)			5.10 (0.000)	
Prob.	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000	0.000

Source: Stata 15

For the independent variable ROA, according to Hausman test, REM is better than FEM, according to F-test, FEM is better than POLS, so in the end REM is the best. Similarly, for the independent variable ROE, REM is also the best choice. For the independent variable EPS, the final result shows that FEM is the best. However, it shows that both REM or FEM models have autocorrelation and uniform variance, so the regression is performed according to FGLS, as shown in Table 6 below:

Table 6. Regression coefficient and P-value according to FGLS

Variable	Coefficient and P-value	ROA	ROE	EPS
BOARD	Coefficient	0.1259	0.0996	-8.3856
	P-value	0.009	0.605	0.764
VALUE	Coefficient	0.7421	1.3234	647.2754
	P-value	0.002	0.003	0.000
LEV	Coefficient	-15.0569	-26.0696	-4157.76
	P-value	0.000	0.000	0.000
LIQ	Coefficient	-0.0484	0.1731	58.8827
	P-value	0.759	0.785	0.522
_cons	Coefficient	4.5134	9.6499	-2661.093
	P-value	0.081	0.354	0.077
Prob.		0.000	0.000	0.000

Source: Stata 15

The results of Table 6 show that:

The coefficients of variable BOARD (number of board meetings) and the variable LIQ (liquidity) are not statistically significant. Thereby, it can be concluded that the number of board meetings has no impact on business performance in the enterprise. In addition, there is no evidence of the impact of liquidity on business performance.

The firm value (VALUE) has an impact on firm performance. The evidence finds that the regression coefficient has a positive sign, meaning that enterprise value has a positive effect on business performance. A business with higher corporate value will have better business performance, and vice versa.

The capital structure variable (LEV), the regression coefficient LEV has a negative sign and is statistically significant, which means that enterprises using more debt will have lower business efficiency, and vice versa, enterprises with more its equity have higher business efficiency. Through the research results, it can be explained that the construction and real estate enterprises use debt inefficiently, because the construction and real estate industry has a large demand for working capital, while the business situation is not very efficient. Macroeconomics has the ability to affect loan interest rates, if businesses depend on debt financing, they will be more affected by shocks occurring in the financial and monetary market, reducing business efficiency. in the business.

5. Discussion and Conclusion

Research on the impact of the board of directors on business performance in construction and real estate enterprises. Using regression analysis method of balance panel data for the period 2006 - 2020, business performance is measured by return on total assets, return on equity or earnings per share, the research results confirm that: board meetings and liquidity have no impact on business performance in the enterprise. The study finds evidence of a positive effect of firm value on business performance, while firms with a capital structure that favor debt have lower business performance.

Through the research results, some managerial implications are suggested: Firstly, construction and real estate enterprises should seek equity financing in order to limit operational risks and volatility. of macroeconomics on business performance of enterprises. Second, businesses improve their debt management capabilities. When businesses are able to use debt more effectively, it is possible to improve operational efficiency in the business. Third, enterprises in the construction and real estate industries need to implement appropriate business strategies in the short and long term, step by step improve their position, help them develop and grow, and enhance their firm values. When the enterprise value is higher, the enterprise has the advantage in the market and the advantage in the ability to withstand risks in the enterprise, the business efficiency is improved.

THE IMPACT OF DEVELOPMENT INVESTMENT ON ENTREPRENEURSHIP PERFORMANCE IN GLOBAL VALUE CHAIN

Dinh Thuy Dung
dtdung@neu.edu.vn

Tran Hoai Nam
namth@neu.edu.vn

National Economic University, Hanoi, Vietnam

Abstract

The purpose of the paper is to evaluate the impact of development investment (with two main sectors are fixed asset investment and human resources) on business and production enterprises when they are participating in the global value chain in Vietnam based on corporate investigation department in 2020. This article uses data from the enterprise survey set of the General Statistics Office (GSO) to evaluate the relationship between the impact of investment capital of production and business enterprises with annual export turnover value to the performance of that enterprise through import and export value which is being used as a tool or scale for these firms' participation in global supply chains.

Keywords: *Development investment, Global value chain, Investment*

1. Introduction

Investment is the main activity that determines the development and growth ability of an enterprise. In investment activities, enterprises invest long-term capital in order to form and supplement necessary assets to realize business goals. This activity is carried out centrally through the implementation of investment projects. In order to meet the goal of maximizing the owner's asset value, enterprises need to have a strategy in finding and selecting the right investments. Without new ideas and new investment projects, businesses will not be able to survive and develop, especially in today's fiercely competitive environment. Businesses that want to stand firm in the market require careful market research and appropriate investment activities to increase the competitiveness of their products.

There have been many studies on investment and development activities in enterprises "Investment efficiency and solutions to improve the efficiency of state-owned enterprises' development investment" (Tu Quang Phuong 2003) is one of the first studies in Vietnam in-depth analysis of this problem.

Development investment plays a huge role in deciding the birth, existence and development of enterprises. It includes the following contents: Renewable investment in fixed assets; invest in research and implementation of science and technology; investment in human resource development; additional investment in inventory (current assets); invest in other intangible assets (for example, investment in purchasing copyrights, inventions,

investments in advertising activities...) and investments outside the enterprise. Research in the world considers investments in Enterprises from different angles: In the study “The influence of investment decisions on the performance of companies listed on the Nairobi Kemuma stock exchange (2014) and Grazzi et al. (2013) in the study : Investment dynamics and corporate performance: Comparative evidence from manufacturing industries Comparative evidence from manufacturing industries considers investment as replacing obsolete machinery with equipment state-of-the-art equipment (Enterprise-level investment does not involve annual routine repairs and maintenance). The studies mainly focus on clarifying the impact of investment on the bottom line of the company. Enterprise: Investment affects the results and performance of the business in many aspects, for example productivity and speed growth (Power, 1998; Huggett and Ospina, 2001; Nilsen, 2009; Shima, 2010), employment growth, sales growth and other factors of production (Sakellaris, 2004; Nilsen, 2009).

- Fixed asset investment affects the production and business results of enterprises:

There are many researchers around the world doing research on this topic. Aivaziana et al. (2005), Yuan and Kazuyuki (2008), Omet et al. (2009), Sung et al. (2008), Xiao (2009), Duchin et al (2010), Piris (2010), Umutlu (2010), Geng and N'Diaye (2012), and O'Reilly (2015) have researched and proven that fixed investment is a decisive factor for the solid development and growth of an enterprise. The study "Investment motivation and firm performance: Comparative evidence from manufacturing industries) by Grazzi et al (2013), is an article synthesizes the relationship between investment in tangible assets and the performance of firms in the French and Italian manufacturing industries. Research results show that enterprises with higher investment level, after a period of investment, will be more efficient and grow faster than other businesses. Investing in assets after an extended investment period, for example opening a new factory, will negatively affect profits but positively affect sales and employment: higher sales and higher levels of employment. Then businesses with rapid growth, profitability and high productivity will be more likely to invest. Thus, investment in fixed assets will essentially have a positive effect on corporate performance, and this effect is usually evident in the long term.

- Investment in human resources affects business results of enterprises.

Regarding the composition of costs that are considered investment in human resources, according to Marimuthu (2009); Ukenna et al (2010), human resource investment includes: skills, knowledge, education, experience and expertise of the organization's staff. Therefore, human capital investment should cover all costs incurred in enhancing the knowledge, education, expertise and skills of employees. This can involve salaries, training and development, payments for conferences, conventions, membership fees and registrations...

Enterprise and global value chain

A production and business enterprise not only conducts production and business in the country but also needs to move towards internationalization and this is growing strongly with the participation of enterprises in the global value chain “Using input–output tables from 10 OECD and four emerging market countries we calculate that vertical specialization

accounts for 21% of these countries' exports, and grew almost 30% between 1970 and 1990. We also find that growth in vertical specialization accounts for 30% of the growth in these countries' exports" (Hummel 2001). In some study, the author has shown that global value chain participation is measured by export value "Backward linkages - the share of foreign value-added in total exports of a country; Forward linkages is the domestic value-added embodied in intermediate exports that are further re-exported to third countries, expressed as a ratio of gross exports. (IMF working paper) or through FDI enterprises "GVC participation, mainly through the channel of foreign direct investment (FDI) for developing countries" (conferences paper 2018), "GVC participation, mainly through the channel of foreign direct investment (FDI) for developing countries" (Trung et al 2018). Most studies have emphasized the value added by firms exporting and importing inputs. This is considered as one of the important factors when determining the position of enterprises in the value chain or global production chain as many concepts are mentioned today.

2. Method

The article uses primary data collected from the enterprise census of the General Statistics Office in 2020.

Model variables:

- Development investment variable, including 2 component variables: Investment in fixed assets, Investment in human resources.
- Variable Import-Export results of enterprises
- Control variable: In this study, only the industry variable and specifically all production and business enterprises are used

Research hypotheses:

H1: Development investment has a positive impact on export performance of enterprises

H2: Investment in development has a negative impact on export performance of enterprises.

Estimate model :

$$\text{Export value} = \beta_0 + \beta_1 * fx + \beta_2 * hr + \varepsilon$$

H3: Investment in development has a positive impact on import performance of enterprises.

H4: Investment in development has a negative impact on import performance of enterprises.

$$\text{Import value} = \beta_0 + \beta_1 * fx + \beta_2 * hr + \varepsilon$$

Meanwhile:

Fxt: Fixed asset investment year t

Hrt: Human resource investment year t

This model is only a general model, reflecting the impact of the independent variables on the dependent variable in general, without taking into account the time factor and the purpose to have a view before the covid epidemic occurs. In fact, where is the import-export value of Vietnamese enterprises and that is also a premise for future comparative quantitative studies.

3. Results

Variables used in the model:

lnTrigiaXK: logarithm of export value of enterprise.

lnLD: Logarithm of average number of employees in the year

lnXDCB: Logarithm capital construction investment in the year

lnTSCD: Logarithm fixed asset investment capital of the enterprise during the year

OLS regression result:

```
. reg lnTrigiaXK lnLD lnXDCB lnTSCD
```

Source	SS	df	MS	Number of obs	=	397
Model	1038.50095	3	346.166983	F(3, 393)	=	102.52

lnTSCD	.1446595	.0548273	2.64	0.009	.036868 .2524509
_cons	1.13624	.50715	2.24	0.026	.1391733 2.133306

White test (detects the phenomenon of variable variance)

```
. estat imtest, white
```

White's test for Ho: homoskedasticity
against Ha: unrestricted heteroskedasticity

```
chi2(9) = 35.94
Prob > chi2 = 0.0000
```

Cameron & Trivedi's decomposition of IM-test

Source	chi2	df	p
Heteroskedasticity	35.94	9	0.0000
Skewness	9.02	3	0.0290
Kurtosis	6.31	1	0.0120
Total	51.27	13	0.0000

The results of the White test have $P_value = 0.000 < 0.05$. Therefore, with the significance level of 5%, it can be said that the model for assessing the impact of factors on the export value of enterprises has the phenomenon of variable variance.

To overcome the phenomenon of variance, the author uses the method of Estimation with standard errors or robust standard errors. The estimated results of the model are as follows:

```
. reg lnTrigiaXK lnLD lnXDCB lnTSCD, robust
```

```
Linear regression                Number of obs   =       397
                                F(3, 393)      =       79.48
                                Prob > F            =       0.0000
                                R-squared           =       0.4390
                                Root MSE        =       1.8375
```

lnTrigiaXK	Coef.	Robust Std. Err.	t	P> t	[95% Conf. Interval]	
lnLD	.8302361	.098382	8.44	0.000	.6368151	1.023657
lnXDCB	.1256827	.0660759	1.90	0.058	-.0042237	.2555892
lnTSCD	.1446595	.0630829	2.29	0.022	.0206374	.2686816
_cons	1.13624	.5390372	2.11	0.036	.0764826	2.195997

The model estimation results show that the factors Labor and fixed assets have statistical significance at the 5% level of significance ($P_value < 0.05$). Factor XDCB has statistical significance at 10% significance level ($P_value = 0.058 < 0.1$). The regression coefficients have positive values, proving that the factors have a positive impact on the Export Value of the Enterprise.

Example: Coef. Of lnLD = 0.83, reflecting that an increase of 1% in the number of employees of the enterprise will increase the export value of the enterprise by an average of 0.83%.

Factors affecting import

```
. reg lnTrigiaNK lnLD lnXDCB lnTSCD
```

Source	SS	df	MS	Number of obs	=	364
Model	690.203577	3	230.067859	F(3, 360)	=	49.84

lnTSCD	.1121809	.0659154	1.70	0.090	-.0174467	.2418085
_cons	1.624205	.6289256	2.58	0.010	.3873755	2.861035

White test:

```
. estat imtest, white
```

```
White's test for Ho: homoskedasticity
against Ha: unrestricted heteroskedasticity
```

```
chi2(9) = 11.64
Prob > chi2 = 0.2342
```

```
Cameron & Trivedi's decomposition of IM-test
```

Source	chi2	df	p
Heteroskedasticity	11.64	9	0.2342
Skewness	9.32	3	0.0254
Kurtosis	3.99	1	0.0458
Total	24.95	13	0.0234

The results of the White test have $P_value = 0.2342 > 0.05$. Therefore, with the significance level of 5%, it can be said that the model assessing the impact of factors on the import value of enterprises does not appear the phenomenon of variance, the model's estimation results the above is the best.

4. Discussion and Conclusion

Based on the above test results, we accept hypothesis H1, H3 and reject H2, H4 with statistical significance of P value less than 0.05%. In the field of development investment, in addition to the direct investment items from the stage of construction, procurement of machinery and equipment, it is also necessary to mention the operation stage of investment results. During the operation phase, the factor is considered important and necessary for the long-term development of the business is investment in people. Because people will create long-term and sustainable value for businesses. In addition to manual labor, people also contribute to creativity in the production process of enterprises. With the experimental results from the enterprise survey in 2019 as above, it can be seen that the regression results for all domestic manufacturing enterprises today, the investment in labor as well as spending more annual fixed capital in fixed assets and capital construction are very necessary and one of the decisive factors in increasing the import-export value of enterprises.

As in previous studies, the global value chain is based on import and export value as a measure for enterprises' participation in the supply chain. With the results of this empirical study, the authors find that the development investment of each enterprise plays a very important role, especially capital and labor factors. To be able to quickly join and increase their participation in the global value chain, it is imperative for businesses to improve their value in the upstream position (Ana Fernandes 2020). As the investment capital increases every year, it means that the business turns around and reinvests and there will be an opportunity to increase the depth of investment for its business. In addition, labor will also contribute a large part to adding value in import and export and improving overall productivity for businesses. Vietnam is considered as one of the countries with abundant labor resources, the available workers are very suitable for company expansion from multinational corporations (companies with FDI capital or the parent company are in need. market expansion).

In summary, it cannot be denied the importance of development investment in each business and its contribution to the economy of each country. With the market open and Vietnam increasingly participating in international markets, standing on a free trade playing field like today, participating in the supply chain as well as improving its position is also one of the important tasks. With the above regression results, it is again confirmed that the trade value of Vietnam is assessed through the annual import and export value which depends and is heavily influenced by capital and labor factors.

Abstract

Research(es) on Corporate Social Responsibility (CSR) towards consumer purchasing behavior have received a lot of attention in recent years. However, the research on the impact of CSR on customer attitudes towards enterprises is quite meager. This study proposes and tests a model in which CSR is an independent variable, customer attitude is a dependent variable and perceived value is an intermediate variable. The data in this study is collected through the testing of the previously stated model with a sample of 337 random customers in the northern regions of Vietnam and the reviewing of 3 case studies about 3 businesses implementing CSR. The results of the research indicated that most Corporate Social Responsibility types positively influence the Vietnamese customers' attitudes, with the only exception being philanthropic CSR. Furthermore, the study revealed that CSR and customers' perceived value shares a positive relation and vice versa. Demographic factors such as gender and income do not affect consumers' perception of firms that commit CSR activities, however, the age and the field of occupation of a consumer does. The implications of the study are discussed, and this paper also provides recommendations for future research.

Keywords: *Corporate Social Responsibilities (CSR), customers' perceived value, customers attitude, demographic factors*

1. Introduction

1.1. Rationale of the study

The concept of Corporate Social Responsibility has had a long history of development, dating back to the second half of the 1800s. It initially started as a way for organizations to share their concerns about the welfare of workers during the boom of the industrial era. Over the years, the concept gradually matured into what we now know as the modern-day Corporate Social Responsibility, a collection of economic, legal, ethical, environmental, philanthropic responsibilities that businesses must uphold to better society (Thomas Insights, 2019).

Though CSR is extremely prevalent in the world, the term is still not well known in Vietnam. As far as the research team can understand, a lot of research concerning CSR activities in Vietnam tends to only focus on the exploration of the effects of CSR on customer loyalty or customer satisfaction, and not on the direct influence of CSR on the consumers' attitude to the firm or their products. Therefore, the author team of this research wishes to conduct this study to find out how CSR activities can directly affect consumers' attitudes toward companies that engage in CSR. This study also explores the effects of customers' perceived values (a mediating variable), and the effect of demographic factors, both of which also have an indirect influence on consumers' attitudes.

This research paper will review the theoretical background of CSR, customers' perceived values, demographic factors, and customers' attitudes to develop hypotheses. For research methodology, the research will use a mixed method, combining both qualitative and quantitative research methods. Empirical results will be presented and discussed along with other data gathered from case studies and in-depth interviews. Lastly, the paper will present a discussion of the research findings and some implications.

1.2. Theoretical backgrounds and hypotheses

1.2.1. Corporate Social Responsibilities

The responsibilities of corporates to society

Corporate social responsibility (CSR) is a popular research topic in the field of economic sciences, best described as the commitments of corporates to promote economic growth, contribute to the building of a better society, and maintain ethical standards in business (Le Minh Truong, 2021).

As mentioned previously, CSR is a collection of many different types of responsibilities. Research done by the Jaume I University (2020) revealed that the four common types of responsibilities in CSR include: economic, legal, philanthropic, and ethical responsibilities (Roig, Sánchez-García, Tena-Monferrer and Fiol, 2020). However, the study has failed to mention an equally important type of responsibility which is environmental responsibility.

Economic responsibilities

Economic responsibility (in CSR) is a combination of many different factors, economic CSR aims to create a balance between economic activities and social activities (such as environmental protection, charity, and ethical business).

Environmental responsibilities

Environmental corporate social responsibility (or ECSR) is best understood as actions taken by firms to reduce the impact of their business (or production) activities on the environment (NI BUSINESS INFO, n.d.), this means that besides exploiting resources to carry out production, businesses also must protect and restore the natural resources that they used (Anna Zelazna, Matylda Bojar, Ewa Bojar, 2020).

Legal responsibilities

Like all other activities, CSR activities must comply with the law as well (Barbara Bean Mellinger, 2018). Research by Roig, Juan & Sánchez-García, Javier & Tena-Monferrer, Sandra

& Callarisa Fiol, Luis (2020) supports the notion that CSR is subject to the laws and established rules in the area of a firm's operations. Only through the law can we achieve fairness for everyone further contributing to the stability and development of society (Toppr, n.d.).

Philanthropic responsibilities

Philanthropic responsibility is not an obligation, but a voluntary act, and businesses can organize the number of charitable activities how they see fit (Mai Nguyen Hoang Nam, 2021). Businesses can contribute either indirectly through charities (of national or international level charity organization) or donate directly to the needy through their own charity foundations, though the latter method is often met with much more rigorous regulations (Hai Yen, 2021).

Ethical responsibilities

Thieu Linh, a writer of *The Conversation on Vietnam Development* (2017) considers ethical responsibility as an extended concept of the previously mentioned concept of ethics, though applied to businesses. To have ethical responsibility (or business ethics) is to know what is right or wrong in the workplace and thereby one strives to do the right thing (Thieu Linh, 2017).

Customers' perceived value

In 1991, Sheth, Newman & Gross studied the concept of perceived value and concluded that it includes the five following components: functional value, intellectual value, social value, emotional value, and conditioned value. Their test results reveal that these 5 components are also the factors affecting the consumer's decision to purchase goods or services (Sheth, Newman & Gross, 1991).

1.2.2. Customer attitude

Solomon (2004) defines attitude as "a general, long-term evaluation of people (including themselves), objects or phenomena" (Solomon, 2004). A dive into the literature revealed that consumers' attitudes - and subsequently their purchasing behavior - are positively affected when they perceive that a business operates in a socially responsible manner (Pomering and Dolnicar, 2009), this means that companies with good social responsibility practices are more likely to resist boycotts (Cruz, 2017).

1.2.3. Demographic factors

This study will examine the influence of gender, income, and age on attitudes towards businesses implementing social responsibility.

1.2.4. Developing hypotheses

H1.1: There is a relationship between economic responsibility and consumer attitudes toward businesses.

H1.2: There is a positive relationship between environmental responsibility and the attitude of consumers to businesses.

H1.3: There is a positive relationship between legal responsibility and the attitude of consumers to businesses.

H1.4: There is a positive relationship between philanthropic responsibility and the attitude of consumers to businesses.

H1.5: There is a positive relationship between ethical responsibility and the attitude of consumers to businesses.

H2.1: Economic responsibility has a positive effect on the perceived value of a customer.

H2.2: Environmental responsibility positively affects the perceived value of a customer.

H2.3: Legal responsibility has a positive effect on the perceived value of customers.

H2.4: Philanthropic responsibility has a positive effect on the perceived value of a customer.

H2.5: Ethical responsibility positively affects the perceived value of customers.

H3: There is a relationship between perceived value and customers' attitudes towards enterprises that implement CSR.

1.3. Research model

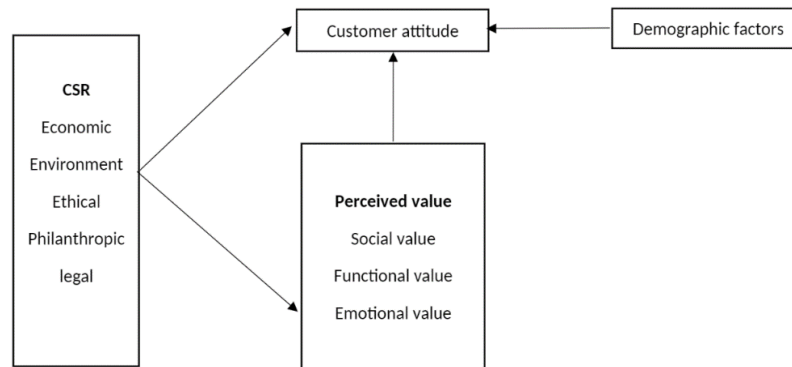

Figure 1. Research framework

Source: developed by author

2. Method

2.1. Research approach

This study was conducted using a mixed methodology: both qualitative and quantitative methods were conducted. The quantitative research was conducted through the use of questionnaires to evaluate the five types of CSR, customers' perceived value and their attitude toward the enterprises. The qualitative research uses the case study method - a method well suited for exploring and discovering concepts, finding similarities, trends, and the nature of socio-economic phenomena (Yin, 1994), the team also conducted in-depth interviews to enhance the richness of the information of the research.

2.2. Variables and measurements

The variable "Environmental responsibilities" is measured through questions regarding firms' activities related to environmental protection such as recycling waste, investing in energy conservation, producing environmentally friendly products, and setting up wastewater treatment plants as reported by Sandhu & Kapoor (2010). Meanwhile, the scale for the four remaining variables is referenced by Carroll & Shabana (2010).

In reference to the "perceived value" variable, specific questions were used in the questionnaire to measure the 3 values related to variable. Those values being the price and quality of the product, the value that the product brings to the customers, and their feelings when using the product as discussed in the Woo and Kim's report (2019).

Lastly, "Customer attitudes" is also measured on the basis of the scale provided by Shih and Fang's (2004) as a measurement of how customer attitudes towards the corporate and their level of support for the corporate social responsibility

Respondents were asked questions about the results of innovation and business results and scored on a five-point Likert scale, from 1 to 5 where 1 = totally disagree, 2 = disagree, 3 = neutral, 4 = agree, and 5 = totally agree.

2.3. Sampling and Data collection

Data collecting target: The focus was on customer groups in Hanoi of Vietnam with different age groups as well as incomes, occupations, and genders.

According to Tleam, an organization specializing in statistics, the number of observed samples must be 5 times more than the total number of questions in the survey (variable). Our study has 46 variables, meaning our sample must be at least 230. Our research team has collected a total of 485 responses from the survey with 337 responses having valid answers, accounting for 69.4% of the total responses collected.

2.4. Data analysis

The Statistical Package for Social Science (SPSS) 25 was used to support the analysis. The research team decided to perform an Exploratory Factor Analysis (EFA), and Confirmatory Factor Analysis (CFA), followed by a SEM linear structural model to analyze the causal relationship between the concepts and measure their relationships. To test the influence of demographic variables on customer attitudes toward enterprises, the research team decided to perform a One-way Analysis of Variance (One-way ANOVA).

3. Results

3.1. Sample characteristics

Table 1. Sample structure

Characteristics	Quantity	Ratio (%)	Characteristics	Quantity	Ratio (%)		
Gender	Male	131	38.7	Income	0 - <5 mil VND	167	49.6
	Female	192	57.1		5 - <10 mil VND	26	7.7
	Other	14	4.2		10 - <20 mil VND	105	31.2
Age	<30	207	61.6		20 - <30 mil VND	16	4.7
	30 - 39	42	12.5		≥30 mil VND	23	6.8
	40 - 49	58	17.3	Know enterprises interested in CSR	Yes	177	52.5
	≥50	30	8.6		No	160	47.5
Occupation	Student	178	53.0	Ever used/purchased product of businesses/brands implementing CSR	Never	149	44.2
	Worker	38	11.3		Used to	188	55.8
	Office worker	44	13.1	Pay attention to corporate social responsibility	Yes	245	72.7
	Freelancer	52	15.2		No	92	27.3
	Other	25	7.4				
Have you known of the term CSR before	No	167	49.5				
	Yes	170	50.5				

The characteristics of the sample (Table 1) indicate that a large number of people are under the age of 30 (accounting for 61.6%). This is consistent with income ratios as well as occupations. There are 50.5% have known the term CSR before, 52.5% know of enterprises interested in CSR, 55.8% have used products/services of enterprises implementing CSR and 72.7% answered that it is important to pay attention to CSR.

3.2. Exploratory Factor Analysis (EFA) and Reliability of measurement scales

The results of EFA analysis indicate that, the coefficient KMO = 0.881 > 0.5 and Sig (Barlett test) = 0.000 < 0.05, showing that the EFA analysis is appropriate.

Table 2. Factor Loading of the Scale

Concepts and observed variables	Factor Loading
Ethical responsibilities (TN)	
TN1. Conduct all business activities in accordance with ethical and social standards.	0.594
TN2. Ensure that respect for ethical principles takes precedence over economic efficiency.	0.868
TN3. Avoid and prevent unethical behavior to achieve business goals.	0.565
TN4. Commitment and effort to take the lead in implementing clear ethical principles.	0.721
Legal responsibilities (PL)	
PL1. Comply with local regulations and state laws.	0.863
PL2. Ensure that their employees comply with legal requirements.	0.666
PL3. Do not ignore the legal obligations on the contract under the state regulations.	0.677
PL4. Avoid circumventing the law even if it improves business performance.	0.582
Environmental responsibilities (EV)	
EV1. Enterprise carry out recycling of pollutants and waste.	0.663
EV2. Enterprise invests in energy conservation.	0.824
EV3. Enterprise manufactures environmentally friendly products.	0.719
EV4. Enterprise sets up wastewater treatment plants.	0.640
Economic responsibilities (CE)	
CE1. Enterprise focuses on maximizing profits.	0.703
CE2. Enterprise develops in a sustainable direction.	0.731
CE3. Enterprise has a superior competitive position.	0.709
CE4. Enterprise looks for a profitable business.	0.656
Philanthropic responsibilities (ND)	
ND1. Support the cultural and artistic activities of the local community.	0.653
ND2. Participate in charitable activities, manage social works in the place where they live.	0.671
ND3. Contributing to society, not simply making a profit.	0.740
ND4. Support to improve quality of life in local communities.	0.753
Emotional value (CX)	
CX1. I love buying products from these enterprises.	0.795
CX2. I feel comfortable and satisfied after using the products/services of enterprises implementing CSR.	0.723
CX3. Using the products/services of these enterprises makes me feel insecure.	0.809
Social value (CV)	
CV1. Buying products from enterprises that implement CSR helps me have a good image in the eyes of others.	0.529
CV2. The product/service of this enterprise improves my quality of life.	0.824
CV3. Using the product/service of this enterprise helps me gain acceptance from others and society.	0.730
Functional value (BV)	
BV1. Products from these enterprises are reasonably priced.	0.745
BV2. Products of enterprises that implement CSR are well-made to minimize negative impacts on society.	0.799
BV3. Standard levels of these products are acceptable.	0.686
Customers attitude (TD)	
TD1. I have a positive attitude towards enterprises that implement good CSR.	0.677
TD2. I prefer to use products/services of enterprises implementing CSR.	0.735
TD3. I support enterprises that implement CSR because their activities help the community.	0.630
TD4. Experiencing CSR activities of the enterprise makes me feel that I am indirectly contributing good values to society.	0.618

Table 2 shows that the variables in the research model are extracted into 9 factors with total variance explained of 68.255% > 50%. The factor loading of the measured variables are all greater than 0.5 thus all variables have convergent values.

3.3. Confirmatory Factor Analysis (CFA)

Figure 2. Critical CFA model (normalized)

The critical CFA model is used to evaluate all the concepts in the model. The results showed that this model was suitable for the market data (Chi-Square/DF = 1.563 <5; GFI = 0.888 <0.9; TLI = 0.935 > 0.9; CFI = 0.944 > 0.9 and RMSEA = 0.041 <0.08) (Kettinger and Lee, 1995). The standardized weights of the observation variables fluctuated from 0.656 - 0.893 which are all satisfactory (greater than 0.5) and the unstandardized coefficients have statistical significance (P = 0.00) with 95% reliability, so the observed variables used to measure concepts have convergent validity. In addition, the correlation coefficient of each pair of concepts is different from 1 with statistical significance, so the components achieve discriminant validity (Figure 2).

The reliability and variance explained results of the concepts show that the Cronbach's alpha reliability and the combined reliability of the components are greater than 0.6 and the variance explained is greater than 0.5 thus the scales are highly reliable.

3.4. Test Theoretical Model by SEM

Results of the theoretical model analysis (SEM) as shown in figure 3 have a P-value of 0,00 (< 0,05). These results are all suitable for the market data (Chi-square/df < 5; GFI < 0.9; CFI, TLI > 0.9, RMSEA < 0.8).

Figure 3. Results of theoretical model analysis SEM (standardized)

The estimated results of the main parameters of the model presented in Table 3 have revealed that the impact of philanthropic responsibilities to consumers attitude on enterprise has no statistical significance ($P = 0.098 > 0.05$ with significance $\alpha = 5\%$). Similarly, the impact of economic responsibilities and environmental responsibilities on the perceived value is not statistically significant with P value respectively equal to 0.868 and 0.23. The remaining relationships in the model are statistically significant with significance $\alpha = 5\%$. Therefore, hypotheses H1.1, H1.2, H1.3, H1.5, H2.3, H2.4, H2.5, and H3 are accepted.

Table 3. Regular regression coefficient of relationships in theoretical model

Hypothesis	Relationship	Estimate	Standardized Estimate	SE	CR	P-value
H1.1	Economic responsibilities -> Customers attitude	0.178	0.164	0.065	2.761	0.006
H1.2	Environmental responsibilities -> Customers attitude	0.194	0.161	0.072	2.704	0.007
H1.3	Legal responsibilities -> Customers attitude	0.262	0.211	0.076	3.445	0.000
H1.5	Ethical responsibilities -> Customers attitude	0.322	0.327	0.069	4.669	0.000
H2.3	Legal responsibilities -> Perceived value	0.146	0.221	0.053	2.739	0.006
H2.4	Philanthropic responsibilities -> Perceived value	0.113	0.184	0.04	2.8	0.005
H2.5	Ethical responsibilities -> Perceived value	0.225	0.429	0.048	4.631	0.000
H3	Perceived value -> Customers attitude	0.448	0.239	0.142	3.167	0.002

4. Discussion and Conclusion

4.1. Discussion

This study was conducted in order to support businesses with insights into the impact of CSR on customer attitudes.

The results show that corporate social responsibility is considered in five aspects (economic, environmental, ethical, legal, and philanthropic), in which economic, environmental, legal, and ethical responsibilities have a direct influence on customer attitudes. This result is consistent with the study of Van Doorn et al. (2017) which found that perceived CSR has an impact on customer attitude when considering brand success indicators. In addition, perceived value also directly affects customer attitudes, this is consistent with results of previous studies such as that of Woo and Kim (2019) which has tested and concluded that all substructures of green perceived value (i.e., functional value, conditional value, social value, and emotional value) is significant and has a positive effect on consumer attitudes towards green food product purchase. Finally, when considering the effects of gender and income level to the attitude of customers, the research team found no considerable differences in the relationship of these variables with customer attitude. On the other hand, when looking at age and occupation, we found a difference between the target groups. Students, office workers, freelancers, workers, and other occupations seem to have different attitudes along with different levels of awareness towards enterprises implementing CSR.

This study also shows that CSR and perceived value are related. Legal, philanthropic, and ethical responsibilities of a business all have a positive effect on perceived value. Once again, this result is relatively consistent with the study done by Green and Peloza (2011) which stated that corporate social responsibility includes charitable responsibility and responsibility for related products that affect perceived value (functional value, social value, and emotional value) in a good sense. At the same time, it is also reasonable to compare our results to the study conducted by Mohammed et al (2019) which affirmed that CSR activities are considered as a significant predictor of customer perceived value and level of customer interact on social networks.

4.2. Recommendations for businesses and policymakers

Currently, the implementation of social responsibility activities has received increasing attention from enterprises as the implementation of CSR can improve the efficiency of their business operations. However, it is worth noting that the implementation of CSR may not lead to positive business performance since the customers may not immediately recognize the importance of CSR and the benefits it provides. Thusly, the study of factors affecting customers' awareness and attitude towards CSR has an important role in both theory and (business) practice to improve customers' awareness and attitude towards CSR activities.

This study suggests that each enterprise should have a specialized department in charge of issues related to social responsibility. The role of this department is to work with the corporate governance board to determine issues such as: corporate vision on CSR activities, analysis of factors related to and affecting social responsibility. Furthermore,

enterprises should incorporate CSR into their set of standards of operations, thereby demonstrating the benefits of CSR activities to the community through their operations. The authors recommends that businesses should approach a number of specialized CSR standards systems that already exist and have international value such as SMETA, RBA, BSCI, etc. Enterprises should also implement policies to disseminate CSR right from within the enterprise, along with implementing policies towards popularizing CSR to customers through various means of marketing and communication, however, firms should be careful to not make CSR look too commercial.

The role of the government is also vital as it is considered as the main driver of CSR activities. In general, Vietnam's legal system has been developed with more detailed regulations for the fields of environmental protection over the years, however, these regulations have not yet been effective, and the responsibilities of the authorities are still vague (Nguyen Dinh Tai, 2010). In addition, there is a need for more attention of the government and social organizations in creating a legal corridor and a code of conduct to ensure that the implementation of CSR is necessary; the government should continue to develop more policies to improve people's quality of life, thereby promoting people's attention to the common interests of society and indirectly promoting people's attention to CSR.

4.3. Conclusion

This study explores customer groups in the Northern regions of Vietnam. The research results show that 4 out of 5 types of CSR responsibility: economic (CE), legal (PL), environmental (EV), and ethical responsibilities (TN) all have a positive influence on consumer attitude (TD) in the North of Vietnam. In which, ethical responsibilities have the most profound influence on consumer attitude (with Standardized Estimate = 0.327), while environmental responsibilities have the least influence (with Standardized Estimate = 0.161). In addition, the results of the study also indicate that the positive relation between re-perceived value and consumer attitude about enterprises implementing CSR is quite significant (with Standardized Estimate = 0.239). Through the process of research and field survey, the scientific research project has achieved the set goal of studying the impact of social responsibility activities on customer attitudes. The following outcomes have been achieved:

1. Conducted substantial literature review related to perceived value and impact of CSR on customer attitude.
2. Organized a theoretical basis, and some theoretical models related to customer's attitude towards enterprises implementing CSR.
3. Established a theoretical framework, a research model, and developed several research hypotheses on the relationship between the factors affecting customer attitude towards enterprises implementing CSR.
4. Researched the impact of social responsibility activities on customer attitudes and evaluated the influence of perceived value factors on consumer attitude.
5. Based on the results of this study, the research team have conducted extra case studies involving three enterprises and have proposed some recommendations for businesses and policy makers which would help these associated parties have a deeper understanding

of the impact of CSR on customer attitudes, therefore helping both firms and policymakers being able to better understand customer psychology, and better identify potential customer segments through perceived value and demographic factors.

IMPACTS OF CORPORATE SOCIAL RESPONSIBILITY ON EMPLOYEE OUTCOMES IN COMMERCIAL BANK: PROPOSAL RESEARCH

Thanh Kim Hue

thanhkimhue1978@gmail.com

Director of Banking Academy Bac Ninh Branch, Bac Ninh, Vietnam

Abstract

The aim of this research was to see how corporate social responsibility affected employee outcomes. Businesses say that workers have a range of job expectations (developmental and ideological) and that CSR is a useful instrument for addressing these demands. Businesses have also observed that addressing employees' ideological and developmental employment expectations results in beneficial employee outcomes, such as work satisfaction and intention to reduce turnover. Finally, companies find that having a tight relationship with CSR improves CSR's positive impact on employee outcomes. This research uncovers substantial differences in employee demand for CSR and gives fresh light on the underlying processes that relate CSR to employee outcomes.

Keywords: *Employees outcomes, corporates social responsibility (CSR)*

1. Introduction

Businesses throughout the world are increasingly turning to CSR to acquire a competitive edge and achieve long-term and short-term success.

Employee morale and turnover are two of the most important methods for CSR to add value to a company (Bonini et al. 2009). Employees that are competent, skilled, and motivated are vital to an organization's long-term success.

As a consequence, understanding how and why employees react to CSR may aid firms in developing and managing CSR programs that meet employee demands while also optimizing profits. Employee reactions to CSR have been studied, and it has been found that it has a positive impact on a variety of employee outcomes, employee perceptions, organizational commitment, employee job satisfaction, and business commitment (Brammer et al. 2007). (2007, Brammer et al.) Bhattacharya et al. (2008) and Bhattacharya et al. (2011) are two papers by Bhattacharya et al.

Second, this study contributes to our knowledge of the processes that relate corporate social responsibility to employee outcomes. We show that in the CSR—employee outcome links, both developmental and ideological needs fulfillment play a role in mediation. Finally, active workers' awareness of their companies' CSR is a powerful lever that may strengthen or decrease the links between CSR, employee ideological and developmental job expectations, and employee results. This emphasizes the importance of organizations wanting higher employee-related advantages from CSR to actively incorporate internal customers in their CSR efforts.

2. Method

Previous researchers have shown that the relationship between CSR awareness has a positive impact on employee outcomes. They point out the urgency in properly and fully understanding the role of corporate social responsibility in enhancing competitiveness and sustainable development of enterprises. One of the key factors determining the success of businesses is understanding employees, motivating them to make decisions that make employees happier and more loyal. CSR is one of the factors, not only help promote the intention to meet the working needs of employees, but also help businesses increase employee satisfaction and loyalty. The study also points out the need to further study this relationship by uncovering mediating or regulatory factors through which to help scholars and managers have a better view of the relationship. this relationship.

There have been many scholars both at home and abroad taking time and effort to study these factors. For example, David's research shows that CSR affects employee outcomes through the intermediary variable of meeting development needs and meeting ideological needs. This helps businesses have a suitable approach to building and developing their CSR programs that are able to meet the needs of employees and maximize business profits.

Employee perceptions of and participation in their organization's CSR activities, or CSR can strengthen or weaken the relationship between the organization's CSR, employee fulfillments, ideologicals job demands, and employee development and outcomes (i.e. job satisfaction and intention to change) produce outcomes. Positive employee-related results, such as higher work satisfaction and a lower desire to leave the company.

CSR has a direct influence on employee outcomes, according to research, thanks to two mediating variables: addressing development requirements and meeting ideological needs. In general, the research looked at a wide range of businesses and industries.

Employee outcomes studies also show that employees are heterogeneous about their multifaceted job needs. Therefore, in order to contribute to corporate CSR-related knowledge, this study focuses on answering the following questions:

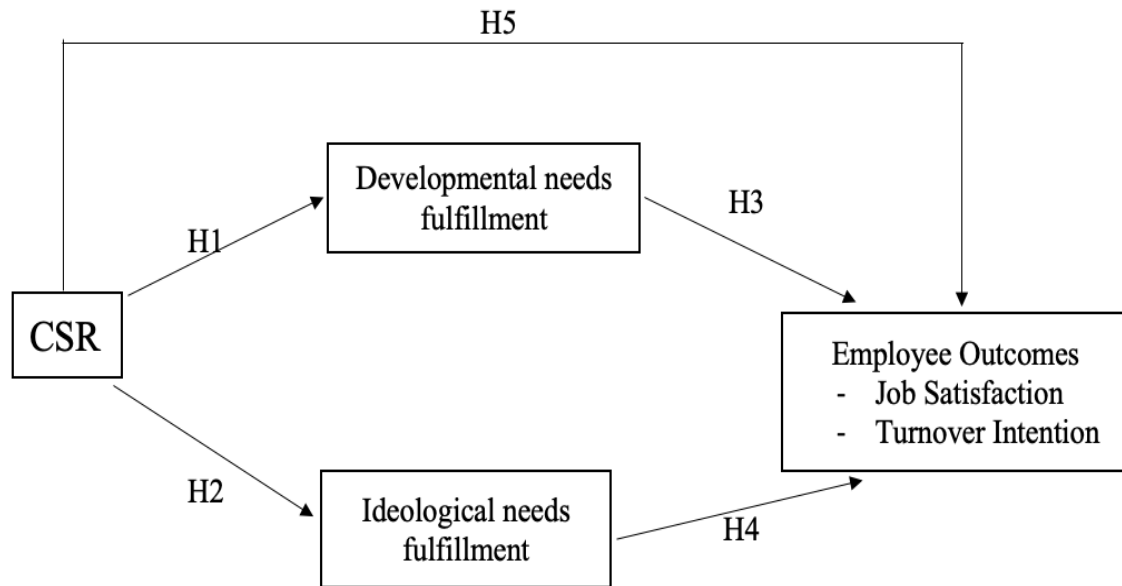

First, to what extent does CSR affect employee outcomes?

Second, CSR impacts on developmental needs fulfillment

Third, CSR impacts on ideological needs fulfillment

Fourth, how does the satisfaction of developmental and ideological requirements effect employee performance?

Below is the research model to easily see the relationships of the variables:

3. Proposal research

3.1. Corporate social responsibility (CSR)

Corporate social responsibility is a topic that has received the attention of managers and scholars in recent years because of its importance to businesses, in the context of fierce competition and the development of social media, current association. Therefore, up to now, the concept of social responsibility has not been unified among scholars and there are many different definitions.

For many years prior to the 1950s, corporate social responsibility (CSR) was referred to as social responsibility (SR). This might be due to the fact that there isn't a lot of agreement on the idea. Bowen's seminal work "Social Responsibilities of the Businessman" was released in 1953, marking the start of the subject's contemporary era. Bowen's study of CSR was based on the notion that hundreds of the world's most powerful entrepreneurs were the centers of power and significant decision-making at the time, and that their activities affected the lives of many businesses in a number of ways.

Frederick (1960) asserted that there are three core ideas in CSR:

- (1) activities of business managers as influencers in the interests of the community,
- (2) the idea of balancing the company's resources and
- (3) accept charity as an expression of business support for good causes.

By 1971, the Association for Committed to Economic Development (CED) promoted CSR and required businesses to assume a broader responsibility for society and serve more human values and obligations to society groups in society beyond shareholders and beyond the scope of the law (Jones, 1980).

In 1991, Carroll described economic responsibility as the expectation that a business will maximize profits for its shareholders and legal responsibility as a requirement for businesses to comply with the provisions of the law. Ethical responsibility means that a business must do what is ethically and ethically expected. Charity responsibility means that a business should have a charitable program to society. Agreeing, Lantos (2001) explains that CSR can become a strategy when it is part of a company's management plan to generate profits, which means that the company will engage in activities considered a social responsibility if it brings financial benefits to the company.

CSR is defined by the European Commission (2011, p.3) as "a voluntary concept in which enterprises incorporate social and environmental considerations in their commercial operations and relationships." CSR is a process in which businesses incorporate social, environmental, and ethical problems into their commercial operations and plans in close collaboration with stakeholders, extending beyond legal obligations and collective bargaining agreements.

3.2. Ideological needs fulfillment

The multiplicity of ways to use the term "ideology" is often acknowledged, if not bemoaned, in sociological debates of ideology (Eagleton 1991). Later Marxists frequently used it to denote conspiratorial ideational wool pulled over the eyes of the masses; political scientists use it to denote packages of positions, often believed to be unifiable in a single preferred optimal state; and, of course, many of us use it to denote the beliefs, attitudes, and opinions of those with whom we disagree.

Our nominalist epistemology, which assumes that broad theoretical concepts must be produced by the analyst and are heuristic devices employed to varying degrees of effectiveness in specific analyses, is a common response in sociology to these challenges. As a result, we presume that each investigator is essentially free to define his or her words as he or she sees fit, and the worst we can say about a given case is that the definitions were ineffective.

3.3. Developmental needs fulfillment

Individual needs should represent what people require to live and survive as humans. Human dispositions such as desires and drives are grounded in needs, and their definition can be based on individual opinion on the one hand and expert judgments on the other. The satisfaction of wants is necessary for a high quality of life and social well-being. If wants are not met, a sense of scarcity or deficit develops, which has severe effects for both individuals and society. Needs may have an important role in social development.

3.4. Employee Outcomes

It seems to reason that excellent human resource management might lead to a number of positive employee outcomes. Commitment to the organization, confidence in management, higher levels of collaboration, higher levels of effort and engagement, and a lesser likelihood of employees leaving the company are all possible results.

These beneficial results for the company's employees should result in improved operational and financial success. Operational performance refers to any type of

performance that stems from a company's operations, such as good quality or increased customer happiness. Profit or revenue growth are examples of financial performance measurements drawn straight from a company's financial statements.

Is it true that HR procedures result in favorable employee outcomes? According to the findings of this study, more usage of effective HR practices is linked to better levels of commitment to the firm, confidence in management, collaboration, effort, and engagement, as well as fewer inclinations to quit. Do great employee outcomes have an influence on a small business's operational and financial performance? The findings of this investigation show that this is actually the case. Various employee outcomes were shown to be significantly linked to various operational and financial performance parameters.

3.5. The impact of Developmental needs fulfillments and Ideological needs fulfillments on employee outcomes: Job satisfaction and turnover intention

Employees are expected to have a diverse set of developmental and ideological requirements. The importance of individual variances in employee labor requirements is emphasized (Bhattacharya et al. 2008). Employees' opinions on organizational obligations are similarly personal, self-constructed, and distinctive, according to the psychological contract literature (Raja et al. 2004). Employee expectations of business obligations have been connected to individual personality, gender, and cultural beliefs. Employee heterogeneity in employment demands will likely be mirrored in their unequal need for corporate CSR, according to our predictions. Employee support and openness to organizational CSR participation differs, according to a previous study. Rodrigo and Arenas (2008) defined three types of workers based on their CSR attitudes in their qualitative study: committed, indifferent, and dissident. Workers who are committed to social welfare and are enthusiastic about their employers' CSR policies; employees who are apathetic about whether or not their businesses participate in CSR; and employees who are dissatisfied with their employers' CSR. However, little is understood about why workers' attitudes toward and requests for CSR initiatives vary. Employees with higher ideological aspirations will naturally place greater weight and expectation on their organization's CSR since CSR symbolizes an organization's attempts to generate some societal benefit outside of the enterprise's interests. As a result, employees who have more developmental needs are more likely to demand that their employers engage in more CSR initiatives. As a result, we provide the following hypotheses,

H3, H4. Employees' multifaceted job requirements are quite heterogeneous (developmental, and ideological).

3.6. Relationship between CSR and Ideological needs fulfillment and 2.3. Relationship between CSR and Developmental needs fulfillment

CSR refers to a collection of business policies and practices that support an organization's long-term financial, cultural, and environmental goals. Sen and Bhattacharya (1997) and Brown and Dacin (1997) (2001). Socially responsible businesses between business and society in their operations (Scott 1987). As a consequence, a company's CSR

programs can help workers achieve their ideological goals of supporting social concerns and making a difference.

According to a recent study, CSR initiatives may benefit employees. Employees that participate in CSR activities learn abilities that will help them advance in their careers. Employees are being compelled to participate in CSR activities on the job as more firms integrate socially responsible initiatives into their core business plan. CSR encourages employees to participate in enhancing the company's social and environmental performance.

Moreover, CSR has become an increasingly important aspect of an organization's strategic planning, and employees are increasingly performing CSR tasks on the job. CSR has been shown to contribute to beneficial employee outcomes such as organizational commitment, work satisfaction, and loyalty in previous studies. To produce good stakeholder reactions, CSR must answer key stakeholder demands. We believe that the most significant strategy for CSR to achieve good employee behavior is to address workers' different employment demands.

It may provide employees with self-relevant benefits, and CSR broadens the range of benefits that a company may deliver to its employees. CSR may be used to satisfy higher-level ideological goals as well as employee professional development demands (Bhattacharya and Sen 2003). Surroca et al. 2010; Mirvis 2012). Employees express improved work satisfaction and loyalty as a result of better addressing ideological and developmental goals.

Finally, meeting employee work needs is a critical strategy for CSR to create positive employee outcomes. As a result, it's feasible that corporate CSR will enhance employee work demand fulfillment to a greater degree for employees who have a high CSR, resulting in better employees outcomes. Employees who are more connected to their company's CSR are more likely to feel successful and learn new skills, which leads to greater fulfillment of ideological and developmental employment demands, as well as increased employee satisfaction and loyalty.

As a result, CSR activities provide much-needed chances for workers to be empowered to effect change and polish critical business skills like leadership, problem-solving, and creative thinking outside the box (Kanter 2009). Therefore,

H1, H2 When all other factors are equal, firms that are praised for their CSR activities are better at meeting employee (a) ideologically job demands and (b) developmental job needs.

3.7. The impact of corporate social responsibility (CSR) on employee outcomes

Furthermore, I look at the role of corporate social responsibility (CSR) in the relationship between CSR and employee outcomes. The extent to which workers are aware of and actively engage in their company's CSR is referred to as CSR. Employees are frequently supportive of their companies' CSR initiatives, both in terms of awareness and engagement. Employees' lack of understanding of CSR continues to be a big challenge for organizations in their efforts to generate positive reactions, as knowledge of CSR is essential for any positive reactions to occur.

Employees also want to be a part of their employers' positive change-making CSR efforts (Cone 2008). Employees' active engagement or involvement in the company's CSR initiatives, in addition to their CSR education, expands their thinking about social issues and prepares them to be facilitators rather than observers of CSR programs. Employees who are aware of their company's CSR and actively participate in developing, promoting. In general, I believe that increasing CSR's effectiveness in delivering positive employee outcomes will boost CSR's efficacy.

H5 The association between CSR and employee outcomes

3.8. Research gap

The influence of CSR on employee results needs to be through two intermediate variables, development needs fulfillment and ideological needs fulfillment, because the whole business system has a CSR culture, so it affects gradually, gradually infiltrates. thinking of each employee and at the same time making them feel that they need to develop and improve to create outcome

s. When a repeated cultural system gradually affects human character. CSR is the whole business to follow, the business philosophy is like that, so everyone must follow it, it gradually forms the ideology, the whole development, it will push the actions. Therefore, it produces good outcomes.

4. Discussion and Conclusion

In this section, we will present the research process and methods to achieve the research objectives

The main content includes the Research model, Research process, Research gap, Qualitative research methods, and Quantitative research methods.

✚ Research model

The framework that drives this research is based on the development of research hypotheses shown in below. This study integrates the theoretical perspectives of stakeholders to examine the relationship between CSR and Employee outcomes to investigate the link between corporate social responsibility and employee outcomes through Ideological needs fulfillment and Developmental needs fulfillment.

✚ Research process

The research process explains step by step how to carry out the research as well as the steps to achieve the research objective. Specifically, there are 3 stages as follows:

- Stage 1: Theoretical overview

This stage begins to form research ideas on CSR and employee outcomes. We have researched and synthesized from many different sources, mainly reputable journals in the world. Then from that, looki

ng at businesses around the world, we realized that businesses began to have certain concerns about CSR in terms of employee results. From there, we found the research gap

and established the research objectives. The results of this process have formed the expected research model presented above.

- Stage 2: Preliminary research process

We use two research methods at the same time, qualitative research method and quantitative research method. In which, qualitative research is mainly to explore more factors that are the benefits of CSR and are the premise of financial performance. Qualitative research results are used for preliminary survey in order to complete the survey form and perform preliminary testing.

- Stage 3: Formal research process

At this stage, the author mainly uses quantitative research methods. The purpose of this phase is to test the research hypotheses. Using techniques to eliminate inappropriate scales, confirmatory factor analysis (CFA) - evaluate the measurement model to check the reasonableness of the model, determine convergent value, discriminant validity, and unidirectionality. Finally, the author analyzes the structural model (SEM) to check the fit of the model, test the hypotheses and test the degree of regulation of the relationship between CSR and employee outcomes through the modulating variable by Smart PLS 3.0 software.

- ✚ *Qualitative research methods*

The results of qualitative research serve as the foundation for quantitative research in the thesis, determining its applicability and feasibility. Because if the findings of qualitative research on consumer perceptions show that they are unaware of CSR, this study is ineffective. As a result, the

author employs qualitative research methods such as (1) study design and sample, (2) data collecting, and (3) data analysis to guarantee that the research model is placed in the proper and essential context./.

Van Lang University, Ho Chi Minh City, Vietnam

Abstract

The Covid-19 pandemic has severely affected the entire economy. In particular, the hotel service industry struggled with the decrease in revenue and affected the ability to develop according to the set goals. Realizing that the development of a touchless model for hotels still has a lot of potentials, the application of touchless hotels in the tourist city of Vung Tau is considered to analyze in the post-pandemic period. By reviewing papers and interviewing four managers in luxury hotels in Vung Tau, the study identifies the strengths, weaknesses, opportunities, and threats for applying touchless hotels in Vung Tau. The expert interviews also unveiled the difficulties in both human interaction and financial situations and hoped to orient safely and sustainably revitalizing tourism in Vietnam in general.

Keywords: *touchless hotels, post-pandemic, Covid-19, sustainable model, Vung Tau, Vietnam*

1. Introduction

Hotel is an essential accommodation service in tourists' travels and has been one of the thriving industries in Vietnam in recent years (Hoa & Huy, 2021). According to Do et al. (2020), the development of the hotel industry has required hotels to provide basic service and a more satisfying and personalized experience to customers. Therefore, to meet the requirements of customers, adapt, and aim for development in the post-Covid-19 context, the hotel industry needs to shift to a new trend of promoting technology application and application 4.0 to bring a new non-touch experience suitable to the situation of ensuring safety and enhancing modernity for customers (S.-H. Chen, Tzeng, Tham, & Chu, 2021). Under the impact of the pandemic, guests need new hotel service models to minimize contact. It means touchless hotel automation is expected to become part of the new normal in future travel trends (Hussain, Ahmad, & Kareem, 2020). The development of a touchless hotel can attract many returning customers, especially when health and safety are considered top priorities in the post-Covid-19 era (Lew, Cheer, Haywood, Brouder, & Salazar, 2020).

To control the Covid 19 epidemic, the Government has decided to temporarily suspend the reception of international tourists for the first six months of 2020 (Nhat Nam,

2020). Therefore, the number of domestic tourists to Ba Ria - Vung Tau is still limited due to the epidemic situation. It is urgent to stimulate demand to attract tourists during the low season (the last four months of the year). Through the Tourism Association, the Department of Tourism (2021) encourages resorts, tourist attractions, accommodation facilities, restaurants, etc., simultaneously to reduce prices from 10% to 30% of service charges for tourists from now until the end of 2020.

Vung Tau is a famous tourist city in the South of Vietnam with steady growth before the pandemic. According to the Department of Tourism of Ba Ria - Vung Tau (2021), In the first six months of 2019, the total number of tourists to Vung Tau has reached about 8.46 million, up 29.22% over the same period and reaching nearly 53% of the year plan. In 2019, Vung Tau's economic indicators exceeded the set plan. The tourism and service trade revenue is estimated at 229,400 billion VND, up 10.02 % over the same period. The total number of arrivals is over 6 million, and international visitors account for about 10%. However, the Department of Statistics (2021) shows that Vietnam's tourism was almost frozen in the first six months of 2021, and in Vung Tau, a series of hotels had to close without knowing when to reopen. Before and in the current complicated epidemic situation, tourism activities are almost stopped across the country in general and Vung Tau City in particular. Tourists must cancel approved or pre-ordered tours or hotels (Lê Vũ, 2021). The outbreak of the Covid-19 epidemic in May 2021 severely affected the hotel industry in Vung Tau. People follow Directive 16 to carry out the Government's call "Whoever stays where he is" to prevent the disease from spreading. Department of Tourism Ba Ria – Vung Tau (2021) emphasizes that in the last months of 2021, the Covid-19 pandemic significantly impacts the tourism industry in general and the hotel industry in particular, falling into difficulties and experiencing a severe decline. Along with that, the trend of tourists is also changing, forcing the hotel industry to be flexible to adapt by applying technology.

The proposed research fields are expected to expand the knowledge base and assist the hospitality industry by recovering from the COVID-19 crisis via digital transformation. AI and robotics are on the verge of a breakthrough that can revitalize hotels while restoring guests' faith in safe hotel operations. The proposed research areas will likely provide the hospitality industry with practical lessons on dealing with disruptive situations. Realizing the problem of post-epidemic recovery for the tourism industry, the author, through researching, reading, and referencing documents related to tourism trends and interviewing experts in luxury hotels in Vietnam, analyzes and proposes the potential to develop new tourism models. The study points out the strengths, weaknesses, opportunities, and threats for touchless tourism, typically in Vung Tau city, in a future new normal.

2. Literature Review

2.1. Protection Motivation Theory (PMT) explains customers' preferences in touchless hotels.

The protection motivation theory (PMT) is as a framework for understanding the impact of fear appeals (Prentice-Dunn & Rogers, 1986). The original purpose of protection motivation theory (PMT) was to understand individual human responses better to fear

appeals. Threat and a coping appraisal are two characteristics humans use to protect themselves. Threat appraisal evaluates the seriousness of the circumstance and its seriousness, whereas coping appraisal evaluates how one response to the situation. The perceived severity of a hazardous event and the perceived probability of its occurrence, or vulnerability, make up threat evaluation. Perceived response efficacy, or an individual's expectation that taking the advised action will eliminate the danger, and perceived self-efficacy, or confidence in one's ability to successfully carry out the recommended courses of action, are two components of the coping evaluation (Norman, Boer, Seydel, Mullan, & behavior, 2015).

Because so many people are exposed to the deadly COVID-19 disease worldwide, understanding the risk will encourage people to change their habits and stay in more protected and safer hotels. In the presence of a perceived health threat, people are motivated to adapt in a self-protective manner, referred to as PMT (Norman et al., 2015). The fear appeal, according to PMT, will initiate the cognitive mediating process, which will lead to protection motivation. A fear appeal can be triggered by severity, vulnerability, reaction effectiveness, and self-efficacy, leading to adopting technologies such as AI and robotics as a protective response to the worldwide pandemic (J. Kim, Yang, Min, & White, 2021). Individuals are persuaded to use practices that minimize human touch by using the fear appeal. Touchless methods such as a contactless fingerprint, face recognition, and contactless data entry can help to limit the virus's transmission.

2.2. Strengths and weaknesses of touchless hotels

The ongoing COVID-19 pandemic has provided ample opportunity for scientists to expand their knowledge of AI and robotics and contribute to the literature in this field. Because COVID-19 is so contagious, keeping a safe distance is critical. As a result, now is the ideal time for hoteliers to accelerate the deployment of AI and robotics in the hospitality business. The hotel service industry is shifting towards AI and robotics worldwide. Hospitality companies have gradually begun to use robots to provide front-line services to their customers. These frontline robots will improve customer service while lowering operational expenses for hospitality companies (Gaur, Afaq, Singh, & Dwivedi, 2021).

According to CDC Vietnam (2021), manual operations with hands that often have to touch and come into contact with surfaces are the main route to Covid-19 infection. Customers can be exposed to the virus everywhere, such as close contact with objects including reception, security, staff, and people staying within 2 meters with a total time of 15 minutes above. Therefore, contact restrictions have been noticed in recent times to limit infection. And tourism businesses are also following this trend. Awan, Shamim, and Ahn (2021) confirm that most of the current large enterprises that want to maintain and develop are applying technology to their business strategies. In particular, with the awareness of many leaders, deciding the direction and ability to increase operational efficiency in the hotel sector is now really necessary. The touchless hotel solves many customer concerns, creates a foundation for upgrading customer experience in the future, and can completely restore the operating status of the business before Covid-19 (Bharwani & Mathews, 2021).

Kinhdoanhnet (2021) also shows that 80% of the respondents are willing to download the hotel's app to check in or check out and receive all information without having direct contact with the staff. 73% of the respondents are willing to download the integrated app for room door opening. The most popular forms of check-in and check-out are through the hotel app (62%), hotel website (30%), or kiosk check-in/check-out (8%). It can be seen that touchless tourism is gradually becoming a basic need of tourists, and it is an entirely new hotel model in Vietnam. Tourists will experience a completely automatic procedure when arriving at the touchless hotel.

Gaur et al. (2021) also drew a graph about tourist responses before and after the pandemic using technologies in figure 1.

Figure 2. The level of fear among the hotel guests

Source: Gaur et al. (2021)

Pizam and Shani (2009) show that hospitality has stayed relatively static since human capital has always been more critical in hospitality than in other industries. This feature has remained relevant in an era of significant technological advancements. Although technology advancements have impacted the sector, many managers believe it is not as technologically advanced as other industries. However, technological advancements allow for a higher level of sophistication in service delivery, particularly when it comes to responding to the specific demands of individual customers. Customers have gotten more sophisticated, which necessitates a significant improvement in service quality, which is not always related to technology. Indeed, it was stated that the industry's service quality is continuously improving. The industry's advancement is also apparent in need to have one's finger on the pulse when it comes to contemporary trends that aren't always immediately tied to customers, such as environmentally responsible practices.

Moreover, applying new technology to the business can also create difficulties in working progress. According to S. Kim, Kim, Badu-Baiden, Giroux, and Choi (2021), The hotel must be equipped with the most modern and best equipment to optimize the customer

experience. It is not simply because of the investment in facilities, and it is about the training cost for staff. Although the awareness of the role of modern technology application brings efficiency to the management, the hotel staff is still low level. Therefore, applying a modern optimal platform requires a highly qualified and well-adapted human resource team to apply in touchless hotel services. Employees need to be trained and have a deep understanding of technology, proficiently use and guide customers most conveniently and quickly. They must have professional communication skills, attitude, and behavior, handling situations quickly and thoughtfully with customers. They all require high costs, threatening the business's profit (Subaramaniam, 2020). Touchless hotels will face many financial difficulties without a specific strategy due to adverse effects and impacts on profits (Park & Lehto, 2021).

In addition, the touchless hotel application needs to have extremely high security of customer information to prevent private information from being stolen (H. S. Chen & Fiscus, 2018). Businesses need to set up a system to keep customer information well, and hotels are forced to commit not to disclose guests' personal information. Investing in technology and cybersecurity will also be a financial burden for businesses, especially after the Covid-19 pandemic (C. Kim, Kang, Chung, & Choi, 2021). From the tourist's point of view, using high-tech services will cause difficulties for some people, typically the elderly, who are not proficient and have little access to modern equipment. Many customers are used to the traditional hotel service, so approaching the touchless hotel model will cause many obstacles (Liu & Hung, 2019). At the same time, customers must also meet the requirements for intelligent devices to enjoy all the hotel's services. If tourists rely heavily on phones, computers, or other forms of technology, connecting to a touchless accommodation will face many obstacles when a device breaks down or has problems (J. J. Kim & Han, 2020).

2.3. Potentials of touchless hotels in Vung Tau, Vietnam

According to the Department of Tourism Ba Ria Vung Tau (2021), Ba Ria - Vung Tau has advantages with many policies to stimulate tourism demand according to the policies of the State. Therefore, visitors traveling in Vung Tau will receive many benefits in terms of intensive investment in hotels, and visitors will have a feeling of comfort and closeness. With the timely introduction of the tourist police force, Vung Tau city has reduced the situation of begging, enticing tourists, or taxis. People have paid more attention to spiritual life through tourism and entertainment activities. Although there are many limitations on specific tourism products, tourism activities are still desirable to domestic tourists. Besides, the number of international tourists coming to Vung Tau is also very stable in number and diversity from many different countries worldwide.

With an average annual economic growth rate of 18% per year, Vung Tau city has constantly risen in all aspects to be worthy of its role as a provincial city, political, economic, culture, science, and technology center of the province. Vung Tau, in recent years, has not only achieved high growth but also ensured the requirements of sustainable development by the orientation and structure of local economic development. Vung Tau is a well-known, comprehensively developed city associated with the image of beautiful and charming

beaches. It is also one locality that promotes investment, attracting domestic and foreign capital. It is considered an advantage to develop a touchless hotel following the trend of ensuring the safety of visitors after the Covid-19 pandemic.

The development of science and technology has helped the resort tourism market in Ba Ria - Vung Tau gradually catch up with many regions worldwide. This factor is very dynamic, contains many opportunities for businesses, and directly influences the business strategy of fields and industries, including accommodation services. Hotels are gradually synchronizing their management systems and applying information technology in search, serving, and maintaining the number of guests staying and traveling in Vung Tau. The issue of technology application can also solve the problem of tourists who cannot stay because of concerns about contact with staff, contributing to accelerating the hotel industry's recovery after the pandemic.

According to Stadler (2015), in line with new travel trends, there is a dynamically growing demand for special offers dedicated to mass tourism, as conscious consumers expect personalized solutions that meet their individual needs. Consumer insights can be stored and tracked through a touchless system so that hotels can tailor customer service to their preferences. Thanks to various flexible tracking techniques such as customer databases (CRM) (Mohammed & Rashid, 2012). Cloud-based CRM customer database systems that generate offers by analyzing sales records and demographic data in the past have multiplied. Massive data sets can be analyzed using effective data analytics methods and scale cost-effectively and anonymously. Although considerable data research is based on working with large samples, it is the most effective method to reveal individual preferences (Gupta & Sahu, 2021).

Industrial revolution 4.0 is taking place firmly globally, creating breakthrough development opportunities. Ba Ria - Vung Tau Province, one of the leading tourist centers of the country, an attractive destination for tourists, is actively promoting its potential and developing effectively under the support of digital technology to develop intelligent, efficient through the touchless hotel model. The Covid-19 pandemic seems to be selective. It is necessary to have the development of the hotel industry at a rapid pace to be able to respond to society. Traditional models have been transformed from traditional to modern by combining both. Innovations in the hospitality industry in the post-Covid era necessitate a combination of (1) product change from physical to digital, (2) delivery change from centralized distribution to over-the-counter delivery, and (3) service changes from a passive service to active service (service personalization).

3. Method

The main objective of this study is to identify the potentials of touchless hotels in Vung Tau based on the preferences of guests via managerial perspectives. A qualitative method by in-depth interviews was adopted to carry on this study to achieve the target. Since this research was conducted during the pandemic Covid-19, the online discussions via GoogleMeet were utilized from January 15th to February 12th. Each discussion was taken place around 45 to 60 minutes.

3.1. Participants

Each participant was the manager of a luxury hotel in Vung Tau, Vietnam. There were four international hotels, including two 4-star and two 5-star properties. The respondents have been working in the hospitality industry for almost ten years. All respondents were anonymous and agreed to respond to this research thoroughly. Respondents were both foreigners and Vietnamese working in Vung Tau City, Vietnam. Due to the difficulties of the pandemic, the study could not contact a broader range of respondents. Still, with various industries and experience, the results showed interesting outcomes, besides expected results.

3.2. Measures and data collection

Since the issues mentioned in this study were relatively new, the interview questions were open-ended. The interview starts with five questions about the hotel situations before, during, and after the pandemic:

<i>Seq</i>	<i>Questions</i>
1	Can you share the financial situation before, during, and after the pandemic?
2	What are the solutions to survive during and after the pandemic?
3	Is there any procedure of your hotel is touchless? What is it? Can you further describe it?
4	What are the pros and cons of touchless hotels?
5	What can you predict about touchless hotels in the future?

After asking general questions, the discussion was extended to obtain further evaluations. The interview focused on the benefits and constraints in different perspectives: investment, human resources, maintenance, and security. The questions about personal points of view were also asked to enhance the validity of the responses.

4. Results

The common idea of all four managers is that they may "unlock" a new dimension in their hotel rooms and create a modern hospitality atmosphere with touchless services. Through innovative hotel technology that automates everyday tasks or allows guests to use their phones for crucial tasks such as check-in, a touchless hotel reduces or eliminates the need for guests to interact with germ, unsafe surfaces as much as possible. Four hotels admitted that they had applied an intelligent booking system and temperature check. Two hotels tried online check-in and a voice control TV. One is testing a chatbot system to control the room. All applied for contactless payment through cards. One is considering digital keys connected to mobile phones. This model helps save time, improve direct bookings and related services, gain access to statistics for audience analysis, and establish targeted marketing campaigns. Thanks to technology, innovative and touchless services are essential for each hotel to stay current and deliver all services to the public safely. In any case, technology can make complete procedures as simple as possible. The hotel business is no stranger to touchless services.

The interview results showed that managers in luxury hotels aimed to change the operational styles from traditional to modern. They preferred applying new technologies to enhance the management and operations. The managers did not mention the model they used to develop their operations, but Lewin's change model was reflected in their responses. The results are shown in Table 1.

Table 2. Lewin's Change Model in 4 luxury hotels

Stages	Touchless applications	Unfreeze	Changes	Refreeze
Hotel 1	-Booking system -Temperature check -Online check-in -A voice control TV -Online payment	-Require all remaining staff of the Front desk/ housekeeping/ finance department to update new apps during the pandemic	-Sales and Marketing department contacted guests about changes in terms of reservation and amendment.	Requiring all related departments to apply new applications simultaneously from August 2020
Hotel 2	-Booking system -Temperature check -Chatbot -Online payment	-Require all remaining staff of Front desk/ housekeeping/ financial department/ techniques to update new apps during the pandemic	Training during the pandemic time with the new working procedure	Requiring all related departments to apply new applications simultaneously from June 2020
Hotel 3	-Booking system -Temperature check -Digital keys -Online payment		Only training for reservation, front desk, housekeeping, and technique departments online	Requiring all related departments to apply new applications simultaneously from January 2021
Hotel 4	-Booking system -Temperature check -Online check-in -A voice control TV -Online payment		Training remaining staff to turn them into core employees	Requiring all related departments to apply new applications simultaneously from July 2020

Source: interviews (2022)

For several years, many hotels have relied on the safe and intelligent application of technology to improve their bottom line and improve their overall hospitality experience. Touchless scenarios now shape the future of the hotel industry and determine the quality of each traveler's hotel experience, following the pandemic that changed the way hotels operate.

Two four-star hotel managers admitted that they were lucky since their hotels had been changing fast based on the fast-paced changes of the external factors. They also stated that because the hotel was built to be upgraded, the installation of modern technologies was convenient. They only had to adapt to those changes only. The other two 5-star hotels were

ready for any changes because they had equipped their hotels with multi-functioned facilities to flexibly adapt to updated versions of technologies. Although all four hotels are not fully touchless because it takes time to change to this type, the managers said they would like to apply the unique model to operate during the turbulent environment, for instance, in the pandemic. One manager shared that the number of employees was cut half during the pandemic, and some of them resigned to changed jobs. Before the new normal, he decided not to hire all employees. He only trained the remaining personnel and guided them to use technology in checking and regulating the hotel's operations.

However, they must admit that they could not apply full touchless hotels because of the problems. Firstly, it's about the financial situation. Before the pandemic, the growth of each hotel was significant, and even in 2019, they rose quickly. However, after two difficult years of Covid-19, they only hoped to survive. Luxury hotels bear a considerable maintenance cost. Manager 1 said, *"My 5-star hotel has more than 300 rooms, and faces to the sea, the cleaning and maintaining aesthetic look and hygiene have been challenging. Sea breeze destroys our facilities, and mold appears when no one stays."* No revenue for almost 18 months was a devastating problem to them. They had to cut costs by reducing human resources and auxiliary bills. *"We have cut most of our augmented services and staff. We only keep 20% of our daily routine."* Manager 2 added. When the country reopened again, they re-operated with care when spending money. Investment for touchless hotels sounds promising but needs time to conduct gradually. Manager 3 also said, *"Each penny for investment needs discussing about ROI carefully. We don't simply spend money without any consideration. And we also need a synchronized system from the headquarter since we are an internationally recognized brand."* The expenditure of upgrading the existing system has been more favorable than the changed hotel from traditional to thoroughly modern. Manager 4 also added, *"We can't invest in a huge amount of money to turn everything into touchless because of our revenue and profit. It may take 2-3 years to do so."*

Furthermore, the hotel facilities of luxury hotels are pretty modern and well-designed to equip with new technologies, but another problem is dealing with people working in the hotels. Managers admit that their staff is excited about new technology, especially front desk agents and housekeeping, and raise concerns about their job stability. Manager 2 stated that the old staff was worried about their remuneration deducted if the machine had replaced their duties. Others mentioned that they were worried about their employments when the hotel was touchless, and they were afraid of losing their jobs. However, manager 3 said that although technologies may replace personal performance, skilled workers were still prioritized. His concern was training people to be familiar with that high-tech and control them effectively. Many staffs were not used to using that equipment. They had to be trained carefully, and it took time to do.

Another concern of hotel managers is about maintenance fees. Manager 1 said that it costs more than usual to keep a system working fluently. Furthermore, the rapid development of technologies asks them to keep updating their systems, and the cost for maintenance will be added. Besides, the upgrade of systems also relates to the security of

the databases. Since the guests will utilize the touchless hotel service via their innovative tools, each hotel must secure their data from cyber thieves. Manager 4 emphasized that cyber security is his hotel's top priority. He required the IT department to stay alert to ensure no problem with their guests' privacy and security through their systems.

They also said that touchless hotels would be a new model for their brands and images. It could help save expenditure and increase long-term profitability. All four hotels are half touchless, which means the workforce still operates another half. To apply the touchless hotel model, they had to apply it step-by-step. They also stated that the transformation from old-styled management to new-style hotels required a lot of time and money, and it also required many well-trained people. Employees working in touchless hotels will be flexible and adaptable to the changes. The number of staff would also be decreased, and technologies replaced some procedures. Although the investment was high at first, it was very convenient and practical for the long-term operation.

In addition, the result from the interview is quite similar to the discussion from previous publications on AI and robotics of Seyitoğlu and Ivanov (2020) and H. Chen, Huang, and Li (2022). They show how service robots in hospitality and tourism may save operating costs and improve services. As a result, the use of AI and robots looks to be a significant shift for hospitality professionals. Technological advancements can, in fact, lessen health hazards among visitors (Seyitoğlu & Ivanov, 2020). These data demonstrate that technical methods can help reduce COVID-19 transmission while still attracting visitors. For example, according to a few papers, service robots can operate as a technical barrier between hotel visitors and personnel, minimizing the risk of infection (H. Chen et al., 2022).

5. Discussion and Conclusion

5.1. Recommendations

5.1.1. For hotels

Touchless hotels will bring many benefits to businesses. First, this new model opens up a foundation in line with modern trends and is a necessary solution to restore and re-develop Vietnam's tourism sustainably after the negative impact of the Covid-19 pandemic. It is also a significant step forward from the traditional business of development to the potential hotel suitable for the context of the "new normal." Second, touchless hotels bridge the gap between departments in the hotel business. When applying this touchless model, the information link is consolidated, convenient in management, and effective employee control, so that it is easy to assess the work quality of each employee. In addition, the technology in the hotel's touchless application promptly solves arising problems and limits work overload. In addition, the touchless hotel helps businesses capture customer information quickly, bringing efficiency in transaction processing.

To preserve social distance, hotels must provide confidence about the efficiency of their safety measures by combining AI and robotics technology. Contactless services such as self-check-in and check-out, facial recognition systems, cleaning robots, and vital digital services should be prioritized. Advanced technology such as electrostatic sprayers, germ-killing robots, and ultraviolet light should be used wherever possible. Because the hotel

amenities are shared with other guests, disinfecting the various high-touch surfaces in the hotel properties is just as crucial as disinfecting the rooms.

Providing visitors with accurate information about the hotel's risk-reduction methods will reassure them of their safety while supporting them in their decision-making process. Accurate information offered by the firm might influence customers' decision-making. As a result, hotels must keep their hospitality clients aware of their health-protection initiatives. With the touchless model, hotels will focus on customer-centricity and improve competitiveness. If the business owns this model, it will deploy and operate an efficient and quality hotel. Businesses that focus on guest experience maintaining guest satisfaction throughout the experience have always been a top priority for hoteliers. The more satisfied customers are, the more they will spend and will keep returning to the hotel in the future. Touchless hotel technology innovation helps businesses seize good opportunities to measure strengths to promote and identify weaknesses to change and improve accordingly.

5.1.2. For tourists

For tourists, the dual psychological relief, including promoting safety and relieving the pressure of the epidemic season, will be the motivation to choose a touchless hotel. The model solves customers' concerns about health and safety issues such as limiting contact with staff or items in the hotel, easing guests' concerns in automatic booking, dedicated support for quick and timely feedback, and enabling customers to evaluate service quality. With the intelligent system, information will be stored in clouds. Customers will not waste time searching for the information again, which are outstanding features that touchless hotels can aim for. Using a touchless hotel brings a new experience, enjoys high-class service, and keeps up with trends. Tourists also save time and quickly find rooms, reservations, check-in, or online payment. These experiences not only help customers expand their vision of the touchless hotel experience, but they also trust and give new personal suggestions to help the business improve and develop more sustainably.

5.2. Conclusion

According to Sirait and Murdianingrum (2020), to overcome the challenge of increasing customer expectations, the hospitality industry needs to adopt touchless technology as quickly as possible. Investing in technology and the internet of things will allow hotel operators to stand out from their competitors, meet all guest expectations and attract new customers. Technology plays a vital role in improving the customer experience. With the initial impacts of the industrial revolution 4.0, the tourism and hotel industry in Vung Tau is facing the opportunity to innovate the development model. Stable financial source, the ability to invest from considerable social resources, many newly built hotels, and the ability to attract domestic tourists (the advantage near Ho Chi Minh City) and international (the airport project of Long Thanh). Taking advantage of this opportunity, Vung Tau tourism will have a revolutionary development, creating outstanding personalized services for customers. This high demand for hotels is a huge potential advantage for a hotel development that does not touch a new and different attraction exclusively for Vung Tau

tourism. The tourism potential has led to developing the touchless hotel business in Vung Tau, fertile land with an essential cradle for southern tourism development.

It can be said that Vung Tau is an ideal place to develop a touchless hotel model. Before the pandemic, sensing and automation technologies were inherently developed to enhance business capacity and efficiency. Since the epidemic outbreak, the need to apply advanced technologies has increased. The application of touchless technology at the hotel is a new development direction in the new reality context to keep a safe distance between staff and visitors. However, with the decrease in revenue due to the epidemic situation, business owners must prioritize applying certain technologies.

5.3. Limitations

This research was conducted in the hospitality industry to suggest recovering from the pandemic. The results were not significantly proven because they were only based on four experts' interviews. It requires more points of view from employees, guests, and stakeholders to ensure the possibility of a touchless hotel. It was only a foundation for the upcoming studies about the application of AI in the tourism and hospitality industry. Next, since the previous research data was not done widely, it needed time to discover this issue. And there was no hotel applying full touchless. The perspectives that managers shared were based on their experiences and some features. Therefore, it could not be generalized for the entire industry. It is recommended that this topic flourishes in a fully equipped touchless hotel, opening new dimensions for further research.

Abstract

The study focuses on analyzing the impacts of social and cultural factors on the intention to use Airbnb as a form of accommodation sharing in Hanoi, Vietnam. This paper includes five key cultural factors namely Collectivism, Femininity, Low Uncertainty Avoidance, Long-term Orientation and Restraint. In addition to cultural factors, social factor represented by eWOM (electronic Word-of-Mouth) is also taken into consideration when measuring the intention to use Airbnb. Through an online questionnaire, data is collected from 401 participants in Hanoi, Vietnam. Implementing Structural Equation Modeling (SEM) approach, eight research hypotheses are tested and the degree of influences of each factor is clarified. The key findings are: (i) Collectivism has the strongest positive effects on consumers' Attitude and Behavioral intention to use Airbnb, followed by Low Uncertainty Avoidance and Long-term Orientation; (ii) only Restraint has negative effects on consumer's Attitude and Behavioral Intention to use Airbnb; (iii) eWOM has positive effects on Subjective norms and Behavioral Intention to use Airbnb; (iv) Attitude and Subjective norms both have positive effects on consumer's Intention to use Airbnb. From the findings, to promote the future use of Airbnb in Hanoi, Vietnam, recommendations for businesses and consumers are provided.

Key words: *Airbnb, peer-to-peer accommodation, socio-cultural factors, structural equation modelling.*

1. Introduction

In recent years, the growth of the new peer-to-peer sharing model has started to exert noticeable impacts on Vietnam tourism. In the first International Conference on Economics, Business and Tourism, Vietnam was listed in the top fifteen growing destinations for both regional and global travelers on Airbnb in the first half 2018. Particularly, in the upcoming years, the Generation Z plays the role of main consumers in Vietnam. Their characteristics such as internet savvy, adventurous, environmental conscious and price-sensitive are

especially fitted to the offerings of P2P accommodation services namely Airbnb. Although peer-to-peer accommodation sharing is still in its infancy in Vietnam, the predicted impacts of this form of sharing are considered to be significant.

The sharing economy is a new concept that involves maintaining consumers' access to goods and services without ownership, which is equivalent to individuals renting out or otherwise offering access to their underused assets (Belk, 2014; Botsman & Rogers 2010). The sharing economy model has influenced many business practices of the tourism sector, most significantly in the form of peer-to-peer (P2P) accommodation. Generally, P2P accommodation happens when a person rents an apartment or a room they own to another person, and this is typically enabled by digital platforms such as Airbnb (Tussyadiah & Pesonen, 2016).

Numerous studies have investigated common factors for consumers' participation in P2P accommodation such as economic appeal, social appeal, authentic local experiences, sustainability, home benefits and enjoyment. However, only a handful of researchers have taken cultural factors into consideration. The necessity to examine cultural factors was first revealed by Gupta, Esmailzadeh, Uz, & Tennant (2019). The findings illustrate that while both Collectivism and Masculinity positively affect individuals' intention to rent out and rent products; Uncertainty Avoidance significantly discourages individuals from renting out their products to others. On the other hand, Power Distance shows insignificant impact on both peer consumer and provider propensity. One limitation of this study is the exclusion of Long-term Orientation and Indulgence cultural dimension. Understanding the prior study limitation, Wallace (2020) continues to explore how individual cultural values influences attitudes and participation in sharing economy services by adding two cultural factors: Long-term Orientation and Indulgence. The study chooses Airbnb sharing accommodation service as a representative. Regards to its results, Long-term Orientation and Indulgence have a positive effect on both attitude and participation. One unique finding of Wallace (2020) is Low Power Distance has a positive effect on attitudes. In addition, high Uncertainty Avoidance positively affected both attitudes and participation. However, Collectivism and Masculinity showed insignificant effects on consumer's attitudes and participation in sharing economy services. Most recently, the influence of cultural and social factors on a consumer's participation in a sharing economy is examined by Lee, Erdogan, & Hong (2021). Findings provide evidence that all the cultural dimensions, excluding Masculinity, have a significant relationship with attitude towards booking on Airbnb. More specifically, Uncertainty Avoidance and Individualism had a negative effect on attitude, while Long-term Orientation and Indulgence showed an opposite association. On the other hand, Subjective norms have no significant effect on booking intention on Airbnb. Thus, the intention to use Airbnb to book accommodation, rather than being influenced by the acceptance or support of others, is more of an individual decision based on their own needs.

Based on the literature review, it could be summarized that only a handful of researchers have taken cultural into considerations while investigating factors for consumers' participation in P2P accommodation, in which our research attempts to fill up this gap. Secondly, additional cultural factors namely Long-term Orientation and Indulgence need to be included. Thirdly, by inheriting the similar approach yet focusing on Hanoi

consumers, this research closes the gap of previous research by understanding how Eastern cultural characteristics deter or encourage the acceptance of sharing accommodation. Finally, to overcome the limitation of findings with insignificant influences of subjective norms on behavioral intention to use Airbnb or other forms of accommodation sharing, the research would include additional measurement items to clarify the connection.

This research highlights its fundamental purpose as: examine socio-cultural factors and its impacts on consumer behavioral intention to predict the prospect of peer-to-peer accommodation in Hanoi, Vietnam. To achieve this primary objective, this paper aims to clarify the relationship between cultural factors and attitude towards using Airbnb and future intentions. In addition, social factors and its relationship with behavioral intention to use Airbnb would also be examined. Finally, recommendations on how to further develop peer-to-peer accommodation sharing is provided based on analysis results.

In order to achieve the research objectives, the study based its framework on two commonly used theories in analyzing the social and cultural factors influencing consumers' behavioral intentions towards using Airbnb namely Theory of Planned Behavior by Ajzen Icek and Theory of Cultural Dimensions by Hofstede. On the one hand, to achieve the goal of examining the impacts of cultural factors on the prospect of using Airbnb in the future, Hofstede's cultural dimensions are taken into consideration. This approach is supported by previous study of Sommestad (2015) and Wallace (2020), that culture affects attitude. As the research focuses on the Vietnamese consumers only, the cultural values are denoted as: Collectivism, Femininity, Low Uncertainty Avoidance, Long-term Orientation, Restraint. Notably, the high-low Power Distance dimension is omitted due to its insignificant effect on the attitude and future intention of consumers. In addition to cultural factors, social factors are also examined, represented by eWOM. eWOM is regarded as all Internet-based communications directed at consumers about the usage or characteristics of products and services and their sellers (Litvin, Goldsmith, & Pan, 2008). Importantly, Schepers & Wetzels (2007) found that eWOM is an antecedent of subjective norms in consumer behavior research. Thus, including eWOM as a determinant of subjective norms could help us understand the relationship between subjective norms and behavioral intention in the case of using Airbnb.

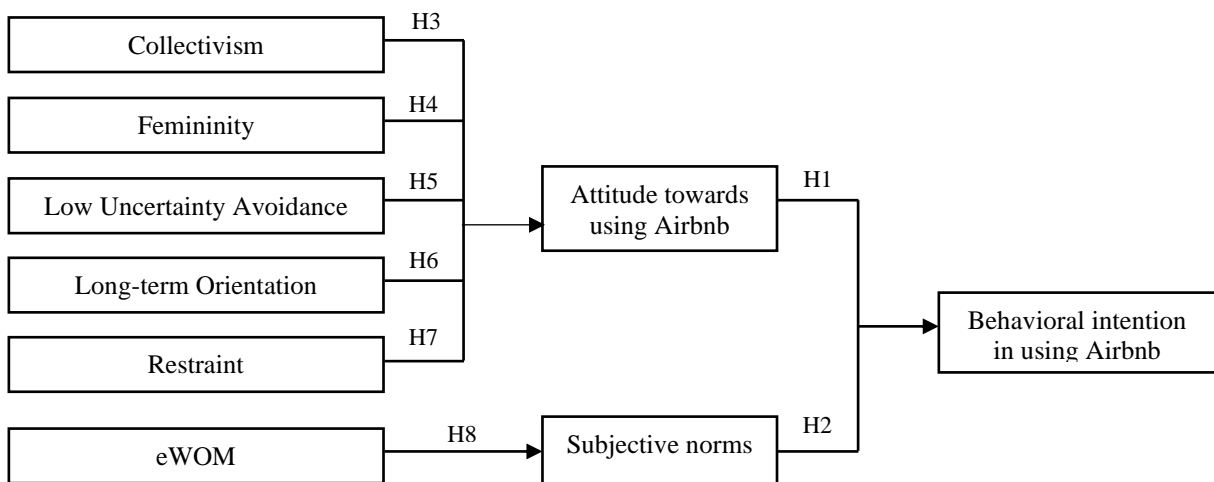

Figure 1. Research Framework (proposed)

Source: Authors' own work

The research hypotheses are based on reviewed literature and the research framework, which are presented as follows:

Hypothesis 1 (H1): Attitude has a positive effect on behavioral intention in using Airbnb.

Hypothesis 2 (H2): Subjective norm has a positive effect on behavioral intention in using Airbnb.

Hypothesis 3 (H3): Collectivism has a positive effect on attitude towards using Airbnb.

Hypothesis 4 (H4): Femininity has a positive effect on attitude towards using Airbnb.

Hypothesis 5 (H5): Low uncertainty avoidance has a positive effect on attitude towards using Airbnb.

Hypothesis 6 (H6): Long-term orientation has a positive effect on attitude towards using Airbnb.

Hypothesis 7 (H7): Restraint has a negative effect on attitude towards using Airbnb.

Hypothesis 8 (H8): eWOM has a positive effect on subjective norms.

The remainder of this paper is organized as followed: Section 2 mentions methodology; Section 3 presents the results; Section 4 will conclude the study.

2. Method

2.1. Data collection and measurements

The data was collected through the method of convenience sample by using online questionnaires on Google Form. The total number of received responses was 401. Invalid replies, which are defined with more than 10% of information absence or 100% homogeneous answers, are removed. As a result, the number of eligible questionnaires was 328.

Table 1 lists nine constructs that have been developed to test the research hypotheses. Measurement items are adapted from the related studies then modified to be more suitable with the current research. The measurement is based on five-point Likert, which ranges from one to five corresponding to these options: Strongly Disagree, Disagree, Neutral, Agree, and Strongly Agree. The survey is designed based on the proposed framework. All the factors own at least two measurement items.

Table 1. Measures and scales

Categories	Items	Sources
Femininity	I choose Airbnb because it partially supports the economic life of the locals.	Lee, Erdogan, & Hong, 2021; Authors' own work
	When traveling, I want to stay in an accommodation that supports me to experience the life of the locals as much as possible.	
	Being able to understand and sympathize more about the livelihood of the locals creates a more memorable traveling experience.	
	If choosing to stay at an Airbnb, I would be more responsible towards the (housing) facilities than when staying at a hotel.	
Collectivism	Choosing Airbnb is a way for me to catch the experience tourism trend.	Lee, Erdogan, & Hong, 2021;

Categories	Items	Sources
	If people in my social circle know and use Airbnb, I would be eager to try out this service.	Authors' own work
	If I choose to use Airbnb, I want to experience the service with my friends and family.	
Low Uncertainty Avoidance	I still choose Airbnb despite the risk that the housing facilities might differ from what I have expected.	Lee, Erdogan, & Hong, 2021; Authors' own work
	I am willing to try out Airbnb even though I am much more familiar with traditional booking methods and hotels' services.	
	I choose Airbnb since its booking procedures are more flexible and convenient than conventional ones.	
	I choose Airbnb despite miscellaneous comments about its services.	
	I tend to choose Airbnb based on positive feedback from KOLs or the general public, even without verification.	
Long Term Orientation	I choose Airbnb because I think it's much more cost-saving than other types of accommodation (e.g., hotels, resorts, etc).	Lee, Erdogan, & Hong, 2021; Authors' own work
	I choose Airbnb because it helps me to form relationships with new people (e.g., host, local people, etc).	
	I choose Airbnb because I think it's more environmentally friendly.	
Restraint	I don't choose Airbnb because I have high control over my desires to experience new accommodation alternatives.	Lee, Erdogan, & Hong, 2021; Authors' own work
	I don't choose Airbnb because it does not fit with Vietnamese's social norms.	
	The unique experiences with the locals that Airbnb offers are less important than the economical aspect of Airbnb.	
eWOM	Social media website was the first place that introduced me to information about Airbnb.	Lee, Erdogan, & Hong, 2021; Authors' own work
	If Airbnb information appears on my social media sites frequently, I would want to learn more about the service.	
	Reading positive reviews online will motivate me to try out Airbnb.	
	I am more eager to try out Airbnb when a KOL talks about it.	
Attitude	Using Airbnb is a wise idea.	Lee, Erdogan, & Hong, 2021
	Using Airbnb is an idea that I like.	
Subjective norms	People who influence my behavior would approve of my choice of using Airbnb.	Lee, Erdogan, & Hong, 2021
	People who are important to me would think that I should use Airbnb.	
Behavioral Intention	I am very likely to use Airbnb in the future.	Lee, Erdogan, & Hong, 2021
	I would recommend that others use Airbnb.	

Source: Summarized and modified by authors

2.2. Structural Equation Modeling

The research uses a quantitative approach of Structural Modeling Equation (SEM). SEM includes a wide range of statistical methods such as factor analysis, regression analysis or path analysis, and discriminant analysis, allowing researchers to examine structural relationships between important variables observation and latent variable (Chin & Marcoulides, 1998). The two-stage analysis method, which includes measurement model and structural model evaluation, is superior when compared to the one-stage evaluation (Sumacker & Lomax, 2004).

3. Results

3.1. Measurement model evaluation

Cronbach's alpha of all variables fell within the range of 0.715 to 0.795 which is higher than the proposed value of 0.6 by Robinson, Shaver, & Wrightsman (1991). All variables' Composite reliability except for RES3 was greater than the proposed value of 0.7 by Chin (2010). The trajectory is measured when all factor's outer loadings are greater than 0.5 (Wong, 2013) and AVE must also be greater than 0.5. The study eliminates indicators RES3 since its AVE and Composite reliability did not satisfy the proposed value. The results are shown in Table 2.

Table 2. Measurement model assessment

Latent variables	Indicators	Outer loadings	Construct reliability and validity		
			Cronbach's alpha	Composite reliability	AVE
Femininity	FEM1	0.777	0.753	0.850	0.589
	FEM2	0.813			
	FEM3	0.829

Table 3 illustrates the results of Heterotrait-Monotrait (HTMT) ratio. HTMT ratio is a widely known method for measuring discriminant validity. Henseler, Ringel, & Sarstede (2015) proposed that if this ratio is smaller than 0.9, the discriminant value is assured. HTMT ratios between all latent variables were smaller than 0.9, therefore, all variables satisfied the condition.

Table 3. Heterotrait - Monotrait (HTMT) ratios

	ATT	COL	EWOM	FEM	IN	LTO	LUA	RES	SN

3.2. Structural model evaluation

Firstly, all Variance Inflation Factor (VIF) ranging between 1.252 and 1.975, suitable with the range proposed by Hair Jr, Sarstedt, Hopkins, & Kuppelwieser (2014). This indicates that the collinearity among the predictor constructs is not an issue in the structural model.

Secondly, to assess the significance of path coefficients and test the research hypotheses, the study implements the PLS-SEM "bootstrapping" technique to generate t-values and p-values. The results confirm Attitude and Subjective norm have significant positive effects on Behavioral Intention. Additionally, Collectivism, Low Uncertainty Avoidance, Long-term Orientation exert positive effects on Attitude; and Restraint has a

negative impact on Attitude. However, hypothesis testing results of H4 to evaluate the effect of Femininity on Attitude is rejected due to unsatisfied t-value and p-value. Furthermore, eWOM has a positive effect on Subjective norms.

Thirdly, based on the R² value, Attitude and Subjective norms explain up to 48.1% of the variability in Behavioral Intention. Additionally, 39.2% of the variability in Attitude is explained by cultural factors namely Collectivism, Low Uncertainty Avoidance and Restraint. Moreover, 24.5% of the variability in Subjective Norms is explained by eWOM.

Fourthly, all the Q2 values were considerably greater than zero, which provided support for the model's predictive relevance concerning the reflective endogenous latent variables.

Table 4. Structural model examination

Hypothesis	Relation	Path coefficients	Std. dev	T – value	P – value	Status	R ²	Q ²	F ²
H1	Attitude → Behavioral intention	0.544	0.056	9.640	0.000	Yes	0.481	0.369	0.370
H2	Subjective norm → Behavioral intention	0.215	0.056	3.875	0.000	Yes			0.058
H3	Collectivism → Attitude	0.227	0.064	3.556	0.000	Yes	0.392	0.306	0.055
H4	Femininity → Attitude	- 0.043	0.065	0.665	0.506	No			0.002
H5	Low uncertainty avoidance → Attitude	0.425	0.049	8.618	0.000	Yes			0.187
H6	Long term orientation → Attitude	0.132	0.063	2.102	0.000	Yes			0.014
H7	Restraint → Attitude	- 0.174	0.060	2.920	0.000	Yes			0.043
H8	EWOM → Subjective norm	0.490	0.040	12.190	0.000	Yes	0.240	0.187	0.315

3.3. Summary of findings

- *Attitude has a positive effect on behavioral intention in using Airbnb*

Attitude has been tested and proven to have a fairly significant and positive effect on behavioral intention. Comparing the results with previous studies, this conclusion is consistent with the theory of TPB, TRA which has been proposed and proven (Ajzen, 1991).

- *Subjective norm has a positive effect on behavioral intention in using Airbnb*

Subjective norms have a beneficial effect, contributing positively to behavioral intention. The influence of subjective norms on behavioral intention, however, is quite

marginal compared to that of attitude. This conclusion is completely consistent with the TPB model researched and proven by Ajzen. However, the influence of subjective norm on the intention and behavior of consumption is not considerable when different types of products and services are scrutinized (Son, 2007).

- *Collectivism has a positive effect on attitude towards using Airbnb*

Collectivism is considered as the most powerful cultural driving force for friendly attitudes towards Airbnb as the development of collaborative services springs from a network of communalists rather than individualists. In comparison with previous research, this outcome is in agreement with Gupta, Esmaeilzadeh, Uz, & Tennant (2019) as regards the positive influence of collectivism on the tendency of sharing economy services providers and users.

- *Low uncertainty avoidance has a positive effect on attitude towards using Airbnb*

The paper can conclude that low uncertainty avoidance has a positive effect on attitude. When compared to other researches, this result is similar to Gupta, Esmaeilzadeh, Uz, & Tennant (2019) but contradicts the finding of Wallace (2020).

- *Long-term orientation have a positive effect on attitude towards using Airbnb*

The results show that long term orientation has a positive effect on attitude, however, its impact is the most negligible of all favorable factors. Compared to previous research, this conclusion is similar to Wallace (2020). Since cultures being high in long-term orientation focus on future rewards over immediate costs (Hofstede, 2001), they may prioritize consumption practices where environmental efforts are apparent, which is a driver of the sharing economy (Botsman & Rogers, 2010; Hamari, Sjöklint, & Ukkonen, 2016).

- *Restraint has a negative effect on attitude towards using Airbnb*

Results have shown that restraint has a negative impact towards attitude. Cultures high in this dimension tend to limit their wants and desires, not focusing consumption practices on hedonic leisure activity (Hofstede, 2001). Compared to previous research, this is considered to be a new finding to the results of Gupta, Esmaeilzadeh, Uz, & Tennant in 2019. Moreover, Wallace (2020) also had the same result, which further consolidates this finding of our research.

- *eWOM has a positive effect on subjective norms*

According to the results of our research, eWOM has a strong positive effect on subjective norms. This finding is a new discovery since there is no previous research that has come to the same conclusion. According to Schepers & Wetzels (2007), eWOM is an antecedent of subjective norms in consumer behavior research. With the collectivist characteristics, Vietnamese consumers' behavioral intention and actual consumption behaviors would rely significantly on the influences of other people's opinions and recommendations. eWOM, which measures the appearance frequency of Airbnb information on social media sites, will encourage individuals to try out the platform.

4. Discussion and Conclusion

The paper successfully determined the influences of cultural and social factors on the customer's behavioral intention to use Airbnb in Hanoi, Vietnam. Significantly, this research filled previous research gaps. The research added and examined two more factors: long-term orientation and restraint, which were not studied due to questionnaire length and participant weariness in Western countries. In addition, the research proposed a new variable (eWOM) that is related to Subjective norms and investigated its impact on the consumer's inclination to use P2P accommodation services.

Implementing the SEM approach, the key findings are: (i) Collectivism has the strongest positive effects on consumers' Attitude and Behavioral intention to use Airbnb, followed by Low Uncertainty Avoidance, Long-term Orientation; (ii) only Restraint has negative effects on consumer's Attitude and Behavioral Intention to use Airbnb; (iii) eWOM has positive effects on Subjective norms and Behavioral Intention to use Airbnb; (iv) Attitude and Subjective norms both have positive effects on consumer's Intention to use Airbnb.

Recommendations for consumers and businesses are provided to demonstrate the practical significance of the research. As for consumers, especially Gen Z, they are advised to raise awareness towards green consumption and change their traveling habits into eco-friendly ones by participating more in local tourism, taking Airbnb as a representative example. As for businesses, it is essential that they constantly enhance the quality of housing infrastructure and complement useful features so that a new platform like Airbnb would gain more trust and popularity among consumers and offer them a competitive advantage compared to traditional accommodation services.

The study still has several limitations that opens opportunities for future research. The first limitation of this research is the sample size. Moreover, this paper focused on only five out of six cultural dimensions by Hofstede, which excluded the power distance dimension. Collecting answers in only five cultural criteria makes it possible to reduce the length of the survey and minimize participant fatigue considerably. Nevertheless, future research could include the power distance dimension to gain more comprehensive and insightful results.

Abstract

The study investigates the key factors including performance expectancy, effort expectancy, social influence, facilitating conditions, trust, security and COVID-19 perceived risk that affect Gen Z's intention in using FinTech digital payment services. Research data was collected from 568 Gen Z people who have already used or have not yet used FinTech payment services. By using regression analysis with the support of SPSS 25 and AMOS 24 software, the research outcomes indicate that simultaneously these seven factors had a significant positive impact on Gen Z's intention to use FinTech payment services. Especially, performance expectancy has the strongest impact on intention to use. On this basis, the study gives some recommendations for governmental authorities and FinTech companies to develop FinTech payment applications suitable for Gen Z as well as improved business efficiency.

Keywords: *FinTech; payment services; intention to use; COVID-19, Gen Z.*

1. Introduction

In the 4.0 technology revolution, the application of technology to create comprehensive breakthroughs is an inevitable trend, especially in the financial and banking industry. One of the breakthroughs in technology that can be said to have had a significant influence is financial technology or which is widely known as FinTech. Basically, FinTech is understood as a combination of financial products and services with technology (Kutler,

1993). FinTech focuses on four main segments: asset management, financing, payments, and other types of FinTech including technology solutions for insurance, searching and comparison, etc. (Dorfleitner et al., 2017). Among these segments, payments are the earliest to be researched and developed; it is also the segment that receives the priority and concentration of FinTech companies. FinTech payment service is defined as a general term that applies to FinTech whose applications and services are related to national and international payment transactions.

Although FinTech was first mentioned by Citigroup in 1990, it was not until 2009 that FinTech really exploded, and only after 2014 did it attract the attention of regulators and customers. FinTech has become a global phenomenon with international companies from Silicon Valley to London, Israel, Singapore, and Sydney. Especially in the US, FinTech has rapidly grown as a major industry of this country. Vietnam is considered one of the most potentially profitable markets for FinTech. In recent years, FinTech in Vietnam has made remarkable developments. This is explained by the fact that Vietnam is a country with a young and tech-savvy population, high rates of mobile phone and Internet usage with a relatively low level of financial inclusion. According to We Are Social (2021), Vietnam has a total of 68.7 million Internet users, accounting for more than 70% of the total population. The report also showed that up to 97% of people in the age group of 16 to 64 have a smartphone with nearly 7 hours of Internet use on average per day. Therefore, the trend towards using FinTech payment services is almost certain. The introduction of FinTech payment services has brought many benefits, flexibility, convenience, meeting all needs regardless of location and time, contributing to saving resources significantly.

There have been many studies investigating the main driver of the adoption of FinTech services. A lot of research on this topic has been becoming more and more diverse and complex with the scope being continuously expanded. Studies have shown that different variables have an impact on the adoption of new technology (Madan & Yadav, 2018; Ramos de Luna et al., 2019). Perceived usefulness, perceived ease of use, security, trust, perceived risk, perceived benefit, social influence are variables mentioned in many previous studies (Wang et al., 2018). The results of studies can be contradictory, depending on the research contexts, theoretical basis, sample size, research methods, and respondents.

Most of the previous studies on FinTech services acceptance have focused more on technological factors but paid less attention to social precursor factors while the adoption of FinTech services is mainly influenced by external factors such as social influence, risk, and trust (Al-Nawayseh, 2020). Moreover, although there have been many studies related to FinTech, especially studies about its payment services, not many of them focus on researching the intention to use FinTech payment services of Generation Z - the generation leading the trend in all aspects, especially in technology. Moreover, there are few studies conducted in the context of the COVID-19 pandemic. Thus, this study is conducted to achieve the overall research objectives of identifying and examining the factors influencing the intention in using FinTech payment services of Gen Z in the context of COVID-19.

2. Method

2.1. Data collection

The authors collected data from 568 Gen Z people within the age group of 15 to 27 living in Hanoi via online questionnaires on popular social media platforms such as Facebook, Instagram, etc. as well as some forums for young people by removing heterogeneous elements. Finally, SPSS 25 and AMOS 24 software were exploited for descriptive statistics and regression analysis.

2.2. Proposed model

The authors propose a research model based on UTAUT to measure the FinTech payment services' usage intention. UTAUT is a theory that has recently been applied by many researchers for their research model because this model unifies the main theories of information technology acceptance and can better explain the intention to use technology services than most other models (Lu & Lee, 2011). Basically, the model preserves the key variables while expanding to investigate the impact of other factors relevant to the research context.

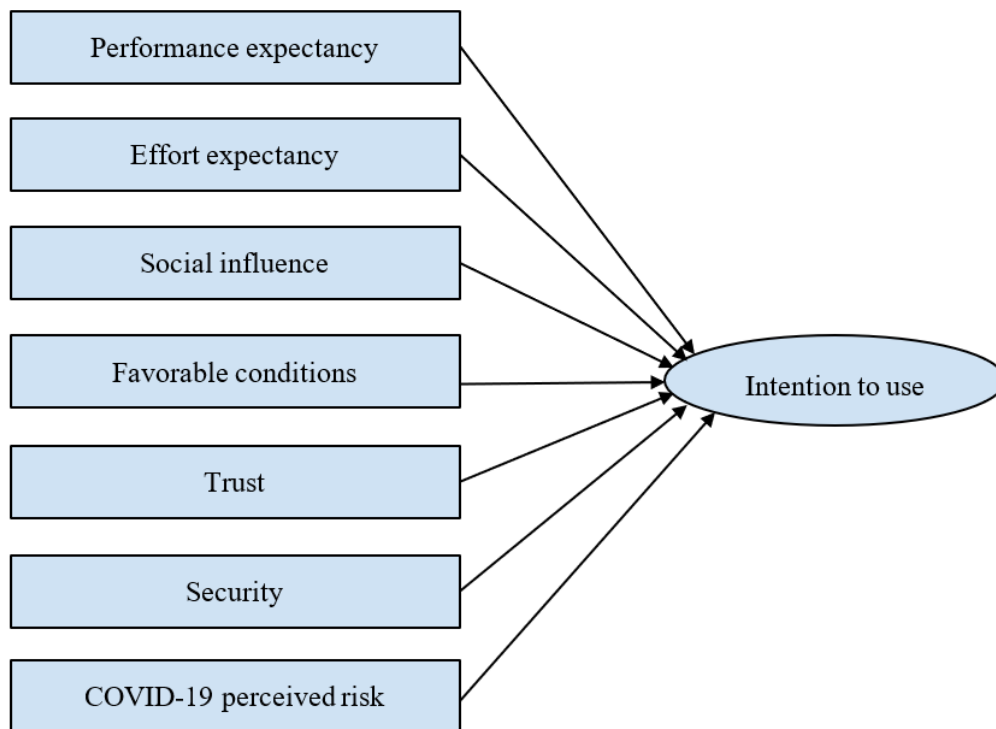

Figure 1. The research model

Most of the regarded studies indicated that performance expectancy is an important factor affecting the decision to use the technology of users (Chuang et al., 2016; Oliveira et al., 2016; Ramos, 2017; Aseng, 2020). Performance expectancy is defined as the degree to which an individual believes that using the system will help him or her to attain gains in job performance (Venkatesh et al., 2003). This factor bears a resemblance to perceived usefulness in TAM/TAM2 model. Other studies by Kim et al. (2017), Le et al. (2019), Lien et al. (2020), Alswaigh & Aloud (2021) showed that an increase in perceived usefulness would lead to a higher level of usage intention. Accordingly, we propose the following hypothesis:

H1: Performance expectancy has a positive influence on Intention to use FinTech payment services.

Effort expectancy is defined as the degree of ease associated with the use of the system (Venkatesh et al., 2003). A series of research showed a positive relationship between effort expectancy and the intention to use FinTech payment services (Aseng, 2020; Alswaigh & Aloud, 2021; Lien et al., 2020). However, there are a few studies that cannot affirm the effect of expected effort on intention to use FinTech payment services (Ramos, 2017), or if so, the impact of it on usage intention is negligible (Daragmeh et al., 2021). We propose the following hypothesis:

H2: Effort expectancy has a positive influence on Intention to use FinTech payment services.

Users often behave in a certain way to meet the expectations of their family, friends, and relatives. (Liébana-Cabanillas et al., 2018). Chong et al. (2010) found that users will consider the opinions of their family and friends before using new technology and will refuse to use it if the opinions of others are unfavorable. Many Indian studies have indicated that social influence is a key factor that has a positive relationship with the behavioral intention of users (Singh, 2016). Thus, we propose the following hypothesis:

H3: Social influence has a positive influence on Intention to use FinTech payment services.

According to Teo et al. (2008), facilitating conditions refer to factors present in the environment that affect an individual's desire to perform a task. Many studies have revealed that there is a positive relationship between facilitating conditions and intention to use electronic payment services (Chawla & Joshi, 2019; Gupta & Arora, 2019; Moorthy et al., 2020; Khatun & Tamanna, 2020). The results from a study by Chawla & Joshi (2019) have shown that facilitation conditions have a significant positive effect on users' intention to use e-wallet services. Hence, we propose the following hypothesis:

H4: Facilitating conditions have a positive influence on Intention to use FinTech payment services.

Trust is defined as the willingness of subject A to be vulnerable to the actions of subject B based on the expectation that subject B will perform a specific action that is important to subject A, regardless of subject A's ability to monitor or control subject B (Davis, 2020). Many studies have proved a positive relationship between trust and intention to use FinTech payment services (Al-Nawayseh, 2020; Alkhowaiter, 2020; Chawla & Joshi, 2019; Singh & Sinha, 2020; Chawla & Joshi, 2020). We propose the following hypothesis:

H5: Trust has a positive influence on Intention to use FinTech payment services.

Security refers to the extent to which customers believe it is safe to use FinTech payment services (Chawla & Joshi, 2019). Ensuring the confidentiality of information when conducting financial transactions is an important factor in driving the growth of FinTech payment services (Alswaigh & Aloud, 2021). Many previous studies have shown the importance of security for the intention to use FinTech payment services (Tan & Teo, 2000; Black et al., 2002). Thus, we propose the following hypothesis:

H6: Security has a positive influence on Intention to use FinTech payment services.

There have been very few previous studies that have examined perceived risk from the perspective of risk stemming from diseases. Aji et al. (2020) found that the COVID-19 outbreak had a negative impact on the intention to use cash of Malaysian and Indonesian consumers, which leads to a significant increase in the use of e-wallets. The use of mobile payment services is also considered as a preventive measure against the possibility of spreading the virus (Sreelakshmi & Prathap, 2020). Hence, we propose the following hypothesis:

H7: COVID-19 perceived risk has a positive influence on Intention to use FinTech payment services.

2.3. Scale of variables

The authors designed a questionnaire with 29 observations including 7 independent variables and 1 dependent variable, using 5-level Likert scale ranging from (1) - strongly disagree to (5) - strongly agree based on previous studies by Venkatesh et al. (2012), Ajzen (1991), Pavlou (2002), Aji et al. (2020), Davis et al. (1989). Specifically, independent variables are measured by observed variables as follows: performance expectancy with 4 observations, effort expectancy with 4 observations, social influence with 3 observations, facilitating conditions with 4 observations, trust with 4 observations, security with 4 observations and COVID-19 perceived risk with 3 observations. The dependent variable of Gen Z' intention to use FinTech payment services is measured by 3 observed variables.

3. Results

3.1. Descriptive analysis

Data is collected from a survey conducted on the Internet and 568 out of 600 responses (95%) are valid. 192 respondents have never used any Fintech services (or 33.8%) and 376 respondents have used such services (or 66.2%). The main reason is that they have never known or heard about FinTech payment services and users' concern about security is another reason. The demographic results are summarized in Table 1:

Table 1. Descriptive statistics

	Frequency	Percentage
Gender		
Male	159	28
Female	409	72
Education level		
Undergraduate	509	89.6
Postgraduate	25	4.4
Highschool	28	4.9
Others	6	1.1
Monthly earning		
Below 3 million VND	364	64.1
03 – 05 million VND	111	19.5
05 – 10 million VND	53	9.3
Over 10 million VND	40	7

Source: Authors

3.2. Reliability analysis

Cronbach's Alpha coefficient is used to test the reliability of the data. All the observed variables gave the values of Cronbach's Alpha ranging from 0.6 to 0.95, which means that they were reliable for testing in the model. In addition, the total correlation coefficients are greater than 0.3. The reliability of the scale according to Cronbach's Alpha coefficient is presented in Table 2:

Table 2. The result of Cronbach's Alpha

	Cronbach's Alpha	Cronbach's Alpha if item deleted	Corrected item - Total Correlation
PE	0.806	0.75~0.77	~0.6
EE	0.802	0.73~0.8	~0.6
SI	0.749	0.63~0.7	~0.6
FC	0.795	0.74~0.75	~0.6
TR	0.850	0.79~0.82	~0.7
SEC	0.837	0.79~0.80	~0.7
C19PR	0.751	0.65~0.69	~0.6
UI	0.887	0.79~0.88	~0.8

Source: Aggregated from analysis

3.3. Exploratory Factor Analysis (EFA)

The Barlett test has the sig value = 0.000 (< 0.05), which ensures that the factor analysis is suitable. Moreover, the KMO (Kaiser-Meyer-Olkin) coefficient is equal to 0.875, which is greater than 0.5 and smaller than 1 and the Eigenvalue is 1.207 (> 1). Therefore, the observed variables have a strong correlation and are accepted for further analysis.

Table 3. The result of KMO and Bartlett's test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.875
Bartlett's Test of Sphericity	Approx. Chi-Square	6765.844
	df	406
	Sig.	.000

Source: Aggregated from analysis

The results of EFA analysis for the independent variables of the rotated factor matrix indicate that the loading factors of all the indicators are greater than 0.5, revealing that 29 observed variables are all qualified and belong to 8 groups. With total variance extracted = 55.833% ($> 50\%$), we also can say that these variables can explain 55.833% of the variability of the data. Since there are not any new groups formed and any changes, the authors keep all the original research hypotheses.

3.4. Confirmatory factor analysis (CFA)

The authors continue to measure the suitability of the research model by applying confirmatory factor analysis (CFA) through AMOS software.

The CFA result shows that $CMIN/df = 1.278 < 3$, $p = 0.000$, $TLI = 0.983$, $GFI = 0.949$, and $CFI = 0.985$. These indicators imply that the theoretical model and the realistic model have no differences. Other indicators: RMSEA index < 0.06 and PCLOSE index > 0.05 show that the model has a proper fit to the market data collected.

Table 4. Model Fit Indexes

	CMIN/df	CFI	GFI	TLI	RMSEA	PCLOSE	P value
Estimate	1.278	0.985	0.49	0.983	0.022	1.000	0.000
Condition	≤ 3	≥ 0.9	≥ 0.9	≥ 0.9	≤ 0.06	≥ 0.05	< 0.05
Result	Good	Very good	Good	Good	Good	Good	Accepted

Source: Aggregated from analysis

3.5. Structural equation modeling (SEM)

The purpose of structural equation modeling (SEM) is to define the relationship between observed and latent variables and examine the linear relationships between these variables.

Figure 2. Standardized Structural Equation Model

The results suggest that the model achieves compatibility with the market data (Chi – squared / df = 1.278 (< 3), GFI = 0.949 (> 0.8), CFI = 0.985 (> 0.9), RMSEA = 0.022 (< 0.06)).

Table 5. Unstandardized Coefficients

	Unstandardized Coefficients				Standardized Coefficients
	Estimate	S.E	C.R	P	Estimate
UI <--- PE	0.287	0.061	4.748	***	0.113
UI <--- EE	0.14	0.065	2.168	.030	0.257
UI <--- TR	0.119	0.057	2.099	.036	0.142
UI <--- SEC	0.153	0.056	2.718	.007	0.124
UI <--- FC	0.12	0.051	2.345	.019	0.103
UI <--- SI	0.154	0.069	2.216	.027	0.133
UI <-- C19PR	0.231	0.051	4.573	***	0.199
R2 = 0.426					

Source: Aggregated from analysis

Table 5 shows that the p-value of all the indicators is smaller than 0.05. Accordingly, all the independent variables have an impact on the dependent variable “Usage Intention”, and we accept all the hypotheses. In addition, it can be seen that they all have a positive relationship with the intention to use FinTech payment services because unstandardized coefficient estimates are greater than 0. Observing the standardized coefficient estimates, “Performance Expectancy” has the most significant effect on “Usage Intention” ($\beta = 0.257$), followed by “COVID-19 Perceived Risk” ($\beta = 0.199$) and finally “Facilitating Conditions” ($\beta = 0.103$). The coefficient $R^2 = 0.426$ infers that 42.6% of the variability of the dependent variable is explained by the independent indicators.

4. Discussion and Recommendation

4.1. Discussion

The purpose of this research is to identify factors affecting Gen Z's intention to use FinTech payment services; thereby, suggest solutions for Vietnam FinTech companies to develop FinTech payment applications suitable for the target customers as well as improved business efficiency. The authors extend the Unified Theory of Acceptance and Use of Technology model (UTAUT) by adding other elements relevant to the research context. From the above research results, it can be said that a significant positive relationship can be seen in the impact of seven proposed independent variables on Gen Z's intention to use FinTech payment services. Specifically:

Performance expectancy: Among the factors affecting Fintech payment services usage intention, the performance expectancy (PE) has the strongest influence. Customers, especially Gen Z, appreciated benefits when using FinTech payment services rather than traditional payment services. This result was consistent with other previous studies (Venkatesh et al., 2012; Chuang et al., 2016; Oliveira et al., 2016; Ramos, 2017; Aseng, 2020; Alswaigh & Aloud, 2021, ...).

COVID-19 perceived risk: Subsequently, COVID-19 perceived risk is the second impactful factor affecting intention to use. This can be predicted because in the context of the escalating COVID epidemic around the world, the virus constantly mutates and records new variants such as Alpha, Delta, Omicron as well as new sub-variants (Vietnam Ministry of Health, 2022). Those who are aware of the FinTech payment benefits believed that using this service would limit the spread of viruses by replacing traditional cash payments or banking services (Sreelakshmi & Prathap, 2020). This finding reinforces the work of Daragmeh (2021), Al-Nawayseh (2020), Sreelakshmi & Prathap (2020), Aji et al. (2020), etc.

Security: The third impactful factor affecting the FinTech payment services usage intention of Gen Z is security. Security has a correlation with the risks that customers perceive in the process of using FinTech payment services (Al-Nawayseh, 2020). According to descriptive statistics, the secondary reason for not using FinTech payment services among Gen Z is being worried about services security. The result matched with research by Alswaigh & Aloud (2021), Sathye (1999), Tan & Teo (2000) and contradicting the findings of Kim et al. (2017) and Al-Nawayseh (2020) (during COVID-19 pandemic).

Social influence: The next element influence on Gen Z's intention to use is the social influence. Customers tend to consider family and friends' opinions before using services and may refuse to experience new technology if the opinions of others are not positive. This result matches with other studies all over the world (Yang et al., 2015, Liébana-Cabanillas et al., 2018).

Effort expectancy: Effort expectancy has the fifth strongest influence affecting intention to use FinTech payment services. Gen Z users will continue using FinTech payment services if these services are easy to manipulate. Effort expectancy is also the biggest motivation for non-users. This result reinforces the findings of many other studies such as Chuang et al. (2016), Giao & Chau (2020), Aseng (2020), Alswaigh & Aloud (2021), Lien et al. (2020) but disagree with the views of Ramos (2017) and Daragmeh et al. (2021).

Trust: Another factor affecting Gen Z's intention to use is trust with the sixth strongest impact out of seven factors. This implies that customers will prefer using FinTech payment services when customers trust that FinTech payment services are responsible and honest. This study once confirmed the importance of trust for intention to use (Alkhowaiter, 2020; Singh & Sinha, 2020; Chawla & Joshi, 2020).

Facilitating conditions: Facilitating conditions is the factor that has lowest effect on usage intention of Gen Z. This result is consistent with the research context in Vietnam when the technical infrastructure and support for the use of the technology system are not adequate to reduce barriers to service utilization. This finding reinforces the work of Gupta & Arora (2019), Chawla & Joshi (2019), Moorthy et al. (2020), Alswaigh & Aloud (2021).

4.2. Recommendation

For government agencies: Continuously completing legal framework to regulate FinTech payment services and other forms of non-cash payment; at the same time, enforcing mechanisms and policies to support and encourage FinTech startups, especially those provide innovative payment services. Thus, the government has better invest in technology

and network infrastructure, ensuring information security as well as improving the quality of system management and supervision and encouraging start-up FinTech to cooperate with Bank institutions.

For FinTech companies in Vietnam: Raising customers' awareness of the usefulness of using FinTech payment services by developing communication strategies, marketing online and promoting products to consumers. At the same time, Fintech companies should construct a diversified FinTech payment ecosystem, integrating many payment features to suit Gen Z consumer needs. In addition, it's necessary for FinTech firms to take advantage of technology infrastructure to minimize risks of connection when making transactions, together with ensuring securities when making transactions. Gen Z prefers to use fast and convenient services, hence, FinTech companies should construct an app that has friendly interface, simple transactions with good customer services.

For customers: Gen Z people need to actively change and increase their awareness in using FinTech payment services as well as personal information safety while using these services.

Abstract

In the context that the world economy has transformed from the industrial economy to the digital economy under the strong impact of the scientific and technical revolution, Vietnam has focused on building foundations and policies for digital economic business models, including e-commerce business models. E-commerce is growing strongly and plays a significant role in daily life and the digital economy in Vietnam. Security has been one of the essential issues in business-to-consumer e-commerce in recent years, as internet crime has increased exponentially. The security issues that are most important to consumers and the interrelationships between these issues are recognized as part of evaluating what online firms may do to improve users' overall secure feeling when shopping. The authors conducted research using qualitative and quantitative methods, surveying more than 215 subjects who were eCommerce customers in Hanoi city, the research aims to show the relationship between perceived security and customers' confirmation – expectations. Customers' confirmation – expectations are influenced by three other factors: privacy security, payment security, and incident reception and response. The study draws out solutions to improve customers' perceived security when deciding to use e-commerce services in Vietnam in the digital economy.

Key words: *perceived security, digital economy, ecommerce*

1. Introduction

Over the years, Vietnam's digital economy has continuously grown in terms of both infrastructure and business market. According to the Center for Global Business at Tufts University, USA, Vietnam ranks 48th out of 60 countries with the fastest digital economic

transformation in the world and 22nd in terms of economic growth. Among them, the most prominent is the popularity and increasing use of e-commerce platforms in Vietnam (Tran Anh Thu & Luong Thi Minh Phuong, 2022).

According to the Vietnam Information Technology White Paper (2020), for the e-commerce sector, both market size and revenue have grown, reaching \$13.2 billion in 2020. In the same year, the number of people participating in online shopping on e-commerce platforms skyrocketed, more than 41%. Among the 10 e-commerce platforms with the most website traffic in Southeast Asia, five are from Vietnamese businesses - including Tiki, Sendo, Thegioididong, Dien May Xanh and FPT Shop. In addition, other companies are also increasingly focusing on developing social media platforms to increase their competitiveness. Thus, it can be seen that Vietnam's e-commerce market is growing and has now become a popular business method used by companies to reach larger customer segments.

However, e-commerce in Vietnam still has many limitations. Including fraud, false advertising, poor quality goods, delivery and transportation of goods that cause damage or loss; personal data security issues, consumer rights violations ... are common problems in e-commerce activities. In addition, many consumers worry about using credit cards when making payments, causing them to invade their privacy when disturbed by revealing personal information such as phone numbers, citizen identification numbers, etc ... Customer confidence in buying products on e-commerce platforms is still low. It can be seen that trust in the environment of e-commerce and digital economy is an important factor in e-commerce transactions and the importance of studying online trust has also been emphasized by many recent studies (Hoffman et al., 1999; Jarvenpaa, 2000). Moreover, in Vietnam, the current legal system to protect consumers' interests is not strong enough. The sanctions to punish criminals in cyberspace are still flawed, causing fear and apprehension in the Vietnamese community consumers when participating in transactions on e-commerce platforms.

E-commerce is on the rise, demonstrating its role and contribution to daily life and to the digital economy in Vietnam. However, with such a great potential and role, the important factors that directly affect e-commerce and consumers have not been properly concerned by the state when there is a lack of laws related to services. E-commerce has not been properly and fully understood by sellers and suppliers. Among the factors affecting customer satisfaction and customer trust, perhaps perceived security is the most important factor, but it is still underestimated. The number of studies on perceived security and factors affecting perceived security are very few in Vietnam. Therefore, the authors conducted a study to identify and evaluate the factors affecting the customer's perceived security when using e-commerce services in Vietnam in the future digital economic era.

2. Literature Review

2.1. Perceived Security

Perceived security is described as the degree to which customers believe they are protected from threats of unauthorized use of personal information on e-commerce platforms (Yousafzai et al., 2003).

Suh and Han (2003) argue that Perceived security is a basic concern of customers who want to shop over the internet. The sense of security is divided into 5 aspects: authenticity, non-repudiation, security, privacy protection and data integrity that affect the experience of using e-commerce platforms.

In addition, perceived security is understood as the degree to which customers trust the security of their personal payment information of e-commerce platforms during the payment process (Shin, 2009). A high sense of security can increase customers' trust in that platform, thereby forming long-term buying habits on e-commerce platforms (Yenisey et al., 2007).

With the synthesis and drawing from the above studies, the research team draws out the most common concept for perceived security which is the level of awareness and evaluation of users about personal information security, product quality, and actual products compared to expectations when using e-commerce services.

2.2. Factors affecting the perceived security of customers when using e-commerce services in Vietnam in the context of the digital economy

+ Product Quality

According to Babakus and Boller (1992), the quality of products and services has long been a concern of many people. Product quality is the customer's assessment of the transcendental and general greatness of an entity, it is a form of attitude and consequences from an event comparison between what is expected and the perception of what is received (Parasuraman et al., 1988). However, according to data from the Ministry of Industry and Trade in 2021, because the policies and product qualities are not as advertised by powerful e-commerce platforms in Vietnam such as Lazada, Shopee, have caused several consumers complained to the Department of Competition and Consumer Protection reached to over 13,000 responses, increase 17.6% compared to 2020 which made the Department make recommendations to users. It can be seen that the product quality of current e-commerce platforms has not yet created customer satisfaction. Therefore, the authors hypothesized:

H1: Product quality has a positive (+) influence on incident reception and response.

+ Privacy security

For the purchase of goods, privacy, pricing mechanism, transactability, and speed of operation can all affect customer satisfaction. Compared with traditional purchases, online shoppers are more aware of the need for privacy/security (Culnan, 1999; Yianakos, 2002; Grewal et al., 2004; Park and Kim, 2003). Issues such as insecure infrastructure, loss of customer trust, and customer concerns about privacy can lead to reduced merchant revenue (Yianakos, 2002; Friedman et al., 2000; Grabner-Kraeuter, 2002; Liu et al., 2008). So, if the level of security perceived by consumers meets their expectations, they may be willing to disclose their personal information and try to buy. From there, the authors hypothesized:

H2: Privacy security has a positive (+) positive effect on customers' confirmation - expectations.

+ Payment security

Payment security is defined as keeping information of transactions and customers from being misused. Security remains one of the most important and well-studied areas for a payment system (Abrazhevich, 2004). Customers' interest in security within the transaction network

suggests that there are additional improvements inside electronic transactions that can enhance trust in online payments. Due to the growth of financial institution mergers and acquisitions, customers have doubts about the security of online invoices (Abrazhevich, 2004). Customers often expect easy, convenient checkout procedures offered by online shopping websites, which also instills confidence in the e-retailer. Therefore, the study hypothesized that:

H3: Payment security has a positive (+) positive influence on customers' confirmation – expectations.

✚ Receiving and responding to incidents

Policies about receiving and responding to incidents for customers consists of mechanisms, policies and rules of sellers or e-commerce service providers to commit and assure their obligations and responsibilities to the customers in a timely manner. Policies about incident reception and response related to customer support services, compensation, refund or exchange goods policies, handling complaints for customers. Customer service and support policies contribute positively to building customer experience or increasing the rate of good perception of a seller's services from the customers (Antinoja & Scherling 2019). From there, the research made the following hypothesis:

H4: Incident reception and response has a positive (+) influence on customers' confirmation - expectations.

✚ Customers' confirmation – expectations

Based on Oliver's (1980) model of Confirmation - Expectation, Customers' confirmation – expectations in this study can be understood as the assumptions in consumers' purchasing decisions at e-commerce platforms in Vietnam. In other words, Customer expectation is what customers want when using ecommerce services. Satisfied customers are an important factor for long-term success in business and appropriate business strategies to attract and retain customers (Zeithaml et al., 1996). So, customers' confirmation – expectations play an essential role in creating perceived security among consumers towards e-commerce platforms. From there, the authors hypothesized that:

H5: Customers' confirmation – expectations has a positive (+) influence on perceived security

The research model of the article is proposed based on the above synthesis studies, specifically as follows:

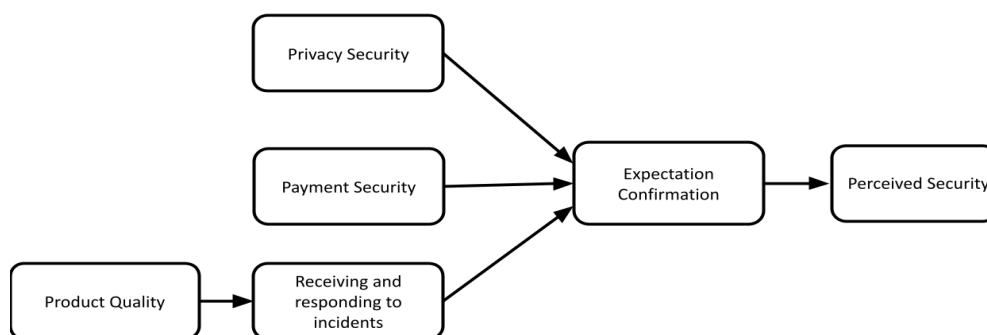

Figure 1. Model of factors affecting customers' perceived security when using e-commerce services in Vietnam in the context of digital economy

3. Method

The research objective is to give an overall picture of the factors affecting the feeling of safety of Vietnamese consumers when using e-commerce services, thereby proposing solutions to help suppliers' products and services enhance the sense of security for consumers and create trust and loyalty of consumers in using e-commerce services. The authors have carried out research processes to serve the following purposes:

First, the team provides a research overview to clarify the concept of sense of security and influencing factors based on secondary data sources that are reputable information sites such as national and international scientific journals, previous scientific studies and seminars on related topics, reports from the Ministry of Science and Technology, the Ministry of Industry and Trade,... Next, based on the collected theories, the authors propose a suitable research model. Finally, in order to collect objective data on the factors that affect the sense of wholeness, analyze and make comments on the importance of each factor, thereby making appropriate conclusions and solutions, The research team used a combination of qualitative and quantitative methods. To ensure objectivity about the necessity of the research, the author conducted a survey to collect opinions by in-depth interview method. The author conducted interviews with 10 people who have been using e-commerce services in Vietnam. The interviews focused on addressing research questions such as:

- What is perceived security? What factors affect customers' perceived security when using e-commerce platforms in Vietnam in the digital economy?
- What solutions should be given to improve perceived security of consumers in Vietnam when buying goods on e-commerce platforms?

Based on the opinions given, the official questionnaire was completed to survey the subjects who have used e-commerce services in Vietnam. Due to the impact of the epidemic, the authors decided to conduct an online survey (via email addresses, Facebook groups...).

This study was conducted based on convenience sampling (non-probability), in terms of sample size, according to Bentler & Chou (1987), for scale analysis in exploratory factor analysis (EFA) and analysis confirmatory factor (CFA) is reliable enough, the sample size is at least five times the number of observed variables in the measurement model. Therefore, the sample size in this study at least 175 (35×5) is reliable enough for factor analysis. After the online survey ended, the research team collected 235 votes. After excluding the unsuitable votes, there are 215 votes that can be analyzed (91.5% valid). The study sample will have 215 observations. Therefore, the sample size in this study is appropriate.

To measure the respondents' attitudes and feelings about the importance of factors affecting perceived security, observed variables are measured using a 5-level Likert scale: (1) Completely disagree; (2) Disagree; (3) No comments; (4) Agree; (5) Totally agree. All data related to valid samples were processed using SPSS 20.0 and AMOS 24.0 to perform the following steps: reliability analysis, correlation analysis, factor analysis, regression analysis, and mock validation theory.

4. Results

4.1. Cronbach's Alpha reliability analysis

Table 1. Cronbach's Alpha coefficient analysis results

No.	Factors	Cronbach's Alpha
1	PQ	0.912
2	PriSe	0.930
3	PaySe	0.896
4	RRI	0.914
5	EC	0.909
6	PS	0.889

Source: Data analysis results of the research team

Reliability analysis results for the independent variables "Product quality" and the dependent variable "Privacy Security", "Payment Security", "Receiving and responding to incidents", "Expectation Confirmation" and "Perceived Security" all have Cronbach's Alpha coefficient $\geq 0,6$, so all have satisfactory reliability (Hoang Trong et al., 2008).

4.2. Exploratory Factor Analysis (EFA)

Table 2. KMO and Bartlett's Test of Independent Variables

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.922
Bartlett's Test of Sphericity	Approx. Chi-Square	3661.942
	df	231

Source: Data analysis results of the research team

The standard of the factor analysis method is that the KMO index must be greater than 0.5 (Garson, 2003) and Bartlett's test has the sig significance level < 0.05 to show that the data used for factor analysis is appropriate and between the variables are correlated with each other. The results of the research team gave KMO = 0.922, sig. BaPriSelett's Test $0.000 < 0.5$, shows that in the same factor, there is a correlation between observed variables, so the data used for factor analysis is completely appropriate.

Table 3. The result of the total variance extracted from the independent variable

Total Variance Explained							
Factor	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings ^a
	Total	% of variance	Cumulative %	Total	% of variance	Cumulative %	Total
1	10.694	48.609	48.609	10.362	47.099	47.099	8.212
2	2.373	10.787	59.396	2.043	9.288	56.388	6.510

Total Variance Explained							
Factor	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings ^a
	Total	% of variance	Cumulative %	Total	% of variance	Cumulative %	Total

Extraction Method: Principal Axis Factoring.							
a. When factors are correlated, sums of squared loadings cannot be added to obtain a total variance.							

(Source: Data analysis results of the research team)

The total variance extracted is 65.356% \geq 50%, the EFA model is completely suitable (Hair et al, 2009). 4 groups of factors are extracted to summarize 65.356% of the variation of observed variables:

Table 4. Rotation matrix of independent variables

Source: Data analysis results of the research team

With sample sizes from 120-349, the load factor 0.5 is usually taken as the standard level. According to Hair & colleagues (2009,116), Multivariate Data Analysis, 7th Edition then:

- Factor Loading at ± 0.3 : Minimum condition for the observed variable to be retained.
- Factor Loading at ± 0.5 : The observed variable has good statistical significance.
- Factor Loading at ± 0.7 : The observed variable has very good statistical significance.

From Table 4.4, we can see that all variables meet the requirements and are kept.

After analysis, the independent variables converge into 3 groups and are created as representative variables as follows:

- The first factor: includes observed variables PQ1 to PQ9 representing the factor "Product quality". The representative variable is PQ.

- The second factor: includes the observed variables PaySe1 to PaySe5, representing the factor "Payment security". The representative variable is PaySe.

- The third factor: includes the observable variables PriSe1 to PriSe4, representing the "Privacy Security" factor. The representative variable is PriSe.

- The fourth factor: includes the observed variables RRI1 to RRI4, representing the factor "Receiving and responding to incidents". The representative variable is the RRI.

4.3. Confirmatory factor analysis CFA

Table 5. Model Fit Index CFA analysis

CMIN	Model	NPAR	CMIN	DF	P	CMIN/DF
	Default model	41	277.336	130	.000	2.133
	Saturated model	171	.000	0		
	Independence model	18	2938.806	153	.000	19.208
RMR, GFI	Model	RMR	GFI	AGFI	PGFI	
	Default model	.038	.875	.836	.666	
	Saturated model	.000	1.000			
	Independence model	.365	.195	.100	.174	
Baseline Comparisons	Model	NFI Delta1	RFI rho1	IFI Delta2	TLI rho2	CFI
	Default model	.906	.889	.948	.938	.947
	Saturated model	1.000		1.000		1.000
	Independence model	.000	.000	.000	.000	.000
RMSEA	Model	RMSEA	LO 90	HI 90	PCLOSE	
	Default model	.073	.061	.085	.001	
	Independence model	.292	.283	.301	.000	

Source: Data analysis results of the research team

Performing CFA analysis, we get the results according to table 4.5, the model has Chi-square/df = 2,133 < 3 with p = 0.000; CFI=0.947 > 0.9, GFI=0.875 > 0.8, TLI=0.938 > 0.9, RMSEA=0.073 < 0.8 so the model fits the research data.

4.4. Test the research model by Structural Model SEM

Table 6. Standardized Coefficients (SEM)

			Estimate
RRI	←	PQ	.554
EC	←	PriSe	.280
EC	←	PaySe	
EC	←	RRI	.501
PS	←	EC	.793

Source: Data analysis results of the research team

The Standardized Coefficients are all positive, so the effects of the factors are all in the same direction.

Standardized Linear Regression:

$$EC = 0.280 * PriSe + 0.280 * PaySe + 0.501 * RRI$$

$$PS = 0.793 * EC$$

Table 7. R-squared coefficient adjusted for dependent variables

	Adjusted R Square
Receiving and Responding to Incidents	.307
Expectation Confirmation	.728
Perceived Security	.629

Source: Data analysis results of the research team

The adjusted R square indicates the degree of influence of the independent variables on the dependent variable. Specifically, the adjusted R square of Receiving and responding to incidents is 0.307, corresponding to the independent variable "Product quality" which explains 30.7% of the change of " Receiving and Responding to Incidents ". "Privacy security", "Payment security" and "Receiving and Responding to Incidents" explain 72.8% of "Expectation Confirmation". And finally, "Expectation Confirmation" explains 62.9% of the change in "Perceived Security".

5. Discussion and Conclusion

5.1. Discussion

From the results of testing the research model with the SEM linear structural model, the impact of the variables in the condition that other factors remain constant is as follows: Receiving and Responding to Incidents will increase (decrease) 0.554 units when product quality increases (decreases) by 1 unit; Expectation Confirmation increases (decrease) by 0.280 units when privacy security increases (decrease) by 1 unit; Expectation Confirmation will increase (decrease) 0.280 units when payment security increases (decreases) by 1 unit; Expectation Confirmation will increase (decrease) by 0.501 units when Receiving and Responding to Incidents increases (decrease) by 1 unit; Perceived Security will increase (fall) 0.793 units upon Expectation Confirmation increase (decrease) by 1 unit.

The study has new points compared to previous research. Specifically, the factor "Product quality" has shown that in addition to the products sold on the e-commerce platform needing to be guaranteed in terms of quality, users also need to be able to easily use that e-commerce platform, while that is the study of Florian N. Egger (2001). This research has shown that when potential customers can easily use and learn much information on the Web, it helps them feel safe and confident. L. Chen et al. (2004) research on the technology acceptance model (TAM) also shows that the ease of use of the Web plays an important role that influences the feeling of usefulness and attitude. Customers' platform usage for e-commerce services. Liang and Lai (2002) also showed similar results. Research also shows differences in feelings of security by income. Accordingly, when consumers' incomes reach over 20 million VND, their sense of security decreases.

Thus, according to the research results, to increase Perceived Security, it is necessary to have solutions to improve Expectation Confirmation, in which Expectation Confirmation is affected by other factors. That factors (in decreasing order of impact) are Receiving and Responding to Incidents, privacy security, and payment security. Receiving and responding to incidents is also affected by product quality.

5.2. Conclusion

In summary, this study builds a model of the factors that affect consumers' sense of security when deciding to use e-commerce platforms in Vietnam in the digital economy. After proposing the model, we analyze and evaluate the reliability of the factors and the model's suitability. The results provide a quantitative analysis of the impact level and direction of the elements, thereby helping product and service providers to improve the sense of security for consumers, create trust and consumer loyalty to the use of e-commerce services. Some of the solutions the research team came up with:

Solution 1: Enterprises and e-commerce platforms need to develop a clear and specific information security policy to protect the interests of consumers.

Develop an easy-to-understand, specific and explicit information security policy for a separate group of customers and employees of the company. If information is disclosed, businesses need to have scripts and documents prepared when customer information is disclosed.

Solution 2: Have a transparent, clear, and easy-to-implement process for receiving and responding to incidents.

One must have a detailed, easy-to-implement, and clear incident receipt and response policy and procedure. Second, there should be a policy of checking goods before receiving goods. Third, the e-commerce platform needs to be an intermediary to ensure fairness between sellers and buyers.

Solution 3: Improve and tighten input standards of items to be sold and displayed on e-commerce platforms.

E-commerce platforms need a specific product and goods traceability. Do not import products that do not match the images and information posted on the system. In addition, businesses should use quality management and inventory management software.

Solution 4: Have a warranty policy, check goods before receiving and return goods clearly and transparently.

Online stores need a simple and effective check-in, refund and return policy, clear warranty policy to impress customers, and turn that policy into a brand differentiator.

Solution 5: The e-commerce platform needs to improve, closely monitor the supplier's commitments and evaluate the actual situation, the level, and how the supplier fulfills the promise.

E-commerce platforms need to have clear and transparent policies for checking goods and returning poor-quality goods. When consumers have problems with their order, they can contact the responsible party quickly until the issue is resolved.

Besides the contributions, the study still has some limitations. Firstly, the sample size is still small (215 observations), so it is impossible to accurately assess the impact of demographic factors on the research results like income, education level. In addition, because the research topic is new and there is little reference material, several other factors still affect the feeling of security. Hopefully, the research will be the premise and theoretical basis for future studies on e-commerce in general and the sense of security in particular.

Abstract

This study aims to examine the influence of factors on the purchase intention of organic agricultural products online among consumers in the North, through a survey of 612 participants. The Technology Acceptance Model (TAM) and the Theory of Planned Behavior (TPB) are used and adjusted accordingly. Besides, the Cronbachs Alpha reliability analysis method, Exploratory Factor Analysis (EFA), and linear regression analysis using SPSS 26.0 are applied as well.

The obtained results show that there are 6 factors affecting consumers' purchase intention of organic agricultural products online, including Price expectation, Food safety awareness, Product quality, Social influence, Trust, and Quality of Logistics. Consequently, the authors propose a few recommendations to businesses, consumers, and management agencies, helping them to take a broader view of organic agricultural products, thereby improving production, selling capacity, and proper decision-making.

Keywords: *online shopping, organic agricultural products, purchase intention.*

1. Introduction

The global market for organic agricultural products is growing. In 2016, the Research Institute of Organic Agriculture (FiBL) and the International Federation of Organic Agriculture Movements (IFOAM) announced the results of a survey that by the end of 2014, there were a total of 172 countries doing organic farming with a cultivated area of 43.7 million hectares. In 2016 alone, the world's consumption of organic agricultural products reached \$80 billion USD and is expected to grow in the coming time.

Not out of the world development, the market for organic agricultural products in Vietnam has experienced strong growth in recent years. The proof is that, by the end of 2016, the number of vegetable and fruit production facilities with VietGap certification was 599 and 706, respectively, with an area of over 3,700 hectares for growing vegetables and more than 12,000 hectares for growing fruit. Up to now, regarding vegetable production facilities alone, this number has increased to 1500 facilities with an area of over 12,000 hectares. Moreover, there are 180 countries importing organic agricultural products from Vietnam, so the cultivated area of Vietnam has increased from 50,000 hectares in 2016 to 24,000 hectares in 2020.

With the new trend, there are more health-conscious consumers who tend to use safe products, typically "organic" products. From that, it can be easily seen that, when consumers are gradually worried about the problems of preservatives and antibiotics that can lead to food poisoning, the market for organic agricultural products is a potential one.

In Vietnam, according to information from Vietnam E-commerce White book by the Ministry of Industry and Trade published in 2021, the percentage of Internet users participating in online shopping has increased from approximately 80% in 2019 to nearly 90% in 2020. In 2021, the impact of the Covid-19 epidemic has paved the way for the birth of online shopping services of e-commerce sites. With the trend of organic consumption as well as the emergence of online shopping, organic agricultural products are increasingly popular, attracting many consumers to shop on e-commerce sites.

The topic will delve into the survey to find out about the real situation of purchasing organic agricultural products online as well as clarify the factors affecting the intention of consumers. Finally, the research will come up with some recommendations and practical solutions, which help businesses supplying organic agricultural products to improve their efficiency on online selling sites.

2. Literature Review

2.1. What is organic agricultural product?

In Vietnam, according to Clause 7, Article 3 of Decree 57/2018/ND-CP, "Agricultural products are products generated by the agriculture, forestry, aquaculture, and salt industries"

According to J. I Rodale - who is regarded as the father of organic production in the US, agricultural products that do not use herbicides, pesticides, and inorganic fertilizers are organic foods.

From that, the authors define organic agricultural products as products generated by agriculture, forestry, aquaculture, and salt industries grown by methods without the use of inorganic fertilizers, herbicides, and pesticides.

2.2. What is online shopping?

According to Kotler & Armstrong (2004), the exchange of goods between buyers and sellers through an electronic connection is called online shopping. The act of consumers purchasing goods through an online store or using an online shopping transaction through a website is online shopping (Monuwe et al., 2004).

2.3. Consumers' purchase intention of organic agricultural products online.

Behavioral intention shows an individual's willingness to perform a behavior, and this is also a prerequisite for an individual to perform a predetermined behavior. Behavioral intention mentions "a person's subjective probability that he or she will perform some behaviors" (Fishbein and Ajzen, 1975). Intention to purchase organic agricultural products refers to motivational factors that encourage consumers to consume organic agricultural products, which represents the efforts of individuals in purchasing organic agricultural products.

Theory of Planned Behavior (TPB) (Ajzen, 1991) was improved and extended, based on the Theory of Reasoned Action (TRA) (Fishbein and Ajzen, 1975). TPB assumes that the core factor to explain behavior is behavioral intention. There are 3 factors affecting behavioral intention, namely "attitude", "subjective norm" and "perceived behavioral control".

Technology Acceptance Model (TAM) (Davis, 1989) assumes that the intention to use information technology is affected by usage attitude. Besides, the usage attitude of users is influenced by 2 factors, which are perceived usefulness and perceived ease of use.

2.4. Research models and hypotheses

Based on the review of previous studies in the world and Vietnam as well as TPB, the authors have built a research model with the following hypotheses:

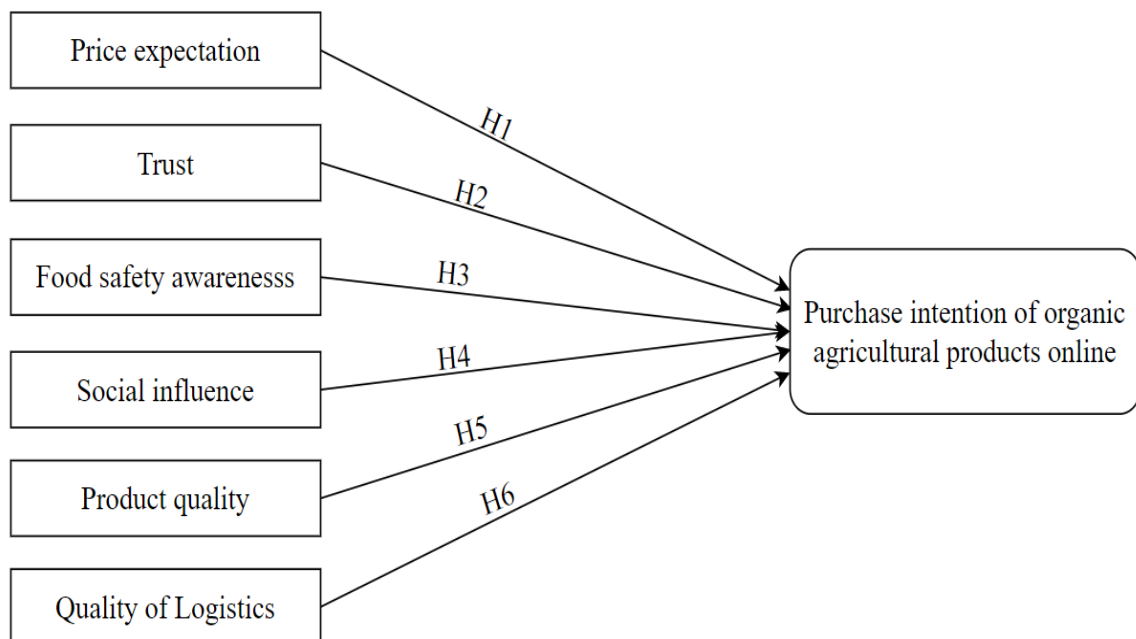

Figure 1. Research Model

Source: Created by the authors (2022).

3. Results

3.1. Descriptive statistics

Survey participants are consumers in 3 provinces of Hanoi, Bac Ninh, and Hung Yen - 3 provinces with basic features of the North. 730 questionnaires were distributed by the research team, of which 612 valid questionnaires were collected, reaching the rate of 83.84%.

Table 1. Sample's Description

Sample		Number of People	Ratio (%)
Gender	Male	259	42,3
	Female	353	57,7
Age	Under 25 years old	249	40,7
	25 - 35 years old	205	33,5
	36 - 50 years old	106	17,3
	Over 50 years old	52	8,5
Residential area	City	362	59,1
	Countryside	211	34,5
	Others	39	6,4
Income	Under 3 million VND	102	16,7
	3 - 10 million VND	275	45
	11 - 20 million VND	153	25
	Over 20 million VND	82	13,3
Frequency of food shopping	Once a day	148	24,2
	2 -3 times a day	270	44,1
	Once a week	95	15,5
	Less than once a week	99	16,2

3.2. Reliability analysis using Cronbach's Alpha

Table 2 shows that the scales used by the research team all have a high Cronbach's Alpha coefficient (>0.4). All observed variables of these scales have the Corrected Item – Total Correlation greater than 0.3. Therefore, these scales are reliable and appropriate to use in this research.

Table 2. Cronbach's Alpha

Number	Variables	Symbol	N of Items	Cronbach's Alpha	Smallest Corrected Item – Total Correlation
1	Price expectation	PE	3	0,714	0,554
2	Trust	TR	4	0,827	0,604
3	Food safety awareness	FS	4	0,749	0,534
4	Product quality	PQ	5	0,862	0,629
5	Social influence	SI	5	0,808	0,480
6	Quality of Logistics	QL	3	0,782	0,592
7	Purchase intention of organic agricultural products online	PI	3	0,791	0,495

Source: Created by the authors (2022).

3.3. Exploratory Factor Analysis

The research team used the exploratory factor analysis method (EFA) for 6 independent variables – 24 observed variables. The Principal Component Analysis method is used, along with Varimax rotation and breakpoint when extracting factors with Eigenvalues of 1. The results show that the KMO value is $0.926 > 0.5$, which is satisfactory. This means the size of the sample is suitable for the analysis. Barlett coefficient has $\text{Sig.} = 0.000 < 0.05$, meaning that observed variables are correlated with each other in the factor.

Then, the results show that there are 6 factors extracted with the criterion of Eigenvalue coefficient greater than 1, with a Total Variance Explained of 65,852% (>50%), which is satisfactory. In other words, 24 observed variables proposed by the research team explained 65.852% of the variation of the observed variables. At the same time, the scales for the 6 factors all reached the convergent validity and all had a load factor greater than 0.3 (which is satisfactory with the sample size $N = 612$).

Table 3. Results Factor Analysis - Independent

Items	Factor					
	1	2	3	4	5	6
PQ4	0,775					
PQ5	0,756					
PQ3	0,736					
PQ2	0,668					
PQ1	0,649					
SI2		0,787				
SI1		0,739				
SI3		0,711				
SI4		0,580				
SI5		0,478				
TR3			0,747			
TR1			0,733			
TR2			0,720			
TR4			0,670			
FS2				0,724		
FS1				0,692		
FS4				0,545		
FS3				0,513		
QL2					0,795	
QL3					0,785	

Items	Factor					
	1	2	3	4	5	6
QL1					0,563	
PE1						0,703
PE3						0,675
PE2						0,507
Eigenvalues	9,018	2,137	1,365	1,154	1,127	1,004
Comulative %	37,574%	46,480%	52,165%	56,974%	61,670%	65,852%

Source: Created by the authors (2022).

Next, the research team conducted an Exploratory Factor Analysis of the dependent variable “Purchase intention of organic agricultural products online” with 6 independent variables. The result shows that KMO value=0.548, the result of the Bartlett test is 175,906 with Sig = 0.000 and the test result of Eigenvalue coefficient is 1,580 (greater than 1). In addition, the Average Variance Extracted of the dependent variable reached 52.680%.

Thus, through the scale test, the factor "Purchase intention of organic agricultural products online" includes 6 independent variables: Price expectation, Food safety awareness, Product quality, Social influence, Trust, and Quality of Logistics.

3.4. Correlation test

The results of correlation analysis through the Pearson correlation matrix show that all the independent variables are strongly correlated with the dependent variable and are correlated with each other at the 5% significance level.

3.5. Regression analysis

First of all, the results of the linear regression analysis show that the Adjusted R-squared is 0.520, indicating that the factors assumed by the research team in this model contribute to 52.0% of the change in the dependent variable “Purchase intention of organic agricultural products online”. The ANOVA results show that the F-statistic of the model = 111,147, Sig = 0.000, meaning that the multiple linear regression model is suitable for the data set of the research team.

Next, Table 4 shows that all 6 variables have statistical significance with Sig < 0.05. In other words, all 6 hypotheses are accepted. Specifically, the factor “Price expectation” has a 21.0% impact on “consumers’ purchase intention of organic agricultural products online”. The factors “Trust”, “Food safety awareness”, “Product quality”, “Social influence”, “Quality of Logistics” affect the “Purchase intention of organic agricultural products online” at the rate of 14%; 19,3%; 15,4%, 14,2% và 9,2% respectively.

The multiple linear regression equation is concluded as follows:

$$PI = 0,156 + 0,19*PE + 0,123*TR + 0,183*FS + 0,138*PQ + 0,141*SI + 0,092 * QL$$

Table 4. Results Regression

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
(Constant)	0,156	0,125		1,241	0,215

Durbin-Watson: 1,934							
F (ANOVA): F = 111,147							
Sig. (ANOVA): 0,000							

Source: Created by the authors (2022).

3.6. T-test

The research team used the Tests of Homogeneity of Variances to find the difference in purchase intention of qualitative variables. The results show that there are differences in purchase intention, depending on occupations, living areas, and the number of people in the family of consumers. At the same time, there was no difference between the sex groups.

4. Discussion and Conclusion

4.1. Managerial implications

Price expectation: From the research results, price expectation is the factor that has the biggest impact on consumers' purchase intention of organic agricultural products online. Businesses should have policies to minimize costs and unimportant steps. At the same time, there should be promotional programs to attract consumers' attention and stimulate shopping.

Food safety awareness: It can be said that one of the biggest reasons why consumers decide to purchase organic agricultural products is that they are concerned about the health of their families and themselves, especially in an alarmingly poor situation of food hygiene and safety. Therefore, businesses should be transparent and clear in the safety certifications of organic agricultural products so that consumers can trust and make the most accurate choice.

Product quality: When consumers perceive organic agricultural products to be of good quality and organic agricultural products sold online also obtain certificates such as VietGap, GlobalGap, etc just like the ones sold in supermarkets, their purchase intention will

increase because of the convenience of this method of shopping. This is also a remarkable point for businesses when selling organic agricultural products online: balancing between quality and price of the product.

Social influence: Consumers have the tendency to purchase organic agricultural products online if they are influenced by relatives, friends, good reviews, and advertisements on social media. Hence, businesses should enhance the building of prestigious brands, good images, and at the same time investing heavily in marketing communications so that organic agricultural products are popularized and create more trust for consumers.

Trust: Trust in the online shopping method or in the quality of organic agricultural products will also change consumers' purchase intentions. In the 4.0 era, consumers tend to use the online shopping method more because they trust the commitment and quality safety certification of organic agricultural products rather than purchasing organic agricultural products at traditional markets. Businesses need to focus on building trust among customers through their own products, online stores, and consulting & customer care services.

Quality of logistics: Through the research, the team found that the faster the delivery time, the higher the consumers' purchase intention for organic agricultural products online. In addition, they are also very concerned about after-sales services as well as the fact that organic agricultural products may be degraded or even damaged during transportation. Therefore, businesses need to focus on their logistics to attract customers with this new method of shopping.

4.2. Limitations of the study and suggestions for further research

The study still has some limitations as follows. Firstly, the research sample is only limited to the northern provinces, so it has not had comprehensive generality for the whole Vietnam. Secondly, the research team only mentioned 6 factors affecting purchase intention while there are other influential factors, such as risk perception, shopping habits, etc. This will be an open direction for future research topics that can be exploited.

4.3. Conclusion

The objective of the study is to examine the factors affecting the purchase intention of organic agricultural products online of consumers in the North. The research was carried out through two steps: qualitative and quantitative. Quantitative research results with a valid sample size of 612 have shown that the scales have guaranteed reliability, and all 6 hypotheses are accepted. Specifically, there are 6 factors that positively affect the purchase intention of organic agricultural products online of consumers in the North, ranked in descending order of impact: Price expectation (Beta = 0.21); Food safety awareness (Beta = 0.193); Product quality (0.154); Social influence (0.142); Trust (0.140) and Quality of Logistics (0.092). At the same time, the research results show that there is a difference in the purchase intention of organic agricultural products online, depending on occupations, living areas, and the number of people in the family.

Abstract

Over the past decade, consumers are more and more aware of the harmful effects of abusing chemicals in agricultural production on their health and the sustainability of the environment. It is gradually becoming popular in many countries. In Vietnam, organic agricultural products have been put on e-commerce platforms to get closer to consumers, but still face many difficulties in consumption. From that fact, this study applies the Theory of consumer perceived values developed by Sweeney and Soutar (2001) and the Theory of Planning Behaviour (TPB) of Ajzen (1991) to analyze the relation between EWOM, customer perceived value, and behavioral intention to buy organic agricultural products on e-marketplace in Hanoi market. Through the survey, the research team collected data from 398 consumers in Hanoi and processed it using SPSS 20.0 and AMOS 24.0 software. The results show the moderating effect of consumer perceived value between EWOM and intention. Moreover, they also prove that quality value, emotional value, social value, and electronic word of mouth have a positive relationship with the intention to buy organic agricultural products on e-commerce platforms. Implications, limitations, and future research directions will be discussed in the following article

Keywords: *consumer perceived values, electronic Word of mouth (EWOM), organic agricultural products, e-marketplace.*

1. Introduction

According to the World Health Organization (WHO), organic agricultural products are "products created from organic agriculture in which the production process uses only organic fertilizers, manual or mechanical weeding, and pest control by biological methods, creating products that meet food hygiene and safety requirements, while at the same time ensuring a sustainable production system in terms of environment, society, economy, protecting the living environment for both present and future". The spread of the COVID-19 pandemic has changed the shopping behavior and eating habits of consumers related to food. They tend to switch to healthier diets, increase their consumption of organic products due to food safety concerns, and change the way they buy food with the rise of online grocery shopping (Lin et al., 2020). The skyrocketing demand for organic food has prompted food manufacturers to offer more products and ramp up their marketing activities to the public. In particular, customer perceived value is considered by many to be the main source of competitive advantage in the 21st century. The theory of customer perceived value has been used in many fields, especially in the field of marketing, to predict consumer preferences and willingness to make transactions in the future. Furthermore, customer perceived value influences and is dependent on behavioral intentions such as loyalty and word of mouth (Johnson et al., 2006). Although there have been many studies exploring perceived value, the research related to technological advances is still limited, especially in the context of online purchases (Zauner et al., 2015). In Vietnam, 86% of Vietnamese consumers prefer to use organic products for their daily meals because of their safety, nutrition, and delicious taste (Nielsen, 2017). However, the real customers of organic agriculture in Vietnam today are quite modest. According to data from FiBL-IFOAM (2021), the per capita consumption of organic products in Vietnam is only about 2 euros. The reason is that consumers currently do not have enough economic conditions to go along with worries about the true value of organic products, which makes consumers afraid to choose this type of product. With theoretical and practical implications, this study was conducted to understand the factors affecting consumers' intentions to buy organic agricultural products, thereby proposing implications to promote the purchase of organic agricultural products consumers this item on the e-marketplace.

2. Theoretical Framework

2.1. Theoretical Basis

2.1.1. Theory of consumer perceived value

The study of Sheth et al, 1991, the authors assumed that customer choice influenced by consumption values is equivalent to 5 aspects of value: (1) functional value (2) epistemic value (3) conditional value (4) social value and (5) emotional value. These factors are considered independent of each other, which means that consumption decisions can be influenced by any or all aspects, depending on the situation as well as the product or service in question.

However, Sweeney and Soutar (2001) suggest that aspects of value may not be independent because groups of factors related to the enjoyment and practicality of attitudes may be related. Then, the authors have developed a customer perceived value model with a scale to measure consumers' perceptions of the value of durable goods based on 4 value

dimensions (emotional, social, quality, value/performance, and price/value for money). In this theory, price and quality are assumed to be sub-factors of functional value proposed by Sheth et al. (1991) and these aspects contribute exclusively to perceived value. The social and emotional aspects are represented by the set of intangible factors that affect the relationship. The scale is proven to be valid and reliable in both pre-purchase and post-purchase situations. This has also been demonstrated when applied to different product categories such as organic food (Al Waseti, 2020; Finch, 2006), education (Stafford, 1994), e-commerce (Peng et al., 2013).

2.1.2. Theory of Planned Behavior

The proposed behavioral theory is the development and improvement of the Theory of Reasoned Action by Ajzen and Fishbein (1975) and is the commonly used theory when it comes to predicting a particular behavior of any individual, maybe the act of choosing to buy products or services; elective behavior, ... According to the TPB model, motivation and intention are the fundamental factors leading to consumer behavior. Therefore, motivation is affected by 3 fundamental premises: (i) the personal factor or the attitude towards intention, which is the positive or negative attitude towards performing the behavior; (ii) subjective norm and (iii) the decisive factor of self-perception and ability to perform the behavior, which is called perceived behavioral control. The TPB model has been shown to be compatible, suitable when applying a theoretical framework to evaluate online purchasing behavior (Joey F. George, 2004). For the field of organic products, many studies have integrated additional variables into the TPB model to conduct a survey on purchase intentions such as adding new factors such as perception of quality, environment and health in consumer decision making (Rahmawati et al, 2018, Akbar et al, 2019).

2.2. Determinants influencing the intention

2.2.1. Electronic word of mouth

EWOM become important to marketers because they are referred to by potential customers during their buying process. According to a study by Levy et al (2020), the participation of customers in the exchange of price information in the online environment will benefit both buyers and sellers because it will enhance the customer's experience of purchase by consumers and thereby help increase customer perceived value. Consumers can trust the product value propositions described by the manufacturer by accessing reviews posted by other consumers in online shopping communities where consumers can find and get answers to the uncertainties they have (Hidayat and Astiti, 2019). Sun (2012) found that when the quality of book reviews on Amazon differs markedly, in particular, the degree of high or low rating significantly affects the perceived level of product quality and sales. In a study on the intention to buy organic food on social networks, Lin et al (2019) showed that social commerce characteristics (interaction, recommendation, and feedback) had positive effects on emotional value. The reason may be that these platforms provide all the necessary information to help consumers reduce fatigue and stress caused by information overload during the shopping process. This opinion is also supported by Jihad Mohammad et al (2020) when it is found that the quality of user-generated content such as content, images, video, audio, has a positive impact on emotional value. From that, the authors put forward the following hypotheses:

H1: *Electronic word of mouth has a positive effect on functional value - quality.*

H2: *Electronic word of mouth has a positive effect on functional value - price.*

H3: *Electronic word of mouth has a positive effect on emotional value.*

H4: *Electronic word of mouth has a positive impact on social values.*

By extension, with the quick development of the Internet, EWOM has become an important factor in product evaluation because of its scalability and rapid spread of social networks. Accordingly, EWOM is a collection of negative and positive opinions and evaluations about products and services of old, current, and potential customers in the future (Hennig-Thurau et al. associates, 2004). When considering the relationship between EWOM and behavioral intention, previous studies have suggested that there is a positive relationship between these two factors in many fields. For organic food, J Lin et al (2020) examined the correlation between social network characteristics (interactivity, recommendations, feedback) and consumer purchase intention. The results indicate that these characteristics have a positive impact on the functional value and emotional value, play an important role in enhancing consumers' perceived value, and indirectly promote purchase intention. From there, the authors hypothesized:

H9: *Electronic word of mouth has a positive effect on intention to buy organic agricultural products on e-marketplace.*

2.2.2. Consumer perceived value

Functional value is explained as the benefit and advantage the consumer gets due to the functional attributes of the demanded product (Waseti et al., 2022). According to Sweeny and Soutar (2001), functional value-quality is measured performance/quality. Specifically, it is the consumer's assessment of the utility that the market provides through its expected performance and perceived quality. Some studies have also demonstrated the role of this factor in promoting the value perceived by customers (Wang et al., 2004; Lin et al., 2012; Suki et al., 2015). In the food sector, especially the organic product market, functional value related to the biological characteristics of organic foods is often of interest to consumers. They pay special attention to the quality of organic products in terms of health protection such as no chemicals and pesticides, all natural and healthy for conventional foods (Rahnama, 2017). Based on that, the authors propose the following hypothesis:

H5: *Functional value-quality has a positive effect on intention to buy organic agricultural products on e-marketplace.*

The functional value-price is able to improve the customer's perception of the value of the product or service and is also considered as one of the factors that consumers evaluate most closely before deciding to buy green products (Akbar et al., 2019). And they are also willing to pay higher prices for products that are said to be environmentally friendly (Lin and Huang, 2012). In terms of the relationship between functional value - price on green product consumption behavior, several studies have demonstrated that it has a positive impact on the sustainable consumption behavior of customers (Akabar et al, 2019). Research by Waseem Shahzad et al (2011) also suggests that price competition will motivate consumers to use green products more often instead of traditional products. Applying these findings to the current study, the study proposes and tests hypothesis that:

H6: *Functional value-price has a positive effect on intention to buy organic agricultural products on e-marketplace.*

Emotional value measures the perceived usefulness of a product or service by a consumer when arousing a feeling or emotional state (Sheth et al., 1991). From that, it can be understood that emotional value is the sum of feelings of disappointment, joy, happiness, ... of customers and consumers when buying and using that product or service. In the study of the intention to buy organic food on social networks, Lin et al (2020) showed that emotional value is identified as important mediating variables in the impact of product attributes. and services on consumer purchase intention in social commerce. This result is also supported by Lin and Huang (2012) when considering factors affecting green product selection behavior based on consumer value theory. Based on these arguments, a hypothesis is proposed by the authors to test that:

H7: *Emotional value has a positive effect on intention to buy organic agricultural products on e-marketplace.*

Sheth et al. (1991) suggested that social value is a measure to measure the level of usefulness received by-products or services related to specific social, demographic, socioeconomic, cultural groups. It can be understood that social value is the value derived from the product's ability to increase individuality in society, through which consumers can express pride or enhance the status and prestige of the product itself. Especially for developing countries, social values are a more noticeable factor as collectivism is given more importance in these countries (Hofstede, 1984). When Suki et al (2015) studied organic food consumer behavior in Pakistan, the authors found that social value is an important factor that has a positive impact on intention. This contrasts with the results of a recent study by Waseti et al (2022) which found that social value has a significant negative impact on the intention to buy organic food. Applying these findings to the current study, the study proposes and tests a hypothesis that:

H8: *Social value has a positive effect on intention to buy organic agricultural products on e-marketplace*

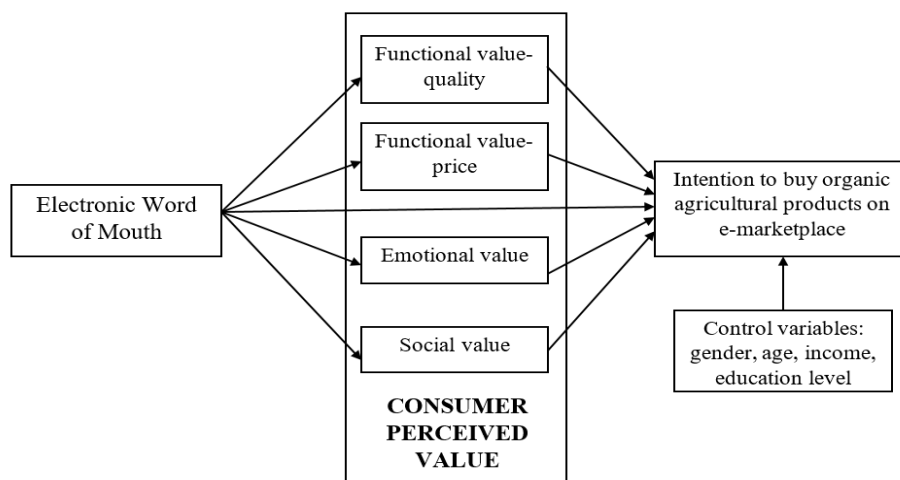

Figure 1. Research Model

Source: Authors' calculation

3. Method

Qualitative research was carried out through 03 depth interviews with 5 experts and 20 survey subjects (consumers in Hanoi city) of different age groups, education levels, and incomes. Qualitative research results show that 24 observed variables used to measure 6 groups of factors have been formed (*see the result in the appendix*). After collecting data from 398 respondents, the data was analyzed using Cronbach's Alpha reliability analysis tool, EFA exploratory factor analysis, and CFA confirmatory factor analysis. Then, all hypotheses were tested by Structural Equation Modeling (SEM), and the model reliability was re-evaluated by the Bootstrap method.

4. Results

4.1. Descriptive statistics

The study considered survey participants according to criteria including gender, age, education level, and income. In particular, about gender, statistical data shows that survey respondents are mainly female with 55.8% higher than 44.2% of men. In terms of age, the group of people between the ages of 18 and 25 accounted for nearly 60%; from 26 to 35 years old accounted for 19.1%; from 36 to 45 years old accounts for 13.6% and over 45 years old is 7.5%. In terms of educational attainment, upper secondary education accounts for about 12.1%; College/intermediate accounted for the lowest proportion with 7.3%, while the number of people with university degree accounted for 71.4% and graduate degree accounted for 9.3%. Regarding income, more than half of the respondents have an income of less than 5 million VND; the group with income from 5 to 10 million VND accounts for 17.1%; the group with income from 10 to 20 million VND accounted for 12.6% and finally the group with income over 20 million VND accounted for 9.0% of the total.

4.2. EFA and CFA results

Cronbach's alpha value for each measure ensures the reliability of all variables. The results show that all of them are greater than 0.7 and corrected item-total correlation greater than 0.5 (*see the result in the appendix*). The scale of variables meets the reliability needed to perform further analysis.

The authors conducted an exploratory factor analysis EFA for the variables. The results show that the KMO coefficient is $0.910 > 0.5$ and $\text{sig.} < 0.05$, equivalent to a high level of significance. In addition, the rotation matrix table shows that 24 observed variables are extracted into 6 groups of factors with high Eigenvalues of all factors (>1). Total Variance Explained is $63.823\% \geq 50\%$, showing that the EFA model is suitable. In addition, the observed variables in the factor groups all have Factor Loading coefficients (Factor Loading) > 0.5 , showing that these observed variables have good statistical significance (Hair et al, 2010).

Table 1. The result of EFA

	Component

Sig. = 0.000; KMO = 0.910						

Source: Authors' calculation

CFA result (*see the result in the appendix*) shows that the standardized regression weight of all variables is greater than 0.5, showing the model reaches a convergent validity, the common criteria used for assessing the model's compatibility with market information including: χ^2 (Chi-square), χ^2 - adjusted by degrees of freedom (Chi-square/df), GFI, CFI,

TLI and RMSEA are considered. The result show that the value χ^2 has the corresponding P-value <0.05 ; $CMIN/df = 2.623 \leq 5$; $CFI = 0.934$, $GFI = 0.886$ and $TLI = 0.922$ are close to 0.9; $RMSEA$ is $0.064 \leq 0.08$, showing that the model's compatibility with data is very good. Correlation coefficients of the variables are all smaller than the unit value, so the scale achieves distinct value (Steenkamp & Van Trijp, 1991)

4.3. Structural Equation Model (SEM) analysis

The goodness-of-fit indices of the structural model is shown in Figure 2. It can be concluded that the structural model demonstrated a good fit to the sample data, with $\chi^2/df = 3.286 < 5$; $GFI = 0.852$ ranges from 0.8 to 0.9; $CFI = 0.905$; $TLI = 0.890$ are close to 0.9, and $RMSEA = 0.076 < 0.08$. The model explained a significant 62,8% ($R^2 = 0.628$) of the intention to buy organic agricultural products on e-marketplace.

Figure 2. Results of testing the models (SEM)

Source: Authors' calculation

Based on the analysis results of the linear structural mode, the authors found that 8 out of 9 proposed hypotheses are supported with P-value < 0.05 . The result shows that the model proposed by the research team has been effective in explaining the relationship between the variables. Among the hypotheses, only hypothesis H9 is rejected because P-value = $0.082 > 0.05$ (Table 2)

Table 2. Analysis of regression weight

	Estimate	S.E.	C.R.	P
GC <--- EWOM	0.586	0.059	9.971	***
CX <--- EWOM	0.401	0.057	7.007	***
XH <--- EWOM	0.562	0.074	7.631	***
CL <--- EWOM	0.608	0.061	9.946	***
YD <--- GC	0.18	0.066	2.73	0.006
YD <--- CL	0.421	0.076	5.522	***
YD <--- CX	0.485	0.074	6.522	***

YD <--- EWOM	0.162	0.093	1.74	0.082

Source: Authors' calculation

From the table of standardized regression coefficients, the authors based the Estimate regression coefficient to assess the impact of Electronic Word of mouth on the groups of value factors. Accordingly, Electronic word of mouth has a positive impact on all 4 groups of factors including Functional value-quality, Functional value-price, Emotional value, Social value with standardized regression coefficients are 0.613, 0.573, 0.439, 0.436, respectively. Thus, it can be seen that online forms of word of mouth have the strongest influence on Functional value-quality and the lowest on Social Value.

The authors also consider hypotheses about the relationship between independent variables and dependent variables. Observing 4 groups of factors of consumption value including Functional value of quality, Functional value of price, Social value, Emotional value, the authors found that the estimated coefficient of these factors has a positive sign (+), showing a positive relationship with the intention to buy organic agricultural products on e-marketplace. Which, the factor Emotional value has the strongest impact with a regression coefficient of 0.351, followed by Functional value-quality with a coefficient of 0.330, Social value with a coefficient of 0.181 and the last is Functional value-price with a coefficient of 0.145. However, for Electronic Word of mouth, the analysis results do not support the hypothesis of the research team when it shows that this factor does not affect the purchase intention of consumers.

4.4. Bootstrap test result

The sample was divided into two sub-samples. One half are used to estimate model parameters and another half are used for re-assessment. There is another method is that repeat the research with a different sample. The above two methods are normally impractical because structural equation modeling needs a large sample, which is expensive with much time (Anderson & Gerbing, 1998). In such cases, Bootstrap is a suitable alternative. Bootstrap is a resampling method with replacement, of which the original sample plays the role of crowd (Nguyen Minh Tam, 2009). This study uses the quantity of repeated samples being N = 1,000. The averaged sample value with deviation is presented in the appendix. It

is found that although there is the deviation, the absolute value is $CR \leq 2$, so the deviation is very small, not statistically significant. Therefore, the model estimates can be reliable.

5. Discussion and Conclusion

Electronic word of mouth has a positive impact on all 4 groups of factors including Functional value-quality, Functional value-price, Emotional value, Social value with a standardized regression coefficient of 0.613, 0.573, 0.439, 0.436. Thus, it can be seen that Electronic word of mouth have the strongest influence on Functional value-quality and the lowest on Social Value. Besides, the authors also consider hypotheses about the relationship between independent variables and dependent variables. Observing 4 groups of factors of customer perceived value including Functional value-quality, Functional value-price, Social value, Emotional value, the authors found that the estimated coefficient of these factors all has a positive sign (+), showing a positive relationship to buy organic agricultural products on e-commerce platforms. The factor Emotional value has the strongest impact, followed by Functional value-quality, Social value, and lastly, is the Function value-price. Research results support the study of Chang (2011), Lin et al (2020), Liu et al (2021), Aslam (2020). However, for Electronic word of mouth, the analysis results do not support the hypothesis of the research team when it shows that this factor does not affect the purchase intention of consumers.

Accordingly, the value related to emotion is the factor that consumers are most interested in. The best way to get people's attention is with emotional stimulation, somehow feeling good, annoyed, happy, angry, indignant, or jumping up and down at the sight. Besides, quality standards must be regularly updated according to world standards and should be unified under the management of state agencies. In addition, in the context that Vietnamese consumers still have the habit of favoring low-priced products, social organizations need to promote communication about the benefits and contributions of organic agricultural products to the community with health and the environment. On the part of enterprises producing and providing services on the e-commerce floor, marketing strategies need to focus on quality or price incentives as well as focus on the characteristics of each customer group to popularize organic agricultural products in consumers' shopping carts.

The limitation of this study is that it only focuses on assessing the impact of value factors and electronic word of mouth factors on intention without considering the relationship between these factors. In addition, this study still has limitations related to research methods to collect and process data, the small sample size. Next studies should increase the sample size. Survey data used in quantitative research is conducted at a point in time, thereby the following studies can conduct surveys over some time.

Abstract

E-commerce platforms today have developed and employed many features to increase engagement with users. Due to the advancement of information and technologies, gamification has been developed as strategies to attract customers and encourage purchase intention. In this study, the authors examine the impact of gamification on the purchase intention of users on e-commerce applications. Data sample collected from 535 mobile commerce shoppers in Vietnam through a survey via Google form was analyzed using cognitive evaluation theory. The results of this study found that immersion, achievement, and social features have a positive impact on brand engagement. Brand engagement has also been shown to positively influence purchase intention. Afterward, the result shows that gamification indirectly affects purchase intention, but relies on interaction with brand engagement. This paper discussed the implications of this study on both research and practice and additionally, this is the first empirical study about the impact of gamification on purchase intention in Vietnam.

Keywords: *Gamification, Purchase Intention, Brand engagement, Cognitive evaluation theory*

1. Introduction

With the advancement of Internet technology and the widespread use of smart devices, a growing number of individuals are shopping and paying with their smartphones. In addition, Yuan et al., (2021) indicated that due to the outbreak of the Covid 19 epidemic, people's demand for online shopping increased significantly. The rapid development of e-commerce in Vietnam has led to fierce competition among e-commerce businesses in Vietnam.

As the competition between these e-commerce platforms is getting more and more intense, boosting the online purchase intention of consumers is considered as an important aspect of this type of business. And one of the effective ways to increase purchase intention is adopting gamification into E-commerce applications.

In the past few years, the concept of gamification is gaining popularity in many fields such as healthcare, education, and business. Especially, in the context that Vietnam has a considerable growth rate of Internet usage, gamification is a very effective marketing tool in communication activities, trade promotion, promotion of consumer buying decisions. Previous quantitative studies have studied gamification as one of the means of promoting consumer behavior, which has been applied across many fields such as education, marketing, training, networking, and health (Bunchball, 2010; Hamari & Lehdonvirta, 2010; Deterding et al., 2011a; Hofacker et al., 2016). Some studies Hofacker et al., (2016); Eisingerich et al., (2019); Dhahak and Huseynov (2020); Gajanova and Radišić (2021) suggest that online purchase intention can be explained by intrinsic motivational factors motivated by gamification. This conclusion is further extended when later studies such as De Canio et al. (2021), Willis and Tjhin (2021) show that these intrinsic motivational factors through building brand engagement influence online purchase intention.

However, the studies on the impact of gamification on the online purchase intention of consumers in Vietnam are quite a few and almost never been done, so this issue needs more research. Moreover, given the increasingly widespread use of gamification in marketing, whether on an online brand platform or at e-commerce platforms, there is little research to show an important, key factor of gamification affecting consumers' decisions in online purchases. In addition, most of the previous studies only selected a certain e-commerce platform. In this case, consumers choose to use multiple e-commerce platforms at the same time in order to achieve the best purchasing benefits.

Addressing these gaps, cognitive evaluation theory (CET) was applied in this study. CET was developed to predict the impact of consumers' enjoyment on the game on their purchase intention. (Ryan & Deci, 2000; Deci & Ryan, 2008, 2013). We use this model as the basis for posing a series of research questions about the effect of gamification on purchase intention in e-commerce markets. In this study, a model based on CET was constructed and tested to see how game aspects affect players' psychological demands and boost their sense of enjoyment, influencing their purchase intention.

The study contributes to the literature and practice in a number of ways. First, the authors prove that gamification indirectly affects purchase intention but it affects through the mediating variable, brand engagement... In addition, we successfully applied scales

referenced from foreign studies to measure the influence of gamification on brand engagement, also brand engagement on purchase intention. Our study thus sheds new light on how e-commerce platforms can encourage purchase intention in gamification contexts by demonstrating how three gamification features: immersion, achievement, social facilitate brand engagement, and purchase intention.

2. Literature review and hypotheses

2.1. Gamification

Firstly, gamification is defined as the art and science of turning everyday customer interactions into games that serve your business purposes (Zichermann & Linder, 2010), Gamification is “the use of design elements characteristic for games in non-game contexts” (Deterding et al., 2011b, p.9). It refers to design principles, processes, and systems that attempt to bring about similar positive experiences as those seen in games used, and consequently influence, engage, and motivate individuals, organizations, and communities to promote user behavior (Glover, 2013; Nicholson, 2012; Deterding et al., 2011a).

Gamification features are frequently used on online shopping platforms for content development or advertising. (Vashisht & Pillai, 2017). Hunter and Werbach (2012) proposed the types of game mechanics: exploration, gathering, competition, status, coordination, challenge, and development. The two most popular gamification methods have been recognized as rewards and challenges. (Tobon et al., 2020). The gaming experience is an important part of services using gamification (Deterding et al., 2011b), while entertainment features are also important factors in the gaming experience (Huotari & Hamari, 2017).

Hofacker et al. (2016) used the four-element model proposed by Shell (2008) to measure gamification factors. They are Story, Mechanics, Aesthetics, and finally Technology. Suh et al. (2018) posit the aspect of game dynamics which are the reward, competition, self-expression, and altruism while Eisingerich (2019) used the game principle to study the impact of gamification on user interaction, variables include social interaction, feeling of control, goals, progress tracking, rewards, reminders.

Moreover, gamification design involves many components and according to Ufford (2017), Xi and Hamari (2020), they are classified into three based on their features: immersion-related features, achievement-related features, and social interaction-related features, which appear to be intuitively associated with the dimensions of intrinsic need fulfillment. Immersion-related features, like avatars, storytelling, narrative structures, roleplay mechanics, etc. aim to immerse the user in self-directed questioning action. Achievement-related features include badges, challenges, missions, goals, leaderboards, progression metrics, and other game mechanics that aim to increase the players' sense of success. Social interaction-related aspects, such as team, group, and competition game mechanics, are primarily employed to enable users' social interaction (Jang et al., 2018). In the context of the research paper, the authors propose to use three variables: immersion-related, achievement-related, and social interaction-related to analyze the proposed motivational characteristics.

2.2. Online purchase intention in E-commerce exchange.

E-commerce is an abbreviation of “electronic commerce” (Mohapatra, 2013). It refers to the use of the Internet and other network platforms, such as Shopee, to purchase, sell, transport, transfer, or trade data, goods, or services (Turban et al., 2017). Moreover, e-commerce can be seen as “a subset of e-business, which refers not only to the buying and selling process but all kinds of businesses such as servicing customers, collaborating with business partners, as well as delivering electronic transactions” (Turban et al., 2018). Customers that use e-commerce have various advantages, according to the US Department of Commerce. It gives users access to a worldwide marketplace that connects global supply and demand. Customers can get products, services, and information at any time of day or night, from any location, which is quite convenient. Shopping is faster and more transparent than traditional retail since it is easier to compare pricing and discounts for similar products. E-commerce also provides an interactive way to learn more about things and how to use them (Commerce, 2020). Within the scope of this study, we define e-commerce as the marketing and sale of goods and services through an online platform and focus on the application of gamification on e-commerce exchanges.

Purchase intention is a combination of a consumer's interest and ability to buy a product. The intention to buy at e-commerce platforms is customers' willingness to purchase behavior via the Internet. Purchase intention is the final step in the decision-making process before the customer actually buys the product. To achieve this step, consumers have to pass through several stages until they express purchase intention or in the case of most studies outward supportive communication (Kim et al., 2019). These stages include identifying a need and recognizing a problem, acquiring information, evaluating various solutions (products), selecting an appropriate solution (product), and evaluating the decision after it has been purchased (Jobber & Lancaster, 2015). Many other aspects influence purchase intent during this process, such as brand relationships (Anuwichanont, 2011), eWOM (Lee et al., 2011), or the buyers' general personality (Till & Busler, 2000).

It also refers to attitudes and preferences towards a brand or product (Kim et al., 2010; Kim & Ko, 2010; Kim & Lee, 2009). Bredahl (2001) identified brand attitude as the most important determinant of purchase intention. Dick and Basu (1994) proposed that consumer purchase intention increases when consumers are positively affected by a brand due to an emotional association.

The study of factors affecting online purchase intention has been based on many different theories by the authors. Many theoretical models are widely applied in predicting human behavior from a psychosocial point of view. Examples such as Theory of Planned Behavior (TPB), Technology Acceptance Model (TAM), Cognitive Evaluation Theory (CET)... were used to identify which factors influence online purchase intention. These theories have proven to be effective in predicting human behavior in many contexts.

2.3. Self-Determination Theory & Cognitive Evaluation Theory (CET)

Motivation, according to Deci and Ryan (2008), is what drives people to think, act, and grow. Deci and Ryan's study focuses on intrinsic motivation, as well as the conditions

and processes that enhance performance, increase persistence, and facilitate growth. In this study, intrinsic motivation is defined as "performing an activity solely for inherent satisfaction". When a person is intrinsically driven, he or she is energized and enthusiastic about the task at hand, and when it is completed, he or she experiences a sense of satisfaction or fulfillment. The concept of intrinsic motivation can be understood using Deci and Ryan's (1985) Self Determination Theory as a framework (SDT). The source of intrinsic drive, according to SDT, is an innate pattern of development and assimilation.

Although researchers describe intrinsic motivation as an inherent quality, the individual's ability to maintain and increase it is influenced by the social and environmental circumstances in which he or she lives (Ryan & Deci, 2000). Deci and Ryan's Cognitive Evaluation Theory (CET) focuses on the social and environmental elements that help or facilitate intrinsic motivation and identifies three key psychological demands that must be met in order for an individual to be self-motivated. Competence, autonomy, and relatedness are three of these demands. Competence, according to Deci and Ryan (2013), a sense of competence comes from success experiences and overall positive feelings about an activity. When an individual is given a sense of choice, acknowledgement of feelings, or the opportunity for self-direction, feelings of intrinsic satisfaction are increased. People who have a sense of attachment and affiliation with others are said to be related.

This is a psychological theory that aims to explain extrinsic results from intrinsic motivation. CET proposes the concept of "intrinsic incentive", also known as "intrinsic motivation". This theory suggests that people are more inclined to engage in an activity when they have intrinsic motivations such as pleasurable experiences (Agarwal & Karahanna, 2000; Gottschal & Zollo, 2007; Beecham et al., 2008)

By extending aspects of CET to build a framework for the impact of gamification which are the main determinants of consumer enjoyment, creating real incentives to influence commitment brand and purchase intention. Specifically, in this study, it is possible to consider competence, autonomy motivated by factors such as achievement-related features, immersion-related features while relatedness is motivated by social interaction-related features in gamification.

2.4. Research framework and hypotheses

The relationship between gamification and brand engagement.

There are many previous studies demonstrating the positive influence of gamification on brand engagement. The study by Holbrook et al. (1984) laid the groundwork for applying gamification in marketing, also appreciating gamification as a joyful experience that unites customers and brands. The positive influence of gamification on brand engagement is demonstrated by Lucassen and Janse (2014); Summers and Young (2016), Gatautis et al. (2016), Högberg et al. (2019), Xi and Hamari (2020). Immersion-related features are frequently associated with the sensation of expressive freedom (Peters et al., 2018, Wolf et al., 2020), as well as more emotive and affective aspects (e.g. enjoyment, joy, pride, and surprise). As a result, immersion-based gamification can be expected to be connected with increased emotional brand engagement. Badges, challenges, missions, goals, progression

metrics, and other achievement-related features are composed of goal-structures (goal-setting theory, Landers et al., 2017), effort investment (effort justification theory, Baek et al. 2015) and optimizing consumer behavior, etc... Therefore, it's reasonable to suppose that achievement-related features positively influence cognitive brand engagement. Moreover, customers may easily get/share knowledge about the brand from/with others when there are more interactions with social-oriented gamification features such as collaboration and teams, which can boost social capital and drive social brand engagement. (Xi & Hamari, 2019a). Thus, we propose the following three hypotheses:

H1: The interaction with the immersion-related features in gamification has a positive effect on brand engagement.

H2: The interaction with the achievement-related features in gamification has a positive effect on brand engagement.

H3: The interaction with the social interaction-related features in gamification has a positive effect on brand engagement.

The relationship between gamification and online purchase intention

The relationship between gamification and online purchase intention has been studied by scholars. However, there is still no specific conclusion on the direct influence of gamification on purchase intention (Tobon et al., 2020). According to Gajanova and Radišić (2021) gamification as part of sales promotion; has a positive effect on the buying behavior and attitude of customers. Gamification brings a lot of benefits to businesses on e-commerce channels, it helps to retain more customers on e-commerce platforms (Behl, 2020). This statement is also supported García-Jurado (2021), in this study, the elements in gamification have a direct and positive influence on customers shopping on e-commerce platforms. E-commerce sites can also find customers who frequently visit or have visited the website through tools using gamification, which tends to make the products more attractive plus the lowest cost (Jayasingh, 2019). On the other hand, there are a number of scholars who have studied this relationship through the mediating role of intrinsic motivation and most empirical studies points out that gamification positively influences customer's purchase intention (Bittner and Schipper, 2014; Yüksel & Durmaz, 2016; Mucollari & Samokhin, 2017; Dhahak & Huseynov, 2020; Xu et al., 2020; Gajanova & Radišić, 2021). We based on this to propose that:

H4: The interaction with the immersion-related features in gamification has a positive effect on online purchase intention.

H5: The interaction with the achievement-related features in gamification has a positive effect on online purchase intention.

H6: The interaction with the social interaction-related features in gamification has a positive effect on online purchase intention.

The relationship between brand engagement and online purchase intention

The relationship between brand engagement and purchase intention has been extensively studied (Hewett et al., 2002; Algesheimer et al., 2005; Hollebeek, 2011b; Kim

and Ko, 2012). Research by Hewett et al. (2002) suggests that there exists a strong relationship between the quality of the relationship with the brand perceived by buyers and their repurchase intention. Brand engagement is positively related to purchase intention and mediates the relationship between brand personality and purchase intention (Lee et al., 2020). On the other hand, brand engagement also positively affects purchase intention for social media campaigns (Jimenez-Castillo & Sánchez-Fernández, 2019), online communities (Prentice et al., 2019), and brands (Kumar & Nayak, 2019). Recently, a study by Bilal et al. (2021) on the influence of brand engagement on customer's purchase intention with 260 valid samples in Beijing and Shanghai (China) concluded that brand engagement has a direct positive effect on purchase intention, while other engagement factors such as eWOM have an indirect effect. Moreover, brand engagement and consumer interaction can add brand value, which then leads to long-term profits and consumer loyalty to the brand (Goldsmith, 2012). When a certain brand has established its distinctive value, consumers often use products/services from that brand for a variety of reasons, such as being able to create and express their own identity, helping consumers satisfy the purpose of establishing and maintaining social relationships (Haugtvedt et al., 2018). Thus, brand attachment can be expected to positively influence consumers' purchase intention. A further hypothesis can be proposed:

H7: Brand engagement has a positive effect on online purchase intention.

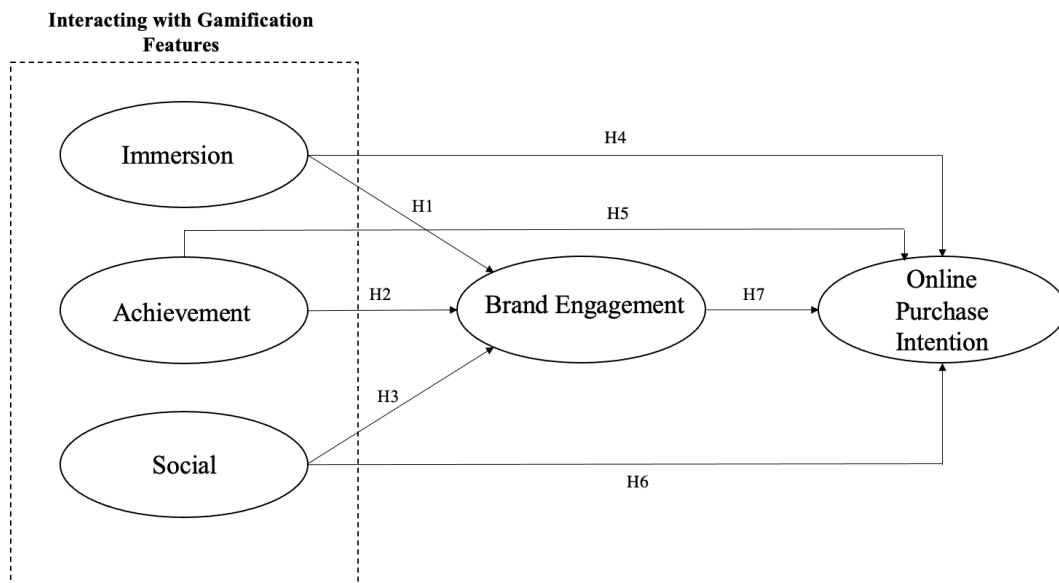

Figure 1. Conceptual model

3. Methods

3.1. Research design

In the first step, the research team designed a preliminary investigation. After consulting with the instructor to ensure the accuracy of the content of the statement, the research team conducted a preliminary survey of a small group of 5 people to check the accuracy and intelligibility of the questionnaire. Since then, the group has adjusted the questionnaire accordingly.

Secondly, after editing and adjusting the questionnaire based on the preliminary survey, the research team then issued a survey with a total of 48 questions. The content of the questionnaire was built with two main parts:

- Part 1: General information (includes questions related to consumer demographics and online shopping habits).

- Part 2: Evaluation questions on how gamification affects consumers' online purchase intention through the intermediary of brand commitment at Vietnamese e-commerce platforms with the form of choosing the level of consent according to Likert scale 5 with 1 - Totally disagree, 2 - Disagree, 3 - Neutral, 4 - Agree, and 5 - Totally agree. Items of Social were adopted from Zhang et al. (2021) to Xi and Hamari (2019b), and we adopted items for Immersion from Willis and Tjhin (2021) to Yee et al. (2006). Items for Achievement were adopted from Suh et al. (2018); Xi and Hamari (2019b); Wang et al.(2017); Bitrián et al. (2021). Items for Brand Engagement were adopted from Xi and Hamari (2020); Willis & Tjhin (2021), Khan et al. (2019), and suggestions by authors. Finally, we adopted items for online purchase intention from Soni and Kuma (2019); Saprikis (2018); Raman (2020); Huang et al., (2017). We collected the data by means of a questionnaire (see Appendix A).

The research team conducted an investigation in Viet Nam with Gen Z consumers as this generation occupies the most potential customer segment, becoming the world's biggest consumer group in the online shopping market. The number of post-screening votes eligible for data entry and analysis is 535 out of a total of 648 votes collected.

3.2. Data analysis techniques

First, the research team analyzes and evaluates the PLS-SEM path model using SmartPLS. The model consists of two elements:

- **The measurement model (also called the outer model)** of the research variables specifies the relationship between the latent variables and the observed variables. It provides information about the measurable attribute of the observed variables (compose reliability, discriminant validity).

- **The structural model (also known as the inner model)** presents research variables that clearly indicate the relationship between latent variables. These relationships can describe theoretical predictions of interest to researchers.

Next, the research team tests the mean between the qualitative variables (with many groups of values to compare) in the research and the quantitative variable Intention to buy. Specifically, the research team performs One-way Anova Test on SPSS 20 to evaluate and compare the difference in purchase intention of Gen Z users on e-commerce apps in Vietnam in different groups, different qualitative values.

4. Results

4.1. One-Way ANOVA Test

The results of *One-Way ANOVA* to test the mean between the qualitative variables (with many value groups for comparison) in the research and the quantitative variable *Intention to buy*.

In terms of gender, the results of the above table show that there is no statistically significant difference in online purchase intention on e-commerce applications of gen Z users in Hanoi of different genders.

In terms of age, the results from the table above show the decreasing level of purchase intention of each age group in the following order: From 26-30 years old (Mean=3.8478); From 18-22 years old (Mean=3.7690); From 22-26 years old (Mean= 3.6471); From 14-18 years old (Mean=3.4110); From 10-14 years old (Mean=3.2059).

In terms of jobs, the results of the above table show that there is no statistically significant difference in online purchase intention on e-commerce applications of gen Z users in Hanoi of different jobs.

In terms of monthly income, the results from the above table show the decreasing level of purchase intention of each monthly income group in the following order: 7–12 million VND (Mean=3.9138); 3–5 million VND (Mean= 3.8893); 5–7 million VND (Mean=3.7639); 1–3 million VND (Mean=3.7374); Over 12 million VND (Mean=3.7250); No income (Mean=3.3626)

In terms of spending on online shopping every month, the results from the table above show the decreasing level of purchase intention of each group of spending on online shopping each month in the following order: From 1,000,000 to 3,000,000 VND (Mean=3.9884); From 500,000 to 1,000,000 VND (Mean=3.7714); Over 3,000,000 VND (Mean=3,50000); Under 500,000 VND (Mean=3.4942).

In terms of shopping habits, the results from the table above show that the decreasing level of purchase intention of shopping habits is in the following order: Frequent online shopping (Mean=3.7074); Always shop online (Mean=3.6078); Search online and go to traditional stores to buy (Mean=3.4307); Buy at traditional stores (Mean=2.8700).

In terms of frequency of accessing e-commerce apps, the results of the above table show that there is no statistically significant difference in online purchase intention on e-commerce applications of gen Z users in Hanoi of different frequencies of accessing e-commerce apps.

In terms of playing games on e-commerce apps, the results of the above table show that there is no statistically significant difference in online purchase intention on e-commerce applications of gen Z users in Hanoi of different frequencies of playing games on e-commerce apps.

In terms of average time using e-commerce apps per day, the results from the table above show the gradual decrease in purchase intention of each group. Average time using e-commerce applications during the day is as follows: 5-7 minutes (Mean=3.7111); Over 15 minutes (Mean=3.6679); 7 - 15 minutes (Mean=3.6622); Under 3 minutes (Mean=3.2115); 3 - 5 minutes (Mean=3.2092).

4.2. Measurement Proposed Research Model Assessment

SmartPLS is one of the leading tools on the problem of applying the PLS method in SEM model estimation, the software also calculates standard results evaluation criteria. Is

software with a graphical user interface for modeling structural equations based on variance using partial least squares path modeling.

The research model is a reflective SEM model. In the outcome measure model, the observed variables are generated by the same research concept (it derives from the same parent), and these observed variables need to be closely related. In addition, the observed variables in the outcome measure are interchangeable, and removing any observed variables from the measure generally does not change the significance of the parent latent variable.

When evaluating the result-type measurement model on SMART PLS, we will focus on the main issues: *Outer loadings (indicators)*, *Cronbach's Alpha*, *Compose reliability*, *Convergence*, and *Discriminant of the scales*.

From previous researches, the research team proposes qualifying thresholds for the criteria in the SEM measurement model analysis:

- Outer Loading > 0.7 (Hair, 2016)
- Cronbach's Alpha \geq 0.7 (DeVellis, 2012)
- Composite Reliability CR \geq 0.7 (Bagozzi & Yi, 1988)
- Average Variance Extracted AVE \geq 0.5 (Hock & Ringle, 2010)

Table 1. Convergent validity and reliability.

Constructs	Items	Outer Loadings	Cronbach's Alpha	rho_A	Compose Reliability	Average Variance Extracted (Ave)
Immersion	NV1	0.762	0.836	0.842	0.890	0.671
	NV2	0.781				
	NV3	0.863				
	NV4	0.683				
	NV5	0.812				
Achievement	TT1	0.677	0.900	0.900	0.930	0.769
	TT2	0.872				
	TT3	0.838				
	TT4	0.853				
	TT5	0.889				
Social	XH1	0.228	0.882	0.888	0.919	0.739
	XH2	0.857				
	XH3	0.895				
	XH4	0.848				
	XH5	0.822				
Brand engagement	CK1	0.669	0.965	0.965	0.968	0.653
	CK2	0.830				

Constructs	Items	Outer Loadings	Cronbach's Alpha	rho_A	Compose Reliability	Average Variance Extracted (Ave)
	CK3	0.850				
	CK4	0.832				
	CK5	0.807				
	CK6	0.807				
	CK7	0.827				
	CK8	0.837				
	CK9	0.794				
	CK10	0.770				
	CK11	0.791				
	CK12	0.793				
	CK13	0.811				
	CK14	0.765				
	CK15	0.803				
	CK16	0.822				
CK17	0.773					
Purchase intention	YD1	0.805	0.900	0.899	0.931	0.771
	YD2	0.907				
	YD3	0.899				
	YD4	0.896				

The result of table 1 shows that the Outer Loadings of the variables CK1, TT1, NV4, XH1 <0.7. Therefore, those variables are removed from the model. The remaining quality criteria were met, as remaining Factor loadings, Cronbach's alpha values, Composite reliability (CR) values, and Average variance extracted (AVE) values were above the recommended thresholds.

In terms of discriminant, Fornell and Larcker (1981) recommend that discriminant is guaranteed when the square root of the AVE for each latent variable is higher than all correlations between the latent variables.

Table 4. Discriminant validity

	CK	TT	NV	XH	YD
CK	0.808				
TT	0.749	0.877			
NV	0.711	0.718	0.819		
XH	0.647	0.547	0.675	0.859	
YD	0.801	0.685	0.621	0.546	0.878

The result from table 1 shows that the numeric part at the top of each key column (square root AVE values (0.808, 0.877, 0.819, 0.859, 0.878) is larger than the numeric part below (correlation between latent variables). Therefore, the discriminant of the model is guaranteed.

4.3 Testing Research Hypothesis

Table 5. Hypothesis Testing

	Hypothesis	Std. Beta	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (O/STDEV)	P Values	Decision
CK -> YD	H7	0.821	0.821	0.042	19.700	0.000	Supported
NV -> CK	H1	0.212	0.213	0.046	4.584	0.000	Supported
NV -> YD	H4	-0.010	-0.011	0.044	0.235	0.814	Not supported
TT -> CK	H2	0.459	0.459	0.039	11.881	0.000	Supported
TT -> YD	H5	0.093	0.093	0.040	2.342	0.019	Supported
XH -> CK	H3	0.252	0.251	0.043	5.897	0.000	Supported
XH -> YD	H6	-0.029	-0.029	0.032	0.882	0.378	Not supported

The research conducted experiments with bootstrapping sample size N = 5000. The results from table 7 show that the research hypotheses H1, H2, H3, H5, H7 have statistical significance and are accepted. The P Values of the remaining effects of H1, H2, H3, H5, H7 are all < 0.05, so the research hypotheses H1, H2, H3, H5, H7 are all statistically significant (p values < 0.05). The Original Sample-standardized effect coefficients of the effects of H1, H2, H3, H5, H7 are all > 0. Therefore, the research hypotheses H1, H2, H3, H5, H7 are accepted.

The level of impact of the independent variables TT, NV, XH on the intermediate variable CK in descending order is as follows: Interaction with achievement feature TT (Beta=0.459), Interaction with social feature XH (Beta=0.252), Interaction with immersion feature NV (Beta=0.212).

5. Discussion and Conclusion

5.1. Findings and implications

The results of the study have shown that of the 3 features of the game, only the achievement feature has an impact on the customer's online shopping intentions, which reflects the fact that when participating in the game application users will enjoy the achievements they achieve through bonus points, this reflects the fact that when participating in game applications users will enjoy the achievements they achieve through bonus points, voucher... these are gifts that can be used to shop right at those e-commerce platforms because most people have a pragmatic mindset, only do things that benefit them and the gifts they receive when playing games will help them buy cheaper, even free.

The results of this study addressed the team's research goal of looking at the impact of gamification on consumers' online purchasing intentions. It also supports some previous studies by Dhahak & Huseynov (2020), Haziri (2021).

Therefore, the implication here is that game creators need to develop more and more game achievement features that match the context, drive and stimulate customer purchase intention. when shopping online at e-commerce platforms.

Secondly, although the study results indicate that immersion and social features do not impact online purchasing intent, these two features have an impact on brand engagement. The results of the study show that brand engagement has a favorable impact on online purchasing intentions. Therefore, the emphasis is that interaction with immersion features and social features has no direct effect on online purchasing intent, so it is necessary to rely on brand engagement as intermediaries. With brand engagement having a great influence on purchasing intent, it's important to know which size is greatest in shaping the brand interaction variable itself, in this case the social aspect.

Previous research has shown that brand engagement has no direct impact on purchasing intent but through brand equity (Verma, 2021). Through experimental research, the authors have demonstrated that brand commitment has a direct impact on purchasing intentions. This demonstrates that the greater the customer's brand commitment, the more intent is to spend on the brand. This conclusion agrees with research by Hewett, Money and Sharma (2002); Algesheimer et al (2005); Erdoğan & Tatar (2015); Bilal et al. (2021) on the impact of brand engagement on online purchasing intent. The results of this study addressed the team's research goal of looking at the impact of gamification on consumers' online purchasing intentions and answering research question 5.

Thus, it is advisable for brands to increase the customer service experience to increase purchasing intentions.

5.2. Limitations and suggestions for Further Studies

The limitation of this study belongs to the sample of the study. Although selected by a convenient method, although the team has tried to take it across The Vietnamese scale, including a variety of ages, occupations, incomes, and frequency of use of e-commerce platforms, the sample may not necessarily meet the requirements for representation and generality because the number of study samples is predominantly female (87.66%) and most use only Shopee e-commerce platforms.

Proposals for further studies

Firstly, further research is needed to continue to build and perfect the scales.

Secondly, since this study has only stopped at studying the impact on Gen Z, the latter study could expand the research unit, looking at a variety of ages to ensure the objectivity of the conclusions made.

5.2. Conclusion

The results of the article's research indicate a positive relationship between gamification and consumers' online purchasing intentions through an intermediary role of brand engagement. It refers to gamification's same-sided relationship to brand engagement while assessing that this factor also has a positive impact on online purchasing intentions. As such, it can be seen that the application of gamification will increase the commitment

and cohesion between the brand and customers, thereby leading to innovation in a positive way and increasing consumers' online purchasing intentions on e-commerce platforms.

With the results obtained, the study gives e-commerce platforms in Vietnam, researchers, and economists an overview of the relationship between gamification and consumers' online purchasing intentions. Therefore, encouraging e-commerce enterprises and the state to come up with practical plans to maximize the role of gamification to increase customer purchases, promotes the development of e-commerce enterprises in the context of modernization today.

Abstract

This research explores the impacts of augmented reality (AR) technology on the security and convenience level of e-commerce platforms in Vietnam. The research's results show that factors of AR technology including Vividness, Novelty, Reality congruence, Quality of information system, Interactivity, Product information all affect the security and convenience level of e-commerce platforms. Based on these results, this research makes some recommendations to help businesses in e-commerce platforms develop their sales tools of AR technology.

Keywords: *augmented reality, AR, security*

1. Introduction

Online marketing in the 4.0 era will no longer be traditional marketing. Consumers are increasingly demanding and wanting more when shopping online. So AR was born as a matter of course. Google's 2019 AR survey shows that 66% of consumers use AR before making a purchase intention. Besides, according to STATISTA, by 2022, the AR augmented reality market's size will increase sharply to 12.85 billion USD, a growth rate 1.3 times larger than in 2021. This is also a sign that predicts the explosion of the market. AR technology for the marketing industry for brands, as well as supporting the online shopping market and increasing customer experience. The challenge for brands is whether AR technology is really relevant and competitive to draw consumers' attention to their products?

Therefore, this study was born in the context of the strong development of the 4.0 era, as well as the gradual application of AR technology in Vietnam, the Covid 19 pandemic has caused a sharp increase in the demand for online shopping, in order to improve the quality of life. more clearly the impact of AR on marketing in the business as well as on the safe and convenient experience of customers when shopping online.

2. Method

2.1. Theoretical basis

According to Hilken et al., 2018; Javornik, 2016, AR provides a rich product experience that makes it easy for consumers to visualize the product, such as recreating the product with the same parameters as a real-life product, providing a visual interaction for the user before the buying product.

In addition to the utility of AR in online shopping, it brings safety and reliability to users, according to Hsu Liu. F, 2014, augmented reality technology also reduces risk factors, and system error rates. This ensures the safety, builds the trust of users when using AR, for the sake of information security, avoids the right to access user information (Poushneh. A, 2016). At the same time, the safety level of AR is reflected in the accuracy of product images, helping users to trust the product quality before making a purchasing decision.

2.2. The research model proposes that

The research team selects and develops a research model as shown in Figure 2.7 below. In which, the attached hypotheses are stated related to each specific factor:

- The group of dependent variables includes: Safeness, Media usefulness
- The group of independent variables includes: Vividness, Novelty, Reality congruence, System quality, Interactivity, Product informativeness.

More specifically, the research model is presented as follows:

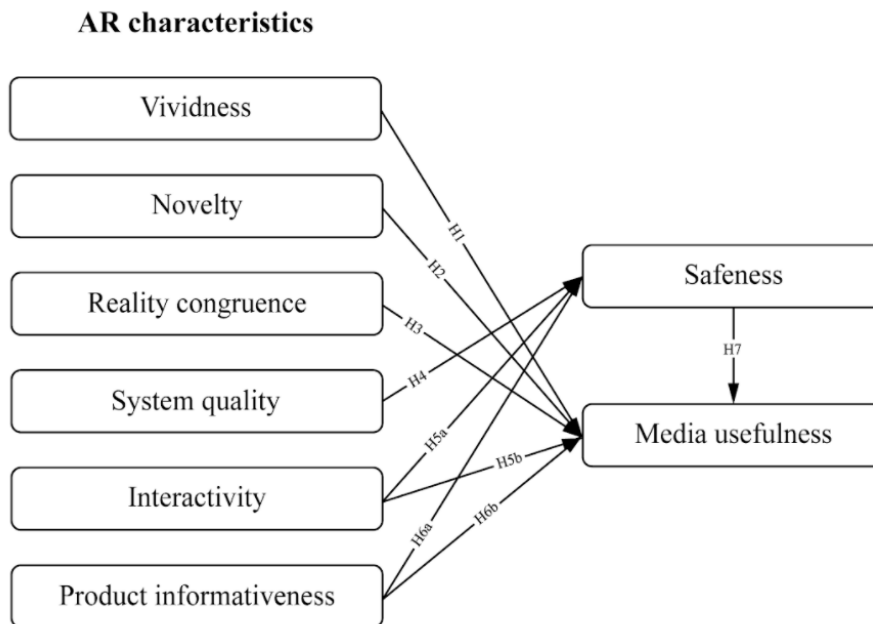

Figure 1. Research model

Source: Proposed Research Team, 2022

The research hypotheses are posed as follows:

H1. Vividness positively affects Media usefulness.

H2. Novelty positively affects Media usefulness.

H3. Reality congruence positively affects Media usefulness.

H4. System quality positively affects security and safety.

H5a. Interactivity positively affects security.

H5b. Interactivity positively affects utility levels.

H6a. Product informativeness positively affects security.

H6b. Product informativeness positively affects utility level.

2.3. Research Methods

In this study, the authors used two methods of quantitative research and qualitative research. In the qualitative research, the authors conducted in-depth interviews with 10 random users who knew/don't know about AR technology. Sampling survey method was conducted on 500 questionnaires and collected 468 survey votes Invalid. The authors conducted analysis of the linear structural model (SEM) and bootstrap to determine the influence level of each factor and test the hypothesis.

3. Results

Tested by linear structural analysis (SEM) method.

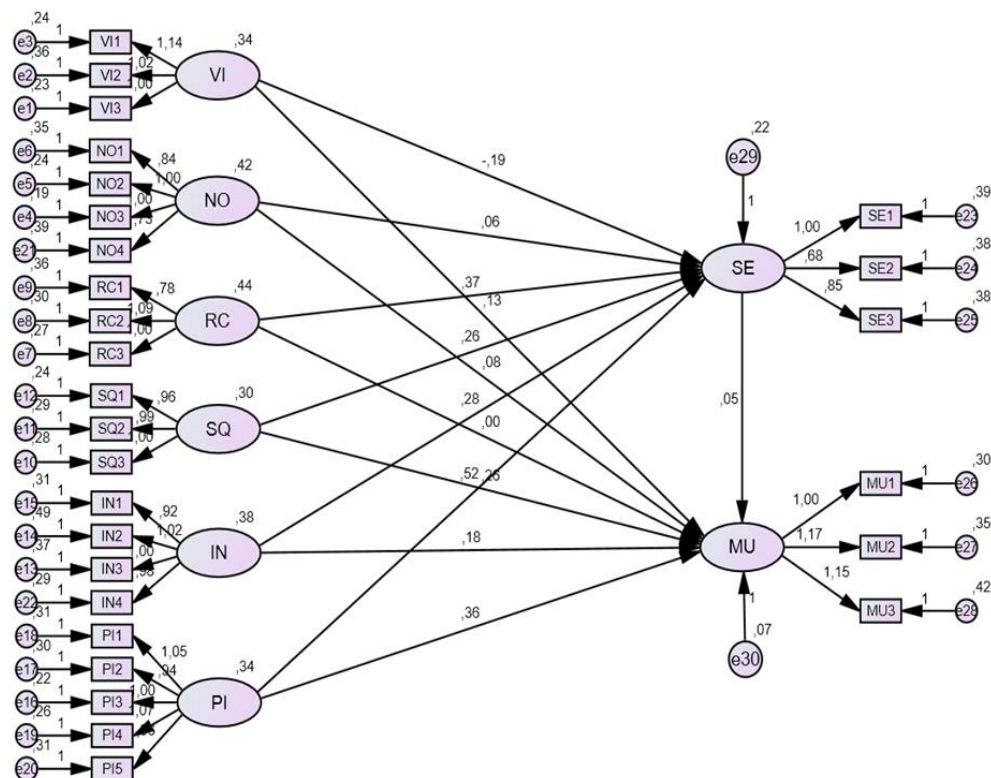

Figure 2. SEM results of the theoretical model

Source: Research team results (2022)

It can be seen that, with the SEM analysis results, the authors found that the model has a CMIN/df value of $2.032 < 3$, at the same time, GFI index = $0.872 > 0.8$; CFI = $0.932 > 0.9$; RMSEA = $0.055 < 0.08$ satisfactory. The data run results show that the model is compatible with market data.

Table 1. Unstandardized weight table

			Estimate	S.E.	C.R.	P	Label
SE	←	SQ	,258	,076	3,383	***	
SE	←	PI	,518	,074	6,962	***	
SE	←	IN	,283	,067	4,206	***	
SE	←	VI	-,194	,069	-2,823	,005	
SE	←	NO	,058	,060	,964	,335	
SE	←	RC	,374	,065	5,750	***	
MU	←	VI	,130	,048	2,714	,007	
MU	←	NO	,077	,040	1,947	,052	
MU	←	RC	,004	,049	,073	,942	
MU	←	IN	,175	,050	3,496	***	
MU	←	PI	,360	,067	5,401	***	
MU	←	SQ	,256	,058	4,397	***	
MU	←	SE	,048	,071	,673	,501	

Source: Research team results, 2022 Unnormalized

The weight table shows the P-values of the variables “System quality”, “Interactivity” and “Product informativeness” are both less than 0.05; should have an effect on the dependent variable “Security”. Thus, the authors accept the hypothesis H4, H5a, H6a.

Besides, the P-value of the two variables "Novelty" and "Safeness" is 0.335 and 0.501, respectively, which are greater than 0.05; Therefore, the two variables “Novelty” and “Safeness” do not show an influence on the dependent variable “Utilities”. The other independent variables are “Vividness”, “Reality congruence”, “Interactivity” and “Product informativeness” all have P-values less than 0.05; Therefore, it is possible to show the influence on the dependent variable "Media usefulness". Thus, the authors reject hypothesis H2, H7 and accept hypothesis H1, H3, H5b, H6b.

Table 2. Normalized Weight Table

Dependent		Variable	Estimate
SE	←	SQ (Information System Quality)	.215
SE	←	PI (Product Information)	.445
SE	←	IN (Experience Interoperability)	.266
MU	←	VI (Vivid)	.186
MU	←	RC (Actual Similarity)	.006
MU	←	IN (Experience Interoperability)	.226
MU	←	PI (Product Information)	.513

Source: Group Results Research, 2022

The standardized regression coefficient table shows that the impact level of “Product informativeness” on “Safeness” is 0.445, the largest of the three factors affecting “Safeness”. The factors "Interactivity of experience" and "Quality of information system" have an impact level of 0.226 and 0.215, respectively, on the variable "System quality".

Among the four factors affecting the variable "Media usefulness", the level of impact of "Product informativeness" is the largest with a coefficient of 0.513. The remaining three factors, "Interactivity", "Vividness" and "Reality congruence" have a decreasing impact afterwards with impact coefficients of 0.226, 0.186 and 0.006 respectively.

Table 3. Table of squares of correlations

	Estimate
Security	.499
Convenience level	.565

Source: Research team results, 2022

The R-squared value of the variable “Safeness” is 0.499 = 49.9%, so independent variables affect 49.9% of variation of “Safeness”. The R-squared value of “Media usefulness” is 0.565 = 56.5%, so the independent variables affect 56.5% of the variation of “Media usefulness”.

Table 4. Comparison table of model coefficients Variability and Invariance of the variable Gender

	Chi-square	df
Invariant	2160,497	687
Variability	2145,101	674
Difference	15,396	13

We can see the Chi-square coefficients of the two models. variable and invariant are different, so the Research Team will take the results from the Variability model for multi-group analysis for the variable "Gender".

Table 5. Results of multigroup structural analysis for the variable Gender

			Male		Female	
			Standardized Regression Weights	P-value	Standardized Regression Weights	P-value
SE	←	SQ	.190	.217 ,	.010	.041

Multiple Correlations (SE)			.620 ,		.620 ,	
Squared Multiple Correlations (MU)			.753			

Source: Research team results, 2022

For the relationships related to the independent variable “Safeness”, the analysis results are as follows:

- In both male and female respondents, “System quality” has an impact on “Safeness”, but with female respondents, the impact is stronger than that of men (standardized impact coefficient of female is higher than that of male $0.217 > 0.190$).

- In both male and female respondents, “Product informativeness” has an impact on “Safeness”, but for male respondents, the effect is much stronger than that of female respondents (standardized impact coefficient for men is high. than female $0.635 > 0.294$).

- In both male and female respondents, “Interactivity” has an impact on “Safeness”, but for female respondents, the effect is stronger than that of men (the standardized impact coefficient for women is higher than that of male respondents). $0.321 > 0.251$).

In general, in relation to “Safeness” in Augmented Reality (AR), there is not much difference between men and women. So the Research Team came to the conclusion that: It is possible to focus on Marketing for both male and female audiences in the "Safeness" of Augmented Reality Technology.

But for the relationships related to the independent variable "Media usefulness", the results of multigroup analysis are slightly different from the variable "Safeness":

- For male respondents, "Vividness" There is no effect on “Media usefulness” (due to P-value > 0.05) but for female respondents there is this effect.

- In both male and female respondents, there is no impact from “Reality congruence” to “Media usefulness”.

- For male respondents, “Interactivity” had no impact on “Media usefulness” (due to P-value > 0.05) but for female respondents, this effect was found.

- For male respondents, “Product informativeness” has no effect on “Media usefulness” (due to P-value > 0.05) but for female respondents there is this effect.

In general, in the relationships involving the independent variable "Media usefulness", women will have an impact on these relationships and men will not. Therefore, the Study Team concludes that: Marketing investment in the “Media usefulness” of AR technology should be more for women than for men

4. Discussion and Conclusion

On the basis of research model and data obtained with 351 respondents (out of 500 respondents, 351 respondents know about AR technology, accounting for 70.2%, 149 respondents do not know about AR technology, 149 respondents do not know about AR technology. AR technology accounts for 29.8%), it can be seen that although the level of technology awareness has increased in the year 2021 - 2022. The authors can draw some conclusions on hypotheses about influencing factors. to the security, safety and convenience level of consumers when shopping on online sales platforms as follows:

Firstly, Novelty (H2) has no impact on the Media usefulness of AR. The results show that consumers consider novelty to feel Novelty is only a small factor to attract attention to sales platforms using enhanced technology. This reinforces the limitations of previous studies that use Novelty to enhance the utility of media in the shopping experience and

purchase decision (Bezjian-Avery, Calder and Iacobucci 1998) ; Childers et al. 2001; Van Noort, Voorveld and van Reijmersdal 2012).

Second, rejecting the hypothesis that Safeness (H7) has a direct impact on Media usefulness when experiencing augmented reality technology in users' shopping activities.

Third, the Safeness is strongly influenced by the factors of System quality (H4), Interactivity (H5a) and Product informativeness (H6a). Accepted hypothesis showing a positive effect from Consumer Acknowledged Information Systems Quality, adding a new AR-enabled feature to existing sales platforms will likely lead to theft data or being attacked by groups of bad actors in order to profit from the business's entire system of sales stalling.

Fourth, the Vividness (H1) and Reality congruence (H3) factors have a direct positive impact on the Media usefulness. The author's research has shown more clearly and deeply this impact on a specific field than online sales platforms in Vietnam. Vividness is one of the key factors that sets AR technology apart by allowing users to realize what their fantasies will look like in reality.

Fifth, Interactivity (H5b) and Product informativeness (H6b) also have a strong impact on Media usefulness. Accordingly, the experiential interactivity directly affects the UX and helps the sales platforms to optimize the design interface, thereby providing an enjoyable but simple and convenient shopping experience.

However, there are still some concerns because AR technology is also a design product, consumers worry about accuracy and brands make their product images too beautiful. difference with the actual product to attract buyers.

Based on the above results, the research team makes a number of recommendations to improve and enhance the utility level as well as assess the security of ARAR technology in promoting, introducing products and selling on websites. online platform as follows:

For businesses

Designing an identity through AR

The introduction of AR technology into product introduction activities helps product information such as: model, design, color, etc. to be truer and clearer, and to solve problems. Image and video problems are not enough for customers to evaluate product quality. The research on consumer behavior of customers to design convenient and smart AR interfaces instead of hiring small units to design traditional, lack of creativity. In order to bring high efficiency and attract consumers, businesses need to diversify their application types (scanning AR products directly, playing sound through scanning AR, applying AR to many Gamification activities. than). Businesses should quickly learn and develop AR tools for their platforms before this technology is widely applied in Vietnam and consumers will partly lose interest in brand communication.

Optimizing security

Customers find it more convenient and safer to use augmented reality than traditional visual purchases when they receive a branded product. When brands decide to use augmented reality to market their products, they need to focus on optimizing features and improving user safety, not just investing in devices. Fresh and lively interface design.

Implementation of the communication

Bringing a new technology into the product introduction does not immediately make a mark on the business, brands need to include these new features in a specific marketing and sales plan. possible to increase engagement (recognition) for the product. AR is a tool to support communication and to achieve the best results, brands need to optimize augmented reality in parallel with other marketing activities.

✚ For E-commerce

E-commerce platforms selling online are currently updating and learning about typical AR technology like Shopee. Applying AR technology in online product marketing will increase a distinct competitive advantage for these online shopping platforms to attract and retain brands and retailers that open stores on e-commerce platforms. this death. AR also helps e-commerce floors control product information, making information more secure. Thanks to the advantage of shortening the distance between the real and virtual worlds of AR, it can be an interesting utility solution to increase the shopping experience of customers when they are too bored with traditional sales interfaces. Currently in Vietnam, augmented reality technology has not been widely applied.

Abstract

This study aims to determine the factors affecting the young's impulse buying behavior on e-commerce platforms for cosmetic products. Based on the findings of previous studies, we examine the influence of factors including the platform's ease of use, impulsiveness, scarcity, visual appeal, user-generated content, and pleasure when shopping. Besides, the study will quantitatively test the relationship between user-generated content and impulse buying behavior. By applying the stimulus-organism-response model (SOR Model), we will examine and clarify the role of mediators, namely "Pleasure when shopping" on impulsive buying. Finally, this research demonstrates that impulsiveness, scarcity, visual appeal, and user-generated content positively impact impulse buying behavior through an intermediary factor called Pleasure.

Keywords: *Cosmetics, e-commerce, impulse buying, the young*

1. Introduction

Impulsive buying, or the tendency to buy goods and services without planning, is known as the heart of marketing strategies (Rook, 1987). Researches on the impulse buying behavior of consumers have received particular attention from experts because of its importance both in practice and in theory. The study conducted in 1980 by Bellinger and Korgaonkar indicated that impulse purchases accounted for 27% to 62% of a store's sales. Even nine out of ten people make regular impulse purchases (Welles, 1986).

The development of science, engineering, and digital technology in recent years has led to an increasing number of online shoppers in Vietnam. According to the Vietnam E-commerce and Digital Economy Agency (iDEA) (belonging to the Ministry of Industry and Trade), 44.8 million people participated in online purchases in 2019, accounting for more

than 46.6% of the country's population. In addition, the value of goods purchased online reached USD 225 per person, up 11.2% over the same period last year.

Due to capturing new consumer trends, studies on impulse buying gradually focus on customer behavior on e-commerce platforms. These researches consider stimulus factors from both the consumer's internal and external environment and their influences on customers' online impulse buying behavior. Internal stimuli include mood when shopping (Ahmad, 2019), trust in online platforms (Verhagen and Dolen, 2011), and impulsiveness (Welles et al., 2011). External stimuli must be mentioned, such as price, quality of goods, and product layout (Beatty and Ferrell, 1998; Salman and Fellow, 2014). For online purchases, there are also website quality, ease of use, interface, and content (Welles et al., 2011; Liu et al., 2013; Floh and Madlberger, 2013; Hamma et al., 2019). The most noticeable was that in 2021, a qualitative study by Djafarova and Bowes indicated that user-generated content (UGC) was one of the significant factors influencing the impulse buying behavior of consumers. However, studies on impulse purchases in Vietnam are limited in both quantity and quality.

It can be said that this study is one of the first analyses in Vietnam on the online impulse buying behavior of the young for a specific category, namely cosmetics. It is also considered one of the first to examine quantitative research on the influence of user-generated content on impulsive buying.

Theoretical framework

The study was based on the stimulus-organism-response (S-O-R) theory developed by Mehrabian and Russell (1974). The S-O-R model describes that factors from the shopping environment will lead to buyer's behavior. Specifically, one or more stimuli (S) from spaces on shopping websites affect individual emotions (O), leading to buyer's reactions, including a desire to approach or avoid (R). Thus, the emotional states of the organism (the buyer) act as mediators between the stimuli and the customer's behavior.

Figure 1. Mehrabian and Russell's psychological environment model (1974)

Source: Mehrabian and Russell (1974)

According to Chan et al. (2017), the S-O-R model is the most popular one applied to research on impulse buying behavior. A large number of previous studies have also shown a relationship between the stimulus from the shopping service environment and the buying behavior of consumers (Ezeh and Harris, 2007). Based on the model of Mehrabian and Russell (1974), studies repeatedly confirm that impulse buying behavior is significantly influenced by stimuli from the shopping space, with the mediating factor that is the buyer's emotions. (Khalifa and Shen, 2007; Parboteeah et al., 2009; Verhagen and Dolen, 2011; Floh and Madlberger, 2013; Liu et al., 2013; Chen and Yao, 2018)

Impulse buying

The first definition of impulse buying is a purchase that is unplanned, it was first introduced by DuPont Consumer Buying Habits Studies (Rook, 1987). Then, Hawkins Stern (1962) also defined impulse buying as any buying activity carried out without prior planning. Meanwhile, Rook and Hoch (1985) paid attention to two aspects of behavior, namely the perception and emotion of shoppers.

In 1991, Francis Piron gave a relatively complete definition after synthesizing the previous theories: Impulse buying is spontaneous purchase behavior that occurs without prior preparation. It results from a complex psychological process when the buyer is exposed to external stimuli. After the buyer has made a purchase, cognitive and emotional processes can still occur.

Therefore, the four most important characteristics of impulse purchasing can be summarized, including (1) the purchase behavior that is beyond the original plan, (2) occurring when buyers are affected by stimuli, leading to complex psychological developments that prompt them to purchase, (3) the act that is spontaneous and performed on the spot, and (4) this is an emotional-oriented behavior.

Model and hypotheses

This study was based on the S-O-R model and theoretical basis to develop the research model. In which, the emotional factor, “shopping enjoyment”, acts as a mediator for the relationship between the factors that stimulate impulse buying behavior.

Figure 2. Proposed research model

Source: Suggested by the authors

According to Davis (1985), ease of use is the level at which an individual believes that using a particular information system does not require physical and mental capabilities. Using and making transactions easily on the online platform can help consumers optimize purchases, so they can enjoy the pleasure of choosing and ordering products and services (Jung and Chung, 2015). In a study on consumer behavior using the S-O-R model of Lee et al. (2011), the authors demonstrated that ease of access positively affects consumer’s

happiness. Similarly, Manganari et al. (2011) and Chen and Yao (2018) also mentioned that the higher the website's ease of use was, the greater the ability to create positive emotions for shoppers was, increasing their delight and shopping needs. Thanks to the previous studies, the research team came up with hypothesis H1, specifically as follows:

H1: The ease of use of the platform has a positive effect on pleasure when shopping.

Consumers are considered impulsive when shopping if they have both of the following tendencies: (1) having a natural urge to make an immediate purchase, and (2) rarely evaluating themselves the consequences of making a purchase (Beatty, 1998). Miao (2011) showed the influence of impulsiveness on buyers' emotions which was shopping enjoyment. Next, Ahmad et al. (2019) demonstrated that impulsiveness made a great contribution to the pleasure when shopping, thereby influencing the impulse buying behavior of consumers. Based on the above statements, we gave the following hypothesis H2:

H2: Impulsiveness positively affects pleasure when shopping.

According to Gierl et al., 2008, the scantiness of products and services can be expressed through a limit on quantity or time. Via an empirical study, Lee and Park (2022) demonstrated that scarcity positively affected happiness when shopping. Information about shortages increases consumer interest (Chen and Yao, 2018; Song et al., 2015). When clients get their hands on a product before it runs out of stock, they feel it is an achievement, which lifts their mood (Aggarwal et al., 2011). Therefore, hypothesis H3 was given.

H3: Scarcity has a positive effect on pleasure when shopping

Daugherty et al. (2008) defined UGC as online media content created, initiated, transmitted, and used by the public. Research by Koo and Ju (2010) also indicated a positive relationship between the frequency and quality of the information provided by people who had used products and services with positive emotions in experiencing and making product-related decisions. Therefore, we presented the following hypothesis H4.

H4: User-generated content has a positive effect on pleasure when shopping.

According to Nadkarni (2007), visual appeal is the graphic elements, design layout, or fonts of a website to enhance consumers' attraction. According to Parboteeah et al. (2009), different levels of website attraction will stimulate users' perceptions and emotions. Visual appeal plays a vital role in creating a sense of attraction and pleasure for buyers (Chowdhury et al., 2014). From the above statements, we came up with the hypothesis H5:

H5: Visual appeal positively affects pleasure when shopping.

Enjoyment when shopping is a positive emotion such as happiness, satisfaction, or delight with the experience received from the store's space (Adelaar et al., 2003; Khalifa and Shen, 2007; Chen et al., 2020). Shen and Khalifa, 2012; Lee and Yi, 2008 and Chen et al., 2020 suggested that the consumer's excited response to stimuli from the shopping environment could lead to impulse buying behavior. Based on the acknowledgments of previous studies, the authors put forward the following hypothesis H6:

H6: Pleasure when shopping positively influences online impulse buying.

2. Method

Research method

The study was carried out with two main methods: qualitative and quantitative methods.

For the qualitative research method, the research team conducted in-depth interviews with 11 subjects to verify the original model and adjust the scale for the first time.

With the quantitative research method, quantitative data was collected by distributing online questionnaires to young consumers aged 15 to under 30 years living in Hanoi City. The research team obtained 450 answer sheets with 440 valid ones. Besides, SPSS 20.0 and AMOS 20.0 software were used to analyze quantitative data.

Measure

The scale to measure the factors affecting impulse buying behavior in the scope of this study was based on research background in the world and translated from English to Vietnamese by the authors to match the research in Vietnam and keep the original scale. The study also used a 5-point Likert scale, from point 1: “Strongly disagree” to point 5: “Strongly agree.” Scales for measuring factors include the scale of ease of use (Gefen and Straub, 2005), the scale of impulsiveness (Rook and Fisher, 1995), the scale of scarcity (Wu et al., 2011), the scale of user-generated content (Sethna et al., 2017), the scale of visual appeal (Loiacono et al., 2007), the scale of enjoyment when shopping (Chen et al., 2020), and the scale of impulsive buying behavior (Beatty and Ferrell, 1998).

3. Results

Sample

The survey was conducted by distributing online questionnaires and received 450 responses. After screening, we performed data analysis on 440 valid responses. With the collected research sample, the survey subjects are mainly young people aged 15 to 25 years old studying at universities and colleges. Their income is not high and is under 5 million VND per month. More than 96% of survey respondents use the Internet quite well, and they spend more than 4 hours a day using the Internet. This is a condition for impulsive buying behavior. They said that they had made a purchase recently, and the platform they used the most was Shopee. While surfing the Internet, they occasionally came across information about cosmetics (both actively and passively) and stopped to read it.

Measure the reliability of the scale

Based on the method of analyzing the scale’s reliability by Cronbach’s alpha, the research team removed the observed variable IM7 in the scale of spontaneity. The remaining observed variables gave the indexes that met the standards of Cronbach’s alpha and were above 0.7, which was a great level.

The results of exploratory factor analysis EFA

Because there were 35 observed variables accepted after analyzing the scale’s reliability using Cronbach’s alpha, the research team continued to investigate the exploratory factor EFA. In this step, the rotated factor matrix provided seven groups of factors, which coincided with the original model proposed. Besides, the indicators in the analysis were

positive. The KMO value was 0.923. The Sig. of Bartlett's test was 0.000, and the total variance explained was 61.5%. It can be stated that the exploratory factor analysis has confirmed the reliability and representativeness of the scale.

The results of confirmatory factor analysis (CFA)

In this study, the research team conducted a CFA analysis for factors appearing in the model to test the directionality, the convergent validity, and discrimination among research concepts. The results showed that the standardized regression coefficients of all variables were more than 0.5, and the model achieved convergent validity. Moreover, the model was accepted with research data because its indexes were satisfied and ranged from acceptable to good levels. The observed variables representing the factors had a p-value of 0.000, demonstrating the ability to represent the factors well in the CFA model.

The results of the structural equation modeling (SEM)

The result was quite good by testing the structural equation modeling (SEM). All indicators were in the range from acceptable to good degrees. The criteria of the model's suitability were satisfactory, with GFI = 0.852; CFI = 0.917 > 0.9; and RMSEA = 0.058 (< 0.08), It can be concluded that the research model completely satisfies and fits the market data. Through analysis, 5 out of 6 factors proposed in the research model have a positive impact on the change of impulse buying behavior for cosmetic products, which means that 5 out of 6 hypotheses put forth by the research team are appropriate.

Table 3. Summarizing research results

Hypothesis	Relationship	Result
H1	The ease of use of the platform has a positive effect on pleasure when shopping	Rejected
H2	Impulsiveness positively affects pleasure when shopping.	Accepted
H3	Scarcity has a positive effect on pleasure when shopping	Accepted
H4	<i>User-generated content has a positive effect on pleasure when shopping</i>	Accepted
H5	<i>Visual appeal positively affects pleasure when shopping</i>	Accepted
H6	<i>Pleasure when shopping positively influences online impulse buying.</i>	Accepted

Source: Calculated based on surveys by authors

4. Discussion and Conclusion

4.1. Discussion

Firstly, we agree with the results of Verhagen and Dolen (2011) because the study demonstrated that the ease of use of the platform doesn't affect the pleasure when shopping. The findings of Liu et al. (2013) also show that the website's ease of access has no relationship with instant customer satisfaction. Nowadays, Internet proficiency has become a crucial skill, so consumers are no longer stimulated to form emotions by the reachability of the web quickly while shopping.

Secondly, impulsiveness plays a crucial part in creating pleasure when shopping. This hypothesis is accepted by many other studies as researchers have found a relationship between customer impulsivity and high arousal as well as more positive feelings (Rook, 1987; Rook and Gardner, 1993; Weiberg and Gottwald, 1982).

Thirdly, findings have shown that perception of the scarcity of products and services positively impacts pleasure when shopping. Cook and Yurchisin (2017) explained that sensing a product's shortage would increase customers' perception of its value. In the in-depth interview, the interviewees said that the scarcity made them feel the product was valuable, and they were delighted because there was a chance to possess it.

Fourthly, user-generated content is indispensable in creating pleasure when shopping. Kennell and Rushton (2015) examined this relationship and attained a positive finding. He found that consumers often loved UGC and considered it a useful reference source. In some cases, even though the opinions provided by users were incredibly subjective, readers still expressed preferences. They especially appreciated content created voluntarily and not influenced by any third party such as a producer or distributor (according to Kennell and Rushton, 2015).

Fifthly, the visual appeal contributes to pleasure when purchasing. This result coincides with the previous study carried out by Parboteeah et al. (2009), who have suggested that a website's characteristics significantly influence users' emotions and moods. Research by Dion et al. (1971) and a study by Liu et al. (2013) indicated that users would have more sympathy for products if their images were beautiful and attractive.

Lastly, results have shown that pleasure when shopping substantially impacts impulse buying behavior. This finding is consistent with previous studies by Jarvenpaa and Todd (1997) and Eighmey (1997), Koufaris (2002), Lee and Yi (2008), and Shen and Khalifa (2012). All of them manifest that customers' pleasure in online shopping can lift the purchasing capacity and encourage them to buy more than they have intended.

4.2. Conclusion

Via the findings, we target three stakeholders to make recommendations to suit their goals and interests. Firstly, e-commerce platform developers need to improve the designs and features. Specifically, they should enhance platforms so that users can make contributions. The development of algorithms that support users as well as data analysis to give them shopping suggestions should be paid more attention to. Secondly, for online sellers, product quality is considered the top factor for customer retention. Developing a sales plan based on factors encouraging buyers, such as visual factors, is necessary. Moreover, it's great for store owners to care about customer service and their experience to provide the services carefully. Finally, it's about consumers. They should think about and prepare a shopping plan based on their needs and budget to choose the most suitable items. It is advisable to consider the store's reputation in particular and the e-commerce platform in general to limit the risks of poor product quality and experience.

Besides the valuable contributions in terms of theory and practice, there are some limitations in this study. Because it was conducted in a short time with the primary sampling

method, the sample's representativeness hasn't been high and hasn't shown the behavioral characteristics of consumers for a long time. Moreover, this research only deals with quantity scarcity and ignores time restrictions, so further studies can focus on the influence of scantiness to impulse buying behavior.

Abstract

The explosion of the technological revolution has brought many benefits to people. With an increasingly large scale, the technological revolution has created countless business opportunities, the most prominent of which is doing business on the e-commerce platform Shopee. Therefore, firms as well as individuals are tending to choose to sell goods online through the Shopee e-commerce platform instead of opening a physical store like the traditional one. This study aims to determine the motivation of individuals to participate in selling on Shopee in the context of the digital economy in Vietnam. The research uses qualitative research method as the main, combined with desk method and analytical method to achieve the research purpose. The results show that income is the driving force that has the strongest impact on individuals' decisions when participating in selling on the Shopee e-commerce platform. After discussing, some recommendations were proposed based on the research results for specific target groups.

Keywords: *E-commerce, Sellers, Sharing economy, Shopee*

1. Introduction

Appearing in the mid-twentieth century, the scientific-technological revolution is a vital contemporary milestone. Along with the industrial revolution 4.0 as well as the rise of the digital economy, the sharing economy model is also growing. With an increasingly large and extensive scale, the scientific - technological revolution has brought about technical and

technological inventions that have a direct impact on people's lives in many fields such as culture and society, health, education, especially the economy. The scientific - technological revolution, especially today when the industrial revolution 4.0 is on the rise, gradually takes people out of the direct production process, turning them into real creative subjects, creating a new material premise and productive force for a new economy, bringing humanity to a new stage of development with different names such as knowledge economy, information society, knowledge society, also known as the digital economy. The explosion of the technological revolution has brought many conveniences, benefits to humans. With its growing scale, the technological revolution has created countless business opportunities, prominent among them are doing business on e-commerce platforms, especially Shopee. It can be easily seen that e-commerce, especially Shopee, have been taking advantage of the benefits of the sharing economy model. Shopee is one of the largest e-commerce platforms in Vietnam, in the field of consumer goods of the sharing economy system, allowing users to buy and sell items through their interface and support the transportation of goods to wherever they want. Applying the advantages of the sharing economy model, more and more businesses and individuals participate in selling on Shopee. Although, recently, Shopee has expanded into the B2C model with Shopee Mall, the C2C model is still the main model that they focus on developing. This model has helped Shopee build a huge network, connecting buyers and sellers. These utilities have created a strong motivation for individuals to participate in selling on Shopee. The explosion of the technological revolution has brought many benefits to people. With its growing scale, the technological revolution has created countless business opportunities, prominent among them is doing business on e-commerce platforms, especially Shopee. Therefore, businesses as well as individuals are tending to choose to sell online through the Shopee e-commerce platform instead of opening a physical store like the traditional one. As a result, from a specific perspective, the motivation for individuals to participate in the sharing economy model and the motivation for individuals to participate in e-commerce also have an intersection. Florian et al. (2016) have pointed out 24 motivations for individuals to join the sharing economy in terms of both buyers and sellers (Hawlitschek, Florian; Teubner, Timm; Gimpel, Henner, 2016). Before that, Birte and Daniel (2015) also identified 10 factors affecting the intention and behavior to participate in the sharing economy and gave the top 5 motivations as price reduction; access and availability; sustainability, the environment, and saving resources; innovation and scarcity; use but not ownership (Balck, Birte; Cracau, Daniel, 2015). There have been quite a few studies on e-commerce, especially Shopee (focusing mainly on Southeast Asia). However, these articles are often only researched from the perspective of consumers. Some factors that have a positive influence on consumer purchase intention are free shipping (Ekwinia & Maydena, 2021) (Ambarwati & Pradana, 2021); brand ambassadors, marketing events and digital marketing (Kok, Ariesa, Kelvin, Pratama, Kosasih, & Alianza, 2021)

In fact, in Vietnam, there have also been many studies conducted to learn about the link between consumers' purchasing decisions and factors such as customer loyalty, corporate brands, etc. career or e-WOM. Many studies have proven that customer loyalty is positively influenced by brand association, brand equity and brand awareness (Phong, Nga,

Hanh, & Minh, 2019); customer's trust, perceived quality, ethnocentrism (Khoa, Uyên, Oanh, & Dung, 2021); e-WOM (Doan, 2019)).

This study makes 2 core contributions: first, identify the motivations that motivate individuals to participate in selling on Shopee in Vietnam in the context of the digital economy. Through these findings, the study can become a document to help point out the differences between the intention to participate in selling on Shopee and other e-commerce platforms and traditional business. Second, the study makes recommendations for individuals to increase sales quality, propose solutions for Shopee as well as other e-commerce platforms and the Government in order to deal with the existing limitations and promote the advantages so that the Vietnamese e-commerce business market will achieve a breakthrough.

In sum, we do not claim to provide a comprehensive theoretical building of participating behavior. By correcting the multiplicity of potential drivers and inhibitors, we rather intend to set the stage for further research in that direction.

The remainder of this article is organized as follows. In Section 2, we outline our methodological approach and how we use the method in this research. We then identify motives for participating behavior by means of analyzing the data collected from in-depth interviews (Section 3). Eventually, we discuss the result and conclude in Section 4.

2. Method

Research uses a qualitative approach as the main method, combining with data processing according to desk research, analytical and meta-analysis methods and in-depth interview because they refer to a phenomenon that occurs when looking at literature studies. Firstly, adaptability and creativity are a form of tacit knowledge, so the identification needs to be based on a rational, or perceptual/judgmental approach in order to know what people think, and why they think so. Therefore, the qualitative research method will allow the authors to collect information about the learners' judgment, identification and sharing in the learning process and practical experience (Norman K. Denzin, 2012) (Thắng, 2014). Secondly, it is a fairly new topic, which has not been discussed much or researched deeply in Vietnam. The models and measures have not been standardized for a quantitative study. As a result, the qualitative approach is reasonable.

Qualitative approach

The research process involved experimental work as well as data collection to consider whether information could be agreed with or disproved; thereby allowing the authors to identify and analyze analysis of different observed variables. Data was collected by interviewing 16 participants via text messages and voice calls. In addition, the research team also used analytical and meta-analysis methods to process the collected data.

Data collection

The authors searched for academic papers through domestic and foreign reports and theses related to the sharing economy, e-commerce, motivation for people to buy and join e-commerce exchanges. Besides, the authors also investigate the development process and operation as well as the popularity of Shopee in Vietnam. From this information, the team has come up with a theoretical basis for the research topic as well as hypotheses to test.

The authors conducted in-depth interviews on 16 Shopee sellers and obtained 15 valid answers. The interview was performed over the Internet using activities such as texting and calling. With a purposeful selection of research subjects, the research team ensures that there is enough information about the reasons that motivate individuals to participate in selling on Shopee when they accumulate enough experience and learn carefully about the policies for Shopee sellers.

In-depth interview:

The interview was conducted online. The purpose of the in-depth interview is to explore the reasons why individuals do business on Shopee in Vietnam; thereby determining the influence of the above-mentioned motivations on the intention to join. sales on this platform. Interviews are recorded or carefully written all questions and answers. The discussion topic is suggestive for individuals to share their reasons and experiences when running a business on e-commerce platforms and why they focus on selling on Shopee. The question revolved around the motivations of individuals to join Shopee as a seller.

Sampling and selection:

The authors used a purposive sampling strategy to select a sample of participants. To reduce the error rate to a minimum when sampling, the research team collected research samples from many provinces across the country with diverse characteristics in terms of age and income level. Participants will receive an interview consisting of about 17 questions lasting about 30 minutes via text message, phone call or face-to-face meeting.

Table 4. Information of interviewees

Interviewee	Age	Gender	Period doing business on Shopee
1	20	Male	1 year
2	20	Female	3 years
3	27	Female	has temporarily stopped selling
4	19	Female	1 year
5	21	Female	1 year
6	20	Male	2 years
7	30	Male	4-5 years
8	20	Female	2 years
9	19	Female	just started joining
10	20	Male	3 months
11	20	Male	1 month
12	24	Male	2 years
13	20	Female	6 months
14	22	Male	7 months
15	20	Female	6 months

Source: Authors

Participants were found through the researchers' personal contacts. Initially sixteen participants were recruited to be interviewed. However, only fifteen responses were valid to analyze based on the study's criteria.

Data analysis

Text messages and audio recordings were converted to text format (tape phase) and entered into the answer sheet. Then, the questions have been classified into separate motivation groups, the answer data will be entered in each corresponding section including: Income; Application of the sharing economy; Large and promising business market share; Application of the development of technology; Understanding and familiarity with Shopee; External influences; Sustainability; Ease for start-up and some other factors. After that, the research team conducted an assessment of the influence of the motivations on the intention to participate in selling on Shopee of individuals.

From the data that has been evaluated and determined, the research team has written statements and analyzed the motivations of individuals when participating in sales on Shopee, then summarized the general observations and findings of the study.

3. Results

About the status of individuals participating in sales on the Shopee, E-commerce has become a commonly used transaction method and is the optimal choice of consumers in the current complicated situation of the COVID-19 pandemic. Therefore, as the most famous e-commerce platform in Vietnam, it is not surprising that more and more people are doing business at Shopee.

From the above fact, it can be shown that there are many reasons why individuals want to participate in selling on Shopee. Our research team has collected data to be able to analyze and identify some personal motivations for selling on Shopee in Vietnam.

From the results of the interview, below are motivations that motivate individuals to sell on Shopee arranged in descending order based on their influence on dependent variables:

Income

Income is the most mentioned motivation by the interviewees. The majority of the interviewees have a monthly income from Shopee is less than 10 million. Many people raised the opinion that joining Shopee is for money or to have an additional source of income. However, there are some interviewees who assessed that the income on Shopee was not really as expected.

Application of the sharing economy

Selling on e-economy platforms has a great advantage compared to selling offline, which is the ability to apply the benefits of the sharing economy like helping sellers reduce the burden of ownership and supporting the shipping system.

Nearly all interviewees agreed that doing business on Shopee helps them reduce ownership burden, save time and costs. However, the majority of interviewees did not give much praise to the platform's transportation system.

Large and promising business market share:

The large and promising business market share of e-commerce in general and Shopee in particular helps sellers to expand their sales range, reach more customers, and support them to connect with domestic and foreign partnerships or with many suppliers.

Most of the interviewees highly consider this motivation's ability to expand the customer network, especially in the complicated situation of the COVID-19 epidemic. Regarding the ability to expand partners, some people consider this to be an advantage when selling Shopee products, but most sellers have not thought about it or experienced it, so they do not really appreciate this.

Application of the development of technology

The application of the development of technology is reflected in two main aspects: flexibility of time, space and automation. In general, the majority of interviewees agree that technology has a positive impact on the development of e-commerce platforms.

Many people appreciate the flexibility of time and space thanks to the application of technology development. However, most of the interviewees assessed that Shopee's technology application, specifically automation, has not really been able to support sellers because there are still many difficulties in the operation process.

Understanding and familiarity with Shopee

Understanding and familiarity with Shopee consists of two parts: popularity and personal understanding of Shopee. Although the majority of interviewees use not only Shopee but also some other e-commerce platforms, they consider Shopee to be better than the rest and they focus on selling on Shopee more than other platforms.

Most sellers agree that Shopee is the most popular e-commerce platform and has the highest number of visitors in Vietnam compared to others. When commenting on Shopee's strengths, many individuals affirmed that the platform's interface is easy to use, has many incentives, and has many customer care policies. Although the above advantages are an important factor to help many sellers choose Shopee to sell their products, Shopee still has some disadvantages that need to be improved, such as the time to approve orders or handle complaints is quite long, and the fees for successful orders are quite high for sellers.

External influences

External influences can come from the environment, context or people around. Although retail business on Shopee is the current trend, especially in the context of the COVID-19 epidemic, only a small percentage of individuals consider it as their motivation. When interviewed about this motivation, individual sellers showed many different reasons that motivated them to do business on Shopee, for example, guided by acquaintances or motivated by customers. The rest of the interviewees said that they are not influenced by external influences, but doing business is their hobby.

Sustainability

Sustainability here is referred to as the stability and longevity of the selling on Shopee. There are 6/15 interview respondents agreeing that sustainability is one of the

motivations that motivate them to sell their products on this e-commerce platform because they believe that the Internet will grow more and more, the demand for online shopping will also increase and because doing business on Shopee does not need to invest too much, so they will not have to worry too much about the risk of the job.

In addition, some interviewees hope that Shopee can improve its outstanding shortcomings such as high commission fees, shipping services... as well as maintain and promote existing advantages, so that the selling on this e-commerce platform can be more stable and long-lasting.

Ease for start-up:

According to the interview results, it is easy to start selling on this platform only when there are ancillary factors such as product availability, having business knowledge or the seller's goal is not high. The difficulties that sellers on Shopee encounter when starting a business are shared a lot such as slow capital turnover, difficulty finding customers, price competition, or lack of understanding about Shopee's policies...

4. Discussion and Conclusion

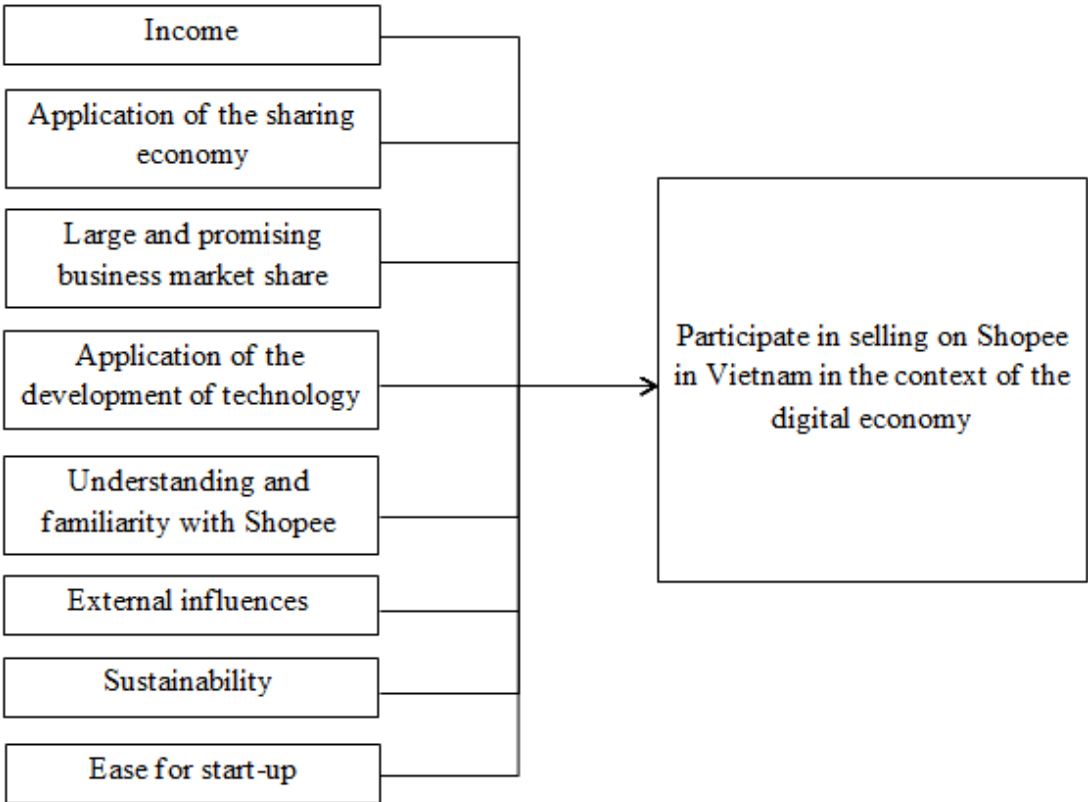

Figure 3. Model of motivations for individuals to participate in selling on Shopee in Vietnam in the context of the digital economy

Source: Authors

From the results of interviewing 15 people, the research has shown 8 motivations for individuals to participate in selling goods on Shopee in Vietnam in the context of the digital economy, which are arranged in descending order based on their influences on dependent variables are: Income; Application of the sharing economy; Large and promising business

market share; Application of the development of technology; Understanding and familiarity with Shopee; External influences; Sustainability; Ease for start-up.

Compared with the research paper “Understanding the Sharing Economy - Drivers and Impediments for Participation in Peer-to-Peer Rental” (2016), in this study, the “income” was rated as the main motivation that promotes individuals to run business on Shopee in Vietnam by most of the interviewees. This result also has similarities with a study of the group of authors Florian Hawlitschek, Timm Teubner, Henner Gimpel, which identifies the income variable as the driving force with a positive impact on the dependent variable. For the application of the sharing economy, it can be seen that reducing the burden of ownership is a prominent advantage of online sales. The motivation related to the burden of ownership has been mentioned by Florian Hawlitschek's group, but it did not have much influence on the intention of individuals to participate in the sharing economy.

According to the results of the study, some recommendations are made for the following subjects and units:

For sellers on Shopee: firstly, investing in product quality; secondly, optimizing product price; thirdly, building product images and booths; finally, investing in marketing campaigns and improving service quality.

For Shopee: this unit needs to promote and maintain its strengths as well as improve its weaknesses such as: the transportation system, the platform's infrastructure system or the speed of complaint handling.

For e-commerce platforms in Vietnam: these units also need to improve a number of points such as the interface setup, the transportation system, or strengthen campaigns to encourage shopping and reduce costs for sellers.

For the Ministry of Industry and Trade: coordinating with the government and relevant ministries and agencies to enlarge and perfect policies for the development and application of the digital economy, set up and operate essential infrastructure for e-commerce development; investing and promoting cross-border e-commerce as well as focusing on and speeding up the process of perfecting the legal framework on protecting consumers in the e-commerce market.

For the Government: firstly, building a fair and effective competition and sustainable e-commerce market by enhancing the legal framework for e-commerce; secondly, expanding the consumption market for Vietnamese goods domestically and abroad through e-commerce platforms; next, strengthening the construction of logistics systems, information technology infrastructure as well as ancillary services for e-commerce; then, narrowing the gap between big cities and localities in terms of e-commerce development level; finally, promoting and implementing training courses on e-commerce application skills as well as supplementing , updating knowledge about e-commerce in educational institutions such as universities or vocational education.

Although much investment and seriousness has been devoted, this study still has some limitations such as: the research sample is not really popular; it is not possible to cover all the motivations; not only the standard research model has not been found yet, but also

have the scale and quantitative research been utilized to evaluate the motivations affecting the selling behavior of individuals on Shopee in Vietnam.

This study, which is one of the first researches conducted to investigate the motivations for individuals to engage in selling on Shopee in Vietnam in the context of the digital economy, has obtained a number of meaningful results. From that, the authors propose a collection of recommendations for relevant parties, including sellers, Shopee, e-commerce platforms in Vietnam, the Ministry of Industry and Trade, the Government in order to improve individual's access opportunities to E-commerce platforms as well as promote Vietnamese e-commerce to develop more and more.

In particular, as a citizen of the new generation, each person needs to gain and enlarge necessary knowledge to adapt to the context of digital transformation in Vietnam, thereby improving and enhancing the quality of life.

ANALYSIS OF P2P ONLINE LENDING MODEL SELECTION AND SUPERVISION BASED ON EVOLUTIONARY GAME THEORY

Dr. To Minh Huong

huongtm@tlu.edu.vn

Faculty of Economics and Management, Thuy Loi University

Abstract

The rise of P2P online lending makes the private lending market more and more diversified, and lending business models become more and more diversified. According to different credit investigation links of online lenders, the way P2P platforms work is also different to get more user groups, market share and maximize benefits. This paper will establish an evolutionary game model between P2P businesses and the scaling up of P2P businesses and government regulators from the point of view of evolutionary game theory.

Keywords: *P2P online lending business; online lending operation model; evolutionary game theory; regenerative dynamic equation*

1. Introduction

In recent years, Internet finance has become a new trend in wealth management and financing, and even a subversion of traditional financial models. Internet finance is an extension of the Internet. It is a new ecological finance that combines the traditional financial industry and the Internet, and it is also an issue of the times that we must face. This paper focuses on the use of evolutionary game theory to discuss the P2P online lending model in Internet finance.

P2P (Peer to Peer) credit is online credit, which is a point-to-point, person-to-person, and a small loan method that invests and borrows with the help of third-party network platforms. It bypasses financial intermediaries such as commercial banks and reduces operations and transactions, information and other costs have become a typical representative of the disintermediation of Internet finance. This method first appeared in the United Kingdom (such as Zopa), with an online lending platform as an intermediary, with the help of Internet technology, the information of the borrower and the borrower is more transparent and symmetrical, which reduces the cost of funds and improves the utilization rate of funds. At present, market is huge, so there is still a lot of room for the development of P2P. However, as an emerging Internet lending channel, P2P online lending platforms are still facing the lack of laws and regulations, and the lack of intermediate accounts, lack of supervision, borrower information transparency, false guarantees and other lending risks.

There are generally three types of P2P online loan models in my country: one is a pure intermediary model represented, which means that all processes such as customer acquisition channels, credit risk control, transactions, and lending are completed on the Internet, and the risk is determined by the loan. Both parties undertake that the platform itself only undertakes information matching review, tool support and services; the other is a

guaranteed model. Once the loan defaults, this type of website promises to advance the principal for the investor first. At present, the vast majority of P2P websites operating in this mode are on the market. This paper mainly analyzes whether the P2P has a guaranteed model or not. With the guaranteed model, there will be problems such as the unclear subject of the guarantee rights, the guarantee company being an affiliated company, the "self-financing" trap, and the increase of platform risks. Some bank credit experts also said that P2P online lending institutions should be information intermediaries rather than credit intermediaries, and the process of "de-guarantee" should be accelerated. This paper uses evolutionary game theory with bounded rationality as the premise to establish an evolutionary game model between online loan companies, between companies and regulatory authorities, and analyze the evolution and stability of the model, which provides a theoretical basis for the selection of online loan models and supervision.

2. Method

Game theory and economic behavior, written jointly by American mathematician von Neumann and Morgenstein in 1944, marks the initial formation of game theory. Traditional game theory adopts the hypothesis of "complete rationality", but human limitations in the process of game can not be avoided; "Game analysis method and equilibrium concept based on complete rationality, that is, one-time choice based on reasoning analysis (for general static game and dynamic game), or overall planning based on high visibility (repeated game) The analysis framework is usually not applicable to the analysis of game problems of bounded rational players. Because these game analysis frameworks can not reflect the learning process of the game side, nor can they discuss the dynamic stability of the game side's behavior and strategy "; Therefore, it is necessary to study the evolution of rational game. Evolutionary game theory has been produced since the 1960s. Ecologists take Darwin's biological evolution theory and Lamarck's genetic gene as the basic ideas to explain ecological phenomena. The development of evolutionary game theory can be divided into two stages: the first stage is the substitution of limited rationality for complete rationality; The second stage is to introduce evolutionary game theory from the biological field into all fields of society. In the traditional game, the use of game theory to study human economic behavior adheres to the hypothesis of economic man and the principle of rationality, but in reality, people are not completely rational, but limited rationality. As an alternative, the rational principle is replaced by population dynamics and stability, while the self-interest principle is replaced by Darwin's fitness. Evolutionary game theory has two core contents: one is evolutionary stable strategy (ESS) and replication dynamic model; The criterion of evolutionary stability emphasizes the role of variation, while replication dynamics emphasizes the role of selection. Evolutionary stability strategy is that if the whole population chooses this strategy, under the action of natural selection, there is no mutation strategy that can invade the population. It is also a refinement of Nash equilibrium. It is also suitable for us to introduce evolutionary game theory from the biological field into the economic field; Replication dynamic process is a random pairing evolutionary game problem in a large group of members with low rational level and slow learning speed in repeated game.

According to the replicator dynamics, we can establish the dynamic differential equation of behavior evolution game between groups:

$$\begin{aligned}\frac{dx}{dt} &= x * U_1 - \bar{U} = x * [U_1 - (x * U_1 + (1 - x) * U_2)] \\ &= x * (1 - x) * (U_1 - U_2)\end{aligned}$$

Where x ($0 < x < 1$) represents the probability of adopting strategy 1, and the probability of adopting strategy 2 is $1-x$;

U_1 and U_2 respectively represent the expected return of adopting strategies 1 and 2; \bar{U} represents the average expected return of a group. When a strategy satisfies the conditions, it is an evolutionary stable strategy.

$$F'(x) = \frac{dx}{dt} < 0,$$

3. Results

3.1. Evolutionary Game Theory Model Analysis of P2P Network Lending Platform

(1) Model assumptions

Suppose there are only two groups in the P2P online lending industry, namely platform A and platform B, and the number of individuals is N . Platform A is a group that voluntarily accepts supervision, and platform B is a group that does not accept supervision. There is information asymmetry between platform A and platform B and they are both bounded rational and mutually random. Within the same group, platforms have the same set of strategies for their attitudes towards regulation and make decisions about regulation at the same time.

Table 1. The payoff matrix of the game between platforms A and B

		A	
		be regulated (P)	not regulated ($1-P$)
B	be regulated (P)	$(R+S, R+S)$	$(R+2S-M, R+M-2F)$
	not regulated ($1-P$)	$(R+M-2F, R+2S-M)$	$(R-F, R-F)$

In Table 1:

(P) : Proportion of groups under supervision

$(1-P)$: Proportion unwilling to accept regulation

R : Platform operating income

S : The platform's increased revenue due to acceptance of supervision

M : The platform loses revenue due to supervision

F : The cost of platform violations

If both platform A and platform B voluntarily accept the regulatory conditions of the regulator, then in addition to the platform's operating income R , the two parties also increase the income S due to accepting supervision, and the total income is $R+S$;

If both platform A and platform B choose not to accept supervision, the operating income is still R, but may be fined by the regulatory authorities F, so the income of both platforms will decrease F, and the income will become $R - F$;

If the two platforms choose different: Platform A is regulated (or Platform B is regulated). At this time, platform A is restricted by regulatory conditions, and the operating income is lost due to the loss of customers to platform B (M). However, platform A will receive twice the benefit of customers who voluntarily accept the regulatory policy as 2S, so the total benefit is $(R + 2S - M)$.

Platform B does not accept supervision (or platform A does not accept supervision. Platform B will receive the loss revenue M due to platform A being supervised, and also bear the fine cost of the regulated department 2F, so the total revenue is $(R + M - 2F)$.

(2) Establishment of evolutionary game model

The expected return (u_1) of the game player who voluntarily accepts supervision is:

$$u_1 = p(R + S) + (1 - p)(R + 2S + M) = R + S + (1 - p)(S - M)$$

The expected return (u_2) of the game party that does not accept supervision is:

$$u_2 = p(R + M + 2F) + (1 - p)(R - F)$$

Then the average income (U) of the group is:

$$u = pu_1 + (1 - p)u_2$$

Therefore, the replication dynamic equation of the evolutionary game model is:

$$\begin{aligned} F(p) &= dp/dt = p(u_1 - u) = p(1 - p)(u_1 - u_2) \\ &= p(1 - p)[2S + F - M - p(S - F)] \end{aligned}$$

Let $F(p) = 0$, when $p^* = 0$, $p^* = 1$, $p^* = (2S + F - M)/(S - F)$, the proportion of the platform under supervision is stable, but it cannot be determined whether it belongs to the evolutionary stable strategy ESS, in $F'(p^*) < 0$ equilibrium point is the evolutionary stable strategy ESS.

$$F'(p) = (2S + F - M) - 2p(3S - M) + 3p^2(S - F)$$

Putting the above p^* value into the equation, it can be calculated as:

$$F'(0) = 2S + F - M$$

$$F'(1) = M - S - 2F = -(S + 2F - M)$$

$$F'[(2S + F - M)/(S - F)] = (2S + F - M)(S + 2F - M)/(S - F)$$

At this time, the relationship between values exists in the following two cases:

Case 1:

When $S - F > 0$, $2S + F - M > 0$ when $S + 2F - M < 0$

Then $F'(0) > 0$, $F'(1) > 0$, $F'[(2S + F - M)/(S - F)] < 0$

At this point only $p^* = (2S + F - M)/(S - F)$ is the only stable evolutionary stable strategy.

When the market meets the above conditions, the probability of P2P platforms voluntarily accepting supervision will eventually stabilize at a level around $p = (2S + F - M)/(S - F)$ at this point, the average return of the group reaches its maximum value.

Figure 1. The phase diagram of the eagle-dove game replicating the dynamic equation

Figure 2. The average payoff curve of the eagle-dove game

Case 2:

When $S - F > 0$, $2S + F - M < 0$ when $2S + F - M > 0$

Then $F'(0) < 0$, $F'(1) < 0$, $F'[(2S + F - M) / (S - F)] > 0$

At this time $p^* = 0$ and $p^* = 1$ are evolutionary stable strategies of the game, forming a "coordination game". And $p^* = (2S + F - M) / (S - F)$ is not an evolutionarily stable strategy.

Therefore, the game between platforms will evolve into two stable states

When the probability of the platform being regulated is (P) and the initial level falls within the interval $[0, (2S + F - M) / (S - F)]$, the replication dynamics will tend to a stable state of $p^* = 0$, that is, all platforms are not regulated;

When the initial level falls within the interval $[(2S + F - M) / (S - F), 1]$, the replication dynamics will tend towards $p^* = 1$, that is all platforms will be voluntarily regulated;

When the initial level is equal to $(2S + F - M) / (S - F)$ each platform will randomly choose whether to accept supervision. At this time, the expected return of the two options of the platform is the same, and the average return of the group will be at the minimum.

Figure 3. Phase diagram of the coordination game replication dynamic equation

Figure 4. Average payoff curve of coordination game

Table 2. List of model equilibrium results

Condition	Equilibrium point p^*	Value $F'(p^*)$	Result
Pigeon game: $S - F > 0$ $2S + F - M > 0$	$p^* = 0$	$2S + F - M > 0$	unstable point
	$p^* = 1$	$M - S - 2F > 0$	unstable point
	$p^* = \frac{2S + F - M}{S - F}$	$\frac{(2S + F - M)(S + 2F - M)}{S - F} < 0$	ESS
Coordination game: $S - F < 0$ $2S + F - M < 0$	$p^* = 0$	$2S + F - M < 0$	ESS
	$p^* = 1$	$M - S - 2F < 0$	ESS
	$p^* = \frac{2S + F - M}{S - F}$	$\frac{(2S + F - M)(S + 2F - M)}{S - F} > 0$	unstable point

(3) Analysis of game parameters

In the "eagle-dove game", when the market tends to be in a stable state, the probability that each P2P lending platform decides to accept the supervision of the regulatory authority will be stable at $p = \frac{(2S+F-M)}{(S-F)}$. Because the platform chooses supervision will lead to loss of revenue (M) and increase of supervision revenue (S). At this time, the regulator should strengthen management, maintain a stable increase in revenue (S) to the platform that accepts supervision, and at the same time increase the fine (F) for illegal behaviors that do not accept the regulator to make $p = \frac{(2S+F-M)}{(S-F)}$ approach 1. At this time, The probability of platform A voluntarily accepting supervision will approach 1, and the average benefit of the group will be the largest at this time.

In the "coordination game", when the regulator first implements the regulatory policy, the number of platforms that accept supervision is very important, which will directly affect the evolution direction of the game. In order to implement regulatory policies more effectively, regulators should pay attention to grasping the regulatory standards when regulatory policies are introduced, appropriately propose incentive policies, increase the revenue (S) of their platforms, and strive for more resources for regulated platforms. Platforms that do not accept supervision or violate supervision shall be strictly punished, and the amount of fines shall be increased (F). The willingness to accept supervision through the platform increases, so that the overall probability of accepting supervision is greater than $p = \frac{(2S+F-M)}{(S-F)}$ to ensure that the evolutionary stability strategy will tend to 1, that is, the platform will choose to accept supervision.

3.2. An Evolutionary Game Model Analysis of the Regulatory Benefits of P2P Online Lending Platforms

(1) Model assumptions

It is assumed that P2P platforms and regulators interact in the development of the industry. If the regulatory authorities do not supervise the P2P industry or choose loose regulatory policies, it will cause industry losses and the losses will be greater than the cost of strict enforcement by the regulatory authorities. Or if, the P2P platform will suffer huge losses due to not accepting supervision, and its platform loss is far greater than the cost of the platform's supervision.

Table 3. Payoff Matrix of Regulatory Authority and Platform Game

Regulatory P2P Platform	No violation (q)	Violation ($1-q$)
Strictly regulated (p)	$(-C, R)$	$(-C, R + \Delta R - K)$
Loose regulation ($1-p$)	$(0, R)$	$(-E, R + \Delta R - L)$

In the table

R : platform revenue

(p) : Proportion of "strictly regulated"

$1-p$: Proportion of "easy regulation"

(q) : Proportion of "non-violating" platforms

$1-p$: Proportion of "offending" platforms

K : The cost of breaching the platform

C : The regulatory cost of the regulator

E : The regulator's unregulated loss

ΔR : The illegal income of the platform

L : The loss of the platform when the crisis broke out

(2) Construction of evolutionary game model of regulatory authorities and P2P online lending platforms.

That is $f(h, s)$ which represents the expected return obtained by the individual choosing strategy s with probability h .

$r_1 = (1, 0)$ indicates that the P2P platform or regulator chooses no violation or strict supervision with probability 1, and $r_2 = (0, 1)$ indicates that the P2P platform or regulator chooses violation or loose supervision with probability 1.

A point (p, q) on the available $[0, 1] \times [0, 1]$ region in state $E = \{(E_1, E_2), (E_3, E_4)\} = \{(p, 1-p), (q, 1-q)\}$ represents the evolutionary dynamics of the system consisting of regulators and platforms.

Fitness for a "strictly regulated" strategy: $f_1(r_1, s) = (-C)q + (-C)(1-q)$

The fitness of adopting the "easy regulation" strategy: $f_1(r_2, s) = 0.q + (-E)(1-q)$

Average fitness: $f_1(p, s) = pf_1(r_1, s) + (1-p)f_1(r_2, s)$

The fitness of adopting the "no violation" strategy: $f_2(r_1, s) = Rp + R(1-p)$

The fitness of adopting the "violation" strategy:
 $f_2(r_2, s) = p(R + \Delta R - K) + (1-p)(R + \Delta R - L)$

The average fitness is: $f_2(q, s) = qf_2(r_1, s) + (1-q)f_2(r_2, s)$

The growth rate of the proportion of regulators adopting a "strict regulation" strategy is:

$$\dot{p}/p = f_1(r_1, s) - f_1(p, s)$$

$$\dot{p} = p[f_1(r_1, s) - f_1(p, s)] = p(1-p)(E - C - Eq)$$

When $q = 0$ is appropriate $q = 0, 1$ or $q = (E - C)/E$, the proportion of departments adopting the "strict supervision" strategy tends to be stable.

The growth rate of the proportion of platforms adopting the "no violation" strategy is:

$$\dot{q}/q = f_2(r_1, s) - f_2(q, s)$$

$$\dot{q} = q[f_2(r_1, s) - f_2(p, s)] = q(1-q)[(L - \Delta R) - (L - K)]$$

Let $q = 0$, which can be properly $q = 0, 1$ or $p = (L - \Delta R)/(L - K)$, the proportion of platforms adopting the "no violation" strategy tends to be stable.

(3) The dynamic evolution of the behavior of regulatory authorities and P2P online lending platforms can obtain a systematic Jacobian matrix:

$$J = \begin{pmatrix} (1-2p)(E-C-Eq) & -Ep(1-p) \\ -q(1-q)(L-K) & (1-2q)[L-\Delta R-p(L-K)] \end{pmatrix}$$

Solution: 5 local equilibrium points, (0,0), (0,1), (1,0), (1,1), and $\left[\frac{L-\Delta R}{L-K}, \frac{E-C}{C} \right]$

Table 4. Equilibrium point structure of the game model of regulatory benefits

Equilibrium	J The determinant (symbol)	J	Result
$p = 0, q = 0$	$(E - C)(L - \Delta R)$ (+)	$(E - C)(L - \Delta R)$ (+)	Unstable point
$p = 0, q = 1$	$C(L - \Delta R)$ (+)	$-C(L - \Delta R)$ (-)	ESS
$p = 1, q = 0$	$-(E - C)(K - \Delta R)$ (+)	$-(E - C)(K - \Delta R)$ (-)	ESS
$p = 1, q = 1$	$-C(K - \Delta R)$ (+)	$C(K - \Delta R)$ (+)	Unstable point
$p = \frac{L - \Delta R}{L - K}$, $q = \frac{E - C}{C}$	$\frac{C(E - C)(L - \Delta R)(\Delta R - K)}{E(L - K)}$	0	saddle point

(0,1), (1,0) are the stability points of the system and the evolutionary stability strategy of the system, namely ESS.

(0,0), (1,1) are the unstable points of the system, and $\left[\frac{L-\Delta R}{L-K}, \frac{E-C}{C} \right]$ is the saddle point of the system.

If the initial state falls within the area A, the system will converge to (0,1), that is, the regulatory authority adopts a loose supervision strategy, and the platform adopts a non-violation strategy. If the initial state falls within the area B, the system converges to (1,0), that is, the regulatory authority adopts a strict supervision strategy, and the platform adopts a violation strategy.

(4) Parameter analysis

If the initial state randomly falls within $D=\{(p, q)|0 \leq p, q \leq 1\}$, the system will evolve in different directions. For $p = \frac{L-\Delta R}{L-K}, q = (E-C)/E$ let $\alpha = \frac{\Delta R}{L}, \beta = \frac{K}{L}, \delta = C/E$ get $p = \frac{1-\alpha}{1-\beta}, q = 1 - \delta$

Figure 5. Phase diagram of system dynamic evolution

Figure 6. Changes in relative area when the P coordinate becomes larger

Figure 7. Change of relative area when the Q coordinate becomes larger

The analysis is as follows:

I. $\alpha = \Delta R/L$ is the profit and loss ratio of the platform's illegal operations. When (α) becomes larger ΔR becomes larger or (L) becomes smaller), the p-coordinate of point O becomes smaller, and the q-coordinate remains unchanged, so that the area of area A becomes smaller and the area of area B becomes larger, and vice versa. When the P2P platform obtains higher profits through illegal operations or the platform suffers a small loss (L) due to the outbreak of the crisis, the platform P2P will choose to violate the regulatory provisions, otherwise, the platform will choose not to violate the regulations.

II. $\beta = K/L$, is the conversion rate of platform internal risk cost to external loss. $p = \frac{L-\Delta R}{L-K}$ therefore, the change of L or K has the same effect on the change of p coordinate. When K or L becomes larger, the P coordinate of the O point becomes larger, and the q

coordinate remains unchanged, so that the area of area A becomes larger, and the area of area B becomes smaller, and vice versa. When the platform bears the risk cost K due to violations, the platform suffers losses L when the crisis breaks out. In order to reduce the loss, the platform will choose a non-violation strategy.

III. δ : $\delta = C/E$ is the profit and loss ratio of supervision by the supervisory authority. When C becomes larger or E becomes smaller, the p coordinate of point O remains unchanged, and the q coordinate becomes smaller. At this time, the area of area A becomes larger, and the area of area B becomes smaller, and vice versa. When the additional cost C of the platform accepting strict supervision is high or the loss E caused by the regulatory authority is small in the case of loose supervision, the regulatory authority will choose a loose supervision strategy.

3.3. Evolutionary game model of P2P network lending regulators and guarantee institutions

(1) Model assumptions

There are two groups of P2P online lending platforms, those who accept guarantees and those who do not accept guarantees. The regulatory authorities also have two strategies to supervise and not supervise P2P online lending platforms, that is, the number of individuals in the online lending enterprise platform group is N, N Sufficiently large and satisfying: The P2P network lending enterprise platform accepts guarantees and does not accept guarantees and the supervision departments interact with each other, and it is random and bounded rationality. Regardless of whether the P2P platform accepts the guarantee or not, the decision-making time when choosing supervision is the same, the same group has the same selection supervision strategy, and there is information asymmetry between the two.

Table 4. Game income matrix of guaranteed and unguaranteed by regulators and online lending companies

Regulators	P2P Platform				
		no guarantee (x)		guaranteed ($1-x$)	
Be regulated (y)	$U_a - V_a$	S_a	$U_d - V_d$	$S_d - W$	
Not regulated ($1-y$)	U_a	S_a	U_d	S_d	

S represents the income of the online loan platform; S_a represents the unsecured income of the online loan enterprise, S_d is the guaranteed income of the online loan enterprise, and the supervision income of the supervision department is $S_d - W$, where W is the supervision fee and fine, $S_d > S_a$

When the regulatory authorities supervise, investors do not pay much attention to whether there are guarantee factors for online loan platforms, but online loan companies that take guarantees will increase the cost of guarantees, so $S_d > (S_a - W)$

V represents the cost of supervision; V_a is the supervision cost of the unsecured government supervision department of the online loan enterprise, V_d is the supervision cost of the government supervision department with the guarantee of the online loan enterprise, $V_d > V_a$,

U represents the income of the supervision department, U_a is the income of the unsecured government supervision department of the online loan company, U_d is the guaranteed income of the government supervision department of the online loan company, $U_a > U_d$

When $x < \frac{V_a}{V_d - V_a}$, $x^* = 0$, $x^* = 1$ are still two stable strategies, but $F'_{(0)} < 0$, $x^* = 0$ is an evolutionary stable strategy.

When $x = \frac{V_a}{V_d - V_a}$ all (y) are in equilibrium. Because of $V_d > V_a$ when $x > \frac{V_a}{V_d - V_a}$ no matter what strategy the platform adopts (guaranteed or not), the best choice for regulators

is regulation, and when $x < \frac{V_a}{V_d - V_a}$ no matter what strategy the platform adopts (guaranteed or not) regulation The best option for the sector is to not regulate.

By analyzing the replication dynamic equation of online loan platform enterprises,

When $y > \frac{S_d - S_a}{W}$, $x^* = 0$, $x^* = 1$, two stable strategies, but $F'_{(1)} < 0$ i.e. $x^* = 1$ is an evolutionary stable strategy;

When $y < \frac{S_d - S_a}{W}$, $x^* = 0$, $x^* = 1$, are still two stable strategies, but $F'_{(0)} < 0$ i.e. $x^* = 0$ is an evolutionary stable strategy;

When $y = \frac{S_d - S_a}{W}$ all y are in equilibrium.

Because of $S_d > S_a$ when $y > \frac{S_d - S_a}{W}$ i.e. no matter what strategy the government adopts (regulatory or not), the platform chooses the unsecured model, and when $y < \frac{S_d - S_a}{W}$ i.e. no matter what strategy the government adopts (regulatory or not), the platform's maximum The preferred option is the secured model.

4. Discussion and Conclusion

Through the construction of the above two models and the deduction and analysis of the relevant parameters, the following conclusions can be drawn:

Conclusion 1: Without the intervention of regulatory authorities, only relying on the adjustment of market interests and the improvement of platform social responsibility awareness, the standardized development of P2P online lending platforms will not reach an ideal state.

Conclusion 2: In the early stage of the implementation of regulatory policies, it is necessary to protect the competitive advantages and operating income of formal platforms, optimize the market competition and development environment through legislation

"rectification", and support and promote the construction of a social credit system, so that most platforms consciously accept supervision.

Conclusion 3: The regulatory authorities should increase the penalties for violations of the platform, so that the cost of the platform being investigated and punished for the illegal operation is far greater than the income obtained by the illegal operation, so as to eliminate the impulse to violate the regulations; the platform itself should also strengthen corporate governance and improve internal control management. level, prevent the risk of violation, and reduce the cost of violation.

Conclusion 4: The regulatory department should reduce the cost of supervision through the comprehensive use of various channels and methods. The first is to improve supervision capabilities and reduce supervision costs through collaborative supervision, informatization of supervision methods, and diversification of supervision methods; the second is to strengthen the information disclosure of the platform, and improve the efficiency of supervision through market supervision; The construction and management of the organization, strengthen the standard operation of the platform itself to reduce the cost of supervision.

The development of online lending companies is not yet ripe, borrowers will use the platform to raise capital illegally, and the online lending platform can self-finance and become become a semi-financial intermediary (or act as a credit converter). Since most of the Investors are risk-averse, will be interested in P2P companies To maximize, attract investors and expand market share, P2P companies will choose underwriting model to collect attract more user groups. However, it is impossible not to mention the potential problems behind the guarantee model such as the unknown subject of the guarantee, the company. underwriters are affiliates, problems like self-financing are loopholes in oversight and even false underwriting platforms will emerge. In the evolutionary game between the studied P2P enterprise and the supervision of the regulators, it is found that whether the Firm has an underwriter under the underwriting model as an associate depends largely on the extent of regulatory oversight and the degree of sanctions. Certainly, the deterrence of companies in the regulatory policy of the regulator affects the income of the business, which in turn affects the choice of operation method of online lending businesses. Regulators need to improve the supervision system, increase the supervision density, raise the industry threshold, evaluate the credit platform system, develop risk monitoring indicators for online lending businesses, etc and establishing a good P2P network funding environment is essential.

Abstract

This study aims to examine the influence of social capital as well as other factors (peer communication, utilitarian value, hedonic value, and browsing activity) on consumers' online impulse buying, by applying the stimulus-organism-response (SOR) paradigm and social capital theory. This study conducted structural equation modeling (SEM), used online questionnaires to collect data, and got 230 responses from students of universities in Hanoi. The results of this study have pointed out that social capital consists of bridging social capital and bonding social capital has significantly affected impulse buying through the mediator factor - peer communication. Besides, utilitarian value, hedonic value, and browsing activity have not influenced impulse buying in this research context.

Keywords: *Social capital, social commerce, impulse buying, impulsiveness, impulse buying behavior*

1. Introduction

Over the past few years, the income of Vietnam's consumers has increased substantially, so expenses for goods or services consumption have also grown dramatically, especially online shopping. Verhagen and van Dolen (2011) pointed out that impulse buying occurs in about 40% of all online expenditures. The estimated e-commerce market size of Vietnam in 2021 is 13,7 billion \$, and the conjectured average growth rate of the e-commerce market of Vietnam is 16%. Online marketing information easily attracts users' attention and stimulates their desires to buy something during the online shopping, or e-tail process. As such, social commerce will be mainstream (Liang & Turban, 2011). It was used to incorporate commercial features and take advantage of the size and stickiness of social media users to offer a variety of value-added services or create e-commerce-based business channels to promote ads and transactions. Recently, more and more customers have tended

to interact to share product information on the Internet and buy products recommended by friends and relatives (Cheng et al., 2019).

Applying social capital to explain impulse buying is a new and growing trend in the world, but there are still not many scholars studying this field. Li-Ting Huang (2015), together with Putnam (2000) agreed to divide social capital into two types: bridging social capital - loose or less close relationships and bonding social capital - close relationships, and they strongly and positively affect consumers' urge to impulse buying through peer communication - interactions among other consumers in their network of relationships. The author has shown that people who have a lot of social networks or relationships and often interact with others tend to buy more impulsively. The views of friends, relatives, and other consumers have a strong influence on consumers' impulsive buying intentions. In Vietnam, researchers have not yet focused on exploring the relationship between social capital and impulse buying. Therefore, this paper will develop into the analysis of the impact of social capital on online impulse purchases and provide the results to suggest solutions for online retailers to push impulse buying.

2. Literature review and hypothesis development

2.1. Impulse buying and the SOR paradigm

There were a lot of definitions for impulse buying, Stern (1962) defined impulse buying as “any purchase which a shopper makes but has not planned in advance”. Furthermore, Rook (1987) indicated impulse buying is a sudden and strong desire to buy when consumers are stimulated. But in general, it is basically recognized that impulse buying has three characteristics: first, it is unplanned which means consumers have no prior purchase plan; secondly, it occurs when consumers are affected by external stimuli that lead to impulse reactions; the third is an emotional response. Consumers are often accompanied by strong emotional reactions in the process of impulsive purchases. These emotional reactions such as desire, excitement, and pleasure make them temporarily irrational and produce impulsive buying behavior.

The SOR paradigm was developed by Houston and Rothschild (1977). It is a micro-theory of how different types of involvement arise from the consumer, the situation, and the decision process interact, providing a rich explanation of how the purchase decision may be affected by different types of involvement. According to this model, a stimulus can provoke action, and an organism initiates internal processes to prepare for making the final response. Scholars have applied the SOR paradigm in explaining consumers' impulse buying behavior. For example, Li et al. (2014) explored consumers' purchase intention on social networking websites based on the SOR paradigm. Dholakia (2000) found out that marketing stimuli, situational factors, and the impulsivity trait of consumers usually lead to impulse buying.

2.2. Social capital theory and peer communication

Social capital

Through the years, scholars have researched social capital and its macro and micro influence on the economy. Nahapiet and Ghoshal (1998) defined social capital as “the sum

of the actual and potential resources embedded within, available through, and derived from the network of relationships possessed by an individual or social unit” (p. 243). They pointed out that there is a structural connection between individuals, through that connection individuals can have more information, knowledge, and material support from people in the network. Social capital includes bonding social capital and bridging social capital (Putnam, 2000). Bridging social capital refers to “loose ties” through which individuals can gain more new knowledge, information, and perspective. Therefore, the more bridging social capital consumers possess the more information and opportunity they will gain throughout interacting with members of diverse backgrounds. Accordingly, the following hypothesis is proposed.

H1: *Consumers’ bridging social capital is positively associated with their perceived peer communication in a social network.*

In the contract, bonding social capital exists in “strong ties” that provide individuals with both material and emotional support. Individuals tend to interact with their close friends frequently and can have discussions and emotional support through intensive communication. Accordingly, the following hypothesis is proposed.

H2: *Consumers’ bonding social capital is positively associated with their perceived peer communication in a social network.*

Peer communication

During communicating with others, individuals gain more information, knowledge, and skills relating to the product that helps them understand the product and the seller better, form a certain emotional expectation such as trust or intimacy for the product, thereby promoting their behavior. Lueg and Finney (2007) have emphasized that peer communication strongly influences consumers' online purchase behaviors. Based on the above discussion, the following hypothesis is proposed:

H5: *Consumers’ perceived peer communication is positively associated with their urge to buy impulsively*

2.3. Utilitarian Value, hedonic Value, and Browsing activity

Utilitarian Value

Zhang et al (2018) defined utilitarian value as consumers’ perceptions regarding the extent to which online reviews can provide instrumental value and fulfill their needs. The more utilitarian value that consumers receive the higher possibility they will buy the product. Consumers perceive obtaining useful information from online reviews, then they are more likely to do browsing (Kusmaharani and Halim, 2020). Thus, the following hypothesis is proposed:

H3: *Utilitarian value of online reviews positively influences browsing of consumers*
Hedonic Value

Hedonic value focuses on the entertaining such as fun and delightful aspects of shopping behavior, and positively influences consumers’ impulse buying behavior (PPark, Kim, Funches, & Foxx, 2012). Consumers who enjoy reading online reviews are likely to

spend time browsing the reviews. Moreover, searching for information online is believed to be a way of self-reward by giving themselves (consumer) leisure and escapism (Mathwick et al., 2001). Accordingly, the following hypothesis is proposed.

H4: *Hedonic value of online reviews positively influences browsing of consumers.*

Browsing activity

Browsing is defined as the activity of scanning product information for either information-seeking purposes or entertainment-seeking purposes, without having buying intention (Verhagen and Van Dolen, 2011). Youn and Faber (2000) have pointed out that browsing activity has the potential to exert a greater influence on the urge to buy impulsively of consumers. Therefore, the following hypothesis is proposed.

H6: *Browsing activity positively influences the urge to buy impulsively.*

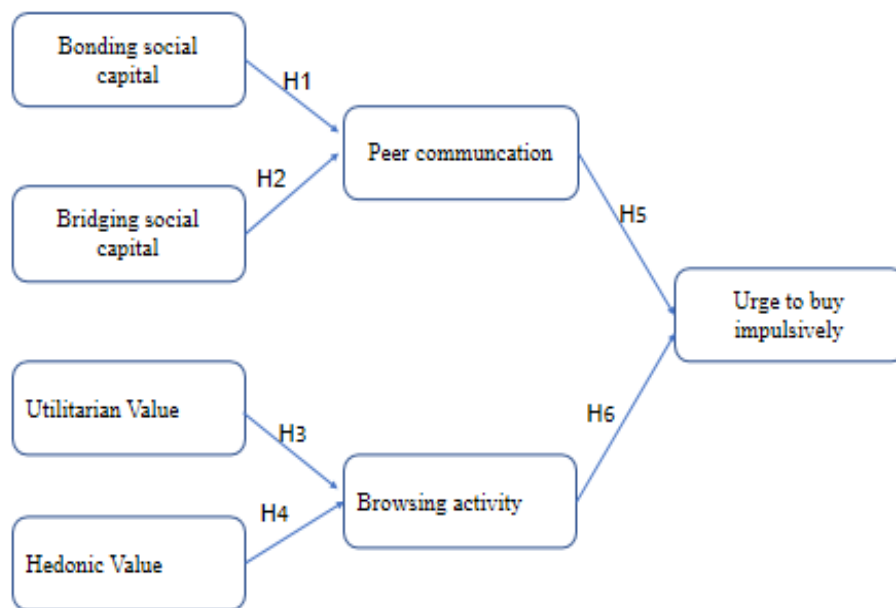

Figure 1. Modified Research Model

3. Method

3.1. Research design

This study was conducted through a quantitative survey method, using structural equation modeling (SEM). All items in the measurement scale were measured with a 5-point Likert scale, ranging from strong disagreement to strong agreement. The study adapted items from previous studies and adjusted them to fit with this research context with 24 items in total: Urge to buy impulsively (3 items), bonding social capital (3 items), bridging social capital (5 items), peer communication (4 items), hedonic value (3 items), utilitarian value (3 items).

3.2. Sample and data collection

The hypothesis was examined through the data of 230 respondents. This study employs an online questionnaire, the link of the questionnaire was posted on Facebook groups and other social media for three weeks. The details of the respondents' characteristics were shown in table 2.

Table 1. Sample characteristics

Sex	Male	22.6%
	Female	77.4%
Years of university	First year	30 %
	second year	10.4%
	Third year	53.9%
	Fourth year	4.8%
	Others	0.9%
Time using the internet	less than 1 hour	0.9%
	1-3 hours	12.2%
	3-5 hours	31.7%
	More than 5 hours	55.2%
The amount of money spent for online purchasing per month	Under 500.000 VND	47%
	500.000-1000.0000 VND	37%
	1000.000-3000.000 VND	13%
	More than 3000.000 VND	3%

4. Results

This article used SPSS 20 and AMOS 20 software to analyze the collected data. Before testing the hypotheses, the reliability and validity of these items have been evaluated. To begin with, all variables are useful because Cronbach's Alphas are close to or above the standard threshold of 0.8. Moreover, all items have the value of Cronbach's Alpha if Item Deleted is smaller than the Cronbach's Alpha, so no variables are eliminated.

Then, by carrying out exploratory factor analysis (EFA), VXHBC2 (item 2 for bridging social capital) was abolished (Factor loading < 0.5). After that, confirmatory factor analysis (CFA) was applied for further tests of the measure validity. The results of CFA indicate acceptable fit: Chi-square/df = 1,886; GFI = 0,876; TLI = 0,906, CFI = 0,922; RMSEA = 0,062. The results exhibited that factor loadings of all items are higher than 0,5, while the average variances extracted (AVE) of all constructs are higher than 0.5. Therefore, the measures can be considered to have adequate convergent validities (Hair et al, 2018). The results show that all variables have the maximum shared variance (MSV) smaller than the average Variance Extracted (AVE), ensuring the test requirements.

Likewise, this study was conducted to plan and adjust the SEM model on AMOS for qualitative analysis to exact test and confirm the theoretical model theory of assessing the influence of social capital (VXH) to urge impulse buying. Model fits data studied by Chi-square/df = 1,945; TLI = 0,901; CFI = 0,914; RMSEA = 0,064; GFI= 0,868. Based on the below SEM analysis table, there are 3 hypotheses (H3,H4,H6) which are not supported as p value is smaller than 0.05.

Figure 2. Regression Weights

The hypotheses were tested as described in Figure 3 and the result of hypothesis testing are shown in Table 2. From Figure 3, concerning H1 and H2, both bridging social capital ($\beta=0.425$, $p < 0.005$) and bonding social capital ($\beta=0.41$, $p < 0.005$) has a significant positive effect on peer communication. Therefore, H1 and H2 are fully supported. Additionally, supporting H5 peer communication was found have significant positive effect on urge to buy impulsively ($\beta=0.693$, $p < 0.05$). With regard to H3 and H4, we found that both utilitarian value ($\beta=0.046$, $p > 0.005$) and hedonic value ($\beta=0.106$, $p > 0.05$) are also found to generate a significant positively effect on browsing activity, but their p-value were bigger than 0.05, which means H3 and H4 are unsupported. In the same way, H6 ($\beta=0.079$, $p > 0.05$) is also unsupported. Furthermore, the model successfully accounted for an amount of variability in urge to buy impulsively with an R-squared value of 41.1 %, peer communication with an R-squared value of 58.2%.

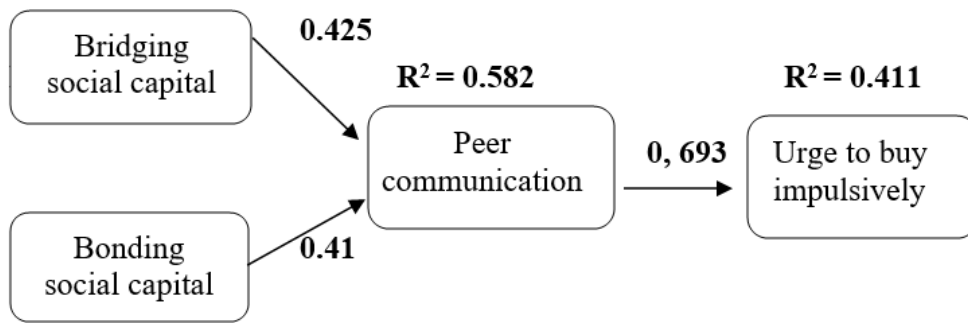

Figure 3. Results of the Research Model Tests

Table 2. Estimated results analysis table

			Estimate	S.E.	C.R	P
PC	<---	VXHBC	,425	,094	4,498	***

BW	<---	UV	,046	,073	,639	,523
BW	<---	HV	,106	,082	1,299	,194
UTB	<---	PC	,639	,081	7,889	***
UTB	<---	BW	,079	,071	1,106	,269

5. Discussion and Conclusion

In conclusion, the results of this study have confirmed the significant influence of social capital on impulse buying. First, the results of this research accord with the results of prior studies (Li-Ting Huang, 2015; Kusmaharani and Halim, 2020). Research confirmed the contributions of social capital in impulse buying and has strengthened the influence of bridging social capital over the influence of bonding social capital. Relationships in social networking enabled consumers to converse with peers, through that they can get more support from peers and discuss the product, therefore, resulting in impulse buying.

Second, utilitarian value, hedonic value, and browsing activity did not impact impulse buying in the context of Vietnam. This result was not in contract with previous research. Zhang et al (2018), Wang (2010), Kusmaharani and Halim (2020) have shown that utilitarian value, hedonic value, and browsing activity had slightly impacted impulse buying.

Thus, this study has contributed to the academic framework of impulse buying's overview when studying the influence of social capital on impulse buying in the context of Vietnam and the research subject - students who have low income but tend to buy goods impulsively (Nguyen Thi Phuong Anh and Vu Huy Thong, 2020)

In terms of practical implications, the research results are the basis to propose some solutions to help increase sale revenue for online retailers. The results of the research implies

that in order to create students' online impulse purchases, it is crucial for those brands to acknowledge the importance of two social factors that can cause impulse buying through the mediator factor - peer communication, namely: bridging social capital and bonding social capital. Many brands should actively monitor peer communications of potential consumers in social media. By monitoring, these brands can quickly detect and take care of negative peer communication. Furthermore, these retailers also can create communities of the brand in social media (for example, Facebook groups) or official websites to connect peers and non-peers with those of the same interest. Based on the findings, they can promote bridging social capital between consumers by taking advantage of the influence of KOL or online reviews. In addition, they could lead consumers to impulse purchases of their products by improving bonding social capital. For example, those brands can apply referral programs which is a system that incentivizes previous customers to recommend your products to their family and friends. Retail stores create their own referral programs as a way to reach more people. Besides, "Groupon" which is a portmanteau of the words group and coupon, can also be promoted and further developed by retailers.

Limitations and Recommendations

Like any other research, this study also has limitations. Firstly, this study used the convenience sampling method for collecting data, and the diversity of the respondents is limited, only focusing on the students (aged 18-22 years old). Secondly, this study has not focused on the difference between people of different ages or incomes or examined it in a particular type of product. Further work could broaden the sample of research and investigate more about the distinction among different ages, sex, and incomes.

Abstract

With the current development of technology, people tend to communicate and exchange through social networks. Since then, more and more companies have invested in audiovisual content, as part of their product/brand outreach strategy. Youtube is one of the most used social networks in recent years. This study focuses on the extent to which Youtubers influence the purchasing intention of young Vietnamese through the products/brands advertised by Youtubers based on consumer brand engagement theory. A survey with 8 factors was conducted by 503 young people in Vietnam. The survey results were then analyzed by SPSS and AMOS software to determine the correlation between independent and dependent variables. The analysis results show that Youtuber has the strongest influence on the shopping intention of young Vietnamese through trust. Youtubers need to increase the trust of their followers through making a good impression and making followers remember and think more about the YouTuber's creative content.

Key words: *purchase intention, Youtuber, young Vietnamese*

1. Introduction

As media grows, influencers through digital platforms will have the opportunity to interact with their fans (Kowalczyk & Pounders, 2016), thus establishing interaction points where has a mix of consumer value, influencers and brands (Hinson et al., 2019) is important. The media provides a networking space that allows consumers to recommend products, express dissatisfaction, express opinions, convince or relieve doubts from the help of other users in the brand community (Yusuf, 2018).

In 2019, YouTube ranked as the second most visited website in the world (after Google), with 23 minutes of average user time (SimilarWeb, 2020). Besides that, YouTube provides a space for YouTubers and followers to discuss about brands and products (Burgess & Green, 2018). In this space, YouTubers produce and share content that positively influences the online community, thus leading to the establishment of strong relationships with their followers as well as with companies that refer to their videos to implement new market strategies (Sabich & Steinberg, 2017). Because YouTubers have the ability to create

content that is viewed by millions (SocialBlade, 2020), brands also want to be able to use YouTubers as a channel to promote their brands.

However, a new problem: how to make communication activities through youtuber most effectively? This study will help those have interest, answer this question through the theory of consumer brand engagement as well as measuring the influence of youtubers on the buying intention of followers and bring out practical solutions.

2. Literature review and proposed model

2.1. Literature review

2.2.1. Definition

Consumer brand engagement focuses on the interactive experience during a customer journey, and it is also defined as “a consumer's positively valenced brand-related cognitive, emotional and behavioral activity during or related to focal consumer/brand interactions” (Hollebeek et al., 2014). The dimension of cognitive processing is described as “a consumer's level of brand-related thought processing and elaboration in a particular consumer/brand interaction”. An emotional dimension of engagement is “a consumer's degree of positive brand-related affect in a particular consumer/brand interaction”. Whereas, the behavioral dimension is defined as “a consumer's level of energy, effort and time spent on a brand in a particular consumer/brand interaction” (Hollebeek et al., 2014). In short, it can be said that customer engagement is a customer's voluntary resource contribution to a firm's marketing function above and beyond financial patronage (Pansari & Kumar, 2017).

In the study on engagement, Hollebeek (2014) stated that it represents a motivational, individual-specific, and context-dependent variable emerging from two-way interactions between relevant engagement subject(s) and object(s). Therefore, engagement can be viewed as a state in which pragmatic values, as well as social aspects, are embedded in the consumption experience and can be beyond purchase. This concept is in great agreement with findings of many studies related to engagement, however, some other researchers provide a different viewpoint. They point out that customer engagement, including non-commercial and direct engagement, begins with a customer's first interaction with your brand (Pansari & Kumar, 2017), tailored to each social media platform (Voorveld et al., 2018).

2.2.2. Components

There are three ways to determine consumer engagement (Abdul-Ghani et al., 2012). Specifically, it includes: (i) Cognitive Processing: Cognitive processing is defined as the degree a particular brand builds positive thoughts, impression to customers; (ii) Affection: refers to the degree of a consumer's positive influence on a brand in interactions with a particular brand. (Hollebeek et al., 2014); (iii) Activation: is defined as the level of energy, effort and time a consumer spends on a brand in interaction with a particular brand (Hollebeek et al., 2014)

2.2. Proposed model and research hypothesis

2.2.1. Proposed model

Based on the consumer engagement theory by Hollebeek & Chen (2014), this study has synthesized and modeled (Figure 1). This model is also completely suitable based on the

assessment of Correa (2020). When customers have greater interaction, their intention to use will increase (Hollebeek, 2014).

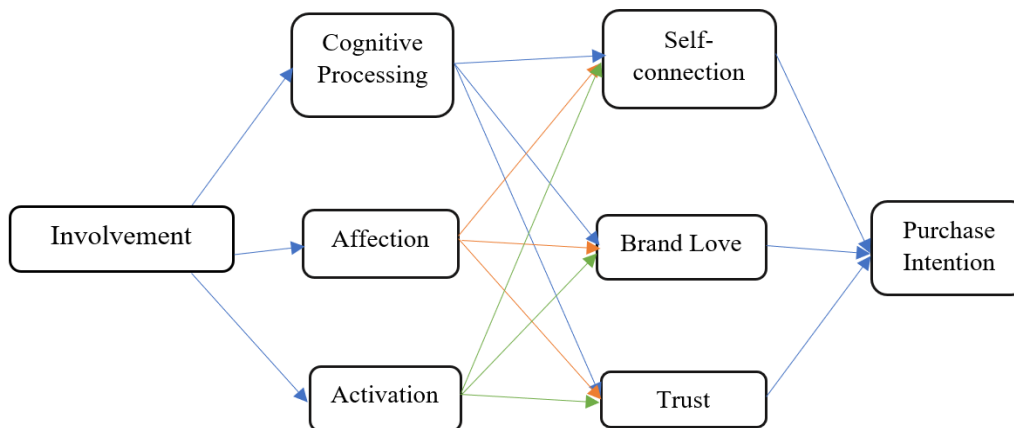

Figure 1. Proposed model

Source: Our group selected and summerized

2.2.2. Research Hypothesis

Involvement is “a person’s perceived relevance of the object based on inherent needs, values and interests” (Zaichkowsky, 1994). The engagement in an object has been closely linked to the participation and connection with it (Vivek et al., 2012). YouTubers are influencers, providing consumers with trusted content about the products they share. Therefore, the authors can assume that:

H1a. The involvement of the public with the YouTuber of his preference impacts the cognitive dimension of the engagement positively.

H1b. The involvement of the public with the YouTuber of his preference impacts the affective dimension of the engagement positively.

H1c. The involvement of the public with the YouTuber of his preference impacts the behavioural dimension of the engagement positively.

Hollebeek (2014) argues that self connection is a consequence of the interactive, co-creative experiences between followers and Youtubers. The basic values, goals, and self-concept of Youtubers are in relation with that of their followers (Hollebeek, 2014). Brands in general and YouTubers in particular tend to become more important to consumers when cultivating the brand-consumer relationship (Escalas, 2004). Therefore, the following hypothesis can be raised:

H2a. The cognitive processing of the public’s engagement with the YouTuber of his preference creates his self-connexion with the YouTuber.

H2b. The affection of the public’s engagement with the YouTuber of his preference creates his self-connection with the YouTuber.

H2c. The activation of the public’s engagement with the YouTuber of his preference creates his self-connection with the YouTuber.

On the social media platforms, YouTubers are seen to be honest and trustworthy by their followers (Rasmussen, 2018). Also, Matos & Rossi (2008) believe that the engagement has a positive and significant influence on the brand loyalty and long-term commitment. In addition, it will build the consumer trust (Bowden 2009; Kumar & Pansari 2016; Ramani & Kumar 2008; Van Doorn, 2010). Chang & Dong (2016) argue that a strong customer engagement will appeal to them, that makes an essential role in further building loyalty when a customer can get necessary information about services or products. Therefore we have the below hypothesis:

H3a. The cognitive processing of the engagement of the public with the YouTuber of its preference results in trust in the YouTuber.

H3b. The affection of the engagement of the public with the YouTuber of its preference results in trust in the YouTuber.

H3c. The activation of the engagement of the public with the YouTuber of its preference results in trust in the YouTuber.

When being provided participation and engagement with brands, customers who experience brand engagement can develop brand love (Vernuccio et al., 2015). In this study, the brand is the YouTuber and the consumer is the follower. In addition, according to Minjung Shin et al (2019), engagement has an effect on brand love, however, in previous studies, this hypothesis was rarely mentioned. Research by Minjung Shin et al (2019) shows that brand love comes not only from content (product quality) but also from customer engagement with images or text on social networks, for example. Therefore we have the below hypothesis:

H4a. The cognitive processing of the engagement of the public with the YouTuber of its preference results in YouTuber brand love.

H4b. The affection of the engagement of the public with the YouTuber of its preference results in YouTuber brand love.

H4c. The activation of the engagement of the public with the YouTuber of its preference results in brand love for the YouTuber.

An engaging brand will be the self-image of a customer. When a consumer decides to be associated with a brand, it indicates that he (or she) finds certain similarities of values between them and the brand. He/she is satisfied with the brand, as it represents him/her in a symbolic way to his/her social group by determining who he/she is (Hollebeek & Chen, 2014). This proposal supports the following hypothesis:

H5. Self-connection of the public to the YouTuber of his preference determines its use intention of the brands indicated or used by the YouTuber.

According to social exchange theory, relationships characterized by trust are beneficial for maintaining this series of exchanges (Cropanzano and Mitchell, 2005). Therefore, it is suggested to build a strong relationship based on customer trust and loyalty, given the fact that customer trust has a positive effect on retaining repurchase intention. This relationship is represented by:

H6. The public's trust in the YouTuber if its preference determines its use intention of the brands indicated or used by YouTubers.

Customers who are in a brand love are more prone to transform their love into loyalty (Alnawas and Altarifi, 2016), same as the intention to incorporate the brand. In this direction, H7 was formulated:

H7. Brand love of the public to the YouTuber of its preference determines its use intention of brands indicated or used by the YouTuber.

3. Method

3.1. Measuring Scale

The study was carried out by using a questionnaire consisting of questions about factors with a scale of 1 to 5 (1: completely disagree, 5: completely agree). Then, the group uses SPSS software to run the model to show the level of influence between the factors.

3.2. Research data

Gender

Table 1. Gender of survey

Gender	Number of people	Percentage
Female	354	70.4
Male	149	29.6

Source: Author group surveyed (2021)

In terms of gender, it can be seen that the Female gender accounts for a higher proportion of 70.4%, the remaining 29.6% are Male gender. In particular, of the 503 survey applications, there were 354 Girls and 149 Men participating in the survey.

Age

Next, the age of the survey participants is as follows:

Table 2. Age of survey

Age	Number of people	Percentage
15 - 20	142	28.2
21 - 25	305	60.6
26 - 30	56	11.2

Source: Author group surveyed (2021)

The primary age of respondents is 21 to 25 years olds, this is the age of university students who are the juniors, the seniors, and new commuters. This group accounts for 60.6% corresponding to 305 participants. In addition, the age of 15 - 20 accounts for 28.2% corresponding to 142 participants. This is the age of school students or the freshmen, the sophomores. The bottom line is the young people at the age of 26 - 30. This is the stage that they are focusing on their career.

Occupation

Table 3. The occupation of the respondents

Occupation	Number of people	Percentage
Entrepreneur	19	3.8
Student	346	68.8
Freelancer	54	10.7
Employee	77	15.3
The unemployed	7	1.4
Total	503	100

Source: Author group surveyed (2021)

From the table above, the main occupation of the survey participants is Student, which accounts for 68,8%. Next is Employee with 15.3%. In third place is Freelancer with 10.7%. The bottom line is Entrepreneur with 3.8% and the unemployed with 1.4%.

Time duration of following favorite Youtuber

The highest percentage of 1 year with 47.1% corresponding to 237 participants. The second place with 42.3% corresponding to 213 participants. The other is a three-year tracking which is dramatically low at 10.5%. It can be found that the more participation in the Youtube platform, the greater the number of people who want to become YouTubers, so the following Youtubers is getting popular and loving a Youtuber faithfully for a period of time will become shorter. Therefore, the level of loyal followers to a favorite Youtuber is mainly for a period of 0 - 3 years.

The frequency of following a favorite Youtuber

Table 4. The frequency of following favorite Youtuber

The frequency of following	Number of people	Percentage
Under 3 times a week	348	69.2
7 times a week	112	22.3
Over 7 times a week	43	8.5
Total	503	100

Source: Author group surveyed (2021)

People who follow under 3 times a week take the highest rate with 69,2%, corresponding to 348 participants. Next, people who follow 7 times a week accounts for 22,3%, corresponding to 112 participants. People who follow over 7 times a week take the lowest rate with 8,5%, corresponding to 43 participants. From the table above, it can be seen that from 0 to 7 times a week is the primary period of time that Followers watch the Youtuber they love.

The purpose of following Youtuber

The purpose of following favorite Youtuber is mostly Entertainment. Next is to Learn that accounts for 37,2%. Updating the information is in the third place with 12,1%. Occupation accounts for 7,8%. The rest are other purposes such as socializing,...

4. Results

4.1. The results of the scale testing by Cronbach's Alpha coefficient analysis

The results of Cronbach's Alpha analysis show that the following factors: Involvement deletes 3 variables, Self-connection deletes 2 variables. The remaining variables meet the requirements, with the result shown in Table 3.

Table 5. Synthesize data to test the scale by using Cronbach's Alpha analysis

Order number	Factors	The number of variables	Cronbach's Alpha	Corrected Item-Total Correlation (min)	Cronbach's Alpha if Item Deleted (max)
1	Involvement	8 (delete 3)	0.900	0.691	0.891
2	Cognitive Processing	3	0.808	0.628	0.766
3	Affection	4	0.804	0.609	0.759
4	Activation	3	0.825	0.670	0.770
5	Self-connection	7 (delete 2)	0.819	0.533	0.806
6	Trust	4	0.854	0.682	0.822
7	Brand love	4	0.808	0.539	0.800
8	Use intention	4	0.816	0.626	0.774

Source: Results from SPSS 22.0.

4.2. Scale test results by exploratory factor analysis

The test results of the coefficient KMO = 0.879 prove that the data is very good and meets the requirements for EFA analysis (Kaiser, 1974; Kaiser & Rice, 1974).

The results of the Bartlett test show that the coefficient Sig = 0.000 < 0.05, which means that the observed variables used to measure the total variable are correlated with each other (Bartlett, 1937; Bartlett, 1950).

After removing the SC3 variable, the remaining variables all meet the reliability requirements as shown in Table 4 below

Table 6. Variables and measuring indicators of variables

Items	Factor Loading
IN1: Youtuber X's video content is absolutely important	0.738
IN2: Youtuber X's video content is completely appropriate	0.802
IN4: Youtuber X's video content is absolutely captivating	0.853

Items	Factor Loading
IN5: Youtuber X's video content is absolutely valuable	0.774
IN6: Youtuber X's video content is absolutely worth watching	0.857
CP1: The more I watch the YouTuber of my preference, the more I think about him (her)	0.741
CP2: I think a lot about the YouTuber of my preference as I keep watching him (her)	0.826
CP3: Watching the YouTuber of my preference stimulates my interest to learn more about him (her)	0.682
AF1: I feel very positive when I watch the YouTuber of my preference	0.705
AF2: Watching the YouTuber of my preference makes me happy	0.723
AF3: I feel good when I watch the YouTuber of my preference	0.655
AF4: I'm proud to watch the YouTuber of my preference	0.773
ATC1: The more I watch the YouTuber of my preference, the more I think about him (her)	0.769
ATC2: I think a lot about the YouTuber of my preference when I watch him (her)	0.790
ATC3: Watching the YouTuber of my preference stimulates my interest in learning more about him (her)	0.797
SC2: I identify myself with the YouTuber of my preference	0.617
SC3: I feel a personal connection to the YouTuber of my preference	Deleted
SC4: I consider that the YouTuber of my preference helps me (or could help me) to be the person I wish to be	0.779
SC5: The YouTuber of my preference meets my needs	0.649
SC7: I watch the YouTuber of my preference to communicate to other people who I am	0.770
BL1: I love the YouTuber of my preference	0.695
BL2: I have feelings towards the YouTuber of my preference	0.595
BL3: I am in love with the YouTuber of my preference	0.711

Items	Factor Loading
BL4: I am a loyal fan of youtuber X	0.755
TR1: I lean on the YouTuber of my preference	0.780
TR2: I rely on the YouTuber of my preference	0.787
TR3: The YouTuber of my preference is an honest person	0.761
TR4: The YouTuber of my preference makes me feel secure	0.672
INT1: It makes more sense to use brands indicated or used by the YouTuber of my preference than other ones, even if they are similar.	0.733
INT2: Even if other brands have the same characteristics, as those indicated or used by the YouTuber of my preference, I still prefer the brands he (she) uses or indicates	0.716
INT3: Even when there are brands as good as the ones indicated or used by the YouTuber of my preference, I still prefer to use the brands he (she) uses or indicates	0.704
INT4: Even if other brands are no different in any way to the ones indicated or used the YouTuber of my preference, I still find it wiser to wear the brands indicated or used by him (her)	0.759

4.3. The results of confirmatory factor analysis CFA

According to Joreskog (1969), Bagozzi (1981), Brow & Cudeck (1993), Hair et al. (2010), the standards for model testing by AMOS are as follows:

chi/ square/ df = 1,846, which is less than 3, so the conclusion is good. CFI = 0,951 (> 0,95) is good. GFI = 0.915 is considered normal. RMSEA = 0.041 (< 0.06) shows that the model is suitable. TLI = 0.944 (> 0.9) is satisfactory.

In conclusion, from the parameters, we can conclude that the model meets the requirements as shown in Table 5 below

Table 7. Analyze CFA

Chi – square = 749.337	TLI = .944
df = 406	CFI = .951
Chi-square/df = 1.846	RMSEA = .041
GFI = .915	P = .000

Source: Results by Amos 21.0.

4.4. Hypothesis test results

Table 8. Results of estimating the relationship between the factors in the model

	Estimate	S.E.	C.R.	P
AF ← IN	.228	.064	3.564	***
CP ← IN	.449	.069	6.456	***
ACT ← IN	.518	.073	7.076	***
SC ← AF	.407	.056	7.336	***
SC ← CP	.285	.045	6.327	***
SC ← ACT	.068	.039	1.762	.078
TR ← AF	.293	.049	5.953	***
TR ← CP	.399	.047	8.395	***
TR ← ACT	.183	.040	4.638	***
BL ← ACT	.337	.044	7.733	***
BL ← AF	.206	.049	4.229	***
BL ← CP	.435	.049	8.962	***
INT ← TR	.352	.065	5.437	***
INT ← BL	.198	.054	3.695	***
INT ← SC	.222	.061	3.627	***

From Table 6 can take out some conclusions:

P-value of SC ← ACT = 0.078 (> 0.05). Therefore can conclude that ACT has no effect on SC.

Besides that, Involvement (IN) has the most influence on the factor Activation (ACT) with 0.518, ranked second is Cognitive Process (CP) with 0.449, and last is Affection (AF) with 0.228. This means that when followers are interested in their favorite YouTuber, followers tend to be influenced by that YouTuber the most in terms of action.

Next in terms of factors affecting Self-connection (SC), Affection (AF) has the most influence on SC with 0.407, followed by cognitive process (CP) with 0.285.

Regarding the factors affecting Trust (TR), Cognitive Process has the strongest influence on Trust with a coefficient of 0.399, ranked second is Affection with 0.293, and finally is Activation (ACT) with 0.183.

Regarding the factors affecting Brand Love (BL), the highest is Cognitive Process (CP) with the strongest influence on BL with 0.435, followed by Activation (ACT) with 0.337.

Regarding the factors affecting Use Intention (INT), the strongest influence is Trust (TR) with 0.352, followed by Self-connection (0.222) and finally Brand Love (0.198)

5. Discussion and Conclusion

The research shows that if Youtubers want to influence the purchasing intention of young Vietnamese through the products/brands advertised by them, it is essential to gain followers' trust. Therefore, Youtubers need to create helpful and unforgettable content to impress their followers. In addition, the effect of other factors on each other is approximate. Depending on this research, the authors would like to recommend several solutions to help entrepreneurs use Youtuber well as a communication channel to increase the purchase intention of young Vietnamese:

It is important for businesses and organizations to understand that the YouTubers who represent a brand must build a personal connection (in terms of emotions, interests, and behaviors) with their followers as well as with the brand. They need to recognize the self connection with customers because individuals tend to include important brands as part of their self-concept if they identify themselves with the brand (Dwayne Ball and Tasaki, 1992). When customers build their self-concepts by human brand of Youtubers, it is easier for brands and Youtubers to reach customers and enhance purchase intention.

Besides, the cognitive, emotional, and behavioral aspects of the engagement also affect the customer's trust and love with Youtuber, thereby positively impacting the purchase intention. It shows the importance of maintaining customer engagement with Youtubers of the brand. It is necessary for brands to make sure that their human brand, Youtubers, regularly engages with their followers or creates chances to boost the audience interaction. It is the reason why Youtubers need to develop and create content on a regular basis and engage with their followers such as replying to comments, liking comments under videos, live streaming, running giveaway programs, etc. Also, in order to help the human brand (Youtubers) and products approach, impress, and attract more potential customers, brands need to follow and create favorable conditions for Youtubers in engaging activities with followers. It, thereby, makes a contribution to boosting consumer engagement to drive purchase decisions.

If that YouTuber is cared but receives a lot of negative interactions, causing a lot of controversy in the online community, then choosing that Youtuber will not bring any impact to the brand. Therefore, when deciding to cooperate with KOLs, brands need to be very careful to choose the right partner because a Youtuber with a large awareness but follows a negative trend will not bring effective marketing to the enterprise.

Brands need to create a personal, emotional and trusting connect with their customers first before getting them to use their products. Companies need to pay attention to how Youtuber brings messages to customers, the similarity between Youtuber's image and brand value, previously built brand image. There are many factors that customers go through before they make a purchase decision. Enterprises should also note that YouTuber is just one of the reference channels between thousands of information sources on the internet and mass media, companies need to understand this to allocate media budgets in a reasonable way.

Abstract

Financial technology (Fintech) is developing strongly and comprehensively in recent years, which is expected to change the face of the world financial industry. However, that development is causing increased stress, reducing consumer confidence in the use of new technologies such as Fintech. To clarify the impact of Technostress and Technology Self-efficacy on intention to use Fintech services, the study uses Exploratory factor analysis (EFA) and Multiple linear regression based on 328 valid observations of young people living, studying and working in Hanoi. The results show that most of the factors of Technostress have a negative impact on the intention to use Fintech services. Meanwhile, Technology self-efficacy was found to not only increase the intention to use but also have a moderating effect on the impact of technology overload and uncertainty on the intention to use Fintech.

Key words: *Technostress, Technology Self-Efficacy, The intention to use Fintech services*

1. Introduction

Fintech (Financial Technology) is defined as “the use of technology to provide financial solutions” for the first time by Arner, Barberis and Buckley in 2015. It can be understood as the application of modern, creative and innovative technologies into the financial services sector, to effectively improve financial services, to meet the needs of users quickly and conveniently, such as: e-wallets, QR pay, online lending, mobile banking, online payments,... In recent years, the world has witnessed a boom in the Fintech field. Vietnam has also recorded outstanding development of the 2021

Vietnamese market with activities ranging from online payment to wealth management, online lending, investment,...; the number of users of Digital financial services skyrocketed, creating a premise for the Fintech industry to develop diversified, becoming a fertile ground for investors.

With favorable conditions such as young population, large percentage of people owning smartphones, and being paid great attention by the state, Vietnam is a potential market to exploit for the development of FinTech. In which, representing creativity, adapting and catching up with modern technology trends, young people are expected to lead in using Fintech services. Especially in Hanoi, the economic, political, cultural and technological center of Vietnam. Young people here have access to knowledge and advanced technology applications in the most complete and fastest way.

However, today's young people are facing a lot of pressure from all aspects of life, including Technostress - the perception that they are not capable of meeting all the requirements in terms of technology (Craig Brod, 1984). This negative emotion tends to discourage people from using technology, so it is important if Fintech businesses want to promote the use of advanced financial services. In addition, each individual has a unique assessment of his or her ability to perform an action, which affects the choices they will make, the effort they put in, and their perseverance in the face of challenges. called self-efficacy (Venkatesh and Davis, 1996; Rogers, 2010). This is also a psychological factor that greatly influences the decision to use Fintech services, depending on the assessment, information analysis as well as confidence in one's ability to complete the task.

However, the impact of these factors on the intention to use Fintech services has not been really interested. Previous studies on the intention to use Fintech have mainly focused on factors such as usefulness, ease of use, or perception of risk,... Therefore, the topic "Research on the impact of Technostress and Technology self-efficacy on young people's intention to use Fintech in Hanoi" was selected, thereby helping to have a more comprehensive view of the motivation to use Fintech services for young people, promoting the development of the Fintech industry in Vietnam.

2. Literature Review

2.1. Fintech Growth in Vietnam

According to the global Fintech center ranking in 2021, Vietnam's Fintech market has made leaps and bounds, ranking 70th in the global rankings, ranking 14th out of 50 in Asia, with Ho Chi Minh City and Hanoi ranked 28th and 33rd respectively in the Asia - Pacific region. Vietnam's fintech ecosystem is divided into many areas of activity, such as payment, P2P lending, insurtech, crowdfunding, retail investment & wealth management, blockchain/cryptocurrency, creditscoring, SMEs Financing, Comparison, POS... According to statistics, Fintech in Vietnam is the strongest development in the payment, in which the type of e-wallet is mainly. While a wide range of sectors have been heavily affected by the COVID-19 epidemic, e-wallets in particular have a great opportunity to break through. Electronic payments are said to grow stronger and will become inevitable trends in the

future. E-commerce enterprises account for 31% of the number of existing enterprises. This is considered the main field with typical applications such as Momo, Zalopay, Viettelpay, Moca, Vnpay, ShopeePay, Napas. The development of digital technology has played an important role, promoting a new online lending method of peer-to-peer lending (P2P Lending). It was followed by businesses operating in the blockchain/cryptocurrency sector accounted for 13% of the existing Fintech enterprises. However, Fintech enterprises operating in the field of Investment and Asset Management accounted for only 7.5%, showing that the "supply" of technology solutions for this field is still in short supply, as well as a potential field for startups in the coming time. Businesses that have successfully developed this field can mention Finhay, Fmarket, Tikop, Fireant ...

2.2. Technostress

Technostress is mentioned in a variety of terms, such as computer anxiety, negative attitudes toward computers, computer stress, fear of technology, computer phobia and cyberphobia. Technostress was first used by Craig, Brod (1984), who defined it as a disease adapted to modernity caused by the inability to cope with the development of computer technologies in a healthy manner. According to Tarafdar et al. (2007), technostress consists of 5 factors: techno-overload; techno-invasion; techno-uncertainty; techno-complexity; techno-insecurity. Technostress is characterized by the stress and anxiety an individual feels when using technology. This negative emotion is considered important because it tends to discourage people from using the technology in subsequent times.

Often depending on different user characteristics, each individual will accept innovation at different times on the basis that when they first experience it without all individuals simultaneously accepting innovation (Roger, 1995). Research by Sanjaya et al. (2018) concluded that technological stress has a negative impact on fintech intent. This conclusion is similar to the conclusions of Son (2019) and Lee (2021). Accordingly, the higher an individual's level of technology stress, the less likely that individual is to use Fintech. In addition, Lee's research (2021) that divides technostress into four factors: techno-overload; techno-invasion; techno-uncertainty; techno-complexity also shows that these four factors all have a direct negative impact on Fintech usage intention.

Hypothesis 1: Techno-complexity is negatively related to the intention to use Fintech services

Hypothesis 2: Techno-overload is negatively related to the intention to use Fintech services.

Hypothesis 3: Techno-invasion is negatively related to the intention to use Fintech services.

Hypothesis 4: Techno-uncertainty is negatively related to the intention to use Fintech services.

2.3. Technology Self-Efficacy

Venkatesh and Davis (1996) defined computer self-efficacy as a self-assessment of an individual's ability to use information technology or one's belief that humans could use computers or Internet-related technologies. Meanwhile, Rogers (2010) found that technology self-efficacy is a characteristic that can vary from level to the individual's level and has a positive effect on the adoption of new technologies, and that technology self-

efficacy has a positive relationship with the innovation and acceptance of new technologies by the leader. In organizations.

Self-efficacy affects acceptance directly as well as indirectly through other variables. Self-efficacy has a positive impact on ease of use (Venkatesh, & Davis, 1996), which in turn positively affects technology adoption (Hill, Smith, & Mann, 1987). When users have the confidence to use technology as they have the necessary skills or help, they will likely be more likely to accept using the technology. The higher the level of effectiveness of people for technology, the more motivated they are to use it (Liaw, 2002). In addition, self-efficacy positively affects enjoyment and usefulness, which in turn positively affects acceptance (Liaw, 2002).

Jumardi et al. (2019) have the same conclusion that self-efficacy positively impacts the intent to use Fintech services, the higher the self-effectiveness of an individual, the higher the intention that the individual desires to use technology.

Hypothesis 5: Technology self-efficacy is positively related to the intention to use Fintech services.

Internet stress has a negative impact on the self-effectiveness of the Internet (Bandura, 1997). Previous research has shown that new users who have been using the Internet for two years or less experience stress issues than online and are also less satisfied with their Internet skills than veteran users (GVU, 1999). Son (2019) has concluded that self-efficacy has a positive impact on reducing technostress. This means that the higher the self-efficacy of a technology user, the less stressed he or she is about the technology. In addition, Lee (2021) has broken down technological tensions into four factors from which to study the impact of technology self-efficacy on the relationship between the factors of technostress and the Fintech usage intention of Gen Z China. The above research indicates that technology self-efficacy significantly reduces the negative impact of techno-overload and techno-complexity on Fintech usage intention, but the above factor do not affect the relationship of the two factors of techno-invasion and techno-uncertainty with the intention to use Fintech.

Hypothesis 6: Technology self-efficacy lowers the negative impact of techno-complexity on the intention to use Fintech services.

Hypothesis 7: Technology self-efficacy lowers the negative impact of techno-overload on the intention to use Fintech services.

Hypothesis 8: Technology self-efficacy lowers the negative impact of techno-invasion on the intention to use Fintech services.

Hypothesis 9: Technology self-efficacy lowers the negative impact of techno-uncertainty on the intention to use Fintech services.

The author offers a research model based on the following hypotheses, which are presented in Fig. 1:

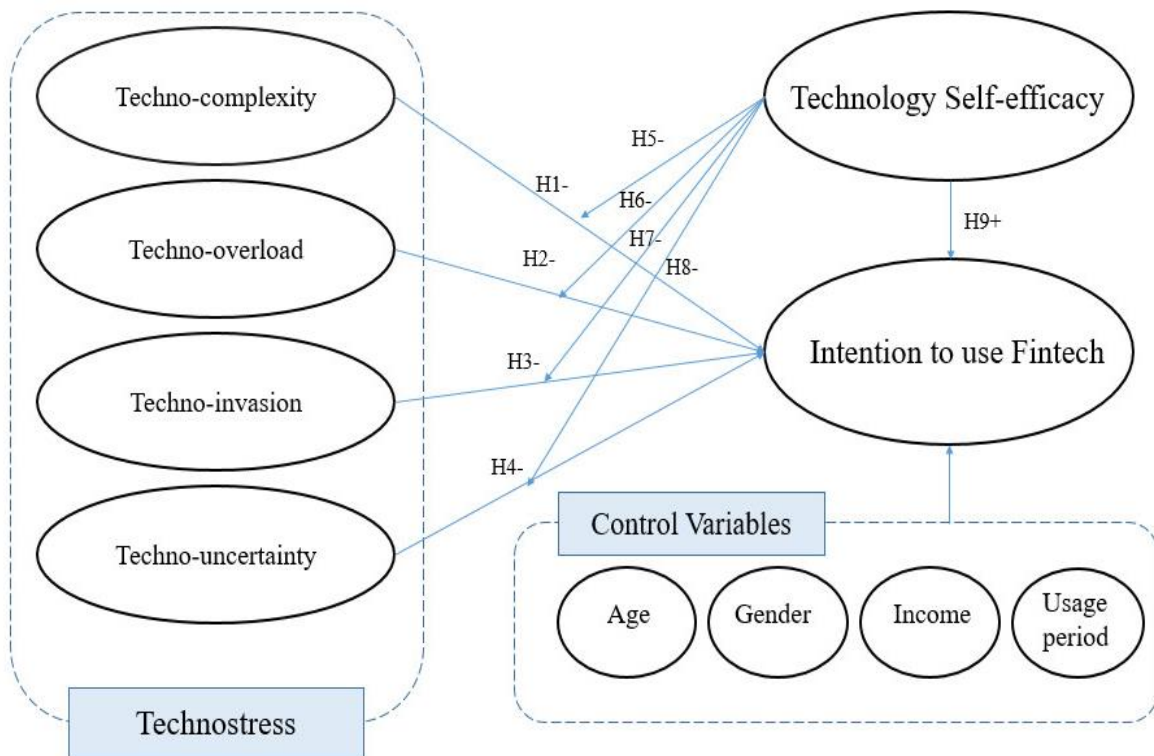

Figure 1. Research Model

3. Method

First, we conducted a pilot survey to check the accuracy and intelligibility of the questionnaire's content, and at the same time to evaluate the effectiveness of the survey in collecting and exploiting data before completing the survey conduct a formal survey. Accordingly, the group distributed questionnaires to 10 respondents in Hanoi. In general, the survey was accepted, easy to understand, and only needed some terminology to be adjusted to avoid misunderstanding the meaning of the questions. After editing, we conducted a large-scale online survey through a Google form. The questionnaire was sent directly to the survey subjects, and posted on websites and study groups of schools. After collecting the necessary number of samples (specifically 343 samples), we checked and cleaned the samples to ensure objectivity. According to statistics, there were 15 invalid votes and were discarded, the final number of valid votes was 328 votes, equivalent to 95.6%. The survey processed from February 21, 2022 to March 20, 2022.

The scales are based on previous studies and have certain adjustments to suit the objectives and context in Vietnam. To measure cognitive-related variables, the research team selected a 5-level Likert scale. The scale of Technostress is measured with 4 factors: Complexity (4 observed variables), Overload (4 observed variables), Invasion (4 observed variables), Uncertainty (3 observed variables). Scale of technology self-efficacy (4 observed variables). Scale of Fintech usage intention (5 observed variables).

Data analysis methods were performed including: Descriptive statistical analysis, Cronbach's Alpha reliability test, Exploratory factor analysis (EFA), Pearson correlation analysis, Regression analysis.

4. Results

4.1. Cronbach's Alpha reliability test

The reliability test results show that the scales used in the study all have Cronbach's Alpha coefficient > 0.6 . This proves that 6 scales are all satisfied. The detailed results of reliability analysis are shown in Table 1.

4.2. EFA exploratory factor analysis results

For independent variables (CPL, OVL, IVS, UCT): KMO coefficient > 0.5 shows that the factor analysis is consistent with the data and Sig. = 0.000 < 0.05 , showing that the observed variables are correlated with each other in the population. Factor Loading of all observed variables are satisfactory (> 0.5). Eigenvalues of the first 4 factors > 1 , so 4 factors are kept in the model and these 4 factors explain 64.098% of the variability of the data.

For the moderating variable (TSE) and the independent variable (FUI): The KMO coefficient of the two variables > 0.5 shows that the factor analysis is consistent with the data and Sig. = 0.000 < 0.05 , showing that the observed variables are correlated with each other in the population. Factor Loading of all observed variables are satisfactory (> 0.5). The Eigenvalues of the first factor in both variables are > 1 , so 1 factor is retained for each variable and these two factors explain 70.378% and 65.575% of the data variability respectively. The research model is considered suitable.

Table 1. Measurement item's loading and construct's convergent validity

	1	2	3	4	5	6
CPL4	0.882					
CPL2	0.870					
CPL3	0.869					
CPL1	0.800					
UCT2		0.926				
UCT1		0.909				
UCT3		0.843				
IVS3			0.821			
IVS4			0.806			
IVS2			0.786			
IVS1			0.617			
OVL3				0.711		
OVL2				0.707		
OVL4				0.652		
OVL1				0.616

	1	2	3	4	5	6
TSE1					0.838	
TSE2					0.797	
FUI2						0.880
FUI1						0.839
FUI3						0.823
FUI4						0.754
FUI5						0.745
Cronbach's Alpha	0.879	0.879	0.756	0.601	0.859	0.865
KMO		0.738			0.787	0.821
Eigenvalues	3.154	2.363	2.300	1.798	2.815	3.279

CPL: complexity; OVL: overload; IVS: invasion; UCT: uncertainty; TSE: technology self-efficacy; FUI: fintech usage intention.

4.3. Pearson correlation analysis results

The data in Table 2 shows that most of the independent variables have a correlation with the dependent variable, except for CPL and IVS. However, in this step, we do not remove the variables, but only evaluate their correlation with the dependent variable. It can be seen that UCT, TSE, OVL, and FUI have only a weak correlation, although non-linear relationships between them may still exist. The values show a weak correlation between the independent variables, which demonstrates that there is little chance for multicollinearity to exist between the constructs.

Table 2. Correlations matrix between constructs

	age	gen	inc	year	CPL	OVL	IVS	UCT	TSE	FUI
age	1									
gen	0.047	1								
inc	0.005	-0.095	1							
year	0.010	-0.045	0.352*	1						
CPL	0.027	0.099	0.020	-0.048	1					
OVL	0.051	-0.103	0.003	-0.064	0.035	1				
IVS	0.041	-0.103	0.096	0.003	0.070	0.043	1			
UCT	0.031	0.049	0.016	0.017	-0.104	-0.086	-0.026	1		
TSE	-0.037	0.043	-0.009	0.007	-0.026	-0.040	-0.075	0.383*	1	
FUI	-0.031	0.035	0.016	0.080	0.033	-0.208*	-0.042	0.462*	0.442*	1

Note: * $p < 0.01$. gen: gender; inc: income; year: smartphone usage period; CPL: complexity; OVL: overload; IVS: invasion; UCT: uncertainty; TSE: technology self-efficacy; FUI: fintech usage intention.

4.4. Multiple regression results

This study uses a quantitative approach to identify the relationship between Technostress, Technology Self-efficacy and Fintech usage intention. Technology Self-efficacy is simultaneously used as independent variable and moderating variable. Besides, this study uses 4 control variables, namely: age (age), gender (gen), income (inc), smartphone usage period (year). Multiple linear regression is used to determine the effect of the independent variables and moderating variable on the dependent variable. The model of analysis is represented by the following equation:

$$FUI = \beta_0 + \beta_1age + \beta_2gen + \beta_3inc + \beta_4year + \beta_5CPL + \beta_6OVL + \beta_7IVS + \beta_8UCT + \beta_9TSE + \beta_{10}CPL*TSE + \beta_{11}OVL*TSE + \beta_{12}IVS*TSE + \beta_{13}UCT*TSE + u_i$$

Where, β_0 : Intercept; $\beta_1, \dots, \beta_{13}$: regression coefficient; CPL*TSE, OVL*TSE, IVS*TSE, UCT*TSE: interaction variables showing the moderating impact of TSE on the relationship between independent variables and dependent variable; u_i : error.

- Result of the first regression:

Regression results show that the Adjusted R Square of the model is 0.337, which means, 33.7% of the variation of the dependent variable FUI is explained by the variation of the independent variables. $F = 13.811$, $Sig. = 0.000$ shows that the given linear regression model fits the data set.

Sig. value of UCT, OVL, TSE, UCT*TSE, OVL*TSE are 0.000, 0.000, 0.015, 0.036 respectively, all < 0.05 , showing that these 5 variables are statistically significant and have a certain influence on the dependent variable FUI (significant level of 5%). The control variables are not statistically significant because of $Sig. > 0.05$ so that they will be excluded from the model. Simultaneously, CPL, IVS, CPL*TSE, IVS*TSE did not guarantee statistical significance, so the research team decided to remove these variables and run the regression model again.

- Results of the second regression:

After removing the variables that were not statistically significant in the first regression, the multiple linear regression equation was adjusted as bellows:

$$FUI = \beta_0 + \beta_1OVL + \beta_2UCT + \beta_3TSE + \beta_4OVL*TSE + \beta_5UCT*TSE + u_i$$

The results in Table 3 show that Adjusted R Square = 0.335. This means that the variation of 3 independent variables OVL, UCT, TSE and 2 interaction variables OVL*TSE, UCT*TSE explain 33.5% of the variation of the dependent variable. Sig. value of the F test = $0.000 < 0.05$, which means that the research model fits the population. At 5% significance level, all variables in the model are Techno-overload (OVL), Techno-uncertainty (UCT), Technology Self-Efficiency (TSE), and two interacting variables OVL*TSE, UCT*TSE have a certain impact on the dependent variable Fintech Usage Intention (FUI). Besides, VIF < 2 , so it can be concluded that this model does not have multicollinearity.

Table 3. Multiple Regression Results

Variables	FUI				
	Unstandardized Coefficients	Standardized Coefficients	t	p-value	VIF
Constant	0.033		0.718	0.473	
UCT	0.311	0.311	6.198	0.000	1.241
OVL	-0.164	-0.164	-3.615	0.000	1.016
TSE	0.286	0.286	5.688	0.000	1.240
UCT*TSE	-0.086	-0.136	-2.820	0.005	1.137
OVL*TSE	-0.027	-0.030	-2.001	0.045	1.067
Adjusted R Square = 0.335; F = 33.883; Sig. = 0.000					

Hence, based on the regression results in Table 3, the research team draws the final regression model showing the impact of Technostress and Technology Self-efficiency on the intention to use Fintech as below:

$$\text{FUI} = 0,033 - 0,164*\text{OVL} + 0,311*\text{UCT} + 0,286*\text{TSE} - 0,086*\text{UCT}*\text{TSE} - 0,027*\text{OVL}*\text{TSE}$$

4.5. Hypotheses Test

Regression results in Table 3 show that CPL and IVS have Sig. = 0.159 and 0.930 > 0.05 respectively, show that Techno-complexity and Techno-invasion does not affect the usage intention of fintech services, so the hypotheses H1 and H3 are rejected. Simultaneously, the two interacting variables CPL*TSE and IVS*TSE of these two factors were also eliminated, so the hypothesis H6 and H8 are also rejected.

Factor Techno-overload has Sig. = 0.000 < 0.05, $\beta = -0.164$ proves that the degree of overload has a negative impact on the intention to use Fintech services, so the hypothesis H2 is accepted. Specifically, in the absence of other factors, when Techno-overload increases by 1 unit, the average of Fintech services usage intention will decrease by 0.164 units. The value of the Standardized coefficient shows that Techno-overload has an effect of about 16.4% on the intention to use Fintech services.

Hypothesis H4 assumes that Techno-uncertainty has a negative impact on the intention to use Fintech. Regression results with Sig. = 0.000 < 0.05, $\beta = 0.311$ proves that Techno-uncertainty has a positive impact on the intention to use Fintech services, so the hypothesis H4 is rejected. Simultaneously, the hypothesis H9 that "Technology self-efficacy lowers the negative impact of techno-uncertainty on the intention to use Fintech services" is also rejected. However, Technology self-efficacy still has a moderating effect on the relationship between Techno-uncertainty and intention to use Fintech (Sig. = 0.005 < 0.05).

Regression results for Technology self-efficacy with Sig. = 0.000 and $\beta = 0.286$ show that Technology self-efficacy has a positive effect on the intention to use Fintech services, so hypothesis H5 is accepted. The value of the standardized coefficient shows that technology self-efficacy has an influence of about 28.6% on the intention to use Fintech services.

Finally, about the interaction variables, Table 3 shows that OVL*TSE has a negative impact on the intention to use Fintech services (Sig. = 0.045, β = -0.027), in other words, Technology self-efficacy has a negative moderating effect on the relationship between Techno-overload and Fintech usage intention, so hypothesis H7 is accepted.

5. Discussion and Conclusions

5.1. Discussion

Research results show that users aged 18-30 in Hanoi show quite positive psychological responses to technology. According to them, whether Fintech products and services are complex and invade their lives does not affect their intentions in deciding to use these services. But besides that, if they feel technology is making them too receptive, they are less likely to use those technologies. However, the results indicate that the more technology changes, the more users use them, which is contrary to the research team's expectations. It seems that users are not afraid of constantly having to accept change and they feel that technology has changed in a good way, so they will use them more. Besides, the study also found that technology self-efficacy has a moderating effect on the impact of techno-overload and Techno-uncertainty on intention to use Fintech. This seems to be because consumers in this age group have a high level of confidence in responding to the impact of techno-overload on individual users' intention to use Fintech. In contrast, the study shows that technology self-efficacy has no moderating effect on the relationship between Techno-complexity, Techno-invasion and intention to use Fintech. It seems because these two factors are problems that are difficult to control from the perspective of individual users.

5.2. Conclusion
