Based on the research results, the authors see the influence of Technostress and Technology Self-efficacy on the intention to use Fintech services of young people living, studying and working in Hanoi. From there, here are some recommendations:

Firstly, Fintech marketers should continue using approaches such as images, animations or videos,... which is easy to remember, easy to understand, easy to create trends to attract young people and create excitement. Simultaneously, it is necessary to design an intuitive application interface that is easy to understand from the first time without instruction and optimize the transaction processing steps.

Secondly, Fintech marketers should improve the verification steps when making transactions so that customers feel secure when pressing confirm, and send timely notifications about fluctuations in customer accounts. In addition, information about applications and services should be sent to customers to increase awareness and understanding of the product, however, the information must be personalized, that is, based on needs and interests. on survey questions, the consumption behavior of each customer is different.

Thirdly, companies creating Fintech products need to carefully consider, integrate and limit the constant exposure of consumers to technological updates or changes. On the other hand, before applying new technologies to Fintech, it is necessary to consider carefully, and consult customers, avoid unnecessary updates to users. Besides, Fintech companies should use experts to analyze and assess the relevance of technology over time. This will

help minimize technological change that comes from obsolescence. Establishing a more meticulous marketing strategy reduces the increased cognitive and emotional burden on consumers caused by technological stress.

Fourthly, Fintech companies should focus on strategies that can increase technology self-efficacy of young people because this study has found a significant direct positive effect of this factor on the intention to use Fintech services among them. Therefore, Fintech marketers should provide various ways for young consumers to understand and learn new technologies easily and with pleasure through different media to raise the confidence level of young people, thereby motivating consumers to use the services.

Finally, the Government also needs to understand the influence of Technostress and Technology Self-efficacy on young people's intention to use Fintech services. Therefore, in order to promoting the development of the Fintech industry in particular and the information technology industry in general, it is advisable to promote the technology self-efficacy of people by organizing training courses on computer and Internet applications. to increase people's familiarity with computers, software, applications and information technology.

Although the study has completed, there are still some limitations. Firstly, due to time and cost constraints, the convenient sampling method is used, so the results of the study are not representative. Future study should use probability sampling to increase the representativeness of the study. Second, the Technostress variable will have big differences by age group and region. Therefore, further study should compare the different effects of Technostress on the Fintech usage intention across age groups and regions. Finally, the study has not analyzed the difference in each type of Fintech service. Therefore, the suggestion for further study is to pay attention to the differences of each type of Fintech service.

Abstract

This research uses an experimental research method to study the influencing factors of Podcast advertising. Based on the theory of brand awareness, this paper shows the influence of the duration and thematic congruence of Podcast advertising on the brand awareness of Ha Noi university students. The results show that Podcast ads of different lengths have different effects on listeners' brand awareness, and the thematic congruence between advertising messages and Podcast content also impacts the audience's brand awareness.

Key words: *Advertisement, Aided brand recall, Brand recall, Brand recognition, Brand awareness, Duration, Podcast, Podcast advertising, Thematic congruence, Unaided brand recall.*

1. Introduction

Podcast is defined as audio files that can be downloaded to a media player or computer and then play whenever and wherever the user wants (Harris & Park, 2008; Potter, 2006). The term Podcast, a neologism that combines the words "broadcast" and "iPod," was first coined in 2004 (McClung & Johnson, 2010). Podcast is highly relevant as a new form of media and has grown to become an effective channel for marketing investment since it was first introduced in 2000 (Haygood, 2007). In Vietnam, Podcast is gradually being exploited and expanded with more and more new channels in recent years. Podcast advertising also gradually appears more on reputable channels with large followers like Vietcetera, The Present Writer, etc.

Podcast ads are audio ads that appear in Podcast programs. Brands pay to place their ads in various Podcasts, and Podcast ads can be purchased directly from Podcast owners (Ad Results Media). Although there are no specific statistics on Podcasts' potential and development scale in Vietnam, it promises to be a strong development of advertising on this medium.

According to a 2017 Nielsen study on the ability to remember names and make purchases of brands appearing in Podcast ads, 62% of listeners can correctly read the brand name appearing in the Podcast ad. Almost 65% of listeners would consider buying the brand's product advertised on that Podcast channel. Another piece of evidence from Edison Research, a market survey company in the US, shows that up to 54% of survey respondents tend to search again for the brand name advertised that they heard from an episode of their favorite Podcast channel. This result shows that Podcast advertising is gradually becoming the new and potential means for businesses to promote their brands and products. Therefore, researching how to make Podcast advertising effective is essential to businesses.

Previous studies on Podcast advertising have only focused on Podcast development trends and the motivation for users to listen to a Podcast (Steven McClung & Kristine Johnson, 2010; Siobhan McHugh, 2016; David Nelson & William V. Faux II, 2016). However, there have not been many studies related to the effectiveness of Podcast advertising and other factors affecting the effectiveness of Podcast advertising. The effectiveness of Podcast advertising can be measured through the ability of customers to perceive the brand, attitude towards the brand, or purchase behavior afterward. Meanwhile, many factors affect the effectiveness of Podcast advertising, such as duration, location, similarity, and the host's voice (Daniel M. Haygood, 2007). On the other hand, currently, studies on factors that affect the effectiveness of Podcast advertising only focus on the location or context congruence (Eric A. Ritter & Chang-Hoan Cho, 2009; Nina Sophie Ettmüller, 2021), but there is no research on the duration factor or a combination of many factors to measure the effectiveness of the ad.

Moreover, current studies on the effectiveness of Podcast advertising do not design Podcast content and advertising messages by themselves but instead use available content that does not ensure accuracy and objectivity because the respondents may have heard the advertisement before. Therefore, to get more accurate results, it is necessary to use a method that has better control over the respondents' responses.

2. Literature review and hypotheses model

2.1. Literature review

2.1.1. Brand awareness

Consumers' decision to buy a certain product or service is often based on their understanding of the brand. Brand awareness helps consumers decide which brand they will buy and where they will go to buy. Brand awareness reflects the ability of customers to recognize, distinguish and name a brand under different conditions (Keller, 1993). Brand awareness includes brand recall and brand recognition.

2.1.2. Brand recall

Brand recall includes Aided brand recall and Unaided brand recall regarding advertising message, product category, or brand name. Aided brand recall occurs when a person reminds of the brand through a clue or cue. In contrast, Unaided brand recall is when a person can recall the brand without prompting. Most advertising researchers believe that Unaided brand recall is generally better than Aided brand recall (Clow & Baack, 2004; Riebe and Dawes, 2006). Furthermore, Axelrod (1968) found that brand name recall due to product category was a good predictor of purchasing behavior.

2.1.3. Brand recognition

Brand recognition is understood as the ability of consumers to distinguish brands they have seen or heard of before (Keller, 1993). In other words, consumers have been exposed to the brand before, and when it comes to brand suggestions, they will recognize the brand. According to power theory or threshold theory (Kintsch, 1970), recognition requires lower memory robustness than recall. Various studies have shown that people often choose things that are familiar to them (Coates et al., 2006; Hoyer & Brown, 1990; McDonald & Sharp, 2000), and at the same time, they are just looking at them without realizing it (Bornstein, 1989 & Zajonc, 1968). Goldstein & Gigerenzer (2002) have shown that when the correct answer is unknown, people tend to choose answers they find familiar (Barreda, Bilgihan, Nusair & Okumus, 2015) because they believe that the familiar answers are more reliable. Brand recognition is an equally important component of branding, explained by Lin (2009) as the consumer's perception of a brand through prior product experience plus known information. According to Aaker (1996), brand recognition is arguably more important for new brands or niche markets.

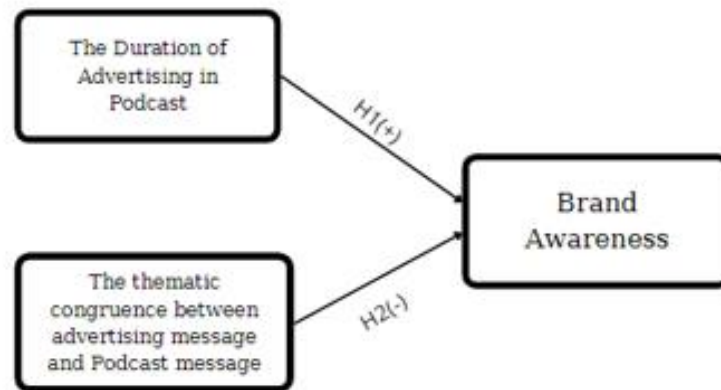

The influence of ad position on brand recall and brand recognition was reported by Erica Riebe & John Dawes (2006); Pieters and Bijmolt (1997); Li (2010) examined and found that ads played at the beginning or end have a higher impact on brand recall than ads placed in the middle. Next, the host's voice also affects the listener's perception; specifically, those who listen to voices with normal syllable speed will pay attention to the advertisement and recall a lot more advertising information than those who listen to advertisements with high syllable voices (Darren W. Dahl, Robin JB Ritchie, Kimary N. Shahin, 2003). Several studies have shown that advertising recorded by hosts makes the products feel more authentic, sophisticated, and believable (McKnight, 2019) because the listeners place a part of their trust and love to go to that Podcast channel. In addition, Hewitt & Associates (2020) concluded that pre-recorded advertisements were perceived as less attractive, while those recorded by the host were more successful and attracted more attention. Kellaris et al. (1993) found that advertising recall and recognition improved by the presence of music can attract attention only when it matches the advertisement's message. The relevance of music to the message also affects advertising effectiveness on three levels: cognitive, affective, and conative (Josefa D. et al., 2015). According to a study by Rainer Hasenauer et al. (2012), using sound and music for advertising on TV, radio, and the internet is important in increasing brand awareness.

A study on radio ads examined the effect of thematic congruence between advertising messages and Podcast content on ad recognition to see better accurate results with thematic incongruence (Martín-Luengo, Luna, & Migueles, 2014). A new radio study by Beatriz Martín-Luengo, Karlos Luna, and Malen Miguélé (2015) measured the results of better recall of respondents in advertisements with thematic incongruence with new products.

David Allan (2007) study showed that in terms of advertising message recall, the effectiveness of 60-second ads outperformed 30-second ads. On the other hand, if the advertiser's goal is only brand name recall, there is no significant difference between the two types of advertising. According to research by Vinith Johnson et al. (2021) on audio ads, ads under 10 seconds are a viable option to raise awareness about the brand's name, product name, and company location, all while listeners are driving or playing games. Generally, longer advertisements outperform the memory retention of advertising messages than shorter ones (Allan, 2007; Danaher & Mullarkey, 2003; Martín - Santana et al., 2016; Pieters & Bijmolt, 1997).

From the review, few studies on the influence of the two factors, Duration and Thematic congruence. Thus, this study will examine the influence of these two factors on Podcast advertising and compare the influence of Duration and Thematic congruence on brand awareness, a combination that no other research has done. In addition, previous studies only used existing advertisements and Podcast content, so the results were limited in accuracy and objectivity. For this study, the content of the Podcast and advertising is completely original, which helps the experiment become more controlled than in previous studies.

2.2. Research model

Hypotheses

H1: 30-second advertising has a greater impact on Podcast listener Brand Awareness than 15-second advertising.

H1: Brand Awareness will be significantly more accurate for 30-second advertising than for 15-second advertising.

H1a: Brand Recall will be significantly more accurate for 30-second advertising than for 15-second advertising.

H1b: Brand Recognition will be significantly more accurate for 30-second advertising than for 15-second advertising.

H2: Brand Awareness will be significantly more accurate for advertising with the message that is not similar to Podcast content than for advertising with the similar message to Podcast content.

H2a: Brand Recall will be significantly more accurate for advertising with the message that is not similar to Podcast content than for advertising with the similar message to Podcast content.

H2b: Brand Recognition will be significantly more accurate for advertising with the message that is not similar to Podcast content than for advertising with the similar message to Podcast content.

H3: There is a distinction between the effects of duration and thematic congruence between advertising message and Podcast content on brand awareness.

H3a: The effects of advertising duration and thematic congruence between advertising message and Podcast content on brand recall are not the same.

H3b: The effects of advertising duration and thematic congruence between advertising message and Podcast content on brand recognition are not the same.

3. Method

The study uses a combination of primary data collection methods, including survey, experiment and interview.

Survey

First, the authors listened to 50 episodes of Podcasts in Vietnam via Spotify to determine the ad duration and ad position of the most popular ads. The authors then conducted a quantitative survey, asking 63 students in Hanoi to list 5 issues they are currently interested in to determine the topics that students are most concerned about today. This was done to choose the most representative Podcast content and advertising message for the experimental research.

Experiment

From the survey result, the most popular issue (education, health...) was then chosen to be the topic of the Podcast. The authors then produced a Podcast used to examine the effect of advertising duration and the thematic congruence on listeners' Brand Awareness. It compared the impact of 30-second and 15-second advertising and the thematic congruence and the thematic incongruence between Podcast content and advertising message on aided brand recall and brand recognition of the listeners. The experiment included 146 participants divided into two phases, each lasting three days and consisting of 11 interviews per day. Among 146 participants, 140 results were accepted.

Table 1. Podcast conventions surveyed

Podcast	Duration of advertising	Message of advertising	Sample size
1	30 seconds	Health	35
2	15 seconds		35
3	30 seconds	Education	35
4	15 seconds		35

The results of the experimental research were coded and analyzed using SPSS. The obtained results are Chi-squared test with hypotheses H1 and H2 to test the impact of independent variables' Duration and thematic congruence on Brand awareness. Hypothesis H3 was examined by using the Independent Sample T-Test method.

Interview

After the experiment, an in-depth interview was conducted to discover the causes and motives behind respondents' responses to experimental research, allowing for reliable findings of brand recognition through Podcast advertising. Twenty-eight respondents were chosen from 4 groups and asked a series of questions based on their replies to learn more about the reasons behind the results, specifically why they recalled the brand name in the advertisement after listening to the Podcast. The results show that the reasons why it is not Brand awareness are frequently caused by respondents paying more attention to the Podcast content than at the beginning of the advertisement or by placing it right at the beginning, causing respondents to miss information about the advertised brand, or by respondents not knowing what the first paragraph is advertising, etc. On the other hand, Respondents have brand awareness because the advertisement theme is distinct from the Podcast content or the advertisement duration is longer.

4. Results

4.1. Quantitative research results

After conducting two quantitative surveys to determine the duration of advertising on Podcasts and the areas of most interest today, the results show that in survey 1 - Podcast advertising duration: The author's group collected 50 samples, and the results showed that Podcasts advertising with a duration from 15 seconds - 30 seconds appeared the most with 32/50 advertising accounting for 64%. In survey 2 - Podcast content and advertising message: the topics "Education" and "Health" are the two most interesting topics, with 39/63 answers being "Education" accounting for 62%, 20/63 answers "Health" accounted for 32%.

Therefore, the group selected the advertisement's message in 2 fields: Education and Health; and Health-themed Podcasts; simultaneously, the advertising duration will be 15s and 30s.

4.2. Chi-squared test analysis

In analyzing the impact of the duration factor on brand awareness, in the Podcast with the ad message related to Health, there is one variable: Unaided brand name recall with the Asymp. Sig. (two-sided) < 0.05 , the recall rate of this variable in the 15s advertising is greater than in the 30s advertising. In the Podcast with the ad message related to Education, there are 2 variables: Unaided brand name recall and Unaided the advertised categories recall with Asymp coefficients. Sig. (two-sided) < 0.05 , the Recall rate of these 2 variables in a 15 - second advertising is greater than in a 30 - second advertising. This result shows a difference in 15s and 30s advertising effectiveness on brand awareness. 15-second ads are more effective than 30-second ads in unaided brand name recall and Unaided the advertised categories recall.

In the analysis of the impact of thematic congruence on brand awareness, in the 30-second advertisement, 2 variables have a relationship with the Thematic congruence variable, namely the variable Unaided brand name recall and Unaided the advertised categories recall. There is only one variable in ads with a duration of 15 seconds; Unaided brand name recall has a relationship with the Thematic congruence variable with the Asymp coefficient. Sig. (two-sided) < 0.05. This result shows a difference in the thematic congruence between advertising message and Podcast content and the thematic congruence between advertising message and Podcast content. Therefore, advertising with the thematic incongruence between advertising message and Podcast content has a stronger impact on Podcast listeners' ability to recall brand names; but is worse than the thematic congruence in unaided the advertised categories recall.

In analyzing the difference between the effect of the duration factor and the thematic congruence on brand awareness, when comparing Podcast 1 and Podcast 4, there are two variables: Unaided brand name recall and Brand name recognition with Asymp. Sig. (two-sided) < 0.05. Moreover, when comparing Podcasts 2 vs. 3, there is only 1 variable that has an impact, Unaided the advertised categories recall (Asymp. Sig. (two-sided) < 0.05). The results show a difference between the effects of Ad Length and Ad thematic congruence on Unaided brand name recall and Brand name recognition.

Table 2. Results of Chi-squared test on brand awareness among Podcasts

		Names of variables	Asymp. Sig. (two sided)
Analyze the impact of the duration factor on brand awareness	Compare the effectiveness of 15-second advertising and 30-second advertising in the field of Health	Unaided brand name recall	0,027
		Unaided the advertised categories recall	0,584
		Brand name recognition	0,192
		Brand name recognition through the feature	0,122
Analyze the impact of thematic congruence factor on brand awareness	Compare the effectiveness of 15-second advertising and 30-second advertising in the field of Education.	Unaided brand name recall	0,044
		Unaided the advertised categories recall	0,016
		Brand name recognition	0,284
		Brand name recognition through the feature	0,122
	Compare the effectiveness of the thematic congruence between advertising	Unaided brand name recall	0,025
		Unaided the advertised categories recall	0,016
		Brand name recognition	0,06
		Brand name recognition	0,806

		Names of variables	Asymp. Sig. (two sided)
	message and Podcast content and the thematic incongruence between advertising message and Podcast content in 30 - second advertising.	through the feature	
	Compare the effectiveness of the thematic congruence between advertising message and Podcast content and the thematic incongruence between advertising message and Podcast content in 15 - second advertising.	Unaided brand name recall	0,025
		Unaided the advertised categories recall	0,584
		Brand name recognition	0,101
		Brand name recognition through the feature	0,771
Analyze the impact of the duration factor and thematic congruence factor on brand awareness	Comparison between Podcast 1 and Podcast 4	Unaided brand name recall	0,000
		Unaided the advertised categories recall	1,000
		Brand name recognition	0,04
		Brand name recognition through the feature	0,068
	Comparison between Podcast 2 and Podcast 3	Unaided brand name recall	0,811
		Unaided the advertised categories recall	0,03
		Brand name recognition	0,550
		Brand name recognition through the feature	0,192

4.3. Test the mean difference between Podcasts by Independent Sample T-Test

Test the average difference between Podcast 1 and Podcast 4

For two variables, Brand name recognition and Unaided recall brand name recall, the results show a statistically significant difference in the recall level of the respondents in Podcast 1 and Podcast 4.

The remaining two variables, Unaided the advertised categories recall and Brand Name Recognition through feature, showed no statistically significant difference in the recall level of Podcast respondents. 1 and Podcasts 4.

Test the average difference between Podcast 2 and Podcast 3

For the advertised Unaided the advertised categories recall variable, the results showed a statistically significant difference in the recall level of the respondents on Podcast 2 and Podcast 3.

The remaining three variables are Brand name recognition through feature, Unaided recall brand name recall, and Brand name recognition. The results show no statistically significant difference in the recall level of the respondents on Podcast 2 and Podcast 3.

Thus, there is a difference between the effects of Ad duration and Ad thematic congruence on unaided recall brand name recall and brand recognition. **H3 is supported.**

4.4. Qualitative research results

After finishing the interview, the responders were divided into 4 groups on brand awareness, as shown below.

Table 3. Brand awareness statistics from responders

	Unaided brand name recall	Recognition brand name	Recognition brand name through the feature	Reason
Group 1	Incorrect	Incorrect	Incorrect	Not focused, didn't know there was ad
Group 2	Incorrect	Correct	Incorrect	Remember the content, impress the brand name but did not remember the features and uses (mostly respondents listen to the 15s ad)
Group 3	Incorrect	Correct	Correct	Host's voiceover, long feature talk (30 seconds ad)
Group 4	Correct	Correct	Correct	The thematic incongruence between advertising message and Podcast content, brand name repetition, ad placement

Based on the results of qualitative in-depth interviews, the authors found that the thematic incongruence between advertising message and Podcast content is one of the reasons that help listeners recall the unaided brand name, recognize the brand name and recognize the brand name through the feature. Besides the Duration factor, listeners can recognize the brand name with the 15 - second advertising but can't remember the useful features of the advertised product, whereas, with the 30s ad, the listeners just recognize the brand name and just recognize the brand through the feature.

5. Discussion and Conclusion

5.1. Summary of research results

Regarding the effect of length on brand awareness, a 15-second Podcast advertising has a stronger impact on Podcast listeners' ability to recall the brand than an advertisement on Podcasts that are 30 seconds long. **Hypothesis H1 is not supported.**

Regarding the thematic congruence factor affecting brand awareness, advertising with the message that is not similar to the Podcast content affects the ability to recall the brand without reminders and recall the field advertised without prompting of Podcast listeners stronger than the thematic congruence between advertising message and Podcast content. **Hypothesis H2a is supported**

Regarding the effect of length and thematic congruence on brand awareness, the results show a difference between the effects of Ad Length and Ad Thematic congruence on recall. The brand name does not remind and recognize the brand. **Hypothesis H3 is supported.**

5.2. Discussion

First, the results proved that Podcast Ads of 15 seconds have a stronger impact on Podcast listeners' brand recall than advertising 30 seconds in length. However, for the recall of the Advertised Category, a 30-second ad performed better than a 15-second ad with a message related to Education.

Second, the results show that an advertised message that is not similar to Podcast Content will have a more effective impact on brand recall and brand recognition. However, for the recall of the Advertised Category, the advertising message similar to the Podcast content will work better. It can be explained as follows: the brand's category will be more familiar and memorable than the brand name. In addition, the content throughout the Podcast is similar to the advertising message, creating opportunities for listeners to remember. It is much easier to advertise a domain than a brand name.

Third, research shows that a suitable combination of ad duration and thematic congruence between ads and Podcast content will bring high efficiency in brand recall and brand recognition. Moreover, if the ad is 15 - second length and the message is not similar to the Podcast content, it will perform better.

5.3. Recommendations

The research results suggest to businesses and advertising companies that if the advertising purpose of the business is for the audience to recall the brand name or brand

recognition, it can select 15-second-long ads and have messages or topics that are not similar to the Podcast content. Moreover, it should be emphasized that if the purpose of advertising is to increase brand awareness, businesses should choose Podcasts with content or topics that are not similar to the advertisement's message, and 15 - a second-length advertisement is optimal.

Research still has some limitations, such as Podcast content examined is only about health; the two advertising brands are also in the fields of health and education, so they are not enough to represent all businesses; Podcast listening is done online, so it is not possible to control the listener's concentration and other distractions. This study also evaluated the influence of the Duration factor and the thematic congruence of advertising messages to Podcast content on brand awareness, so it can be suggested that the following studies examine the influence of other factors such as the Voice of the Host, Position of the advertisement, Music in the advertisement... on brand awareness.

FACTORS INFLUENCING ONLINE SHOPPING INTENTION BASED ON THE EXPANDED TAM

Truong Thi Thu Huong

huongtruong@epu.edu.vn

Assoc. Prof. Dr. Le Anh Tuan

tuanla@epu.edu.vn

Faculty of Economic & Management Electric Power University, Hanoi, Vietnam

Abstract

The article analyzes the factors influencing purchase intention through online retail websites. The proposed research model is based on extending the Technology Acceptance Model (TAM) to examine a number of factors affecting customers' online purchases in Vietnam (an emerging country). In addition to the basic factors of TAM, what is different from the previous literature in Vietnam, is the introduction of variable "perceived enjoyment". This study was based on a fairly large sample size, compared to the requirements. EFA analysis and SEM analysis show that TAM's factors, particularly perceived enjoyment, have strong influences on attitude towards online purchasing.

Keyword: *Online purchasing intention, Theory of technology acceptance, Perceived enjoyment.*

1. Introduction

Online retailing has seen a rapid increase in scale and speed in Vietnam and in the world. 2020 & 2021 E-Conomy SEA report predicts that by 2025, Vietnam's e-commerce can achieve the highest growth rate in the region at 34% and will become the second largest economy in Southeast Asia, reaching 220 billion US dollars in gross merchandise value by 2030.

In order to attract customers and improve competitiveness, e-commerce website must constantly understand the behavior of online consumers. The online business of e-commerce website involves the use of the internet platform, so the study of consumer behavior based on models related to technology application is of interest to many researchers in the world as well as in Vietnam. Some previous literature has studied online purchase intention in the Vietnamese context based on fundamental theories such as Theory of technology acceptance (TAM) (Ahamed, Limbu, Pham, & Van Nguyen, 2020), Extended Unified Theory of Acceptance and Use of Technology (UTAUT) (Nguyen, Tran, Pham, & Le, 2019) or a combination of TAM with TPB (Toan Duc Le et al., 2020).

This paper builds up a research model of online purchase intention derived from the TAM theory of Davis (1989). Like other domestic studies, the model in this paper inherits two basic factors of TAM, which are perceived usefulness and perceived ease of use. Besides, one more factor was included in the model is perceived enjoyment by Richard et al. (1992), this factor has not been studied for review and testing in Vietnam.

2. Literature Review and Hypotheses

2.1. Online purchase intention (IN)

Behavioral intention is the motivating factor that drives a person to be willing to do things to perform a behavior (Ajzen, 1991). Regarding online shopping, purchase intention is when a consumer is willing and intends to make an online transaction (Meskaran, Ismail, & Shanmugam, 2013). According to the theory of planned behavior - TPB by Ajen (1991), intention is considered the main predictor of actual behavior. In the online context, many studies also confirm this relation (Nguyen et al., 2019; Rehman, Bhatti, Mohamed, & Ayoub, 2019; Sultan, Tarafder, Pearson, & Henryks, 2020). Therefore, this study does not reexamine the relationship between intention and real behavior but focuses on examining online purchase intention as influenced by factors derived from the extended TAM model.

2.2. Attitude (AT)

According to the theory of planned behavior, attitude is one of the determinants of behavior. Several factors can influence consumer attitudes, such as perceived services, information, and risks in use (Akroush & Al-Debei, 2015; Aldousari, Delafrooz, Ab Yajid, & Ahmed, 2016). Online purchases are on the internet, which is a high-tech environment, so the attitudes of online shoppers are influenced by factors related to this environment. Davis (1989) applied the TAM technology acceptance model to present factors affecting customer attitudes towards the use and adaptation of new technologies. According to the model, there are several factors influencing attitudes, including perceived ease of use, perceived usefulness, and enjoyment of online purchases (Childersa, Carrb, Peck, & Carson, 2011). This study also evaluates the influence of these factors.

In online shopping, an attitude refers to consumers' positive or negative judgments about using the internet to purchase goods or services from retail websites (Lin, 2007). A positive attitude will promote online consumer purchase intention (Aldhmour & Sarayrah, 2016; Aqila et al., 2016; Bilal, Akram, Rasool, Yang, & Tanveer, 2021; Ha, 2015; Peña-García, Gil-Saura, Rodríguez-Orejuela, & Siqueira-Junior, 2020; Toan Duc Le et al., 2020). Therefore, this study proposes the hypothesis:

H1: Online consumer attitude positively affect purchase intention.

2.3. Perceived easy of use (EOU)

Perceived ease of use is “the degree to which a person believes that using a particular system will be effortless” (Davis, 1989). Concerning e-commerce, perceived ease of use is often related to the website navigational properties (Maditinos, Sarigiannidis, & Dimitriadis, 2010), which represents a convenient search function for customers and allows them to easily and quickly navigate through the pages (Parasuraman, Zeithaml, & Malhotra, 2005; Ramanathan, 2011).

Many other studies in B2C e-commerce have tested the positive relation between perceived ease of use and consumer attitudes (Atulkar & Kesari, 2019; Childersa et al., 2011; H. H. Lee, A. M. Fiore, & J. Kim, 2006; Maditinos et al., 2010; Pena-Garcia, Gil-Saura, Rodriguez-Orejuela, & Siqueira-Junior, 2020). The above grounds are the basis for the hypothesis:

H2: Perceived ease of use positively affects online consumer attitude.

2.4. Perceived usefulness (PU)

In the technology acceptance model, Davis (1989) defined *Perceived usefulness* as “the degree to which a person believes that using a particular system will increase his or her work efficiency or productivity”.

In e-commerce, consumers perceive Perceived usefulness after experiencing it (Monsuwé, Dellaert, & de ruyter, 2004). Therefore, if an online store improves the outcome of the shopping experience, then consumers will rate e-commerce favorably (Peña-García et al., 2020). Many other studies have also demonstrated the link between perceived usefulness to consumer attitudes and tested them in the context of online research (Atulkar & Kesari, 2019; Childers et al., 2011; H. H. Lee et al., 2006; Maditinos et al., 2010). So, the hypothesis is:

H3: Perceived usefulness positively affects online consumer attitude.

2.5. Perceived Enjoyment (EJ)

Perceived Enjoyment was first mentioned in the study of Richard et al. (1992) in general working conditions with computers. In the context of online business via the internet, Semeijn et al. (2005) presented the entertainment aspect, pleasure when shopping online, called "Online Joy" (Semeijn, Gustafsson, van Riel, van Birgelen, & Streukens, 2005). Online Joy is the joyfulness of browsing these retail sites and the comfort of shopping while surfing the web. In other studies, the concept of “enjoyment” is the result of amusement derived from the satisfaction and pleasure of the online shopping experience (Childers, Carr, Peck, & Carson, 2001), not from the completion of the procurement task (Atulkar & Kesari, 2019). Consumer enjoyment motivation is related to the possibility of entertainment from online shopping, which is similar to the concept of “Online Joy”, so they can be used equally. Many studies have confirmed that hedonic motivation (or Online Joy) is a strong influence on attitude (Atulkar & Kesari, 2019; Childers et al., 2011). A more concrete explanation of this relation is that if consumers prefer the online shopping experience, they will have a more positive attitude and are more likely to use the internet for frequent shopping. So, the hypothesis is:

H4: Online pleasure positively affects online consumer attitude.

The set of hypotheses to form the proposed research model is presented in Figure 1.

Figure 1. Proposed Research Model

3. Method

3.1. Measures

Based on many previous studies, the author selected the items for each concept (or latent variable) of the model in the questionnaire.

Online purchase intention is measured by three items inherited from the study of (Ling, Chai, & Piew, 2010) and (Gan & Wang, 2017). Online consumer *attitudes* measured by three

observed variables presented in Peña-García et al. (2020) have an inheritance from some prior research (Ha, 2015; Hasbullah et al., 2016). Although the two latent variables derived from TAM are *perceived ease of use* - EOU and *perceived usefulness*- PU, there are differences in the reference sources for constructing the scale. The EOU consists of 4 observed variables inherited from (Childers et al., 2011; H.-H. Lee, A. Fiore, & J. Kim, 2006), while PU includes 3 observed variables inherited from Childers et al., (2011) and Chen et al., (2018). With new variable, the *perceived enjoyment* consisting of 3 observed variables is inherited from the similarities in the scales of the 2 above studies (Chen, Hsiao, & Wu, 2018; Childers et al., 2011).

3.2. Data collection

While the ideal sample size should be in a 10:1 ratio (for example, 10 observations for 1 indicator) (Hair, Black, Babin, Anderson, & Tatham, 2014). The total number of indicators of the observed variables is 16, so the required number of observations is $16 \times 10 = 160$. The actual sample size of this study was 398, which met the above requirements.

A simple random sampling method that does not repeat itself. The subjects of the investigation are consumers who have purchased products online through retail websites in Vietnam. The data collection is conducted entirely through the online survey form. All questions in the questionnaire are "mandatory" except for the last one, which is about the respondent's personal information. There were 446 questionnaires collected. After eliminating 48 incorrect responses due to the respondents' misunderstanding of the presentation, the remaining 398 units with the characteristics are presented in Table 1.

Table1. Respondents Profile (n=398)

Characteristics	Category	Frequency	%
Gender	Male	137	34.4
	Female	261	65.6
Occupation	Student	144	36.2
	Staff-Teacher	121	30.4
	Engineer	37	9.3
	Manager	38	9.5
	Others	58	14.6
Age	< 25	194	48.7
	25 to <40	115	28.9
	≥ 40	89	22.4
Income (VND)	< 10	239	60.1
	10 to <20	107	26.9
	≥20	52	13.1
frequency of purchase	1-3	116	29.1
	4-6	68	17.1
	7-9	39	9.8
	≥10	175	44.0
Total		398	100.0

The percentage of young customers under 25 or the student group has a higher rate than other groups, which is reasonable because they are from Generation Z (Gen Z). And online shopping is increasingly popular among this generation (Veybitha, Alfansi, Salim, & Dart, 2021).

4. Results

From the proposed research model, we perform EFA on SPSS software with a group of 3 factors: EOU, PU, and EJ, affecting AT. The condition for performing EFA through Bartlett and KMO tests for KMO is 0.885, with sigs. <0.05, this result is satisfactory for conducting EFA (Hair et al., 2014). The outcomes of performing EFA analysis by Promax rotation with Kaiser Normalization are in Table 2. According to Hair et al. (2017), factor loading is an indicator to ensure the practical significance of EFA: Factor loading ≥ 0.5 is considered to be of practical significance. The EFA results show that variables all have factor loading > 0.5 , so they all have practical significance. Thus, the results of Table 2 are consistent with some previous studies (Childers et al., 2011; Maia, Lunardi, Longaray, & Munhoz, 2018) and contribute to reaffirming the group of factors constituting consumer attitudes online.

Table 2. Constructs and indicators of the model

Constructs and indicators	EFA Loading	PLS-SEM	Mean	Std.
<i>Perceived ease of use (EOU)</i> Cronbach's Alpha = 0.888				
This website would be clear and understandable.	0.921	0.846	5.477	0.927
This website would not require a lot of mental effort	0.860	0.853	5.342	1.011
This website would be easy to use.	0.870	0.900	5.616	0.945
This website would allow me to shop the way I want to shop.	0.771	0.861	5.583	0.987
<i>Perceived usefulness (PU)</i> Cronbach's Alpha = 0.878				
This website would enhance my effectiveness in shopping.	0.942	0.906	5.173	1.005
This website would be useful in buying what I want.	0.814	0.898	5.389	0.969
This website would improve my shopping ability.	0.907	0.884	5.035	1.078
<i>Perceived enjoyment (EJ)</i> Cronbach's Alpha = 0.899				
If I were online shopping, this web site would be entertaining	0.957	0.882	5.053	1.069
If I were online shopping, this web site would be enjoyable.	0.922	0.943	5.050	0.972
If I were online shopping, this web site would be exciting.	0.844	0.909	5.075	0.970
<i>Attitude (AT)</i> Cronbach's Alpha = 0.904				
Buying on this website is attractive	0.902	0.902	4.955	0.938
I like to buy on in this website	0.931	0.928	5.080	0.941
Buying on this website is a good idea	0.916	0.919	5.193	0.909
<i>Online intetion (IN)</i> Cronbach's Alpha = 0.900				
If the need arises, I intend to shopping online	0.871	0.864	5.138	0.975
Given the chance, I will buy something with this website in the near future.	0.938	0.941	5.221	0.884
I predict that I should use this retailer's website in the future.	0.929	0.932	5.133	0.933

Approaching PLS-SEM to analyze the model, the results are the following: Regarding *Outer Loading*, if the figure is greater than or equal to 0.708, rounded to 0.7, the observed variable is qualified (Joseph F Hair, Hult, Ringle, & Sarstedt, 2017). The Outer Loading coefficients show that all the variables meet the quality standards. Regarding *item reliability*, this feature is evaluated through two main indexes, Cronbach's Alpha and Composite Reliability. Reliability is guaranteed when Cronbach's Alpha ≥ 0.7 , Composite Reliability CR ≥ 0.7 (Joseph F Hair et al., 2017). The results of the coefficients in the above Construct Reliability and Validity table are satisfactory, so the reliability of the scales is guaranteed. Concerning *Convergence*: the evaluation is based on Average Variance Extracted (AVE). If the AVE is 0.5 or higher, the scale is convergent (Joseph F Hair et al., 2017). The obtained AVE coefficients are satisfactory, indicating the model meets the convergence criteria. Regarding *Discriminant*: Fornell and Larcker (1981) recommend that discriminability is guaranteed when the square root of the AVE for each latent variable is higher than all correlations between the latent margins. From the Discriminant Validity coefficients obtained, the data indicates that the model ensures discrimination according to this criterion (Fornell & Larcker, 1981). Moreover, the study by Hair et al. (2017) cited that the discriminant value between two latent variables is guaranteed when the HTMT index is less than 1. The study also suggests that a value below 0.9 of the discriminatory value is warranted, while the more stringent standard threshold is 0.85. The results of the Heterotrait-Monotrait Ratio obtained all meet this standard.

Regarding the *Initial Structural Model*, the results of running bootstrapping at the 5% significance level are presented in fig.2. According to Hair et al. (2017), with this level of significance, the relation in the model is accepted.

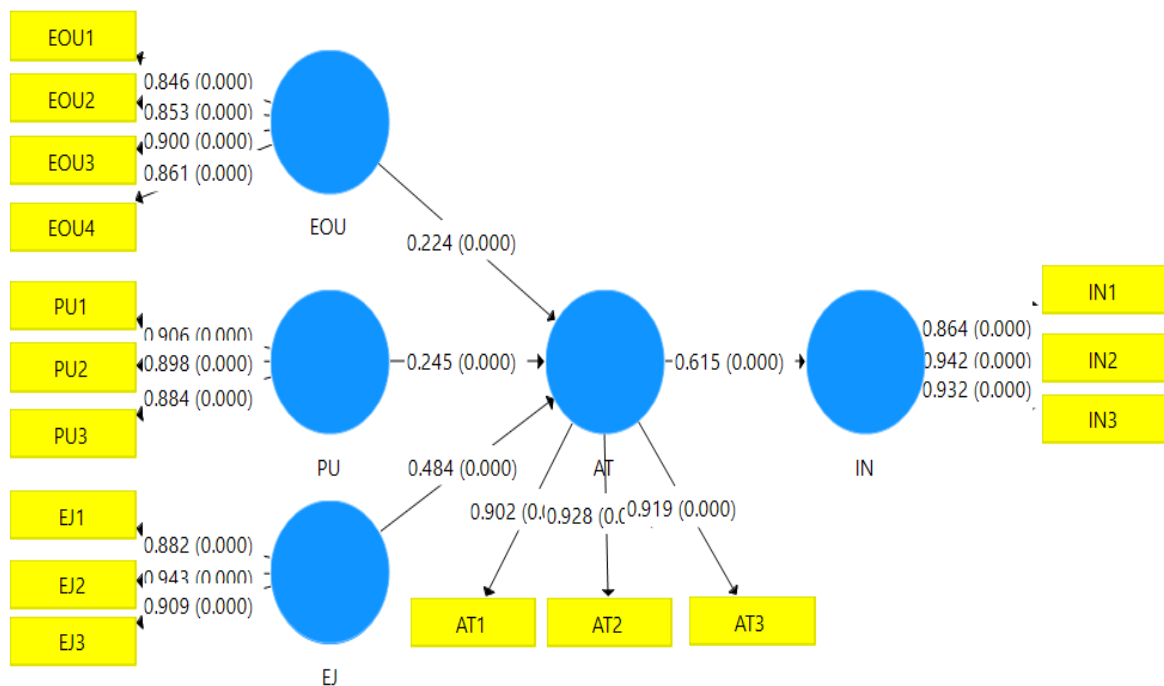

Figure 2. Diagram of the structural model

Evaluation of *model fit* in PLS-SEM can use SRMR (standardized root mean square residual) index to check the model fit (Henseler, Hubona, & Ray, 2016)). Regarding the results of the "Model fit index" of the estimated model, the most significant general criterion of the model is SRMR = 0.066 compared with the standard suggested by Henseler et al. (2016), which is <0.08. Then the model reached the data fit.

Thus, the most important element in this study is reflected in the review and construction of a new variable of perceived enjoyment which has not been found in studies in Vietnam before. In addition, this variable has been adopted in foreign literatures, but a theoretical basis has only been provided (Perea y Monsuwé, Dellaert, & de Ruyter, 2004), (Atulkar & Kesari, 2019). This study performed the primary data test with good results, accepting that new variable.

4. Conclusion

This study tested the extended TAM model in the context of online retail in Vietnam. This study shows that the recognition of relationships in the model is appropriate in the context of an emerging but rapidly growing online retail market. The model is confirmed to contribute to adding important and suggestive aspects for the retail managers of the e-commerce website to focus on the factors of usefulness, ease of use and especially the creation of excitement and joy for customers to participate in online shopping.

THE IMPACT OF THE INDUSTRIAL REVOLUTION 4.0 ON LOGISTICS BUSINESSES: A CASE IN MEKONG DELTA

Huang Ying Ying

*Department of Industrial Engineering & Management,
National Taipei University of Technology, Taipei, Taiwan*

Abstract

The 4th Industrial Revolution is the manufacturing movement that is reshaping the business of building products and strongly impacting related industries. As in the case of most industries, logistics in Vietnam is encountering sustained and profound changes, which demands a rapid shift in processes to accommodate the fundamental of Industry 4.0. This study aims to examine the impact of the 4th Industry Revolution (Industry 4.0) on the logistics industry and enterprises in the Mekong delta. The article also gives an overview in terms of activities of logistics service within the Mekong Delta region and suggests possible solutions to improve logistics services in Industry 4.0 era.

Keywords: *Industry 4.0; enterprises; Logistics 4.0; Mekong delta*

1. Introduction

The 4th industrial revolution (Industry 4.0) is now owning every corner of life, strongly affecting every industry, every field, and every business (enterprise), creating a big change in the way production mode, the convergence of applied physics and digital to form the emergence of the Internet of Things (IoT) that changes rapidly, the entire width of the value chain from R&D to manufacturing, logistics Customer service, reduced transaction costs, and shipping come magically to production and capacity operations. The competitiveness of enterprises is assessed by applying technology in production and management.

The Mekong Delta is identified as a key economic region of Vietnam with the main advantage of agricultural production and has not fully promoted its role to contribute to the promotion of production and export, especially the operation of the product business, which is the strength of the region. In the face of fierce competition at the school, especially the Industrial Revolution 4.0, in order to adapt to the trend of international economic integration, the development of logistics services in the Mekong Delta region will be an important factor in optimally developing the network of supply and application of goods of this rich land with potential for economic development.

2. Literature Review

2.1. Industry 4.0

In the history of technological and industrial development, mankind has witnessed three industrial revolutions. Steam engines were utilized to mechanize production during the

first industrial revolution, which began in the late eighteenth century. The second revolution took place at the end of the twentieth century thanks to the application of electricity to mass production. Electronics and information technology are used to automate production during the third revolution [1], [2]. Unlike previous revolutions, Industry 4.0 is not associated with the birth of a specific technology but rather integrates multiple industries with an emphasis on application [2] [3] [4]. As a result of this revolution, industries in society must shift to become "smarter" and more efficient through boosting automation in connection with the digital system. This is to relieve individuals from manual and intellectual labor in order to fulfill increasing demands in today's society. The speed and scale of impact of modern technologies have accelerated socio-economic development in the industrial and service sectors [2].

In general, Industry 4.0 emphasizes the role of digital production, often known as smart factories [4]. Smart manufacturing is not about replacing people at work; instead, it is about preventing errors and speeding up production by collaborating to share knowledge or data effectively [1] [4]. All information and data sharing processes are managed by humans [1] [4]. Data is the lifeline created in all manufacturing processes, from product development to production to after-sales service, and the amount of data generated is enormous (figure 1) [1] [2]. In the implementation of advanced business models, adaptable data that reflects compatibility between customers and suppliers, if systematically and intelligently integrated, can provide great efficiency [1]. The emergence of several digital technologies such as Artificial Intelligence (AI), as well as the integration of the Internet of Things (IoT) and Big Data or Cloud computing, are indeed implications. The core of digital in the 4.0 industrial revolution has formed a special production platform, that is smart manufacturing. The application of information and communication technologies, as well as computer science IoT (Internet of Things) and IoS (Internet of Services), would have an impact on every aspect of the modern production process, boosting the operational efficiency of the entire supply chain. This helps to transform existing working methods, develop numerous innovative products with different and outstanding quality, reduce time, and protect the environment. [1] [2] [3] [5]. As a result, supply chain management activities, particularly product and information flow management (logistics), are introduced in this article as "Logistics 4.0".

Figure 1. The combined data and digital technology of the value chain form a smart factory

Source: https://www.lgcns.com/LGCNS.GHP.Main/Solution/SmartFactory_En

2.2. Logistics 4.0

Logistics is frequently classified based on the type and level of logistics services provided by a logistics firm (1PL, 2PL, 3PL, 4PL, 5PL) [6]. However, in this case, the development process in logistics is examined. Logistics 1.0 refers to the period of transport mechanization that began in the second half of the nineteenth century when ships and steam engines replaced people and animals as the primary modes of transport [3]. Logistics 2.0 (from the early twentieth century to 1960) was an automation era in logistics that included freight and warehouse mechanization, automated handling systems, mechanical loading and unloading systems (electric power invention), and mass manufacturing [3] [7]. Logistics 3.0 (1960 - 2000), a stage of information technology (IT) application to standardize logistics management. Warehouse management systems (WMS) and Transportation Management Systems (TMS), for example, which automate and efficiently handle logistics, inventory, and transportation, have greatly evolved and improved [3], [7]. Logistics 4.0 (2000 - present) is the logistics development phase in the Industry 4.0 era, mainly focused on the development of the Internet of Things (IoT) and Big Data. The primary purpose of logistics 4.0 is to reduce labor costs and standardize the workforce in supply chain management [8]. Warehouse robots and autonomous vehicles are attempting to replace procedures that do not require human input or decision-making. The aim is to obtain the ideal balance of automation and mechanization [3] [7].

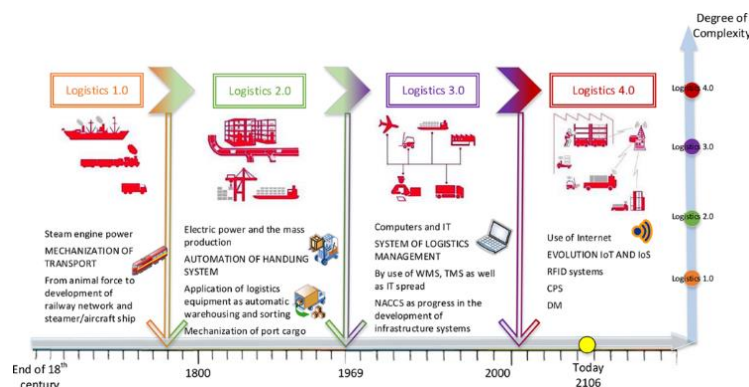

Figure 2. The history of Logistics 4.0's development

2.3. Impact of Industry 4.0 on logistics

Industry 4.0 has been identified as having 4 main impacts on businesses, including i) customer expectations, ii) product quality improvement, iii) new author change, and iv) format organization.

For industry logistics, Industry 4.0 is the core foundation for future development. Show the development trends of logistics can be divided into 3 areas: IT and software (IT & software), robotics and sensor engineering (robot & sensor technology), and network systems (network). The combination of three elements forms the core foundation for the different directions in logistics 4.0 [9].

Industry 4.0 helps logistics businesses improve customer service efficiency while minimizing order fulfillment costs and time, opening new facilities and business types in the field. this. To achieve that, ask businesses that need to change and reorient their development strategies, specifically:

- Data automation and transparency: New technologies applied to data collection and analysis (which are a central part of logistics) provide an opportunity for expert logistics professionals to understand the status, data analysis is a fine way to get the title item. Those technologies are decimal systems and data processing, logistics control, artificial intelligence (AI), ... [3]

- Utilizing innovative modes of transportation, including self-driving cars and drones, to assemble and transport goods by automating devices or vehicles. Warehouse handling machines, delivery drones, automatic delivery trucks, smart forklifts, and so on... [3]

- The use of digital-based devices in the logistics system. Examples, Wi-Fi and Bluetooth-enabled devices for tracking, positioning, navigation, and observation; online barcode scanning apps in warehouse management; cloud-based inventory optimization... [3]

- Latest production methods in the future in terms of 3D printing's influence: can change traditional logistics services, and enhance product output to the market [6, 10].

Furthermore, Industry 4.0 enables businesses to start up with less initial investment and earn higher profits in a shorter time. Firms can effectively access each business unit with the help of IoT, monitoring and evaluating their performance in real-time. Hyperlinking, on the other hand, raises cybersecurity concerns.

3. Method

This paper used both secondary and primary data to discover the problems. Authors gathered the secondary data such as high-quality research papers and industry reports about the current state of logistics in the Mekong Delta, and the benefits and challenges that logistics businesses are dealing with. Primary data are shared by experts from researchers, logistics service providers, and a port manager in a Mekong Delta city, which is collected through in-depth interviews in the year 2021. After collecting data, the authors used the qualitative content analysis method to analyze the gathered data in a systematic approach in order to get insight into the research problem.

4. Results

4.1. Opportunities

- Government's support policies

Joining international trade agreements has created chances to increase the number of commodities imported and exported by the whole country, and by the Mekong Delta in particular. With the benefit of diversified development in agriculture, fisheries, and tourism, the government has adopted policies to invest in the country's transport infrastructure connecting with other regions.

The Prime Minister's approving the long-term strategy for the development of the logistics compartment in the entire country to 2020, with orientation to 2030, would determine sub-regional economic development. The Mekong Delta's central economy will have one Grade II logistics center with a minimum scale of 30 hectares by 2020 and more than 70 hectares by 2030. The scope of strategy mainly includes the 9 provinces and cities

in the Mekong Delta, connecting with inland ports, river ports (Can Tho, My Thoi), airports, railway stations, bus stations, industrial parks, and border gates (in Kien Giang and An Giang provinces) [11].

Moreover, according to Official Dispatch No. 7709/VPCP-CN, dated September 15, 2020, on the request "There's a must-have separated cargo airline (Cargo Airlines) serving Vietnamese agricultural products, for separate routes," [12] several VLA enterprises have aided capital to establish Asian Cargo Gateway Joint Stock Company (ACG), with the first flight on March 6, 2021, providing fixed weekly air freight services from Ho Chi Minh City to several large Asian markets, including – Jakarta, Bangkok, and Incheon. As the largest granary of rice and seafood in the country, it is regarded not only as a significant opportunity for agriculture in the Mekong Delta but also as a big motive to impulse the development of the region's logistics industry.

- Strategic position

The Mekong Delta offers key locations that connect transportation and have enough room to establish a very convenient logistics center. Furthermore, because of the geographical features of the Mekong Delta, which is in an area with international maritime and aviation traffic routes connecting South Asia and Southeast Asia, as well as Australia and other Pacific Ocean archipelagos. To agriculture, the system not only provides water for production activities but also has enormous implications for product transportation. In comparison to roadways, inland waterways provide more efficient delivery with huge volumes of agricultural products.

In general, the Mekong Delta's waterway and land transportation systems are dense and evenly developed. The Mekong Delta's port system spreads across the Hau and Tien rivers. The rivers and canals system is 28,000 km long, with 23,000 km capable of transportation, accounting for 70% of the country's river length. There are two vital waterways from Ho Chi Minh City to Kien Giang and Ca Mau, as well as the Quan Chanh Bo canal, which allows large vessels to enter and exit the Hau River. Five road corridor routes connect the Mekong Delta to the Southeast and the rest of the country. Furthermore, the Mekong Delta's airport system has been upgraded and developed so that it can connect to international flights.

With the advantages of inland waterway transport and the development trend of the Mekong Delta's inland waterway transport infrastructure system, an increase in inland waterway transport is expected in 2030-2040, with an average growth rate of 5%. Report on the Feasibility Study Activity Development Project Southern Regional Logistics and Waterway Corridor of the Ministry of Transport, funded by the World Bank (WB). The implementation survey demonstrates the transformation from road transportation to inland waterway transport in the Mekong Delta regions, consequently increasing the need for inland waterway logistics services as well as the correlating resource requirements, to ensure meeting future development trends.

2030		Long An	Tiền Giang	Bến Tre	Trà Vinh	Vĩnh Long	Đồng Tháp	An Giang	Kiên Giang	Cần Thơ	Hậu Giang	Sóc Trăng	Bạc Liêu	Cà Mau

Figure 3. Transport model - Forecasting the increase of inland waterway transport 2030 - 2040

Source: [13]

- Market potentials

Currently, the country has almost 300,000 logistics businesses, with a total workforce of approximately 1.5 million workers. Meanwhile, the number of logistics firms operating in the Mekong Delta region is modest, with no significant firms directly participating in this sector. Meanwhile, the demand for logistics services has constantly expanded, both in quantity and quality, particularly since Vietnam's recent membership in FTAs, EVFTAs, and worldwide economic activities.

According to the Annual Economic Report of the Mekong Delta in 2020, the Mekong Delta currently contributes about 40% of agricultural production value, over 54% of rice production, which is 90% of those is exported, 65% of aquatic products, and 70% of fruit production of the country [14]. The region's potential for agricultural and aquatic product export indicates that there is an urgent need for developing the logistics service industry to serve the entire region's agricultural and aquatic products, with major logistics services such as transportation and warehousing, goods, preserving goods, and value-added services. Services such as cold storage, irradiation, and autoclaving for fruit products, for example, to ensure the quality of exported goods as well as merchandise distributed for domestic consumption.

Furthermore, the Mekong Delta's economy is thought to be growing steadily, and the business environment is improving to attract investors. As a result, this is a very promising investment market.

- Opportunities provided by Industry 4.0

Industry 4.0 enables firms, particularly logistics enterprises in the Mekong Delta, to expand their markets, which is the driving force of corporate development. To reach Industry 4.0 standards, businesses must invest in machinery, technology, and automation in production and management operations such as applying digital technology and integrating smart technologies to optimize process and mode of operation.

Automated technology also helps enterprises in combating fragmentation, instability, inconsistent product quality, and noncompliance with quality standards such as Global GAP. Following that, businesses in this region would confidently sign contracts to supply items to big clients with guaranteed quality.

Vietnam is one of the five nations in the world with the fastest growth in over 30 years. Industry 4.0, like earlier industrial revolutions, promises to deliver significant benefits and prospects to the logistics industry, leading to shorter delivery times, reduced shipping expenses, and lower communication costs, then optimizing business costs. At the same time, it will help the logistics system and supply chain of companies be more transparent.

4.2. Difficulties

- Cold chain technology investment limitations

Statistics from 2019 show that, even though approximately 123 factories are producing and processing the main agricultural and aquatic products (rice, fruit, aquatic products) of the Mekong Delta, there are only 6 warehouses in the entire region. Refrigeration is concentrated primarily in Long An, Can Tho, and Hau Giang, with a capacity of approximately 50,000 tons and 93,000 pallets [15].

In the context of the Covid-19 pandemic, the Ministry of Industry and Trade has issued recommendations for logistics companies, particularly those involved in cold storage, to support agribusinesses by prioritizing the preservation of agricultural products that are struggling to export to China and lowering storage and handling costs.

This fact demonstrates the critical need to develop cold storage infrastructure in the Mekong Delta region in order to improve the region's ability to respond to any arising incidents and ensure that they can store and preserve agricultural and aquatic products after harvest while reducing spoilage rates and be proactive in production, export, and distribution for domestic consumption.

- Enterprises in the industry lack interaction with farmers and industry linkages.

It is estimated that more than 90% of farmers consider traders as their sole source of markets, as well as their exclusive buyer of agricultural products. Therefore, traders act as sellers and manipulate prices while businesses are unaware of the supply situation. As a result, businesses lack sufficient information to make accurate forecasts and supply planning decisions. If the output enterprise in a supply chain does not master the plan, the efficiency of the entire supply chain suffers. The Mekong Delta is the country's largest rice and aquatic manufacturer. According to a survey conducted by the Vietnam Logistics Research and Development Institute (2019) among logistics enterprises and shippers about logistics challenges serving agricultural and aquatic products. Some surveyed groups said they handled logistics themselves, which indicates the significance of outsourcing costs, apprehension about information leakage, and a lack of trust in logistics companies. The reason is that the region's logistics enterprises continue to operate independently and without the necessary connections. While the current logistics trend is collaboration and outsourcing, each company should focus on its strengths and consider outsourcing services that are not strengths.

- The Mekong Delta's logistics infrastructure remains deficient.

According to the report for the period 2014-2018, the Mekong Delta region's export growth rate is 10.57 percent, with exports increasing by an average of 9.43 percent per year and imports increasing by 13.1 percent per year. The region's average annual export volume of products is around 17-18 million tons. However, up to 70% of cargo volume must be transported by road to Ho Chi Minh City and Cai Mep ports. This increases shipping costs by 10% to 40% per cargo.

The Mekong Delta is home to 12 seaports, 35 wharves, and 4.9 kilometers of wharves. These seaports function as satellite docks for the ports of Ho Chi Minh City and Cai Mep - Thi Vai, as well as for short-distance inter-regional transportation. Because of the dense waterway traffic, it is considered to have the advantage of waterways for transporting goods. However, at present, inland waterway transport in the Mekong Delta still has to compete with road transportation due to limited infrastructure, which varies depending on the water and the static height of the bridge. As a result, the average transit time for the routes Can Tho - Cat Lai and Can Tho - Cai Mep Thi Vai is 18 hours and 36 hours, respectively, while the average road traffic on the same route is 5 hours and 8 hours. The freight of refrigerated containers by inland water vessel is significantly higher than that of land transport (70 percent higher per 40 feet container, and about 9 percent higher per 20 feet container) [15]. The above issues are huge barriers to promoting transport development of inland waterways that connect the Mekong Delta with the main ports of the southern region.

This situation is due to the fact that the Mekong Delta still lacks seaports and deep-water ports capable of serving the growing number of modes of transportation. A major logistics center and satellite center systems have yet to be built; there are no container yards or cold storage systems for agricultural and aquatic products at ports or airports, which are primarily manufacturer's depots, ...

Furthermore, the transport infrastructure between localities is underdeveloped and asynchronous, particularly in rural areas, making it difficult for heavy-loaded vehicles to enter and pick up goods.

- The application of information technology (IT) in enterprises is still limited.

Most websites of logistics companies simply introduce their services, lacking the utilities that customers require such as track and trace tools, shipping schedules, e-booking, tracking of documents, particularly visibility (the ability to see and control orders). The application of modern IT in businesses, such as warehouse management software (WMS), radio identification technology (RFID), or logistics cloud, is also quite limited. The reason, in this case, is a lot of logistics enterprises in the Mekong Delta primarily provide basic logistics services.

Furthermore, most logistics enterprises in the Mekong Delta have difficulty accessing specialized management software such as warehouse management software (WMS) and transportation system management software (TMS), because they frequently have to buy those products from foreign software developers. The highlight barriers are the

cost of buying from overseas, the highly problematic installation and commissioning process, and the connection standards are not synchronized internally and with customers. Therefore, logistics businesses frequently prefer to use domestic transport management systems, vehicle tracking, and traditional forwarding service management tools developed by domestic suppliers. However, this rate is less than 10% of all businesses. A majority of businesses remain dependent on Microsoft Excel software for management because of no adequate system software for small and medium-sized businesses.

- A lack of highly qualified logistics specialists

This is not only the circumstance in the Mekong Delta region but also in the country generally. According to statistics from the Vietnam Logistics Business Association (VLA), Vietnam's logistics industry has lacked approximately 200,000 high-quality workers with professional qualifications and skills between 2017 and 2020. By 2025, the need will be increased to 300,000 professional employees with professional qualifications, IT, and English proficiency. According to a VLA survey of 108 businesses in September 2017, there are nearly 50% of organizations consider hiring 15-20% more employees in the upcoming years. This situation demonstrates that businesses and colleges have not made a strong bond and effective link.

According to a survey from the General Department of Vocational Education and Training (Ministry of Labour, Invalids, and Social Affairs), there are currently only about 20 colleges and intermediate schools which provide specialized logistics training, and each year provide approximately 2,000 employees over 200,000 recruitment needs. If higher education graduates are counted in, the whole country would only meet 3% of labor demand. In the Mekong Delta, there is only one university that offers advanced education in Logistics and Supply Chain (Can Tho University of Economics and Technology). This amount is insufficient in comparison to societal needs.

5. Conclusion

Industry 4.0 brings significant benefits as well as challenges to logistics service providers in Vietnam in general, and in the Mekong Delta in particular. With an abundant source of raw materials and a large output, the Mekong Delta is the country's largest production center for food, aquatic products, and tropical fruit trees. As a result, Mekong Delta's logistics development is vital to the socio-economic development of the Mekong Delta, as well as the economic development of the Mekong Delta and the overall development of Vietnam's logistics industry. Thus, forming the logistics industry strategy in an organized manner following established requirements of the era is not only the responsibility of enterprises but also demands significant support from the Government and authorities. Innovating business processes to assess the benefits of Industry 4.0, as well as planning a cohesive infrastructure network in management are the fundamental solutions to develop potential business industries such as logistics in The Mekong Delta in the Industry 4.0 era.

AE-COMMERCE TAX POLICY: INTERNATIONAL EXPERIENCE AND LESSONS FOR VIETNAM

Assoc. Prof. Dr. Nguyen Thi Thuy Duong

duongnt@neu.edu.vn

School of Banking Finance, National Economics University, Hanoi, Vietnam

Nguyen Thuy Linh

ntl29012010@gmail.com

Hanoi- Amsterdam Highschool for the Gifted, Hanoi, Vietnam

Abstract

The article analyses the experiences of some countries around the world on tax policies for e-commerce. At the same time, the article also synthesizes the e-commerce tax policy in Vietnam and points out the weaknesses of the tax policy that make the tax management become more difficult. There are no clear regulations on how to verify the authenticity of digital signatures and the integrity of electronic documents as well as the responsibilities of organizations and individuals that directly form and create transactions. electronic translation. There is no difference in tax regulations between e-commerce activities and traditional commercial activities. Some e-commerce activities are not included in the list of business lines. The definition of permanent establishment in Vietnam's Law on CIT is not suitable. Finally, the article offers some solutions to improve the tax policy of e-commerce. It is necessary to study and amend regulations on procedures for declaring and paying VAT and other consumption taxes. The modification is made in order to be able to calculate and collect taxes automatically, to link with the real-time arising of tax obligations and to match the characteristics of digital economic activities. The tax authorities should revise the definition of permanent establishmen. Tax authorities need to build a database and widely deploy electronic tax services such as electronic tax declaration, electronic invoice, online tax payment, business registration. In addition, it is necessary to research and develop an intelligent internet search engine on websites with e-commerce activities to identify e-commerce activities that have not yet been declared tax.

Keywords: *E-commerce, international experience, tax policy, tax revenue*

1. Introduction

The growth of the Internet globally has brought many new types of businesses. Newly-appearing goods and services have different characteristics from those in the traditional way of doing business. Therefore, e-commerce is gradually becoming a popular and widely used business method. The diversity of operation models, participants as well as the supply chain of goods and services with the support of internet infrastructure and modern technology application has made e-commerce an important pillar in the process of national digital transformation. According to S.Bach, M. Hubbert and W. Muller (2000), e-commerce

includes fields that use electronic connections to transmit information in the exchange of goods and services. According to J.Li (2003), e-commerce transactions are classified based on the method of distribution and the participants in the transaction. The global e-commerce market reached to US\$30,981 billion in 2021. The strong growth of e-commerce in the Covid-19 pandemic has brought the share of online retail in total retail sales to 19% in 2020 and over 25% in 2021.

Table 1. Global ecommerce sales growth by region in 2020

No.	Regions	Growth
1.	Latin America	36.7%
2.	North America	31.8%
3	Central and Eastern Europe	29.1%
4	Asia Pacific	26.4%
5	Western Europe	26.3%
6	Middle East, Africa	19.8%
7	Worthwilde	27.6%

Source: Alessandra Sindresten et al, 2021

In 2021, e-commerce continues to expand globally. Among the top 10 countries ranked by e-commerce sales in 2021, China market continue to lead. However, on a per capita basis, the US still has the highest amount of \$2,547 thousand per capita

Table 2. Top 10 countries ranked by e-commerce sales in 2021

No.	Countries	E-commerce sales (billion dollar)	E-commerce sales per capital (thousand dollar)
1.	China	2,779	1,931
2.	United States	843	2,547
3	United Kingdom	169	2,490
4	Japan	144	1,139
5	South Korea	121	2,352
6	Germany	102	1,212
7	France	80	1,226
8	India	68	49
9	Canada	44	1,169
10	Spain	37	794

Source: Alessandra Sindresten et al, 2021

Over the years, mechanisms and policies in many countries around the world have not been improved in time to respond to the rapid change of business forms in the field of e-commerce. Therefore, the business of many goods and services in the field of e-commerce has not fulfilled tax obligations and creates unfairness in the tax systems of countries. Goods and services purchased and sold in the field of e-commerce are subject to the same taxes as traditional goods and services. However, in reality, tax collection for e-commerce transactions is relatively difficult because it is not easily to collect all information on goods and service transactions. Therefore, in the development of tax policies for e-commerce, some countries are oriented to design a simpler tax policy system. Tax collection with e-commerce transactions requires tax administration agencies to coordinate with sellers, businesses providing online business platforms, financial intermediaries and internet service providers. Tax authorities have to build a system of complex software to calculate the amount of tax that people have to pay, write reports and process tax debt payments. In addition, the tax policy for cross-border e-commerce is also built on the basis of trade agreements signed between countries to avoid double taxation for goods and services.

From 2017 to now, e-commerce in Vietnam has grown annually by over 25%. The transition from traditional retail to online business is an inevitable trend, even though the e-commerce market share in Vietnam is still relatively small compared to other countries in the region and the world. Two outstanding advantages of Vietnam's e-commerce are its high smartphone penetration rate and large digitally savvy young population. When the Covid-19 epidemic broke out, it was also an opportunity for e-commerce to develop. In 2020, there are 49.3 million online shoppers. The percentage of internet users participating in online shopping is 88%. The types of goods chosen for shopping the most are food, clothing, shoes, cosmetics, home appliances. The scale of e-commerce activities has reached about 13.2 billion USD in 2021, ie over 3 million billion VND. With such a scale, national budget revenues will increase significantly if tax policies in the field of e-commerce are completed appropriately so that taxes can be collected on all goods and services in this field. .

In Vietnam, e-commerce has made strong development steps in recent years. The growth potential of e-commerce is huge because Vietnam has over 50% of the population using the internet, nearly 50 million subscribers using smartphones and 200,000 enterprises that are doing business on social networks. From 2017 to now, e-commerce in Vietnam has grown annually by over 25%. Vietnam's e-commerce revenue will reach 13.2 billion USD in 2020 and may reach 52 billion USD in 2025 with an average growth rate of 29%. In 2020, there are 49.3 million online shoppers. The percentage of internet users participating in online shopping is 88%. The types of goods chosen for shopping the most are food, clothing, shoes, cosmetics, household appliances.

In summary, e-commerce is a popular global trend. Countries need to change their tax policies to better manage taxpayers and increase state budget revenue. This article will analyze the international experiences on tax policy with e-commerce, summarize the tax policies of e-commerce in Vietnam, detect limitations and propose solutions to improve e-commerce tax policy.

2. Method

The narrative reviews are used in this paper. The research has summarized and synthesized the experiences of some countries on tax policies for e-commerce. The paper has also analysed Vietnam's tax policy of e-commerce and pointed out the limitations. The purpose is to help the readers understand the reality of tax policy in Vietnam for e-commerce. The scope of the research questions being investigated is broad: (a) What are the experiences of some countries on tax policies for e-commerce? (b) What are limitations of tax policy of e-commerce in Vietnam (c) how should the e-commerce tax policy be improved? To provide clear answers to these questions, a literature review has been conducted. Secondary data are synthesized from domestic and foreign researches

3. Results

3.1. Tax policy of e-commerce in Vietnam

Currently, in Vietnam, there are 5 groups of e-commerce objects, including:

Group 1: Individuals, business households, organizations that collect from foreign organizations (Google, Facebook, Apple...);

Group 2: Individuals and business households selling goods online (online);

Group 3: Individuals, business households, and organizations that rent houses online through the application

Group 4: Organizations and individuals paying for electronic services of foreign contractors

Group 5: Enterprises organizing and operating e-commerce trading floors (Sendo, Lazada...), operating payment intermediary applications and shipping intermediary applications.

E-commerce objects must pay VAT, CIT and PIT. Tax regulations on e-commerce activities have been fully promulgated

Tax Administration Law No. 38/2019/QH14, which took effect from July 1, 2020, has established the legal foundation for management of this business. Specifically, the law has added the obligation to register, declare and pay tax for foreign suppliers that do e-commerce or digital-based business but do not have a permanent establishment in Vietnam. The Law also added provisions on the powers and responsibilities of competent state agencies in the management of e-commerce. The Ministry of Finance has issued legal documents to detail and guide the implementation of the Law on Tax Administration. The contents of management of e-commerce are clearly guided in Decree 126/2020/ND-CP, Circular 105/2020/TT-BTC, Circular 40/2021/TT-BTC, Circular 80/2021 /TT-BTC and Circular 100/2021/TT-BTC. According to the provisions of Circular 80, commercial banks and financial intermediaries are obliged to withhold and pay tax on behalf of foreign suppliers that conduct e-commerce business with organizations and individuals in Vietnam. Vietnam. These suppliers do not have a permanent establishment and do not actively conduct tax registration, tax declaration, and tax payment in Vietnam.

Key issues for management of e-commerce have been clearly guided, including procedures for registration, declaration, and tax payment for foreign e-commerce suppliers without a permanent establishment in Vietnam; obligations of organizations and individuals

doing e-commerce business in registration, declaration and payment of taxes; obligations of organizations when cooperating with individuals doing e-commerce business; obligations of an e-commerce trading floor when providing services to organizations and individuals doing e-commerce business...

In addition to the application of conventional management practices, the financial authorities has recently implemented specific operations to control e-commerce transactions, such as issuing Decision No. 2146/QD/BTC on management tax on e-commerce activities. This decision has clearly defined the contents, methods and measures of tax administration for e-commerce activities. The Ministry of Finance has cooperated with the Ministry of Information and Communications and the Ministry of Industry and Trade to develop and perfect the law in the field of e-commerce; sharing databases, connecting to exploit information to serve the state management of e-commerce business activities.

3.2. Experiences of some countries on tax policies for e-commerce

China's experience

The Chinese Tax Agency has built computer inspection support applications on HugeSearch software to search for documents; Access and Excel for data extraction and analysis; Bcp Utility to copy data; PC Tools for disk analysis; Ghost to access images from CDs; PowerIP for system analysis; Easy Recovery to recover data; PL/SQL to load data. Tax authorities have applied software in inspection and selected inspection records according to predefined criteria (including commands such as calculating rate, comparing with average, filtering revenue, payable tax amount, tax amount, etc.) owed...). The tax authority also applies the electronic data extraction of taxpayers and converts it into an application based on Access and Excel tools for analysis and reconciliation...

Since 2010, the state regulatory agency for industry and commerce has required all online retailers to provide real names and ID numbers on open online shopping platforms. In 2012, eight Chinese government agencies issued guidelines to promote e-commerce and e-invoices. Instructions include setting up an electronic invoicing system, an online information platform and an online payment standard. E-invoices are expected to bring benefits to the authorities in e-commerce tax collection and better monitoring of tax revenue.

German experience

German tax authorities face a risk when e-commerce businesses shift profits to countries with lower tax rates such as tax havens, especially for intangible goods. or digital goods and services (S. Bach, M. Hubbert and W. Muller, 2000). This has caused the state budget of Germany to suffer a significant annual loss of revenue. With current technology and technical management equipment, it is very difficult for the German government to manage and monitor e-commerce transactions when the server system is located abroad. For example, tax evasion will occur when customers download paid software, music, and videos from foreign suppliers because there are no links, distribution systems, or production of products within the country for tax authorities to control. Therefore, Germany has asked other countries to sign bilateral trade agreements with Germany to exchange information voluntarily, limit fraud on tax obligations, avoid taxes, as well as avoid double taxation.

However, countries having low tax rates such as tax havens will usually not join the tax agreements with Germany, Helge Sigurd Næss (2019).

In Germany, a bill was passed in 2018 requires that e-commerce platforms are legally liable for unpaid VAT from German sellers. In order to select websites of non-compliant taxpayers, the German tax authority compares information sourced from the Internet with information extracted from an internal database, including information on VAT and tax declarations. CIT and import and export tax. As a result, they compile a risk analysis profile on taxpayers. Germany has also built intelligent search engines on the Internet. Therefore, tax authorities have classified activities between organizations and individuals that have business activities on the Internet but do not declare and pay taxes. Germany uses Xpider tool to detect websites of German organizations and individuals that have e-commerce business activities; identification of e-commerce activities that are not yet subject to tax and collect and store information for tax inspection and examination.

Japan's experience

According to the Japan's Tax Agency, e-commerce transactions, whether partially or completely done via the internet, have such characteristics as high anonymity, ease of implementation, wide scope, digitalized and secured data... To handle these issues, the Japanese Tax Agency has taken the following measures:

- Require banks to provide account numbers used to pay for e-commerce transactions to identify e-commerce service providers.
- Do test shopping to receive emails from sellers and to identify e-commerce service providers.
- Use data recovery software to recover data on magnetic devices or the hard disks of personal computers, thereby preparing in case of future lawsuits.
- Establishing a tax management team for e-commerce activities including information technology experts, experienced inspectors and examiners from regional tax departments and tax sub-departments.
- Building a database collected from e-commerce service providers, internet auction service providers for the purpose of identifying objects participating in electronic transactions.
- Develop an automatic internet detection system to collect information from websites and identify unknown taxpayers.
- Annually organize training for senior inspectors (information technology) of tax agencies on basic skills in using commercial software, general understanding of information systems. Information and basic knowledge about networking, collecting and analyzing corporate data.

4. Discussion and Conclusion

4.1. Limitations of tax policy for e-commerce in Vietnam

Firstly, there are no clear regulations on how to verify the authenticity of digital signatures and the integrity of electronic documents as well as the responsibilities of organizations and individuals that directly form and create transactions. electronic translation. A transaction must ensure the maintenance of "trace" from the beginning to the end of the transaction.

Secondly, there is no difference in tax regulations between e-commerce activities and traditional commercial activities. Some e-commerce activities are not included in the list of business lines. Moreover, there are a number of e-commerce activities that have not yet identified the type of business, leading to difficulties in determining the nature and type to tax. In fact, there have been many individuals making transactions of buying and selling "virtual" money, transferring "virtual" items in games or renting apps to place ads online. These people have a revenue of tens of billions of dong, even hundreds of billions of dong, but they do not declare and pay taxes in full.

Thirdly, state budget revenue from e-commerce is still relatively small. The reason is that e-commerce activities are very diverse and have many areas of activity. Meanwhile, many foreign network operators currently do not have business registration and do not have a representative office in Vietnam. Moreover, the granting of business licenses to e-commerce businesses is still problematic because some types of e-commerce have not been allowed to be deployed.

Table 3. Tax collection from e-commerce in Vietnam

	Units	2019	2020	2021
E-commerce sales	Billion dollar	10.1	13.2	17.03
Tax revenue from cross-border e-commerce	Billion dong	1,167.8	1,143.7	1,314

Source: Ministry of Industry and Trade

Many foreign enterprises that have revenue from advertising activities in Vietnam have not yet paid taxes, causing huge losses to the state budget. For example, Facebook, Inc and Google LLC which have been operating in advertising business in Vietnam and accounting for 70 % market share, have not paid any taxes. In addition, many domestic and foreign organizations and individuals doing business through e-commerce in Vietnam have a large revenue. However, they have not yet declared, calculated and fulfilled their tax obligations. In fact, there are thousands of facebook accounts with commercial transactions via the internet. However, the number of registered accounts and granted tax codes is still very small.

Fourthly, according to Decree 126 and Circular 80, commercial banks and intermediary payment service providers are responsible for withholding and paying on behalf of overseas suppliers' tax obligations. This regulation has raised some unclear issues and confused commercial banks and intermediary payment service providers. For example, determining each product, goods and service provided by a foreign supplier in order to apply the correct percentage of tax rate is a difficult requirement for commercial banks and payment intermediaries. In addition, commercial banks also face difficulties when they have to track the amount of money transferred to overseas suppliers and report to the General Department of Taxation on a monthly basis. For transactions at domestic e-commerce floors, Circular 40 stipulates that e-commerce trading floors are responsible for declaring and paying value added tax and personal income tax on behalf of individuals. The tax amount

declared or paid on behalf of the business person is based on the tax rate of each field applicable to business individuals. E-commerce floor is actually not an income payer, but only provides a technology infrastructure to connect and facilitate transactions between sellers and buyers. The management of the seller's information, providing business information, and declaring and paying taxes instead will also increase the administrative burden as well as the operating costs of the e-commerce floor. It may arise a situation where e-commerce floor owners help customers evade taxes, avoid taxes or do not provide sufficient information to tax authorities on a regular basis.

4.2. Solutions

To improve e-commerce tax policy, Vietnam needs to focus on the following solutions:

Firstly, tax administration agencies need to study the actual development of technology and applications for e-commerce that have been changing daily. At the same time, tax authorities need to forecast and build a specific list of fields that will participate in e-commerce activities. It is necessary to propose tax management policies that are both stable for the type of e-commerce and flexible with the increasing change of online payment in the society.

Secondly, tax authorities need to build a database and widely deploy electronic tax services such as electronic tax declaration, electronic invoice, online tax payment, business registration. In addition, it is necessary to research and develop an intelligent internet search engine on websites with e-commerce activities to identify e-commerce activities that have not yet been declared tax. Recording of results as evidence for use in tax calculation, inspection and examination should be implemented.

Thirdly, the definition of permanent establishment in Vietnam's Law on CIT needs to be revised. A permanent establishment is defined as a production and business establishment through which a foreign enterprise carries out all or part of its production and business activities in Vietnam. This definition is also common in bilateral tax agreements between Vietnam and other countries. The phrase "production and business establishment" is explained as a fixed space such as branches, representative offices, warehouses, construction works. This leads to the fact that multinational companies engaged in e-commerce and digital content business use cyberspace as a way to avoid the formation of permanent bases and avoid taxes in countries.

One more issue, like other countries, VAT in Vietnam is levied on the principle of destination. Accordingly, taxable objects are goods and services serving production, business and consumption in Vietnam. In practice, problems have arisen when determining taxable objects for some intangible products and digital services provided on the internet (except for internet advertising and online training which have been regulated). This requires amending and supplementing regulations on objects subject to VAT which covers all arising products and services.

In addition, it is necessary to study and amend regulations on procedures for declaring and paying VAT and other consumption taxes. The modification is made in order to be able to calculate and collect taxes automatically, to link with the real-time arising of

tax obligations and to match the characteristics of digital economic activities. In the long term, along with the amendment of legal regulations on tax declaration and payment, tax authorities need to develop an automatic tax calculation system associated with the space and real time of transactions in the digital economy.

Finally, in order to improve the efficiency of management of e-commerce, it is necessary to promote the application of technology. Specifically, it is possible to establish a high-tech tax evasion prevention center under the General Department of Taxation. Tax authorities can assign the Information Technology Department (General Department of Taxation) to deploy the management software system for e-commerce. Tax authorities need to strengthen the application of modern technology to the management of e-commerce. Information technology along with other modern technologies helps to control business transactions of taxpayers, building automatic detection software to detect suspicious transactions on the internet. It is necessary to develop an information technology system to support electronic tax declaration, calculation and payment; applying modern integrated technologies (physical, biological, etc.) to detect shipping signs in the cash payment e-commerce model.

THE DIGITAL TRANSFORMATION OF VIETNAM LOGISTICS SERVICES PROVIDERS: BARRIERS AND RECOMMENDATIONS

MSc. Nguyen Thanh Nga

nganguyen@ptit.edu.vn

*Faculty of Business Management, Posts and Telecommunications,
Institute of Technology, Hanoi, Vietnam*

Abstract

The paper presents the literature review of the digital transformation of Vietnam Logistics Service Providers (LSPs) and the fact of their implementation. Five barriers are indicated are the complexity of the logistics service industry, the lack of resources, the hesitation to transformation, difficulties in digital transformation management, and information security threats. Finally, the paper proposes the recommendations for the Vietnam Logistics Association and Vietnam LSP in dealing with barriers and enhancing the digital transformation process.

Keywords: *digital transformation, logistics service providers, LSPs, barriers.*

1. Introduction

Digital transformation has become an indispensable objective for Vietnam Logistics Service Providers for enhancing productivity and generating competitive advantages. The Vietnam government addressed the vital role of the Logistics Industry as a spearhead economic sector and a pioneer in the digital transformation process. Because 40% of total logistics expenditures are directed to outsourcing (Langley et al., 2022) the Logistics Service Providers (LSPs) are main the actors to deal with the objective. Besides, Vietnam e-commerce businesses are pursuing a race to innovate technologies in their in-house logistics processes, which causes challenges for LSPs in Vietnam. Logistics costs in this country account for 20% of GDP (Vy, 2021), which is nearly twice as average logistics costs in the world. It motivates LSP to innovate to minimize costs and improve production efficiency. However, the digital transformation process in this industry is still backward, outdated technologies hinder to exploit locality's geo-economic advantages and potential. The perspective of the study is to propose an insight into the digital transformation of logistics service providers, analyze barriers and suggest recommendations for Vietnam LSPs to enhance the digital transformation process.

2. Literature Review

2.1. Digital Transformation

The term “digital transformation” is more widely known as a goal of businesses toward sustainability. Digital transformation is “an evolutionary process that leverages

digital capabilities and technologies to enable business models, operational processes, and customer experiences to create value” (Morakanyane, Grace & O'Reilly, 2017, p.9). It makes long-term impacts on the business organization, which is not emphasized in single advancement but through significant changes in technologies to create value (Cichosz, Wallenburg & Knemeyer, 2020). The digital transformation process is enabled by drivers which are digital technologies and digital capabilities (Morakanyane, Grace & O'Reilly, 2017). Digital technologies are the basement of the digital transformation process such as social, mobile connectivity, cloud computing, the Internet of Things, artificial intelligence and blockchain (Sayabek & Suieubayeva, 2020). However, using digital technologies is not enough to conduct the long-term transformation that it also uses digital capabilities. Digital capabilities are skills, mindset, and organizational culture incorporated with digital technologies (Morakanyane, Grace & O'Reilly, 2017).

The vital impact of the digital transformation is value creation in three main areas: business models, operational, and customer experience ((Morakanyane, Grace & O'Reilly, 2017). The transformation of three main areas can create great changes in organizations as well as customers. Digital transformation helps business organizations meet the need of customers, increase efficient performance, and survive in the face of the future. It allows all enterprises and organizations to compete better in the fast-changing-technologies era, toward the sustainability goals.

2.2. Digital transformation of Logistics Service Providers

Logistics service providers (LSPs) provide services to customers including warehousing, inventory management, information management, packaging, transportation and product delivery (Dang, Ta, Nguyen & Dang, 2019). LSPs play an important role in the global supply chain by delivering goods and services from suppliers to customers

The logistics service industry is considered a pioneer in implementing the digital transformation process. Technological changes, which are taking place in LSP businesses, are the foundation for moving forward to a digital ecosystem. It helps meet diverse customers' needs, optimizes production, and reduces storage costs. Hofmann & Rusch (2017) has introduced the logistics service model with two aspects: the physical supply chain aspect and the digital value chain aspect. The physical supply chain involves automated and self-managed logistics systems such as automated trucks, automated material handling systems, and automated order processing systems (e.g., smart contracts by technology, and blockchain technology). The digital aspect includes data from sensors and machines in the physical supply chain. Data is the key input for strategic business decisions (Demir et al., 2021).

Junge & Straube (2020) mentioned drivers of the digital transformation process (which are digital technologies and their capabilities) in logistics and supply chain management with different maturity levels and diffusion rates, as shown in Figure 1.

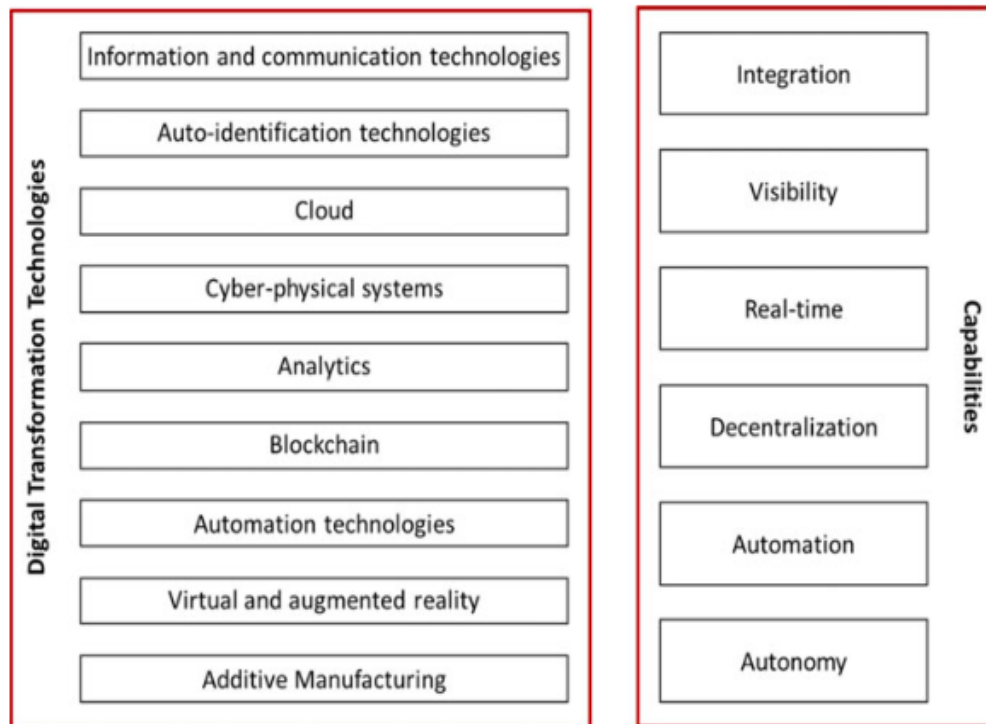

Figure 4. Digital technologies and digital capabilities in logistics and supply chain management

Source: Junge & Straube (2020)

3. Results

3.1. Facts of digital transformation of Vietnam Logistics Service Providers

Due to the Covid-19 pandemic, many factories had to suspend operations, thus, the number of goods that need to be transported decreased, thus, the supply chain was broken in a few months, caused an enormous impact on the business operation of firms. Vietnam's Logistics Service Industry is affected by more than 30 transnational logistic providers, who have close relationships with major shipping lines in the world. The decline in international demand led to a decrease in export orders, and many companies had to lay off workers. LSPs were affected significantly in business performance and operation areas. Therefore, LSPs have faced many challenges in conducting digital transformation objectives. The level of applying LSPs' information technology is still not prominent. 30% of information technology applications are being used at LSPs are basic applications such as logistics management systems, warehousing, data exchange, and customs declaration (Nguyen, 2021)

80% of the LSP members of the Vietnam Logistics Association are small and medium enterprises, thus, the impact of the pandemic has caused businesses to suffer huge economic losses (Vietnam Ministry of Industry and Trade, 2020). Meanwhile, investment costs for digital transformation are immense. Enterprises are almost in the early stage of digital transformation, which means that technologies in some business processes are conducted. International standard software has not been widely implemented in Vietnam because there are more than 17 types of logistics services (Nguyen, 2021). Uniformity in

technology application has not been achieved. Currently, the coordination of Vietnamese LSPs to build a digital transformation ecosystem is not apparent.

3.2. Barriers to the digital transformation of Vietnam Logistics Service Providers

According to the annual report on Vietnam’s business digital transformation carried out by the Ministry of Planning and Investment (2021), there are 9 main barriers of Vietnam businesses in facing digital transformation objectives, including the barrier to investment costs of technology applications; the changing business habits and practices; the lack of skilled-human resources to apply digital technology; the barrier of digital technology infrastructure; the lack of information about digital technology; difficulties in integrating digital technology solutions; the lack of commitment and understanding of the Board of Directors; the lack of commitment and understanding of employees; and the leakage of personal and business data (Figure 2).

These barriers are also identified by firms in the Vietnam Logistics Industry. However, the detailed barriers of LSP firms in implementing the digital transformation process are clearly stated as below:

3.2.1. The complexity of the logistics service industry

The complexity manifests itself in two aspects: the complexity of transactions between LSPs with carriers, warehouses, and operators and the complexity of business processes of LSPs. The characteristic of the logistics service industry is the participation of many parties. Therefore, the goal of digital transformation is called a “mega-project” involving the participation of all members of the system, requiring cooperation between companies, countries, locations and departments. However, this encounters obstacles because LSPs differ in sizes and types. Furthermore, the industry has no standard applications to apply in all Vietnam LSPs because of the difference in the services they provide.

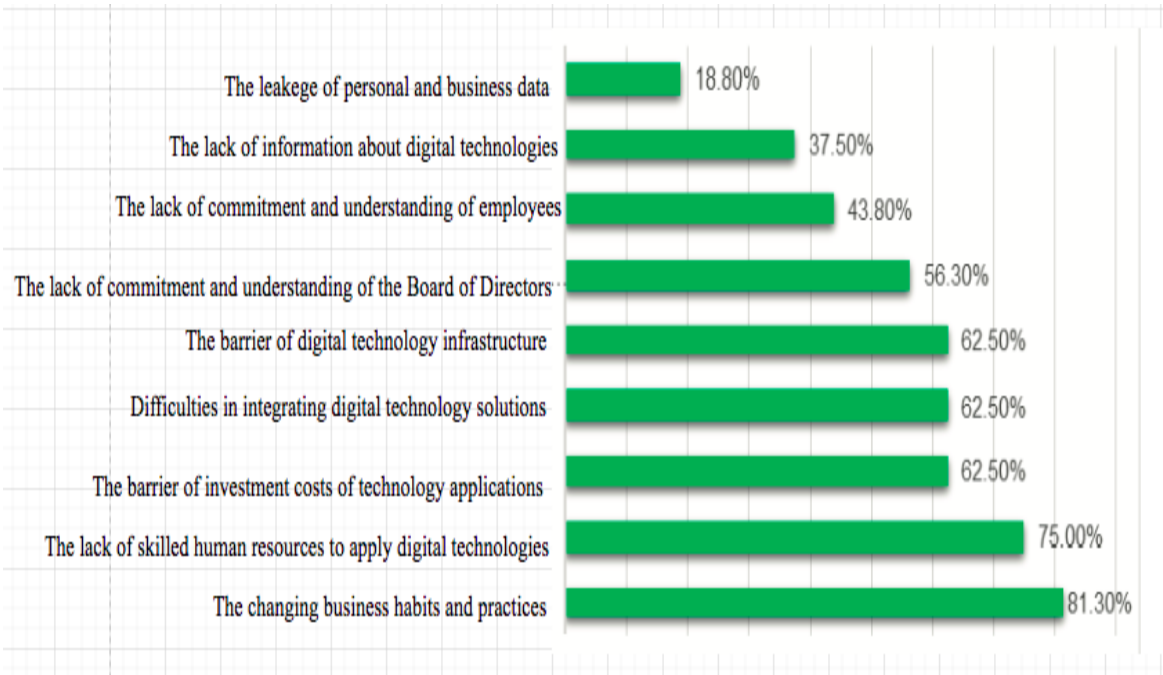

Figure 5. Barriers to digital transformation of Vietnam medium enterprises
Source: Vietnam Ministry of Planning and Investment, 2021

3.2.2. The complexity of the logistics service industry

The complexity manifests itself in two aspects: the complexity of transactions between LSPs with carriers, warehouses, operators and the complexity of business processes of LSPs. The characteristic of the logistics service industry is the participation of many parties. Therefore, the goal of digital transformation is called “mega-project” involving the participation of all members of the system, requiring cooperation between companies, countries, locations, and departments. However, this encounters obstacles because LSPs differ in size and type. Furthermore, the industry has no standard applications to apply in all Vietnam LSPs because of the difference in the services they provide.

The differences in the digital transformation process and technologies of each LSPs can create challenges for partners and customers of LSPs. For example, while LSPs make efforts to reduce the transaction of hard copy contracts, many customs procedures in some countries still require signatures and hard copies. Many shippers or authorized persons must be present at the delivery point to receive goods. In addition, LSPs mostly recruit a large number of short-term employees with low payments, which makes the digital transformation-oriented standardization processes chaotic (Cichosz, Wallenburg & Knemeyer, 2020)

3.2.3. The lack of resources

The second barrier is the lack of resources, namely financial resources and skilled human resources. Firstly, LSPs must have the financial capability to carry out the digital transformation program in the long-term. The digital transformation process is divided into 3 periods which include: doing digital, becoming digital, and being digital (Vietnam Ministry of Planning and Investment, 2021). Each period consists of many projects which require stable financial resources used for digital transformation. The investment cost for the process is relatively large, while its effect has not been clearly shown in a short time. Thus, it is difficult for LSPs to achieve their transformation. The cost race creates a major barrier for small and medium enterprises. The technologies used in some LSPs present how businesses innovate as a marketing tool rather than suggest how to solve the problems (Cichosz, Wallenburg & Knemeyer, 2020)

Besides, the limitation of skilled human resources also poses an arduous problem for LSPs. The lack of experts and skilled labours who are knowledgeable about digital transformation is a bottleneck for businesses. For large LSPs, this problem can be solved by providing training programs. However, this is a big barrier for small companies, small carriers, and subcontractor. For example, small LSP often hires experienced drivers who are about to retire, those with low education, and short-term workers, who have difficulty developing digital capabilities.

3.2.4. The hesitation to transformation

Psychology comes from both organizations and individuals. As mentioned in the literature review, digital transformation process is not only the application of digital technologies but also implementation of digital capabilities which include mindset, skills,

and organizational culture (Morakanyane, Grace & O'Reilly, 2017). The Board of Directors plays a vital role in changing the mindset and building a digital transformation-oriented organizational culture. In large LSPs, it is a complicated issue. When all process is running fluently, businesses are skeptical about whether the change is effective or costly.

The unreadiness of digital transformation also comes from employees. They are afraid to change and step out of their “comfort zone”, not open to innovation and, fear changing routines and daily operations. Their psychology is caused by the fear of job loss by the replacement of robots and automation machines. Cichosz, Wallenburg & Knemeyer (2020) indicate an example of a company's implementation of a transportation routing system. Based on the data of delivery points on the same days, the algorithms will suggest the best routes for the shippers. However, in reality, the shippers will not take the suggested routes because they are used to the old routes. The system has been integrated with another system to track the goods and estimated delivery times, which caused causes performance impediments to LSPs.

3.2.5. Difficulty in digital transformation management.

In addition to building a technical team for digital transformation and setting up a digital transformation culture, digital transformation management plays a very important role. They have difficulty in making management decisions about which technologies to integrate into the business apparatus and operating processes (Cichosz, Wallenburg & Knemeyer, 2020). This presents the lack of cooperation between the company's digital transformation team and other departments, which can lead to ineffective solutions to meet business needs. Furthermore, the use of discrete management applications also makes it difficult to build a seamless technology solution system.

3.2.6. Information security threats

One of the biggest hurdles for LSP companies in the digital transformation process is data leakage. When cloud solution helps LSPs store data about transactions with customers, suppliers, and internal information anywhere, anytime, security issues become a great challenge for LSP. If businesses do not manage this problem well, it will cause unpredictable consequences such as loss of customer information, legal problems, or bringing to the brink of collapse.

4. Discussion and Conclusion

4.1. Recommendations for Vietnam Logistics Service Providers to enhance the digital transformation

4.1.1. For Vietnam Logistics Providers Association

The association among Vietnam LSPs is an inevitable solution because they are currently operating on a small scale and lack cooperation. Logistics enterprises should accompany together in choosing international market penetration and applying Electronic Data Interchange (Dang et al., 2019), which is a form of information transfer that replaces physical papers. For small and medium enterprises (SMEs), their small scale of capital và operation depends heavily on partners. Therefore, large-sized enterprises and state-owned

enterprises should be pioneers in this field, conducting each stage such as electronic data connection in warehouse operations, and port before forming the entire transmission line. SMEs, on the one hand, can learn and apply with partners, and on the other hand, should negotiate with large-sized enterprises and state-owned enterprises to share the participation of the transmission line for them at a reasonable cost. Government and Vietnam Logistics Association should give a hand in this affair. This partnership will help business entities save costs in learning and developing in digital transformation roadmap and achieve the ability to deliver high-quality services.

Furthermore, the Vietnam Logistics Association performs the role of association of LSP. Meanwhile, the organization needs to propose applications to build a technology platform serving the LSP community.

4.1.2. For Vietnam Logistics Service Providers

LSP should step by step specialize in logistics operations with their competitive advantages. Vietnam exporters need to develop specialized goods such as leather shoes, woods, seafood, equipment, fibers, steel, etc. By specialization, the LSPs can provide the market with high-quality services and become indispensable suppliers in the import and export businesses.

Building a digital roadmap for businesses to achieve specialization will make it easier to integrate technologies with business models and provide professional knowledge training for employees. They should divide the digital transformation plan into periods with detailed projects. Every project is prepared with an estimated budget, time, and target to manage digital transformation process well. They also pay attention to three below criteria:

People: People act as a pivotal role in the digital transformation process. For building the digital transformation-oriented organizational culture, the Board of Directors needs to be a pioneer in learning and innovating new knowledge of digital transformation. In addition, professional training is needed to be invested, including of internal and external training. There are types of internal training: on-job training, formal courses and learning from peers.

Process: LSPs should pay attention to the way business operating to combine people and technology to enhance customer experience and productivity. LSPs should assess the current status, the business visions; the readiness for digital transformation; review processes and make necessary changes; and demonstrate the digital transformation commitment of the board of directors and the business.

Protection: The core of digital transformation is data. The transformation must always be accompanied by information security, which is in harmony with the goals of the LSPs. They need to ensure the balance between reducing risks and enabling innovation. During this time, LSPs should raise the users' awareness and knowledge of information security for all parties (employees, customers, providers), establish security policies and a reward-punishment system. Besides, LSPs can learn from the experiences of digital transformation LSPs or outsourced information security consulting services.

4.2. Conclusion

Digital transformation plays an important role for Vietnam LSPs to enhance customers' experience and improve productivity. Particularly, the Covid-19 pandemic is an alarm for LSPs against fluctuations in the business environment, thus, the digital transformation is the goal for sustainable development. The paper presents an overview of the digital transformation of LSPs and facts about the process. Five barriers are indicated are the complexity of the logistics service industry, the lack of resources, the hesitation to transformation, difficulties in digital transformation management, and information security threats. Therefore, the Vietnam Association of Logistics Services Providers should connect Vietnam LSPs to build a community of learning digital transformation knowledge and implementing digital transformation projects. In addition, Vietnam LSPs need to build an appropriate digital transformation roadmap with detailed plans and targets. They also need to focus on great changes in people, processes, and information protection. Due to limitations in research scope and time, the paper only collects the secondary data, which may not reflect the exact facts and barriers to the digital transformation process of Vietnam LSPs. Future studies are wished to conduct various methods as quantitative reserach, case studies, to examine the more accurate impacts.

Abstract

Research examining the main factors that urges online shopping behavior of consumers on the e-commerce platform. The results of regression analysis surveyed 600 people participating in research in Hanoi, Viet Nam during the time of COVID - 19, show that online buyers behaviors are influenced by three factors: feeling of convenience, risk sensing, and social factors. In which social factors have the most remarkable impact on online buying behavior. The results of research also indicate several solutions to promote online shopping such as businesses that need to be aware of the capacity of the social status that the products and brands represent. In addition, the businesses should suggest solutions to lessen the risk of buying for customers and simultaneously increase the convenience for online buyers' experiences.

Keywords: *feeling of convenience, risk sensing, social factors, intention, online buying behavior.*

1. Introduction

E-commerce has contributed significantly to the economic growth of Vietnam. One of the factors having made a major impact on the development of the e-commerce market is customers. However, customers themselves are often not simple, apart from their basic

needs, they also have many other ones related to psychological characteristics, their lifestyle or culture, society where they reside in. Therefore, analyzing and evaluating the behavior of customers shopping online can help managers predict user's psychology and assess the future growth of the e-commerce industry (Shwu-Ing, 2003).

Many purchasing behavior studies on e-commerce platforms are recognized. Bellman et al. (1999) investigated that income, education, and age have little impact on online shopping decisions. While the experience from previous purchases by individuals has had a relatively large influence. Faith is an important factor in marketing, and especially for e-commerce (Urban et al., 2000). The image of an Internet retailer is important to consumers when they make a purchase (Rust et al., 2002). Many researchers argue that perceived risk in online shopping negatively affects consumers' online purchasing behavior (Martin and Camarero, 2009). Swinyard & Smith (2003) states that more than 70% of people don't engage in online shopping due to risks that could hurt them financially. The scientific research team will continue to clarify and analyze this issue more closely.

In addition, although online shopping participants are of all ages, university students are identified as the most frequent visitors of the Internet market and a source of future online sales growth. (Silvennan, 2000). Nowadays, young generation is very active and has a lot of knowledge about technology. When shopping for a product, they usually think and consider about 5 brands before users buy the product (according to Nielsen research). They may be willing to rebrand for a better experience. What's more important is that young customers when buying products not only consider the price but also consider the benefits that they will receive when buying the product. After that, they pay attention to quality, usefulness and above all convenience and simplicity. It can be said that the online shopping behavior of today's younger generation is constantly changing and is different from previous generations, so it is necessary to supplement and contribute more for previous studies to be completed.

Moreover, COVID-19 has posed unprecedented challenges all over the world and Viet Nam is no exception. The outbreak has taken a toll on business, leading to delays in production, business closures, or a substantial decline in profits. Therefore, Covid-19's regulations have had a major impact on enterprises and customers interests in cybershopping. The General Statistics Office of Vietnam has declared that online shopping is becoming much more popular in the first six months of 2020, especially in the period of restrictions and social blockades. Instead of stocking food and basic needs items, citizens tend to purchase them online. This has created a significant change in the e-commerce industry and the economic growth of Vietnam. Therefore, the study of the factors that affect the behavior of online purchases on the e-commerce platform is very meaningful in practice and reasoning.

2. Literature Review

Research in the e-commerce market on the analysis of consumer behavior has shown that there are many positive and negative factors affecting consumers. Monsuwe et al. (2004) suggested that online shopping is an act of customers making a purchase online via retailers' websites. According to Haubl and Trifts (2000), online shopping is the activity of customers

buying products and services through transactions on computers or electronic devices that have internet access to get access to online retailers.

Feeling of convenience

Cybershopping convenience: Empirical research shows that the convenience of the Internet is one of the factors having a considerable influence on consumers' level of willingness to shop online (Wang et al. 2005). Online shopping is always available for customers to browse and purchase compared to physical stores. As a result, the advantage of shopping online involves making simpler purchases and reducing the time spent shopping (Kim & Lim, 2001). Consumers value the benefits of accessing brands, stores, and products that are not yet available where they work or live.

Website responsiveness: Online shopping participants argue that online sales sites offer higher conveniences in communication, distribution, and outreach. Exceptional website designs can attract consumers and outweigh other competitors. Song and Zahedi (2001) classified website quality factors into 5 categories: promotion, service, influence of information, self-efficacy, and resource facilitation. How handy a website is often depends on effectiveness of technical features, such as advanced search engines and personalized services provided by service providers to consumers (Kim & Song, 2010).

Price: When consumers assess the value of a product from a customer's perspective, they always focus on price. The price directly has a substantial impact on the perception of the benefits and usefulness of trading, thus affecting customer satisfaction (Kim et al., 2012). A competitive pricing strategy should be set to attract online visitors to the site and encourage them to make purchases (Hamza & idalavi, 2014). Customers are always looking for competitive pricing and making comparisons between online retailers before deciding to purchase. Because customers often drive better deals from shopping online, therefore, they can buy the same product for a lower price than in-store purchases (Rox, 2007).

Faith: Trust is one of the factors that plays a key role in the online shopping behavior of users or in physical stores (Chen, 2009). Trust increases the level of willingness to use services (Lu et al., 2011). When consumers have faith in online activity on their website, they leave genuinely good feedback which help customers have a positive attitude and vice versa. Prestigious level not only affects the business itself but also affects the feelings of customers and partners. Moreover, customers' trust is built based on trust in online sellers and online payment methods. Therefore, the hypothesis H1 is designed as:

H1: feeling of convenience has a positive effect on the shopping intentions.

Risk sensing

Financial risks: Financial risk is defined as the risk being related to financial transactions on the Internet. These risks are always presented in every financial transaction on the Internet, no matter how many times it takes place, and it comprises the costs associated with returning products, shipment, prohibitively expensive products, and especially

cybersecurity issues such as the loss of personal information, is the main reason for limiting online shopping behavior (Miyazaki & Fernandez, 2001).

Low-quality product risks: Product risk is defined as the risk that a product is considered to be different in design, style, color, and quality than the product's description by the seller before making a purchase. Comparing to shopping in physical stores, the Internet makes it difficult to assure the actual condition of products which is attributed to limits of retailers' information and images (Jarvenpaa and Tractinsky, 1999). Losses occur when a brand or product is not as expected, primarily because buyers are incapable of accurately assessing the quality of the product online (Bhatnagar et al., 2000).

Security risks: When consumers have the need to shop on e-commerce platforms, the site will ask them to fill out a lot of information such as phone number, address or credit card information. Hence, the customer information may be disclosed resulting in the customer being harassed, or money being stolen from personal credit cards. Previous experiments have shown the risk of personal information being disclosed or exchanged for other businesses has caused a concern for several people when shopping online (Bui Thanh Khoa, 2018).

Shipping risks: In online shopping platforms, many people are brand-new customers, therefore, buyers and sellers do not have trust in each other so it is necessary to avoid risks in delivery process - especially items that are quite the distance, the sellers often ask users to prepay or deposit half of the bill. Dan and Kim (2007) pointed out risks in delivery can be due to loss of goods, damage to goods, and delivering to wrong address. Updating shipment status can help customers reduce their worries about the shipment process and not being able to ship goods (Masoud, 2013). Therefore, we design the hypothesis as:

H2: Risk sensing has a negative effect on online shopping intentions.

Social impacts such as the opinions of other people (family members, friends, colleagues, celebrities, etc.) directly or indirectly influence consumers' trust in retailers. It also refers to the possibility of losing status in the social group of consumers due to the inappropriate product or disapproval of the use of the internet as a shopping method (Stone and Gronhaug, 1993). Consumers normally strive to seek advice or consent from others in their social group to reduce social risk. Kudeshia et al. (2017) conducted research and came to the conclusion that the social impact not only affects the intent to shop online but also significantly affects consumers' attitudes when making online purchases.

H3: Social factors have a negative effect on online shopping intentions.

Intent is a factor in creating a driving force and motivating individuals to engage in future behavior. Delafrooz et al. (2011) pointed out that the intention to shop online is the possibility that a person will have bought a product on the Internet. The stronger an individual's behavioral intentions, the higher their ability to perform such behavior. Additionally, this is a factor to evaluate the importance of psychology affecting the customers' shopping behavior. Hence, hypothesis H4 is designed as:

H4: Intention has a positive effect on online shopping behavior.

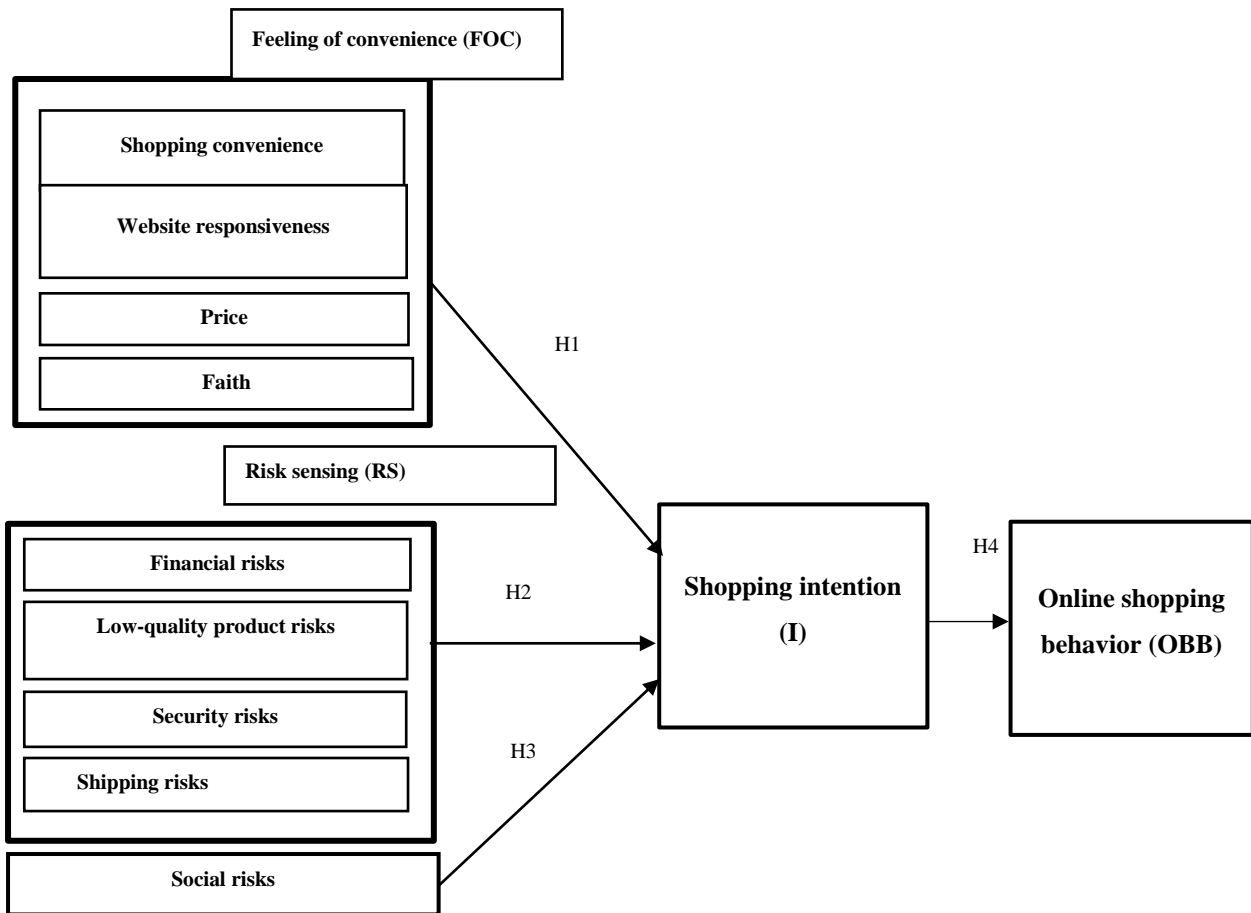

Figure 1. Research model

3. Method

Research and data collection

Research on the convenience sampling method. The questionnaire which is designed on the Google Docs tool, is sent to customers via Email and Facebook. There are 600 of these questionnaires that are qualified for data processing. Details of the research sample are: According to 600 qualified samples, female participants account for 71.9%, and male participants account for 28.1%. In addition, the group (aged 18 to 25) is the highest number of participants. The second is the age group over 40 years old, the third is the age group 26-40 years old. Participants over 40 years old are the second group and those from 26 to 40 years old are the third one.

Measurement scale and table development

The measurement scale used to measure aspects in the factors (measurement of observed variables) is a 5-point Likert scale ranging from 1 representing for being "strongly disagree" and 5 representing for being "strongly agree". The study has summarized the scales in Table 1.

Table 1. Variables and Attributes and Results of Cronbach's Alpha Coefficients

Variables		Scale	Cronbach's Alpha if Item Deleted	Source
Feeling of convenience (FOC) .823	Convenience level (CL)	I can easily find the products I need when I shop online	.818	Rao et al., (2018)
		I choose online shopping because I can avoid crowds and traffic jams .	.810	
		I choose online shopping because it avoids embarrassment if I do not make a purchase.	.814	
	Responsiveness (WR)	I only buy on sites with reliable information about the seller.	.820	Chau (2014)
		I only buy products on websites that have customer feedback system	.811	
		I only buy products on websites where the sellers are retailers, big companies.	.808	
	Price (P)	I opt for online shopping to get reasonably priced products	.805	Chau (2014)
		I regularly make a comparison between prices of products when I shop online	.815	
		After comparing, I usually choose the seller with the lowest price.	.814	
	Faith (FA)	I have trust in online shopping platforms	.803	Chau (2014)
		I have trust in online sellers	.797	
		I have trust in online shopping payments	.804	
Risk sensing (RS) .874	Financial risks (FR)	I feel that my credit card details could be compromised and misused if I shop online.	.865	Sinha & Kim (2012)
		When shopping online, I may be overcharged because the retailer has my credit card information.	.865	
		I feel that my personal information provided for the transaction with the retailer may be compromised to a third party.	.869	
	Low-quality product risks (PR)	I am concerned that the products will not be as effective as they are advertised.	.870	Minh (2018)
		I am concerned that the product will not live up to my expectation	.870	
		Buying online makes me lose the opportunity to buy at brick-and-mortar stores.	.868	

Variables		Scale	Cronbach's Alpha if Item Deleted	Source
	Security risks (SR)	I am concerned that the sales site collects too much of my personal information.	.853	Minh (2018)
		I am concerned that the sales site will use my personal information for other purposes without my permission.	.861	
		I am concerned that my personal information is not securely managed on the sales site.	.858	
	Shipping risks (SHIP)	I do not shop online because there is no reliable and well-equipped delivery person.	.865	Sinha & Kim (2012)
		I may not receive the product I have ordered online.	.862	
		During delivery process, the product might be damaged.	.868	
Social factors (SF) .876	Social media helps me gather information about products to buy online.	.868	Rao et al., (2018)	
	Comments by individuals on the internet have an influence on my online shopping.	.862		
	When I shop online, opinions of friends and family are important to me.	.758		
	Shopping online alleviates the possibility of getting COVID - 19	.798	Complements from qualitative research	
	Shopping online helps me comply with social distancing orders	.835		
	Distance and isolation rules in the context of covid-19 motivate me to shop online	.847		
Intention (I) .719	I only intend to shop online when I have the need.	.713	Nguyen & Hoang, (2020)	
	I will continue to shop online in the future.	.578		
	I will recommend friends and family to choose online shopping platforms	.604		
Online shopping behavior (OBB) .880	I always use online shopping	.852	Nguyen & Hoang (2020)	
	I rather choose to use online shopping platforms than go out shopping in brick-and-mortar stores	.839		
	I will have been shopping on a regular basis	.856		
	I plan to shop online way more in the future	.837		

To collect data for the research, the questionnaire was developed on the basis of indicators measuring concepts in the research model. However, before designing the sample questionnaire with a small sample, the study conducted interviews with 13 customers to verify the concepts of variables and the content of the indicators and explore 3 more indicators in the factors. society. In addition, the questionnaire included questions about demographics, such as gender, age, income, and occupation. The indexes are translated into Vietnamese through the reverse translation process. The questionnaire was then checked with several small response samples to ensure there were no misunderstandings about the content of the question and to finalize the format of the questionnaire.

Data analysis

Before testing the hypotheses, the study carried out testing the reliability of the scale by Cronbach's alpha coefficient and exploratory factor analysis (EFA) for all the indicators of the scale measuring the independent variables and EFA for dependent variable indicators. The results serve as a basis for linear regression analysis and testing of research hypotheses.

4. Results

Evaluate the reliability and validity of the measurement scale.

To evaluate the scales of perceived convenience, perceived risk, social factors, intention, online purchase behavior, the study carried out reliability test with Cronbach's Alpha coefficient and analysis EFA.

Table 1 shows the results of the reliability test for the final scale of 37 observed variables. Indicators measure variables with appropriate reliability. Cronbach's Alpha for each scale ranges from 0.719 (intent) to 0.880 (Online buying behavior). These results show an acceptable level of confidence because the alpha coefficients are all greater than 0.6 and the total variable correlation of the variables is greater than 0.3 (Hair & cộng sự, 1998).

After removing CL1, PR3, SHIP2, SF2, I1 because of the high loading coefficient on both factors, the final results of EFA showed the convergent value and discriminant value of the scales in the study. The results of KMO index are suitable ($0.5 \leq KMO = 0.865 \leq 1$) (Hoang Trong & Chu Nguyen Mong Ngoc). The results of Bartlett's test on the correlation between the remaining variables are significant (Sig.) = 0.000 < 0.005, showing that the variables are closely related. Specifically, exploratory factor analysis was performed on indicators measuring 3 independent variables, namely FOC, RS, SF. Expected results created 4 factors, explaining 65.251% of the total variance, satisfying the requirements. >50% (Anderson & Gerbing, 1998). All measurement indicators have factor loading >0.5. These indicators have a high load on one factor and a lower load on the other.

Table 2. Results of the final factor rotation matrix

	Observable Variables	Factors				
		F1	F2	F3	F4	F5
FOC	CL2	0,949				
	CL3	0,923				
	WR1	0,882				
	WR2	0,810				
	P1	0,790				
	P2	0,906				
	FA1	0,852				
	FA2	0,792				
	FA3	0,860				
RS	FR1		0,790			
	FR2		0,870			
	FR3		0,768			
	PR1		0,711			
	PR2		0,633			
	SR1		0,691			
	SR2		0,950			
	SR3		0,678			
	SHIP1		0,790			
	SHIP3		0,870			
SF	SF1			0,590		
	SF3			0,680		
	SF4			0,768		
	SF5			0,748		
	SF6			0,718		
	I	I2				0,668
I3					0,868	
OBB	OBB1					0,720
	OBB2					0,875
	OBB3					0,763
	OBB4					0,868

Correlation coefficient matrix

The correlation between the concepts was also examined. Result of correlation coefficient matrix shows the matrix of correlation coefficients between variables including perceived support of the organization, sense of responsibility, motivation for scientific research. At 5% significance level, the results show that FOC has a positive relationship with FOC ($r=1$), RS has a positive relationship with RS, SF has a positive relationship with SF ($r=1$). I has a positive relationship with I ($r=$) and FOC has a positive relationship with FOC. Thus, the correlation coefficient shows that the dependent relationship between the dependent variable (I, OBB) with the independent variables FOC, RS, SF and the intermediate is statistically significant (Sig. < 0.05), otherwise it is not. any variable is not statistically significant.

Linear regression analysis results

The results of the regression analysis also confirmed that there was no multicollinearity because all the variance exaggeration factors (VIFs) were less than 10.

Table 3. Regression results

Factor	Coefficient B	Standard deviation	Beta (β)	T test	Level of meaning (Sig.)	VIF
FOC	0,014	0,001	0,015	0,792	0,02	1,526
RS	-0,124	0,051	-0,125	0,192	0,008	1,426
SF	0,432	0,109	0,437	2,717	0,006	1,477
Coefficient R ²	0,600					
Adjusted R ² coefficient	0,696					
Durbin-Watson Coefficient	2,011					
Level of meaning (Sig. F)	0,000					

Note: Dependent variables is : I

Table 4. Regression results

Factor	Coefficient B	Standard deviation	Beta (β)	T test	Level of meaning (Sig.)	VIF
I	0,424	0,061	0,435	0,592	0,0002	1,826
Coefficient R ²	0,800					
Adjusted R ² coefficient	0,886					
Durbin-Watson coefficient	2,000					
Level of meaning (Sig. F)	0,000					

Note: The dependent variable is: OBB

The results of the linear regression model 1 in Tables 3 and 4 show that the significance level of this model (Sig. F) = 0.000 is much smaller than the significance level of $\alpha = 0.05$. The Durbin-Watson coefficients of 2.011 (for the dependent variable model I) and 2,000 (for the dependent variable model OBB), between 1.5 and 2.5, show that this model has no correlation phenomenon (Hoang Trong and Chu Nguyen Mong Ngoc, 2008). The adjusted coefficients $R^2 = 0.696$ and 0.886 show that the independent variable included in the regression explained 69.6% and 88.6% of the change of the dependent variables I and OBB respectively.

All 3 variables have statistical significance are FOC, RS, SF. In which SF has the most influence on I ($\beta = 0.437$ and $p\text{-value} < 0.01$); then the variable RS ($\beta = -0.125$ and $p\text{-value} < 0.01$); the last is FOC ($\beta = 0.015$ and $p\text{-value} < 0.001$). I (Intention) has the most influence on OBB ($\beta = 0.435$ and $p\text{-value} < 0.01$). Thus, hypotheses H1, H2, H3, H4 are all supported.

5. Discussion and Conclusion

Discussion of the results

As the consequences of regression, it is evident that social factors have the most significant impact on consumers' purchasing intentions, especially in the context of the Covid-19 epidemic, online shopping helps to alleviate the possibility of catching Covid-19 and comply with social distancing regulations. Furthermore, social distancing and isolation regulations urges customers to shop online frequently.

The second strongest factor influencing purchasing intent is the perception of risk with a standardized regression. This is the only factor that has a negative impact on customers' intent to shop. This result is identical to the study of Mohammed Saleh et al. (2015), which is explained because this study mainly focuses on young users who do not have a deep awareness of security issues and they only pay attention to the benefits of this kind of payment. Therefore, if the risk increases, their intention to continue (starting) online shopping will decrease because of a common mentality of consumers that they do not want to take any risks and losses when shopping online.

The third factor that positively impacts shopping intentions is the feeling or sense of convenience. The convenience of shopping, website responsiveness, price and trust, all show consistent results with previous studies of customer satisfaction when shopping online (Wolfenbarger & Gilly, 2003).

Research implications

Risk reduction measure: Consumers are likely to face the risk of being violated their personal benefits when shopping online, such as goods received differ from describing images of products, goods that are delayed or not delivered, and disclosing personal information. Enterprises need to be responsible for enhancing the protection of consumers' benefits in e-commerce transactions with the aim of reducing the possibility of customers being scammed when shopping online. Some of the feasible strategies that businesses can conduct to minimize perceived risk include fully providing customers the information of the

product's features, providing flexible, efficient, and free return policies, and ensuring that the credit card payment process is completely accurate and secure. To assure this, businesses need to invest in an effective security mechanism to prevent the intrusion of hackers or black marketeers, ensuring electronic transactions are safe.

Solutions to social factors: Social factors such as family, social status partly influence the online shopping behavior of users. Businesses must endeavor to identify a certain group of customers for reference and need to determine which group of customers are likely to be more affected by online shopping behavior. Each role is associated with a state that reflects the general respect in society and is consistent with that role. As a result, buyers tend to choose products that reflect their role and status in society. Businesses need to be aware of the ability to display the social status of products and brands.

Development of website responsiveness: The fully detailed and accurate provision of information through the brand's website can directly affect consumer psychology and easily get access to customers. Enterprises must ensure the diversity of products or services, the ordering process needs to be simple and straightforward, and eventually, the website itself ensures to provide 24/7 support for the customer with the shortest waiting time.

Increase the reliability of the product: Businesses need to pay attention to the quality of the product to derive positive feedback from customers which helps them enhance the sales of the product. Information from sellers, friends, and other sources is the fundament for users to create expectations. Sellers must advertise their products with accurate quality and condition of the product to build trust for buyers. Otherwise, it would result in not living up to their expectations.

The reasonableness of the price for consumers: Student is one of the most potential group of customers for shopping activities. Due to the possibility to attract these group of consumers, retailers need to offer them a fair deal which is the price that students can be willing to pay for online shopping activities. Therefore, businesses should consider the reasonableness of the price aiming to reach out to consumers.

Development in delivery: It is undeniable that online shopping has a myriad of benefits, but it also contains risks that can significantly affect consumers' shopping behavior. Buyers often face risks such as loss of goods, delayed delivery, goods being damaged or not the same as described, etc. With the aim of limiting the damage and protect the rights of consumers, enterprises must focus on organizing and managing the department of processing goods orderings and delivery, having reasonable return policies, quickly handling consumer complaints about the quality of goods products.

VIETNAM'S OPPORTUNITIES AND CHALLENGES FROM THE INNOVATION START-UP IN INNOVATION IN DIGITAL TRANSFORMATION

MA. Nguyen Chu Du

dunc@dhcd.edu.vn

Faculty of Sociology, Trade Union University, Hanoi, Vietnam

Abstract

Innovation has become the "key to success" and one of the most important "benefits" in the socio-economic development strategies of most countries and territories. According to statistics, Vietnam currently has more than 1,400 organizations capable of supporting startups, of which 196 co-working zones, 69 business incubators and 28 business promotion organizations have been established. The number of venture capital funds that consider Vietnam as a target market or have operations in Vietnam is currently 108 funds, of which 23 have Vietnamese legal entities and 23 are "purely Vietnamese". In the context of digital transformation, these numbers are constantly increasing, showing the development of the ecosystem. However, innovative start-ups still face many challenges and difficulties. Within the scope of this article, the author deeply analyzes the opportunities and challenges of Vietnam from the perspective of innovation and makes recommendations to improve the effectiveness of innovation in the current digital transformation period.

Keywords: *Challenges, Digital transformation, Opportunities Start-up innovation*

1. Introduction

The fourth industrial revolution with the development platform is digital technology that has shaped the digital trend in all areas. Digital conversions are also ongoing in most sectors, sectors such as banking finance, education, health, transportation, agriculture, and other fields. Innovative innovation activity in digital conversions has opportunities and challenges to be taken to get appropriate solutions.

The concept of "start-up" has been introduced by researchers under many different approaches and research purposes. According to the concept of entrepreneurship as starting something new, entrepreneurship includes activities necessary to create or form a new business (Leibenstein, 1968) or a new organization (Gartner, 1988; Cromie, 2000).

From the perspective of a new entrepreneur/organization (business) owner, entrepreneurship is an individual taking risks to create a new and self-employed business for the purpose of getting rich (Wortman, 1987), or starting a business. Entrepreneurship is starting a new business by investing capital, or opening a business (Macmillan, 1993). Hisrich and Peters (2002) also stated that entrepreneurship is strongly related to some personal characteristics such as creativity, independence and risk-taking.

From the perspective of exploiting business opportunities, entrepreneurship is a process by which an individual perceives and evaluates business opportunities, gathers the necessary resources, and initiates appropriate actions to exploit them effectively results in business opportunities (Nwachukwu, 1990); is the discovery of opportunity and the creation of new economic activities, often through the creation of a new organization (Reynolds, 1995); is the process by which an individual searches for opportunities regardless of the resources they currently control (Baringer & Ireland, 2010) or an individual's willingness and ability to seek opportunities investment; and being able to establish and run a successful business based on recognizing opportunities in a business environment (Okpara, 2000). According to Baringer and Ireland (2010), entrepreneurship is a process by which an individual seeks opportunities regardless of the resources they currently control.

Approaching from the perspective of social responsibility, entrepreneurship is a process of renewing and making a difference with the aim of bringing wealth to individuals and creating new values for society (Kao, 1993). Tan va cong su (2005), said that it is necessary to recognize entrepreneurship from a social perspective, specifically starting a business is not only for the purpose of creating wealth for individuals and it is necessary to see entrepreneurship in terms of values that bring benefits to individuals. back to society

In Vietnam, the concept of "innovation" has been mentioned quite commonly over the past decade and is understood as "the creation and application of achievements, technical solutions, technologies, management solutions to improve the efficiency of socio-economic development, improve productivity, quality and added value of products and goods" (Clause 16, Article 3, Law on Science and Technology, two thousand and thirteen). However, in Clause 2, Article 3 of the Law on Support for Small and Medium-sized Enterprises, 2017, it is stated that "Creative start-up small and medium enterprises (who are supported under the Law) are enterprises established to carry out their ideas on the basis of exploiting intellectual property, technology, new and fast-growing business models".

Keeping pace with the global trend of digitalisation, in Vietnam, the wave of innovative start-ups started very early and won the special attention of the Party, State as well as the whole community. In the spirit of the Government accompanying businesses, over the years, the Government has had many policies to support start-up and innovation related to legal procedures, production premises, working offices, technology, human resource training, credit guarantee, receiving capital from investment funds, consumer market... such as: Resolution No. 35/NQ-CP of the Government on supporting and developing enterprises in the period 2016-2020, with a goal that by 2020, Vietnam will have "one million start-up businesses". The trend of innovative start-ups is one of the driving forces behind the development of innovative technology products, especially in the current digital economy.

Realizing the guidelines of the Party and Government, besides the Law on Science and Technology of 2013 (amended and supplemented in 2018), the Law on Supporting Small and Medium Enterprises of 2017 and many other Schemes, Decrees and Circulars On May 18, 2016, the Prime Minister issued Decision 844/QĐ - TTg of the Prime Minister

approving the project "Supporting the national innovation startup ecosystem until 2025" (Project judgment 844). This is a project developed and chaired by the Ministry of Science and Technology, with a nationwide coverage, the first and comprehensive legal document with the goal of "By 2020, perfecting the system legal system to support innovative start-ups; established the National Innovation Startup Portal; supported 800 projects; 200 startups. By 2025, support 2000 start-up projects, support 600 start-up businesses...". Implement Project 844 through the national channel of Science & Technology topics, schemes and projects under the management of the Ministry of Science and Technology, November 7, 2016, the Ministry of Science and Technology issued Decision 3362/QĐ – BKHCN on promulgating temporary regulations on handling dossiers of participation in Project 844 and on February 7, 2017, issued Decision 171/QĐ – BKHCN approving the list of orders belonging to Project 844. Project 844 began to be implemented in 2017. In recent years, the Ministry of Science and Technology has also participated in developing content on supporting innovation startups and investing in innovation startups from the Development Fund. National Science and Technology Development (NAFOSTED) in Decree 76/2018/ND-CP of the Government detailing and guiding the implementation of a number of Articles of the Law on Technology Transfer; propose solutions to attract domestic and foreign innovation startup investment in Official Dispatch No. 666/BKHCN-PTTĐDN dated March 19, 2018... along with many solutions and key policies to support start-ups and startups innovation, such as: Vietnam - Finland Innovation Partnership Program, Project to promote innovation through research, Science & Technology, Project to develop innovation and development policy developing business incubators...; and start-up events Techfest, Demoday, HatchFair, Venture Cup, Startup Weekend, Stratup Fair Danang... Besides, the Ministry of Science and Technology also directs People's Councils, People's Committees of provinces and cities directly The central government promulgates many Resolutions, Decisions, Plans and Programs on entrepreneurship and innovative start-ups...

The explosion of the digital economy and the industrial revolution 4.0 have had a great impact on the economy - culture - society, especially innovation and start-up activities. The digital economy has opened up many new opportunities and challenges.

2. Method

The study used the method of document analysis. The document includes reports from individual organizations, countries, and articles published in specialized research journals on Vietnam's opportunities and challenges from the innovation start-up in innovation in digital transformation. The data is taken from 14 reports and papers in prestigious magazines to find opportunities and challenges from the innovation start-up in innovation in digital transformation. Materials are publicly available or paid to be free to download. Comparative methods and case studies are used to synthesize, analyze, and compare policy systems. Research using SOWT method to assess Vietnam's opportunities and challenges from the innovation start-up in innovation in digital transformation

3. Results

3.1. Vietnam's opportunities from the perspective of start-ups and innovation in the digital economy

With the strong determination of the Party and Government, the innovation startup ecosystem in Vietnam has been gradually formed and developed, bringing high efficiency in all industries, professions and fields, contributing to part of solving many urgent problems of the Party, State and localities. Specifically:

The innovation startup ecosystem is growing day by day. In which, social sciences and humanities have contributed to the formulation of guidelines, lines and policies, directly the draft documents of the Party Congress; Basic science has achieved a number of achievements, some fields of natural science continue to hold high rankings in the world and in the ASEAN region. In the GII 2021 rankings, Vietnam ranks 44th out of 132 countries/economies (compared to 42nd in 2019 and 2020) after WIPO updated GDP figures according to Vietnam's new calculation (increased). about 36% compared to 2020). Recently, social financial resources for investment in science and technology have increased sharply, the proportion of investment between the State and enterprises has improved in a positive direction with the rate of 52% and 48% ... Number and The quality of S&T enterprises has increased rapidly with thousands of enterprises operating under the model of S&T enterprises. According to statistics of Echelon Magazine (Singapore), as of 2018, Vietnam has about 3,000 innovative entrepreneurship enterprises (innovation). This number is almost double the estimated figure in 2015 (about 1,800 DN). In addition, there are nearly 70 co-working spaces, 50 incubators and business promotion organizations, and a number of venture capital funds have been formed such as the Venture Capital Fund of Vingroup, Startup Viet Partner...

Besides, facing the requirements of the industrial revolution 4.0 and digitizing the economy, Vietnam has many great opportunities to develop the innovation ecosystem, especially in the field of information and communication with more than 72 million people use social networks, equivalent to 73% of the population (as of December 2020). According to Appota's report on "Mobile application market 2021" shared on May 12, 2021, Vietnam is in the TOP 12 countries with the cheapest Internet prices globally and 2nd in the East. South Asia in terms of mobile Internet speed with about 70% of the population using mobile phones, of which 64% of subscribers have 3G and 4G connections. The percentage of the population using the Internet also accounts for 70%, the number of users using the Internet via mobile devices accounts for about 95%, and on average it takes 3 hours and 18 minutes to use the Internet via mobile every day and due to the impact of the Internet. COVID-19 as well as social distancing, the growth of mobile usage per day in 2020 is 25%, from 4 hours/day to 5.1 hours/day.

In addition, with a well-developed information and communication infrastructure system and a system of policies and regulations of the Party and State creating favorable conditions, Vietnam has many opportunities to form an innovative start-up ecosystem. When it comes to innovation in the digital economy, out of about 3,000 innovative start-ups, the majority of these are startups in the field of information technology with great development potential, able to apply Implemented it into practice and achieved many positive results, such as: Project of Cheap Bus Tickets (vexere.com) - an online bus ticket booking system, after a short time of implementation, it was invested by CyberAgent Fund. Ventures, Pix Vine Capital; The Net

Loading project of a group of students from the National Economics University attracted the attention of many foreign investors or M-Service startups with the product MoMo with an investment of more than VND 600 billion from Standard Chartered Investment Fund. Private Equity and Global Investment Bank Goldman Sachs... The above examples show that the innovative start-up market in Vietnam is happening with vitality and potential, integrating early with the trend of innovative startups. creation of the region and the world countries.

3.2. Vietnam's challenges from the perspective of innovative startups in the digital economy

Although startups in the digital economy have had certain successes, however, with the rapid progress of the industrial revolution 4.0, there are still many challenges for innovative start-ups in Vietnam, such as:

Firstly, Vietnam has a large and abundant labor source, but it lacks in-depth expertise and high technology level to be able to actively apply innovation... Research by Thai Development Research Institute Lan (TDRI) research on human resources of enterprises in Vietnam shows that the proportion of research and technical staff in enterprises, including large-scale enterprises, is only less than 40%. small and medium-sized accounts for only 36.4%; support staff with more than 29.5% and the rest are human resources for other common positions. The data also shows that the proportion of enterprises that have not paid attention to R&D activities because most of the enterprises operating in the low-industry group account for 44.2% and the high-tech industry group accounts for only 17.3%. the ratio of S&T human resources is low, the number of innovative start-ups in Vietnam in the field of S&T are still limited (only about 23.9%) and very few of them are considered innovative start-ups.

Second, 97% of Vietnamese enterprises are small and medium-sized, and do not have many conditions to pay attention to investment in science and technology. Although the increase in the number of start-up businesses in Vietnam in the past time is mainly due to the spillover effects of the industrial revolution 4.0 when the ability to connect IoT increases along with many applications and sub-conditions. Other support is available than the qualitative change of the digital economy, because of the following characteristics: (1) Innovative start-ups in the field of information and communication technology do not need too much initial capital like many other traditional fields; (2) enterprises mainly rely on new ideas and highly innovative ways of doing things, fast applicability; (3) the ability to easily connect globally via IoT technology makes it easy for good creative ideas to reach the world and vice versa, businesses can easily learn from experiences from many countries around the world; (4) Enterprises have not yet paid attention to technology investment activities to catch up with the digital economy. Out of a total of 7,450 enterprises participating in the survey, only 464 enterprises confirmed to have research and development (R&D) activities, accounting for 6.23%. This shows that the majority of businesses have not yet paid attention to technology development and application activities.

Third, the shortcomings exist in the implementation of bilateral and multilateral trade agreements into life, so that businesses are aware of and participate in the global chain. The survey results of the Global Startup Network (GEN) show that Vietnam is ranked among the 20 highest start-up economies, but it is in the group of 20 countries with the lowest ability

to implement business plans. best. Part of the reason is that young startups focus on product ideas and forget about the capacity and operational capabilities of the business. On the other hand, language barriers and challenges when calling for investment capital of businesses are still difficult. Therefore, in order to call for investment capital from the world, to integrate into the "common playing field" with countries around the world, especially Vietnam's countries participating in the signing of multilateral and bilateral free trade agreements. In other words, startups, especially young ones, must improve their presentation skills, their ability to conquer customers, and how to market their products to international markets; at the same time, pay attention to international connectivity, the ability to call international experts and investors to Vietnam... to experience, learn and connect is absolutely necessary.

4. Discussion and Conclusion

4.1. Opportunity

The first opportunity for viet nam from the creation of innovative innovation in that digital transformation is an increasingly innovative innovation ecosystem. The party and the state, the government has issued many documents, forms many agencies, organizations and organizations expressing vietnam' s determination to create an innovative creation ecosystem. That creates favorable conditions for successful startup ideas.

The number of internet users is a potential market for innovative innovative innovation projects. With the number of population in the region and in the world, the percentage of internet users leading the region and asia, the internet' s use of the high - end internet demand raises high demand for traditional activities.

The increasingly developed technology infrastructure responds to market requirements and technical requirements during the transition. The technological infrastructure system ensures that the requirements of the technology activities make up the need for the use of security and infrastructure activities that are not overloaded when digital conversion is carried out.

4.2. Challenge

Human resources with scientific and technical qualifications, in fact, the proportion of untrained workers is still large, low - quality training, non - business structure, lack of skilled labor, capacity, skill and skill of skilled and skilled people in the economic, technical and professional sectors, with a high capacity and professional skill shortage ; lack of staff or professional staff. International competition with unskilled labor, cheap labor prices are increasingly inefficient and makes us weak. Low - quality development, high - quality human resource shortage is becoming a major obstacle to industrialization, modernization of the country and international integration.

Small and medium enterprises, not many conditions for scientific and technological investment. The small and medium - sized enterprises of Vietnam are not sufficiently skilled to be able to apply technology to production and business. In fact, small and medium enterprises don' t have much of an understanding of productivity improvement, quality, most of which are unskilled workers so the investment in technology is limited. In particular, for small business areas, it is a major obstacle to capital, which is very difficult to access capital sources to invest in the scientific and technological innovation

Vietnam participates in FTAs, especially the FTAs requires the business to be prepared to take care of the difficulties, challenges when the FTAs takes effect. The implementation requirements of commitments made in the CPTPP agreement are very high compared to the capacity of vietnamese enterprises. Code requirements, intellectual property of products, product quality, and environmental protection are the first problems when Vietnam's business is connected to the world. Legal issues are also complex, in the world many countries exist in parallel with the two laws of the central and local governments that force both ministries to comply with these laws. The fierce competition of other firms in the world is also one of the challenges facing vietnamese enterprises during the international integration process.

4.3. Recommendations

From research and review the difficulties of innovative startups, the article makes some recommendations to support innovative startups as follows:

First, drastically reform the education and training system, focusing on training workers and skilled workers to respond to new technologies, and linking the training of skilled workers to the needs of the workforce. technology and equipment innovation needs of enterprises. Currently, the start-up environment in Vietnam is still too young compared to many countries in the world, therefore, promoting training activities with the goal of creating a spirit of entrepreneurship - innovation - creativity in schools. , whose core role is to create seeds and incubate startup ideas. Accordingly, the State should pay attention to strongly reforming the education and training system, such as sponsoring innovative start-up training programs, supporting young scientists to participate in startup programs. innovation, undergraduate and graduate training in entrepreneurship and innovative start-ups. In addition, it is necessary to reform the education system, combine theory with practice, improve autonomy, especially at vocational training institutions, so that workers and skilled workers can meet the technology requirements. new. At the same time, the State needs to support and promote business consulting and support activities to help innovative start-ups overcome difficulties in business, investment capital, promotion and network connection. ...

Second, building infrastructure bridges and developing capital markets to provide input facilities for businesses. The State needs to build a database, create a quality science and technology business incubator, develop capital markets to provide inputs for businesses; strengthen the exchange of knowledge, experience and investment capital in educational institutions, research institutes and industrial parks; at the same time, technology transfer and technological innovation in the business environment with many developed countries start-up innovation in the world. The State also needs to focus on developing innovative start-ups to stimulate growth through financial support to the State, tax exemptions and reductions for businesses, value-added tax exemption and reduction. social insurance contributions..., develop more capital raising channels for innovative startups, establish venture capital funds, call for private participation in venture capital activities for innovative start-ups, especially during the time when the COVID-19 pandemic is still complicated, economic recovery and development is essential.

Third, amend the legal framework and mechanism, and have specific policies for enterprises to innovate. In order to have a high-tech infrastructure, the State needs to build a

"start-up nation" with a comprehensive national startup program, such as: Building an institutional framework to support start-up activities including policies on procedures for establishment, tax, investment, commercialization of technology products, etc. At the same time, the State needs to study carefully to come up with a national strategy to actively support start-up activities. innovate, enhance online and offline infrastructure; strengthen cooperation between startups, build a platform for finding partners, a platform for networking and events, a virtual portal...

DIGITAL ECONOMIC DEVELOPMENT EXPERIENCE OF SOME ASIA COUNTRIES AND POLICY IMPLICATIONS FOR VIETNAM

Dr. Nguyen Mai Phuong

nguyenmaiphuong@ftu.edu.vn

Foreign Trade University, Hanoi, Vietnam

Abstract

In the context of the fourth industrial revolution, the digital economy is an inevitable development step in line with the development trend of the global economy when the traditional economy is gradually becoming saturated. The digital economy helps businesses innovate production and business processes to an ecosystem model, linking from production, commerce to consumption, etc. to bring about high labour productivity. The digital economy is also the development path which many countries around the world have successfully implemented that Vietnam can learn from. Accordingly, within the framework of the article, the author studies the experience of developing the digital economy of some Asian countries with high growth rates such as Korea, China, and Singapore, thereby drawing some important policies that are valuable references for Vietnam in the coming time.

Keywords: *Digital economy, Experience in developing digital economy*

1. Introduction

Digital economy is an economy that operates mainly based on digital technology, especially electronic transactions conducted through the Internet. Digital economy includes all sectors and economies (industry, agriculture, services; production, distribution, circulation of goods, transportation, logistics, finance and banking, ...) that which digital technology is applied. Essentially, this is the organizational model and mode of operation of the economy based on the application of digital technology. The digital economy is also an inevitable trend of the world's economy in the near future when the value and contribution of many traditional economic fields are showing signs of decline over time.

Recognizing the importance of the digital economy to the country's development, on September 27, 2019, the Politburo issued Resolution No. 52-NQ/TW "On a number of proactive undertakings and policies participating in the Fourth Industrial Revolution", has set a goal: by 2025, the digital economy will reach about 20% of GDP; by 2030, the digital economy will account for over 30% of GDP. To implement the above policies, on June 3, 2020, the Prime Minister issued Decision No. 749/QĐ-TTg "National Digital Transformation Program to 2025, with orientation to 2030", with the following objectives: Vietnam will be in the top 50 leading countries in e-government, related to the development of the digital economy, improving the competitiveness of the economy. To achieve that goal, in addition to the great efforts and determination of the Ministries, Departments and the

whole citizens, it is important to study the experiences of countries with achievements in the development of digital economy such as Korea, China, and Singapore for reference.

2. Method

The article uses research methods including analysis and synthesis, comparison, systematization, etc... to analyze and clarify the development experience of the digital economy in Korea, China, Singapore. In addition, the article also exploits data from research projects on the digital economy in Vietnam and abroad to provide more data on the results achieved by Korea, China, and Singapore in digital economy development.

3. Results

3.1. Experience of Korea

Korea is a country that attaches great importance to developing the digital economy and has become one of the leading countries in the field of digital economy in the world. In developing the digital economy, Korea focuses on the following areas:

Firstly, focusing on building e-government (E-government). E-Government is the application of information and communication technology for government agencies to innovate, work more efficiently and transparently, and provide better information and services to people, businesses and organizations; at the same time, creating more favourable conditions for people to exercise their democratic rights in the process of participating in state management. Based on the application of information and communication technology, the purpose of e-government is to provide more effective administrative services to the people. The more online services are provided, the more people use them and the more influential e-government becomes.

Korea focuses on building e-government to promote the transformation of the digital economy. The first efforts in building e-government in Korea were carried out in the late 80s of the 20th century with the implementation of the National Basic Information System (NBIS) project, which focuses on deploying information technology applications nationwide. Thousands of public services have been performed through electronic forms across central, regional and local government websites.

Korea has been very successful in building e-government and is always in the top 10 most developed countries in terms of e-government. From the beginning, Korea has methodically implemented e-government construction with the issuance of legal documents to create a legal corridor for information-technology application activities to build e-government. The Korean government has designed many development assistance programs for the three basic elements of e-government called: Technology, human resources and standards of e-government, focusing on deploying information technology applications nationwide.

Second, the policy of universalizing the Internet to citizens. In order to develop the digital economy, Korea actively implements internet policies for their citizens. In 2020, the percentage of Korean households connected to the internet reached 99.2%, ranking first among 175 countries of the International Telecommunication Union (ITU). According to the Akamai Internet Research Organization, Korea is currently the country with the fastest internet

connection speed in the world, surpassing both Japan and the US. The success in popularizing high-speed internet in Korea today is, first of all, thanks to the Korean Government's timely and vigorous implementation of initiatives on education and information technology infrastructure, which helps to improve the quality of the Internet. This makes a perfect start and internet universalization policies continue to be effectively implemented.

Along with that, Korea is also a leader in new technology trends, including 5G. According to market research firm Strategy Analytics, the number of 5G smartphone users in South Korea reached 5.5% in 2019 and increased to 10.9% in 2020. This is the highest number among countries globally. It is forecast that 5G technology will contribute \$1.3 trillion to global GDP by 2030, of which South Korea's contribution is \$30 billion (Pwc.com/economic-impact-5g, 2021).

The success in using high-speed internet is due to the Korean government's focus on investing in educational activities to raise people's awareness and skills to use the internet. For example, the project of Internet education for 10 million people through the application of Internet infrastructure for schools to create an educational broadcasting system to provide educational radio programs on the Internet platform. The government also provides many scholarships and study joint programs in developed countries, especially the US, to encourage more people to study this field. As a result, after returning from training, these people have made a certain contribution and influence to the development of Korea, as well as opening up new majors, introducing new industries and leading new industries. important development projects. In addition, the Government also has many activities and programs to improve capacity and skills in using information technology in education such as: Support and development of digital textbooks; Cybersecurity education and electronic signature certification; Strengthening global cooperation for the use of information technology in education; Activities of the National Center for Quality Management of E-Learning, etc. In addition, the Government also has a policy of free information technology education for those who have little opportunity to interact with information technology (people who are not interested in information technology). housewives, soldiers, the elderly, the disabled and even prisoners).

Third, developing e-commerce. With the successful internet universalization policy, Korea's e-commerce sector has exploded. The Korean government allows the use of online signatures in electronic commerce (e-seal system) with full legal status as signatures on paper documents. This regulation was enacted in 1999 and allows electronic signatures to be used as evidence in legal matters. To enhance security in e-commerce, the Korean Government has also developed regulations related to the security of personal information and guided the private sector to use encryption technology. Along with that, e-commerce has grown strongly in Korea, accounting for over 40% of commercial transactions. Korea's e-commerce market size ranks seventh in the world and third in Asia. According to the report of the National Bureau of Statistics of Korea (KS) published on October 5, 2020 on "Online shopping trends in August 2020", showing that the value of online shopping transactions (using computer computers and mobile phones) in South Korea in August 2020 reached 14,383.3 billion won (about 12.37 billion USD), up 27.5% from a year ago. This is a record

high since Korea started implementing this activity in January 2001, and also the second-highest increase after 30.7% in October 2018 (Ministry of Industry and Trade, 2020).

3.2. China's Experience

China is a leader in e-commerce and digital payments. According to the "White Paper on Developing China's Digital Economy (2021)" released by the China Academy of Information and Communications Technology, China's digital economy proportion in GDP has been increased annually from 14.2% in 2005 to 38.6% in 2020. The digital economy in China grew at an average of 16.6% in the period 2015-2020, the highest in the world; and in terms of scale, ranking second in the world (after the US) (Tran Chi Nam, 2021). Compared to other countries in the world, China has an advantage in market size. In terms of changing and creating large-scale consumption habits, this is a big challenge for many countries, but China has succeeded. This outcome depends on many factors, but above all, this is because the Chinese government has created a favourable environment to support digital service providers. Along with that, there are favourable policies to promote the development of the digital economy such as:

Firstly, the Chinese Government creates favourable conditions for businesses in building a legal corridor. The Chinese government encourages inventors and entrepreneurs to invest in digital technology by spending a certain amount of time helping businesses test and perfect their services before the Government applies legal regulations. specific governing law. For example, the Government introduced a ceiling on transfer limits 11 years after Alipay introduced online money transfers (in 2005); in 2010, the government issued a request for a third-party payment service business license after 7 years Taobao - China's most online shopping website made its first online payment transaction (in 2003); in 2016, the Government issued the standard regulations for the barcode-based payment service 5 years after Alipay introduced this type (in 2011) (Mckinsey Global Institute, 2017).

On the other hand, the Chinese Government is gradually completing the legal corridor to protect the benefits of digital service providers by tightening sanctions on intellectual property rights. A 2010 survey found that copyright infringements led to a loss of about \$15 billion in the software sector in China (Mckinsey Global Institute, 2017). However, China has made efforts to promote the opening of specialized intellectual property courts in Beijing, Guangzhou and Shanghai, which has gradually helped shape a healthier digital market and the compliance of intellectual property laws have been significantly improved.

Second, the Chinese government has supported the digitalization of the economy with various roles. The Chinese government is not only a manager but also a participant in the process of promoting the digitalization of the economy with many different roles. First of all, in order to encourage the digitalization of the economy, the Government has pioneered in actively applying the most advanced technologies in the world to the management, operation and distribution of Government's public services. Specifically, in 2015, the Government issued a blueprint to integrate the Internet, cloud computing, big data and the Internet of Things with traditional manufacturing and consumer industries. Accordingly, government agencies are the first pioneers. In June 2017, the city of Shanghai opened its

first web portal, which integrates e-commerce companies providing logistics, data analysis, financial and related legal services,... Zhejiang Province has run pilot programs to roll out an online utility of social security cards that allows citizens to pay for health insurance via the Internet and mobile phones.

Next, as an investor, the Chinese Government provides financial support for digital technology development projects or the application of advanced modern digital technologies. Since 2016, China's National Development and Reform Commission, the government's economic development strategic planning agency, has announced the three-year action plan of Internet Plus Artificial Intelligence, which enables institutions of Government agencies to fund projects related to the plan from budgets controlled by central and local governments. The plan aims to build an artificial intelligence ecosystem, including smart home appliances, smart cars, etc.

Third, develop e-commerce. China's rapidly growing digital economy represents a spike in e-commerce transactions. China is now the world leader in e-commerce and manufacturing. The country has more than 1.3 billion mobile Internet users, the largest online shopping population, the largest volume and the highest rate of mobile payments in the world. According to the China Statistical Yearbook 2020, in 2019 up to a quarter of retail transactions took place online, totalling \$1.8 trillion, and more than 90% of these were mobile payments. Millennials (born in 1980-1994) and Generation Z (born in 1995-2009) make up nearly 40% of China's population, and are netizens who represent the most powerful force in the domestic consumer market. Mobile Internet has become an indispensable part of their daily life. (Thai An, 2021).

China's digital economy is characterized by the strong development of digital media and e-commerce with the presence of 3 giant domestic suppliers including: E-commerce (Alibaba); Online games and social networks (Tencent); Search engines (Baidu). Each year, Alibaba e-commerce Group handles more purchases than that of both Ebay (the American company that runs the eBay.com website) and Amazon (the American multinational technology company)⁶. With strengths in online games and social networks, Tencent is currently the 10th most valuable company globally (about 275 billion USD). Baidu is the dominant company in the search engine segment in the domestic market after Google had to withdraw from the market due to censorship.

Fourth, establishing e-government. In 2004, China advocated the establishment of e-government by developing electronic signatures. State agencies at central and local levels set up their own websites, providing many online services to facilitate people's lives. China strongly develops e-banking, Internet-based P2P (Peer-to-Peer) lending methods. In 2016, China's total P2P transaction volume reached 2.06 trillion CNY, more than doubling in just one year and equivalent to 12% of total bank loans renewed. In 2018, there were about 50 million people participating in the P2P lending platform, with a total outstanding loan of 1.3 trillion CNY (\$192 billion). Currently, China is the leading country in the global P2P lending market. The form of cash payment is decreasing and being replaced by modern electronic payment methods such as scanning QR codes, paying with e-wallets. Many basic products

allow mobile payments. The two most popular electronic payment applications in China are Tencent's Wechat Pay (Tenpay) and Alibaba's Alipay. The size of the mobile payment market in China has increased sharply and reached 1.2 trillion USD in 2018. E-government helps to improve the efficiency of public services through digitalization. According to the United Nations E-Government Index, the digitalization of public services in China ranks 63rd out of 193 countries surveyed.

3.3. Singapore's Experience

Singapore is digitizing its economy on a strong foundation. Singapore ranks first in the Global Fintech Rankings released by the Institute of Financial Services (IFZ), surpassing traditional financial markets such as Zurich and New York, and third in the Bloomberg's 2018 Innovation Index. Over the past time, Singapore has implemented many policies to develop the digital economy.

Firstly, focusing on building digital infrastructure. Improving the digital infrastructure at all 3 levels: Government, businesses and households, Singapore focuses on developing fibre optic systems, improving the speed of information transmission. In the period 2012 - 2016, thanks to the development of 4G mobile networks, the Internet connection speed has increased from 5.4 Megabits per second (Mbps) to 20 Mbps, on par with Japan and Finland, among the top countries with the fastest 4G connection speed in the world. Faster Internet speeds spur Singaporean households to increase digital adoption in their operations.

For 5G networks, the Singapore Information and Communications Development Authority (IMDA) has set aside S\$40 million (US\$29.53 million) to support research and development efforts as well as enhancing application 5G, including vertical-focused initiatives such as urban and maritime mobility. Singapore is expected to start rolling out its 5G network in early 2020 and cover more than 50% by the end of 2022 and the entire country by 2025 (Paul Budde, 2017). In addition, the government of this country also requires that the two initial operators developing the 5G network will have to provide wholesale services to other network operators to increase competitiveness and scalability.

Second, implementation of national initiatives/visions. The "Smart Nation" initiative was launched by Prime Minister Ly Hien Long in 2014 with the goal of making Singapore the world's first smart country and a model for other countries. The smart nation platform is set up with many important features to support individuals, governments and businesses, focusing on 3 aspects: connectivity, income and understanding.

Singapore has developed a specific roadmap for the implementation of the initiative. In the first phase, Singapore identified five key areas including: transport, housing and environment, business efficiency, health and public services with a commitment to facilitate infrastructure and policy so that every initiative and idea has the opportunity to form and test, even if there are risks. Information technology is identified as the core to realize the Smart Nation goal, which focuses on 3 priorities: technology to support society; mobility and intelligent traffic; secure data environment. The government also pledged to invest about 1% of GDP each year in research and development. Those decisions have yielded impressive results. Information technology has become a part of life in Singapore, 75% of households have at least one

computer, over 50% have a broadband connection to access the Internet. The information technology industry has contributed to 6.5% of the country's GDP. (Paul Budde, 2017).

Third, non-cash payment, this is an important condition for the development of the digital economy. To accelerate cashless payments, the Government of Singapore has established a working group with the participation of the Monetary Commission of Singapore and the Information and Communication Development Board of Singapore along with stakeholders such as banks, payment schemes, QR payment service providers, and government agencies to develop a rapid payment system using a common QR code to make universal payments across the country. Previously, the Monetary Authority of Singapore launched an initiative with 2,000 POS systems (machines that accept card payments) for uniform payment at 650 retail stores across the country, POS machines supporting payment of many different services and banks, including payment services of Samsung Pay and Apple Pay. Currently, Singapore is the strongest e-commerce developer in the ASEAN region with an e-commerce index of about 56% - 57%, e-wallet services also developing strongly, the percentage of people using e-wallets doubled in 2015, accounting for 23% of the total population and more than 41% of all online shoppers.

Fourth, developing the information and communication technology (ICM) industry. Singapore develops the ICM industry as a fundamental driving force for the development of the digital economy with 12 sub-sectors that produce or promote the development of digital goods and services (hardware, telecommunications, information technology services, software, games, online services, printing, postal and courier services, publishing, broadcasting, film and video, music,...), thereby playing an important role in enabling conditions for the adoption of digitization among households and businesses.

To develop the ICM industry, the Singapore Government focuses on equipping new skills and enhancing the digital capabilities of the workforce across the economy; strengthening research and innovation capacity; promulgate policies, regulations and standards for the development of the digital economy in line with the development purposes of the country's digital economy, and at the same time ensure compliance with high standards of the world; continuously ensure the development of digital and physical infrastructure to meet the rapid increase of businesses using digital technology. From 2011 to 2015, the nominal value-added of the ICM industry grew at an average of 7.2%/year, faster than the average growth rate of 4.2%/year of the whole economy. Employment growth in the ICM sector in the same period reached 2.5%/year, although it was slower than the overall employment growth of the economy (3.2%/year). Accordingly, the productivity of the ICM industry in terms of nominal value added per worker increased by more than 4.6%/year, much higher than the general productivity growth of the economy (0.6%/year) in the period 2011-2015 (Paul Budde, 2017).

3.4. Digital economy development in Vietnam and suggestions from the experience of some Asian countries

3.4.1. Overview of digital economic development in Vietnam

With a population of nearly 100 million people, as of June 2021, the number of Internet users is 70 million. Vietnam is considered as one of the countries with a good digital

economy development rate in the ASEAN region. The Vietnamese government also clearly shows its determination, orientation and strong action efforts in promoting the development of the digital economy. In the long-term strategic vision, the Report "Vietnam 2035: Towards Prosperity, Innovation, Equity and Democracy" sets out the task of taking advantage of the industrial revolution 4.0 and the digital economy to achieve the goal of exiting the country "middle-income trap", sustainable development, putting Vietnam in top 20 largest economies in the world. Next, Resolution 01/NQ-CP on January 1, 2019, of the Government of Vietnam on the main tasks and solutions to implement the socio-economic development plan and the State budget estimate in 2019, set out tasks to promote the digital economy.

With the Government's efforts, Vietnam's digital economy is making continuous development steps, according to the "Southeast Asian Digital Economy 2019" Report published by Google, Temasek and Bain in October 2019. Vietnam's digital economy in 2019 is worth 12 billion USD (contributing 5% of national GDP in 2019), 4 times higher than the value in 2015 and is expected to reach 43 billion USD in 2025 (up from the forecast previously reported at 30 billion USD) with the fields of e-commerce, online travel, online media and ride-hailing technology. Among the 7 major cities with the strongest digital economy development in the region, Vietnam has 02 representatives, which are Hanoi and Ho Chi Minh City. Vietnam became the third largest investment recipient market in the region (after Indonesia and Singapore), with \$600 million in investment in the period 2018 to the first half of 2019 compared to a total value of \$350 million in 2018 and \$140 million in 2017. Research by Data 61 (Australia), Vietnam's GDP could increase by about \$162 billion in 20 years if Vietnam's digital transformation is successful (Tran Mai Uoc, 2021)

To enhance access to the digital economy, Vietnam has deployed 5G trial licenses for some network providers such as Viettel, VNPT, MobiFone... which are considered launch in reality in Vietnam in 2021 to improve connections and transactions of members in the economy. Fixed broadband Internet rates in Vietnam are among the lowest in the Asia-Pacific region (converted according to purchasing power parity). In addition, in order to have more premises for the development of the digital economy, the postal industry has shifted to developing in the direction of e-commerce, strongly applying digital technology, forming a number of large companies as the core; building a system of postal codes to each address, completing the project of providing public services through the postal system...

Along with that, telecommunications infrastructure has been transformed towards digitalization, increasing transmission capacity, reducing access costs. At the same time, popularizing smartphones, planning 5G frequencies, testing payments via smartphone applications (mobile money), dealing with telecommunications waste problems, etc. The leading companies in the digital platform are and will be moving in the direction of bringing a lot of services on the same application, while still having a core business service to retain users. Some businesses also choose the form of symbiosis, cooperate to expand the inventory of products and services.

However, besides the achieved results, the digital economy in Vietnam is still facing many difficulties and challenges. That is the imbalance between fields and regions,

disadvantaged people in remote areas who have difficulties in accessing the digital economy. Legal issues, network security and ensuring user privacy. Awareness, habits and quality of human resources in Vietnam are not "ready" for the digital economy. The annual Vietnam economic report published by the Vietnam Institute for Economic and Policy Research (VEPR), University of Economics, Hanoi National University published at the end of May 2019 shows that up to 85% of Vietnamese industrial enterprises is still outside the digital economy, only 13% at the beginner level. Vietnam is facing a shortage of high-quality human resources, especially information and communication technology human resources. Awareness of the digital economy, demand and actions in the digital economy is still slow, uneven, and unified from top to bottom, from the government to businesses and people which slow down the trend of digitization of the Vietnamese economy.

3.4.2. Some policy implications for Vietnam

From the practice of developing the digital economy in Vietnam and through studying the experience of developing the digital economy of some Asian countries with a developed digital economy such as Korea, China, Singapore, the article draws some policy implications to promote the development of the digital economy in Vietnam in the near future:

Firstly, the perception of resource allocation for the digital economy. From the lessons of Korea, China, and Singapore, shows that to successfully develop the digital economy, it is necessary not only to promote the development of information technology but also to comprehensively digitize all areas of life, shifting the focus from building digital infrastructure to the application of digital technologies to enhance the value and quality of digital economic development. Digital economic policy is essentially a digital socio-economic policy that covers all aspects of the country's development. Therefore, there is a need for a unified awareness of the position, role and connotation of the digital economy in policy making and formulation in Vietnam, especially in government agencies. Hence, having an accurate positioning and orientation of the digital economy as well as a reasonable and effective resource allocation for implementation in practice.

Second, developing mechanisms and policies to support businesses and individuals to research and test new technologies. Digital technology applications will be leveraged to promote innovation of individuals and businesses, therefore, encouraging businesses to make the most of the power of digital technology must be a high priority. Accordingly, it is necessary to have strong support from the Government with an open management mindset in order to "untie" and support businesses, especially small and medium-sized enterprises to enhance innovation and creativity. At the same time, the Government also needs to support businesses to cooperate with research institutions and organizations in the country and abroad to connect and share in digital business development related fields.

Third, improving the quality of digital infrastructure. Vietnam needs to improve the quality of digital infrastructure to ensure the development of a digital economy that is still in the developing process. There is a need for coordination and investment of both the public

and private sectors in upgrading digital infrastructure as well as modern digital technology solutions to be able to deploy intelligently connected applications, accelerate non-cash payment applications, etc. The government and businesses need to continue to invest in 3G and 4G networks and deploy 5G services to keep up with world technology. 5G technology is going to create good infrastructure for the Internet of Things, opening up many great business opportunities for Vietnamese businesses.

Fourth, paying attention to the training of information technology human resources. The information technology human resource training program should aim to accelerate the socialization of information technology education, especially updating the information technology training curriculum in association with new technology trends such as the connected Internet of Things (IoT), artificial intelligence (AI), robotics technology, creating conditions for students to access this field as soon as possible, promoting connection between training and practice between schools and the business sector in information technology application. Policies to promote information technology and human resources must have clear priorities while taking into account disadvantaged groups in society such as people with disabilities, farmers, women, etc. to promote equal development. At the same time, it is necessary to build a pivotal role workforce, sufficient in quantity and satisfying in quality to serve the requirements of digitalization in all areas of social life.

Fifth, building and perfecting institutions and laws, creating a legal framework for the development of the digital economy. The Government needs to urgently review, amend and supplement legal regulations to improve the legal framework, mechanisms and policies for the development of the digital economy and digital society, including: amending the Law on Electricity Transactions in the direction of adding new contents on the digital economy in line with the developing requirements of the field, formulate the Government's Decree on the management of the platform economy and business on the Internet. finalize and issue the Decree on electronic identification and authentication, finalize and submit for approval the Decree on personal data protection in order to create a safe and secure digital transaction environment., promulgate regulations on codes of conduct in the digital environment as well as regulations to create trust and assess credit in cyberspace.

4. Conclusion

In summary, from the experience of some Asian countries with developed digital economies such as Korea, China, and Singapore, shows that Vietnam can learn experiences from the pioneered countries in the field of digital economy in order to develop an overall strategy for digital economic development which is suitable for each development stage of the country, as well as build a modern digital infrastructure foundation and framework to support businesses and people. Along with that, the open mechanism and the Government's support for businesses, organizations and well-trained and professional staff working in the field of information technology will be the important factor, promoting Vietnam's digital economy to develop rapidly and sustainably.

DEVELOPMENT OF E-COMMERCE IN VIETNAM: OPPORTUNITIES AND CHALLENGES

MA. Do Thi Nga

donga.neu@gmail.com

Faculty of Political Economy, Regional Academy of Politics I, Hanoi, Vietnam

Abstract

Vietnam's e-commerce has had a remarkable development in recent years of the globalization process and international economic integration of the country. However, the development of e-commerce in Vietnam is also facing many challenges that need to be overcome. This study analyzes the current development situation of e-commerce in Vietnam and points out the opportunities and challenges for the development of e-commerce in Vietnam in the coming time. Based on the analysis of opportunities and challenges, the study has made recommendations to develop e-commerce in Vietnam in the future.

Keywords: *e-commerce, development of e-commerce, opportunities and challenges*

1. Introduction

There are many different interpretations of "E-commerce" (Electronics Commerce, E-commerce for short). According to IBM, the company that started the concept "E-commerce" is what happens when combine the vast capabilities of the Internet with information and communication technology systems. Here the scope of the e-commerce system includes personal local area networks (Private Intranets), shared supplementary networks (Shared Extranets) and the Internet. The Web is a tool that links sellers with buyers, suppliers and employees. A broader approach, e-commerce is a form of commercial activity by electronic methods, it is the exchange of commercial information through electronic means that generally do not need to be printed during any stage of the transaction process (called "undocumented trade").

Vietnam's e-commerce has had a strong development in parallel with Vietnam's deep economic integration into the global economy over the past time, and e-commerce development is inevitable help Vietnam take advantage of opportunities brought by information and communication technology. E-commerce offers consumers an advanced form of shopping and business, based on the network environment, eliminating boundaries and distances between countries.

Recognizing the importance of e-commerce. the Party, Government and State management agencies have issued a series of programs, plans and legal documents regulating the activities of e-commerce. In the National E-commerce Development Master Plan for the period 2021 - 2025 approved by the Prime Minister in Decision No. 645/QD-TTg dated May 15, 2020, also identifies It is clear that in the coming time, the role of e-commerce will be one of the pioneering fields of the digital economy, helping businesses

improve their competitiveness and develop export markets, and at the same time, e-commerce will also be an effective tool helping Vietnamese businesses overcome difficulties and promote development after the Covid-19 pandemic. E-commerce businesses are increasingly investing to develop this business in Vietnam in order to capture the opportunities brought by e-commerce. However, opportunities also come with many challenges that require governments and businesses to have new solutions to take advantage of opportunities and turn challenges into opportunities for the development of e-commerce in Vietnam in the future.

2. Method

The article uses qualitative research methods, based on the analysis and evaluation of documents and data of a number of agencies and organizations. The article uses the survey results of more than 5000 businesses by the Vietnam E-commerce Association in 2020 to build the E-commerce Index Report. Statistical results of a survey of more than 8000 enterprises by the Department of E-commerce and Digital Economy - Ministry of Industry and Trade in the E-commerce White Paper 2020. The data is used to assess the development status of e-commerce in Vietnam and see opportunities as well as challenges for the development of e-commerce in the coming time.

3. Results

3.1. The current situation of e-commerce development in Vietnam in recent years

Internet officially appeared in Vietnam in 1997. The period 1997 - 2000 marked the existence and development of the internet in Vietnam. However, at this time, internet access speed was still very slow, and the number of users was limited. The period from 2000 to 2004 marked the formation and development of e-commerce in Vietnam with the introduction of a number of forums that laid the foundation for online advertising and sales activities on the internet.

From 2005 to now, e-commerce in Vietnam has developed rapidly and has undergone many changes, many new e-commerce models have appeared, diverse in terms of participants, complex in nature of operations, and business methods platform-based and take advantage of the unique features of the electronic method. Commercial activities using electronic media are also increasingly diversified, through computers, phones, tablets, and e-commerce activities are not only limited to websites but also to applications on mobile devices.

From 2016 up to now, Vietnam's e-commerce has grown at a much faster rate than in previous periods in many aspects.

Number of business and personal accounts registered on the Portal of Information and e-commerce management activities increased significantly. If in 2016 there were only 19,456 business accounts. In 2020, the number will increase to 52,880, 2.7 times higher than in 2016, and 7,170 personal accounts in 2016, 4 years later it will increase to 17,423, 2.4 times more times compared to 2016.

Figure 1. Number of accounts registered on the Portal of Information and E-commerce management for the period 2016 - 2020

Source: iDEA, 2021

In terms of scale, with a low starting point of about 4 billion USD in 2015, but high average growth rate for three consecutive years, the size of the e-commerce market increased to about 11.5 billion USD in 2019. Accordingly, the average growth rate of e-commerce in the period 2016-2019 is about 30%. The e-commerce Index report estimates that in 2020, our country's e-commerce will grow by about 15% and reach a scale of about 13.2 billion USD (Vecom, 2021).

Despite the negative impacts in 2021 due to the COVID-19 pandemic, Vietnam's digital economy in general and the e-commerce sector still have strong acceleration steps, becoming one of the growing e-commerce markets fastest in Southeast Asia. According to the e-Economy Southeast Asia 2021 Report conducted by Google, Temasek and its partner Bain & Company have published specific data on Southeast Asia's digital economy, including the six largest markets, Indonesia, Malaysia, Philippines, Singapore, Thailand and Vietnam. The report shows that Vietnam's digital economy in 2021 is expected to reach a total value of 21 billion USD - an increase of 31% compared to the previous year. In which, the field of e-commerce increased by 53% ride-hailing and technology food increased by 35%, marketing, entertainment and online games increased by 30%, and online travel alone decreased by 45%. This is a clear proof that Vietnam's e-commerce industry has successfully overcome the difficulties caused by Covid-19 and is thriving in the context of the "new normal life". This development is even more dramatic than in the pre-pandemic era. The report also predicts that Vietnam's digital economy has the potential to break through to 57 billion USD by 2025. With the rapid change towards digital transformation of businesses and online shopping of consumers, it can be identified that Vietnam's e-commerce continues to make steady progress and maintains a fast and sustainable development for the whole period of 2021 - 2025 as predicted by the e-commerce Index report of previous years.

Figure 2. Scale of Vietnam's digital economy

Source: Google et al. 2021

Figure 3. Vietnam's digital economy by sector

Source: Google et al. 2021

Over the past years, Vietnam has continuously recorded strong growth in both the percentage of people using the internet as well as the number of consumers shopping online and shopping value. It is estimated that the number of consumers shopping online in 2020 is about 49.3 million people. The percentage of internet users participating in online shopping in 2020 in Vietnam accounted for 88%, while in 2019 it was 77% (iDEA, 2021).

Table 1. Size of retail e-commerce market in Vietnam period 2016 - 2020

	2016	2017	2018	2019	2020
Estimated number of consumers shopping online (millions of people)	32,7	33,6	39,9	44,8	49,3
Estimated value of one's online shopping (USD)	170	186	202	225	240
Proportion of B2C e-commerce revenue to the total retail sales of goods and services for the whole country (%)	3,0	3,6	4,2	4,9	5,5
Percentage of people using the Internet (%)	54,2	58,1	60,0	66,0	70,0

Source: iDEA, 2021

In addition, in 2020, the average online shopping value of each user is about 240 USD, higher than in 2019. During the COVID-19 pandemic, about 57% of consumers said they had order more online. As a result, B2C (business-consumer) e-commerce revenue continuously increased sharply. If in 2016, this number only reached 5 billion USD, by 2019 it has doubled, reaching more than 10 billion USD and in 2020 it is 11.8 billion USD.

**Figure 4. Vietnam B2C e-commerce revenue in the period 2016 - 2020 (billion USD)**

Source: iDEA, 2021

Vietnamese consumers have gradually formed a new shopping habit. Vietnam has seen 8 million new digital consumers since the start of the pandemic (to the first half of 2021), with 55% of them coming from non-major cities. Retention of engagement remains high when 97% of new consumers are still using services and 99% intend to continue using shopping services. People who used services before the pandemic have consumed an average of 4 more services since the pandemic (Google et al. 2021).

Among online shopping channels, e-commerce websites and e-commerce trading floors in 2020 increased dramatically, with the percentage of buyers skyrocketing from 52% to 74%. Meanwhile, the percentage of people making purchases on forums, social networks and mobile applications decreased previous year (iDEA, 2021).

Payment for online shopping is still mainly in the form of cash on delivery (COD), but in 2020 this rate has decreased from 86% to 78%. In particular, the rate of payment via e-wallets and credit, debit and scratch cards has increased over the previous year (although the level is still low) (iDEA, 2021).

3.2. Opportunities of e-commerce in Vietnam

With the new development trend of the world economy and the drastic change in Vietnam's economic development strategy, there has never been a time when e-commerce has had a great opportunity to develop as in the present period:

Firstly, in the economic development orientation of the Government, e-commerce development is an important and strategic goal. Promoting digitalization is considered a national goal by the Vietnamese Government, and the "National Digital Transformation" project is highly expected by the Government by 2025, of which 50% of small and medium-sized enterprises will shift to the platform. number; digital industry reaches at least 25% of GDP; Develop at least 80,000 Vietnamese digital technology enterprises. In addition, Vietnam aims to reach 50% of non-cash payments in e-commerce, of which payments made through intermediary payment service providers account for 80% (Prime Minister, (2020b)). To achieve this goal, Vietnam's startup environment and policies need to be focused. The national start-up ecosystem is gradually being formed with a very high rate of start-up projects in the fields of information technology and e-commerce, accounting for about 35% compared to the remaining industries. This is a very good opportunity for Vietnam's e-commerce ecosystem to be formed and thrive in the coming time.

Second, the 4.0 Revolution is shaping and creating opportunities for Vietnam's e-commerce sector and the e-commerce ecosystem to move to a new stage of development based on the foundation of big data (Big-Data), chain block-chain, automation, and the Internet of Things (IoT). The Vietnamese government currently has a strategic orientation for the approach and readiness to adapt to the Industrial Revolution 4.0, which will create an important premise for the development of e-commerce in our country.

Third, with the strong development of information technology and the popularity of smartphones, the percentage of Internet participants will increase steadily in the period 2015-2019, from 54% to 66% of the population, will be an important foundation, creating favorable conditions for the development of e-commerce. In addition, the widely used online payment models of Nganluong.vn, Baokim.vn or Momo e-wallet will create favorable conditions for Vietnam's e-commerce ecosystem to have the opportunity to perfect the payment system. e-commerce and e-commerce models.

Fourth, the pandemic creates momentum and promotes e-commerce activities of Vietnamese businesses when customers in many parts of the world and Vietnam have no choice but to be forced to sit in front of a computer screen to search for products and services. make purchase and sale transactions, payment via electronic devices. This is a very good condition for Vietnam's e-commerce market to accelerate its comprehensive development with a larger number and value of e-commerce transactions in the near future. This is also an opportunity for businesses and consumers to realize the benefits of e-commerce and

businesses themselves have to change and shift from traditional business to selling through the e-commerce market. Since then, when the epidemic passes, the e-commerce business method will have the opportunity to develop more strongly.

3.3. Challenges for Vietnam's e-commerce

Although e-commerce in Vietnam has many favorable conditions for development, the practice shows many difficulties and challenges, specifically:

First, consumer confidence. According to a survey by the Department of E-commerce and Digital Economy, there are still many obstacles when shopping online that make consumers hesitant to join this market.

Figure 5. Obstacles when shopping online

Source: iDEA, 2021

It can be seen that one of the biggest obstacles to the e-commerce market in Vietnam is the poor quality of products compared to advertising, with 42% of survey respondents choosing it. The problem of counterfeit goods, which is a pain on e-commerce platforms, is also a challenge in the coming time, it is necessary to take preventive measures to protect consumers and strengthen consumer confidence in the field. E-commerce.

The lax management of the authorities, the deceit in business makes consumers lose confidence when buying goods and services online. Consumers' trust in online transactions is not high, but it can be seen that most e-commerce transactions in Vietnam currently mainly use the form of COD (Cost on delivery). row). Although it has decreased compared to 2019, the use of cash when receiving goods in the form of COD to pay for e-commerce transactions still accounts for 78% in 2020 (iDEA, 2021). Statistics show that 30% of orders are returned due to poor quality of goods. Currently, a part of consumers, especially the younger generation, are very fond of buying goods through foreign e-commerce platforms such as Amazon and eBay because of the high reputation of the supplier.

Besides, there are a number of other limitations that affect consumers' trust such as: privacy of personal information, more expensive prices at the store even after the price has been reduced (the phenomenon of raising prices and then announcing promotions), logistics services and weak customer care.

Secondly, the institutional and legal environment for e-commerce development in our country is still weak, not tight, synchronous, transparent and constructive. The rapid transformation of business models in the field of e-commerce has occurred. Due to the rapid development of science - technology, business methods and new creative ideas, state management agencies are quite confused in managing e-commerce business activities. For example: management and tax collection for online commercial activities, especially business through social networks and providing cross-border services; the issue of ensuring the interests of consumers through the online world; the handling and settlement of disputes and conflicts about activities as well as interests of subjects participating in business activities in e-commerce. The e-commerce market has a fast growth rate and is more difficult to manage than the traditional market, leading to a number of legal regulations not keeping up. Besides, similar to many countries in the world, Vietnam still has a big gap in the collection of contractor tax of foreign enterprises - those that are not registered to operate in Vietnam but generate income in Viet Nam (Truong, 2021).

Third, human resources have not met the requirements. Human resources, especially technology human resources Information - the most important factor in competition and e-commerce development is still small in quantity, not guaranteed in quality. Vietnam is facing a shortage of high-quality human resources, especially high-quality information and communication technology human resources, human resources for new technology fields such as artificial intelligence (AI). Vietnam's education has not kept up with the rapid development trend of the digital economy and the creative economy of the Industrial Revolution 4.0. If this issue is not paid attention to and invested properly in the near future, it will be a big obstacle for the development of the digital economy in our country.

According to a survey by the Department of E-commerce and Digital Economy (Ministry of Industry and Trade), the current form of e-commerce training is mainly by order, accounting for 37%; Short-term training focuses on 33%, long-term formal training accounts for 16%, online training accounts for 9%. According to a survey from companies providing e-commerce solutions, there is a shortage of e-commerce human resources, with less than 30% of the workforce having formal training in e-commerce, 55% of training from business, commerce, and information technology. information, the rest are other professions. The above figures reflect that the current formal training of e-commerce human resources has only partially met the actual needs.

Fourth, the assurance of network security, privacy and information safety in our country is facing many risks. Doing business in the field of e-commerce on the basis of information technology, the internet contains great risks in terms of security, information safety, finance and privacy of data and of participants. Vietnam is one of the countries most vulnerable to cyberattacks and is also vulnerable to cyberattacks. According to the Kaspersky security firm, in recent years, Vietnam is among the countries with the most cyber attacks; ranked 4 out of 10 countries at risk of being infected with malicious code over the network and 1 out of 10 countries infected with malicious code from using removable storage devices (USB, external memory cards) (Nguyen, 2021)

This shows that there is a huge gap in Vietnam in the field of ensuring network security and information safety, which will hinder the development of e-commerce in our country. Especially, in an increasingly connected world, when digital becomes ubiquitous, preventing and solving cyberattacks becomes more and more urgent because it's not just a matter of security and safety. economic, information security of individuals, businesses, etc but also security issues and national interests.

The issue of private information security is increasingly concerned by customers because of concerns about the "holes" of the internet, websites are often designed to easily access and share information. Many studies show that customers are not willing to participate in e-commerce because they are insecure about issues related to security and privacy of transaction data. According to the data of the E-commerce White Paper 2020, the second reason that accounts for 43% of consumers not participating in online shopping is fear of revealing personal information.

Figure 6. Consumers' reasons for not shopping online

Source: iDEA, 2021

Fifth, Vietnamese e-commerce enterprises compete fiercely with foreign enterprises. With the FTAs that Vietnam has signed, it is also easy for foreign businesses to enter the Vietnamese e-commerce market. This is expected to create a boost for Vietnam's e-commerce market in the near future, but it will create great competitive pressure on domestic enterprises, who are weak in resources and may be knocked out of the market. school. Currently, many large enterprises also have the participation of foreign enterprises operating in different forms. Therefore, the participation of businesses is no longer a new factor, but is considered to create a new movement trend, inherited from developed e-commerce markets such as the US, Japan, etc.

Despite achieving some results, the market witnessed the collapse of a series of e-commerce websites in Vietnam. Before Adayroi, Robins, Vui Vui, names like Beyeu, Lingo, Deca, etc also decided to close down when their activities were not efficient.

Sixth, the development of e-logistics services is not commensurate with the potential to meet the needs of customers and the e-commerce market. In the current development of e-commerce, logistics is one of the factors that determine the purchasing behavior of consumers and sales of each e-commerce enterprise.

Logistics enterprises for e-commerce are facing the challenge of low rate of information technology application in Ecommerce-Logistics. Currently, only about 11% of businesses are applying basic information technology related to tracking and tracing goods, delivery systems, warehousing, etc. The rest, most businesses are still maintaining. Manual form in sorting, dividing and selecting goods, etc. leads to errors and high costs, especially when e-commerce output is as large as it is today. In addition, the size of enterprises is still small and medium, and the financial capacity of enterprises is limited, so there are many barriers in digital transformation. Financial constraints also make it difficult for logistics businesses to invest in warehouse systems to manage inventory and stockpile goods. In addition, the human resources serving in the logistics industry in Vietnam are young, but the number is small, the professional qualifications are weak, the working experience is not available, especially the limitation of foreign language ability has made the job difficult. promoting the application of information technology to activities facing difficulties.

4. Discussion and Conclusion

Vietnam's e-commerce in recent years has developed at a fast pace following the general trend of the world. Although there are many advantages in the process of operation and development, e-commerce has not yet brought into full play its inherent potential. In order to further increase the growth rate of this market, it is necessary to overcome the shortcomings and limitations. To do this, there are a few things that need to be taken into account:

Firstly, improve the reputation of e-commerce floors. First of all, businesses participating in this market must ensure the quality of goods and services as advertised. Only then will online customers have confidence in suppliers because the specificity of this market is that buyers do not have direct contact with goods like the traditional market. At the same time, businesses need to commit to the confidentiality of consumers' personal information, especially about personal account numbers when making electronic payments.

Second, improve the legal system on e-commerce. Any economic activity that wants to develop sustainably needs a clear legal environment. The Government needs to continue to review, amend, supplement and complete legal issues in e-commerce: network security, information security and safety, consumer protection, etc. At the same time, it is necessary to have regulations. strictly on sales management via social networks, promoting tax collection, thereby creating fair competition in the e-commerce market.

Third, improve the competitiveness of enterprises. Businesses need to focus on improving the quality and diversification of products, as well as the quality of customer care services, freight forwarding and payment services. At the same time, businesses also need to increase investment in technology innovation and application of effective management software, improve the quality of human resources, promote market research, understand consumer tastes in order to meet the needs of consumers. meet the needs of customers to the fullest extent.

Fourth, improve the quality of human resources and protect intellectual property rights, security and safety - in the network environment. Strengthen training and human resource development for the e-commerce industry. Encourage organizations and individuals to invest in training facilities. Strengthen the type of training experts, technicians,

vocational training, training model of tripartite association (enterprise - institute, school - state management agency). The government needs to have a well-planned strategy in combating intellectual property rights violations, especially in the network environment, to ensure network security and safety. It is necessary to step up propaganda on the enforcement of intellectual property rights to the business community and people, to disseminate international commitments and conventions on the protection of intellectual property rights when Vietnam joins the WTO and trade agreements. free trade. Next, it is necessary to have sanctions that are enough to deter violations of intellectual property rights, security and safety in the network environment, so that e-commerce can be promoted sustainably.

Fifth, develop logistics services to meet the development requirements of e-commerce. Vietnamese logistics enterprises need to invest in technology, thoroughness, and improve quality in transport and logistics services; must change to adapt and grow or accept competition and takeover. In particular, businesses need to pay attention to developing more specialized logistics areas for cross-border e-commerce and import (4PLs). On the other hand, with the increasingly popular trend of online shopping, the logistics supply chain needs to be shortened, eliminating the intermediary stage so that goods can go directly from the distributor's warehouse to the consumer.

E-commerce is increasingly developing and will play an important role in socio-economic life, as well as consumers increasingly prefer civilized, modern and time-saving forms of shopping. However, in order to develop e-commerce in Vietnam in a sustainable way, in order to make the most of the benefits of this method, businesses, people and the government must make reasonable adjustments to take advantage of opportunities and avoid the risks brought by the network environment.

Vietnam has made great progress in e-commerce development in recent years. Businesses, governments and people are increasingly aware of the importance of this method in all aspects of socio-economic life, and this study also wants to contribute some ideas to businesses, Government and people for the development of e-commerce in Vietnam in the coming time.

Abstract

This study aims to investigate the impact of digitalization on the job satisfaction and the work-life balance of employees in the banking industry in Vietnam. The online survey was conducted with 278 participants at 9 different banks in Vietnam. The analysis of correlation shows the relationship between Digitalization and Job satisfaction as well as the relationship between Digitalization and the Work-life balance of bankers. Then linear regression analysis confirmed that Digitalization positively influences on both the Job satisfaction and the Work-life balance of employees of the banks. The study also suggests some solutions to improve job satisfaction and balance between work-life for banking employees.

Keywords: *Digitalization, employee performance, work-life balance, job satisfaction*

1. Introduction

The State Bank of Vietnam stated that up to 95% of credit associations have or are planning to develop a digitalization project. Among those, 39% of credit associations approving their own digitalization approach differentiated or integrated in their information technology development planning, 42% of credit institutions are completing their digitalization strategy (Le Thi Thuy Sen, 2021). This shows that the level of digitalization in the banking industry in Vietnam has strong signs of change. Although the digitalization process in Vietnam's banking industry is showing positive changes, according to the assessment of regulators and experts, there are still many difficulties affecting this process. According to World Bank statistics, from now to 2030, the middle class in Vietnam will have a continuous growth rate of double digits. Vietnam will become an attractive market for financial services, especially digitized financial services (Hansen, 2016). Furthermore, one of the most important assessments for any organization to gauge the success and effectiveness of any technology implementation is employee. Therefore, job satisfaction and work-life balance of employee play important roles

that needs to be evaluated. Consequently, we chose this topic to gain insight into the relationship between digitalization and job satisfaction, work-life balance.

As with all other businesses, the banking sector is fast evolving towards a new mode of operation because of rapid technological advancements and digital transformation. This movement toward digitalization is altering cost-cutting opportunities and potentially producing new profit sources. The banking sector has benefited from digitalization mostly in terms of daily banking services such as online banking and payment methods (Isern and Pung, 2007). With proper use of digitalization, the banking sector may achieve more stability in terms of profitability and growth. The advancement of digitalization has compelled banks to rearrange their activities in order to remain competitive and provide new digital offerings. The major banks have successfully navigated the first phase of digitalization, allowing customers to purchase stocks and transfer money using digital services. According to Zamaslo, Kovalenko and Lozynska (2021), one of the aspects in the banking industry where digital transformation occurs most powerfully is the banking platforms. Furthermore, Khanboubi and Boulmakoul (2018) stated that data management is the most important facet that needs to be digitalized in order to keep up with the digital era these days. Besides, following Diener and Špaček (2021), efficient risk management is ranked among the most fundamental factors that contribute to a bank's development in the digital era.

Job satisfaction is defined as individual's overall feelings about their jobs and their perspective on different factors of their jobs, along with the way and viewpoint which influence on the level of interrelation among employee and employer. An individual who is satisfied with their job tends to have mostly positive perspective, whereas an individual who is unsatisfied tends to possess negative perspective (Lumley et al., 2011). Ratna & Kaur (2016) state that the influence of information technology on job-related elements, involving job satisfaction. Lumley et al. (2011) discovered that if employers want to create a work environment that inspire employees to stay in with their companies, they should consider current pay methods with the goal of providing fair pay, challenging as well as valid jobs tasks, and encouraging positive relationships among colleagues. The professional working environment greatly affects the productivity and work efficiency of each person. For a quality working environment, digitalization must take place in a comprehensive and effective manner, employee performance will be improved (Ratna & Kaur, 2016). Moreover, the significant expansion of utilizing computer throughout European countries in the previous 20 years (Salvatori, Menon, & Zwysen, 2018), employee job satisfaction increased, somewhat, because of utilizing advanced technology, and continue to put new technology in order to run primary company operations.

Work-life balance, following by Lockwood (2003), is defined as "a state of equilibrium in which the needs of an individual's work and personal life are equal". Furthermore, work-life balance could be defined as a condition of equilibrium in which one's preferences about their job and personal living are met (Ratna & Kaur, 2016).

Work-life balance is described by Kalliath and Brough (2008) as how compatible an individual's insight between work and non-work functions is, as well as how significant their

present life priorities are. It can also be thought of as a balance between two completely distinct functions that an individual must manage in their career job and their family life in order to accomplish life pleasure (Makela & Suutari, 2011; Shaffer et al., 2016). In recent years, several ability labor-saving technology tools have been created. Nonetheless, whether they enhance or reduce workload and stress is debatable. In fact, technology is appreciated as a popular device with the capability of making work for people more accurately and simply. Besides, utilizing personal computer at home, which is a double-edged sword. The benefit of using technology in free time is obvious: an individual can make a decision whether or not to work for a job while at home, for instance, arrange reports or presentations. (Ratna & Kaur, 2016). Following Towers et al (2006), because hours of working rise, family living is affected negatively, which means the flexibility creates a gap between work and family living. Besides, Duxbury and Smart (2011), stated that mobile devices and setting work via web-based tools such as email, webinar, etc are one of main kind of ICTs utilize that impact on work-life balance. Mobile technology devices are interest to scholars in finding about work-life balance due to the fact that they show a foundation shift in constructing the work-life boundaries. Several studies demonstrated that there are some proofs related to how ICTs impact on flexibility. People can approach to work or without work anytime they need throughout ICTs, which rising the permeability of work-fife barriers (Valcour and Hunter 2005). Moreover, thanks to the expansion of utilizing ICTs, employees can accomplish their jobs anytime and anywhere in order to support flexible working approaches. Mobile devices connectivity via ICTs tends to bring employees with higher flexibility than typical office employees in terms of balancing work and family living (Hill et al. 2003).

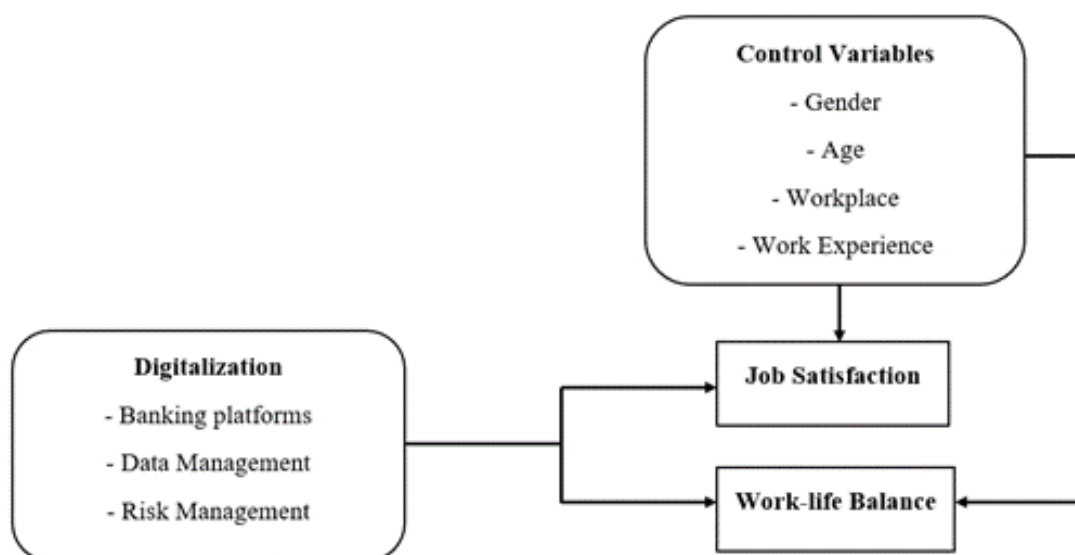

Figure 1. Research Framework

2. Method

The quantitative research method was used in this study. An online questionnaire was distributed to employees in 9 banks in Vietnam through the Google Form platform to research subjects to collect primary data in November 2021. The questionnaire is divided

into two parts with the first part of the questionnaire containing questions about demographics such as age, gender, and marital status. Next is the part are 11 key questions measured on a 5-point Likert scale from 1 (Strongly disagree) to 5 (Strongly agree) to collect information related to the main variables. After collecting, the data are cleaned and using the software SPSS version 26 to analyze with 278 correspondants. The Chronbach Alpha model is used to measure the reliability. To determine validity, exploratory factor analysis was applied. Finally, the authors conduct regression model to determine the correlation between Job Satisfaction, Work-life balance and Digitization in the bank.

3. Results

Table 1 demonstrates the demographic diversity of the study's sample in related to demographic factors.

Table 1. Demographic details

Characteristics		Frequency	% Of total
Gender	Male	132	47.5
	Female	146	52.5
Age	23 - 30 years old	20	7.2
	30 - 40 years old	75	27.0
	40 – 50 years old	43	15.5
	50 – 60 years old	83	29.9
	Over 60 years old	57	20.5
Working place	VP Bank	35	12.6
	Techcombank	43	15.5
	TP Bank	43	15.5
	MB Bank	95	34.2
	ACB	39	14.0
	Sacombank	8	2.9
	BIDV	8	2.9
	Vietcombank	2	0.7
	Agribank	5	1.8
Working Experience	Less than 1 year	20	7.2
	1-3 years	36	12.9
	3-5 years	132	47.5
	5-7 years	56	20.1
	More than 10 years	34	12.2

A total of 278 participants answered the survey questionnaire for this study, in which the sex ratio between males and females did not differ much (47.5% versus 52.5%).

Regarding age factors, the majority of participants were between the ages of 30–40 years old and 50–60 years old (27% and 29.9%). Meanwhile, there were only 20 participants, most of whom were young, aged 23–30 years old. The rest are 40–50 years old, accounting for 15.5%, and over 60 years old, accounting for 20.5%. The next factor in the demographic is the workplace. This research paper has the participation of staff from nine different banks in Vietnam. MB Bank is the bank with the largest ratio, with 34.2%. The following are four banks with similar ratios: VP Bank, Techcombank, TP Bank, and ACB, ranked in the order of 12.6%, 15.5%, 15.5%, and 14%. However, only 2 participants are working at Vietcombank, and 5 participants are working at Agribank. The last element of the demographic is working experience. Nearly half of the participants had 3-5 years of work experience (47.5%), while the second 5-7 years accounted for only 20.1%. Followed by working time from 1-3 years and over 10 years, at 12.9% and 12.2%. Only 20 participants, or 7.2%, had less than 1 year of work experience.

Cronbach's alpha and EFA tests were used to assess the scale employed in this study. After testing EFA with Digital Banking, Data Management and Risk Management, it generated a solid result, with each variable group clearly classified. The table 2 summarizes the statistic of scale items, containing Cronbach's alpha, mean, standard deviation, and factor loadings

Table 2. Descriptive statistics and Factor loadings for scale items

Coding	Construct and scale items	Mean	Std. Deviation	Factor loadings
Banking platforms (Cronbach's alpha = 0.887)				
DT 01	Smart apps help you get to know your customers better	3.622	1.063	0.794
DT 02	Online banking increases customer satisfaction	3.543	1.112	0.781
DT 03	Digital banking system saves time resolving customer complaints	3.547	0.981	0.740
DT 04	Digital banking improves service delivery from banks	3.629	1.079	0.717
DT 05	Workload is reduced thanks to the automation system in the bank	3.532	1.063	0.783
Data Management (Cronbach's alpha = 0.902)				
DM 01	Big data helps analyze user habits	3.514	1.100	0.778
DM 02	Applying big data in the process of customer classification and profile appraisal	3.644	1.047	0.752
DM 03	Improve service quality through building a system that earns customer feedback	3.586	1.032	0.827
DM 04	Big data changes the way services are delivered to customers	3.532	1.086	0.679
DM 05	Develop the scope of analysis, including "People," Processes, Strategies, and Technology	3.586	1.077	0.812

Coding	Construct and scale items	Mean	Std. Deviation	Factor loadings
DM 06	Drive innovation through leveraging Cloud, Machine Learning, Artificial Intelligence, Big Data, and Analytics technologies	3.529	1.056	0.749
Risk Management (Cronbach's alpha = 0.861)				
RM 01	Robotic processing system	3.676	0.981	
RM 02	Artificial intelligence and machine learning models	3.522	1.004	0.673
RM 03	Data analysis tools	3.342	1.065	0.795
RM 04	Voice and face recognition tools in the security system	3.284	1.121	0.833
RM 05	Automation tools	3.594	1.014	0.610
RM 06	Electronic authentication system	3.547	0.928	0.626

The results in Table 2 shows that Cronbach's alpha varied from 0.861 (Risk Management) to 0.902 (Data Management), all of which were higher than 0.7 and that means those items meeting the desired reliability level (Hair et al., 1998). Moreover, the Mean values of all 3 variables are approximately 4, which means most respondents agree with the statements given. Added, the difference between opinions is not high indicating that the variables are reported with Low standard deviation. In terms of EFA, the statistics in factor loadings of were greater than 0.5 showing that all findings were statistically significant for further investigation (Hair et al., 1998). Nonetheless, only item RM1 is not included because it is not correlated with the other items in the Risk Management variable.

Table 3. Regression results

Dependent variable: Job Satisfaction

	Model 1 β (standardized)	Model 2 β (standardized)
<i>Independent variables</i>		
Gender		.045
Age		.066
Current Bank		.129
Work Experience		.749*
Digital Banking	.288**	.234**
Data Management	.191**	.179
Risk Management	.354**	.352**
R ²	.445	.476
Adjusted R ²	.438	.463

Note: * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

With Job Satisfaction as a dependent variable, two models were executed. In Model 1, the independent variables containing Digital Banking, Data management, and Risk

Management explained for 44.5% of the dependent variable. In Model 2 which included Model 1 and the control variables, the Adjusted R² value increased to 47.6%, which was not substantially higher than Model 1.

The regression findings in Model 1 and Model 2 indicated that both Data Management and Risk Management had a positive effect on Job Satisfaction. In Model 1, Digital banking, Data Management and Risk Management positively influence Job Satisfaction with $\beta = 0.288$, $p < 0.05$, $\beta = 0.191$, $p < 0.05$ and $\beta = 0.354$, $p < 0.05$, respectively. Meanwhile, considering the effect of Work Experience on Job Satisfaction, Model 2 produced $\beta = 0.749$ and $p < 0.05$. This indicated that employees with more years of experience were likely to have a better Job Satisfaction aspect.

Table 4. Regression results

Dependent variable: Work-life Balance

	Model 3	Model 4
	β (standardized)	β (standardized)
<i>Independent variables</i>		
Gender		.036
Age		.279
Current Bank		.231
Work Experience		.486
Digital Banking	.185*	.150*
Data Management	.058	.054
Risk Management	.046	.572
R ²	.085	.119
Adjusted R ²	.075	.096

Note: * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$

With the dependent variable of Work-life balance, two models were generated in which Model 3 containing independent variables including Digital Banking, Data Management, and Risk Management only accounted for 7.5% of variance in dependent variable. Model 4 included Model 3 and control variables. Model 3 had the Adjusted R² of 0.075 meaning that the three independent variables explained for 7.5% variance of Work-life balance. In terms of Model 4, the figure of Adjusted R² was 9.6% which was higher than that of Model 3.

The regression analysis revealed that Digital Banking had a significant positive effect on Work-life balance, with $\beta = 0.185$ and $p < 0.05$ in Model 3. Model 4 likewise demonstrated a positive association between Digital Banking and Work-life Balance, with $\beta = 0.150$ and $p < 0.05$. The statistic findings from the significant level of Digital Banking indicated that Digitalization positively impact on work-life balance of the employees.

4. Discussion and Conclusion

The purpose of this study was to ascertain the link between Digitalization and Job Satisfaction and Work-life balance among banking employees. Two hypotheses were tested, and both were supported, which was consistent with previous research.

In terms of hypothesis 1, the implementation of Digitalization in Digital banking platforms, Data Management and Risk Management has a positive effect on Job Satisfaction, which was consistent with prior findings (Cijan, Jenič, Lamovšek and Stemberger, 2019; Bolli and Pusterla, 2021) by demonstrating that digitalization has a beneficial effect on employee's job satisfaction. That means when the level of digitalization in employee's workplace is high, the employees' job satisfaction will increase. According to Bolli and Pusterla, (2021), Digitalization promotes Job Satisfaction hence increases productivity, increases interest among workplace, and raises the level of engagement with colleagues and superiors. It stated that digital transformation allows employees to receive, access, analyze, and preserve information in a far more organized and timely manner than before. Increased access to information enhances the efficiency of work, which leads to increased Job Satisfaction among employees. Another study of Ratna and Kaur (2016) statistically revealed that after implementing digitalization, 23% of workers become more dedicated 20% think their work is recognized and they can manage multiple tasks simultaneously, 19% think they have better job prospects, and 18% think they are provided with all necessary resources to operate their tasks, all of which positively impact Job Satisfaction.

Furthermore, regarding the relationship between Digitalization and Work-life Balance (H2 of this research), it reveals that the application of Digitalization into Digital banking platforms has a positive effect of Work-life Balance of employees. Due to digitalization, employees could have the opportunity to choose when, and how they work. Digitalization has also aided them in managing their time effectively, allowing them to work and spend time with family. According to Goodspeed (2015), digitalization has an effect on how employees balance work and leisure time. Employees might be more productive and adaptable to their own lifestyles and routines with the assistance of digitalization, which has become an integral part of our everyday personal lives. As a result, this was consistent with the studies of Towers et al. (2016). The benefit of implementing digitalization in the workplace leads to increasing freedom that technology affords people.

Furthermore, the findings of demographic variables in Model 2, Work experience also has a positive impact on the quality of job satisfaction of employees with $\beta = 0.749$ and $p < 0.05$. This finding was inconsistent with prior research (Bhandari et al., 2017) in which the research showed that there was no relationship between work experience and Job-satisfaction of employees. The positive impact of work experience on work-life balance in this study might be due to the fact that employees with long-term work experience often have suitable workload, which in turns leads to an increase in the quality of their work-life balance and job satisfaction. Besides that, high-experienced employees tend to be more dedicated and responsible for their jobs, making them be excessively concerned about their work-related aspects.

At the moment, digital transformation is gaining traction in the financial business, particularly in banking platforms in Vietnam. Specifically, figures indicate that 94% of Vietnamese commercial banks have invested in digital transformation, and 40% of banks have declared digital transformation a strategic objective for the next five to ten years. Apart from assisting banks in meeting client expectations, digital transformation also assists employee in simplifying processes and procedures, hence increasing their satisfaction level via reduced effort (Le Thi Thuy Sen, 2021). Therefore, in order to properly use this application, banks must prioritize monthly training programs that assist staff in developing professional skills and increasing job efficiency, ultimately boosting the bank's performance. Moreover, banks should invest in banking platforms enables the bank to enhance performance while also assisting employees in reducing burden, developing professional skills, and ultimately enhancing job satisfaction.

Furthermore, banks should focus on using technology to achieve production efficiency through reducing processing time and costs, increasing processing volume and replacing labour with IT applications. According to Argyres (1999), the application of Information Technology has three levels of impact, especially production impact, coordination impact and information impact, bringing benefits such as reducing processing time, replacing human labour with automated applications, coordinate across time intervals or refactor relationships, develop extensive databases and knowledge bases, and support decision-making processes through better use of information and reduced complexity in the organization unstructured decision-making processes. Consequently, banks should invest more in digital transformation technology applicable to risk management. To be more specific, on June 3, 2020, the Prime Minister signed and promulgated Decision No. 749/QĐ-TT approving the national digital transformation program to 2025, with orientation to 2030 (Thanh Phuong, 2020). This shows the Government interest in digital transformation. Meanwhile, the banking sector is one of the key areas in the economic development of the country, so investing and applying digital transformation in risk management at banks is also a necessary thing to do.

Banking platforms also has benefited work-life balance. Due to the Covid-19 outbreak, the use of digitalization in banks is quite widespread at the moment, and as a result, employee have flexible working hours. In order to enhance employees' work-life balance, banks should enable their back office department, which manage their internal jobs, to transit from working temporarily from home to working permanently from home during severe times (e.g. when the disease booming). The transition from temporary to permanent employment in the back office, where they are not required to interact with or work with customers, ensure the bank's safety and allow employees to spend more time with their families, as this is the part of the business that spends the majority of its time at the office.

This study has some limitations. Due to the impact of the COVID-19 epidemic, it has become more difficult to meet face-to-face with employees at the bank, limiting the sample size of this study. Moreover, most of the respondents to the survey questionnaire

are from Hanoi city. Hence, future studies can expand the number of respondents to other provinces as well. Moreover, the relationship between Digitalization and Job satisfaction as well as Digitalization and Work-life balance of employees can be examined in other industries, not just banking.

THE ROLE OF DIGITAL TRANSFORMATION IN AGRICULTURE IN TUYEN QUANG PROVINCE

MA. Nguyen Thi Hai Huong

nguyenhuong9191@gmail.com

Faculty of Accounting and Auditing,

University of Finance and Business Administration, Hung Yen, Vietnam

Abstract

The digital transformation and application of modern technology in agriculture are gradually becoming an inevitable trend, making an important contribution to changing production methods, liberating labor, reducing costs, and improving productivity. productivity, product quality. However, the digital transformation in agriculture still has many "bottlenecks", which need to be cleared. Therefore, the objective of this paper is to evaluate the role of digital transformation in agriculture in Tuyen Quang province and point out the province's limitations in the process of implementing this transformation including difficulties in capital, level of human resources, digital infrastructure and production models and methods; On that basis, the article proposes solutions to accelerate digital transformation in the near future.

Key words: *digital agriculture, the role of digital agriculture, Tuyen Quang province.*

1. Introduction

Tuyen Quang is a mountainous province, located in the center of the Lo river basin with a dominant agro-forestry economy, a farm economic model combining agro-forestry, including 7 district-level administrative units including: 1 city and 6 districts with 138 commune-level administrative units, including 10 wards, 6 townships and 122 communes [3].

With the goal of digital transformation in the agricultural sector, it is considered as a lever in increasing the competitiveness of agricultural products, especially in accompanying the Government to achieve the set goals. Under the National Digital Transformation Program, Tuyen Quang province is gradually creating an environment and an agricultural digital ecosystem as the foundation, creating institutions, promoting the transformation from "Agricultural production" to "Agricultural production". agriculture"; develop hi-tech agriculture in the direction of focusing on smart agriculture, precision agriculture, increase the proportion of digital agriculture in the economy, with many agricultural products with high competitive value such as oranges Ham Yen crockery is in the Top 10 most delicious fruits in Vietnam; Bat Tien My Bang tea; Tuyen Quang honey was "Honored typical agricultural products in 2017"; halibut; Vinh Tan specialty tea was voted the title of "Vietnamese Agricultural Gold Brand 2017"; Xuan Van pomelo ranked in Top 10 Famous Brands - Brands in 2018...

2. Method

The article uses qualitative research methods (methods of analysis, comparison, synthesis, descriptive statistics...) and the collected data are secondary data selected from previous research results. as well as from reports from Tuyen Quang province on digital transformation in agriculture. These methods are used to clarify the research contents in order to point out the urgency of the article on digital transformation in agriculture in Tuyen Quang province; at the same time, analyze and evaluate the current situation to highlight the results achieved by Tuyen Quang province in recent times and point out the limitations and causes. From there, the article analyzes, evaluates and predicts trends and solutions that need to be given to accelerate the process of changing arguments in the industry in Tuyen Quang.

3. Results

3.1. Changing arguments in agriculture contributes to improving the value of agricultural products

Tuyen Quang agriculture is strongly shifting to commodity agriculture associated with quality standards, brands, added value and sustainable development. The province currently has 311 hectares of oranges and 73 hectares of tea meeting VietGAP standards; 702 hectares of tea with sustainable agriculture standards (SAN); 30 hectares of organic oranges (PGS); over 25,000 ha of planted forests have been granted FSC forest certificates; 1 dairy facility that meets GlobalGAP international standards; There are 3 breeding facilities applying VietGAP standards.

In 2019, the province's total agricultural, forestry and fishery product (GRDP) reached VND 4,765.7 billion, the production value of agriculture, forestry and fishery (at 2010 constant prices) reached VND 8,407.3 billion. , an increase of 4.4% over the same period in 2018. These are important steps in the process of developing commodity agriculture associated with local new rural construction [5].

Digital agriculture can solve the problem of large farmers, but the farming scale is small, the investment is small, the equipment is old and outdated by electronic trading platforms, eliminating the intermediaries, connecting directly between sellers and buyers, regardless of geographical distance, allowing to collect data on prices on the market in many different localities and countries, compare prices automatically, update with frequency daily, weekly or monthly rate and even predict future prices to propose a competitive and appropriate selling price of agricultural products, farmers in mountainous and rural areas do not have to Go to big cities to find a market that can be done right in your hometown.

Through digital transformation, a digital agricultural data platform will be created for farmers to know and best exploit their advantages, not just based on qualitative experience, less on quantitative data and less on quantitative data. There is almost no information about the parameters on its own arable land such as weather, light, precipitation or minerals. It is government agencies that can generate useful data for farmers by analyzing soil conditions, satellite images, weather data or other factors. The Soil Health Cards initiative with 158 million land health cards from each region in India has improved farmers' productivity by up to 40% over the last 5 years in this way, or Kenya offers weather insurance

pays farmers if certain adverse weather conditions occur. On the basis of using 30 weather stations automatically collect weather data, thereby determining the cases of receiving compensation [6].

Digital agriculture can use sensors to collect information about the storage environment, then process and analyze it and send notifications to drivers or warehouse managers according to service quality standards. and help trace the origin of agricultural products, allowing transparency of the process and quality standards of agricultural products to help genuine farmers sell products with their efforts, avoiding the situation of agricultural products. perishable quickly, thereby increasing the quality of agricultural products, sustainably.

Digital transformation in agriculture also connects with transporters, optimizes warehouse locations and delivery routes to avoid slow shipping times and high costs, leading to reduced competitiveness of agricultural products. produce.

Up to now, many key agricultural products of the province have been granted certificates, trademarks as well as geographical indications: 54 products have been certified by the National Office of Intellectual Property - Ministry of Science and Technology; over 200 products are stamped with traceability; 24 establishments certified for safe food supply chains; There are 03 products, namely Ham Sanh Cam, Na Hang Shan Tuyet Tea, Soi Ha Grapefruit, Yen Son District, which have been granted geographical indications by the National Office of Intellectual Property - Ministry of Science and Technology, and are marketed in and around the world. Out-of-province preferred. Thanks to that, Shan Tuyet tea from wild forest trees has now given people in Hong Thai commune, Na Hang district an average income of 28 million VND/ha/year, becoming one of the province's 4-star OCOP products. Another typical agricultural product of Tuyen Quang is Ham Yen oranges, it is also because of its quality and reputation that Ham Yen oranges are honored to be in the top 10 famous fruits and one of the 50 famous fruits. The most delicious tree in Vietnam, orange tree has become a specialty tree with priority and priority for concentrated planting. Currently, Ham Yen district has more than 7,200 hectares of oranges in 13 communes and towns with over 4,000 households growing oranges, including 687 hectares of oranges produced according to VietGAP standards and about 30 hectares of oranges produced organically. The implementation of care and production of oranges according to VietGAP standards not only increases productivity, improves design and quality of products, but also helps farmers reduce the cost of fertilizers and pesticides by up to 50% compared to the usual way of growing oranges. Fertilizers used in farming are all organic fertilizers, microbial fertilizers and clean water sources. After the tree flowers, people stop fertilizing, but mainly just water and prevent insects to naturally produce healthy fruit, ensure fruit quality and food safety. Thanks to growing oranges, many families in Ham Yen have escaped poverty and become rich and wealthy, some have become billionaires. The orange season in Ham Yen also creates jobs for thousands of workers in the region and neighboring localities such as Ha Giang, Cao Bang, Yen Bai and Vinh Phuc. Many people earn millions of dong a day from the burden of rented oranges. In recent years, the orange tree has really become a key tree for the economic development of local people; In addition to Shan Tuyet Hong Thai

organic tea, there are also Vinh Tan specialty teas, as well as the title of "Vietnamese Agricultural Gold Brand"; My Bang Bat Tien tea, Tuyen Quang honey are "Honored typical agricultural products"; Xuan Van pomelo ranked in TOP 10 Famous Brands-Brands; Buffaloes are built with collective trademarks of "Zu Chiem Hoa" and "Stupid Buffalo Tuyen Quang" [4].

3.2. Digital transformation in agriculture contributes to raising people's income

Agriculture currently accounts for 14% of Vietnam's GDP, accounting for nearly 40% of the labor force. Agriculture has grown tremendously, becoming the backbone of the economy.

The goal of Vietnam in general and Tuyen Quang province in particular is how farmers produce quality agricultural products, with the lowest cost but sell at the highest price. Therefore, digital transformation in the field of agriculture or digital agriculture will be one of the keys to successfully realize this goal.

Digital transformation can help farmers easily access credit with just the smartphone they have. Through transaction and credit histories, farmers have access to loans with suitable interest rates.

The restructuring of the agricultural sector of Tuyen Quang province is currently associated with the National Target Program on building new rural areas, in which the core is to promote production development and increase income for people according to the national target program. towards sustainability through diversifying crops and livestock according to market demand and building large-scale commodity production areas, linking production, processing, preservation and consumption of products in association with ensuring hygiene and food safety; replicating the effective production model, enhancing the application of science and technology.

Along with improving the quality of agricultural products, towards clean agricultural production, the Agriculture and Rural Development sector of Tuyen Quang province has actively coordinated with other branches and People's Committees of districts and cities to maintain and expand 687 ha of oranges according to VietGAP standards, 30 ha of oranges according to organic standards, 729 ha of tea according to sustainable agriculture standards, 93 ha of VietGAP standard tea, 24 ha of organic standard tea. In 2021, the whole province has 95, 65 hectares of tea, orange, pomelo, rice... registered for production according to VietGAP standards and converted to organic production, the province has 1,835.35 hectares of crops produced according to VietGAP standards and other standards equivalent [. At the same time, improving the quality of agricultural products through supporting trade promotion funds, searching for product consumption markets for products that have been registered trademarks, product quality and goods for a particular country. number of cooperatives. At the same time, renewing forms of production organization, strengthening linkages along the value chain, linking production with processing and consuming agricultural products. Promote the development of commodity husbandry with an appropriate scale. To develop specialized farming areas, to produce concentrated goods such as: rice, oranges, pomelo, tea, sugarcane, peanuts... Many key products are linked with production enterprises along the value chain, contributing to part of creating brands and

enhancing values for Tuyen Quang agricultural products. New technical and technological advances in the direction of high-tech agriculture and organic agriculture are increasingly applied. Since then, it has encouraged organizations and individuals to switch to developing clean agricultural production with the aim of improving the lives and incomes of farmers.

4. Discussion and Conclusion

4.1. Some problems raised in the process of digital transformation in agriculture in Tuyen Quang province

Firstly, the agricultural production model is small, fragmented and scattered

In the period 2010 - 2020, the population of the province has increased from 729 thousand people per year 2010 to 794 thousand people in 2020. In Tuyen Quang province, farmers mainly cultivate in small, scattered fields. The total natural area of the province in 2020 is 586,795 hectares. The average area per capita is 0.81 ha/person, of which the agricultural land area is 81,633 ha, accounting for 13.91%, the forestry land area is 446,641 ha, accounting for 76.12%. Soil is divided into 7 groups with 17 main types of soil such as alluvial soil group, infertile soil group, black soil group, red yellow soil group...[2] Besides, the province's agricultural production model lacks chain linkage although there are now a number of production linkage chains such as the chain of orange oranges in Ham Yen, the chain of maize linkages, the linkage of raw tea plantations, the linkage of material afforestation, ...[8]

Secondly, the quality and qualifications of human resources in the province in general and in the agricultural sector in particular are still low

In terms of quantity in 2020, the labor force of working age of Tuyen Quang province is 480.5 thousand people (accounting for 60.6% of the total population), of which 54.5 thousand people are in urban areas (accounting for 60.6 percent of the total population). the rate of 11.35%) and 426,000 people in rural areas (accounting for 88.65%), of which the labor force in the rural areas mainly concentrates on agriculture, forestry and fishery, accounting for 88.7%; industry – construction accounted for 6.71%; commerce and transportation accounted for 2.21%; The rest of the service sector accounted for 2.39% [2].

In terms of qualifications and quality of human resources, the percentage of trained workers aged 15 and over in the Northern mountainous region reached 17.6%; Northern midland and mountainous region 20.5%. Basically, the quality of human resources with high expertise in the production and processing of agricultural products, knowing how to use and operate equipment (automatic, digital, analytical equipment...) is very limited...[9]

Thirdly, rural infrastructure for digital transformation is not synchronized

The digital transformation in agriculture in Tuyen Quang province still has difficulties: Infrastructure for development and application of new technologies has not been synchronized, agricultural and rural infrastructure has not yet met modern requirements. agricultural chemistry. The level of mechanization is still low, supporting technologies for agricultural development (mechanical, deep processing, agricultural product testing lines...) are not adequate [8].

Fourthly, investment capital in agriculture for digital transformation is still lacking and ineffective

In recent years, investment resources for agriculture and rural areas are limited, only meeting 55-60% of demand. In addition, mobilized capital sources are not diversified. In which, FDI in agriculture for digital transformation is very low not only in Tuyen Quang province but also nationwide. The reason is that investing in agriculture is high risk, low profit rate, long time. As of 2020, FDI in agriculture accounts for about 0.97% of total FDI inflows to Vietnam, while the global average is 3% of total FDI [12].

In addition, access to bank credit for small businesses and households is still difficult. Subjects eligible for agricultural preferential loans are limited. Specifically, those who want to access preferential capital for high-tech agriculture must satisfy the criteria of Decision No. 738/QD-BNN-KHCN dated March 14, 2017, while this Decision only provides setting criteria for objects directly engaged in high-tech agricultural production [1]. Meanwhile, in order to develop hi-tech agriculture, the product consumption market (production and supply chain) is also crucial. Therefore, only giving preferential loans to those directly producing but ignoring the remaining stages in the supply chain also makes it difficult for the development of high-tech agricultural production. The number of linkage models is still small and ineffective, so it is difficult to access preferential credit [10,11].

4.2. Some basic solutions to promote digital transformation in agriculture in Tuyen Quang province

Firstly, forming a cooperative model and a closed chain for agricultural products

To solve these difficulties in the context of small and fragmented production is not possible, many experts emphasized. They believe that, in order to expand digital transformation in agriculture, it is necessary to strengthen and develop cooperative groups and cooperatives, especially the cooperation model with the participation of enterprises, in which enterprises are the leading people. Farmers are central. On that basis, the province actively builds closed linkage models from research, development to farming, processing and consumption to ensure inputs and outputs for farmers and businesses. strong status everyone does.

The construction and development of this model, chain of links and cooperatives has been proposed by Tuyen Quang province in the Project of Restructuring the agricultural sector towards the development of commodity agriculture, forestry and fishery, focusing on key products and specialties in the chain of quality assurance, high added value associated with new rural construction in the 2021-2025 period, with a vision to 2030 . Tuyen Quang province identifies and effectively implements support policies to link production with product consumption; supporting the development of cooperatives and cooperative groups that carry out the production of goods in a sustainable chain; rural industry development; supporting small and medium enterprises to join industry clusters and value chains.

To realize this goal and solution, Tuyen Quang province needs to provide credit support for agricultural and rural development, land reclamation, lease of land use rights to accumulate land, encourage businesses to invest in agriculture and rural areas; supporting

the development of agricultural production of commodities and OCOP products ⁸⁸to consolidate and build production and consumption links.

Focus on supporting affiliates in building business linkage projects; building trademarks, geographical indications; promote and develop value chain brands; apply science and technology to production, improve productivity, quality and competitiveness of products; Finish the product to meet the standards of the importing country.

Secondly, strengthen the training of rural human resources to serve the shift in agriculture in Tuyen Quang province

A huge challenge and an urgent requirement in training and developing human resources to promptly supply human resources for the digital transformation of the agricultural sector in Tuyen Quang province are localities and units that need to building training models on the basis of linking training and scientific research with production activities.

On the other hand, to encourage localities and businesses to establish agricultural technology vocational training institutions and implement training cooperation programs in agricultural production areas.

Increase the opening of training courses at production facilities for rural workers, so that they can quickly access and promptly apply high technology to actual production, in parallel with the application of information technology in activities. agricultural services.

Thirdly, strengthen digital infrastructure for the agricultural sector of Tuyen Quang province

To implement digital transformation for agriculture in Tuyen Quang province, building digital infrastructure is necessary because Tuyen Quang province has poor digital infrastructure and lack of synchronization. Therefore, building digital infrastructure (connection system, equipment, operation center); building specialized information systems and databases (including shared data modules and specialized modules on cultivation, husbandry, irrigation, dikes, office blocks...); building digital applications for administration at the Department of Agriculture and Rural Development; include: website; software for making status reports and building plans; software to forecast indicators and natural disasters; software for granting and managing permits and planting area codes; software to monitor water level, flow, water quality and operate the irrigation system; online disaster prevention and control operating software; building an IoT system to monitor agricultural data in the province. In addition, it also completes and digitizes technical regulations and processes for agriculture and rural development, including: Technical processes for cultivation, harvesting and processing of crop production; plant pest control; livestock production, slaughter and processing; Seafood; planting and protecting forests; building digital applications to manage the operation of agricultural infrastructure systems and support production, manage products and connect agricultural markets for people and businesses, such as: Blockchain system for traceability original agricultural products; App agricultural electronic handbook... At the same time, focus on training for people and officials, creating human resources for operation and digital transformation application [13, 14].

⁸⁸OCOP (One Commune, One Product) is an economic development *program* in rural areas in the direction of promoting internal resources and increasing the value of products, :

Fourthly, diversify investment capital for digital transformation in agriculture

In recent years, investment resources for agriculture and rural areas are limited, only meeting 55-60% of demand. Therefore, the system of policies and laws on public investment in agriculture and rural areas needs to continue to be adjusted and perfected in the coming time, such as increasing investment spending in agriculture and rural areas; implement state budget allocation to ensure harmony between the interests of localities with conditions for industrial development with those of purely agricultural provinces. In addition, in order to attract private investment in the agricultural sector, especially through the form of PPP, it is necessary to have a breakthrough solution to take advantage of capital, qualifications, management capacity and strength. about the supply chains of the world's leading corporations, as well as Vietnam's in the agricultural sector. In particular, there are policies to encourage attracting FDI into the province. This is a source of great potential that the province needs to focus on in the coming time [15].

Thus, digital transformation in agriculture is an inevitable trend in the context of the industrial revolution 4.0 and is an objective requirement to improve the competitiveness and value of agricultural goods compared to the traditional farming model. traditional work. However, in order to implement agricultural digital transformation in Tuyen Quang province, it is necessary to implement many synchronous solutions because Tuyen Quang is a mountainous and purely agricultural province with many limitations and difficulties such as farming habits, low The basic level, capital and qualifications of farmers have not yet followed this new, advanced and modern method. If these solutions are implemented, the digital transformation process in the province will be as effective as desired, successfully contributing to the transformation of the province's economic structure in general and agriculture in particular towards modern, advanced.

DEVELOPING INFORMATION TECHNOLOGY HUMAN RESOURCES TO MEET THE REQUIREMENTS OF DIGITAL TRANSFORMATION

MSc. Bui Thi Bich Thuan

thuanbb@dhcd.edu.vn

Trade Union University, Hanoi, Vietnam

Abstract

Human resources and human resource development are factors that play a decisive role in the development of each country, each industry, and each field. Especially, for information technology (IT) which is the core field of the knowledge economy, IT is participating more and more deeply in all aspects of economic and social life and has become an indispensable factor for digital transformation. The Communist Party of Vietnam identifies the development of IT human resources as a key and decisive factor for the application and development of IT. The article points out that the requirement of digital transformation is inevitably for Vietnam and other countries in the world in the current context, the opportunities and challenges of Vietnam in the digital transformation process, in which the development of IT human resources is a big challenge. At the same time, the author focuses on analyzing the role, reality, necessity and solutions to develop IT human resources to meet the requirements of the digital transformation process.

Keywords: *Digital transformation, Digital technology, Human resources, Information technology*

1. Introduction

Over the past 35 years, we have been witnessing 3 waves of technology, each wave lasting about 15 years: The first wave, from 1985 to 1999, associated with the popularity of computers, was the first wave information digitization wave, converting documents from paper to electronic version. The second wave, from 2000 to 2015, associated with the popularity of the internet, mobile phones and mobile telecommunications networks, can be called the digital technology wave, digitizing business processes to enhance productivity and efficiency. The third wave, from 2015, is forecasted to last until 2030, associated with the development of the wave of digital transformation, bringing all real social activities to cyberspace. The success of the above waves in Vietnam is associated with the development of IT human resources in the doi moi period.

Today's IT under the impact of the 4.0 Revolution develops at an unprecedented speed. The speed of digitization and new technology opens up new prospects, new business models and new values, but also poses many challenges and risks of falling behind. Every country, organization or individual must make efforts to transform, seize opportunities, and overcome challenges if they do not want to be left behind. Digital transformation is a process of total and comprehensive change of individuals and organizations in the way of living,

working and production methods based on digital technologies, so the improvement of digital skills, development National digital transformation human resources play a particularly important role in determining the success of digital transformation. To develop human resources on all three pillars of building a digital government, developing the digital economy and a digital society, requires a huge human force with expertise in IT, digital technology and digital skills. Meanwhile, currently, IT human resources in Vietnam are in serious shortage, not meeting the quality requirements. To meet the requirements of digital transformation, IT human resources need to have further development in quantity and quality, meet social requirements, and be the driving force of the national digital transformation process.

Currently, in the world and in Vietnam, there are many studies on IT human resource development, however, research on IT human resource development to meet digital transformation requirements is very limited, because digital transformation is a new problem in Vietnam. Therefore, the author wants to clarify the current situation of IT human resource development; digital transformation in Vietnam is inevitable with very positive initial results; requirements and some solutions to develop IT human resources to meet the national digital transformation.

2. Method

The article uses both qualitative, quantitative and logical research methods. Qualitative methods for the study of digital transformation. Quantitative method of research on the development of the ICT industry, the digital transformation process and the current situation of IT human resource development in Vietnam. Logical method to find out the relationship from the theoretical basis, the actual situation and to point out the requirements and necessary solutions to develop IT human resources.

3. Results

3.1. Digital transformation and IT human resource development requirements

Digital Transformation is defined as “a process that aims to improve an entity by making significant changes to its properties through a combination of information technology, computers, communication and connect” (Vial, Gregory, 2019). Siebel (2019) defines digital transformation as the convergence of the following four breakthrough technologies: Cloud Computing, Big Data, Internet of Things (IoT), Artificial Intelligence (WHO). This convergence makes the scope and influence of digital transformation extremely large, so there are many different views and approaches to digital transformation. Leaders and human resource managers pay attention to the impact of digital transformation to restructure the economy, industries, businesses and the impact on the workforce. Technical managers are interested in applying digital technology to create new economic values... In terms of practical implementation, digital transformation is a means/tool to support changing a profession or industry businesses to survive and develop in the digital age. Digital transformation, if carried out in a systematic and synchronous manner, can make a business, an industry, or a country take off. Digital transformation is actually another name for the 4.0 revolution as Ustundag and Cevikcan (2019) pointed out: “The transformation

era that we are living in is different from other eras that not only bring about changes in the economic process basic business but also highlights the concept of intelligent interactive products embodied in service-oriented business models”.

Digital transformation is an inevitable trend of the world, an objective requirement of development, and Vietnam cannot stand aside. According to a forecast by McKinsey (2020), by 2025, the digital transformation impact on GDP of the US will be about 25% and that of European countries will be about 36%. With three main pillars in national digital transformation namely digital government, digital economy and digital society, Vietnam is one of the pioneer countries in the world in building a national digital transformation program approved by the Government approved to meet the development requirements of the country in the new period. Resolution No. 52-NQ/TW, dated September 27, 2019 of the Politburo *"On a number of guidelines and policies to proactively participate in the Fourth Industrial Revolution"* emphasizes the goal by 2025, economic The digital economy will account for about 20% of GDP and over 30% of GDP by 2030, with labor productivity increasing by over 7%/year. In 2045, Vietnam aims to become one of the leading smart manufacturing and service centers, start-ups and innovation in Asia.

The Prime Minister's Decision No. 749/QĐ-TTg dated June 3, 2020 approving the *"National Digital Transformation Program to 2025, with a vision to 2030"* has clearly stated the vision; basic goals; opinion; tasks and foundations for digital transformation; a number of tasks and solutions to develop digital government/digital economy/digital society; Some priority areas need digital transformation. The decision sets out a vision that by 2030, Vietnam will become a digital, stable and prosperous country, a pioneer in testing new technologies and models; fundamentally and comprehensively renovate the management and administration activities of the Government, production and business activities of enterprises, the way of living and working of people, developing a safe, humane, and wide digital environment. all over. At the same time, it aims to achieve the dual goal of developing a digital government, a digital economy, and a digital society, as well as forming Vietnamese digital technology enterprises capable of going global.

Over the past time, Vietnam has achieved certain achievements in digital transformation. Accordingly, guidelines, institutions and policies on digital transformation are relatively complete, and basic legal documents have been issued. Notably, digital technology applications were built quickly (contributing to the whole country's participation in the prevention of the COVID-19 epidemic); State agencies, businesses and people have actively used and promoted the application of information technology in all aspects of life, economy and society, especially online public services.

Currently, the IT industry is identified as the foundation for implementing the Industrial Revolution 4.0 with core elements such as: Artificial Intelligence (AI), Internet of Things (IoT), Big Data. IT appears in most fields such as: economy 4.0, smart services, smart agriculture 4.0, smart health 4.0, smart education 4.0... The ICT industry is the basis for the boom. With the explosion of Vietnam's digital economy, the trend of digital transformation has helped the IT industry to face strong long-term growth opportunities. The report of the

Ministry of Information and Communications shows that the total revenue of Vietnam's Information Technology - Telecommunications industry in 2020 has reached 124.678 billion USD. The average growth rate in the period from 2016-2020 is 16.23 % /year, an increase of more than 1.8 times after 5 years (Ministry of Information and Communications, 2021). In 2021, the revenue of the information and communication industry will reach VND 3,462,170 billion, basically completing 100% of the set plan, up 9% compared to 2020. Number of digital technology enterprises in Vietnam, 2021 has about 64,000 digital technology enterprises, an increase of 9.5% compared to 2020 (Ministry of Information and Communications, December 2021). In particular, in the two years 2020 and 2021, other fields are heavily affected by the Covid-19 epidemic, but the ICT industry has become the bright spot of Vietnam's economy, being one of the few economic sectors that has large revenue, contributing much to the state budget.

Figures 1, 2: Total revenue of the entire ICT industry 2016-2021 (VND billion) and number of Vietnamese digital technology enterprises in the period 2016-2021

Source: Ministry of Information and Communications, December 2021

Currently, Vietnam is facing opportunities and challenges in the digital transformation process. Researchers have pointed out a number of important prerequisites for digital transformation such as: 1- High proportion of people using internet platforms; 2- The adaptability of people, businesses and authorities in digital transformation; 3- The high level of competition in internet services contributes to diversifying service types and lowering costs compared to other countries in the region; 4- Inter-industry linkage services and infrastructure structure are increasingly improved (Tran Quang Tuyen, Le Van Dao, 11/2021), information technology tools and platforms are used by enterprises used more and more. Vietnam also has the presence of some of the world's leading IT corporations.

However, Vietnam is facing many difficulties and challenges. In April 2020, Cisco released the Report "Digital Development Index of Small and Medium Enterprises in Asia - Pacific", covering more than 1,340 enterprises operating in the Asia-Pacific and 50 Vietnamese enterprises. In Vietnam, enterprises are facing "barriers" in the digital transformation process such as: lack of digital skills and IT human resources, lack of strong enough IT foundation to enable digital transformation digitalisation, lack of digital thinking or digital cultural challenges in the business (Cisco, April 2020). In which, a noticeable challenge is the lack and weakness of IT human resources for digital

transformation. It is increasingly difficult for businesses to find and retain good data analysts, programmers, and modelers.

In order to ensure the implementation of digital transformation in the three pillars of Digital Government, Digital Economy and Digital Society, in addition to investing in modern facilities and implementing advanced technical measures, investment in mining and developing human resources mastering digital technology plays a very important role, especially IT human resources with digital technology skills and knowledge.

The Government has given directions for the development of digital human resources in general, IT human resources to meet the requirements of digital transformation in particular. Decision No. 146/QĐ-TTg of the Prime Minister, dated January 28, 2022 approving the Project *"Raising awareness, universalizing skills and developing human resources for national digital transformation to 2025, defining towards 2030"* identified: Human resource development is the key to effective and sustainable digital transformation, helping to successfully realize the goals of the National Digital Transformation Program to 2025, with orientations to 2030. The Government defines the target by 2025 as: 100% of staff in charge of digital transformation and information technology are annually trained, retrained and trained in digital technology and are evaluated online through the skills assessment and testing system number of countries. Training at least 1,000 digital transformation experts in industries, fields and localities to become the core force leading, organizing and spreading the national digital transformation process. Training 5,000 engineers, bachelors and bachelors of high quality practice in digital technology at universities and colleges with strengths in training in digital transformation. Goals by 2030: Train 20,000 engineers, bachelors and bachelors in high-quality practice in digital technology at universities and colleges with strengths in digital transformation training.

Besides, according to the orientation in the draft Project *"Training and developing human resources for digital transformation to 2025 and orientation to 2030"*, each year we need to train about 100,000 highly qualified IT engineers, of which about 10,000 are digital professionals, which shows that the need to develop in the quantity and quality of IT human resources becomes even more urgent. Therefore, if the Party and State do not take drastic actions and do not have strong enough mechanisms to meet the quantity and quality of world-class human resources, Vietnam will not be able to realize its goals development in the information age.

3.2. Current situation of IT human resource development

In the early 90s, Vietnam's IT human resources were still very thin, both in terms of research and training, implementation and application. In particular, the IT core force, with deep knowledge and mastery of key technologies... has appeared sporadically, scattered and fragmented. The number of professional staff working in the IT field is small, not yet assigned and coordinated under a unified goal to create synergy. New universities only train a small number of students in IT-related fields. After implementing the "National Program on IT" in 1995, the number of IT human resources has increased in number. In 1998, there were about 20,000 IT human resources in our country (Vietnam Informatics Association,

1998). After being invested and developed by the Party and State, by 2019, the total number of IT industry employees is 1,055,000 people (Ministry of Information and Communications, 2020), the first time IT human resources has surpassed the number of 1 million people, completing 1 year earlier the goal of Vietnam's IT human resources to reach 1 million people by 2020.

The number of IT training schools has also increased rapidly: in 2000, there were 42 universities, 36 colleges and 9 non-formal IT training institutions (Ho Chi Minh City Informatics Association, 2003), in 2020 has increased to 158 universities and 442 colleges and vocational schools providing IT training, in which the total target of university enrollment in IT, electronics, telecommunications, and information security for the school year 2020 – 2021 is 82,085 students (Ministry of Information and Communications, 2020). The annual number of university and college students majoring in IT and communications is estimated at more than 50,000 people. IT vocational schools annually provide about 12,000 people (Nhat Nam, 2019).

Table 1. Number of universities, colleges, vocational schools and enrollment targets for IT majors (2010-2020)⁸⁹

Year	College and University block		College, Vocational secondary school	
	College and University number	Enrollment targets (students)	College, Vocational secondary school number	Enrollment targets (students)
2010	277	60,332	186	66,631
2011	290	64,796	113	32,632
2012	290	65,501	143	25,527
2013	290	67,518	228	24,569
2016	250	68,883	204	18,311
2017	131	48,631	412	67,673
2018	149	51,114	412	67,662
2019	158	68,435	442	52,424
2020	158	82,085	442	56,838

Source: Ministry of Information and Communications, 2010-2021

The reality of IT enrollment in universities, colleges and vocational schools is quite high. In 2020, the actual rate of students entering universities and colleges is 84% and colleges and vocational schools are 68.27% (White Paper 2021). The number of IT graduates increases steadily every year, in 2016 the graduation rate reached 93.88 % (about 64,000 people). For vocational schools, the graduation rate reaches 52.4 % (about 9,600 people) (Ministry of Information and Communications, 2017).

In order to improve the quality of training, besides investing in material and technical facilities, renovating education and training, universities and colleges focus on training,

⁸⁹ Data for the year 2017-2020, a number of colleges have moved from the Ministry of Education and Training to the Ministry of Labour, Invalids and Social Affairs

improving professional qualifications and English for IT teaching staff to ensure sufficient English language teaching skills. Many universities have policies to attract overseas Vietnamese scientists and international IT experts to participate in training and scientific research; promote forms of high-quality training association, exchange of lecturers and experts with foreign countries; encourage experts, technicians, managers with professional experience in enterprises to participate in training IT human resources. At the same time, many training institutions conduct the selection and direct use of IT documents and textbooks in English; have policies to encourage and give incentives to students to write and defend their projects, graduation theses and essays in English or other foreign languages; use bilingualism when compiling and publishing training programs.

Since 2017, the Ministry of Education and Training has advocated allowing universities and colleges to provide IT training according to specific mechanisms. Accordingly, the training program has 30%-50% of the time to study and practice at the enterprise (directly trained by the experts of the enterprise). The school works closely with IT enterprises in the training process to improve students' practical skills and practical application. At the same time, universities must publicize on the website of the training institution and report to the Ministry of Education and Training on the employment rate (12 months after graduation), the degree of satisfaction of the requirements job requirements of IT students after graduation. Training institutions promote training according to the orders of businesses and according to the needs of society, and link training between user facilities and IT human resource training institutions.

As a result, the number of students and graduates in IT is relatively large and a part of them have met the high requirements while working and researching in IT. However, currently, IT human resources have not yet met the labor market demand. According to Vietnamworks forecast, our country currently lacks about 400,000 IT workers and needs to supply 78,000 new employees every year (Vietnamworks, 2015). The demand for recruiting human resources in this industry increases when the Government promotes digital transformation, technology 4.0, and businesses in the IT field are born more and more, leading to fierce competition for human resources. Although the demand for IT human resources is very large, domestic IT human resource training institutions have not met the development needs of society, especially in training high-quality engineers. Currently, only about 27% of IT workers can meet the requirements, the remaining 72% need additional training for at least 3 months (Nhat Nam, 2019). According to the Prime Minister's Decision 1755/QD-TTg in 2010 approving the *project " Make Vietnam a strong country in information and communication technology" by 2020, 80% of IT students and media graduates from universities with sufficient professional and foreign language skills to be able to participate in the international labor market.* Thus, regarding the quality of human resources, we have not yet achieved the set target.

On the other hand, the digital transformation includes 03 main pillars: building a digital government, developing the digital economy, and a digital society, requiring a large IT workforce with deep expertise in digital technology and digital skills. Currently, there is

a serious shortage of human resources for digital transformation on all three pillars of Vietnam. The digital transformation requires a lot of human resources trained in new and specialized areas of Artificial Intelligence (AI); Big Data; Cloud Computing); Internet of Things (IoT); Virtual Reality/Augmented Reality (VR/AR); Blockchain; 3D Printing... but currently very few training institutions have these new majors. Most universities, colleges and vocational schools providing IT training to serve the requirements of digital transformation are facing challenges due to the lack of teaching staff; The training programs and contents have not been standardized, the facilities and practice rooms for research training are inadequate.

IT enterprises have not cooperated and closely associated with state management agencies and training institutions in training IT human resources. Some businesses, although they have affiliate programs with training institutions that accept interns, and support jobs for students after graduation, but only focus on some fairly good students, not paying attention to them long-term development leads to output imbalance.

Along with promoting digital transformation across the country, in all industries and fields, the demand for human resources knowledgeable and deeply skilled in IT and digital transformation in agencies, organizations and businesses is increasing business is becoming more and more urgent. Meanwhile, human resources in the public sector have not met the actual requirements in both quantity and quality. On average, each unit under the Ministry, ministerial-level agency has 5.8% of civil servants in charge of IT; in the province and city block is only 1.4% (Ministry of Information and Communications, 2020). In many units, a computer science engineer has to

perform many tasks concurrently, and his qualifications are not guaranteed, so the consulting work on implementation and application at agencies and localities is not deep and unsatisfactory request. The majority of IT staff in agencies, organizations and enterprises have not been trained in digital technology and have not obtained certificates from reputable domestic and international organizations.

4. Discussion and Conclusion

4.1. Discussion

Some solutions to develop IT human resources to meet the requirements of digital transformation

One, it is necessary to foster and raise awareness of digital transformation and digital governance for leaders, managers, and staff working in digital transformation consulting in state management agencies to commune levels, corporations, the corporation and all lecturers, officials and employees in universities, colleges and vocational training institutions. Focus on training to update knowledge and skills of digital transformation, digital technology, and digital platform for lecturers. Standardize the training majors associated with the profession according to international standards. Promote overall and comprehensive digital transformation, drastically change processes and modes of operation, apply digital platforms and digital technologies, especially open platforms and open technologies for rapid digital transformation and overview...

Two, deploying the construction of a coordination mechanism between 03 agencies: the State, the trainer, and the user in developing IT human resources. In which, state agencies have the role of leading and linking universities, colleges, vocational education and training institutions with enterprises to develop human resource training programs according to actual requirements and requirements business order. Building and implementing digital platforms connecting education and training institutions with businesses in order to exchange information and promote learning from real work; training and retraining digital skills for employees to adapt to the labor market, connecting labor market supply and demand.

The benefits of “Order” training are clear, but it is not easy for each school. To be able to create human resources suitable to the requirements of socio-economic development, all training plans must be oriented to the needs of the labor market, must be associated with the goals and tasks of economic development, local society. Education - training not only meets social needs, but also has to "go ahead" to create social needs. Establishing a relationship between schools and businesses is an urgent issue to improve the quality and effectiveness of training. However, in order to have such relationships besides the voluntariness of both parties, it is necessary to have appropriate policies and mechanisms to acknowledge and support this relationship to develop. This relationship needs to be institutionalized by legal documents, not arbitrarily according to the feelings of school and business leaders.

Three, organize training of lecturers and researchers specializing in digital technologies such as artificial intelligence technology, blockchain, big data, cloud computing, digital finance, digital business, digital communication. It is necessary to promote doctoral training abroad for lecturers and researchers in digital technology. Organize additional training, update digital knowledge and skills for university lecturers, especially lecturers of economic and social majors.

Fourth, education and training institutions need to increase resources to increase training targets for IT human resources, open more training majors or update and supplement training content on digital transformation in the field of digital transformation sector, industry or profession. Open new majors and increase training quotas for engineers and bachelors in universities and colleges, and practical engineers and technical workers in digital technology vocational colleges such as: AI; Big Data; Cloud Computing; Iodine; VR/AR; Blockchain; 3D Printing; New Generation Network Technology; Intelligent Robots; Data Science... Innovating training programs and increasing training targets for the fields of technology, engineering, and application of technology. Standardize training majors associated with occupations according to international standards.

Fifth, short-term training in digital transformation and digital skills for professional IT human resources in the IT industry; a team of leaders and staff specialized in IT in agencies, units and enterprises. Training at least 1000 IT experts on digital transformation for industries, fields and localities. The above staff and experts continue to re-train staff in their agencies and organizations and become the core force to lead, organize and spread the process of national digital transformation. At the same

time, forming a national network of digital transformation experts on the basis of linking IT experts with experience in digital transformation with domestic and foreign experts and scientists working in the field of digital transformation, digital technology to combine the power of knowledge, promote digital transformation.

Sixth, implement digital transformation, improve capacity and quality of training and research of IT training institutions. Universities and colleges providing IT training must regularly update the knowledge and skills of digital transformation and digital platforms for the teaching staff. Standardize the training majors associated with the profession according to international standards. Support digitally in training programs, curricula and methods, especially import new and advanced training programs in digital technology, digital economy and digital society. Invest in building and upgrading laboratories on digital technology and digital platforms to serve training and research in order to increase training capacity and quality in digital transformation and digital technology.

Seven is, develop and annually publish forecasting reports on human market demand and future careers in the fields of information technology, electronics - telecommunications, network information security, digital transformation human resources in Vietnam for a suitable training solution; Update trends and introduce some new industries and occupations that require new skills.

Eight is, promote international cooperation in IT human resource development. Domestic universities need to cooperate with major research institutes, universities and research centers in the world on technology and digital platforms to build a smart university system and gradually form new universities leading research center on science, technology and digital in the region and in the world. In the context of deep international integration, international cooperation in training and scientific research is an important factor to develop IT human resources.

4.2. Conclusion

- Digital transformation is an inevitable trend of the world, an objective requirement of development and Vietnam cannot stand aside. The Party and State of Vietnam have promptly set out guidelines and policies to implement the National Digital Transformation. The digital transformation process in Vietnam has achieved some important results, happening more quickly due to the impact of the Covid-19 epidemic.

- To successfully conduct Digital Transformation, it is necessary to invest in training and developing human resources mastering digital technology, especially IT human resources with digital technology skills and knowledge. However, the current situation of IT human resources shows that the Digital Transformation process is facing great challenges, because of the lack of high-quality IT human resources to meet the requirements of digital transformation.

- Strengthening solutions to develop IT human resources to meet the requirements of Digital Transformation is one of the tasks to be performed in the current period.

Abstract

Digital transformation in the banking sector is an inevitable trend in the digital age. The development of digital banking depends of course on customer acceptance. Customer acceptance of digital banking services is influenced by many internal and external factors. Along with the development of the internet and social networks, electronic word of mouth (eWOM) is becoming an important source of information that affects customer behavior. This paper is based on a quantitative survey of 305 Gen Z customers of the bank to examine the influence of eWOM factors on the attitude towards eWOM information and the intention to use the digital banking. Research findings have shown that factors including tie strength, homophily and source credibility have a positive influence on the attitude towards eWOM information and the intention to use digital banking. Research findings have suggested some managerial implications for commercial banks about communication activities through eWOM to develop digital banking.

Keywords: *Word of mouth (WOM); electronic word of mouth (eWOM); Attitude towards eWOM; Homophily; Intention to use digital banking; Source credibility.*

1. Introduction

Along with the development of the internet and information technology, digital transformation has been a strong development trend across the world in general as well as in Vietnam in particular. According to the Vietnam Digital 2021 report which was jointly published by We are Social and Hootsuite in February 2021, as of January 2021, Vietnam has 68.72 million Internet users, accounting for 70.3% of the total population, 72 million social network users, accounting for 73.7% of the total population, 154.4 million mobile connections.

The advancement and strong spread of the Internet over the past decades has rapidly increased the number of online users, allowing a strong and continuous exchange of information among consumers, forming a new form of communication called electronic word of mouth (eWOM). The emergence of social networking sites has offered a new condition for eWOM as users can communicate with each other in cyberspace. Consumers

can share their reviews and opinions about products and services through online platforms such as social networks, blogs, etc. Recent studies show that social media has increased the number of online reviews and opinions (Trusov et al., 2010). eWOM has certain influences on the purchase process of customers, especially the search of information when customers do not have much information about a new product or service, affecting the formation of purchase intentions for new products and services.

In the banking sector, digital banking services (D-banking) have been growing strongly along with the development of e-commerce activities, promoting domestic and international economic and commercial activities thanks to its convenience, speed, accuracy, saving time and effort for users. Digital banking services have been replacing traditional methods of providing banking services. In the context of the recent Covid-19 pandemic with regulations on social distancing, the trend of using D-banking is more likely to develop. However, according to Vietnam E-banking market research report released in January 2021 by Mibrand - a brand consulting company, many banking services on D-banking platform have not been known to everyone, except for intrabank and interbank money transfer services. In which, typical banking services such as savings, international money transfers, credit card payment, insurance purchases, or ATM card locking/unlocking saw an average awareness (only 30-60% of users) and low usage (about 20% of users). The reason can be that digital banking (D-banking) is a new technology-based method of providing banking services, so many individual customers do not have a full understanding of this service, its reliability, safety as well as the method of using the service. Individual customers will certainly have to search for a lot of information before making a decision on accepting a digital banking service. Internet is the place to provide complete information in the simplest and fastest way for potential customers, forming an intention to use digital banking services. Therefore, this paper examines the influence of eWOM on the attitude of potential customers towards eWOM and the intention to use digital banking services. The study focuses on Gen Z customers, young customers, those who are savvy about technology, internet and social networks; this group will be the most important potential customers of banks in the future.

2. Theoretical basis and Research model

2.1. Word of mouth and electronic word of mouth

Word of mouth (WOM) is the direct transmission of information among people. To date, there are different definitions of WOM. Arndt (1973) defined WOM as “a one-on-one communication between a receiver and a communicator, concerning a brand, a product or a service, that is perceived as noncommercial by the receiver”. Litvin et al., (2008) defined WOM as “*the reciprocal communication between consumers about a product, service, or company in which the sources are considered independent of commercial influence*”. Although there are different definitions, researchers agree that WOM includes verbal communication between individuals (Nyilasy, 2006). “*WOM is oral, person-to-person communication between receiver and communicator whom the receiver perceives as non-commercial, concerning a brand, a product, a service or an organization*”.

Word-of-mouth activities on the internet platform are called electronic word of mouth (eWOM), “are all activities that transmit information about the features or attributes of certain goods and services or providers on the internet platforms addressed to customers” (Litvin et al, 2008). Hennig-Thurau et al. (2004) offered a more specific definition, narrowing the scope of eWOM while clearly distinguishing between transmitters and receivers of eWOM communication: “any positive or negative statement made by potential, actual, or former customers about a product or company, which is made available to a multitude of people and institutions via the Internet”. Ismagilova et al., (2017) introduced a new concept for eWOM: “eWOM is a dynamic and ongoing information exchange information process between potential, actual, or former consumers regarding a product, service, brand, or company, which is available to a multitude of individuals and institutions via the Internet”. This concept emphasizes that the exchange of eWOM information is not an immutable process but an ongoing and dynamic information exchange process, and the message itself is spread on the internet. In addition, this concept also indicates the content and source of eWOM information.

Table 1. Differences between WOM and eWOM

Features	WOM	eWOM
Network width	Information is shared among individual groups or small communities	Information can be spread out of a locality due to wide internet connection
Circumstance	Almost face to face	On the internet
Tie strength	Strong tie as it happens between relatives, friends or acquaintance	Weak tie as it happens mainly between strangers
Privacy	Private	Information is shared in the group
Anonymity	No	Yes
Speed	Spread mainly among small individual groups	Spread on different social networks, so the speed is faster
Sustainability and accessibility	Difficult	Easy
Measurement	Difficult	Easy
Scope	Narrow	Wide

Source: Synthesized by the author

2.2. Digital banking service

Currently there are different definitions of the term “digital banking” in the financial industry. Generally, digital banking is a banking model based on a digitized platform that integrates traditional banking operations and services, thereby helping customers to perform almost all conventional banking transactions in the online form via internet. All banking transactions will be conducted on the websites or mobile devices.

Globally, the digital banking trend is booming as most of the big banks have boosted investment in applying digital technology to business activities. In Vietnam, most commercial banks have been actively implementing digital transformation to create a seamless customer experience across payment channels. New applications and solutions are introduced by banks such as Biometric authentication (fingerprint, eKYC); Quick response code (QR code); Secure and convenient payment through card information encryption; Contactless payments; Flexible payment acceptance solution on mobile devices, etc. Commercial banks continuously announce and introduce new digital banking services such as BIDV with SmartBanking, Vietcombank with VCBDigibank.

2.3. Influence of eWOM on the intention to use digital banking

2.3.1. Factors of eWOM influencing attitude towards eWOM and purchase intention

The influence of eWOM on consumer behavior has been paid great attention by scholars. Literature shows the influence of eWOM on consumers in aspects of: information acceptance (Aghakhani and Karimi, 2013; Cheung et al., 2008), changing attitudes towards eWOM (Bartikowski and Walsh, 2014; Chih et al, 2013), and purchase intention (Akyüz, 2013; Bartikowski and Walsh, 2014).

Attitude toward eWOM information acceptance refers to the extent to which individual consumers perceive and use eWOM in their purchase decisions (Cheung and Thadani, 2012; Lis, 2013; Sussman and Siegal, 2003). A study conducted by Cheung (2014) discovered that the factors of eWOM influence consumers' attitude towards information acceptance. eWOM adoption may lead to changes in consumers' attitudes towards products/services and their purchase intentions. As such, consumers' purchase decision-making process is significantly influenced by the eWOM information they receive (Fan et al, 2013).

Studies have shown that factors of eWOM including source of information, message quality, relationship between sender and receiver, influence consumers' attitude towards accepting eWOM. Studies have also shown that factors of eWOM have an influence on attitudes towards eWOM information (Kim et al, 2018), thereby on attitudes towards products (Chih et al, 2013; Park, 2008).) and brand (Lee et al, 2009; Wu and Wang, 2011), thereby influencing consumers' purchase intention (Cheung and Thadani, 2012).

Based on the Online Social Networking (OSN) research framework (Brown et al, 2007), Kim et al (2018) mentioned the role of three social networking factors on the websites (tie strength, homophily and source credibility) in consumers' attitudes and perceptions towards eWOM. The research findings show that the homophily and the tie strength between the social networking site and the consumer are important drivers for the eWOM source credibility, thereby influencing attitudes towards reviews as well as towards social networking sites. Attitude towards eWOM acceptance is formed through perception of tie strength, homophily, and source credibility and impacts the influence of eWOM on purchase intention of consumers.

Studies on the influence of eWOM information on attitude towards eWOM mainly focus on the following factors:

- Argument strength
- The attractiveness of eWOM
- Quantity of eWOM
- Quality of eWOM
- Form of eWOM

A study conducted by Rabjohn et al (2008) found that the adoption of information in online communities is significantly influenced by the usefulness of the information. Luo et al (2014a) reported that the data were collected from two well-known websites in China (www.jd.com and www.pconline.com). The research has observed that two central factors - information comprehensiveness and argument strength - and two peripheral factors - consistency and quantity of information - may influence the adoption of information. The high number of eWOM messages and its contents may lead to information overload. Negative eWOM has a stronger influence than positive one on attitudes. A research conducted by Shuang (2013) using a textual data collection and indepth interviews found that information quality and source credibility positively influence the adoption of information.

2.3.2. Research models and hypotheses

Based on overview of literature on the factors of eWOM that influence the positive attitude towards eWOM and thereby influencing the purchase intention, the author has built a model to study the influence of these factors of eWOM on attitudes towards eWOM and intention to use digital banking. However, instead of just measuring the relationship between the receiver and the social networking site, the author decided to consider the relationship and the social network of the sender-receiver in the general online environment.

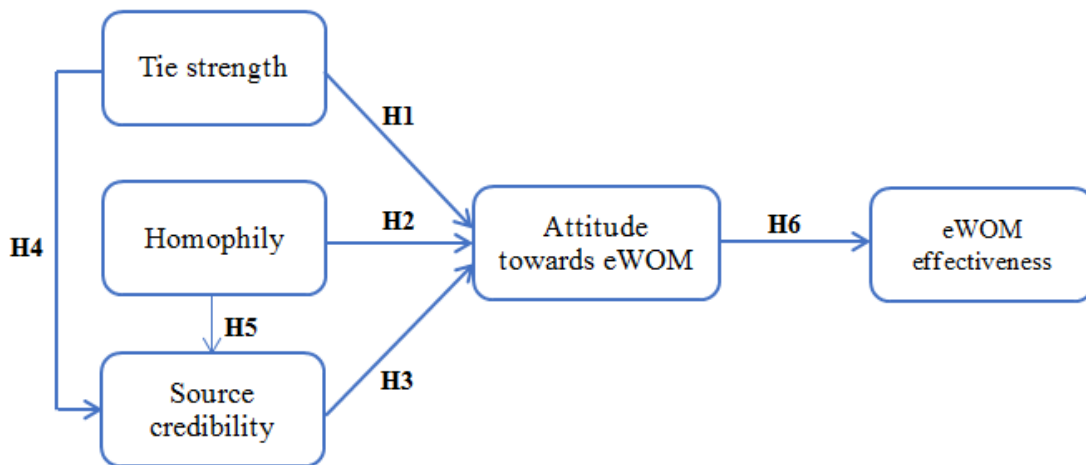

Figure 1. Research model

Research hypotheses in the model

Tie strength between eWOM sender and receiver

Tie strength refers to “the influence of ties between members of a network” (Mittal et al, 2008). According to Granovetter (1973), social ties can be classified as strong or weak (less strong). Close friends and relatives are considered strong ties, while neighbors, colleagues, acquaintances or friends are considered less strong ties (Gilbert and Karahalios,

2009; Marsden and Campbell, 1984). Word-of-mouth information given by friends of strong tie is more influential than that given by friends of less strong tie in decision making (Brown and Reingen, 1987). In addition, when people perceive their tie strength, they are more likely to engage in eWOM behaviors on social networking sites (Chu and Kim, 2011).

On the other hand, weak ties are often between less strong and less personal social ties including acquaintances and colleagues, facilitating the search for information on diverse topics (Pigg and Crank, 2004). Weak ties act as a communication bridge between strongly-tied groups and can allow people to access resources which are not available in their strong ties (Constant et al., 1996). The number of friends of people with weak tie is much higher than that of people with strong tie. Furthermore, friends of people with less strong tie offer more potential help (Friedkin, 1982) and offer more diverse advice than those with strong ties (Burt and Minor, 1983). However, people may not trust less strong ties as much as strong ones.

H1. The strong tie between eWOM sender and receiver has a positive influence on attitude towards eWOM information.

Homophily

Homophily refers to the degree to which individuals interact with each other share certain attributes (Rogers and Bhowmik, 1970). Previous literature has concluded that friends and members of social networks tend to be similar with respect to sociodemographic characteristics such as gender, race, and age, as well as perceptual characteristics such as beliefs and attitudes (Gilly et al, 1998).

Individuals with higher levels of attractiveness and trustworthiness develop higher levels of emotional attachment (Hyun and Kim, 2014). Furthermore, individuals tend to interact more with people sharing similar attributes (such as age, gender, ethnicity, education level) as it helps to reduce potential conflict in the relationship through trust and emotional attachment (Katz et al, 2004). Therefore, consumers with a higher level of homophily may be more likely to engage with each other's eWOM when making product choices. Despite the diversity of Internet users in general, online consumers can freely choose certain topics and participate in virtual communities, and therefore can direct their social interactions to consumers who are like themselves (Best and Krueger, 2006).

On social networking sites, similar demographic characteristics such as age and education level, describe users on these sites (Solman, 2007). Thus, social networking sites can do a great job of attracting consumers who have a lot in common, and this phenomenon increases the likelihood of those people engaging in eWOM behavior.

Similar people can bolster trust as the proposed solutions can also work for the receiver due to the similarity between the sender and the receiver (Levine and Valle, 1975). Social cognitive theory suggests that people are susceptible to being influenced by social figures who are perceived to be like themselves (Bandura, 1994). For example, millennials are more likely to purchase a product endorsed by someone who matches their self-image, according to Sukhdial et al (2002). Although, homophily may have an opposite effect if the receiver considers the sender to be a non-expert (Goethals and Nelson, 1973), particularly regarding matters related to objective truth.

H2. Homophily has a positive influence on attitude towards eWOM information.

Source credibility

Source credibility is a term used to refer to the positive characteristics of the sender that influences the receiver's acceptance of the message. Significant evidences from previous studies have shown that source credibility is an important factor that influences attitudes towards eWOM adoption (Park and Lee, 2009; Wu and Wang, 2011). Although there remains debate over the exact metrics, source credibility is generally considered to consist of two important aspects: reputation and expertise of the sender. Reputation refers to the extent to which the source conveys authentic information (Willemsen et al, 2012). Another aspect of source credibility is expertise, which is defined as the degree to which a source is considered to be capable of making reasonable and sound assertions (Willemsen et al, 2012).

Banks' customers are likely to trust information posted by people with higher expertise, knowledge, experience or skills related to digital banking. A large number of studies have provided empirical evidence that source credibility has a positive influence on the attitudes and behavior of message receiver, and that reliable sources are more persuasive than untrustworthy ones (Ayeh et al, 2013). Source credibility greatly influences customers' attitudes towards eWOM, as well as their intention to use digital banking. Therefore, if a consumer believes that the review is written by an expert, they are more likely to consider it positively, which positively influences their purchase decision. It is expected that when consumers consider reviews to be reputable and trustworthy, they are more likely to develop a positive attitude towards both the review and the product.

H3. Source credibility has a positive influence on attitude towards eWOM information.

Relationship between tie strength, homophily, and source credibility

The credibility of information received is usually determined by assessing the sender's level of knowledge and expertise (Brown et al, 2007; Gotlieb and Sarel, 1991). As sender and receiver often have a close personal relationship in this context, it is easier for the receiver to assess the sender's knowledge, which finally determines the credibility of the source.

When considering social and relational factors that determine the source credibility, the tie strength and homophily should be taken into account. Individuals tend to regard information created in a strong tie relationship as more reliable (Brown et al, 2007; Mack et al, 2008; Zhu and Zhang, 2010).

Based on this argument, this paper proposes that credibility evaluations are influenced by the receiver's perception of the relationship with the eWOM sender, which is expressed by the tie strength and homophily. When individuals in a strong tie relationship with someone who shares eWOM information, they are more likely to feel that person's evaluations are more trustworthy.

H4. Tie strength has a positive influence on the source credibility

H5. Homophily has a positive influence on the source credibility

Influence on the effectiveness of eWOM on intention to use digital banking services

Studies on consumer behavior show that consumers' emotional and cognitive attitudes towards eWOM information determine the relationship between eWOM evaluation and product/service evaluations (Harrison-Walker, 2001). Thus, a positive attitude towards eWOM helps to increase purchase intention. If eWOMs are considered trustworthy due to their tie strength and homophily, customers are more likely to rate eWOM information and digital banking positively and they will consider such eWOM information when making decision on using digital banking. Therefore, it would be reasonable to assume that attitude towards eWOM information has a positive influence on the effectiveness of eWOM on receiver's intention to use digital banking.

H6. Attitude towards eWOM information has a positive influence on the intention to use digital banking

3. Method

Qualitative research method is used to examine the relationship between the variables and adjust the scale for each variable with a focus on the factors that affect the effectiveness of eWOM on the intention to use digital banking. Two groups directly interviewed are experts in the fields of economics, especially in the fields of Marketing and Finance - Banking and Generation Z students who are customers of commercial banks. Qualitative research results are used to calibrate scales which have been inherited from existing studies.

Quantitative research method: The research used a questionnaire to survey a sample of generation Z customers of the bank, who are mainly students in Hanoi. The data were encrypted and analyzed using SPSS data analysis software. Next, the scale model and proposed hypotheses were analyzed and tested through the following procedures:

- Preliminary evaluation of the scale as well as the reliability of the measured variables through Cronbach's Alpha coefficient of reliability and exploratory factor analysis (EFA);
- Testing the scale by confirmatory factor analysis (CFA);
- Testing model by SEM in AMOS

The author uses Cronbach's Alpha coefficient to determine the exclusion of observed variables. Cronbach's Alpha coefficient less than 0.6 for factors (Hair et al, 1998) will be excluded. At the same time, the author conducts the EFA exploratory factor test to remove observed variables with small factor loading (< 0.3). Next, the remaining observed variables of the scale are tested for certainty through CFA (Confirmatory factor analysis). Finally, the structural equation modeling (SEM) will be included to test the validity and model fit to give acceptable or unacceptable results for all proposed hypotheses.

Research sampling technique is convenience sampling, 450 questionnaires were sent, the total number of questionnaires collected was 352, accounting for 78%. The screening results show that the number of questionnaires eligible for analysis and testing is 305. According to Hair et al (1998), this number of observations meets the minimum sample size requirement for EFA and multiple regression analysis in the topic.

4. Results

4.1. Scale testing result using EFA and Cronbach's Alpha

Before conducting CFA to examine the quality and reliability of the scales in the official research phase, the author conducts exploratory factor analysis (EFA) and Cronbach's Alpha.

Table 2. Synthesis of confidence level and total variance extracted of the scale

No	Scales	No of observed variables	Cronbach's Alpha coefficient	Total variance extracted	Conclusion
1.	Tie Strength	3	0.790	70.858%	All scales satisfy the reliability
2.	Homophily	8	0.927	66.445%	
3.	Source credibility	9	0.940	68.491%	
4.	Attitude towards eWOM	6	0.810	51.453%	
5.	eWOM efficiency	2	0.754	80.266%	

4.2. Testing model fit using confirmatory factor analysis (CFA) The set of data continued to be included in confirmatory factor analysis (CFA) under the following model:

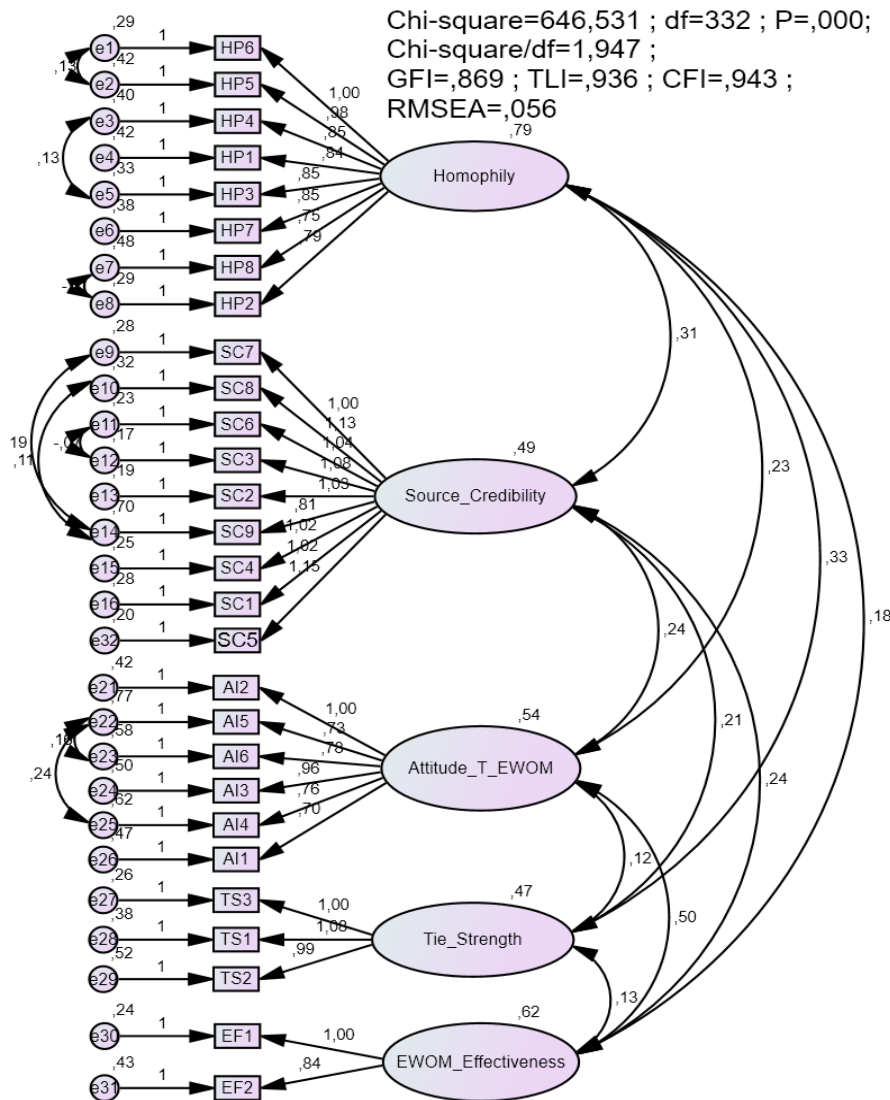

Figure 2. Results of model fit evaluation analysis

The author has conducted Reliability Analysis to measure Cronbach's Alpha coefficient and exploratory factor analysis (EFA) to measure the variance extracted. From Table 4.2, the Cronbach's Alpha coefficients are both greater than 0.6 and total variance extracted is greater than 50%. Theoretically, the scales have met the requirements.

The CFA results obtained from the above model show that Chi-Square/df = 1.947; GFI = 0.869; TLI = 0.936; CFI = 0.943; RMSEA = 0.056

As specifically argued in the section “Standard for CFA testing”: Tho and Trang (2007) reckoned that if the model receives values TLI, CFI \geq 0.9, CMIN/df \leq 2, RMSEA \leq 0.08 then the model is compatible with market data; the case of RMSEA \leq 0.05, according to Steiger, is considered very good. Similar comparison with the analyzed results: Chi-Square/df = 1.947 ($<$ 2); TLI = 0.936 ($>$ 0.9); CFI = 0.943 ($>$ 0.9); RMSEA = 0.056 ($<$ 0.8). It is proved that the testing results satisfy the reality of the market.

In addition, the evaluation of whether the scale can reach the convergent validity or not is done through the evaluation of the loadings in the table of normalized and unnormalized loadings are of statistical significance. The scale reaches the convergent validity when the normalized loadings of the scale are all higher than 0.5 and have P-value $<$ 0.05. In fact, the normalized loadings are all $>$ 0.523 (Appendix 3.2.3) and the normalized loadings are all of statistical significance, so the concepts meet the convergent validity. Moreover, the scale also achieves unidimensionality as the correlation coefficient between the concepts on the overall scale is different from 1 (Appendix 3.2.4)

In addition, to assess the quality and reliability of the scales more comprehensively, the author conducts an assessment of the Composite Reliability (C.R), and Average Variance Extracted (A.V.E). According to Hair et al. (2010), if C.R $>$ 0.7 and A.V.E $>$ 0.5, it can be concluded that the observed variable is correlated with other observed variables in the same factor and the scale is considered to meet the convergent validity, and if the square root of A.V.E is larger than the correlations between the two concepts, it can be concluded that the observed variable has no correlation with other observed variables in other factors and the scale is considered to achieve discriminant value.

Table 3. Synthesis results of C.R; AVE in models

No	Scales	No of observed variables	C.R	A.V.E
1	Homophily	8	0.926	0.610
2	Source credibility	9	0.944	0.656
3	Attitude towards eWOM information	6	0.796	0.397
4	Tie strength	3	0.797	0.568
5	eWOM effectiveness	2	0.761	0.616

It was found that the composite reliability coefficients of the scales all reached a value higher than 0.7, the coefficients of average variance extracted were all greater than 0.5. It can be confirmed that the scales achieve convergent validity and unidimensionality

(Hair et al, 1998). Thus, the scale has achieved reliability. The discriminant value test results show that the correlation coefficients of each pair of concepts with the standard error (SE) are all less than 0.5, so the correlation coefficient of each pair of concepts is different from 1 at the confidence level of 95%, reaching statistical significance (all P-values are less than 0.05). In conclusion, the concepts gain discriminant value.

Based on that, it can be concluded that the research scale model is compatible with the data, achieving unidimensionality, convergent validity, discriminant value and ensuring reliability, the model has comprehensive validity.

4.3. Model and hypothesis testing

After the results of testing the entire model fit are available, the author puts the observed variables and latent variables that were satisfied into the testing model. First, the author runs to test the variables that affect the regulatory variable - Attitude towards eWOM in model No. 01, then continues to add the testing of 2 variables: Tie Strength and Homophily on Source Credibility in model No. 02.

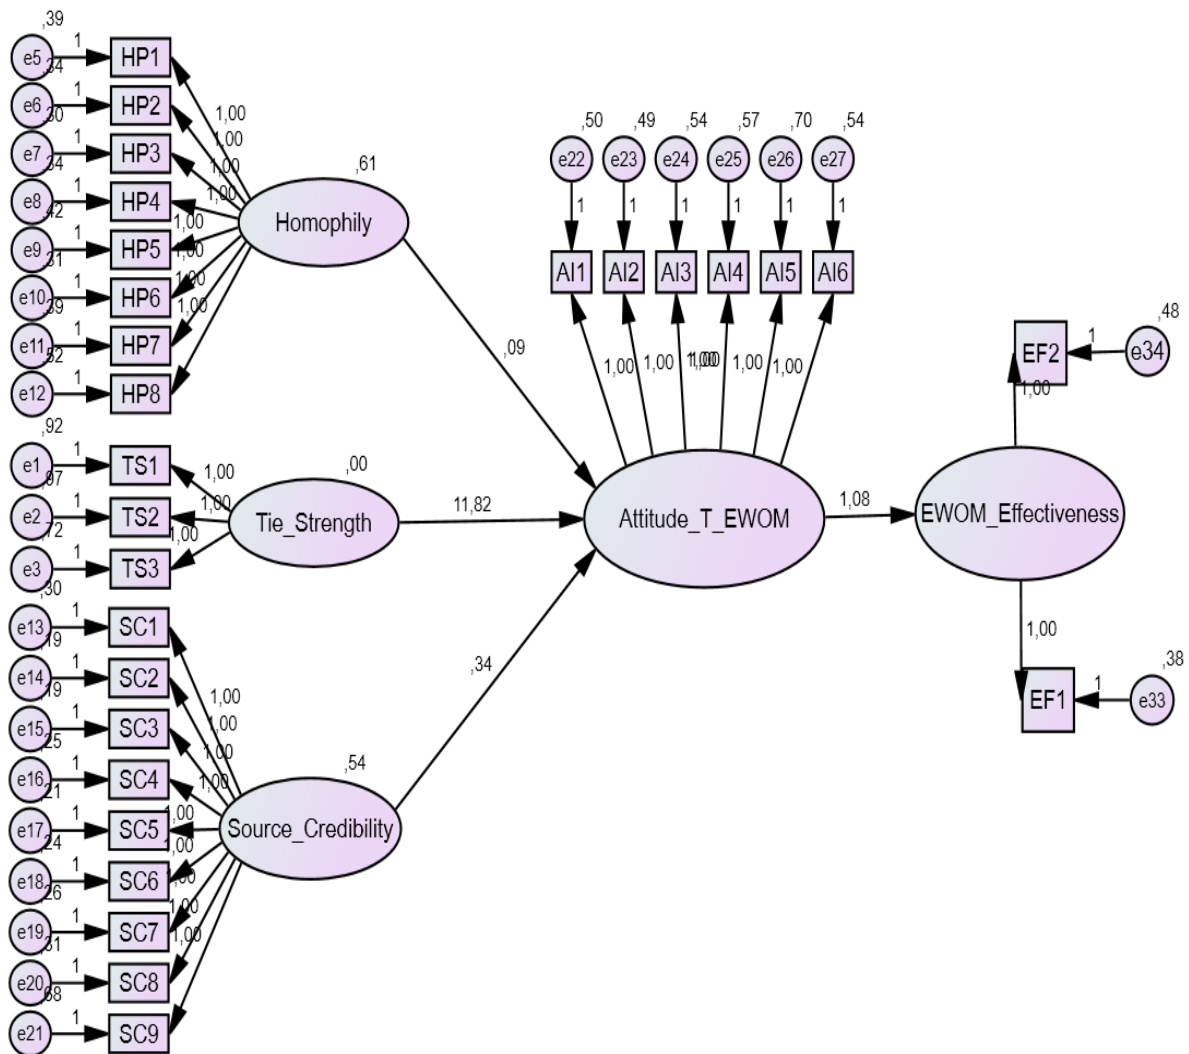

Figure 3. Analysis of structural equation modeling (SEM) No. 01

Figure 4. Analysis of structural equation modeling (SEM) No. 02

The unnormalized loading table is combined from the results of the two models above, allowing for evaluation of the influence of the factors: the eWOM effectiveness through the intermediate variable - the Attitude towards eWOM information and the influence of the two base factors on the Source credibility variable. In which, the influencing factors are considered significant when the P-value is less than 0.05. The results of testing the influence of these factors are summarized in the following table:

Table 4. Testing results of SEMs 01 and 02

Model		Estimate	S.E.	C.R.	P	Hypothesis
01	Attitude towards eWOM <--- Homophily	.087	.044	1.965	.049	H2: Accepted
01	Attitude towards eWOM <--- Source Credibility	.341	.047	7.241	***	H3: Accepted
01	Attitude towards eWOM <--- Tie Strength	11.821	9.029	1.309	.190	H1: Accepted
01	eWOM Effectiveness <--- Attitude towards eWOM	1.078	.061	17.554	***	H6: Accepted
02	Source Credibility <--- Tie Strength	2.656	.322	8.255	***	H4: Accepted
02	Source Credibility <--- Homophily	.211	.048	4.403	***	H5: Accepted

*Note: P=*** < 0.001

5. Discussion and Conclusion

Based on the analysis, argument and testing, this research has demonstrated that the factors including tie strength, homophily, source credibility, and attitudes towards eWOM information all have a positive influence on the eWOM effectiveness on the intention to use digital banking. Although the factors contain many complex sub-variables, meta-analyses have clearly shown the influence of all four factors on the eWOM effectiveness. The research findings are practical and highly applicable.

In addition, in this research, the research process expanded from previous studies to test the regulatory role of attitudes towards eWOM information. In particular, all the above pairs of influence, under the influence of the above regulatory variables, are also studied, clearly reflecting the difference. In addition, in this research, the research process also emphasized to test the interpersonal relationship.

The research findings have taken a deep dive into and comprehensively explored the factors influencing the eWOM effectiveness on the intention to use digital banking, specifically the influence of eWOM information senders and the influence of the eWOM itself. The research deep-dived into the influence of eWOM on generation Z customers of banks, particularly students in Hanoi City. The research findings serve as the basis for banks to develop strategies to use eWOM actively to influence these customers' intention to use digital banking.

The influence of tie strength, homophily, and source credibility on attitudes towards eWOM information

The SEM analysis results have shown that all the above mentioned three factors have a direct positive influence on the intermediate variable, which is the attitude towards eWOM information and have indirect influence on the eWOM effectiveness on the intention to use banking services.

That assertion is based on the unnormalized loadings which are 0.897; 0.116; 0.427, respectively. So the influence of tie strength on eWOM information is the largest, when increasing the tie strength variable by 1 unit, the attitude towards eWOM information increases by 0.897 units. Moreover, the regression estimates showing the influence of the variables of tie strength (TS), homophily (HP), source credibility (SC) on attitude towards eWOM information (AI) are 0.015, 0.136, and 0.316, respectively. The figures show that the source credibility has the most influence on the positive attitude towards eWOM while the two remaining variables do not have enough grounds to conclude.

With the standard $P < 0.05$, it proves that the influence loadings are of statistical significance. In fact, the results show that the P-values of the above validity are 0.190; 0.049 and *** (< 0.01), respectively, at the same time, have a positive sign, proving that the factors have a positive influence on the attitude towards eWOM information.

Influence of tie strength and homophily on source credibility

In addition to analyzing the influence of the intermediate variable - attitude towards eWOM information, the SEM analysis results also show the influence between the

component variables, particularly the influence of tie strength and homophily on source credibility. That assertion is evidenced by the following unnormalized loadings: the influence of tie strength is 0.971 and the homophily is 0.237. Thus, the influence of tie strength on the source credibility is larger than that of homophily. Particularly, when the variable “tie strength” increases by 1 unit, the source credibility increases by 0.971 units. Furthermore, the regression estimates showing the influence of tie strength (TS) and homophily (HP) on source credibility (SC) are 0.170 and 0.336, respectively. The figures show that tie strength has a more positive influence on source credibility than homophily.

With the standard $P < 0.05$, it proves that the loadings of influence are of statistical significance. In fact, the results show that the P-value of the above test is ***, and has a positive sign, proving that the factors have a positive influence on the attitude towards eWOM information.

Impact of attitude towards eWOM information on eWOM effectiveness influences the intention to use digital banking

The SEM analysis results also show that the impact of attitude towards eWOM information has a positive influence on its effectiveness on the intention to use digital banking. This is an important conclusion as attitude towards information and eWOM effectiveness are two important variables that determine the significance of the research model. That assertion is through unnormalized loadings: 1.000, P-value =*** and has a positive sign. Furthermore, the regression estimates showing the influence of attitude towards eWOM information (AI) on eWOM effectiveness (EF) are 0.792. The conclusion is that attitude towards eWOM information has a positive influence on eWOM effectiveness.

Managerial implications

First, businesses should prioritize customer gratitude and satisfaction, that is, to focus on improving user experience: Always care, motivate and encourage them to express their feelings, introduce products to friends and acquaintances. Link their interests with the interests of the business.

Second, when choosing influencers to write eWOMs about digital banking, businesses should choose people who have strong interactions and engagement with their fans.

Third, banks should create a social network among customers in order to promote eWOM effectiveness. Website activities must be strong and regular, focusing on the social ties between customers, between customers and the bank, helping create a loyal customer community that operates regularly on social networking sites.

DETERMINE FINANCIAL CONTRIBUTION RESPONSIBILITY IN THE IMPLEMENTATION OF EXTENDED PRODUCER RESPONSIBILITY (EPR) POLICY IN VIETNAM

Assoc. Prof. Dr. Le Thu Hoa

hoalethu@neu.edu.vn

*Faculty of Environmental, Climate Change and Urban Studies,
National Economics University, Hanoi*

Abstract

In Extended Producer Responsibility (EPR) systems, producer responsibility for a product is extended to the post-consumer stage of a product's life cycle. The responsibility of the producer can be physical, financial and/ or informational. This paper aims to define producers' financial contribution responsibility to support implementation of EPR policy for products and packages that can and need to be collected for recycling in Vietnam. The results are (1) methodology to formulate the calculation of recycling financial contribution to Vietnam Environmental Protection Fund (VEPF); (2) proposed reference cost norms for financial contribution to VEPF; and (3) recommendations to promote determination and implementation of producer financial contribution responsibility in Vietnam.

Keywords: *Extended Producer Responsibility (EPR), Financial Contribution Responsibility, Recycling Products and Packages, Reference Cost Norms.*

1. Introduction

The Organization for Economic Cooperation and Development (OECD) defines Extended Producer Responsibility (EPR) as “*an environmental policy approach in which a producer's responsibility for a product is extended to the post-consumer stage of a product's life cycle*”. The responsibility of the producer can be physical, financial and/ or informational. There are two related features of EPR policy: (1) shifting of responsibility (physically and/ or economically; fully or partially) to the upstream producers and away from the municipality and general taxpayer, and (2) to provide incentives to producers to incorporate environmental considerations in the design of their products (OECD, 2001).

EPR policy requires producers to finance the cost of waste collection and recycling of designated products (Nahman, 2010; Nash and Bosso, 2013). The main function of this financial contribution is to shift financial management responsibilities from local government authorities and the general taxpayers to producers.

Financial contribution of producers (manufacturer or importer) of products and packaging is one of the important contents of EPR policy in Vietnam. The Law on Environmental Protection (2020) stipulates EPR in two cases: (1) products and packages that can and need to be collected for recycling; and (2) non-recyclable, hazardous products and packaging that need to be collected for disposal. Responsibilities for recycling products and

packages of manufactures and importers are regulated in Article 54 of the Law on Environmental Protection:

➤ Organizations and individuals that manufacture or import recyclable products and packages must recycle in accordance with the required recycling rate, methods, and standards, except for exported, temporarily imported products and packages, re-exported, manufactured, or imported for research, study and testing.

➤ Organizations and individuals may choose to recycle products and packages in one of the following forms:

- a) Organize the recycling of products and packages;
- b) Make a financial contribution to Vietnam Environment Protection Fund (VEPF) to support product and packaging recycling.

Thus, in cases that the producers (manufacturer or importer) do not organize the recycling of the product or packaging (carry out the recycling by themselves; hire a recycling unit; or authorize a third party to organize recycling in its entirety), they must make a financial contribution to VEPF to support product and packaging recycling. Producers' responsibility in relation with other stakeholders' roles in Vietnam's EPR system are illustrated in figure 1.

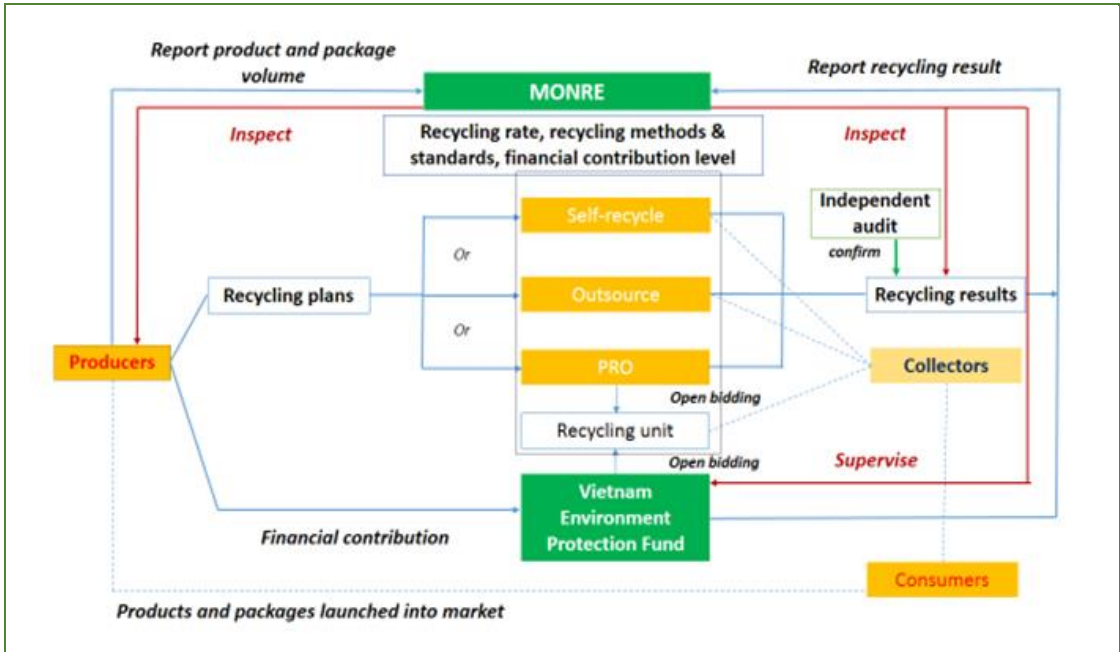

Figure 1. Producers' Responsibility in Vietnam's EPR System

Source: Hoa & Quang (2021)

This paper aims to define producers' financial contribution responsibility to support implementation of EPR policy for products and packages that can and need to be collected for recycling in Vietnam. The key research questions include:

- 1) What is the methodology to formulate the calculation of recycling financial contribution to VEPF?
- 2) What are the reference cost norms for financial contribution to VEPF?

2. Method

In order to find answers to the above and other related questions regarding financial contributions to Vietnam's EPR policy, a number of activities were carried out.

➤ Studying international experiences (desk review) to draw guiding principles, propose the formula for calculating the financial contribution applicable in Vietnam;

➤ Consultation and surveying to get opinions on the principles, proposed formula as well as the information for proposed reference cost norms. These are:

- Organizing official consultation meetings - offline and online, with experts and stakeholders; especially meetings with representatives of 6 industry groups subject to EPR policy implementation under the provisions of the Law on Environmental Protection. Several official meetings were organized by the Ministry of Natural Resources and Environment, Department of Legal Affairs, the Vietnam Chamber of Commerce and Industry (VCCI). Some meetings are actively organized by a group of representatives of industry associations (such as Packaging Association, Electric-Electronics Association, Tire Manufacturers Association...).

- Conducting personal consultations with a number of representatives of industry associations, experts from universities and research agencies (such as the Institute of Strategy and Policy on Natural Resources and Environment, the Central Institute for Economic Management). The form of communication/ consultation can be via email, face book or mobile phone.

- Conducting a number of survey visits to craft village waste recycling businesses and urban environmental companies to collect information on recycling practices of plastic waste, paper, packaging, batteries, ELV; especially information regarding waste recycling costs.

3. Results

3.1. International Experience on Financial Contribution in EPR Policy

3.1.1. Experience from Taiwan

Taiwan imposes the financial responsibility on producers by charging them recycling fees since 1998. Every two months, producers and importers have to pay recycling fees, based on their domestic sales quantities and the recycling fee rates for different products, to the Recycling Fund Management Board (RFMB) of the Environmental Protection Administration of Taiwan (EPAT), the environmental authority at the cabinet level of the central government. The fees are not only for the cost of take-back schemes and recycling, but also for articles scattered in nature without being collected for proper treatment.

In 2012, the RFMB initiated the Green Recycling Fees program, which allowed producers to reduce their recycling fee payments by up to 30% if the articles sold to the market are certified with eco-labels. Eco-labels issued in Taiwan such as the Environmental Labels from the EPAT and the Water-Saving Labels and Energy-Saving Labels from the Ministry of Economic Affairs. The purpose of Green Recycling Fees is to encourage the green design of products to facilitate the recycling process later, reducing the costs of recycling operations, and in turn, reducing the environmental costs. With the fee-charging EPR system, which originally evolved from environmental cost considerations for better

waste management, Taiwan has achieved a 60% take-back rate of total waste and created a mature recycling industry because of the governmental recycling scheme. However, this system has resulted in a risk of unbalancing the Recycling Fund.

Fee Calculation Equations

The recycling fee calculation equation plays a crucial role in determining payment from producers. The equation has also become a tool for maintaining the balance of the recycling fund because of the adjustable parameters in the equation, such as the environmental cost, administration cost, etc. For different periods of time, the equation incorporated different considerations and different parameters.

In 1998, when the RFMB started to operate the EPR scheme for e-waste recycling, the recycling fee determination was purely based on the cost needed for the operation without considering other factors, such as the environmental cost of littering with recyclable products that were not collected into the process. In 2001, after 3 years of operation, RFMB revised the fee calculation equation to include the environmental cost from the littering of recyclable products that were not collected into the collection process. Therefore, calculating recycling fees not only for the operational cost but also for the environmental cost of uncollected articles became a challenge for the Taiwanese EPR scheme. In 2005, the environmental cost for the littering of unrecyclable waste products was further differentiated into two categories: the environmental cost of unrecyclable products with proper collection and final disposal, and the environmental cost of unrecyclable products without proper final disposal.

3.1.2. Experience from Korea

Since the introduction of Korean EPR System in 2003, the target items have expanded. As of 2014, the items covered by the scheme include twenty-seven electronic products, as well as tires, lubricant, batteries, and fluorescent lamps, styrofoam float, and packaging materials defined by the presidential decree. A mandatory recycling ratio for each EPR product category is announced every year by the Ministry of Environment. Although the legal obligations of waste recycling lies with producers, the Korean EPR system requires shared duties between all societal stakeholders (e.g. consumers, local governments and the state government).

Producers (manufacturers or importers) of EPR items shall collect and recycle the end of life products or packaging materials or pay the allotted share of charges to the Producer Responsibility Organizations (PROs). Producers may establish a PRO for recycling to carry out the obligatory recycling responsibility.

To ensure the implementation and transparency of the related procurement, Korea Environment Corporation (KECO), entrusted by the Ministry of Environment, checks and monitors the producer compliance, the invoices and receipts of the producers to ensure that targets are met. Producers, together with recycling businesses, are obliged to record on-line the recycling process – including the amount of waste collected and the methods of recycling - and KECO confirms the records through on-site inspections. KECO also provides financial assistance in the form of low-interest rate loans to small and medium sized recycling businesses seeking technical consulting to improve technological and product manufacturing capacity. As complements to EPR, Korea has several economic policy tools in place. In

particular, there is a pay as you throw unit pricing scheme, often referred to as a volume-based waste fee system, separate collection, charging and recording system of bulky wastes.

Producers or PROs should submit recycling implementation results to the KECO every April. The Ministry of Environment imposes financial sanctions to the producers or the PROs, if the analysis report drafted by KECO reports any incompliance - referred to as recycling charges. The recycling charges are differentiated according to the unmet portion, and the charges range from 115% to 130% of the recycling fees.

Fee/ financial contribution levels are not subject to the approval by public authorities but decided by individual PROs. However, the government still publishes the standard recycling fees for each and every EPR item, which the PROs take into consideration when deciding the level of funds to be collected. To decide the standard recycling fees, the Ministry commit specialized agency to calculate these fees by estimating expenses of each recycling step including collection, transportation and treatment. The Ministry of Environment enacts and revises related Acts and regulations, decides the mandated recycling rate of EPR items, permits the establishment of PROs, supports and manages local governments and KECO, and coordinates and settles conflicts between other stakeholders.

3.1.3. Experience from European Countries

Since 1990s, the EPR concept has been widely implemented in the European Union with a great variety of EPR schemes and the creation of PROs. For the four streams targeted by specific Directives (packaging, batteries, ELVs and WEEE), an EPR scheme has been systematically implemented in all Member States. Additional waste streams for which EPR schemes have been most commonly identified within the EU are: tyres, graphic paper, oils, medical waste and agricultural films.

Despite EPR being, in theory, an individual obligation, in practice producers often exert this responsibility collectively. In collective schemes, a Producer Responsibility Organisation (PRO) is set up to implement the EPR principle on behalf of all the adhering companies (the obligated industry).

In the last years, two main evolutions of EPR have occurred:

- Whereas the initial fees paid by producers represented only a partial contribution to solid waste management costs, the operational costs coverage by producers fees has gradually increased, sometimes reaching 100%;

- Whereas the PROs were initially created as entities whose role was merely to aggregate the producers financial contribution, their role has been drifting towards more operational interventions and a broader scope of action (data management, organising operations, launching bids, communication campaigns, etc.).

Such evolutions have accompanied undeniable improvements in waste recycling and recovery performances in all Member States.

Full cost principle and different financial contribution for different product/ package categories

There seems to be a consensus on the fact that EPR systems should cover the collection, sorting and treatment costs of separately collected waste management minus the

revenues from recovered material sales (thus the full net cost). The extent to which net operational costs are assumed by PROs (and therefore covered by producers' fees) is highly variable and depends notably on the share of organisational and financial responsibilities of the various stakeholders, as well as on the national framework for EPR. For example, for packaging, the cost coverage by producers' fees range from around 10 % (UK) to 100% (AT, BE, CZ, DE, NL) of net separate collection and treatment costs. When the costs that need to be covered by EPR do not fall within the operational responsibility of producers, nor within the direct functioning costs of the PROs, some EPR systems use a reference cost to estimate the amounts to be covered.

In EU's EPR system, fees paid by the producers vary greatly for all product categories. These differences reflect either a difference in scope and cost coverage, or in the actual net costs for collection and treatment of waste (or both). Costs and performance are influenced by many factors, including factors external to the design and implementation of the EPR scheme, for example: Population density and country geography; Historical development of the waste management infrastructure; Value of secondary materials on the national market; Awareness and willingness of citizens to participate; Existence of complementary waste policy instruments, especially economic instruments like pay-as-you-throw schemes and landfill taxes.

Although a majority of PROs charge less than 1,000 EUR/tonne of portable batteries, the fees paid by producers to PROs can vary from 240 EUR/tonne in France to 5,400 EUR/tonne in Belgium. When comparing the fees charged to producers per tonne of packaging material put on the market, similar discrepancies appear: average fees charged to producers range from 14EUR/tonne to 200EUR/tonne, with an average of 92EUR/tonne.

In the case of WEEE, tariffs are not set up in the same way and important discrepancies appear. For example, in France, fees for televisions are divided into eight subcategories with prices ranging from 0.8 to 8.0 EUR/piece whereas in Greece producers pay a contribution of 254.2EUR/tonne of televisions put on the market.

In 2018, the EU introduced mandatory requirements for EPR, including the principle of fee modulation: "In the case of collective fulfilment of EPR obligations, fees are modulated, where possible, for individual products or groups of similar products, notably by taking into account their durability, reparability, reusability and recyclability and the presence of hazardous substances, thereby taking a lifecycle approach". Although few Member States have introduced such modulations in practice, work is in progress to develop a harmonised approach and provide Member States with detailed guidance on how to implement this principle.

3.2. Guiding Principles for Financial Contribution in Vietnam's EPR system

Learning from international experience, some principles for financial contribution in Vietnam's EPR system could be drawn as follows:

➤ ***First, full net cost coverage principle:*** the design and implementation of an EPR scheme should at least ensure the coverage of the full net costs related to the separate collection and treatment/ recycling of the end-of-life products. Thus, EPR scheme should cover the following net costs related to the end-of-life of products:

- + Costs for establishing a separate waste collection system;
- + Collection, transport and treatment/ recycling costs for separately collected waste;
- + Administrative costs, i.e. costs linked to the running of PROs;
- + Costs for public communication and awareness-raising;
- + Costs for the appropriate surveillance of the system (*including auditing and measures against free riders*);

- Subtract revenues (if yes) from recycled material sales.

➤ **Second, the true end-of-life cost principle:** money paid by each producer should reflect as faithfully as possible the end-of-life cost of his own products

➤ **Third, fee modulation principle:** charging differing fees to producers for each product type/ material.

➤ **Fourth, principle of simplicity and ease of implementation:** in the beginning (pilot) phase of EPR implementation, the way to calculate the financial contribution should be as simple as possible. The proposal of more detailed contribution (eg. for more advanced eco-modulation of fees, for the differences in market size or product size, etc.) will be employed in the following stages. The financial responsibility also needs to pay attention on “big fishes”. That are, for example: big polluters, big producers, “big” pollutants. Thus, micro and/ or SME producers may contribute EPR financially from the 2nd phase, after some year of EPR implementation.

➤ **Fifth, revision of financial contribution:** All international experiences show that initial financial contributions (or fees) are just a proxy and are going to evolve a lot due to many reasons. Financial contributions (or fees) can grow or decrease, once the system tested the current country set-up for collection, sorting & recycling; Value of recycled material is linked to value of global commodities market that is extremely volatile. Thus, financial contributions (or fees) should be revised after 1 – 3 years.

3.3. Formula to Calculate Financial Contribution to Support Recycling

The financial contribution to VEPP to support recycling is determined based on the compulsory recycling rate; volume of products and packages on the market and standard recycling cost. Following the principle of simplicity and ease of implementation, options to the calculation of financial contribution were derived. Through a number of discussions and consultations with experts and businesses, the equation for calculation financial contribution of each type of product and package has been proposed to determine by the formula:

$$F = (R \times V \times Fs) \times k$$

Where:

➤ **F:** total amount of money that the producer must contribute to the VEPP for each type of products or packages (unit: VND);

➤ **R:** compulsory recycling rate for each type of products or packages (unit: %). Rs are specified in the Decree guiding the implementation of the Law on Environmental Protection;

➤ **V:** quantity/ amount of products or packages put on the market in the year of undertaking the recycling responsibility (unit: kg or unit of products, packages);

➤ **Fs**: the norm of product and package recycling costs determined based on the total reasonable and valid costs for collection, transportation treatment and recycling of products and packages, cost of management and organization of recycling activities of the EPR Vietnam Office and the VEPF (units: VND/kg or VND/unit of products, packages).

➤ **K**: factor adjusted for the eco-friendliness and/ or ease of recycling of the product or packaging. Coefficient k is added into the equation as a simple form of Eco modulation application. For example, in the plastic industry group, PET plastic packaging has a coefficient of $k = 1$ while some other plastics that are more difficult to recycle - such as colored plastic bottles, hard plastic - will receive a higher k factor (1.2 or 1.5, or more).

3.4. Proposed Reference Cost Norm of Recycling Products and Packages (Fs)

Following the formula for determining F (total amount of money that the producer must contribute to the VEPF for each type of products or packages - presented in section 3.3), it is important to determine Cost Norm of Recycling Products and Packages (Fs) for financial accountability.

Fs will be determined based on the total reasonable and valid costs for collection (**Fc**), transportation (**Ft**), treatment and recycling (**Fr**) of products and packages as well as costs of management and organization of recycling activities of the EPR Vietnam Office and the VEPF (**Fm**).

Based on studies of Fs levels from many different countries, combining the results of a number of survey visits to craft village waste recycling businesses and urban environmental companies and consultation meetings, reference levels of cost norms for some types of products and packages were initially proposed as shown in table 1.

Table 1. Proposed Reference Cost Norm (Fs) for Some Types of Products and Packages

No.	Product Category	List of products	Proposed cost norm (VND/ kg)
A. ELECTRICAL – ELECTRONIC PRODUCTS			
1	A.1. Cooling & Heating Equipment	A.1.1. Refrigerators, freezers, automatic equipment for frozen product supply, vending machines	3,200
2		A.1.2. Fixed and portable air conditioners	1,500
3	A.2. Monitors and display devices	A.2.1. Laptops, notebooks	750
4		A.2.2. Televisions and computer monitors, other types of monitors	3,000

4. Discussion and Recommendations

4.1. Methodology of Financial Contribution Calculation

- The recycling cost calculation formula plays a crucial role in determining financial contribution from producers. For different periods of time, the equation should incorporate different considerations and different parameters.

Although EPR is not an entirely new policy in Vietnam, it is a new issue to prescribe specific levels of financial contributions to fulfill producer responsibilities. The current formula for calculating financial contribution of the proposed producers is relatively simple, determination is purely based on the cost needed for the operation without considering other factors, such as the environmental costs of littering with recyclable products that were not collected into the process, other costs/ benefits associated with different types of products and packaging.

- Thus, financial contribution must be kept flexible to revise every year. A sound general principle is to ensure full coverage costs of separate collection, transportation and recycling/ treatment necessary to reach the national target. Additional costs when exceeding the target, costs for waste not collected separately, etc. need to be considered and clear rules for their coverage set. In order to

ensure the requirement of flexibility of financial contribution, specific regulation on contribution levels should be promulgated by Circular of MONRE or Inter-Ministerial Circular between MONRE, MOF and MOIT.

4.2. Financial Contribution Modulation and Eco-design

Eco-design or eco-modulated fee is consistent to the EU principle of fee modulation (presented in 3.1): the level of the fee should, as far as possible, reflect the individual characteristics of the products put on the market, and their impact on the waste management

system, in order to encourage products that are more easily recycled. Thus, the financial contribution should be restructured towards, for example, to reward recyclable materials (fees reduce 50-130% on the use of recycled packages) and penalise difficult to recycle materials (fees increase 30 – 50% on the package with use of mixed materials, full sleeve, small litter-prone components, non-plasma coatings & additives, dark pigments, hard to dissolve glue...).

Vietnam would surely benefit from learning this lesson, which could be a source of inspiration. The application of eco-modulation should be considered in the time to come, may be after 2 -3 years form the time that new EPR system takes effect.

4.3. Design Financial Contributions to Incentivize Producers' Initiative

Beside to the guiding principles presented in 3.2, in the specific context of Vietnam, determination of recycling costs and financial contributions to the VEPF also have to pay attention on further rules, which are:

(1) Determine the recycling cost of product and packaging in accordance with the technology and recycling rate; compliance with technical procedures, standards, environmental regulations, and consistent quality of recycling services;

(2) The recycling cost of product and packaging should be properly and fully calculated with reasonable and valid costs of the process of investment, exploitation and operation of the collection, transportation and recycling system; suitable to the actual conditions of the service organization; technical infrastructure conditions, socio-economic conditions;

(3) Financial contribution to the VEPF to fulfill the extended responsibility of the manufacturer must be higher than the recycling cost of the PROs in order to encourage producers to organize their own recycling or recycling through PROs. Thus VEPF contribution should include PRO fee and fine and other related costs.

4.4. Procedure for Determining and Issuing the Financial Contribution to VEPF

The financial contribution to VEPF should be determined following the procedure of determining the compulsory recycling rate specified in the Decree guiding implementation of Law on Environmental Protection:

- Vietnam EPR Office (belonged to the Ministry of Natural Resource and Environment, MONRE) in collaboration with VEPF to calculate, determine the financial contribution to support recycling of each type of products and packages;

- Vietnam EPR Office and VEPF conducts actual surveys, consults relevant organizations and individuals, and proposes the cost norm of recycling products and packages (the Fs in the above formula) to determine level of financial contribution for each type of products and packages;

- MONRE issues the cost norm of recycling products and packages (Fs) to determine level of financial contribution for each type of products and packages to VEPF upon suggestion of National EPR Council;

- The cost norm of recycling products and packages (Fs) is reviewed and adjusted in the same period when the recycling rate is adjusted (every 1 – 3 years) to ensure compatibility with the actual change in recycling cost.

4.5. Ensure and Improve Transparency

Transparency is key to increasing acceptability and involvement by all stakeholders, especially where a single VEPF operates, and where options for complying through individual systems are limited. Producers need to understand why they are taking a financial responsibility, and how it contributes to increasing the recycling rates of the products they put on the market.

According to stakeholders' feedback during the consultation meetings, the following improvements in transparency seem to be necessary:

- *Transparency over the calculation of money paid by producers:* the publication of the fee structure reassures producers that they are paying their “fair share”. The MONRE should publish on the website the methodology for calculating the contribution and the detailed cost norm tables. The methodology is approved by the Decree and provides the general principles for setting the financial contributions. Although the basic principles seem sound, the description of the methodology is quite basic, and the calculation of contribution could be more detailed and refined, in order to further improve transparency.

- *Transparency over expenditure:* producers need to be reassured that the money they pay are actually directed towards cost-effective programmes for recycling their products. The practice of financing programmes not directly related to the collection and recycling of waste under the scope of the EPR could be maintained, but would gain from being clarified and dissociated from the core activities (for example, a small fraction of the money paid by producers could be earmarked for cross-cutting programmes, with the main share being spent on collection and recycling). VEPF is responsible for reporting to MONRE and sending the reports to Vietnam EPR Office to publicize the receiving and using the annual financial contribution on National EPR portal before March 31 of the following year.

4.6. Raising Awareness

Awareness about EPR programmes in general, financial contribution in particular, was still lacking in Vietnam. This is unsurprising since the system is very recent, but efforts should now be focused on this area. Media campaigns have already been designed and broadcast by the MONRE/ National EPR Office and the VEPF, and all stakeholders should be encouraged to participate. Local authorities should play a central role in informing and raising awareness among their populations. In some countries, municipalities receive specific communication support from the PRO - both financial and in the design and implementation of communication campaigns. Labels on products that are subject to EPR and/or that need to be collected separately is also a common approach to make consumers aware of the schemes and help them to separate such products at source.

Abstract

This study was conducted to investigate the influence of eco-labels on green purchase behavior of Vietnamese youth. Based on the collected data of 499 young consumers in Vietnam, the Structural Equation Modeling (SEM) was used to test the research hypotheses. Research results indicate that eco-label, environmental attitude, environmental concern, and trust in eco-label have a positive influence on green purchase. Eco-labels have a positive effect on product attributes. Eco-label knowledge, product attributes, and environmental attitude have a positive influence on environmental concern. Finally, Eco-label knowledge has a significant influence on trust in eco-label. Based on the research results, the author gives some suggestions for administrators in improving green purchase behavior for consumers.

Keywords: *Eco-label, green purchase, eco-label knowledge, environment concern.*

1. Introduction

Currently, the environment is increasingly polluted, which is a very difficult and urgent problem (Kirmani and Rao, 2000), yet there is no reasonable solution in resource management and environmental protection. As a result, consumers pay great attention to clean, safe food, and those derived from nature, with as few chemicals as possible (Roosen, 2003) because of the risk of food poisoning, as the consequence is quite serious (Rao et al., 1999). The growing concern of society about the environment has led to the emergence of a new type of consumer whose purchasing behavior demonstrates environmental sensitivity (Otto and Kaiser, 2014). Modern consumers seem to be increasingly concerned about the ultimate negative impact of their purchasing decisions, which in turn affect their purchasing behavior (Taufique et al., 2014, Sharma and Kushwaha, 2019). Eco-labels can be considered

as an important green marketing tool widely used to provide consumers with knowledge about green aspects of products (Sharma and Kushwaha, 2019). Since consumers cannot directly verify the attributes of green products, they must rely on eco-labels to validate such claims. Eco-labels promote sustainable behavior without jeopardizing consumers' freedom of choice. They reduce uncertainty and the costs of searching for information. At the same time, they help consumers make use of such information. However, sometimes manufacturers do not provide complete, reliable, and understandable eco-labels information, which can cause a lack of transparency (Rex and Baumann, 2007) and discourage consumers from buying green products (Atkinson and Rosenthal, 2014). Therefore, they doubt the reliability of eco-labels (Oates et al., 2008). This controversial condition highlights the important role that eco-labels' credibility plays in green marketing and consumer research. Although several academic studies have highlighted the important role of eco-labels' reliability in green consumer behavior, mainly theoretically (Cerjak et al., 2010), there is a gap in the marketing material regarding the effectiveness of eco-labels' credibility from an empirical point of view. The present study attempts to fill this gap.

In this context, The Theory of Planned Behavior (TPB) has been widely used in green marketing as a framework to study the ways in which consumer trust, attitude, interest, and knowledge are used to predict green purchase behavior (Cheung and To, 2019). Even though TPB can significantly predict purchasing behavior based on consumer attitude and belief, the gap between attitude and actual green purchase behavior is detected in many different green marketing studies (Claudy et al., 2013). Previous studies support that the impact of attitude on green purchase behavior can be context-specific (Ajzen and Fishbein, 1977). Consumer attitude can only predict actual behavior when context-specific requirements are met (Zsóka, 2008). For example, consumer knowledge can be an important factor showing the influence of consumers' attitude towards green living on green purchase behavior (Polonsky et al., 2012). However, to the best of the authors' knowledge, research on the effects of eco-labels on purchasing behavior is limited (Cheung and To, 2019), while no previous studies have investigated the impact of eco-labels' credibility in this context. This study aims to fill this gap by investigating the impact of eco-labels reputation on the actual behavior of green product purchasing among Vietnamese youth today.

Thus, how do consumers in Vietnam perceive eco-labels? What factors influence environmental attitude, trust in eco-label and green purchase behavior? How should Vietnamese businesses promote and maintain consumers' awareness in Vietnam about eco-labels, thereby improving trust, attitude, and green purchase behavior? This study was conducted to answer such questions.

2. Literature Review

Today, environmental issues are an increasingly concerning topic. Before the negative impacts in daily life, business, and the like of humans, the environment is severely affected. This influence also threatens the present and future lives of people. Therefore, green purchase was born and is considered as a new consumption trend, a solution to environmental problems around people.

“Green” consumers are those who carefully consider the impact of consumption, use of products or services on the environment and are willing to change their behavior towards a trend that does little or no harm to the environment (Moisander, 2007). Thus, green consumption can also be defined by purchasing, consuming, and using products that are friendly, recyclable, beneficial to the environment and still capable of meeting the needs of consumers. In addition, green products limit harm to society and the environment. Consumer’s green purchase behavior is often evaluated based on consumer intention and willingness to buy green products. This intention is then often transformed into green purchase behavior and ultimately influences customer behavior towards the purchase of environmentally sustainable products (Joshi and Rahman, 2015).

2.1. Eco-label

An eco-label is a tool used by companies or government agencies to raise awareness about the quality of a product's environment (Taufique et al., 2019). The Global Ecolabelling Network (2019) advocates that eco-labels “identify products or services that have been demonstrated to be environmentally appropriate in a particular category”. The International Organization for Standardization (ISO), in 2019, defines an eco-label as a label that “provides information about a product or service about its overall environmental benefits, such as the recyclability of packaging or contain no harmful ingredients”. Eco-labels can be considered as a significant emerging trend in green marketing and green advertising (Atkinson and Rosenthal, 2014) as well as a marketing tool to inform consumers and promote green products. (Hornibrook et al., 2015, Testa et al., 2015). They can be considered as certification marks that inform consumers about the environmental quality of products/services and assure them of the truthfulness of these claims (Atkinson and Rosenthal, 2014). Eco-labels enhance transparency and consumer confidence in environmental claims (Commission of the European Communities, 2017) (Thøgersen et al., 2010). Eco-labelling improves consumer perception of a brand in the name of eco-concern and green marketing (Taufique et al., 2016, Taufique et al., 2014). Finally, eco-labeling is positively associated with enhanced consumer preferences, increased purchasing behavior and higher appreciation for eco-labeled products (Song et al., 2019, Guyader et al., 2017, Khachatryan et al., 2017, Rihn et al., 2019). From that, the authors propose the following hypotheses:

H1: Eco-label has a positive effect on product attributes.

H2: Eco-label has a positive effect on green purchase

2.2. Product Attributes

Product attributes are a standardized way to get information about how well a product fits a certain requirement (Open Food Facts Wiki, 2021). Previous studies have shown that ethical product attributes can promote consumer-oriented behavior and tend to be effective determinants for converting positive attitudes into purchasing actions. Some scholars have demonstrated that the presence of the word "green" does not seem to significantly influence people's purchase intention (Bamberg, 2003). In this context, eco-labels are considered as one of the most recognizable attributes of green products to inform consumers to lead them to their purchasing decisions (Yau, 2012), improve transparency and relevance. to

environmental and social claims (Thøgersen and Ölander, 2002). Empirical studies suggest that the perception of integrating environmental concerns into product attributes is common in companies' product development (Dangelico and Pujari, 2010). Eco-labels tend to be an important factor in consumer purchasing decisions when one green product is relatively expensive or of lower quality than the other (Joshi and Rahman, 2015). In other words, the product attributes of ecolabelling play a dominant role over other conventional attributes, such as functional qualities. From that, the authors propose the following hypotheses:

H3: *Product attributes positively influence environmental attitude.*

H4: *Product attributes positively influence concerns towards the environment.*

2.3. Eco-label Knowledge

A customer's knowledge is any information in their memory, including product knowledge, shopping knowledge and consumer knowledge, all of which influence their consumption and purchases. Thus, there is a relationship between customer knowledge and purchasing decisions. Environmentally friendly products are special products. To distinguish them from other conventional products, customers often rely on the information provided about the product, where the eco-label is a reliable proof of the product's environmental factors. Customers have knowledge about eco-labels, that is, they understand the types of eco-labels, understand the meaning and information the eco-labels refer to. They easily determine the product's value to themselves and the environment, thereby making appropriate decisions. According to Taufique et al. (2017), Eco-label knowledge positively affects green purchase behavior of customers. From that, the authors propose the following hypotheses:

H5: *Eco-label Knowledge has a positive effect on green purchase*

H6: *Eco-label Knowledge positively influences environmental attitude.*

H7: *Eco-label Knowledge has a positive effect on environmental concerns*

H8: *Eco-label Knowledge has a significant influence on trust in eco-label.*

2.4. Environmental Attitude

Attitudes are essential to consumer behavior; therefore, understanding these attitudes can help researchers predict future behavior. According to Ajzen (1991) proposed in the theory of planned behavior and knowledge - attitude - behavior models, environmental attitude have a direct influence on the behavior of consumers who are for the environment. It also mediates other influencing factors. Environmental attitude is defined as “perceptual and affective assessment of environmental protection objects” (Bamberg, 2003). Many studies consider environmental attitudes as one of the premises that strongly influence environmental behaviors (Ballantyne and Packer, 2005, Kotchen and Reiling, 2000, Wells et al., 2011). Furthermore, Arcury (1990) argued that knowledge of the environment changes attitudes about the environment, while knowledge and environmental attitude enhance consumer behavior for the environment [9]. The importance of attitudes is one reason that some researchers have proposed the knowledge-attitude-behavior model (Flamm, 2009, Kaiser et al., 1999, Oreg and Katz-Gerro, 2006). From that, the authors propose the following hypotheses.

H9: Environment attitude has a positive effect on green purchase

H10: Environment attitude has a positive effect on environmental concern

2.5. Environmental concern

Environmental concern is often considered an important predictor of eco-friendly behavior and directly drives green purchase intention, widely used to explain pro-environmental behavior and sustainable behavior, etc. (Bamberg, 2003, Felix et al., 2018, McDonald et al., 2015, Pagiaslis and Krontalis, 2014, White and Simpson, 2013). The concept of environmental concerns is primarily an operational definition, and different studies have had different operational concepts. Dunlap and Van Liere (1978) developed the New Ecological Paradigm Model (NEP) scale, which is considered the earliest quantitative definition of environmental concern. To date, environmental concerns have been divided into two categories: environmental concerns over specific environmental issues (e.g.: attitudes towards waste disposal or water pollution), and comprehensive and pervasive environmental concerns (e.g., views on various ecological crises, problems, and attitudes towards the relationship between man and the environment). Previous research on environmental behavior has suggested an important link between environmental responsibility and environmental concerns. e.g., Sadachar et al. (2016) demonstrated that people with higher environmental responsibility are more concerned with environmental issues and advocate green products, as they believe that people are responsible for the rise of environmental problems. White and Simpson (2013) also suggested that individuals with a high sense of environmental responsibility tend to focus on environmental benefits and they tend to think that humans are closely related to the environment, especially when they are responsible for ecologically fragile environment, and will be more likely to solve environmental problems. From that, the authors propose the following hypotheses:

H11: Environmental concern has a positive effect on green purchase

2.6. Trust in eco-labels

For an eco-label to be effective in promoting consumer behavior for the environment, it needs to be incorporated into consumer decision making (Grunert, 2011). Therefore, consumers need to be informed of the label and trust its information (Grunert, 2011, Thøgersen et al., 2010). Such trust has been defined as an individual's expectation that another person, product or entity will keep promises and fulfill obligations (Perrini et al., 2010). Despite the importance of trust, some studies show that consumers are often skeptical about the reliability of environmental advertising claims (Eurobarometer, 2008, Peattie and Crane, 2005). This often acts as a barrier to consumers based on environmental claims. This lack of trust can also impede pro-environment consumer behavior (Atkinson and Rosenthal, 2014, Oates et al., 2008). The increasing number of environmental claims seems to have led to consumer confusion and limited their effectiveness in encouraging consumer behavior for the environment (Testa et al., 2015). Environmental attributes have high credit value but cannot be directly assessed by consumers (Atkinson and Rosenthal, 2014, Testa et al., 2015). As a result, consumer behavior for the environment is often based on consumer confidence in environmental claims, especially when there is no independent confirmation system in

place (Schoorman et al., 2007). Therefore, a higher degree of trust in eco-label (Testa et al., 2015) has a greater effect on pro-environmental consumer behavior.

H12: *Trust in eco-labels have a positive effect on green purchase*

Based on the findings of previous studies, the following research model

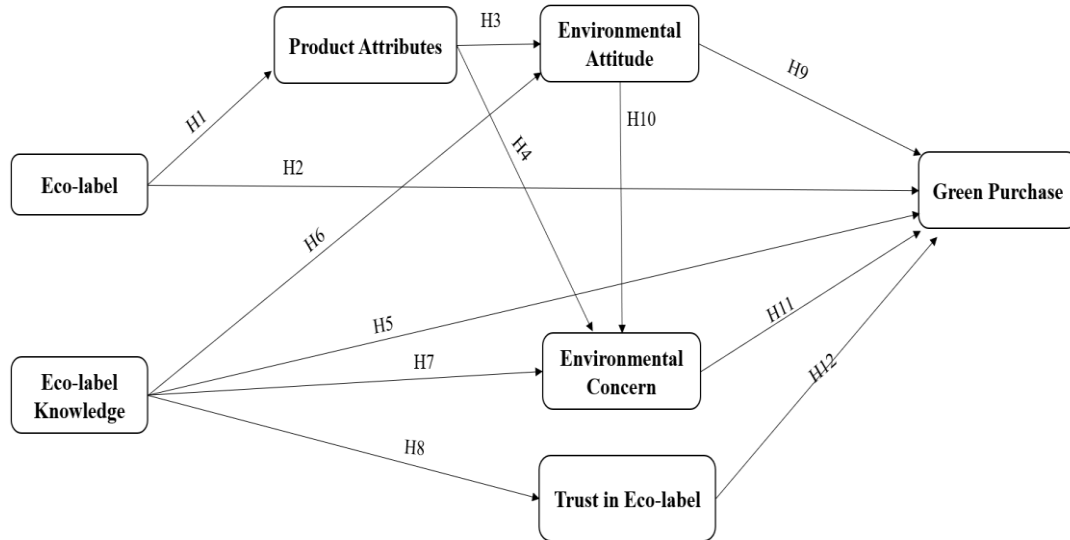

Figure 1. Proposed research model

3. Method

This study combines both qualitative and quantitative research to assess the influence of eco-labels on young people's green purchase behavior. Qualitative research is used to help discover the factors of eco-labels affecting young people's green purchase behavior, and to adjust the scales of each factor to suit the current consumption context in Vietnam. Quantitative research was carried out in two phases: preliminary and formal research; Both phases use survey method by questionnaire. Preliminary quantitative research was carried out to make a preliminary assessment of the reliability of the scales and to remove inappropriate observed variables. This helps the author team to adjust and build a more complete and reliable survey. After collecting the answer sheets and removing invalid ones, the authors conduct data analysis using a number of data analysis techniques such as: Cronbach's Alpha, EFA with the support of SPSS software version 20.0 and AMOS version 24.0, to evaluate the quality of the scale. In addition, the authors also used confirmatory factor analysis (CFA) to evaluate the reliability, convergence, and discriminability through two metrics: Composite Reliability (CR), and Average Variance Extracted (AVE). Analysis of the Structural Equation Model (SEM) to test the research hypotheses.

Measurement items in this study were modified from previous studies. Slight modification of the wording of the previous scales was done to fit the current research context. The measures were then tested according to the standard scale development guidelines (Nunnally and Bernstein, 1994). As this study was conducted in Vietnam, all the items were translated from English to Vietnamese and back to English to check their accuracy. When necessary, adjustments were made to the Vietnamese translation.

Five-point Likert scales, ranging from 1 “strongly disagree” to 5 “strongly agree” were used to measure the study variables. We employ Kyriakos et al. (2021) adjusted eco-label scale with four items to quantify eco-label. Similarly, the scale of eco-label knowledge is evaluated with the four items of Taufique et al. (2017). product attribute is measured by three adjusted items proposed by Song et al. (2019). environmental attitude is measured with three items developed by Ting et al. (2019), environmental concerns is measured with five items developed by Junior et al. (2014), and trust in eco-labels was measured by three items, respectively, developed by Taufique et al. (2017). Finally, green purchase is evaluated based on the study of Song et al. (2019) with 3 items.

After adjusting the survey, the authors conducted the official survey in online form nationwide from September 2021 to November 2021. The research mainly focuses on young people in all three regions of the Vietnam North, Central, and South. The research questionnaire consists of 24 observed variables used in factor analysis according to the principle of at least 1 in every 5 elements for 1 observed variable (Bentler and Chou, 1987). So, the initial sample count is $24 \times 5 = 120$ elements. But in order to increase the reliability of the research results, in this study the group intends to collect a sample with a size of 600 elements ($N=600$) and the obtained results are 510 elements (questionnaire). After screening and removing invalid votes, the authors use 499 valid votes to use in formal analytical processing. Sampling method is a convenient sampling method through online questionnaire submission. Of the respondents, 274 (54,9%) were female, 225 (45,1%) were male. The results are printed in Table 1.

Table 1. Respondent profiles

Characteristics		Frequency	Percentage
Gender	Male	225	45,1%
	Female	274	54,9%
Age	From 18 to 22	377	75,6%
	From 23 to 25	122	24,4%
Occupation	Student	339	67,9%
	Employment	139	27,9%
	Other	21	4,2%
Incom (VND)	Under 5 millions	300	60,1%
	From 5 to 10 millions	117	23,5%
	10 million and over	82	16,4%
Metropolitan area	North	240	48,1%
	Central	153	30,7%
	South	106	21,2%

Source: Own calculations

4. Results

4.1. Measurement model

In the preliminary quantitative research phase, the analysis results show that the concept of environmental concerns has a Cronbach's Alpha reliability coefficient of 0.872, according to the standards of Hoàng Trọng and Ngọc (2008). It can be said that the scale is very good. However, the results of EFA suggest removing the EC1 variable because of its high correlation with the variables in the concept column of attitude towards the environment. Therefore, based on the results, the authors removed the observed item EC1 and did not include it in the official research phase.

CFA was used to verify the scales' unidirectionality, reliability and validity after the initial descriptive analysis phases. The findings of the index scale test are all acceptable, and the scales are accepted. Based on the indexes, the CFA results indicate compatibility with the possible model: Chi-square/df = 2,405; GFI = 0,916; TLI = 0,951; CFI = 0,960; RMSEA = 0,053. Furthermore, all the standardised factor loadings for the scales are greater than 0.6 ($P < 0.001$) and the composite reliability (CR) of the seven scales is greater than 0.7, varying between 0.801 and 0.880. The convergent and discriminant validity of each scale was determined by calculating the Average Variance Extracted (AVE). All the AVE values are greater than or equal to 0.5 and they range from 0.573 to 0.674, indicating uni-dimensionality and convergent validity. To assess discriminant validity, the AVE for each scale was compared with the squared correlation between all pairs of variables. For each variable, the squared correlation was greater than the AVE, indicating acceptable discriminant validity. Additionally, Cronbach's alpha coefficients were calculated for each construct, and they ranged from 0.800 to 0.880. The results are printed in Table 2.

Table 2. Summary of the measurement model

No.	Scale	Items	Cronbach's Alpha coefficient	C.R	A.V.E	Encode
1	Eco-label	3	0,829	0,831	0,621	EL
2	Eco-label Knowledge	4	0,880	0,880	0,648	EK
3	Product Attributes	3	0,800	0,801	0,573	PA
4	Environmental Attitude	3	0,860	0,861	0,674	EA
5	Environmental Concern	4	0,851	0,858	0,603	EC
6	Trust in eco-label	3	0,817	0,817	0,598	TE
7	Green Purchase	3	0,810	0,810	0,587	GP

4.2. Structural model

SEM analysis is used to evaluate the proposed model and test the research hypotheses. Figure 2 shows the fit of the accepted model: Chi-square (499) = 695,954; Chi-square/df = 3,207; $P = 0,000$; RMR = 0,054; GFI = 0,888; TLI = 0,924; CFI = 0,934; RMSEA = 0,067 (Schumacker and Lomax, 2004).

Also from the SEM analysis, the hypothetical relationships were tested. Table 3 shows that 10 out of 12 hypotheses are accepted. First, eco-labels affect product attributes and green purchase ($H1: \beta = 0.655$, $p\text{-value} = 0.000$; $H2: \beta = 0.293$, $p\text{-value} = 0.001$).

The results show that the presence of eco-labels has a positive impact on people's perception of product attributes and plays a role in shaping young people's green purchase behavior. Previous studies cast doubt on the role of eco-labels in green purchase (Guyader et al., 2017, Khachatryan et al., 2017, Mei et al., 2012, Song et al., 2019). This evidence by a group of authors from young Vietnamese has confirmed its effectiveness once again.

In this study, although product attributes did not affect attitude towards the environment (H3: p -value = 0.235) but still significantly influenced environmental concerns (H4: $\beta = 0.49$, p -value = 0.000). This result is completely opposite to the results of previous studies (Song et al., 2019). This may be a new finding when researching for young Vietnamese in the purchase of green products. Clearly, product attributes still have an indirect impact on green purchase under the decisive factor being eco-labels.

Although the relationship between eco-labels knowledge and green purchase is still significant, it is a negative relationship, (H5: $\beta = -0.337$, p -value = 0.006), so hypothesis H5: "Eco-label Knowledge has a positive effect on green purchase" is rejected. This is consistent with the results of previous research by Khan et al. This may be because consumers are often sceptical about eco-label information when the sources are not perceived as credible. That is, when consumers believe eco-label information is 'greenwashing' ('disinformation disseminated by an organization to present an environmentally responsible public image'), they are deterred from undertaking corresponding green purchase behaviour (Taufique et al., 2017). In addition, Eco-label knowledge positively influence attitudes towards (H6: $\beta = 0.809$, p -value = 0.000), Environmental concern (H7: $\beta = 0.255$, p -value = 0.000) and trust in eco-labels (H8: $\beta = 0.671$, p -value = 0.000). This is consistent with relevant studies that have suggested on the impact of knowledge about eco-labels and green purchase, that they both have positive effects on environmental attitude, environmental concerns, and trust in eco-label (Hameed and Waris, 2018, Taufique et al., 2017, Mei et al., 2012).

In addition, attitude towards the environment has a positive and direct influence on green purchase (H9: $\beta = 0.268$, p -value = 0.000) and tends to indirectly affect green purchase through concern for the environment (Esmailpour and Elahe, 2017, Song et al., 2019). Indeed, the results of SEM analysis confirm the relationship of positive impact of attitude to environment on environmental concern (H10: $\beta = 0.297$, p -value = 0.000) and environmental concerns on green purchase (H9: $\beta = 0.459$, p -value = 0.000). Therefore, it can be said that the attitude and concern about the environment are both significant in shaping the purchasing behavior of the young generation (Paul et al., 2016, Hartmann and Apaolaza-Ibañez, 2012, Junior et al., 2014) under the decisive factor which is eco-label (Taufique et al., 2017, Song et al., 2019).

Finally, the hypothesis that the relationship between trust with eco-labels and green purchase is statistically significant (H12: $\beta = 0.298$, p -value = 0.000). Trust in eco-labels have a positive effect on green purchase. Therefore, trust with eco-labels plays an important role in determining the acceptance level of young people with green products (Hameed and Waris, 2018).

From the experimental analysis results, the group has clarified the relationships, the level of impact of the factors on each other and on green purchase behavior. This is the basis for the authors to make appropriate conclusions and recommendations to businesses for the Vietnamese market in section 5.

5. Discussion and Conclusion

After analyzing data from 499 observations filtered from the questionnaire, the research has shown statistically significant relationships, indicating factors that directly and indirectly affect green purchase behavior of young consumers. This study makes a number of theoretical contributions in the fields of eco-labeling, environmental awareness and green purchase, helping scholars gain insight into this relationship. First, this study has demonstrated the impact of eco-labels through mediating variables such as product attributes, environmental attitude, and environmental concern. Eco-label knowledge and how green purchase behavior is significantly affected through this process.

Eco-labels affect product attributes, an important intermediary factor promoting green purchase behavior of Vietnamese youth. This is because the influence of eco-label on green purchase behavior through intermediaries is still limited (Taufique et al., 2017, Teisl et al., 2002). The results of this study suggest that an important mediator is product attributes that contribute to the fact that eco-labels can be conveyed through the appeal of eco-friendly products.

Environmental issues, as one of the general predictors for understanding green purchase behavior of consumers, have been discussed and studied for a long time. However, its relationship and effectiveness are still controversial. The study examined environmental perceptions from all three main streams, namely environmental attitude, environmental concern, and product attributes. While environmental attitude may have more to do with an individual's perceived predisposition or consistent assessment of the environment. Environmental concerns can be more related to emotions and genuine concern for environmental issues. That may explain why product attributes can influence environmental concerns while not affecting environmental attitudes. This finding can contribute to a deeper understanding of environmental concerns and to better improve the effectiveness of environmental concerns in the current context.

However, one finding showed that knowledge of eco-labels negatively affects green purchase behavior. Previous studies have found that consumers have difficulty understanding what the eco-labels are communicating, often leading to confusion (Thøgersen et al., 2010). This may be because consumers are often skeptical about eco-label information when the sources are not verified and widely available, leading to not winning customers' trust to make a purchase decision. It is also an opportunity for businesses to grasp the weaknesses of eco-labels, and how to enhance the information reliability of eco-labels.

With the remaining hypotheses, the results also provide conclusions consistent with the original hypothesis proposed by the authors: Eco-label knowledge has a significant positive and indirect influence on green purchase behavior through environmental concern and trust in eco-label; trust in eco-label positively affects green purchase.

5.1. Implications

From the results of the study, the authors propose a number of recommendations to administrators to promote green purchase behavior of young people. Specifically, businesses play an important role in making communication strategies to attract and promote green purchase behavior of young people. Companies need to do more than just apply an eco-

symbol on their products – they also need to invest in increasing consumer Eco-label Knowledge attributes through enhancing awareness and concern of young people about the environment. Businesses can create community campaigns on the environment, policies to support and generate ideas about environmental protection, thereby helping young people become more aware and interested in the environment. This is also the motivation for them to increase their purchases of environmentally friendly products.

In addition, third-party proven eco-label can be an approach, as they have been shown to achieve a higher level of consumer confidence (Atkinson and Rosenthal, 2014, Erskine and Collins, 1997) than with business information. Third-party certification is considered an effective tool to increase competitiveness, so administrators should pay attention to this issue.

Furthermore, the results show that the inclusion of eco-label in the product design process is an effective way to improve the young generation's attitude and interest in the environment. Thus, in order to promote green purchase behavior, at the production stage, businesses can pay more attention to product attributes, put eco-labels on the packaging, especially design products in a way to impress customers. This helps customers apply more environmentally friendly technology in the production process and create environmentally friendly products.

5.2. Limitations and future research

Based on the evaluation of the research results, the authors found a number of theoretical and methodological limitations as follows: Firstly, the research scope (spatial scope) is wide, with limited research resources and a small number of answer sheets, so the research results may not have achieved high accuracy. Second, some of the observed variables have no influence which is likely to confound the model during the analysis of the results.

From the limitations of this study, with future studies, researchers can develop new research directions such as: supplementing some price factors affecting consumers' purchasing decisions (Fei Lee Weisstein, et al. 2014), or expanding research to compare the receptive attitude and green purchase behavior of Vietnamese young people with those all around the world. In addition, future studies may further exploit variables belonging to the psychology of consumer behavior to explore and examine more complex relationships (Kollmuss and Agyeman, 2002).

Abstract

The purpose of this paper is to explore the impact of seven dimensions of green supply chain management (GSCM) on the three dimensions of corporate sustainability: economic, environmental, and social performance. Green purchasing, green manufacturing, green distribution, green packaging, green marketing, and internal environmental management are the seven dimensions explored in this study. Based on the data collected from a sample of 239 medium and small firms operating in Vietnam, the study examines the impact of GSCM elements on sustainable performance using quantitative research methods. The result finds that GSCM practices have a positive impact on environmental performance. However, it seems that GSCM has not been as effective as expected in influencing social performance and economic performance.

Keywords: *Green Supply Chain Management (GSCM), Sustainable performance, Small and Medium Enterprises*

1. Introduction

The process of industrialization and modernization has accelerated in recent decades, resulting in negative environmental consequences such as greenhouse gas emissions, climate change, and resource depletion, among others. Vietnam is a developing country that is innovating its economy and achieving rapid growth. Apart from the good aspects, when tens of millions of tons of domestic garbage, industrial solid leftover, hundred thousand tons of hazardous substances, and plastic waste are released each year, this growth has numerous flaws. Companies that are seen as the source of environmental problems have had to review their production processes and supply chains as a result of pressure from the community and

governments. Along with the acceptance of company responsibility resulting from activities throughout the supply chain, green supply chain management (GSCM) has started to become prominent (Adriana, 2009). It is gaining traction as a new strategic approach for Vietnamese enterprises that has been extensively promoted in recent years (Ministry of Industry and Trade).

Since the supply chain revolution of the 1990s, the environmental management framework in companies has changed; sustainability goals have become the core of many organizations' vision, and companies have realized that integration of environmental management practices across all departments of organizations is necessary for the best outcome (Srivastava, 2007). Elkington (1998) proposed the need for a reasonable balance between three factors: environmental, social, and economic to achieve sustainability in the organization. Diabat and Govindan (2011) pointed out that GSCM may be a good way to balance environmental, economic, and social advantages. A lot of research on sustainability performance has emerged as sources to provide different views and perspectives on sustainability performance (Senzen và Cankaya, 2019; Green et al., 2012; Rao and Holt, 2005; Sarkis et al, 2011; Zhu và Sarkis, 2004; Laosirihongthong et al, 2013, Le Thi Tam, 2020,...). For example, the natural resource-based view (NRBV) sees environmental practices as a source of substantial gains for enterprises (Hart, 1995). Sustainable development requires a balance among three basic dimensions including the economy, environment, and society, but most previous researchers focused on economic the environmental performance (Zhu et al., 2008; Green et al., 2012; and De Giovanni & Vinzi, 2012). A few papers consider all aspects of sustainability (economic, environmental and social) simultaneously (Wang & Dai, 2017; Senzen và Cankaya, 2019, Le Thi Tam, 2019). Furthermore, the impact of GSCM practices on the social dimension has been discussed in the literature mainly concerning developed countries while this relationship in developing economies is still not much exploited (Laosirihongthong et al., 2013). In Vietnam, social responsibility has only received attention recently and there are very few studies on corporate social responsibility. This can be considered as a research direction that should be exploited more in the future to more objectively evaluate the effectiveness of GSCM practice in the period toward a sustainable development economy in Vietnam. In addition, the results from previous studies are inconsistent in affirming that GSCM helps to improve or weaken the sustainable performance of enterprises, making it difficult for enterprises to get clear answers about factors that can bring benefits, thereby making more correct decisions for the development of the business.

In the light of the aforementioned shortcomings, in this paper, we identified seven GSCM dimensions (green purchasing, green manufacturing, green distribution, green packaging, green marketing, internal educational and environmental management, and green design) and aimed to investigate the effects of these dimensions on economic, environmental and social performance. To achieve this goal, a survey was conducted on 239 medium and small firms operating in Vietnam.

This study applies Stakeholder Theory and Nature resource-based view perspective (NRBV) and takes medium and small firms operating in Vietnam as a case study. With

adjustments from previous empirical studies, some hypotheses are proposed the following research model:

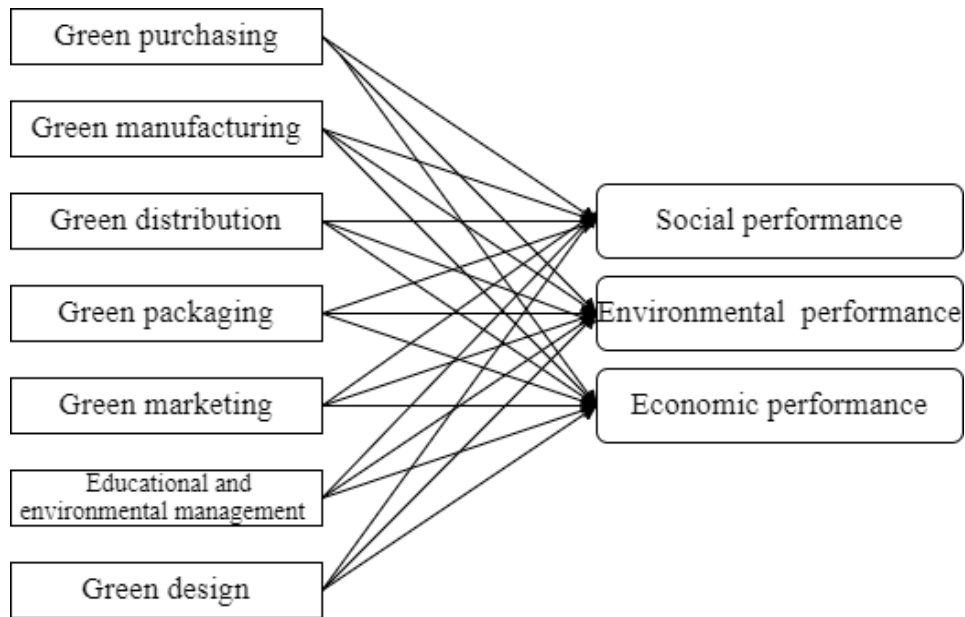

Figure 1. The research model

GSCM and economic performance. Businesses can gain direct economic benefits by reducing waste and energy costs. Moreover, businesses can derive economic benefits from more indirect ways by increasing corporate loyalty and reputation through green practices (Schmidt et al., 2017).

H1a. Green purchasing has a positive relationship with economic e performance

H1b. Green manufacturing has a positive relationship with economic performance

H1c. Green packaging has a positive relationship with economic performance

H1d. Green distribution has a positive relationship with economic performance

H1e. Green marketing has a positive relationship with economic performance

H1f. Educational and environmental management has a positive relationship with economic performance

H1g. Green design has a positive relationship with economic performance

GSCM and environmental performance. GSCM practices include effort to reduce the adverse impact of the company's products or services on the environment by reducing consumption of solid/liquid waste and hazardous substances, reducing environmental accident rates and improving public health (Eltayeb et al., 2011).

H2a. Green purchasing has a positive relationship with environmental performance

H2b. Green manufacturing has a positive relationship with environmental performance

H2c. Green packaging has a positive relationship with environmental performance

H2d. Green distribution has a positive relationship with environmental performance

H2e. Green marketing has a positive relationship with environmental performance

H2f. Environmental and educational management has a positive relationship with environmental performance

H2g. Green design has a positive relationship with environmental performance

GSCM and environmental performance. Practicing green supply chains enables corporations to have a more positive image in the eyes of stakeholders, society, customers, personnel and governments by reducing environmental damage. This positive image is important for both customer and employee satisfaction and loyalty (Hoffman, 2001).

H3a. Green purchasing has a positive relationship with social performance

H3b. Green manufacturing has a positive relationship with social performance

H3c. Green packaging has a positive relationship with social performance

H3d. Green distribution has a positive relationship with social performance

H3e. Green marketing has a positive relationship with social performance

H3f. Environmental and educational management has a positive relationship with social performance

H3g. Green design has a positive relationship with social performance

2. Method

The relationships between GSCM practices and corporate sustainability performance were tested using a survey. We consulted some of the head experts in the supply chain management field to limit the biases and add up more dimensions to the study. Based on references to previous studies, the author's team built a preliminary questionnaire. After that, the questionnaire was revised with the support of Assoc. Prof. Dr. Nguyen Xuan Hung and referenced from the survey form of Prof. Dr. Senzen. The purpose is to standardize terminology and create reliability for the questionnaire so that the respondents are guaranteed not to misunderstand the meaning of the question.

Table 1. Measurement items of the variables

Code	Construct	Items	Likert type scale	Source
MX	Green purchasing	4	5	Zhu et al (2008), De Giovanni & Vinzi (2012), Eltayeb et al (2016), Esfahbodi et al (2016), Vanalle et al (2017), Senzen and Cankaya (2019)
SXX	Green manufacturing	4	5	De Giovanni & Vinzi (2012), Hsu và cộng sự (2016), Luthra và cộng sự (2016), Wang & Dai (2017), Senzen và Cankaya (2019)
BBX	Green packaging	3	5	Hsu et al (2016), Senzen and Cankaya (2019)
PPX	Green distribution	4	5	Zhu et al (2008), Green et al (2012), Esfahbodi et al (2016), Laari (2016), Hamdy et al (2018), Choi and Hwang (2015), Vanalle et al (2017) Senzen and Cankaya (2019)

Code	Construct	Items	Likert type scale	Source
MKX	Green marketing	5	5	Shang et al (2010), Kung et al (2012), Luthra et al (2016), Senzen and Cankaya (2019)
GDQL	Environmental and educational management	6	5	Zhu and Sarkis (2004, 2006), Lee et al (2012), Green et al (2012), Kung et al (2012), Luthra et al (2016), Vanalle et al (2017), Senzen and Cankaya (2019)
TKX	Green design	4	5	Zhu and Sarkis (2004), Choi and Hwang (2014), Vanalle et al (2017), Hamdy et al (2018)
KT	Economic performance	5	5	Zhu et al. (2008), De Giovanni and Vinzi (2012), Green et al. (2012), Yang et al. (2013), Esfahbodi et al (2016), Laari (2016), Senzen and Cankaya (2019)
XH	Social performance	7	5	De Giovanni (2012), Wang and Dai (2017), Senzen and Cankaya (2019),
MT	Environmental performance	4	5	Zhu et al. (2008), De Giovanni and Vinzi (2012), Green et al. (2012), Yang et al. (2013), Esfahbodi et al (2016), Laari (2016), Senzen and Cankaya (2019), Hamdy et al (2018)

After completing the basic questionnaire, the variables were measured on a bipolar 5-point semantic differential Likert type scale where 1 = strongly disagree and 5 = strongly agree. Then we evaluated the scale's value by exploratory factor analysis (EFA).

To ensure the reliability of the collected information, this survey is only sent to senior officials in the enterprise. With this method, the research team filtered and collected 239 answer sheets. The period to send survey forms is from November 16, 2021, to March 15, 2022

EFA analysis was performed separately for the first time with 30 observed variables of green purchasing, green manufacturing, green distribution, green design, green packaging, green marketing, environmental and educational management, and the second time with 16 variables. Observation of economic performance, environmental performance, and social performance. After that, the research team will conduct a confirmatory factor analysis CFA and SEM model.

The research team coded and entered data from the official questionnaire in Excel, then entered the data and processed the data on IBM SPSS Statistics version 26 and AMOS version 24. Descriptive statistics are used to statistically analyze the characteristics of the sample, including Employee size, operating time, headquarters, and location of the business in the supply chain. Data from the remaining variables will be analyzed on SPSS 26 to test the reliability of the scale (Cronbach's Alpha), exploratory factor analysis (EFA), and then

will be analyzed for confirmatory factor CFA and network model. (SEM) to test the hypothesis and estimate the model on AMOS 24.

3. Results

3.1. Descriptive Statistic

Table 2. Demographic characteristics of the respondents (N=239)

Enterprise characteristics	Frequency	Percentage (%)
Operating time		
<5 year	48	20,1
5-10 year	79	33,1
10-15 year	63	26,4
15-20 year	29	12,1
>20 year	20	8,3
Total	239	100

Source: The survey results

Descriptive statistics show that:

The operating time of enterprises: Enterprises operating under 5 years accounted for 20.1%; Enterprises operating [5,10] years accounted for the majority of 33.1%; Enterprises operating from [10,15] years accounted for 26.4%; Enterprises operating from [15,20] years accounted for 12.1%; Enterprises operating for more than 20 years accounted for 8.3%.

The head office of the enterprise: Most of the enterprises have their head office in the North (with 74.1%); in the South account for 18.8% and in the Central region only 7.1%.

The position of enterprises in the supply chain: The enterprises that are the main manufacturers accounted for the majority of the research with 70.3%; Businesses that are tier-1 suppliers accounted for 20.1%; Businesses that are tier-2 suppliers accounted for 0.8%; Enterprises that are level 1 distributors account for 8.8%; There is no business as a tier 2 distributor.

Quality certificates of enterprises: Enterprises with ISO 9001 certificate accounted for 41.4%; Enterprises with iso 14001 certificates accounted for 38.4%; Enterprises with HACCP certificates accounted for 10.8%; Enterprises with ISO 22000 certificate accounted for 9.2%. Statistics show that most of the quality certificates that businesses own are ISO 9001 certificates for product quality management.

3.2. Cronbach's Alpha

Table 3. Exploratory measurement results

Factor	Variables	Cronbach's Alpha
Green purchasing	4	0,795
Green manufacturing	4	0,700
Green distribution	4	0,708
Green design	4	0,724
Green packaging	3	0,733
Green marketing	5	0,841
Environmental and educational management	6	0,806
Economic performance	5	0,809
Environmental performance	4	0,701
Social performance	7	0,857

Source: The survey results

The results of the reliability test (Cronbach's Alpha) show that the scales used in the study all have Cronbach's Alpha coefficient of the total variable greater than 0.7 and the correlation coefficient of the total variable greater than 0.3. Therefore, it can be concluded that the scale is reliable and continues to be used to analyze the next steps.

3.3. Exploratory factor analysis (EFA)

The research team used Principal axis factoring with Promax rotation to analyze into 2 groups: Group 1 includes independent variables and group 2 includes dependent variables. The analysis results show that the KMO coefficients of both groups are greater than 0.5 (specifically: group 1 is $0.888 > 0.5$ and group 2 is $0.892 > 0.5$), so EFA analysis of both groups is equal fit the data. In addition, the Sig value. In the Bartlett test of both groups, the scores were $0.000 < 0.005$, showing that the observed variables in each factor are correlated with each other. The total extracted variance of group 1 reached $58.329\% > 50\%$ and the total extracted variance of group 2 reached $50.008\% > 50\%$, showing that the EFA model is appropriate.

The results for group 1 show that 30/30 observed variables all have FL load coefficients greater than 0.4, extracted into 7 factors from 30 observed variables while the results for group 2 also show 16/ 16 observed variables all have loading coefficient FL greater than 0.4, extracted into 3 factors from 16 observed variables. The loading coefficients of these two groups are in the range of 0.418 to 0.909 and none of the observed variables falls into 2 or more factor groups, therefore, the observed variables are all suitable and included in the analysis of the next steps.

3.4. Confirmatory factor analysis (CFA) results

After analyzing CFA for the first time, the results obtained were that 2 factors MX4 and SXX2 had standardized regression weight (CFA) of 0.476 and 0.481, respectively. According to Hair et al. (2010), observed variables with a minimum standardized regression weight of 0.5 or more will be kept, ideally 0.7 or higher. Therefore, the authors removed these 2 observed variables and re-analyzed CFA to ensure a higher level of agreement with the factors.

With the factors obtained, the authors continued to analyze CFA with new observed variables. The results of this CFA analysis show that the critical model has a chi-square statistical value of 2,536.4 with 854 degrees of freedom. If the degree of freedom adjustment has $CMIN/df = 2.945 < 3$, the compatibility requirement is quite good. Other indicators such as $CFI = 0.907 > 0.9$; $RMSEA = 0.076 < 0.8$; $PCLOSE = 0.06 > 0.05$ shows that the compatibility with the collected data is quite good, although only $TLI = 0.866 < 0.9$, but in some cases, TLI greater than 0.8 is still acceptable. receive.

CFA loading coefficient of observed variables from 0.527 to 0.904. The CR reliability ranged from 0.706 to 0.859. The average extracted variance (AVE) from 0.522 to 0.691 are all greater than 50%, so it can be concluded that the scales have a convergent value. Along with that, the AVE coefficient of each scale is larger than the MSV coefficient and the SQRTAVE values are larger than all corresponding Inter - Construct Correlations values, so the scales reach discriminant values.

The CFA results show that the measurement model ensures reliability, convergent value, and discriminant value. This result is used to test the model and research hypotheses

3.5. Hypothesis testing

Table 4. Structural relationships among structural model components (SEM)

Hypothesis	Relationship	Estimate	P	Result
H1a	KT ← MX	.243	.013	Supported
H2a	MT ← MX	.411	***	Supported
H3a	XH ← MX	.356	***	Supported
H1b	KT ← SXX	.313	***	Supported
H2b	MT ← SXX	.355	***	Supported

Hypothesis	Relationship	Estimate	P	Result
H3b	XH ← SXX	.124	***	Supported
H1c	KT ← PPX	.162	.048	Supported
H2c	MT ← PPX	.292	***	Supported
H3c	XH ← PPX	.083	.099	Not supported
H1d	KT ← TKX	.407	***	Supported
H2d	MT ← TKX	.485	***	Supported
H3d	XH ← TKX	.476	***	Supported
H1e	KT ← BBX	.309	.203	Not supported
H2e	MT ← BBX	.624	***	Supported
H3e	XH ← BBX	.336	***	Supported
H1f	KT ← MKTX	.099	.064	Not supported
H2f	MT ← MKTX	.231	***	Supported
H3f	XH ← MKTX	.179	.027	Supported
H1g	KT ← GDQL	.292	***	Supported
H2g	MT ← GDQL	.477	***	Supported
H3g	XH ← GDQL	.217	***	Supported

Most of the normalized parameters are statistically significant ($P < 5\%$) and the hypothesis is accepted. However, there are 3 hypotheses that were rejected due to not having statistical significance ($P > 5\%$), namely $XH \leftarrow PPX$ ($P = .099 > 5\%$), $KT \leftarrow BBX$ ($P = .203 > 5\%$) and $KT \leftarrow MKTX$ ($P = .064 > 5\%$). The remaining hypotheses were accepted with statistical significance at $P < 5\%$. In which, Green Design Factor (TKX) has the strongest impact on economic efficiency (KT) with a coefficient γ of 0.407 (statistical significance level $P=0.000$). Green Packaging Factor (BBX) has the strongest impact on environmental performance (MT) with a coefficient γ of 0.624 (statistical significance level $P=0.000$). The Green Design Factor has the strongest impact on social performance with a coefficient of 0.476 (statistical significance level $P=0.000$)

4. Discussion and Conclusion

The study's findings suggest that GSCM practices have a positive impact on environmental performance. However, it seems that GSCM has not been as effective as expected in influencing social performance and economic performance.

4.1. GSCM practice and environmental performance

The results of our study show that all seven factors of GSCM are a positive impact on environmental performance. And it can be claimed that the improvement in the environmental performance of enterprises in Vietnam is mainly due to these factors. The dimension of green packaging (γ is 0.522) is the variable that affects environmental performance to the highest degree. Green packaging uses and packages products in an economical and environmentally friendly way, which reduces the negative environmental impact caused by packaging. On the other hand, the green distributive factor has the lowest correlation with environmental performance. Green distribution strives to minimize the environmental impacts caused by distribution. Green distribution contributes to improved environmental performance by reducing fuel consumption, optimizing distribution routes, and ensuring that containers are fully loaded (Kumar et al., 2015). However, the reality may be that because green distribution practices put a lot of pressure on technology costs, green distribution can effectively focus on transport businesses such as logistics businesses. GSCM practice and economic performance

4.2. GSCM practice and social performance

The results of our study show that five out of seven factors of GSCM are positively related to economic performance. These dimensions are green purchasing (γ is 0.243), green manufacturing (γ is 0.282), green design (γ is 0.393), green distribution (γ is 0.162), and environmental and educational management (γ is 0.273). Green manufacturing practices such as resource and energy saving, waste reduction and better treatment help businesses improving their environment, and since they are closely related to economic activity, they are quickly adopted by the company. For example, many businesses prefer recycled packages because those packages are cheaper than others. By practicing green manufacturing, businesses will be able to use resources and control the waste treatment process more effectively. This will allow businesses to reduce production costs and increase their economic efficiency.

Green design has the strongest correlation with economic performance. Because green design helps businesses proactively consider sustainability factors from the beginning, it will bring many benefits. For example, the design will dictate what materials are used. It also affects reuse, recycling, or disposal.

In the study, the relationship established between economic performance and environmental educational management was relatively low. environmental educational management affects the internal of the business, helping to improve employees' awareness of the environment. It is possible that the actual effectiveness of environmental management education will depend on the ability of each particular enterprise to adapt to the environment.

Another remarkable finding in the study was that there was no relationship between aspects of green packaging and business economics. The use of effective green packaging also comes with energy costs as well as costs and technical requirements to meet the requirements of creating green packaging to ensure quality is not easy.

Green Marketing activities increase the reputation and image of the business and lead to an increase in sales; thus, they influence the economy to do business positively. However, in this study, no relationship was observed between green marketing and economic performance. This may be because, as some authors suggest, green marketing practices can initially lead to additional costs for firms (Welling and Chavan, 2010; Jain and Kaur, 2004).

4.3. GSCM practice and social performance

Finally, our results show that six out of seven GSCM factors are positively related to social performance. These are green purchasing (γ 0.364), green manufacturing (γ 0.361), green packaging (γ 0.294), green marketing (γ 0.179), environmental management education (γ 0.236), and design green (γ is 0.446).

As can be seen, GSCM practices not only positively affect the environment and economic performance, but also the social performance of enterprises. Businesses that adopt and implement environmentally friendly production will be able to develop a better relationship with society through that friendliness. Green design gives customers green values while using resources in the most efficient and socially responsible manner.

The relationship between environmental management education and social performance is quite low (γ is 0.179). Employees, managers, and distribution channel partners need to be aware of the environmental issue along with the increase in environmental pollution. However, it may take some time for green strategies to reach the masses. Because environmental and educational management is not a practice we can observe results in a short time.

Our research results give another remarkable finding that the correlation between Green Marketing and social performance is the lowest among GSCM practices. In fact, green marketing is an important tool for a business to develop relationships with all its stakeholders. Possibly because of the importance and usefulness in communication, making this tool misused, advertising appears "fake" green products, confusing consumers when choosing products from businesses. through those marketing activities.

No relationship was observed between green distribution and social performance. Green distribution strives to minimize the environmental impacts caused by distribution. And centralized green distribution is effective for the environment and the economy.

EXPLORING STRATEGIC BEHAVIOUR IN CHOICE EXPERIMENTS: A CASE OF AIR QUALITY IMPROVEMENTS IN HANOI CITY, VIETNAM

Dr. Nguyen Cong Thanh

thanhnc@neu.edu.vn

*Department of Natural Resource - Environmental Economics and Management,
Faculty of Environmental, Climate Change and Urban Studies,
National Economics University, Vietnam*

Abstract

A choice experiment (CE) with approximately 1000 respondents was designed and conducted to estimate economic benefits associated with air quality improvements in Hanoi City, the capital of Vietnam. In this CE application, different scenarios of air quality improvements were described based on reduction in morbidity and mortality risk and increase in urban tree cover to elicit respondents' willingness-to-pay (WTP). Strategic behaviour that may cause biases in WTP estimates is a concern in the application of SP surveys. It has been recognised that some respondents will not state their true preferences when they believe that they might gain benefits from not doing so. To analyse respondents' strategic behaviour, two follow-up questions on the beliefs were used to detect respondents who could behave strategically. A finding of this analysis is that a dominant strategy of the strategic respondents is to understate their WTP for air quality improvements. This is consistent with Samuelson (1954)'s statement suggesting that people are more likely to pretend to have less interest in a public good with the expectation that others will pay enough to provide the good nevertheless.

Keywords: *stated-preference methods, choice experiments, strategic behaviour*

1. Introduction

Choice experiment (CE) is a stated preference (SP) method, which can be used to estimate willingness to pay (WTP) for non-market goods and services. The CE approach is based on the assumption that goods or services can be represented by its characteristics (or attributes). In a CE exercise, respondents are requested to make choice decisions over a series of choice tasks. Each choice task includes a number of mutually exclusive hypothetical alternatives between which respondents choose their preferred one. Alternatives are described by different levels of attributes or characteristics of the good or service that is being valued. In making trade-offs between the alternatives, respondents reveal their preferences for the levels of attributes. When the monetary cost or price of the good or service is included as an attribute and the levels of all attributes are designed to systematically vary across the experiment, researchers are able to estimate the values that respondents assign to the attribute levels.

Strategic behaviour that may cause biases in WTP estimates is a concern in the application of SP surveys (Milon, 1989; Throsby and Withers, 1986). It has been recognised that some respondents will not state their true preferences when they believe that they might enhance their utility or well-being by not doing so. Some respondents could have an incentive to understate their value for the goods in SP surveys to encourage the provision of the goods at a low price. In certain circumstances, some respondents believe that they will not be required to actually pay the amounts they state they would be willing to pay; and they may overstate the values to promote the provision of the goods. If many respondents behaving strategically act in a similar manner, the strategic responses will bias the estimated values (Boyle, 2003). In DCE surveys, a series of choice questions could provide opportunities for respondents to develop their strategic responses as they become more aware of the strategic opportunities after each choice task (strategic learning) (Scheufele and Bennett, 2012). Carson and Groves (2007) also point out that when facing a series of choice options offering the non-market good with different levels of price and qualities, respondents might not believe in the credibility of those options; therefore, they may try to answer strategically to manipulate the survey results to their advantage. If many respondents behaving strategically act in a similar manner, the strategic responses will bias the estimated values (Boyle, 2003).

In CE surveys, it is expected that the complexity of choice tasks with multi-attribute and multi-alternatives could make it difficult for respondents to form response strategies in order to strategically bias their answers. However, Carson and Groves (2011) argue that all respondents have to do is to act as if they are more (or less) price sensitive than they actually are when they believe that they would gain benefits from their responses. Using a case study in transportation, Lu et al. (2008) show that making choice tasks more complex (i.e. adding more attributes to the CE experiment) would not significantly reduce the strategic bias, but contributes to a higher error variance in the CE responses. They reason that respondents make more errors in the complex design, but respondents' valuation of the good or service that is being valued is not affected.

The concerns about strategic bias increase if the good under consideration is a public good (Day et al., 2012; Milon, 1989; Throsby and Withers, 1986). The key feature of a public good is that only one level can be provided to all people. Some respondents could attempt to choose an option that they think has a reasonable chance of “winning”, even when this excludes their most preferred option (Bennett and Blamey, 2001). By making choices in such a way, they respond strategically and do not reveal their true preferences.

Hanoi, a densely populated capital city of Vietnam, has a population of 8.05 million and covers an area of 3359 km² (GSO, 2019). Hanoi has experienced high level of air pollution. According to the National State of Environment Report on Air quality (MONRE, 2014), during the period 2010–2013, the proportion of days with Air Quality Index (AQI) at unhealthy levels of 101–200 ranged from 40% to 60% of total monitoring days. The air quality data (monitored by the United States Embassy in Hanoi) showed that the average annual concentration of PM_{2.5}, in the period of 2015 - 2019, was 54 µg/m³, much higher than both the Vietnamese standard (25µg/m³) and the WHO guideline limit (10µg/m³)

(AirNow, 2019). During many consecutive months in late 2019, Hanoi was among the most polluted capital cities globally (Van Khuc et al., 2020).

With the application of the CE approach, WTP for air quality improvements in Hanoi City was estimated. In this paper, the WTP results for air quality improvements are used to explore strategic behaviours. In this study of strategic behaviour, respondents are assigned to assumed non-strategic and strategic groups using their answers to two follow-up questions on their beliefs about the consequentiality of the survey and the payment obligation. Comparison between the two groups may show anomalies in the choice made by the strategic respondents. Mixed logit models are separately constructed for the non-strategic and strategic groups. Comparison of WTP values estimated from the models enables us to explore strategic behaviour in WTP for air quality improvements in Hanoi City, Vietnam.

2. Method

2.1. Overview of survey design and implementation

The CE survey for air quality improvements in Hanoi City was designed following state-of-the-art practices (Johnston et al., 2017), and based on residents' opinions collected from a number of small surveys. The survey design began with the search for the attributes of an air quality improvement program, which are the most significant for Hanoi residents' benefits. To learn about residents' desire for air quality improvements, two focus studies were conducted in the form of an internet survey with 191 respondents and 212 face-to-face interviews with Hanoi residents. These focus studies, in concert with an in-depth literature review, resulted in the attributes and levels, which are presented in Table 1. In our CE study, the economic benefits associated with air quality improvements were estimated by eliciting residents' WTP for reducing risk of hospitalization and death due to air pollution-related diseases, and for boosting urban tree cover.

Table 1. Attributes and levels

Attributes	Variables	Current levels	Improvement levels
Health risk related to air pollution: People who get hospitalised due to air pollution-related diseases People who die from air pollution-related diseases	Morbidity	Out of 100,000 people: 350 people	350; 250; 150 people
	Mortality	50 people	50; 35; 20 people
Urban tree cover area	Urban tree cover	8 m ² per capita	8; 13; 18 m ² per capita
Change to household electricity bill	Cost	No change	Increase of 15; 50; 85; 120 thousand VND/month = 180; 600; 1020; 1440 thousand VND/year

To estimate monetary values associated with the improved attributes, a cost attribute or payment vehicle is included in the choice tasks. Previous SP studies conducted in Vietnam have used the electricity bill as the payment vehicle, because this payment vehicle is coercive

and has good coverage (Do and Bennett, 2008; Nguyen et al., 2013). Monthly coercive payments through the electricity bill, therefore, were selected as the payment vehicle in our CE application.

Once the attributes were selected, their levels were determined based on a rigorous literature review and two pilot surveys. The baseline risk level of hospitalisation was estimated using exposure-response relationship between the air pollutant’s concentration variation and the percentage change in number of hospitalized cases, which derived from epidemiological studies in Vietnam (Phung et al., 2016). Information on the mortality risk attributed to air pollution in Vietnam was collected from the database of WHO (WHO, 2018a), and the annual mortality risk level used in this research was adjusted to the case of Hanoi using the annual mortality rate of Hanoi City. Information on morbidity/mortality annual rates was obtained from Health Statistics Yearbook of Vietnam (Ministry of Health, 2017). The levels of urban tree cover were identified from reports and plans of Hanoi authorities. All the attribute levels and the cost levels were piloted in two surveys, including an internet survey of 161 respondents and a face-to-face survey of 162 participants. The pilot surveys led to an upward adjustment of the cost levels.

Having attributes and levels determined, an orthogonal choice task design was used, resulting in six blocks of six choice tasks. A block of six choice tasks was randomly selected for presenting to each respondent with the aim of reducing the cognitive burden on respondents. For each choice task, respondents indicated their preference between two improvement alternatives described by different combinations of the levels of the selected attributes. An example of choice task is presented in Figure 1.

	Program A	Program B
<p>HEALTH RISK related to air pollution</p> <p>Out of 100,000 people: ■ 150 people get hospitalised (<i>200 fewer</i> cases than current situation) ■ 20 people die (<i>30 fewer</i> deaths than current situation)</p> <p>Out of 100,000 people: ■ People who get hospitalised due to air pollution-related diseases ■ People who die from air pollution-related diseases ■ Remaining population</p>	<p>Out of 100,000 people: 150 people get hospitalised (<i>200 fewer</i> cases than current situation) 20 people die (<i>30 fewer</i> deaths than current situation)</p> 	<p>Out of 100,000 people: 250 people get hospitalised (<i>100 fewer</i> cases than current situation) 20 people die (<i>30 fewer</i> deaths than current situation)</p> 
<p>URBAN TREE cover area</p>	<p>8 m² per capita (<i>0m² larger</i> than current situation)</p> 	<p>18 m² per capita (<i>10m² larger</i> than current situation)</p> 
<p>Change to household electricity bill, starting in 2020</p>	<p>Increase of 50 thousand VND/month (= 600 thousand VND/year)</p> 	<p>Increase of 120 thousand VND/month (= 1,440 thousand VND/year)</p> 

Figure 1. An example of a choice task

In June and July 2019, the main survey was administered in the form of face-to-face interviews with 1028 representatives of households living in different districts of Hanoi City, including Thanh Xuan, Hai Ba Trung, Hoang Mai, Cau Giay, Ba Dinh and Gia Lam districts. Interviews were conducted by undergraduate students from Hanoi National Economics University, who were carefully trained as enumerators. Households in the selected locations were randomly approached by enumerators, and a member who was over 18 years old was asked for his/her consent to represent the household to answer the questionnaire. The survey was completed by 1028 respondents.

Our main survey was implemented with real policy implications and monetary repercussions. The survey was implemented as a project of the Institute of Strategy and Policy on Natural Resources and Environment (ISPONRE), which is a unit of Ministry of Natural Resources and Environment (MONRE). Enumerators were accompanied by leaders of community, who helped to introduce the survey as an activity of ISPONRE. Detailed information on the survey objectives was presented to respondents using recommendation letters from ISPONRE. Given the governmental collaboration on the survey implementation, respondents were expected to believe that their responses to the survey would potentially influence policy makers' actions on improving air quality, and their "yes" responses would result in their payment in the future.

2.2. Assignment of respondents to non-strategic and strategic behaviour groups

Concerning the identification of strategic behaviour, Mitchell and Carson (1989) suggest that respondents' strategies in SP studies can be a function of two factors: (A) the respondents' expectations about the provision of the good or service under valuation and (B) the respondents' perceived payment obligation. The key distinction within (A) is whether or not respondents believe that the survey's results will potentially influence the related agency's decisions to provide the good. SP practitioners avoid (or should avoid) any hint that the good they are trying to value is certain to be provided; and it should be explained to respondents that the provision of the good would depend on the results of the survey (Mitchell and Carson, 1989). Carson and Groves (2007) indicate that given the amount of effort investigators expend on the survey, most respondents would believe that the provision of the good under consideration depends on their response to the survey.

In relation to perceived payment obligation (B), it is standard practice in the design of the DCE survey for more than one level of cost to be presented, and this could mean that respondents are uncertain about the amount that they have to pay (Carson and Groves, 2007). It would be difficult to convince respondents that they would have to pay exactly what they state in the hypothetical DCE survey. However, the idea that their payments may be in some way related to their stated WTP should be credible to respondents. Since respondents are uncertain about the amount of their payment, they are assumed to make decisions according to their expected amount of payment calculated using a set of perceived probabilities associated with each of the various cost levels presented in the DCE survey. The difference in the respondents' perceived probabilities would represent the difference in their belief and other factors as risk averseness. The interpretation of respondents' belief in the payment

obligation, therefore, will correspond to their perceived probabilities. The distinction within (B) is whether or not respondents believe that they will actually have to pay for the good at a level of payment determined using the WTP amounts they choose in the DCE survey. If a respondent believes in the payment obligation enforced by the agency, the respondent appears to believe that there is no chance he/she will not have to pay for the provision of the good; in other words, the perceived probability associated with the zero-cost level in the calculation of his/her expected payment would be zero. If a respondent does not believe in the payment obligation, the respondent would perceive that there is a positive probability he/she will have to pay nothing even though his/her stated WTP is non-zero; hence, the perceived probability of the zero-cost level in his/her expected payment calculation would be a positive value with possible highest value of 100%.

To examine strategic behaviour in our survey, respondents were assigned to one of two groups of non-strategic and strategic respondents according to their possibly strategic behaviour. The possible anomalies in WTP of the strategic respondents are examined based on a comparison with WTP of the non-strategic respondents. This assignment was undertaken on the basis of respondents' answers to two follow-up questions:

(1) "How likely do you think it is that the results of this survey will affect the Government's decisions about improving early warning service for tropical cyclones?". Respondents could select one of five options: (1) No effect at all, (2) Very low, (3) Low, (4) High, (5) Very high (Definite effects). Carson and Groves (2007) distinguish between inconsequential surveys (where respondents believe that there is a zero percent chance the survey results will influence the agency's decisions) and consequential surveys (where respondents perceive their responses will influence the agency's decisions up to some non-zero probability). We assumed that respondents who did not select the option "(1) No effect at all" believed that their choices will influence policy makers' decisions about implementation of improvements in cyclone warning services up to some non-zero level of probability.

(2) Respondents with non-zero bids were also requested to answer a follow-up question on their perceived payment obligation: "I voted for the program but I do not think that I will actually have to pay the fee". There were three options for respondents to choose: (1) Agree, (2) Maybe, (3) Disagree. When compared with the respondents answering 'Agree', the respondents who chose 'Maybe' could be less certain about their chance of having to pay nothing for improvements in the future. Both groups of respondents, however, would perceive that at *a positive probability* they would have to pay nothing even though they had non-zero bids. Therefore, we assume that respondents with the answer of 'Agree' and 'Maybe' belong to the same group of respondents who did not believe the payment obligation up to some non-zero level of probability.

Based on the two follow-up questions, it is assumed that the non-strategic subsample includes respondents, who (i) believed that the survey was policy consequential (hence, did not choose the option "(1) No effect at all"), and (ii) believed that there was *no chance* they would have to pay nothing for improvements in cyclone warning services if they had at least one non-zero bid. Respondents, who (i) believed that the survey was policy consequential

(hence, did not choose the option “(1) No effect at all”), and (ii) did not believe the payment obligation, could behave strategically.

2.3. Estimation of willingness-to-pay

Estimation of WTP in our CE exercise is based on the application of mixed logit (ML) models (Hensher and Greene, 2003; Train, 2009). In a ML model, the utility (U_{ikt}) associated with each alternative k , as evaluated by each individual i in choice task t , can be approximated by a linear function form as follows:

$$U_{ikt} = \alpha_{ik} + \beta_i'X_{ikt} + \varepsilon_{ikt}$$

where α_{ik} is the coefficient on an alternative specific constant (ASC) representing utility associated with moving away from the status quo option, β_i is the vector of taste parameters, X_{ikt} is the vector of independent variables that are observed by the researcher, and ε_{ikt} is the stochastic unobserved component. In each choice task, respondents are assumed to choose an option that yields a better utility. The choice data from our CE survey are analysed using *NLOGIT 5.0*.

To examine strategic behaviour in our CE survey, ML models are constructed separately for the non-strategic and strategic groups. The comparison between WTP estimated for the two group of respondents may show anomalies in the choice made by the strategic respondents. The ML models, in which the coefficients on the attribute variables, except for the cost attribute, are specified as random parameters with normal distribution, are estimated with 1000 Halton draws. The ML models also allow free correlation among the random parameters.

3. Results

Effects of strategic behaviour on willingness-to-pay estimates

When examining WTP estimates of strategic respondents, another interesting question is whether strategic respondents over- or understate their WTP. The requirement for surveys to be seen as consequential might create incentive for respondents to strategically misrepresent their preferences (Meginnis et al., 2018). Respondents who are likely to answer strategically are those who (i) believe the survey is influential in deciding to provide the good that they care about, or policy consequentiality; (ii) but do not believe in the payment obligation enforced by the agency. If a respondent perceiving the survey to be consequential believes that he/she will not have to pay, then the respondent will have an incentive to strategically indicate a higher WTP amount assuming that payment for the good will not be enforced. This is a type of strategic overbidding found in previous studies. Posavac (1998) and Lunander (1998) provide examples in which respondents, who believe that the payment level is zero (i.e. paid by the related agency) or only a small amount of money, report higher WTP than do respondents who expect that they would be personally responsible for paying for the good they care about. If a respondent believes that the likelihood of paying nothing is a positive probability, the zero-cost level will be included in his/her expected payment calculation, resulting a lower value of expected payment. If everything else held constant, this would increase incentive for the respondent to strategically overstate the WTP amount, with the aim of exerting more influence on the provision of the good but only being exposed to a lower value of expected payment.

However, the direction of strategic motivation is not always overbidding when respondents believe that the survey is policy consequential, but do not believe in the payment obligation. Mitchell and Carson (1989) suggest that if respondents are uncertain about their payment, the direction of strategic behaviour would take depends on the comparison between their expected payment and true WTP value. If the respondent's expected payment is perceived to be less than his/her true value, he/she will tend to overbid; if his/her expected payment is calculated to be larger than the true value, he/she will tend to underbid or free ride. In our DCE experiment, the respondents' uncertainty about their payment would create incentives to behave strategically in both directions of overbidding and underbidding. And if respondents do not believe in the payment obligation, they may more frequently use the strategy of underbidding. If respondents believe that there is a positive probability of paying nothing, the addition of zero-cost level to their expected payment formulation will make the calculation more complex, leading to higher uncertainty about payment obligation. In the case of the provision of public good with a coercive payment mechanism where the status quo choice set will still be available but where respondents must commit ex ante to paying the uncertain cost, the commitment to uncertain payment is never preferred by risk adverse respondents; hence, some respondents would be expected to shift from "yes" to "no" responses (Carson and Groves, 2007). In laboratory choice experiments, Collins and Vossler (2009) find that respondents seem to move toward the status-quo option, as the preferences of others are unknown and this option is offered at zero cost. If respondents do not believe in the payment obligation, their shift toward the status-quo option, which is usually the second-best alternative in each choice set, can be considered as the strategic act of underbidding.

The CE surveys for this research identified whether respondents had own experience of respiratory illness or not. To gain a better understanding of whether WTP estimates for the strategic respondents are over-or underestimates, WTP estimates are compared between the non-strategic and strategic subsamples in each of the two groups of respondents (Table 2).

In relation to the total WTP estimates with the pooled data from the two groups reported in Table 2, the resampling tests indicate that the strategic respondents understated their WTP for both of the minimum and maximum improvement programs. The evidence of underbid also can be found in the total WTP estimates for each group of respondents with and without own sick experiences. This is consistent with the Samuelson (1954)'s statement. A dominant strategy of strategic respondents with selfish interest is to be willing to pay less than their true value of a public good in the expectation that others will nevertheless pay enough to provide the good.

With regards to the WTP estimates for the attributes, the negative sign indicates the WTP values for morbidity reduction and increase in urban tree cover area are underbid by the strategic respondents. Again the dominant strategy of underbidding suggested by Samuelson (1954) could be an explanation for the strategic behaviour related to these two attributes.

4. Conclusion

Ambient air pollution is a leading cause of excess mortality and loss of life expectancy (Lelieveld et al., 2020). In general, ambient air pollution is closely associated with urbanization (Wang and Zhang, 2009). This means that the urban dwellers are likely to be the primary group affected by air pollution. According to World Health Organization (WHO), more than 80% of people living in urban areas are subjected to air quality levels not satisfying the WHO guideline limits (Sofia et al., 2020). The estimates of air pollution-related deaths provided by WHO show that low- and middle-income countries in the WHO Western Pacific and South-East Asia regions experience the highest burden (WHO, 2018b).

The CE survey with about 1000 respondents was designed and conducted to estimate the WTP for improvements in public health and urban tree cover relating to air quality management in Hanoi City, Vietnam. The analysis of strategic behaviour in this study focused on the strategic behaviour of respondents who believe that their responses potentially influence the provision of the good, but do not believe that they will actually have to pay for the good even if their stated WTP is non-zero. In this survey, two follow-up questions on the beliefs were used to detect respondents who could behave strategically. A finding of this analysis is that a dominant strategy of the strategic respondents is to understate their WTP for air quality improvements. This is consistent with Samuelson (1954)'s statement suggesting that people are more likely to pretend to have less interest in a public good with the expectation that others will pay enough to provide the good nevertheless.

Table 2. WTP estimates (in 1000VND) by strategic and non-strategic subsamples in two groups of respondents with and without sick experiences

	Pooled data from the two groups			With own sick experiences			Without own sick experiences		
	Strategic subsample	Non-strategic subsample	Resampling test ^b	Strategic subsample	Non-strategic subsample	Resampling test	Strategic subsample	Non-strategic subsample	Resampling test

Morbidity reduction	0.167*** (0.020)	0.254*** (0.031)	– 0.009***	0.203*** (0.040)	0.306*** (0.070)	– 0.092*	0.158*** (0.023)	0.236*** (0.034)	– 0.036**
Mortality reduction	1.273*** (0.157)	1.451*** (0.239)	– 0.255	0.938*** (0.276)	1.693*** (0.562)	– 0.106	1.353*** (0.188)	1.406*** (0.277)	– 0.419
Urban tree cover area	3.768*** (0.420)	4.818*** (0.633)	– 0.077*	4.664*** (0.919)	5.332*** (1.320)	– 0.332	3.488*** (0.476)	4.684*** (0.734)	– 0.077*

***, **, * = Significance at 1%, 5%, 10% level; Standard errors are in parentheses, and are based on the Krinsky–Robb simulation using 1000 draws; ^aResampling tests (Poe et al., 2005) were used to test the null hypothesis of whether the WTP estimates from the strategic subsample are equal to the equivalent values estimated from the non-strategic subsample. The negative sign indicates that the WTP estimates from the strategic subsample are relatively lower. P-values of the resampling tests are used to confirm the statistical significance of the negative sign.

MEASURING THE EFFICIENCY OF IRRIGATION SYSTEMS USING DATA ENVELOPMENT ANALYSIS METHOD: THE CASE OF BAC HUNG HAI

Dr. Le Thanh Phuong

phuonglt_kt@tlu.edu.vn

Faculty of Economics and Management, Thuy Loi University, Hanoi, Vietnam

Abstract

The efficiency of the Bac Hung Hai irrigation system is measured using Data Envelopment Analysis. Bac Hung Hai region can be divided in to ten sub-areas based on the design and structure of the system. The results show the relatively high level of technical and scale efficiency of the Bac Hung Hai irrigation system. Besides, the difference in efficiency level between sub-areas is due to the impact of industrialization and urbanization. Accordingly, the less impacted sub-areas are more efficient.

Keywords: *Bac Hung Hai region, Irrigation system, Efficiency*

1. Introduction

Water has become an increasingly important resource and input of economies or agricultural systems. The consumption of food is increasing substantially due to the growth of the global population and the rise in average per capital income (Bjornlund and Pittock, 2017; Irmak et al., 2011). Besides, trends toward more water-intense lifestyles and diets also intensify the demand for water and food. While water resources are the important driver of econo-socio development in many regions, the world faces the challenges of future supply of water. According to Schneider et al. (2011), these challenges include: limited technical progress in agriculture, limited land expansion and soil degradation, environmental and human health regulations, continued growth in domestic and industrial sector water consumption, and climate change which is likely to change the productivity and agricultural systems and the allocation of water supply.

As water scarcity increases, inefficient allocation of water causes higher costs to society. Missing property rights and inadequate water pricing are major causes of such inefficiencies. Preventing these externalities from growing out of proportion is therefore in societies' best interest. However, national and international policymakers need scientific guidance to adequately regulate water use. In particular, appropriate assessments of agricultural water use need to consider (1) the heterogeneity of natural and farming conditions, (2) international commodity markets especially for agricultural products, (3) agricultural and land use related environmental policies, and (4) synergies and trade-offs between different land use related externalities (Mattison and Norris, 2005; Vanlauwe et al., 2019).

Vietnam has a dense river system, with relatively abundant surface water resources, but because it is a country located at the end of large rivers, flowing through many countries, Vietnam has disadvantages (Hoang et al., 2018). The amount of surface water depends

greatly on exogenous water sources. When the upstream countries build dams and block the flow, it immediately affects the livelihoods of millions of Vietnamese people. Vietnam's surface water is highly dependent on exogenous water sources. Every year, cross-border rivers and streams transfer about 520 billion cubic meters of water into our country, accounting for about 63% of Vietnam's total surface water (Hung et al., 2021). The endogenous water source of Vietnam is only 4,200m³/person/year, lower than the Southeast Asian average of 4,900m³/person/year. Specifically, water sources from the upstream countries of the Mekong River Basin accounted for 90.1%, the Red River accounted for 38.5%, the Ca River accounted for 18.4% and the Ma River accounted for 27.1% of the total water volume. flows in these rivers.

Climate changes bring about additional challenges to water supply and allocation in Vietnam (Ho et al., 2022). Natural disasters such as huge tropical storms, large flooding and salinity in coastal areas can threaten the water resources.

Irrigation systems play essential roles in agricultural practice for food, pasture and fibre production via directing water from the source of supply, such as a reservoir or a river, into the irrigated fields (Qadir et al., 2007). These systems include a number of departments, such as intake structure, pumping station, conveyance and distribution system, and drainage system removing the excess water (caused by rainfall and/or irrigation) from the fields. The operation and efficiency of irrigation systems can determine the water use efficiency in agriculture in particular and agricultural production in general (Van Halsema and Vincent, 2012).

Increasing levels of irrigation will raise the cost of water and in some regions this may have severe consequences (Sauer et al., 2010). As water scarcity increases, inefficient allocation of water causes higher costs to society. Missing property rights and inadequate water pricing are major causes of such inefficiencies. Preventing these externalities from growing out of proportion is therefore in societies' best interest. However, national and international policymakers need scientific guidance to adequately regulate water use. In particular, appropriate assessments of agricultural water use need to consider (1) the heterogeneity of natural and farming conditions, (2) international commodity markets especially for agricultural products, (3) agricultural and land use related environmental policies, and (4) synergies and trade-offs between different land use related externalities (Altieri and Nicholls, 2017; Angus et al., 2009).

Even though the roles of irrigation systems have been mentioned in the literature but their efficiency in agricultural production has not been adequately investigated. In this study, we measure the efficiency of a specific irrigation system and its contribution to agricultural production.

In this paper, the data of Bac Hung Hai irrigation system in the Red river delta and its effective irrigation region is utilised. The method of Data Envelopment Analysis (DEA) is to measure the efficiency of this irrigation system with the number of irrigative structures proxied for the contribution of the system. The results show that the level of technical efficiency is high, while the scale effect has been achievable by the operators.

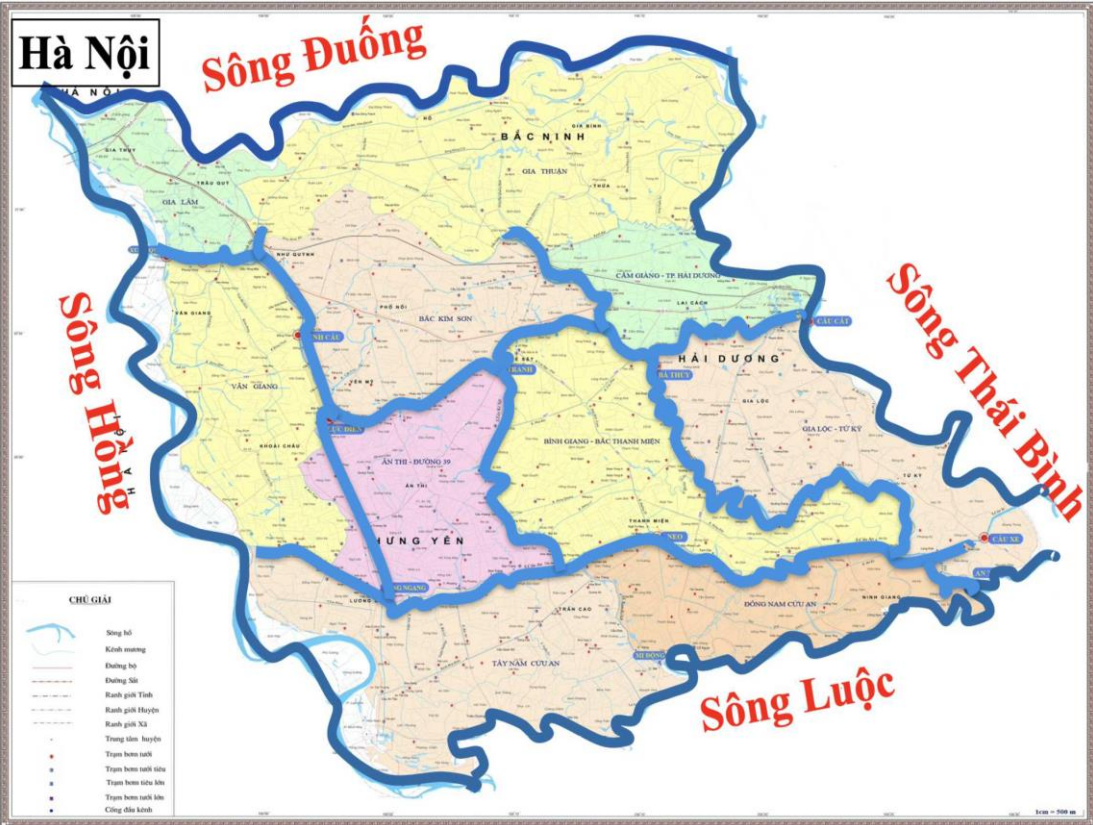

The structure of this study is organised as below. The next section is an overview of Bac Hung Hai irrigation system. The Section 3 of methodology provides the theoretical

framework of measuring efficiency using DEA method. The data and results providing an empirical analysis of the efficiency in Bac Hung Hai irrigated system and its sources of change are presented in Section 4 and Section 5, respectively. Lastly, Section 6 provides several important concluding remarks and open discussions.

2. Overview of Bac Hung Hai Irrigation System

Bac Hung Hai Irrigation System (BHHIR) is a system of canals, dams, pumping stations, and dikes to serve the irrigation and drainage of a quadrangle area bounded by the Red River in the West (57 km) and the Duong River in the North (67 km), Thai Binh River in the East (73 km), and Luoc River in the South (72 km). Construction of the system started at the end of 1958 and finished in May 1959. The total length of the main canal system is 200 km (Grignard et al., 2020)

The area is 214.932 ha with 86% of this area inside dykes. The system plays an important role in the development of local economies when providing irrigation to 110.000 ha of rice, crop and free lands, bringing water for livestock, poultry and aquaculture (12.000 ha), and providing water for daily lives of more than three million residents and hundreds of industrial zones (4.300 ha), controlling floods I the dyke area. (Grignard et al., 2020)

Adopted from Grignard et al. (2020)

Figure 1. Map of Bac Hung Hai irrigation system

Based on the design of the BHH system, the whole are can be divided into 10 sub-areas including Gia Lam, Gia Thuan, Chau Giang, Bac Kim Son, Kim Thi, Tay Nam Cuc An, Cam Giang – Hai Duong city, Tu Loc, Binh Giang – Bac Thanh Mien, Dong Nam Cuc An. These sub-areas belong to four provinces including Ha Noi, Bac Ninh, Hung Yen and Hai Duong.

3. Method

Charnes et al. (1978) developed the so-called Data Envelopment Analysis (DEA) method to measure the technical efficiency of firms. This method uses a linear programming technique to maximise a ratio of the weighted average output index to a weighted average input index for each firm with constraints which bound the same ratios of all firms to not exceed unity. They assume that all firms operate at optimal size and the technology has constant returns to scale. However, there are market limitations, such as imperfect competition and government regulations on the operation of firms, that inhibit them from achieving optimal size. Thus, the assumption of constant returns to scale seems to be inappropriate in many circumstances. Banker et al. (1984) proposes an alternative assumption of variable returns to scale by adding a convexity constraint. Under the latter assumption the overall efficiency of firms can be established by two components. The first is pure technical efficiency component reflecting the ability of managers to utilise the firm's resources at a given scale, while the second efficiency component (so-called scale efficiency) measures the gap between the firm's temporary scale and the optimal scale.

Under the assumption of variable to scale, the DEA output-oriented estimator can be written in terms of the linear program as:

$$\hat{\delta}vrs = \delta(x, y \in \hat{\phi}) = \max\{\delta > 0; \sum_{k=1}^n z_k y_k^i \geq \delta y^i, i = 1, \dots, q; \sum_{k=1}^n z_k x_k^j \leq x^j, j = 1, \dots, p; \sum_{k=1}^n z_k = 1, z_k \geq 0\} \quad (3.1)$$

Under the assumption of constant to scale, the DEA output-oriented estimator can be written in terms of the linear program as:

$$\hat{\delta}crs = \delta(x, y \in \hat{\phi}) = \max\{\delta > 0; \sum_{k=1}^n z_k y_k^i \geq \delta y^i, i = 1, \dots, q; \sum_{k=1}^n z_k x_k^j \leq x^j, j = 1, \dots, p; \sum_{k=1}^n z_k \geq 0\} \quad (3.2)$$

Equations (3.1) and (3.2) can be used to estimate the technical efficiency scores of irrigation systems. The scale efficiency can be identified as the ratio between $\hat{\delta}crs$ and $\hat{\delta}vrs$ as below:

$$\hat{\delta}scale = \hat{\delta}vrs / \hat{\delta}crs \quad (3.3)$$

Data

To estimate the efficiency of irrigation systems, the data of inputs and outputs should be identified. In this paper, water resource is one of inputs of agricultural production and can be proxied by the total irrigation structures including weirs, culverts, bridges, pumping stations. Besides, two other important inputs are labourers who are working in agricultural section and land that is used for agricultural production. Due to the fact that most of agricultural land in Bac Hung Hai region is to grow grain, so that the grain productivity is utilised as the single output of this research's models.

The detail of input and output data can be seen in the Table 1. In which, Binh Giang – Northern Thanh Mien is the sub-area that owns the largest number of irrigation structures. In contrast, Gia Lam is the area having the least. While Cam Giang – Hai Duong city sub-area achieves the highest grain output at 244,927,052 kg, Tay Nam Cuu An has the output equal to one fifth of the former. There is no substantial difference between sub-areas in terms of agricultural labour size.

Table 1. Input and output data of Bac Hung Hai irrigation system

No	Old District	No. of irrigation structures	Irrigated area (km ²)	Labourer size in irrigated area (in person)	Grain output in irrigated area (total in kg)
1	Gia Lam	10	175.19	470,857	59,648,165
2	Gia Thuan	23	331.30	396,253	114,758,831
3	Chau Giang	29	276.68	431,196	133,869,110
4	Bac Kim Son	28	247.01	410,520	127,450,039
5	Kim Thi	25	233.30	253,491	78,698,816
6	Tay Nam Cuu An	40	173.23	173,883	53,983,716
7	Cam Giang - Hai Duong city	14	220.59	667,049	244,927,052
8	Tu Loc	42	265.02	268,211	98,481,715
9	Binh Giang - Northern Thanh Mien	52	186.65	268,470	98,576,796
10	Dong Nam Cuu An	22	175.77	250,627	92,025,240

4. Results

Table 2 provides results on technical efficiency of Bac Hung Hai irrigation system using both variable and constant return to scale and under output orientation. In detail, if the assumption of variable return to scale is utilised, the average technical efficiency score is 1.0816, meaning that the level of efficiency is about 92% ($1/1.0816$) when compared to the best practice level (100%). Alternatively, if the system is operated under the constant return to scale assumption, the efficiency score is 1.2897 or at the 78% efficiency level. The average scale efficiency level is 0.9191 (or 91.91%) and is close to the optimal size at which the system achieves 100% level of scale efficiency.

An interesting finding is that the sub-areas locating closely to Hanoi city have a lower level of technical efficiency, including Gia Lam, Gia Thuan, Chau Giang, Bac Kim Son, Kim Thi, and Tay Nam Cuu An. The reason behind this fact is that these sub-areas are being industrialised and urbanised quickly, hence more land and labour resources are located to industries and service sector rather than agriculture. While the system of irrigation in the mentioned sub-areas has not narrowed proportionally according to the reduction of agricultural production.

The impact of industrialisation and urbanisation can be clearly seen in some cases. For example, Gia Lam, a district of Hanoi city, is the sub-area suffering the least scale efficiency at 0.3450. The agricultural production contributes only 8% of this district's Gross Domestic Product value as a result of industrialising and urbanising processes. More labourers have been moved to and more land has been used for industries and services. However, the irrigation structures have been kept despite their very low efficiency level.

In a contrary, sub-areas located in agricultural provinces including Cam Giang – Hai Duong city, Tu Loc, Binh Giang - Northern Thanh Mien and Dong Nam Cuu An are technically efficient. Using both variable- and constant-return to scale, these sub-areas are all best-practice (technical efficiency score is equal to one) and locate on the production frontier. This issue can be explained by the reality that the main focus of these sub-areas is on agricultural activities, so that irrigation systems are carefully considered by the local governments on the one side. On the other side, the impact of industrialisation is trivial when there is no substantial shift of labour and land resources from agricultural sector to industrial and service sectors. Moreover, the scale efficiency level of these sub-areas are all 100% demonstrating the optimal size of agricultural production.

Table 2. Technical efficiency and scale efficiency of Bac Hung Hai irrigation system in different sub-areas

No	Sub-area	Tech.Eff (Output-oriented, VRS)	Tech.Eff (Output-oriented, CRS)	Scale eff.
1	Gia Lam	1.0000	2.8985	0.3450
2	Gia Thuan	1.2678	1.2678	1.0000
3	Chau Giang	1.1827	1.1827	1.0000
4	Bac Kim Son	1.1827	1.1827	1.0000

No	Sub-area	Tech.Eff (Output-oriented, VRS)	Tech.Eff (Output-oriented, CRS)	Scale eff.
5	Kim Thi	1.1827	1.1827	1.0000
6	Tay Nam Cuu An	1.0000	1.1827	0.8455
7	Cam Giannng - Hai Duong city	1.0000	1.0000	1.0000
8	Tu Loc	1.0000	1.0000	1.0000
9	Binh Giang - Northern Thanh Mien	1.0000	1.0000	1.0000
10	Dong Nam Cuu An	1.0000	1.0000	1.0000
	Average	1.0816	1.2897	0.9191

Notes: Tech.Eff is technical efficiency; VRS is variant return to scale; CRS is constant return to scale

5. Discussion and Conclusion

In this study, the efficiency of Bac Hung Hai irrigation system is measured based on the Data Envelopment Analysis. The Bac Hung Hai system can be divided into ten sub-areas and can be seen as independent decision making units which can adjust the water resources to flow in or out of the cultivated land. Three inputs are employed including the irrigation structures, labourers in agriculture and cultivated land while the only output is grain output.

The results show that Bac Hung Hai irrigation system is operating at a relative high level of efficiency. The sub-areas located near Hanoi city is less efficient due to the impact of industrialisation and urbanisation while those in the agricultural provinces are more efficient and better in terms of exploiting their irrigation systems. And based on these findings, this research suggests that the size of irrigation systems in different sub-areas should be subject to adjust in accordance with the contribution of agriculture sector to the local economy. In detail, in sub-areas where the impact of industrialisation and urbanisation is substantial, the size of irrigation system should be reduced. In contrast, irrigation system should be enhanced and consolidated in sub-areas where agricultural production is their focus and contributes largely to the local economies.

Abstract

This paper is an attempt to empirically examine the influences of financial development (FD) on the trade in green goods (TGG). By applying diverse econometric techniques to a global sample of 85 developing and 34 developed countries during the 2001-2018 period, the estimation results demonstrate that the financialization captured by nine indices from the Financial Development Index database has a light influence on the trade values of green goods. We find robust results by utilizing various econometric techniques and adding more explanatory variables. Furthermore, there is evidence on the long-term cointegration between financial development and TGG and our results confirm its effects in the long term. Finally, the nexus between two samples: developing and developed countries, but the importance of both financial institutions is more evident, especially in the developing countries. Finally, the effects of uncertainty or risk on TGG value become less sizable if these economies have a well-developed financial system.

Keywords: *Economic complexity, trade in green goods, global uncertainty, global sample.*

1. Introduction

Environment is considered to be one of the five biggest threats to global health and the environment in accordance with the UNFCCC (2017), since environmental issues are capable of seriously impacting human health and the environment. Environmental degradation and climate change, for example, might result in extraordinary risks such as glacier melting, harsh weather, unpredictable rainfall, species extinction, low agricultural productivity, food shortages, and water scarcity (Dong et al., 2019; Shahbaz et al., 2018). Global attention has already been drawn to the need for a sustainable environment. Energy efficiency and pollution reduction are regarded vital to the modern world and critical determinants of any economy's long-term growth (Lyu, Khan, Zakari & Bilal, 2021; Zahoor, Khan & Hou, 2021; Zakari & Khan, 2021a; Zakari, Khan, Tan, Alvarado & Dagar, 2022). In the contemporary setting of rising industrialization and urbanization, environmental conservation is more crucial than ever (Patnaik, 2018). According to some academics, a healthy natural environment is both desirable and necessary for businesses (Starik & Rands,

1995). Companies are increasingly aware of the importance of environmental preservation in strengthening their reputation and gaining a lasting competitive advantage, and they consider it a requirement of their operations (Farhadi, Ismail & Fooladi, 2012; Kim, 2018; Singh, Chen, Del Giudice & El-Kassar, 2019; Yadav & Iqbal, 2021). Firms keep a close eye on some environmental challenges, such as ecosystem conservation, air quality, resource sustainability, and maintaining a clean and healthy environment (Zelazna, Bojar & Bojar, 2020). Many business executives know that applying environmental standards to their operations has a positive and significant impact on their expenses, reputation, competitive advantage, and profit (Liu, Koehler, Gailhofer, Gensch & Wolff, 2019). As a result, many businesses have developed practical solutions such as workplace recycling, fostering green communities, forming sustainability committees, and adopting new digitization trends. However, there still exist problems, for example, although European countries have made significant progress in reducing greenhouse gas emissions and strengthening environmental protection over the last two decades, they still face significant environmental challenges, such as biodiversity loss, climate change effects, and natural resource exhaustion.

Financial development (FD) is seen as a major driver of economic development in economic theories (e.g. King and Levine, 1993). It is crucial in the transmission of funds and provision of financial services (Levine, 1999). The policies, circumstances, and institutions that contribute to efficient intermediation and effective financial markets are referred to as financial development. Risk diversification and efficient capital allocation are two benefits of a healthy financial system. The mobilization of savings and their deployment to high-return initiatives would increase as financial development increased. Levine (1993) underlined the significance of the financial sector in economic development. Given the negative effects of trade, it might be claimed that building a green economy will aid in reducing environmental damage and achieving carbon neutrality (UNEP, 2011). In other words, a green economy is a viable option for achieving environmental and development sustainability. The function of trade in green goods (TGG) as a strategy of lowering pollution while promoting economic growth by shifting manufacturing from pollution-intensive to pro-environmental items and fostering technical innovation is gaining traction in the literature (Zugravu-Soilita, 2018). In this study, we focus on exploring the influences of financial development.

In most trade studies, there is a complex relationship between financial development and trade, as evident in a variety of indicators that have been used to measure the degree of financial development, such as the ratio of loans to the private sector to GDP (Beck 2002 and 2003; Hur et al. 2006); Menyah et al. 2014; Kim et al. 2011); and stock market capitalization to GDP (Beck 2003, Kim et al. 2011). These indicators have also been applied to estimates of liquid liabilities (Menyah et al. 2014, Beck 2003 (Becker et al.2013). In addition to exports and imports (Beck, 2002; Becker et al.2013), trade balances (Hur et al, 2006, Beck 2002) and openness to trade (Kim et al.2011; Menyah et al. 2014), other variables have also been taken into account.

The majority of academic studies looking at the effects of financial development on international trade find that there is a significant link between trade and finance: a strong

financial system appears to be associated with an increase in trade volumes as well as a change in its structure (Beck 2002, 2003; Svaleryd and Vlachos, 2005; Hur et al., 2006; Kim et al., 2010; Becker et al., 2013; Manova 2013; Bilas et al., 2017). The impact of financial markets on industrial specialization trends and international competitiveness was examined by Svaleryd and Vlachos (2005) using data from OECD countries. Nevertheless, some studies have found that financial impacts on commerce are weak or inconclusive (Menyah et al., 2014; Sare et al., 2019). The impact of financial markets on industrial specialization trends and international competitiveness was examined by Svaleryd and Vlachos (2005) using data from OECD countries. Across the board, countries with well-functioning financial systems tend to specialize in businesses that are heavily dependent on external finance, with countries with poorly functioning financial systems focusing more on businesses that rely on internal financing. Therefore, the Heckscher-Ohlin-Vanek (HOV) model suggests that the financial sector represents a source of competitive advantage (see Vanek, 1968). It was found by Hur et al. (2006) that there is a link between financial development, asset tangibility, and international trade. According to the authors, the relationship between financial development and the tangibility of assets affects patterns of international trade. The study examined 27 industries in 42 countries, to determine the degree to which enterprises rely on external funding and the tangible nature of their assets. These researchers found that countries with higher levels of financial development had higher export share and trade balances in industries with more intangible assets.

Using data for 87 OECD and non-OECD countries covering 1960-to 2005, Kim et al. (2010) examined the long- and short-run correlations between financial development and trade openness. Based on empirical findings, the authors conclude that the development of financial markets has little impact on trade within OECD countries. Non-OECD nations, on the other hand, show long-term complementarities between financial development and trade openness and short-run substitutability between the two variables. Therefore, emerging economies benefit more from financial development than developed economies. The study examined the relationship between financial development and international commerce in 46 African nations over the period 1980-2016 by Sare et al. (2019). Their findings indicate that there is no significant effect of the expansion of the banking sector on international trade either over the short term or over the long term. After accounting for transmission channels, they discover that finance and trade do not substitute in the long run.

The non-linear impacts of FD on economic development have been described in the form of an inverted-U shape in several empirical results (Asimakopoulos et al., 2019; Botev et al., 2019). In a sample of 50 nations from 1990 to 2016, Asimakopoulos et al. (2019) found that larger FD had a lower positive or insignificant influence on innovation, whereas innovation had an insignificant positive impact on output growth when private sector credit exceeded a threshold of roughly 60% (of GDP). It should be highlighted that FD supports official economic operations at a modest level until a particular threshold is reached (Botev et al., 2019). Due to the possibility of overdevelopment, FD may be harmful to official economic operations after this point.

Based on our discussion, we hypothesize:

H1: Financial development has a positive influence on the trade in green goods.

H2: The effect of financial institution development is more sizable than those of financial market development.

H3: The effect of financial development in the developing countries is more sizable than those in the developed countries.

2. Method

We base on both the environment and trade literature to develop the model to investigate the nexus between financial development (FD) and trade in green goods (TGG)

$$\ln TGG_{it} = \beta_0 + \beta_1 FINANCE_{i,t} + \beta_3 CONTROL_{i,t} + \varepsilon_{ijt} \quad (1)$$

where subscripts i and t represent country i and year t , respectively.

Trade in Green Goods (TGG):

TGG is the value of export of EGs. Data on bilateral trade in APEC products were taken from the UN Comtrade database using the six-digit level of the 2007 version of the Harmonized System (HS 2007). Values are all expressed in current USD. To cover the years 1996 to 2019, the HS codes listed on the APEC were converted from HS 2007 into HS 1996 by the UN Trade Statistics⁹⁰.

Key explanatory variable: Financial Development

The key independent variable ($FINANCE_{i,t}$) in this paper is the overall financial index (LFD), which is measured based on two sub-indices of financial development, including financial institutions (LFI) and financial markets (LFM). We analyze these two sub-indices in three different aspects, including depth, access, and efficiency (for financial institutions (LFID, LFIA, LFIE, respective) and financial markets (LFMD, LFMA, LFME, respectively)). These variables are available from the IMF.

$CONTROL_{i,t}$ is the set of control variables that the selection is based on previous works in the literature, such as Allard et al. (2016), Aslam et al., (2017), and Efogo (2020). Specifically, we incorporate the income level (INC) measured by the real gross domestic product (GDP) per capita at the constant 2010 US dollars, the level of industrialization (IND) measured as a share of value-added in the industry sector to GDP, nature rents (NR) measured as a share of the sum of coal rents, mineral rents, natural gas rents, and forest rents, human capital (HDI) captured by the human capital index, level of democratization (DM), net inflow of foreign direct investment (FDI), tax rate (TAX), which is total tax and contribution tax rate measured a share of profits, and government effectiveness level (PS) captured by the government effectiveness index. Except for the variable DM collected from the Finnish Social Science Data Archive (FSSDA) and PS collected from the World Bank Group Indicator (WBGI), we source the remaining control variables from the World Development Indicator (WDI).

⁹⁰ <https://unstats.un.org/unsd/trade/classifications/correspondence-tables.asp>

After merging and cleaning the country database, our final sample includes 119 countries, including 85 developing and 34 developed countries for the period 2000 – 2018. Table 1 presents a statistical description of all variables. The results in Table 2 illustrate the correlation matrix between all variables. The results show a positive correlation between financialization and TGG.

From an econometric perspective, our study firstly employs the cross-sectional dependence (CD) tests developed by Pesaran (2021) to check for the existence of CD issues in our sample. Subsequently, we conduct the stationarity test of data with the existence of CD by applying the Levin-Lin-Chu unit-root test (Levin et al., 2002) and Im-Pesaran-Shin unit root test (Im et al., 2003). The test results are presented in Table 3, which shows that the issue of CD exists among included variables. Levin-Lin-Chu unit root tests and Im-Pesaran-Shin unit root tests suggest that some variables are stationary. We also apply similar tests for the first difference of included variables, and the stationarity is confirmed.

According to Beck & Katz (1995) and Nguyen et al. (2020), the panel corrected standard error (PCSE) model is adequately applied to the sample data characterized by a large number of countries (N) and small time-length (T) as well as the existence of CD and stationarity of first-difference variables. Besides, the one-year lag of all independent variables is applied to deal with an endogeneity resulting from the simultaneity between TGG and financial variables. The feasible generalized least square (FGLS) model is also employed to resolve heteroscedasticity as stated by Canh & Thanh (2020) and Liao & Cao (2013), while the two-step GMM is applied to resolve the issue of endogeneity (Gala et al., 2018; Nguyen et al., 2020; Sweet & Eterovic, 2019). Another concentration of this paper investigates the relationship between financialization and TGG in the short term and long term. For this purpose, we apply the autoregressive distributed lag (ARDL) method (Pesaran & Smith, 1995). For further checks, a similar estimation process is replicated for subsample by income levels. The existence of cointegration between these two variables is checked firstly by using various tests, including the Kao cointegration test, Pedroni test, and Westerlund cointegration test. These are popular cointegration tests in the literature, respectively developed by Kao (1999), Pedroni (2004), and Westerlund (2005). The results of these tests are depicted in Table 4, implying the long-term cointegration between financial variables and TGG.

Table 1. Description of variables

Variable	Definition	Measure	Source	Obs	Mean	SD	Min	Max
LnTGG	Trade in green goods values	A natural logarithm of TGG values	UN Comtrade	2261	11.41	3.16	2.42	19.11

Regarding the Pedroni test, the null hypothesis is “No cointegration”, while the alternative hypothesis is “All panels are cointegrated”. Regarding the Westerlund test, the null hypothesis is “No cointegration”, while the alternative hypothesis is “Some panels are cointegrated”.

3. Results

This study examines the relationship between financial development (FD) and trade values of green goods (TGG). The estimation results are presented in Table 5. Financialization is statistically significant and positive in our estimation model. This finding is consistent when we apply various econometric models, including the PCSE estimate, PCSE estimate with more variables, the FGLS estimate, and the two-step GMM estimate, although the effects of Financial Development (FD), Financial institutions development (FI), Financial markets development (FM) on TGG obtained from PCSE estimate, PCSE estimate with more variables and FGLS estimate are stronger than those from Two-step GMM. This implies that higher values of financialization increase the scale of TGG, hence confirming Hypothesis H1. When considering effects of the specific type of financialization, including financial development (FD), financial markets development (FM), financial institutions development (FI), the estimation results indicate the positive link between these four variables and TGG when studying subsamples of developing and developed countries. Results obtained from the FGLS estimate suggest that the marginal effects of FD are stronger than those of FM and FI in both developing and developed countries, whereas the results from the two-step GMM are more likely to emphasize the impact of FI on TGG. Particularly, the coefficients of FM on TGG on PCSE estimate, PCSE estimate and Two-step GMM are 0.26, 0.21, 0.26 and 0.02 respectively, compared to 2.72, 2.82, 2.72 and 2.79 of FD, and 2.01, 2.07, 2.01 and 0.70 of FI. Therefore, we cannot draw the conclusion regarding a comparison between magnitude effects of FD, FI and FM. of FD and FI.

In the next analysis, we empirically analyze the association between the short-term and long-term effects of financialization on trade in green goods (TGG) by applying the DFE-ARDL model. The results are shown in Table 6. Regarding financialization, as reported in Panel A, its short-term effects on TGG are barely significant, as only financial development (FD) and financial institutions (FI) are negative and significant at 5%. On the other hand, in the long-term, financialization has statistically significant and positive contributions to the rise in TGG, and this is compatible with the results reported in Table 5. In Panel B, in the short-term, financialization does not have an impact on TGG in developed countries, but barely affects TGG in developing countries. Meanwhile, in the long-term, financialization has a larger impact in developing countries. This means that the expansion of financialization leads to the increase of TGG and these effects become more evident in the long-run.

4. Conclusion

By applying diverse econometric techniques to a global sample of 85 developing and 34 developed countries during the 2001-2018 period, the paper examines the influences of financial development (FD) on the trade in green goods (TGG). Both financial market and institutional development boost the TGG because financial development in terms of depth and efficiency has a positive impact on TGG. Furthermore, the effect of financialization on TGG is more evident in the long-term and in developing countries. Finally, if these economies have a well-developed financial system, the effects of uncertainty or risk on TGG value are reduced.

On the policy front, our study suggests that accelerating financial system quality can be considered to be an effective policy in enhancing trade in green goods. This may include controlling central bank operations, taxation, and standards regarding accounting practices. In addition, the government should focus on addressing uncertainty issues and mitigate its effect.

ACHIEVEMENTS AND CHALLENGES OF RENEWABLE ENERGY DEVELOPMENT IN VIETNAM

Assoc. Prof. Dr. Dinh Duc Truong

truongdd@neu.edu.vn

National Economics University, Hanoi, Vietnam

Abstract

In recent years, the demand for energy for production and socio-economic development has increased in Vietnam, which is a great challenge for the energy sector in the context of primary energy supply such as coal, oil and gas is increasingly depleted. Therefore, the shift from exploiting traditional energy sources to developing renewable energy is a common development trend not only in Vietnam but also around the world. This paper presents some key points in the overall picture of the potential, development and challenges of renewable energy in Vietnam. Renewable energy development is a major policy of the Party and State, which has been concretized in Resolution 55 of the Politburo to the Prime Minister's decisions approving the RE development strategy. Vietnam's renewable energy sources, especially solar and wind power sources, have increased rapidly in recent times. To achieve net zero emissions by 2050, Vietnam needs to dramatically increase renewable energy capacity, especially solar and wind power. This will require completing national and sectoral master plans and standards, promoting supporting policies and encouraging investment, especially private and international sectors.

Keywords: *renewable energy, economic growth, planning, wind power, solar power, biomass, feed in tariff.*

1. Introduction

Vietnam is one of the developing countries with a relatively high increase in energy demand, while the proportion of fossil energy is still quite large. In addition to the risk of a shortage of fossil energy sources due to the gradually depleting reserves, the use of fossil energy is polluting, greatly affecting the environment. This is a development challenge that Vietnam faces [1].

The country is known as a place with a fairly large potential for renewable energy (RE), but currently only a very small percentage is exploited and used. Up to now, the number of projects of great size and scale in our country is very small, and the proportion of installed capacity of RE power plants in the total installed capacity of the whole system is still very modest. Although there have been many efforts to promote the development of RE and RE sources in the recent Power Development Plans, the development of RE in Vietnam is still not commensurate with its potential [2, 8, 9].

Climate change is a serious global challenge. Vietnam is one of the five countries heavily affected by the impacts of climate change. At COP26, Vietnam made strong

commitments with 150 countries around the world to commit to bringing net emissions to "zero" by mid-century (2050) [3]. Together with more than 100 countries have participated in the Glasgow's Statement of leaders on forests and land use; together with 48 countries participating in the Global Declaration on the transition of coal power to clean energy; Join 150 countries in the Coalition for Safe Adaptation. The implementation of commitments at COP26, especially the commitment to bring net emissions to "zero" by the middle of the century of Vietnam is an inevitable trend, bringing great and long-term benefits to the country [4].

With Vietnam's commitments at the Summit on Climate Change (COP26), many experts and businesses believe that the draft Power Plan VIII needs to bring RE to develop faster, besides phase out coal power projects. In particular, Power Planning VIII is expected to create an important innovation step; is the basis and foundation for mobilizing resources, investing in the development of the electricity industry, meeting the needs of socio-economic development. Moreover, this is also a tool for effective and sustainable control and management, ensuring the security of energy sources for the country [10, 11, 12].

The reason energy is the top concern is because at present, energy is the largest emitter in our country. According to Vietnam's development-as-usual (BAU) Emissions Scenario, by 2050, 81% of emissions will come from energy. So energy will be the industry that determines Vietnam's net zero emissions target [5].

To achieve net zero emissions by 2050, Vietnam needs to dramatically increase RE capacity, especially solar and wind power. This will require significant investment: Vietnam's Power Development Plan 8 recently estimated annual financial needs of more than \$11 billion, much of which will be devoted to energy regenerative. Historically, almost all RE investments in Vietnam have come from domestic and regional sources. However, sustaining the rapid expansion of RE depends on Vietnam's ability to expand international investment [6].

This article analyzes the potential and status of RE development in Vietnam, mechanisms and policies to promote RE in the past time and identify challenges and propose some solutions to develop RE in Vietnam.

2. Results

2.1. Renewable energy potential in Vietnam

Vietnam has particularly great potential in exploiting RE sources such as: Hydroelectricity, wind power, solar power, biomass power. In particular, hydroelectricity is focused on developing almost to the maximum in Vietnam. By the end of 2018, hydropower was the main energy source of our country, accounting for more than 40% of the total national electricity capacity. Excluding medium and large hydropower, hydropower and other forms of RE (including small hydroelectricity) account for 2.1% of the total capacity of the system [1, 3].

Wind power

With a coastline of more than 3,000 km, the mountains and highlands of the North and Central regions, Vietnam has great potential for wind power development (see map).

According to the World Bank's ESMAP study (see table below), more than 39% of the area of Vietnam has an average wind speed of more than 6 m/s at an altitude of 65 m, equivalent to a total capacity of 512 GW. In addition, about 8% of the land area has an average annual wind speed of more than 7 m/s, equivalent to a total capacity of 110 GW [1, 3].

Table 1. Wind potential of Vietnam at an altitude of 65m

Wind speed average	Low < 6 m/s	Average 6–7 m/s	Relatively high 7–8 m/s	High 8–9 m/s	Very high > 9 m/s
Area (km ²)	197.242	100.367	25.679	2.178	111
Area percentage (%)	60,6	30,8	7,9	0,7	>0
Potential (MW)	-	401.444	102.716	8.748	482

Source: [3]

Another study has shown that 8.6% of Vietnam's territory has potential from "good" to "very good" for the development of large wind power stations. This rate in Cambodia and Thailand is only 0.2%, Laos is 2.9% [5].

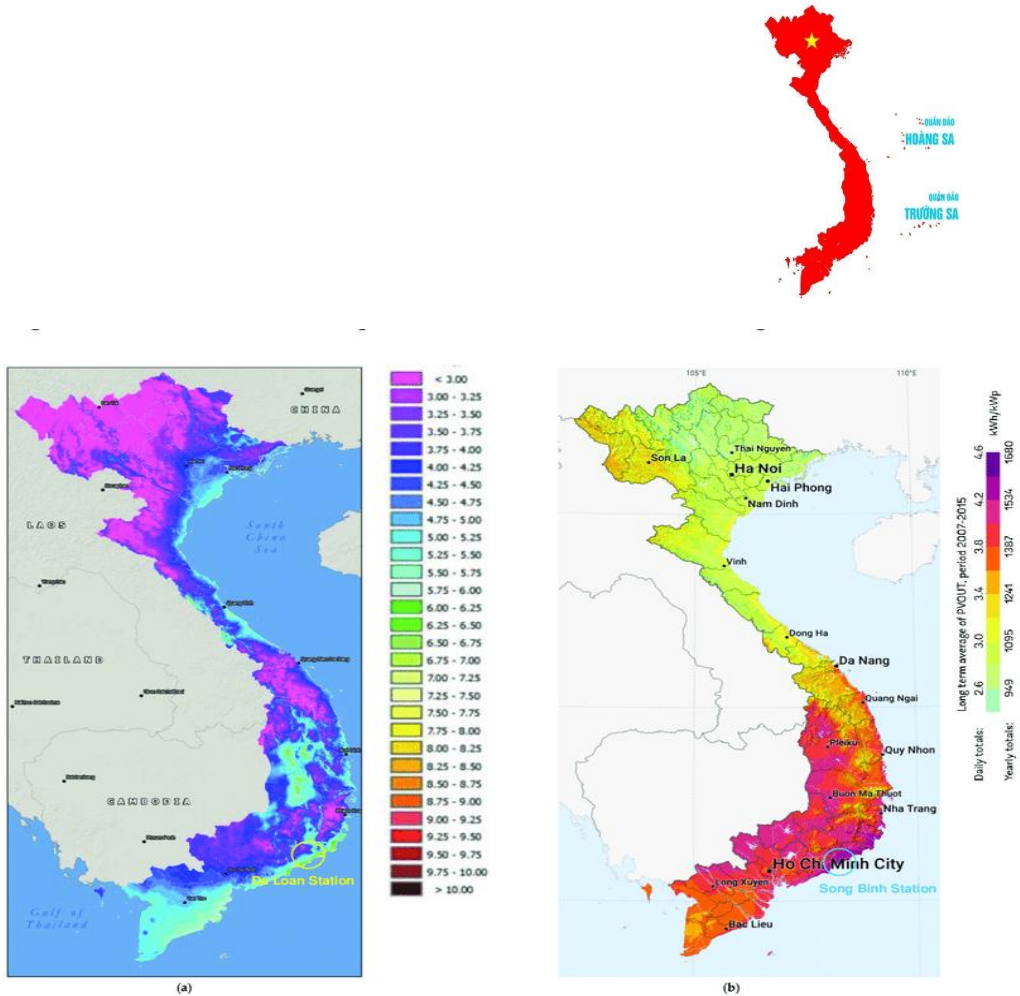

Figure 2. RE map of Vietnam with varying: (a) wind speed at 80 m above sea level; and (b) solar power.

Source: [7]

Solar power

Vietnam has great potential for solar energy development, especially in the central and southern regions. The average number of sunshine hours in the Northern region ranges from 1,500 to 1,700 hours of sunshine per year. The central and southern regions have higher average annual sunshine hours, from 2,000 to 2,600 hours/year.

Table 2. Data on solar radiation in Vietnam

Regions	Hours of sunshine in the year BXMT	Solar radiation intensity (kWh/m², day)	Application
Northeast	1600 – 1750	3.3 – 4.1	Medium
Northwest	1750 – 1800	4.1 – 4.9	Medium
North Central	1700 – 2000	4.6 – 5.2	Good
Central Highlands and South Central	2000 – 2600	4.9 – 5.7	Very good
Southern	2200 – 2500	4.3 – 4.9	Very good
National average	1700 – 2500	4.6	Good

Source: [5]

The average daily solar radiation intensity in the North is 3.69 kWh/m², in the South it is 5.9 kWh/m². The amount of solar radiation depends on the amount of cloud and the local atmosphere. Radiation intensity in the South is usually higher than in the North [7].

Biomass energy

As an agricultural country, Vietnam has a lot of potential for the development of biomass energy. Some common forms of biomass: energy wood, waste - crop by-products, livestock waste, urban waste and other organic waste. Biomass energy sources can be used by burning directly, or forming biomass fuel pellets.

Since the Prime Minister announced Decision 24/2014/QD-TTg on the mechanism to support the development of biomass power projects, many agricultural by-products have become an important source of raw materials. reuse to create a large source of energy. As in the sugar industry, the potential for biomass energy from bagasse is huge. If the source of bagasse is used and exploited thoroughly and effectively, bagasse will contribute significantly to electricity production, contributing to ensuring national energy security [3, 5].

2.2. Orientations and policies for renewable energy development in Vietnam

RE development is a major policy of the Party and State, which has been concretized in the Politburo's Resolution 55 to the Prime Minister's decisions approving the RE Development Strategy and other mechanisms. encourage the development of RE projects.

RE development goals in Vietnam's RE Development Strategy for the period to 2030 with a vision to 2050, approved by the Prime Minister in Decision No. 2068/QDTTg dated November 25th/ In 2015, the proportion of electricity produced from RE (including large and small hydroelectricity) in the total national electricity production must reach 32% by 2030 and 43% by 2050. In the revised Power Master Plan VII, It is expected that RE sources (including small hydropower, wind power, solar power, and biomass power) will account for 21% of the country's total power capacity by 2030. And in Resolution No. 55-NQ/ The Central Government on February 11, 2020 of the Politburo stipulates that the proportion of RE sources in the total primary energy supply will reach 15-20% in 2030 and 25-30% in 2045, corresponding to the proportion of RE in the total energy supply. Nationally produced electricity is about 30% in 2030 and 40% in 2045 [10, 11, 12].

In order to achieve the above-mentioned RE targets, the Ministry of Industry and Trade has advised and submitted to the Government of Vietnam to issue various incentive mechanisms for different types of RE that are assessed as having great potential as follows:

Table 3. Incentive price for RE in Vietnam

Type of solar energy	Type of technology	Incentive and effective mechanism	Selling price (without VAT)
(under 30MW)	Power production	Avoidable cost tariff	The electricity price list is published annually by the MOIT
Wind power (for projects put into operation before November 2021)	Project on land	FIT for 20 years	8,5 USCents/kWh
	Offshore project	FIT for 20 years	9,8 USCents/kWh
Biomass	Co-generation of heat-electricity	FIT for 20 years	7,03 USCents/kWh
	Not Co-generation of heat-electricity	FIT for 20 years	8,47 USCents/kWh

Source: [7]

In addition, ministries and regulatory agencies in Vietnam have also adopted other financial instruments to encourage investment in RE (table 2).

Table 4. Other financial instruments for RE development

No.	Financial Incentive	Mechanism Level
1	CIT	CIT rate: - The first 4 years from the year of taxable income: 0% - Next 9 years: 5% - Next 2 years: 10% - The remaining years: 20%
2	Import Tax	Goods imported as fixed assets, materials and semi-finished products not produced domestically. Investors should check the annual List of goods and products exempt from import tax published by the Ministry of Planning and Investment
3	Using land	Preferential land rental according to the regulations of the Province
4	Environmental protection fee	0%
5	Investment	The Vietnam Development Bank (VDB) lends up to 70% of the total investment cost at an interest rate equivalent to that of a 5-year Government bond plus 1%/year

Source: [7]

2.3. Achievement of renewable energy development in Vietnam

The energy industry is on the right track in developing and using clean energy, RE. Therefore, many mechanisms and policies for RE development have been issued, in which focus is on encouraging the development of power sources using RE, especially wind power, solar power, biomass, etc. Electricity using RE has made great progress in recent times.

About wind power

Wind energy is a RE source that has received the attention of the Government of Vietnam from a very early age. Up to now, the number of wind power projects developed has increased rapidly, especially when the Government promulgated a mechanism to encourage wind power development (Decision No. 37/2011/QD-TTg dated June 29, 2011 and Decision No. 37/2011/QD-TTg dated June 29, 2011). Decision No. 39/2018/QD-TTg dated September 10, 2018). By the end of December 2020, the total capacity of wind power projects has been approved by the Prime Minister on the list of sources and power grids connected to the revised Power Master Plan VII: 11,584MW/176 projects; however, only about 600 MW of wind power has been put into operation nationwide.

According to an update from the Electricity of Vietnam (EVN), by the end of August 3, 2021, a total of 106 wind power plants with a total capacity of 5,655.5 MW have sent documents and application documents to the energizing program. grid connection, testing,

request for recognition of commercial operation (COD) before October 31, 2021 (the price of FIT 2 wind power has expired) [15].

Solar power

Before 2017, despite its great potential, the situation of grid-connected solar power development implemented in Vietnam was still lower than expected. As of August 2017, the total installed capacity of solar power is only about 28 MW, mainly from small-scale power sources (off-grid systems and a number of low-voltage grid-connected demonstration projects - located in high-rise buildings). home and office). However, since the Government issued Decision No. 11/2017/QD-TTg dated April 11, 2017 on the mechanism to encourage the development of solar power projects in Vietnam and Circular No. 16/2017/ TT-BCT stipulates project development and sample power purchase agreement applicable to solar power projects, within more than 3 years, many domestic and foreign investors have sought investment opportunities in solar power projects. large-scale solar power projects nationwide. The projects are mainly concentrated in the central and southern regions where solar radiation is high. By the end of 2020, the grid-connected solar power source has been put into operation up to about 9,000 MW (of which Ninh Thuan and Binh Thuan provinces are nearly 3.5GW) [16].

Figure 2. RE energy development in Vietnam during 2017-2020

Source: [7]

The capacity scale of solar power projects that have been added to the planning is over 13GW, the total scale of construction registration but not yet added is about

50GW. Besides farm-type solar power projects (installed on the ground, on water), rooftop solar power projects are also developing at a very fast rate. At the end of 2019, the installed capacity of rooftop solar PV nationwide only reached 340MWp (272MW), but by August 2021, the total installed capacity will reach 9,580MWp. The total capacity of solar power sources added to the adjusted plan VII is 19,079 MWp (15,260MWac)/172 projects. The Southeast provinces (including Ho Chi Minh City) still remain the leading localities in installing rooftop solar power with both the number of projects and the total installed capacity.

Biomass power

Although there is a mechanism to support the development of biomass power projects in Decision No. 24/2014/QĐ-TTg dated March 24, 2014, up to now, the development of biomass power projects not as expected, not commensurate with the available potential. Recently, the Government continued to issue Decision No. 08/2020/QĐ-TTg dated March 5, 2020 amending and supplementing a number of articles of Decision No. 24/2014/QĐ-TTg. The most notable point is the adjustment of electricity purchase price for biomass power projects:

- For heat-power cogeneration projects: Increase from 5.8 UScents/kWh to 7.03 UScents/kWh.

- For projects that are not heat-power cogeneration: switch from Avoided Cost mechanism (with the average price in 2019 about 7.36 UScents/kWh) to FIT (Feed in Tariff) mechanism with the electricity purchase price of 8.47 UScents/kWh.

- + Status of rice husk power development: Up to now, in Vietnam, there is no biomass power plant that only produces electricity separately. Based on available information and additional data collected from localities, currently, only about 10 investors have applied for permission to build with an average capacity of 10MW/plant. Most of them are domestic investors with 8 projects, the remaining 2 projects are joint ventures with foreign countries. The above rice husk power projects are concentrated in the provinces of the Mekong Delta, including Tien Giang: 02 projects; Dong Thap: 03 projects; Can Tho: 03 projects; Kien Giang: 01 project, Hau Giang: 01 project. Among the 10 projects mentioned above, only Dinh Hai rice husk power plant in Can Tho has been invested and built. However, this factory has only completed the construction of the boiler system and steam production for sale to consumers in Tra Noc industrial zone, Can Tho. For the remaining projects, there are 01 projects that have completed the investment project formulation stage, 02 projects have completed the investment report preparation stage, the rest just stop at the step of applying for investment policies. Most of the projects were established a long time ago, from 2007 to 2008. Up to now, many projects have had their investment licenses revoked or have no further information on the next stages.

As of November 2020, there are about 560MW of total capacity of biomass power projects from wood power registered for investment and investment research (Northern: 166MW, North Central: 50MW, Central Central Coast: 166MW, North Central Coast: 50MW, Central Vietnam): 117MW, Central Highlands: 120MW, South Central: 50MW, South: 60MW). In addition, there

are currently 2 biomass power projects from agricultural waste (sorghum) with a registered scale of 600MW in An Giang province being proposed for investment [17, 18].

2.4. Challenges for renewable energy development in Vietnam

Despite significant progress in recent years, the development of RE in Vietnam is facing a number of fundamental challenges, including:

Firstly, challenges on supporting policies and mechanisms

The problems and inadequacies about current policies and legal regulations are reflected in some of the following contents:

The RE market needs clear policies and legal procedures to increase investor interest. State management agencies need to come up with policies with conditions that create a stable investment environment and predictable revenue streams of projects. The support mechanisms in the past time have not given a long-term orientation: Decision No. 13/2020/QĐ-TTg dated April 6, 2020 of the Prime Minister on the mechanism to encourage the development of solar power regulated a number of grid-connected solar power projects and rooftop solar power projects that meet the conditions for application of a support tariff (FIT price) when put into commercial operation until December 31, 2020. The Ministry of Industry and Trade studies to complete the bidding mechanism for solar power projects to apply from 2021. Thus, from the beginning of 2021 up to now, solar power projects are not allowed to apply the FIT tariff. bidding mechanism has not been issued. Similarly, wind power projects after November 1, 2021 also do not have an application mechanism.

The support price (FIT) is applied uniformly throughout the country, leading to the phenomenon of concentration development in areas with great economic potential (high solar radiation, high average wind speed). As a result, it is overloading the power grid in some areas or investing in places with low electricity demand, having to carry electricity far away. To overcome this drawback, it is necessary to have policies to encourage development by region and region.

FIT prices are generally applied, regardless of size, which will lead to inadequacies, large-scale projects will bring higher efficiency than smaller-scale projects if there are similar natural conditions. It is proposed that the FIT price mechanism only apply to small-scale projects (about a few MW), for projects with a scale of several tens of MW or more, direct electricity purchase and sale negotiations between the buyers electricity under the Vietnam Electricity Group with investors, ensuring the project can recover capital and have a reasonable profit.

In the mechanism to support rooftop solar power projects, there are some shortcomings: (i) Regulations on rooftop solar power systems with a capacity of no more than 1 MW, generally applied to households and businesses. business is not reasonable. This leads to many agencies and businesses that have a large construction roof area that can build solar power with a larger capacity to supply electricity for their needs. resources

and resources. It is recommended to separate this regulation into 2 parts. For households, the maximum capacity is smaller (about a few tens of kW); for agencies and businesses, it is possible to stipulate that the solar power capacity does not exceed the maximum capacity demand, and does not limit the maximum capacity. (ii) Regulating that households must sell all the electricity they produce and buy all their electricity needs from the electricity unit, which will result in households having to pay 2 times the tax for the same electricity unit: pay VAT on electricity purchased from the electricity unit and income tax on the amount of electricity sold. To overcome this shortcoming, it is proposed to apply the net metering mechanism as approved by the Prime Minister in Decision No. 2068/QĐ-TTg dated November 25, 2015 [19].

Lack of standards and regulations of RE projects: Standards and certificates are needed to ensure that equipment manufactured or procured from abroad is consistent with current standards. The promulgation of standards is necessary to ensure that the businesses operating the plants are in compliance with applicable laws. The lack of necessary standards also causes confusion and RE producers face unnecessary difficulties.

Secondly, economic and financial constraints

RE projects are high initial capital, lack of financial institutions, lack of investors, competition from fossil fuels and less subsidies compared to conventional fuels. These factors have prevented RE from becoming popular.

It is currently difficult for RE projects to access domestic credit, because many banks consider RE to be risky, so they require a high investor capital ratio (from 30-40%) and high loan interest rate (from 30 to 40%). 10% or more), has caused many difficulties in the financial arrangement process. Borrowing capital from foreign banks and financial institutions, although the interest rate is lower (about 4-5%), but it is difficult for domestic enterprises to access because of the requirement of government guarantee.

In order to ensure the efficiency and early implementation of the project to put the project into operation on schedule, domestic investors often cooperate with foreign investors in the form of transferring part or the whole project to gain access to the project. loans from abroad at low interest rates.

In addition to support in terms of mechanisms and policies, subsidies from the budget for RE projects are not significant. To create financial support, it is suggested that the Government soon issue a policy that organizations and individuals using fossil fuels for energy purposes must pay environmental fees corresponding to the volume of fuel used. Part of the environmental fee is used to encourage the development and use of RE sources through the Sustainable Energy Development Fund [20].

Thirdly, technological problems

Asynchronous development between RE projects and the transmission grid: To build and put into operation an RE project usually takes only about 6 months to a year, while it takes about 6 months to a year to implement investment and construction procedures.

construction of a transmission line or substation normally takes 2 to 3 years, if there are problems with compensation, site clearance, etc., the time may be extended by 1-2 years.

The lack of synchronization between the development of RE sources and the transmission grid has caused "choke points" in transmission, reducing the generating capacity of the sources. To overcome this, there is a need for closer coordination between stakeholders: Central and local state management agencies, investors and electricity units in the process of appraising and approving the master plan. investment promotion in the process of investment preparation and investment. The power grid needs to be newly invested or upgraded before connecting to RE sources. If there is no agreement regarding the responsibilities of each party in the implementation of the grid investment, the construction work may not be started.

Wind and solar power projects with variable capacity depend on natural conditions (wind speed, solar radiation), which partly affects the operation of the power system. When the proportion of wind and solar power sources increases in the coming time, it is necessary to have solutions to ensure the safe and continuous operation of the national power system [19, 20].

3. Discussion and Recommendations

To achieve net zero emissions by 2050, Vietnam needs to dramatically increase RE capacity, especially solar and wind power. This will require significant investment: Vietnam's Power Development Plan 8 recently estimated annual financial needs of more than \$11 billion, much of which will be devoted to energy regenerative. Historically, almost all RE investments in Vietnam have come from domestic and regional sources. However, sustaining the rapid expansion of RE depends on Vietnam's ability to expand international investment.

Figure 3. RE energy development to achieve net zero emissions by 2050

Source: [7]

Vietnam has made an impressive record of attracting domestic private investment to rapidly scale up solar from virtually nothing in 2017 to more than 16,000 MW in 2017- 2022, far beyond the Government's targets. While it is not clear exactly how much solar and wind energy will be included in Power Development Plan 8 in the future, it is clear that this energy system is developed to scale up energy.

Here are some solutions to promote the development of RE in Vietnam in the coming time:

Firstly, in the coming time, according to the experience of developed countries, in order to develop strong and sustainable RE, it is necessary to focus on the main contents: policy, transmission infrastructure and system operation regulation. electrical system.

Regarding policy: for large-scale RE projects, the bidding mechanism will be switched. The selected developer will be the one who offers the lowest selling price of electricity from the ground solar power project, the floating solar power project. The implementation of this mechanism will take more time, but it will be fairer and more transparent for investors, ensuring harmony and balance between the development of RE power projects and the transmission grid.

Secondly, it is necessary to promote the development of distributed RE systems to serve local consumption needs such as consumers such as industrial parks, commercial and service consumers, and houses. Install rooftop solar power to supply your own needs in combination with electricity purchased from the grid. Continue to develop and perfect Vietnamese standards and regulations to ensure RE development more sustainably. For some new types of RE in Vietnam such as offshore wind power, tidal power, continue to study and propose a development incentive mechanism suitable to the potential and development capabilities in Vietnam.

In addition, increase investment in upgrading and expanding transmission infrastructure in combination with storage systems and enhance the ability to dispatch and operate the power system, strengthen regional grid connection. This will help improve the ability to absorb RE sources, ensure safe and efficient operation of the power grid.

Institute of Agriculture and Environment, Quang Binh University

Abstract

Microplastics (MPs) are plastics (including flakes, fibers, particles, foams, films, etc.) with a particle size of less than 5mm that exist in many environments. Due to their high contents in the soil environment and low degradation rates, long-term impact of microplastics on soil ecosystems has become a major source of concern around the world. Through researching recent literature on microplastic pollution in agricultural soils and its effects, this paper evaluated the effects of microplastics on agricultural soils and proposed research directions in the future. This paper reported the morphology, origin and influence of MPs on soil properties, organisms and plants. It also highlighted the combined pollution of MPs and cadmium to plants. This literature review aimed to provide comprehensive information on the effects of microplastics on agricultural soils and directions for future research.

Keywords: *microplastics, agricultural soil, soil properties, organisms, plants, Cadmium.*

1. Introduction

According to the US Ocean and Atmospheric Administration, microplastics (MPs) are very small pieces of plastic which are less than 5mm in length. Currently, microplastics are divided into 2 categories: primary microplastics which are ≤ 5 mm in length, and secondary microplastics which are created from the degradation of large plastic products such as water bottles, plastic bags and fishing nets. Both types of MPs exist in the environment in large concentrations. In recent years, researchers have defined plastic particles which are 1-1000nm in size as nanoplastics (NPs). The main components of NP are polyethylene (PE), polypropylene (PP), polystyrene (PS), polyvinyl chloride (PVC), polylactic acid (PLA) and polyethylene terephthalate (PET) and other polymers [51].

MPs are widespread worldwide and have harmful influences to ecosystems. They can even be transmitted to humans through food and daily necessities, thereby increasing the risk of chronic diseases and cancer [2].

Around the world, the annual amount of microplastics entering soils exceeds that of the oceans. The input of microplastics in terrestrial ecosystems is 4-23 times higher than in the ocean [10], while the content of microplastics in agricultural soils is even higher [7]. It was estimated that the annual input of microplastics into agricultural soils through sewage sludge was 63,000–430,000 and 44,000–300,000 tons in Europe and North America, respectively [32]. In a study involved 54 landfills from Cambodia, India, Indonesia, Laos, the Philippines and Vietnam, Tun et al (2022) reported that about half of the additives in the

landfill soil came from MPs [39]. In a study with 50 agricultural soil samples collected from Yunnan, China, Zhang et al [55] reported MPs contents of 7,100-42,960 particles kg^{-1} , of which up to 95% were 1-0.05mm in size.

Covering soil with plastic films is a globally popular agricultural technique which has been considered to be effective in heat and water retention, weed prevention, fertilizer conservation and soil fertility improvement [18]. However, in a study with 384 soil samples collected from 19 provinces of China, Yi Huang et al. [12] reported that the macroplastic content in the soil samples was 0.1 - 324.5 kg ha^{-1} and the averaged content was 83.6 kg ha^{-1} . He et al [8] found that the concentrations of microplastics in 20 vegetable and agricultural soils in suburban Shanghai were 78.00 ± 12.91 and 62.50 ± 12.97 particles kg^{-1} , respectively. Most microplastics were polypropylene (50.51%) and polyethylene (43.43%). This study showed that microplastic pollution in soil mainly comes from agricultural humus layer. In recent years, the area covered with plastic film worldwide has increased rapidly. Over time these plastic films will penetrate into the soil and contaminate agricultural land.

In addition, Smith et al. [37] detected 9 types of MPs in human feces. Hu Hanwen et al. [11] also found that polystyrene (PS) and polyvinyl chloride (PVC) particles can migrate through the intestines to the lymphatic and circulatory systems, posing a threat to human health. Rillig [14] showed that the accumulation of MPs in soils to a certain extent alters soil properties, affects soil functions and biodiversity, and then affects plant growth. Currently, there is little information on the effects of MPs in soils on plants. The aim of this paper was to summarize the origins, distribution characteristics and accumulation of MPs in agricultural soils, and focus on analyzing the effects of MPs on soil organisms and plants.

2. Method

The present article reviews and synthesizes the literature relative to microplastics pollution on soils and plants.

3. Results

3.1. Overview of microplastics in agricultural soils

3.1.1. Morphology of microplastics in agricultural soils

Currently, there is no unified MPs classification system. MPs can be classified according to their morphology: pellets/granules, foams, flakes, scales, films, fibers and sponges [35; 56]. (Figure 1)

Figure 1. Common morphology of microplastics (a. composites, b. pellets/granules, c. foams, d. flakes, e. scales, f. films, g. fibers, h. sponges)

The types of MPs are closely related to the environment in which they exist. In a study of MPs in coastal soils in Shandong province, Zhou et al. [56] reported seven types: foams, pellets, flakes, fibers, films and sponges. Liu et al. [26] reported that the MPs in the soils of 20 vegetable fields in some suburbs of Shanghai mainly included fibers, flakes and films. In a study on MPs in agricultural lands of Hetao irrigation zone in Inner Mongolia, Wang Zhichao et al. [46] detected 4 types of MPs: fibers (23.34%), flakes (26.31%), films (38.57%) and particles (11.78%). Yue Junjie et al. [53] investigated MPs in soils in Yellow River Delta wetlands and reported three types of MPs: particles (16.67%), fibers (33.33%) and flakes (50%).

Degradation of covering films is a major source of MPs in agricultural soils. The main components of covering films are polyethylene (PE), polyvinyl chloride (PVC), polystyrene(PS), high density polyethylene (HDPE), low density polyethylene (LDPE) and linear low density polyethylene (LLDPE). PVC film has poor light transmittance and produce toxic substances when burned, so it has been banned in the US. However, in Asia, the use of this product in agricultural production accounts for nearly half of the global use as reported by the Food and Agriculture Organization of the United Nations (FAO).

MPs in compost are also another source of pollution in agricultural soils. Germany has strict regulations on fertilizer quality, allowing fertilizers to contain no more than 0.1% plastics, and no plastic particles less than 2mm in diameter [50]. Weithmann et al. [49] found that organic fertilizers produced by composting biological waste often contain MPs with concentrations of about 14-895 particles kg^{-1} , and particle sizes larger than 1mm. China is the largest producer and user of compost, with an annual output of more than 2.5×10^7 tons. The average concentration of MPs in composts can be as high as 1.2 g kg^{-1} [52]. The annual commercial organic fertilizer production in China is more than 25 million tons, and the actual application amount of organic fertilizer is about 22 million tons per year. Some studies estimate the total amount of MPs introduced into agricultural soils through organic fertilizers in China to be 52.4-26,400 tons per year [28].

Using wastewater for irrigation and sewage sludge for growing crop are also causes of MPs pollution in agricultural soils. International surveys of MPs in wastewater treatment plants show that about 90% of MPs in wastewater accumulate as sludge after treatment. Nizzetto et al. [32] found that in Europe, MPs production was 125-850 tons/million people and MPs were discharged into agricultural soils through sludge. In Europe and North America, the amount of MPs in the sludge is 6.3×10^4 - 43×10^4 and 4.4×10^4 – 30×10^4 tons, and about 50% of the sludge is used in the agricultural sector. Several cities in the United States, Germany, Finland and Sweden also have MPs in sludge, in which MPs concentrations ranged from 1,500 to 24,000 particles kg^{-1} [31]. The annual agricultural use of sludge in China is about 3 million tons. In a study with 79 sludge samples collected from 28 wastewater treatment plants in 11 provinces of China, Li et al [21] reported that the average MPs content in the sludge was $(22,700 \pm 12,100)$ particles kg^{-1} .

Surface water used for crop irrigation is also a source of MPs pollution in agricultural soils. The content of MPs in the Yangtze estuary waters (China) was $4,137.3 \pm 2,461.5$ particles m^{-3} [50]. In addition to surface water, groundwater is also one of the main sources for agricultural irrigation. Mintenig et al. [24] detected plastic particles in groundwater and drinking water with a particle size of 50-150 μm . MPs were also found in groundwater of the State of Illinois, USA, with a maximum concentration of 15,200 particles m^{-3} . Panno et al [33] also detected large amounts of MPs in table salt from salt wells. In addition, wastewater contains a large amount of MPs, although wastewater treatment plants can remove a certain amount of MPs, the concentration of MPs is still high in treated wastewater. The direct use of untreated wastewater to irrigate arable land is also increasing. Dris et al. [6] reported that in the world, an area of 2,107 hm^2 is irrigated with untreated or partially treated wastewater, and 10% of the world's population uses wastewater for irrigation in agricultural production.

MPs can also enter soils from the atmosphere. Dris et al. [6] found that atmospheric dust in the Paris metropolitan area contained MPs filaments, and that MPs filaments accumulated into this region through the atmosphere by about 3-10 tons per year. Liu et al. [25] [9] and Klein et al. [17] also detected MPs in atmospheric sediments in Paris, Dongguan, Shanghai, Hamburg and other cities, and the main form of MPs in the atmosphere was fibers. However, there is still little information on atmospheric deposition of MPs [52].

3.1.2. Accumulation of microplastics in agricultural soils

Scheurer et al [31] detected MPs in 90% of soil samples from Swiss plains, with an averaged concentration of 593 particles kg^{-1} , and 88% of MPs ranged from 12.5 to 500 μm in size. In some areas with severe plastic pollution, the MPs content in the soil can be as high as 60% [29]. As modern agricultural practices can affect the MPs content in soils, studies on MPs in agricultural soils have increasingly drawn attention. Huerta et al [32] detected MPs contamination in a rural home garden in Southeastern Mexico at a concentration of 2,770 particles kg^{-1} , and the MPs size ranged from 5 to 150 μm . In a study on long-term plastic covers on agricultural soils in China, Liu et al [33] reported that concentration of residues of plastic covers in the soil was 50-260 kg hm^{-2} . The concentration of MPs in vegetable fields in Wuhan, Hubei was as high as 2.2×10^4 - 6.9×10^5 particles kg^{-1} [3].

3.1.3. Effects of MPs pollution on soil structure

Because MPs are difficult to dissolve, they can accumulate in the soil or combine with other organic pollutants and thus induce changes in soil structure. De Souza et al. [35] found that the effects of different MPs on soil structure and microbial functions were different. Polyester significantly reduces the number of water-stable aggregates in soils, while polyethylene can greatly improve water-stable aggregates and reduce water content and the diversity in soils. In a study on MPs in soil in Dianchi Lake, Yunnan (China), Zhang et al. [8] discovered that about 70% of MPs were closely associated with soil aggregates, especially microaggregates, and participated into the formation of soil aggregates. However, there are few studies, especially long-term ones, on the combination of MPs with soil aggregates, and related mechanisms.

3.2. Effects of MPs pollution on agricultural soil organisms

3.2.1. Effects of MPs pollution on soil fauna

There are fewer studies on the ecotoxic effects of MPs on soil animals, in which earthworms are the main research subjects, compared to those on aquatic animals. Rillig et al. [37] found that MPs in soils can be ingested by earthworms and then transported from the topsoil to deeper soil layers. Current studies on the toxicological effects of MPs on earthworms mainly include growth inhibition, intestinal injury, weight loss, immune responses, changes in gut microbes, reproduction problems and even death [38, 39]. Huerta et al. [39] found that earthworms can selectively feed on LDPE (<150 μm) and accumulate it in their body. The accumulation of LDPE decreased with its size. In addition, high concentrations (>28% MPs) damaged earthworm intestines, inhibited growth and increased lethality significantly, but had little effect on reproduction rate. However, Rodriguez-Seijo et al. [38] found that low MPs content (<1000 mg kg^{-1}) did not significantly affect mortality of earthworms after 28 days of soil exposure, but higher MPs content and prolonged exposure time seriously damaged intestinal tract of earthworms and thus directly caused weight loss and death. Further, MPs were also found in earthworm feces that were swallowed by soil arthropods [52]. Some studies showed that MPs can be transferred from earthworms to chickens, thereby affecting human health [29].

3.2.2. Effects of MPs pollution on soil microorganisms

Additives included in MPs, such as antioxidants, flame retardants, plasticizers and light stabilizers can inhibit microbial activity in the soil [35; 45]. Phthalates and bisphenol A (BPA), which are two important substances used in the plastics industry, can inhibit microbial activity, thus reduce microbial reproduction and growth. Wang et al. [48] found that the plasticizer pollutant dimethyl phthalate can lead to accelerated soil carbon and nitrogen cycling, which would reduce soil fertility. Zettler et al. [54] showed that microorganisms can be adsorbed on MPs surface to form biofilms that last for a long time, which may restrict the ecological function of soil microbes. Kettner et al. [15] found that both parasitic and saprophytic fungi on PE and PS particles proliferated in biofilms of MPs, causing detrimental effects on animal and human health. In addition, MPs alter soil porosity and moisture, thus influence the oxygen flow in soils and then relative distribution of anaerobic and aerobic microbes in soils [36].

3.3. Effects of MPs pollution on plants

It is well documented that MPs have significant effects on the growth and development of various plants such as wheat [34], broad beans [45], watercress [13], onion [5], lettuce [23], and cucumber [24]. However, it is revealed by some studies that MPs have less effect on plants than on animals and soil microbes [14]. For example, Qi et al. [34] first used LDPE and biodegradable plastic films as research subjects in potted experiments. It was found that residues of these plastic films significantly inhibited seed germination and seedling growth and adversely affected the reproductive period. Judy et al. [14] found that when wheat seeds were exposed to MPs, their germination rate and thereafter plant biomass did not change significantly. De Souza et al. [5] found that MPs can induce changes in total

biomass, tissue composition (such as water content, nitrogen content and carbon-nitrogen ratio) and root characteristics (including root length, mean root diameter, and total root area) of onion. Their effects were different depending on the particle size. Li et al. [23] found that PVC sized 100 nm-18 μ m and PVC sized 18-150 μ m with different concentrations (0.5%, 1%, 2%) had no significant effect on lettuce root activity, but at concentrations of 0.5% and 1% PVC (100 nm-18 μ m), overall length, surface area, volume and diameter of roots increased significantly compared to the control without exposure to MPs. Bosker et al [2] found that MPs could accumulate in the pores of pea capsules during seed germination. Liu Yingying et al. [27] revealed that HDPE (23-38 μ m, 100 mg g⁻¹) could inhibit water uptake and growth of green bean plants. Physical impediment of water uptake could be the reason for slow seed germination and root growth. Meng et al [30] found that MPs (LDPE and Bio-MPs) affected the development of kidney beans. Urbina et al [40] reported that HDPE had no adverse effects on maize, while PS had significant phytotoxicity. However, some studies showed that PS with large grain size (8.3 \pm 0.5 mm) had no adverse effects on three crops (mung beans, lettuce and rice) [16]. The average abundance of MPs in the studied sludge samples was 30.940 \pm 8589 particles kg⁻¹ (dry weight). Soils containing MPs promoted tomato plant growth, but slowed fruit production and reduced yield [9].

In addition, NPs can enter plant cells. Bandmann et al. [1] reported that nano-sized MPs entered tobacco cells through endocytosis and PS (20 and 40 nm) microspheres were taken up by the cells. This indicates that NPs with small particle size can be absorbed into plants. Li Ruijie et al. [20] found that submicron PS can penetrate the roots of wheat plants under sand culture conditions, and distribute in the outer bark and vascular system of leaves. Bosker et al. [2] revealed that among different MPs sizes (50 nm, 0.5 μ m, 4.8 μ m), the 4.8 μ m size was able to penetrate pores in the roots of watercress. Li Lianzhen et al. [1] reported that the 200 nm particle size of PS in lettuce roots would be transferred to its stem and leaves, causing inhibition of the subcellular structure. PS particle sizes of 500 nm and 700 nm could be transported from roots to flowers and fruits of cucumber [24].

Furthermore, the phytotoxicity of MPs is related to the production of reactive oxygen species (ROS), and the accumulation of reactive oxygen in plant cells can influence plant photosynthesis [4]. Plants can inhibit ROS-producing enzymes and interfere with chlorophyll synthesis, thereby affecting chlorophyll and carotenoids [19]. Li et al. [23] found that PVC (100 nm-18 μ m) did not have much effect on malondialdehyde content, however, at 1% concentration, PVC significantly increased superoxide dismutase activity and promoted carotenoid synthesis. In a study on physiological effects of NP on lettuce, Li et al. [23] also reported that 100 nm PS could significantly reduce chlorophyll, soluble sugars, carotenoids, proline and fluorescence contents in cucumber leaves. Due to polystyrene nanoplastic pollution, the enzyme activity of acid and peroxidase-related genes, the hydrogen peroxide content increased significantly. Further, an increase in particle size would lead to a decrease in the relative expression and activity of the major antioxidant enzymes *superoxide dismutase* (SOD) and catalase (CAT) [24].

Finally, the presence of MPs can lead to changes in soil structure, bulk density, water holding capacity and nutrients [5; 41]. These changes can directly affect plant yield by altering root characteristics, growth states and nutrient uptake processes [34].

3.4. Effects of co-contamination of MPs and Cd on plants

Currently, many countries in the world, especially some countries in Asia, are facing serious heavy metal pollution. MPs can adsorb heavy metals and carry them into fauna and flora as carriers [42]. However, there are very few studies on the heavy metal adsorption of MPs and effects of this phenomenon on plants, and most of these studies focused on the combination of MPs and Cd [38]. MPs and Cd which coexist widely may interact to influence plants in agro-ecosystems [44]. In a study on effects of MPs and Cd contamination on cucumber seedlings, Li Zhenxia et al [22] reported that PVC (<18 μm , 18–150 μm) could alleviate the effects of Cd on cucumber root growth, while the combination of MPs and Cd had an adverse effect on SOD of cucumber leaves. In a study on Cd absorption by HDPE and PS at different dosages, Wang et al [43] found that the co-existence of HDPE and PS was more toxic to plants than PS alone. They also reported that co-occurring MPs can change Cd bioavailability, plant performance, and soil properties. In addition, a high-dose of HDPE (10%) led to an increase in soil pH, thus promoted plant growth. But when the high-dose of HDPE was combined with Cd, it had an inhibitory effect on plant growth, indicating that MPs can amplify Cd phytotoxicity. In another study, Wang et al. [44] reported that the coexistence of MPs (PE and polylactic acid) did not affect the Cd content in plant tissues, but influenced the structure and diversity of arbuscular mycorrhizal fungi (AMF) community. In a study on effects of co-contamination of MPs and Cd on rice plants, Wang Zezheng et al [47] reported that low concentrations of MPs (100mg L⁻¹) and Cd (2mg L⁻¹) inhibited rice shoot and root growth. It can be concluded that combined effects of MPs and Cd on plants may depend on MP particle sizes, concentrations of MP and Cd as well as plant species.

4. Discussion and Conclusion

Studies on effects and mechanisms of MPs on agricultural soils have not been systematic and relatively dispersed. Future research can be in the following directions:

(1) At present, methods for detecting MPs in agricultural soils are limited and there is no uniform standard for identification and quantification of MPs. An accurate and practicable standard procedure of identification and quantification should be established.

(2) Studies on MPs pollution in agro-ecosystems have been carried out, but activities of MPs after they enter the soil have not been studied in depth. Further, most of these studies only completed in simulated laboratory conditions. In the future, it is necessary to carry further research on the influence of MPs on soil microbial genes, and changes in soil nutrient cycling, degradation mechanism of MPs and soil microbes. It is also vital to conduct studies on migration pathways and distribution of MPs to control them at the beginning of pollution.

(3) Some heavy metals and other pollutants might form compounds with MPs. There are few studies on combined effects of MPs and heavy metals on some plant species. Further

research on co-contamination of MPs and other pollutants and its effects on various organisms should be carried out.

(4) MPs in soils and nanoparticles formed upon the degradation of MPs will enter the plant, thereby affecting plant growth. An array of studies have shown that MPs have toxic effects on the growth and development of plants. However, it is necessary to further clarify the transportation of MPs from soils to plants and mechanisms of harmful effects of MPs on plants. In addition, exposure pathway of MPs and their effects on human health need to be further studied.

FACTORS AFFECTING FINANCING DECISION FOR WIND ENERGY PROJECTS IN VIETNAM

Cao Truong Giang

david.cao057@gmail.com

National Economics University, Hanoi, Vietnam

Abstract

Wind energy is considered as one of the most potential energy sources in the future, as it can benefit the environment, economy and the society in the long-term. However, wind energy still accounted for a small proportion in the national energy sources in Vietnam. One of the main reasons is the hesitation of investors and financial institutions in the decision-making process in financing wind energy projects. The research has pointed out that, besides economic and financial factors, financing decisions for wind energy projects of financial organizations in Vietnam are also influenced by non-financial factors. Our research uses a combination of qualitative research method, deep interview and quantitative analysis with Structural Equation Modeling (SEM) to analyze data of 200 institutions that have been investing in wind energy projects. Our results show – the positive impact of the priori beliefs in the effectiveness of wind power’s existing policies and technological adequacy, knowledge of wind energy operational context as well as the institutional influence from normative sources - on wind energy financing decision of Vietnamese institutional investors. Based on our research, we also make some recommendations for investors and policy-makers to encourage more capital invested in wind energy projects, which contributes to the sustainable growth of renewable energy in Vietnam.

Keywords: *wind energy, financing decision, non-financial factors, institutional investors, SEM*

1. Introduction

Currently, problems of energy supply and to use are not only related to global warming, but also to environmental concerns such as air pollution, acid precipitation, ozone depletion. Therefore, renewable energy development has become the major concern of many countries around the world to maintain the current electricity supply as well as to minimize environmental impacts caused by fossil fuels. According to the (IRENA, 2020), by 2025, renewable energy will become the main source of electricity generation, providing a third of the world's electricity.

Among the types of renewable energy nowadays, wind energy is emerging as one of the most potential energies, besides solar energy. Wind power is expected to play an important role in the energy future supply of the world. By 2020, around 180 GW of onshore and offshore wind was installed in the European Union, accounting for 15% of the EU's total electricity demand. Worldwide, wind power also provided a sizable amount of electricity - around 16% by 2020, according to data by the Global Wind Energy Council. In Vietnam, renewable energy development is a major concern. According to (EVN, 2021), by the end

of August 2020, Vietnam has about 102 solar power projects in operation with a total capacity of 6,314 MW, 11 wind power plants with a total capacity of 435 MW, as well as 325 MW capacity of biomass power plants. Overall, the proportion of renewable energy capacity accounts for about 11.6% of the total capacity of the power system.

Although the potential for renewable energy development in Vietnam is huge, the capital sources for renewable energy are still very modest. The actual survey shows that only 17/35 commercial banks participate in financing renewable energy. During the credit appraisal, banks have encountered lots of obstacles: The terms of loans usually last for 10-15 years, in which case, banks have to face several limits to these projects (Nguyen Quoc Viet, 2021). Moreover, the risks of capacity release as well as EVN's refusal to purchase electricity on PPA make it much more difficult for banks to appraise the projects' efficiency.

This situation shows that the understanding of factors that affect financial institutions in the process of capital allocation for renewable energy technology projects in general and wind energy projects, in particular, is still limited. The authors believe that, in addition to the rational assessment of investment opportunities, a number of non-financial factors also influence investor decisions, which can lead to very different resource allocation results when financial institutions decide to invest in wind energy projects. However, previous studies have only mentioned the highlights of the issues surrounding development potential and general policies to support wind power projects in Vietnam without going into deep understanding. carefully examine the financial and non-financial factors that influence investors in financing wind energy projects.

Determining the importance of factors affecting investment decisions in wind energy projects, the authors have selected: "Research about the factors affecting financing decisions of financial institutions on wind energy projects in Vietnam" as the topic of our research paper. The research team hopes that this paper provides an overview of the non-financial factors which affect the financing decisions on wind energy projects in Vietnam, thereby proposing solutions and strategic wind energy policies to develop energy system in the long run.

2. Literature Review

2.1. Current situation of financing wind power in Vietnam

Vietnam has witnessed a current trend in financing wind energy in 2021. In a report released by SSI Securities Corporation on the electricity sector, in 2020, energy enterprises will issue 35,700 billion VND of bonds, which is an increase of 274% compared to 2019 (EVN, 2021). Most recently, Vietnam Electrical Equipment Corporation (Gelex) decided to finance 5 wind power projects in Quang Tri, with the capacity of each plant being 30 MW. This might be due to the fact that the price mechanism of investment in wind and solar energy receives preferential treatment compared to coal and gas power, hence more bank credit can be accessed.

However, due to high financial leverage, lots of wind projects in Vietnam are under bad debt pressure. According to (Do et al., 2020), by the end of 2020, banks have poured VND 84,000 billion into renewable energy loans. Even though this figure is not too large compared to the total credit balance, the capital mobilized by credit institutions is usually short-term and at the cost of commercial capital in the market. Moreover, another risk is that the majority of

enterprises investing in renewable electricity today do not have strong financial capacity and experience. Besides, in 2021, EVN estimated to cut down on 1.3 billion KWh of renewable energy, and this increases the risk for banks and financial investors (EVN, 2021)

Currently, lots of banks and institutions have implemented green credit programs with green credit accounting for 3.6% of the total outstanding loan of the whole economy (Do et al., 2020), however, the credit from the programs to renewable energy projects in general is still small.

International financial institutions:

Japan International Cooperation Agency (JICA) has signed a loan agreement worth 25 million USD for an onshore wind power project in Quang Tri province with a total generating capacity of 144MW in 2021. This is JICA's first debt financing wind energy production project in Vietnam.

International Finance Corporation (IFC) and the Managed Co-Lending Portfolio Program (MCP) managed by IFC will provide a \$57 million funding package to Thuan Binh Wind Power Joint Stock Company (TBW) to build 2 wind power plant projects. This funding package is for the construction of onshore wind power plants - Phu Lac 2 in Binh Thuan province and Loi Hai 2 in Ninh Thuan province, with a total capacity of over 54MW. It is expected that the two wind power plants Phu Lac 2 and Loi Hai 2, which will start operating at the end of 2021, will produce about 170 million kWh of clean energy per year

Banks:

HSBC Bank Vietnam has just confirmed the agreement to provide short-term green credit in the field of general contractor for construction and installation of renewable energy projects for the Power Construction Joint Stock Company No. 1 (PCC1) - a leading Vietnamese company in energy construction general contractor (Ngo Hai, 2021).

Military Commercial Joint Stock Bank (MB) has arranged capital for lots of wind energy projects, with a total of more than 60,000 billion VND, helping investors to generate about 2,800 MW of renewable energy. Besides domestic projects, MB has arranged foreign capital for five wind energy projects in the form of a payment guarantee for the projects' loans from ECA. With strong financial potential, MB intends to continue arranging capital for 1,000 MW of wind power in 2021. At the same time, MB also arranged the deal for the purchase of bonds issued by a domestic credit institution to pay for construction and equipment costs to implement the Wind Power Plant project in Phong Lieu (Minh Trang, 2021).

Asian Development Bank (ADB) has signed a green loan worth 116 million USD with Lien Lap Wind Power Joint Stock Company, Phong Huy Wind Power Joint Stock Company, and Phong Nguyen Wind Power Joint Stock Company to build and operate 3 wind power farms with a total capacity of 144MW in Quang Tri Province, Vietnam (Nhat Minh, 2021). This project will increase Vietnam's wind power capacity by 30% and help Vietnam meet its rapidly increasing energy demand.

For wind power investment and development to unfold, specialized policies will be needed to promote capital inflows into wind power in a more efficient way, remove barriers, and take advantage of all the decision-making drivers to make investment decisions. However, up to now, in Vietnam, there have not been any in-depth studies that have been conducted to elucidate the factors affecting investment decisions in the field of wind energy. In addition to financial criteria, non-financial factors affecting the decision-making process of financing wind power projects are also an attractive topic and a useful source of reference for policy makers to provide solutions to promote investment capital for renewable energy in general and wind energy in particular.

2.2. The impact of factors on wind power financing decision

After researching a wide range of relevant documents and research about investing in wind energy projects, as well as conducting deep interviews with some experts in the industry, we had the elementary base to develop the model which illustrates the relationship between non-financial factors to investing decisions in wind energy projects in Vietnam. The model is presented in Figure 1. Through the model, we expect that the financing decision will be affected by 4 main non-financial factors: priori beliefs (PB), institutional influence from legal obligations (IO), institutional influence from normative sources (IN), and knowledge of wind power operational context (KC).

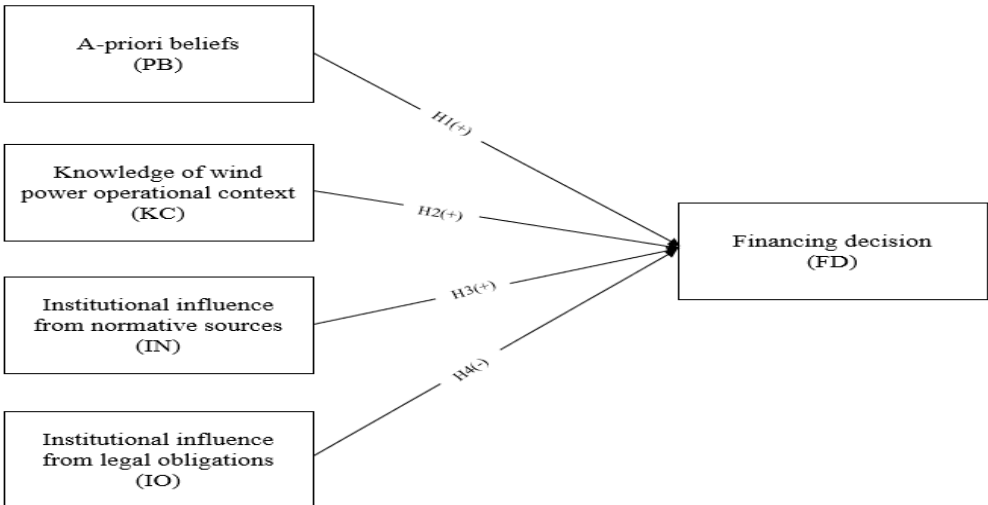

Figure 1. Conceptual model

Source: Authors, 2022

2.2.1. A Priori Beliefs

Institutional theorists and behavioral economists have long questioned the rational agent models of classical economics and proposed that cognitive and cultural factors, as well as personal beliefs influence personal decisions. (Daniel Kahneman, 2014) The research literature in the field of renewable energy has begun to examine the role of personal beliefs. Especially in the study of barriers to investment and widespread development of clean energy technologies in general and wind energy in particular. Scholars in this field have suggested that, in addition to the well-known "NIMBY" syndrome and purely technical and

economic factors, a variety of social and behavioral factors which influences human interactions with social and political institutions and possibly causes resistance to investment and adoption of renewable energy systems [(West et al., 2010),(Upreti, 2004)]. Previous studies have also documented how individuals use their priori beliefs to form opinions about investing in renewable energy, and use different sources of information to rationalize these views [(Woods, 2003), (Haggett & Toke, 2006), (Szarka, 2004)].

In line with the views from previous studies, the research team expects priori beliefs that an investor form from his/her personal history, educational background, and previous experience in either wind energy investment to have an influence on further financing and investment decisions. The research team examines whether investors' transcendental beliefs affect their trust in the technological feasibility of wind energy and the confidence in the effectiveness of current wind power policies.

First, the technological feasibility of a project has been identified as one of the most relevant barriers to the adoption of RE in general and wind power in particular. It is also regarded as one of the primary reasons leading to pitching sessions which introduced and interpreted the potential of projects (Hendry et al., 2010). The team predicts the potential attractiveness of a wind energy project and the positive outlook an investor holds depends on his/her priori belief in technical and efficiency completion of wind power technology - a basis for evaluating funding and investment opportunities.

Second, since the economic survival of most wind power projects often depends on incentive mechanisms, the research team expects the view and decisions of the investors to be affected by the level of their confidence in the effectiveness of policies as well as support programs encouraging promotion and investment in wind energy. Particularly, the uncertainty of public policies has been determined as a significant impediment to securing investment in wind energy in the private sector (Barradale, 2010). This has been proved by the decline in investment in clean energy projects, including wind power, due to alterations in regulations and policies in Denmark, Germany and the US.

To conclude, the overview of the priori belief factor has led the research team to assume that the belief in the effectiveness of wind power policy and technology exerts a positive effect on the willingness of investors to allocate capital for wind energy projects. Thereby, we proposed the following hypotheses:

H1: A priori belief in the effectiveness of wind power policy and technology has a positive impact on an organization's decision to finance wind energy projects.

2.2.2. Knowledge of Wind Energy Operational Context

According to (Masini & Menichetti, 2013), investment decisions are strongly influenced by the knowledge of the investors about renewables energy's operational context. At the same time, the study also shows that investors with greater knowledge of the renewable energy sector are more likely to go against the conventional wisdom and invest in risky renewable energy projects. In addition, other studies have concluded that the gap in technical knowledge has become a barrier for institutional investors to make financing decisions as well as for green energy projects to obtain bank loan approval [(Mustapa et al.,

2010); (Amran et al., 2020)]. Therefore, a greater knowledge of the projects' operational knowledge makes investors more likely to make financing decisions, and the proposed research hypothesis is as follows:

H2: Greater knowledge of wind power operational context has a positive impact on the investors' willingness to finance wind energy projects

2.2.3. Institutional Pressure from Normative Sources

Normative isomorphism is determined by the sources of information that investors use to make decisions. The effect of institutional isomorphism is even more significant in the context of incomplete information because when decision-makers lack the knowledge necessary to make objective judgments about investment or using complex technological options, they will consult experts and recognized authorities to reach their conclusions. Research by (Masini & Menichetti, 2012) indicates that agents or investors use two main sources of information to make their investment decisions: first, they consider the opinions of investors or external consultants, experts in the renewable energy industry; and second, they also use factual information derived from technical reports or from due diligence conducted by other organizations. Accordingly, the research team expects that the decision making to finance or invest in wind energy projects or the proportion of wind energy segments in the investment portfolio will be affected by the sensitivity of the investors with these sources of information. Therefore, we propose the following hypotheses:

H3: Institutional influence from normative sources has a positive impact on investment and financing decisions for wind energy projects.

2.2.4. Institutional Pressure from Legal Obligations

According to institutional theory, the coercive isomorphic is constituted by pressure from other organizations on which the stated institution is dependent and pressure from the cultural expectations of the society. Previous studies have highlighted the effect that coercion exerts on the organizations' behavior through regulatory control and financial regulations of central banks (Hoque & Hopper, 1994). Banks are required to operate in accordance with central bank regulations, such as privacy regulations and the Basel Accords. However, the updated Basel Accord III is likely to increase the cost of long-term financing, which will eventually affect the funding of capital-intensive renewable energy technologies such as wind power due to its reliance on long-term financing. In addition, the strict requirements of Basel III related to capital and liquidity could limit the number of banks' available sources of funds to finance renewable energy in the future. Moreover, the requirements of Basel III on the minimum capital adequacy ratio that banks must maintain are also the limitations to long-term capital sources to invest in capital-intensive projects such as wind energy. Based on the theory of coercive isomorphism as well as the theoretical overview of previous studies about the impact of regulations and institutional policies of the banking industry on the investors' willingness to make financing decisions, the proposed research hypothesis is as follows:

H4: Institutional influence from legal obligations has a negative impact on the investors' willingness to finance wind energy projects

3. Method

3.1. Sample Selection and Data Collection

The above hypotheses have been studied and tested by analyzing a sample of primary data. The study design consisted of a combination of qualitative and quantitative methods and was divided into two phases. In the first phase, the research team conducts document analysis and interviews with experts along with fine-tuning the conceptual model and ensuring the validity of the content for different structures in the model. In the second phase, a web-based survey questionnaire was developed, pre-tested and presented to a sample of institutional investors in Vietnam.

As the first step in the data collection process, the research team put together a list of the target institutional investors that the team will survey. Contact details for companies, organizations and their senior representatives are obtained from a variety of sources including institutional websites, government websites and other different specialized directories. Additional resources include a list of participants in some of the most prestigious international conferences on sustainable energy finance, such as the Wind Energy Investors Conference, the renewable energy financial forum and the New Energy Finance Summit. Overall, the list includes about 211 contacts in investment institutions and financial institutions operating in Vietnam. Investor profiles include venture capitalists, private equity funds, mixed funds, commercial banks, energy companies and associations of foreign institutional investors operating in Vietnam. In total, we received 200 responses, 11 of which had to be removed because they were unreliable or incomplete. The resulting 200 questionnaires were ultimately retained for analysis consistent with studies of this nature.

The investment organization survey process was conducted by the team from December 2021 to February 2022. Before conducting the survey, the research team had the opportunity to do in-depth interviews with several senior representatives of the investment organizations to understand more about their decision to finance wind power projects and confirm the appropriateness of the research model and scales. Investors selected for the full survey received individual invitations via email, reminders were sent at regular intervals, and the survey was also sent to the EuroCham association (European Chamber of Commerce) in Vietnam for a survey. The research team guarantees that the information collected will be kept completely confidential and we promise to share the final results of the research with the institutions that invested in the research team.

3.2. Verification Process

The raw processed data will be processed in SPSS 20.0 software. Descriptive statistical methods are used to analyze frequency statistics and describe the characteristics of the sample, including: type of investment organization, wind power investment experience and proportion of wind power investment in the organization's portfolio. Data of the remaining variables of the study are analyzed through the following steps: scale reliability test (Cronbach's Alpha), exploratory factor analysis (EFA), evaluate the scale by Confirmatory Factor Analysis (CFA), test the model and the research hypotheses using structural equation model (SEM) and test the reliability of the model using Bootstrap technique.

4. Results

4.1. Sample descriptive

The team has conducted a survey of senior leaders of financial institutions joining wind energy financing projects in Vietnam, along with international experts of economic and trade organizations in Europe, who is working in Vietnam. The survey recorded 211 responses, 11 of which were rejected due to dissatisfaction with the quality of the answers. The number of verified samples inserted into the analysis was 200.

Statistics show that all respondents have engaged in investing in wind energy. In particular, the majority of officers and specialists responding are working at Banks with 138 votes (accounting for 69%), 5 times higher than the number of people working in private enterprises (15.5%) and group of venture capital funds, private, or hybrid (12.5%). This shows that banks seem to take much interest in the wind energy market in Vietnam, and the results of the factors affecting wind power financing decisions will be highly affected by the Banking team.

Regarding investment experience, the number of investors with less than 5 years of experience accounts for the largest number with 74 people, followed by those with 5-10 years of experience (69 people) and over 10 years of experience respectively (57 people). The disparity in experience can be understandable, as the wind power industry in Vietnam used to be quite young, facing many obstacles; however, today it is on the way to growing and displaying a strong potential market. As for the share of wind energy investment, 43.5% of financial institutions tend to spend 5% - 9% in wind energy portfolios, nearly double the figure for enterprises which invest less than 5% and from 10% - 49%.

4.2. Evaluate The Scale By Cronbach's Alpha Confidence Coefficient

Table 1 shows the Cronbach's Alpha analysis results in which all the Cronbach's Alpha coefficients are greater than 0.6 so that the scale used in the research is well evaluated. The corrected item-total correlation is checked to eliminate variables with unsatisfactory correlation coefficients. In addition, the results show that all variables have correlation coefficients greater than 0.3. Therefore, the authors conclude that the scale can be evaluated and suitable for further analysis and evaluation.

Table 1. Results of scale's Reliability

Factors	Items	Cronbach's Alpha	Minimum value of corrected Item-Total correlation
A priori beliefs	4	0.848	0.775
Knowledge of wind energy's operational context	4	0.857	0.799
Institutional influence of legal obligation	3	0.868	0.792
Institutional influence of normative sources	3	0.899	0.814
Wind energy financing decision	3	0.817	0.700

Source: Investigated by authors in 2022

4.3. Explore Factor Analysis EFA

Table 2. KMO and Bartlett's test results

Kaiser-Meyer-Olkin Measure of Sampling Adequacy		0.870
Bartlett's Test of Sphericity	Approx. Chi-Square	1983.159
	df	136
	Sig.	0.000

Source: Investigated by authors in 2022

From the table 2, the KMO coefficient = 0.870 > 0.5 was satisfactory and showed that the sample size of the study was appropriate for factor analysis. Sig coefficient of Bartlett's Test = 0.000 < 0.05, we can conclude that the observed variables are correlated with each other in the population and it is satisfactory and statistically significant. The obtained values of the extraction sums of squared loadings as well as those of the initial eigenvalues were larger than one. The cumulative value of the extraction sums of squared loadings for five components was 75.566% which satisfies the requirement of greater than 50%. In addition, all the variables used have the values of factor loadings greater than 0.5, indicating a practical significance.

4.4. Evaluate The Scale By Confirmatory Factor Analysis (CFA)

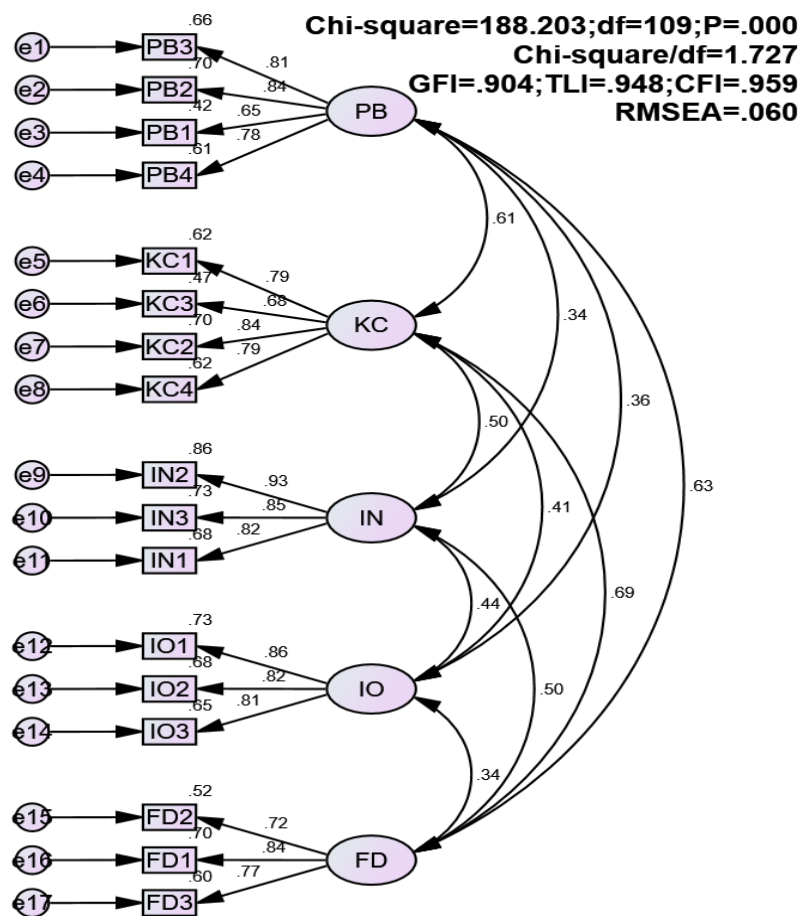

Figure 2. Confirmatory factor analysis (CFA) results – Normalized form

Source: Investigated by authors in 2022

After performing the confirmatory factor analysis (CFA) in AMOS, the results extracted are as followed: χ^2 (Chi-square) = 188.203; df = 109; p = 0.000; $1 < \text{CMIN}/df = 1.727 < 3$, indicating an acceptable fit between sample data and hypothetical model (Kline, 1998); CFI = 0.959 > 0.9, GFI=0.904 (>0.9) và RMSEA = 0.060 < 0.08. The Model Fit test showed that the statistical model fits well with the set of observations.

Moreover, constructing Convergent Validity, Discriminant Validity, and Reliability tests in CFA is also an important step. If the scales did not meet the requirements, certain deviations from the analysis results would be foreseeable, and the estimates obtained would not be statistically significant as well as would not represent the real situations. According to Table 4, the Composite Reliability (CR)>0.7, proving the reliability of the scale; Average Variance Extracted (AVE)>0.5, meaning the convergent validity of the construct is adequate; MSV are smaller than AVE and SQRTAVE values are greater than Inter-Construct Correlations, which shows that the discriminant validity of the construct is adequate.

Table 3. Model Validity test results

	CR	AVE	MSV	MaxR(H)	SQRTAVE	PB	KC	IN	IO	FD

4.5. Test The Model And The Research Hypotheses

Figure 3. Structural Model Analysis (SEM) – Normalized Form

Source: Investigated by authors in 2022

The numbers are used to evaluate the value of model is presented: $\chi^2 = 188.203$; $df = 109$; $p = 0,000$; $CMIN/df = 1,727$ (between 1 and 3) (Seiler et al., 2010); $CFI = 0.959 > 0.9$, $GFI=0.904 (>0.9)$ and $RMSEA = 0.060 < 0.08$. Therefore, the model is suitable and qualified to use SEM analysis. Moreover, with the data set collected from the survey on financing decisions for wind power of investment organizations in Vietnam and the factors affecting the decision, the research model is expected to be built from the overview and appropriate theoretical basis and the relationship between the scales ensure statistical significance.

Table 4. Results of the structural equation modeling (SEM) analysis

Impact relationship			Standardized weight	Unstandardized weight	P-value	Hypothesis	Status
FD	←	PB	0.332	0.399	***	H1	accept
FD	←	KC	0.394	0.386	***	H2	accept
FD	←	IN	0.199	0.220	0.011	H3	accept
FD	←	IO	-0.03	-0.320	0.692	H4	reject

Source: Investigated by authors in 2022

After conducting analysis all the hypothesis H1, H2, H3, H4 by the Structural Equation Modeling, we make these following conclusions:

A priori belief in the effectiveness of the current policy to support wind power development and belief in the efficiency of wind energy technology has a positive impact on the financing decision of the organization with the coefficient $\beta = 0.399$ and $p\text{-value} < 0.01$, so hypothesis H1 is supported. The research results of the group in the Vietnam market are similar to the research results of (Masini & Menichetti, 2012), (Amran et al., 2020). The research results presented by the team imply that institutional investors in Vietnam are more willing to make investment decisions and pour capital into wind energy projects when they have strong confidence and beliefs on the effectiveness of current wind power development support mechanisms and policies as well as confidence in the economic viability of wind power projects.

Knowledge of the operating context of wind power projects has a positive impact on financing and investment decisions of organizations with the coefficient $\beta = 0.386$ and $p\text{-value} < 0.01$, so hypothesis H2 is supported. Knowledge of the operating context of a wind power project is the factor that has the strongest impact on an organization's financing decision with the largest standardized impact weight of 0.394.

Normative institutional pressure has a positive impact on the organization's decision to finance wind power projects with the coefficient $\beta = 0.220$ and $p\text{-value} < 0.05$, so the hypothesis H3 is accepted. This result implies that with the source of information, the normative knowledge about knowledge in specialized projects such as wind power projects plus the support from technical reports will help banks, investment organizations and

individuals investors have multiple sources of information to evaluate projects and make funding decisions by reduce the risks of investing in projects as well as storing information to improve their knowledge of project appraisal. Wind power projects serve as a premise for the organization's future investment and financing of renewable energy projects. This facility is completely in line with the practice in the Vietnamese market. When the renewable energy industry is still a young market, investment institutions and financial institutions such as banks do not have much experience and knowledge in lending to green energy projects such as solar power or wind power, along with apprehension about the risks that these projects bring, organizations are still very restrained in funding wind power projects. Therefore, good quality reference information from consultants or technical reports will be a quality reference source to support investment organizations in making financing decisions for wind energy projects.

Coercive institutional pressure has a negative impact on the organization's capital financing decision with the coefficient $\beta = -0.032$ and p-value >0.05 , so hypothesis H4 is not statistically significant and hypothesis research is not accepted.

4.6. Test the reliability of the estimates

Table 5. Bootstrap results

Parameter	SE	SE-SE	Mean	Bias	SE-bias	CR	
FD ← PB	.117	.004	.340	.009	.005	1.8	
FD ← KC	.110	.003	.394	.000	.005	0	
FD ← IN	.092	.003	.193	-.006	.004	-1.5	
FD ← IO	.080	.003	-.045	-.015	.004	-3.75	

Source: Investigated by authors in 2022

From the Bootstrap test results, the study team calculated the critical value Critical Rate for Standard Errors of Bias. The combined results of the research team are seen for CR as the only number of estimates of the impact relationship between trust, operational prior knowledge, and normative application for project financing decisions. All wind projects are less than 1.96. Therefore, we can reject the null hypothesis that zero bias means that statistics and conclusions are quantified in the model with 3 variables namely a priori belief, knowledge of operating context and standard pressure that can be trusted.

5. Discussion and Conclusion

Currently, although Vietnam has a favorable natural potential for wind energy, the investors are still hesitant to finance this energy sector due to concerns about the efficiency of the wind power system. policy, land use, grid connection, and access to new technology. At the same time, the investors' low levels of knowledge about the technique and operation of the energy systems have become a barrier to the development of wind power in Vietnam. From the aforementioned research results, the authors would like to recommend several possible solutions for Vietnamese financial institutions as follows:

First, in order to attract capital inflows to wind power, Vietnam needs to ensure stable and complete policy schemes as well as up-to-date research and development technology. The Vietnamese government needs to focus on promoting the process of socializing the development of the transmission grid, encouraging businesses to actively mobilize capital to invest in the development of the transmission grid. This solution will help accelerate investment in the transmission network infrastructure in coastal areas, creating favorable conditions for the development of offshore wind power projects.

Second, the government and ministries should focus on building, developing and completing a complete policy framework for offshore wind power development, which is the foundation for achieving the goal of reaching net zero emissions by 2050, requires careful preparation in terms of the policy framework, including including support mechanisms, licensing procedures, as well as power purchase and sale contracts in accordance with international standards. In the case of wind power projects that are not eligible for the preferential FIT price mechanism, there may be other support mechanisms such as fixed price support for the first GW of wind power of the project. Besides, the The government level also needs to focus on the process of developing Power Master Plan VII, because this is one of the wind power policies that investors in the industry are particularly interested in.

Third, in order to ensure that the development of wind energy projects meets the standards, units (not only officials operating in the field of wind power but also public agencies) need to be trained and improve expertise in the field of wind power, especially knowledge of environmental impacts, impacts on the power grid, safety and security requirements and other requirements. Improving wind energy expertise and knowledge is crucial for investors to make financing policy decisions.

Moreover, improving knowledge of the operating context should also apply to with people in the area. Proposals for renewable energy projects are often opposed by people and some social organizations. Public outcry occurs for a number of reasons, such as environmental degradation, landscape impact, and lack of interest in consultation among local communities. Thus, in order to encourage the development of renewable energy projects, the government in general and localities in particular need to solve the problems in the hearts of the people and overcome the above situation by the public's support. conducive to the implementation of renewable energy policies.

Finally, data for wind power development research in different regions need to be supplemented. The thorough assessment of renewable energy potential fluctuates greatly due to the lack of reliable data, in addition to the new technology in the renewable energy segment, complex techniques and domestic contractors. Not having much experience in construction and installation of wind turbines on the sea makes many investors afraid of making decisions to finance these projects.

DETERMINANTS OF WILLINGNESS TO PAY FOR IMPROVING SERVICES OF MUNICIPAL SOLID WASTE COLLECTION AND TRANSPORTATION: THE CASE OF THANH HOA CITY

Dr. Ngo Thanh Mai
thanhmai@neu.edu.vn

Nguyen Tram Anh
ng.tr.anh81200@gmail.com

*Faculty of Environmental, Climate Change and Urban Studies,
National Economics University, Hanoi, Vietnam*

Abstract

Thanh Hoa is one of many cities in Vietnam, which has to face many difficulties of solid waste management due to a shortage of human resources, equipment and especially financial problems. In order to overcome these challenges, it is essential to assess households' willingness to pay for improvement of solid waste management services. By using Contingent Valuation Method, the survey results of 325 households in the city estimate the WTP of households to be 13,464 VND /person/ month. The regression model reveals that gender, age, education level, household size, household spending and level of satisfaction are factors influencing their WTP. This can be considered as an important information for Thanh Hoa authority to mobilize the participation and financial contribution from the community. This also set up a bridge to design a feasible service charge for solid waste collection and transportation which is suitable with community's payment.

Keywords: *Municipal Solid Waste, Municipal Solid Waste Management, Solid Waste, Willingness to Pay.*

1. Introduction

Solid waste is an inevitable consequence of production and consumption in the economy. In Vietnam, solid waste (SW) is increasing rapidly in both volume generated and hazardous perspectives. According to the Ministry of Natural Resources and Environment (2020), quantity of SW in 2019 reached 64,658 tons/day, higher than 46% as compared this of 2010. Meanwhile, the annual average rate of SW collection in 2019 was 87% and 66% in urban and rural area, respectively. There are 1,322 solid waste treatment facilities, including 904 landfills, 381 incinerators and 37 composting processing lines. The main form of treatment for SW in Vietnam is still landfilling (accounting for 71% of the collection quantity), of which only about 20% of facilities are hygienic. The remaining SW, which is not collected, is either improperly disposed of into open dumpsites or illegally thrown to the city's roads, rivers and lakes, causing negative impacts on environment and community's health.

Like many other cities, Thanh Hoa city is facing the problem of SW management due to strong economic growth and urbanization. Currently, the municipal solid waste

(MSW) management system in Thanh Hoa city is currently implemented in 30 wards and 4 communes. According to Thanh Hoa City People's Committee (2017), it is forecast that the quantity of SW generated in urban areas will be 754,000 kg/day in 2030, higher than 71.36% as compared to 2020. Under pressure of managing a large volume of SW, the MSW system in Thanh Hoa has many difficulties due to limitation of equipment, human resources and especially financial resources. The lack of financial resources significantly reduces the scope and quality of MSW service delivery.

In 2019, the People's Committee of Thanh Hoa City issued the 'Regulation on the maximum price for the service of collection, transportation and treatment of domestic solid waste funded by the state budget in Thanh Hoa province'. This is a bridge to calculate correctly and fully the full cost of SW collection and transportation into the price for service users to pay in the future. However, whether this policy is feasible and accepted by the people is still an open question. Therefore, estimating and defining factors influencing Willingness To Pay (WTP) of households for the improvement of MSW services are essential to mobilize financial contribution from the community and provide input data for the Thanh Hoa authorities to design price of SW service in coming time.

This paper includes 3 purposes. Firstly, identifying the factors affecting the household WTP level for improvement of MSW services. Secondly, estimating the household's WTP. Thirdly, based on the analysis results, some policy implications are proposed to encourage the participation and financial sharing of the community for MSW management in Thanh Hoa City.

2. Method

2.1. Primary Data collection

In the research, quantitative information was collected through the survey using pre-designed questionnaires. The questionnaires were developed to collect quantitative information at the household level. The survey was conducted from September to October in 2021.

Subjects of information: To collect information, the subjects providing information include:

- (i) Households who use the MSW services of collecting and transporting in the Thanh Hoa city
- (ii) Representative of People's Committee of Thanh Hoa City

Sample Scale: Due to the situation of Covid 19 pandemic, the household survey was implemented by online form. After conducting the survey, some of the receipts were removed. There are 337 survey participants, of which 12 were misinterpreted. After filtering out the questionnaires, the valid votes were 325. The reliability of the questionnaires was acceptable as sampling procedures were in accordance with statistical principles. The questionnaire design and conduct of the survey attempt to ensure that the questionnaires are designed appropriately, that the respondents understand the questions. Based on the principles of statistics, results of the survey in Thanh Hoa can provide a certain level of confidence.

2.2. Research Method

Contingent Valuation Method (CVM) is used to quantify household WTP levels for positive changes in solid waste collection and transportation services in the study area. This is a commonly used technique to determine the non-use value of resources and the environment with the following process (Bolt et al., 2005).

(i) Focus group discussions - FDGs

To build a questionnaire suitable for research, two group discussions were conducted. The first discussion (1) was conducted with representatives of city authorities to understand the current status and propose some recommendations for improving the performance of the MSW system. The second discussion (2) was conducted with 12 people to assess the quality and expectations of improving SW collection and transportation services. In addition, the household was also asked if they were willing to pay a sum of money for the improvement of MSW services. Individuals who answer 'Yes' will be asked about the WTP/person/month. To determine the number of payment levels and the gap between reasonable levels, Open-ended questions were used to ask households about the 'highest willingness to pay for improvement of SW collection and transportation services'. After group discussion with 12 people, 7 levels of WTP were determined: VND 3,000, VND 5,000; VND 7000, VND 9,000, VND 11,000; VND 13,000 and VND 15,000. These WTP levels are edited and designed as payment cards in the questionnaires.

(ii) Pre-test

In order to improve the questionnaires and the range of WTP, the author conducted a trial survey of 22 households. Among the WTP levels obtained from in-depth interviews, 4 more levels were selected, bringing the total selected payment level to 12 levels. On that basis, the willingness to pay range is designed in the payment card in ascending order with the lowest payment being VND 1,000 and the highest being over 25,000 VND/person/month; the distance between the payment levels is 2,000 VND

(iii) Survey content

The household questionnaire was designed according to the guidelines of Mitchell & Carson (1989) with 3 groups of information. (i) Firstly, the general household information group, including information on age, sex, education, occupation, and income. (ii) Secondly, questionnaires on MSW behaviour at household level and assessment of MSW service quality. (iii) Thirdly, questionnaires on the selection of the household's WTP level. A scenario for improving MSW services was introduced to the people based on the results obtained from in-depth interviews. This scenario presents the main outline of the current status and the need to improve the quality of MSW services. After the scenario is presented, people will be asked if they are willing to pay a sum of money to improve service quality. WTP level is selected at random within the willingness to pay range of the payment card.

(iv) Models and factors influencing WTP

To analyze the influence of some key factors to WTP households performing SW collection services, manage and handle, regression function is used used for evaluation. WTP

is a dependent variable with independent variables, including: Gender, Age, Education level, Household size, Household spend and and Level of satisfaction with the segment of SW collection and transportation. The model is presented as follows:

$$WTP = C + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \beta_5 X_5 + \beta_6 X_6$$

Where:

X₁: Gender (Equal to 1 if female, equal to 0 if male)

X₂: Age (Average of age ranges included)

X₃: Education Level (Dummy variable: Under Secondary school: 0, High school: 1, College and University: 2, Post university: 3)

X₄: Household Size (Number of people in the household,)

X₅: Household Spending

X₆: Level of satisfaction with the segment of MSW collection and transportation (Dummy variable: Very dissatisfied: 0; Dissatisfied: 1; Medium: 2; Satisfied: 3; Very satisfied: 4)

C: Intercept coefficient of the regression model

B₁, B₂, B₃, B₄, B₅, B₆: Corresponding coefficients of the variables

3. Results

3.1. Socioeconomic profile of respondents

Among 337 survey participants, 325 votes were valid. The number of men participating in the survey is 119 people, accounting for 36.6%, and women are 206 people (accounting for 63.4%). The age variation in 325 valid questionnaires is from 18 to 60 years old, the average age of the research survey is 35 years old, the most common age is from 30 to 40 years old. It can be said that most of the interviewees are family heads who have certain financial independence. The highest percentage of education is high school, accounting for 54.3% of the respondents. The percentage of college and university is about 21.5%, and the rest accounts for 14.9%. Among the 325 households surveyed, it can be seen that size of households are quite different, ranging from the size of a nuclear family to a large family with many generations. Specifically, the most common is the family with a size of 3-5 people (accounting for 79.1%), the largest is 5-8 members (accounting for 11.7%). The socio-economic characteristics of respondents are presented in the following table

Table 1. Statistical Description of variables

Variable	Age	Gender	Education level	Household size
Mean	35,09	0,82	1,94	4,11
Variance	100,96	0,15	0,18	1,45
Median value	35	1	2	4
Mod	35	1	2	4
Standard deviation	10,05	0,39	0,43	1,20
Min	23,5	0	0	1,5
Max	65,5	1	3	9,5
Observation	325	325	325	325

Source: Calculated from the survey by author

3.2. Willingness to pay of households for improved MSW collection and transportation

To find out the willingness to pay of households for the segment of MSW collection and transportation, A hypothetical scenario is designed. That is “If the SW collection and transportation services can be improved as noted in Box 1, how much are you willing to pay per month for these?”. There are 325 people participating their willingness to pay for this service. The survey shows that this answer depends on the needs, desires of the household. There are people who are not satisfied with the current service but still accept to pay a higher price with the desire to ensure a change in service quality, and there are households who are satisfied with the service provided. and at the same time do not want to pay more to upgrade the current service.

Box 1. Scenario for upgrading solid waste collection and transportation service

- **SW Collection service:**
 - Collection location
 - + Traditional household collection
 - + There are more places to put large cans so that people can put their trash if they miss the collection time.
 - Increasing the frequency of SW collection to 3 times per day
- **SW Transportation service:**
 - In each residential area, build a reasonable temporary garbage collection place, avoiding causing odors to residential areas.
 - Frequency of transportation from temporary gathering area to treatment area in all wards and communes: 2 times/day on average.
- **Public sanitation:**
 - Provide more trash cans in public places.
 - Maintain sanitation of village/commune roads throughout the day.

Source: Compiled from the survey by author

Among 325 valid interviewees, 265 people agree that they are willing to pay more than 11,000 VND/person/month to improve the quality of solid waste collection and transportation services. Therefore, for households who do not agree to pay a price higher than 11,000, the statistical value for the remaining cases will be the price of 11,000 VND. The author has synthesized the willingness to pay of interviewees through the Descriptive Statistic tool in Excel to describe the WTP level.

Table 2. Descriptive statistics of WTP of respondents

WTP Value	
Mean	13.464,61
Variance	4.558.157,64
Median value	13.000
Mod	13.000
Standard deviation	2134,98
Min	11.000
Max	20.000
Observation	325

Source: Calculated from the survey by author

The highest WTP is 25,000 VND/person/month, the lowest is 0 VND/person/month. The maximum payout is 13,000 VND as shown by the mode value = 13,000 in Table 2. To calculate the WTP of the respondents, the random evaluation method is performed by choosing to use the mean WTP value of the research sample. This value is random and depends on the research object, time and location of the study, but the results are different.

The average WTP in Thanh Hoa city 13,464.61, equivalent to VND 55,000/ household/ month. With the number of households in this city, financial sources can be mobilized from the community. This can be seen as a potential source of funding from the community to share limited government budgets, solving financial difficulties in the MSWM model and improving the quality of SWM services.

3.3. Factors detemining households' Willingness to pay

The study identifies the coefficients for the regression model as follows

Table 3. Results of willingness to pay model estimation

Variables	Unnormalized coefficient	Unnormalized coefficient	P-value	VIF
C	11696.942		0.000	
X₁ (Gender)	449.367	0.811	0.028	1.113
X₂ (Age)	9.334	0.914	0.074	1.007
X₃ (Education)	157.571	0.310	0.054	1.046
X₄ (Household Size)	187.464	-0.106	0.053	1.156
X₅ (Household Spending)	0.000	0.314	0.000	1.282
X₆ (Level of satisfaction)	548.244	0.251	0.000	1,024
R₂	0.188	Hệ số Durbin - Watson		2.040
R₂ hiệu chỉnh	0.172	P-value		0.000

Source: Calculated from the survey by author

So, the model is described in the form of a normalized regression equation as follows:

$$WTP = 0.81X_1 + 0.91X_2 + 0.31X_3 - 0.106X_4 + 0.2X_5 + 0.251X_6$$

In the above model, we see that $R^2 = 0.172$ that is, from the survey data, it can be seen that the independent variables in the model explaining the change of the dependent variable (willingness to pay) are 17.2% for the model. Durbin - Watson coefficient = 2.040 fill in the range of 1.5-2.5, so there is no first order series autocorrelation. Therefore, the sequence of numbers has no delay, the independent variables do not depend on the period of time. Sig. F = 0.000 < 0.05 test, then this linear regression model fits the data set and can be used. Sig. The t-test (P-value) of the coefficients of regression of the independent variables is quite different. There are 5 variables, including Gender, Age, Education level, Household spending and Satisfaction level are positively related to WTP; meanwhile only household size variables is inversely proportional to WTP.

For the Gender variable, P-Value = 0.028 < 0.1, which means that the gender variable is positive related to WTP. In other words, the women are more likely to accept

higher payment than men (coefficient of 0.811 is statistically significant). According to Ezebilo (2013), this is also consistent with the traditions of developing countries where women often take responsibility for the care of household waste. Therefore, they are expected to be able to pay higher for improving the MSW services.

With the Age variable, P-Value = $0.05 < 0.074 < 0.1$, which means that the Age variable has a relative relationship with WTP. The estimating coefficient of Age variables with positive sign indicates that people of older age have better awareness of environmental protection.

With the variable of Education Level, P-Value = $0.054 < 0.1$, which means that this variable is closely related to WTP. This result is consistent with Zerbock's result (2003). His research pointed out that people with higher levels of education are probably willing to spend more for improving SWM services because they understand the benefits and importance of SWM system for the environment and their health.

With the variable Family Size, P-Value = $0.05 < 0.053 < 0.1$. The coefficient of the variable is negative, implying that when households' size is large (consist of many people), their WTP tends to decrease. Householders believe that WTP may add the burden on family spending. Therefore, the increase of household population will reduce WTP. This result is supported by the study of Nkansah E. (2015).

With the Household Expenditure variable, P-Value = $0.00 < 0.01$, which means that the expenditure variable is closely related to WTP. The level of expenditure per household in the month affects the WTP. Households with high spending levels are often willing to pay a higher price for SW collection and transportation (WTP). $\beta_5=0.314$ can be understood that if the spending level increases by 1 unit, the WTP will increase by 0.314 units. When income or expenditure increases, people's needs for the quality of the living environment are also higher than those with lower income.

For the Satisfaction level variable, P-Value = $0.00 < 0.01$, which means that this variable is closely related to WTP. The higher the satisfaction level of the interviewee, the higher the willingness to pay. This explains why households feel satisfied and tend to want better services. $\beta_6 = 0.251$ can be understood that if the spending level increases by 1 unit, the WTP increases by 0.251 units.

The VIF coefficients of the independent variables are all smaller than 2, so there is no multicollinearity phenomenon. That is, the independent variables in this regression function do not depend on each other.

In summary, for the dependent variable which is the WTP for improved SW collection and transportation services, there are 6 influencing factors which are Gender, Age, Education Level, Household Size, Spending and Satisfaction Level. In fact, these six independent variables also affect WTP. When the size of the household is large, it also means that the expenditure level of the household increases, while there are many households with small children and the elderly who are not yet of working age and are not old enough to work, partly affect the willingness to pay of the interviewees. In terms of monthly expenditure, when households spend more for daily living needs, the amount of waste increases, when people's living standards are improved, the needs of households are also

increasingly diverse and complex. At that time, households tend to want to pay more for SW collection and transportation services and at the same time, the demand for service quality is also improved. The last variable is about Satisfaction, it can be said that when the satisfaction level of households increases, the ability to want to pay for this service also increases. The regression results of this study have similarities with the results of previous studies. Therefore, it is increasing confidence about the relationship between the independent variables and the WTP variable.

4. Conclusion

The MSW system in Thanh Hoa city is facing many challenges due to limited financial resources, human capacity and equipment. The lack of these resources significantly reduces the quality and scale of MSW service delivery, creating potential risks that negatively affect the environment and public health.

Also, from the household's point of view, many outstanding problems in the quality of SW collection and transportation services have been noted. The difference in service quality between regions is a clear demonstration of the city government's limited capacity to provide environmental goods and services. That shows that the participation and sharing of the community is absolutely necessary to reduce the burden on the public sector.

The results of research and calculation of WTP levels of 325 households in Thanh Hoa show that the average WTP level is 13,464 VND/person/month in research sample. It can be seen that the WTP level of the household is higher than the current price of collection and transportation services. This is a good basis for the Government and the People's Committee of Thanh Hoa City to develop a roadmap to increase the price of collection and transportation services to suit their ability to pay and the desire to improve service quality. community service when the quality of life is increasingly improved.

The regression model identifies a number of factors that positively affect the WTP level of the household, such as: gender, age, education level, household spending and satisfaction level. That shows that in order to mobilize the participation and financial contribution from the community, it is necessary to combine and support many factors. Improving income, developing education, raising awareness for the community, especially diversifying content, forms and objects of propaganda are important platforms to encourage sharing from the community, open up a new direction, in line with the current trend of socialization and empowerment

Abstract

China is the leading country in terms of seafood export value, and at the same time ranks number one in the world in terms of fishery output caught at sea. Like Vietnam and many other countries, China's fishery resources are facing the pressure of declining stocks due to overfishing. Therefore, the article studies the system and measures of Chinese fishing management, thereby drawing necessary lessons for Vietnam's seafood industry in the coming time.

Keywords: *China's experience, fishing management system, fishing management methods.*

1. Introduction

China is the number one country in the world in terms of seafood export value (with nearly 20 billion USD). At the same time, China also leads the world in fishing output at sea. In 2013, China's fishing fleets harvested nearly 14 million tons, nearly three times the catch of the next largest fishing nation, Indonesia. Due to the pressure on fishery production leading to prolonged overfishing along with marine environmental pollution, it has severely reduced marine fishery resources and reduced the health of marine and coastal ecosystems in China. More and more waters of China appear the phenomenon of "rare fish in the sea". For example, the fishing grounds in the Zhushan Islands, covering an area of 220,000 square kilometers, were once so productive that the area was known as the home of China's fishing, the region's large yellow croaker catch, which reached 170,000 tons in 1957, fell to just 400 tons in 2015, a decrease of more than 99%. The trend of declines in catches for other Chinese fishery species is similar, especially for the highest value species, although the loss has been offset by increased catches of these low-value and more abundant species. Facing the problem of decreasing fishery resources, and facing economic and social pressure, the Chinese government has applied many drastic management measures.

Vietnam possesses many natural advantages to develop the fisheries economy. Taking advantage of available advantages, the fishery industry has made significant contributions to Vietnam's economy, especially promoting exports, creating jobs, improving livelihoods for fishing communities, contributing to ensuring food security, and protecting

the country's sovereignty over the sea and islands. However, due to overexploitation and eradication, the aquatic resources in Vietnam have been and continue to be in serious decline. According to "Report on survey results on marine seafood resources of Vietnam for the period 2011-2015" published by the Institute of Fisheries Research in 2018, a comparison of marine fishery reserves in the period 2011-2015 and the period 2000-2005 shows that reserves of major groups of marine resources are lower than 13.9% (equivalent to about 710 thousand tons) the reserve of small pelagic fish group decreased by 3.2%; bottom seafood group decreased 41.7%; group of large pelagic fish decreased by 10.2% (Institute of Fisheries Research, 2018).

Thus, like in China, aquatic resources in Vietnam's sea are being seriously reduced. Therefore, studying China's experiences in the application of marine fisheries management systems will help Vietnam gain practical reference lessons.

2. Method

The methods used in this study includes researching, summarizing and analyzing secondary data. The researched data is from Vietnamese and foreign studies from 2011 to 2021. Some of the foreign research is in Chinese.

3. Results

3.1. Economic and social challenges in fisheries management in China

Fisheries are an important economic engine of China. In 2016, the total value of China's fisheries industry was 2.366 trillion yuan, of which the fishery output value was 1.2 trillion yuan, and the output value of the industry and Construction, circulation, and related services are about 1.16 trillion yuan. In terms of the global market, China is the leading country in the world in terms of seafood export value (ranked first with nearly 20 billion USD). China leads the world in marine fisheries production. In 2013, China's fishing fleets harvested nearly 14 million tons, nearly three times the catch of the next largest fishing nation, Indonesia. Thus, if the restriction of fishing is to protect natural marine aquatic resources, it is imperative for China to promote aquaculture to ensure maintain the number one position in the world market for aquatic products. However, the promotion of aquaculture has not received much support from seafood consumers because the majority of consumers still prefer wild-caught seafood over farmed seafood. Therefore, increasing the application of fisheries management measures is really a big economic challenge for China.

In addition to the economic challenge, fisheries management in China also faces a social challenge from the requirement of changing livelihoods for the fishing community. This is considered an important social issue that needs to be resolved to realize the goal of sustainable management of aquatic resources in China. According to statistics, China had 9.4 million fishermen engaged in fishing activities and 5 million aquaculture farmers in 2016 (FAO, 2018). In theory, the solution to restoring and stabilizing fisheries is simply to reduce fishing pressure to allow supplies to recover. With a large number of fish, even a low fishing effort can produce high yields and profits because of abundant resources, high fishing efficiency. In practice, however, economic and social pressures often prevent governments from taking the necessary actions to restore marine fishery resources. If the government takes drastic action to recover, the fishing community will face the risk of job loss, loss of

income. Therefore, livelihood transformation for fishermen is considered the most important job to solve the problem of "rare fish in the sea" and restore fishing grounds. The Zhejiang provincial government is an example of China's early and successful implementation of the livelihood transformation model for fishing communities.

3.2. Experience in applying China's fisheries management system and measures

Since the founding of the People's Republic of China, the Government of China has continuously issued and implemented a series of fisheries management systems and measures to promote the sustainable development of the fisheries industry to the actual economic and social conditions of this country.

China's fisheries management systems and measures are broadly grouped into six groups as follows: input control, output control, technical or managerial measures, and control measures economy, offshore fisheries management systems, and international cooperation mechanisms on fisheries management (Table 1).

China's fisheries management systems and measures are broadly divided into six groups as follows: input control, output control, technical management or control measures, economic control measures, offshore fisheries management systems and international cooperation mechanisms on fisheries management (Table 1).

3.2.1. Input control

- Fishery license system

The fisheries license system adopted in 1979 is one of the management systems implemented by the competent national administrative authorities of China to plan and control fisheries activities and production. China's fishing permit system was originally defined under the “Regulations on the Reconstruction and Conservation of Fishery Resources” issued by the State Council in 1979. In the same year, the State Fisheries Administration issued a provisional regulation on a number of issues related to aquaculture licenses.

The system of fishing permits is defined by the 1986 Fisheries Law. Article 16 of the Fisheries Law stipulates that "Any unit or individual intending to exploit inland fisheries or inshore fishing must first apply for a fishery exploitation permit at the fisheries management department. Licenses for the use of large driftnets and driftnets in fishing shall be granted with the approval of the Fishing Authority of the National Assembly. Other fisheries permits will be issued with the approval of the local government at or above the county level, but fishing permits for marine activities that have been issued are not allowed to use driftnets and other fishing gear in excess of the state-regulated quota. Specific measures shall be taken by the people's governments of provinces, autonomous regions and centrally run cities.

Fisheries permits may not be sold, leased or transferred by other unlawful means and they may not be altered. The provisions on liability related to violations of aquaculture licenses are clearly stated in Article 30, Article 31 and Article 32 of the Fisheries Law. Accordingly, “Any person who fishes without a mining license in accordance with this Law shall be confiscated from illegal fishing products and income and may also be subject to a fine. In serious cases, his fishing gear may also be confiscated” (Article 30); “Anyone who catches in violation of the type of activity, location, duration and quantity of fishing gear stated in the permit, shall be confiscated of the fishing product and illegal income and shall be concurrently fined. In serious cases, his fishing gear may also be confiscated and his fishing license revoked” (Article 31) and “Anyone who trades in, leases or transfers fishing

licenses by other illegal means shall forfeit his illegal income and have his fishing license revoked, and may be subject to a fine ” (Article 32)

In keeping with the provisions of the 1986 Fisheries Law and its implementing regulations, the MOA has developed and promulgated the “Fishing License Regulations”, and introduced specific regulations on the fishing license system in the waters under the jurisdiction of China. This Regulation was amended in 1997. In 2000, the Fisheries Law was amended, consolidating the relevant provisions of the fishing permit system (Shuolin Huang, Yuru He, 2019). Although the fisheries license system has been strengthened in practice, according to the results of the first national survey of fishing vessels conducted in 2000 organized by the MOA, 67,200 illegal vessels without fisheries license, fishing vessel registration certificate, fishing vessel registration certificate, accounted for 27.5% of the total number of vessels (Huang KJ, 2001).

Despite the fact that the fishing license system has been strengthened in practice, the MOA's first national census of fishing vessels in 2000 revealed that there were still 67,200 illegal fishing vessels without fishing licenses, fishing vessel registration certificates, accounting for 27.5 percent of total vessels (Huang KJ, 2001).

Moa issued the "Regulation on Management of Fishing Licenses" in 2002 to tighten the management of fishing licenses. This Regulation describes the requirements for obtaining a fishing license, fishing zones, the number of fishing gear that may be used, and the types of sanctions that may be imposed if regulations are broken. In 2004 and 2007, this regulation was updated (Gongming Shen, Mikko Heino, 2014).

In general, fishing permits are issued in China depending on the state of fishery resources, which is defined by biomass and total authorized catches (TAC). However, in Chinese practice, this requirement is frequently neglected, and as a result, the system serves only a limited role in the conservation of fisheries resources.

- Restricted fishing vessel and fishing gear system:

China began using the "Dual Control" system in 1987, which controls both the total number of fishing vessels and their total engine capacity (Ou et al., 2011). In practice, however, the data did not indicate a positive overall effect. The "Dual Control" concept has not yet been fully implemented in many coastal locations. The number of fishing vessels surged by more than 60,000 between 1986 and 2002, and their machine capacity more than doubled (Gongming Shen, Mikko Heino, 2014). China has pushed to strengthen its "Dual Control" system since 2003. The MOA established a "Implemented Attitude toward the Control of Fishing Vessels at Sea for the Period 2003-2010" in 2003, which defined clear goals and specific implementation requirements.

By 2010, the fishing fleet's number and total machine capacity are expected to be reduced to 30,000 vessels and 1.27 million kilowatts, respectively. As a result, despite the fact that the number of fishing vessels has fallen since 2003, the overall number of capacity machines has constantly climbed, with the exception of 2003. As a result, it is clear that the "Dual Control" system failed to meet its objectives. This method has failed to halt the tide of rising fishing attempts, particularly in terms of total fishing vessel capacity. The low efficiency of the "Dual Control" system can be explained by three key issues: 1) Local

authorities' inadequate inspections; 2) Illegal fishing vessels; and 3) the introduction of additional fishermen (Ou HK, Yu CD, 2011).

- Fishermen's resettlement assistance system

According to data, China has paid out 25.167 billion yuan (\$3.84 billion) in compensation and subsidies to fishermen who have stopped fishing as of January 31, 2021. 129,743 workers were relocated to different occupations in important waters, and 171,626 were given social security benefits. For example, China's desire to restore the environment can be shown in the instance of resettlement assistance for fishermen affected by the 10-year fishing ban on natural waterways along the Yangtze River, which went into force on January 1, 2021. This "fish in, people out" program intends to not only rehabilitate river fish stocks, but also to give new life to fishermen who fish far from shore. Because the prohibition directly impacts almost 231,000 fishermen and roughly 111,000 boats in a dozen provinces, local governments have been actively assisting fishermen in their relocation. Local authorities have created and implemented a range of relocation measures, including job introductions, insurance support, and monthly living allowances, in addition to giving up fishing boats and equipment for a one-time financial compensation of more than 200,000 yuan (\$30,562). Work in the industrial park has been introduced to many fishermen. The "Resettlement Assistance System for Fishermen" is, in reality, a good measure in China's fisheries resource management.

3.2.2. Controlling the output

- Quota system for fishing (TAC)

The amended Fisheries Law of 2000 introduced a fishing quota system (TAC), which presents a significant compliance difficulty for Chinese authorities. As a result, China has approached the TAC with caution.

In northern Zhejiang province and Shandong Province's Lai Chau Bay, a pilot project of sea crab fishing quotas (*Portunus trituberculatus*) and jellyfish (*Rhopilema esculentum*) was launched. The projects aimed to identify tac and allocate fishing quotas, as well as set up a number of support systems, such as fishing log management, fishing business in designated market areas, fishing vessel inspection process, fisheries observers system, marine management system, reward and sanctioning system, and quota prevention mechanism (Chen, 2017).

Pilot projects in five provinces were expanded in 2018: Zhejiang, Shandong, Liaoning, Fujian, and Guangdong. Silver anchovies (*Engraulis japonicas*) are on the pilot list in Zhejiang; Shandong continues to set jelly fishing quotas (*Ropilema esculentum*); Liaoning chose Chinese tiger shrimp (*Fenneropenaeus chinensis*) from certain waters in the Pulandian region of Dalian; Fujian chose swimming crabs (*Portunus trituberculatus*) from the waters of Zhangzhou city. By 2020, China's coastal provinces should have selected at least one location with relatively mature quotas to manage mining quotas, as planned. These pilot projects are a concrete step toward promoting the implementation of fishing quotas in China, assisting in the resolution of difficult issues, identifying viable methods for effectively conserving fisheries resources, and investigating a new model for making reasonable use of fisheries resources in China.

- Policies relating to the output of marine fishing include "zero growth" and "negative growth."

To alleviate the strain of the fishing effort, China began to examine regulating overall marine fishing output through a framework that regulates fishing production, rather than seeing high catches as a political triumph of local governments. The MOA proposed a "Zero Growth" program in 1999.

The MOA suggested a policy of "Negative Growth" in 2000 in order to boost the strategy's execution. In China, the regime of controlling fishing output to regulate total catches and sustain fishing levels is regarded as a suitable approach in the face of the depletion of marine fisheries resources as well as the necessity to safeguard the livelihoods of fishermen (considered vulnerable populations).

3.2.3. Measures of technical direct oversight

- Area or duration of closure

In 1955, China started defining the borders of its bottom-fishing sea-closing area. The boundary line has been relocated to 27°N, 121°10'E. On August 16, 1957, it was added to two base points to the south. A completely protected region along the continental shore was constructed on May 6, 1980. Bottom fishing is prohibited in the land-side portion of this line all year. This strategy helps to maintain and make fair use of coastal fishing resources while also supporting fisheries management, small-scale fisheries protection, China's maritime rights and interests, fishing production, and border restrictions.

Moreover, to safeguard and enhance fishery resources, China has established a "summer fishing restriction." In 1995, the South China Sea and the Yellow Sea implemented a summer fishing restriction. In addition to limiting fishing gear, all fishing at sea is prohibited for two to three months each year during the summer, with varied prohibition laws in different seas. In the meantime, during the early summer, local governments in coastal regions suspend all fishing netting in their waterways for at least two months. Summer fishing rules in China began in 1998, with changes to operating hours and kinds of fishing gear. The banned areas were expanded to include the South China Sea in 1999, while the Yellow Sea closure time was prolonged and the seas in Fujian province were also altered. On an annual basis, the system is modified and perfected in terms of sea, type of operation, time range, and other factors.

Since 2017, the summer fishing season has been prolonged (the net closure period has been extended from 2 to 3 months) and the closing time for all forms of fishing has been universally extended from 2-3.5 months to 4.5 months, with the exception of fisheries. It is widely acknowledged that China's summer fishing prohibition system provides breeding groups and fry with adequate protection for a period of time, thereby providing opportunities and sufficient space for fishing resources to grow and develop, as well as increased resource volume and mining output throughout the year. The strategy also aims to cut down on the amount of time spent at sea each year, total fishing efforts, and the impact on fishing resources. Summer fishing bans are widely regarded as one of China's most effective fishing management techniques. This system's success may be attributed to two factors: The fishing ban is less difficult to create and requires less scientific evidence than other solutions.

All fishing vessels must be anchored in the harbor during the embargo so that enforcement officers may readily locate unlawful fishing vessels. The quick rise in fishing efforts after the restriction, however, totally restored the ban's conservation impact. As a result, this approach has a negligible impact on long-term fishing resource conservation and restoration. China has also banned spring fishing in the Yangtze and Zhujiang rivers in order to reduce fishing time. Since 2002, the Ministry of Agriculture has prohibited spring fishing in the middle and lower Yangtze Rivers for three months, and the Yangtze river fishing ban has been fully operational with State Council permission since 2003. The Yangtze River's major lines and several of its important tributaries are among the locations. The higher portions of the Dau Chau Dam close from February 1 to April 30 each year, while the downstream side of the dam closes from April 1 to June 30 each year. During this period, all forms of fishing are restricted (Yangtze Fisheries Resources Management Commission, 2011). The Ministry of Agriculture released a notification on December 23, 2015, stating that the Yangtze River fishing ban would be adjusted beginning January 1, 2016. As a result, the closed areas should be expanded to include the Yangtze River's main lines and tributaries, as well as major lakes; the closing period should be agreed upon and extended from 0:00 am on March 1 to 24 hours on June 30; and all fishing activities should be prohibited during the closed time and area. This strategy is critical for the conservation of the Yangtze River's aquatic resources, the protection of the river basin's environment, the maintenance of biodiversity and ecological balance, and the safeguarding of national food security (Li, 2016). From midnight on April 1 to 12:00 p.m. on June 1 each year, China banned spring fishing on the Zhujiang River, encompassing the main currents, main rivers, and pine lakes in the sea of six provinces (districts): Jiangxi, Hunan, Guangdong, Guangxi, Guizhou, and Yunnan. In February 2017, the Ministry of Agriculture tweaked and finished the system, increasing the shut-down duration from 0:00 a.m. on March 1 to 24 hours on June 30 and widening the closure zones (Ministry of Agriculture, 2017). The policy's execution has resulted in a significant increase in the amount and quality of fish captured, although its usefulness is limited (Han et al., 2015).

- Areas of protection

Increasing reserves is a good strategy to help ecosystems and fisheries resources recover. The Chinese government has begun to standardize herd augmentation initiatives by issuing a number of rules, including the "Wildlife Protection Regulation" and the "Announcement on the Promotion of Fisheries Resources Enhancement." 24.8 billion pieces of shrimp larvae were released between 1980 and 1992; 3.5 billion breeds were released between 1999 and 2001; and 88.2 billion breeding fish were released in 2005 alone. During the same time period, over 3,000 Chinese sturgeon, as well as over 3 million oysters and mussels, were released. With the help of the Fisheries Department, three coastal provinces—Guangdong, Fujian, and Zhejiang—have started artificial reef initiatives to aid in the restoration of marine natural ecosystems and the enhancement of fishing resources.

Article 29 of the People's Republic of China Fisheries Law mandates that fishing germ protection zones be established in places where live aquatic resources of high economic and genetic importance are cultivated and bred (AGRPAs). Article 29 of the People's

Republic of China Fisheries Law mandates that fishing germ protection zones be established in places where live aquatic resources of high economic and genetic importance are cultivated and bred (AGRPA). China launched the first phase of the AGRPA's formation in 2007. MOA released "Interim measures for the management of fishery germ protection areas" in 2011 with the goal of enhancing and harmonizing protected area management. Artificial reefs and marine breeding facilities have been constructed, and reclamation and emancipation efforts have had a significant impact. China has created 492 national aquatic germ nature reserves and 23 national aquatic nature reserves as of 2015, both of which are vital for the preservation of fishery resources. The development of the AGRPA is one of China's most significant new management initiatives. The reason for this is that the AGRPA lacks specialized regulatory entities and funding to carry out its mandate. Furthermore, ordinary people have limited understanding of AGRPA, with many unaware of the organization's role (Yang WB, Li JL, Feng GF, Li XS, Li HQ, 2011).

In 2007, China began the first phase of the establishment of the AGRPA. In 2011, MOA issued "Interim measures for the management of fisheries germ protection areas" to strengthen and standardize the management of protected areas. Artificial reefs and marine breeding have been built, and reclamation and emancipation measures have had a marked effect. As of 2015, China has established 492 national aquatic germ nature reserves along with 23 national aquatic nature reserves, which play an important role in preserving fisheries' resources. The establishment of the AGRPA is one of China's important new management measures. However, the actual level of protection that AGRPA provides remains limited. The reason is that the AGRPA lacks specialized regulatory bodies, lack funds to implement. In addition, ordinary people have very little knowledge of AGRPA, many of whom do not know the role of AGRPA (Yang WB, Li JL, Feng GF, Li XS, Li HQ, 2011).

In addition to introducing regulations on protected areas, China has introduced technical measures such as regulations on net limits of fishing nets, limits on the size of fish allowed, limits on the rate of fishing below size, and prohibited fishing methods.

In China, research on minimum mesh size began in the 1970s. However, regulations on mesh size were not implemented until later. Article 30 of the Fisheries Law of the People's Republic of China stipulates that fishing gear with meshes smaller than the minimum mesh size is not allowed. Only after 2004, did the MOA begin to fully implement regulations on minimum mesh size. The minimum allowable mesh size depends on the fishing gear as well as the fishing area (Table 2). However, it can be seen that this regulation still has many limitations. For example, there is a very small number of legally binding standards for mesh size, which currently has only six standards. There are currently at least 40 major commercial fish species and more than 10 fishing gear in Chinese waters, and current standards make many fishing gears and fish species out of regulation. There are no rules regarding technical limits for shrimp and crab fishing. Moreover, the state of fisheries resources in China has changed a lot in the last 30 years so standards need to be updated. Although there are shortcomings, it should be acknowledged that the "Minimum Mesh Size Regulation" is a very important means to protect fisheries resources in China.

Table 2. Regulations on Minimum Mesh Size (MMS)

Fishing gear	MMS (mm)	Scope of application		Standard (year)
		Area	Major species	
Dragnet drop	54	The Yellow Sea, East China Sea	All	GB11779-1989a, b (1989)
	39	South China Sea (South China Sea)	All	GB11780-1989a, c (1989)
Drip nets	137	The Bohai Sea, The Yellow Sea, East China Sea	White bird fish (Pampus argenteus)	SC119-1983d (1983)
	90	The Yellow Sea, East China Sea	Chinese beet/Herring (Ilisha elongata)	SC120-1983d (1983)
	90	The Bohai Sea, The Yellow Sea, East China Sea	Japanese mackerel (Scomberomorus phonics)	SC121-1983d (1983)
The drop of the netting profession	50	East China Sea	Pilotfish/Sawfish (Trichiurus lepturus)	SC4013-1995d (1995)

a. GB - National Standard

b. The standard was revised in 2005. The size has not changed.

The standard was revised in 2005. The size is adjusted to 40mm.

SC - Industry Standards

In addition, China specifies the fishing methods prohibited in Article 20 of the Fisheries Law. Specifically: "It is strictly forbidden to use explosives and poisons in fishing. Fishing is not allowed in no-fishing areas and in closed seasons, fishing by equipment and methods prohibited by fisheries management agencies, or using fishing gear with meshes smaller than the minimum size as prescribed. Fisheries management agencies under the people's administration of the district or district level shall designate specially protected species, prohibited fishing areas and closed seasons, prohibited or restricted fishing gear and methods and minimum sizes for the mesh, as well as other measures to protect fisheries resources." In addition, the Law on Fisheries also clearly stipulates liability for cases of violations of prohibited fishing methods in Article 28, specifically "Those who use explosives and poisons for fishing and fishing violate regulations on fishing zones and closed seasonalities, use of prohibited fishing gear, means of fishing or rare fishing vessels under the State protection will be confiscated products.

3.2.4. Economic instruments

In the late 1980s, the Chinese government began to charge a fee to protect fishery resources. Article 19 of the Fisheries Law stipulates that "Fisheries management agencies

under district and district people's governments are responsible for formulating a master plan and taking measures to increase fishery resources in the sea area fisheries under its jurisdiction. These agencies can collect fees from entities and individuals who profit from the use of such waters and spend the proceeds to enhance and protect fishery resources. The procedures for collecting these fees are developed by the Department of Fisheries Management and the Department of Finance under the State Council and must be approved by the State Council before they take effect. Fishery resource protection fees are collected from fishing organizations and fishermen and used to conserve and develop fish resources. Specifically, the fee for the protection of aquatic resources is used for activities such as stocking the whole seed, buying the necessary means of support for culturing the fingerlings; construction of artificial coral reefs, fish houses, and other reclamation works in coastal and inland waters; loans to fishermen for production, relocation or business; subsidies for scientific research on the protection and development of fish resources; and provide financial support to implement management approaches to enhance, protect, and monitor fisheries resources. Fishery resource protection fees have added to the operating costs of fishermen, thereby reducing their fishing efforts. The system plays an important role in developing and protecting fishery resources and building the fisheries law enforcement team in China.

3.2.5. Offshore fisheries management

China has promulgated a series of offshore fisheries management systems and measures, including: Offshore fisheries registration and approval system; A system of accreditation and annual inspection for fishing enterprises in offshore waters; Management system for offshore fisheries; Monitoring vessel position, fishing standards, logbook; State observer, legal catch certificate; Crew management system and offshore fishing vessels; Self-regulating and coordinating mechanism of offshore fisheries.

The offshore fishery registration and approval system stipulate that businesses wishing to engage in fishing in remote waters must submit an application to the provincial government and obtain approval from the Ministry of Agriculture before obtaining a permit for such activities. The Department of Agriculture grants to top businesses with the necessary qualifications for offshore fisheries and no record of illegal activities or violations.

The annual capacity testing and recognition system for fishing enterprises in offshore waters is also a measure adopted by China in the management of offshore fisheries. The Department of Agriculture conducts an annual assessment of participating businesses and checks their overseas operations through fishing vessel inspections, location monitoring, and verification by embassies and consulates in the country. Appropriate penalties will be given for any major problems discovered (Ocean & Fishery, 2015). In recent years, China has applied an annual ranking of offshore fishing companies (DWF) based on 42 factors considered, in four areas: internal rules; supervision and management; compliance and innovation; and violations. According to the Ministry of Agriculture, the rating system draws on the experience of regional fisheries management organizations (RFMOs). RFMOs set regulations for governments and fishing vessels to limit fishing activities, conserve fishery resources, and ensure the sustainable development of fisheries in the region. China's DWF rating is basically according to RFMO requirements and China's DWF management rules

into a scoring system. According to the Ministry of Agriculture's 2020 White Paper on DWF Compliance, as of the end of 2019, China had 178 registered DWF companies, operating 2,701 fishing vessels. Of these, 1,589 vessels fish in the open waters of the Pacific, Indian, Atlantic, and Antarctic oceans, as well as in the national waters of other countries. The 13th Five-year Plan (2016–2020) for the DWF sector states that to protect fishery resources, “in principle” will not issue more permits to DWF companies or vessels, and the fleet will not exceed 3,000 ships. The DWF ratings are intended to “encourage” rather than force companies to “improve their management systems and implement strict monitoring measures... to avoid illegal practices.” The MOA also said there are plans to use compliance data as a factor for DWF licensing.

In addition, China has also taken a series of measures to monitor fishing boats in remote waters. Since 2007, the Ministry of Agriculture has started deploying a position monitoring system for offshore fishing vessels, this system is required to be equipped with a positioning device and be integrated into the position monitoring system of fishing vessels of the country. The Ministry of Agriculture; along with it was the development of a catch log system, requiring fishing boats to fill in the log accurately and give it to fisheries agencies; National servers have also been sent to large fishing vessels operating on the high seas (Wang, 2013). . The development of technology and the evolution of management objectives pose challenges for fisheries monitoring in transitioning to a timelier and accurate data reporting scheme. This transformation features the replacement of traditional paper diaries with electronic diaries (e-logbooks). In 2017, China launched its first total allowable catch (TAC) pilot in Zhejiang province, which aims to develop and implement an electronic log plan in fisheries monitoring and management. . The results show that electronic diaries can improve data quality and timely reporting. There are mixed opinions when evaluating electronic diaries, for example, fishermen consider it difficult to use and often malfunction, while managers, observers, and scientists highly appreciate electronic diaries. The electronic diary is more important than paper diaries and considers that the application of electronic diaries is necessary for fisheries monitoring.

In addition, offshore fishing vessels must be inspected by the Fishing Vessel Inspection Department and registered with the fishing port authority before being issued with relevant certificates. Crew members must be trained by specialized agencies, pass the fishing port or admiralty exams authorized by the Ministry of Agriculture and state management agencies, and have more than 1 year of fishing experience. Furthermore, as a member of 7 Regional Fisheries Management Organizations (RFMO), China actively participates in the negotiation of fisheries management measures in these areas. The waters under the jurisdiction of such RFMOs include essentially all areas of operation of offshore fishing vessels. Meanwhile, China has signed eight Fisheries Agreements or Memorandums of Understanding with other countries or regions, which define terms and conditions regarding the access and operation of Chinese fishing vessels. Country. As can be seen, China has established a remote water fisheries management system compatible with international fisheries management rules (Wang, 2013). These systems require further improvement in

functionality and specification to be compatible with increasingly stringent international fisheries management systems.

As can be seen, China has basically established a remote water fisheries management system compatible with international fisheries management rules (Wang, 2013). These systems require further improvement in functionality and specification to be compatible with increasingly stringent international fisheries management systems.

3.2.6. Mechanism of international cooperation on fisheries management

In 1994, China established many international cooperation mechanisms on fisheries management with neighboring countries including Japan, Korea, and Vietnam. China and Japan signed the Sino-Japanese Fisheries Agreement on November 11, 1997, which officially entered into force on June 1, 2000. China and Korea signed the China-Korea Fisheries Agreement on August 3, 2000, effective from June 3, 2001. China and Vietnam signed the Sino-Vietnamese Fisheries Agreement on December 25, 2000 and commenced operations on June 30, 2000. 2004. Those bilateral fisheries agreements all established Fisheries Committees, requiring the parties to conduct long-term fisheries cooperation in the spirit of mutual benefit in the waters with provisional measures or in other agreements.

To date, China has signed more than 20 bilateral fisheries cooperation agreements, related to the management and maintenance of fishery resources in the Exclusive Economic Zone, fishing, aquaculture, scientific exchange and technology and cooperation in different fields. The participating countries are Korea, Japan, Vietnam, United States, Australia, Malaysia, Seychelles, Uruguay, Norway, Indonesia, and Russia. In general, the areas of international cooperation are operating smoothly, but management cooperation has not been fully implemented in the co-management areas.

In summary, the fisheries management systems in China basically belong to the input control system and the technical control measures, the output control system is still very limited. To date, input controls and engineering controls are still the oldest and earliest fisheries management practices worldwide, used by both developing and developed countries. . China's input control system and technical control measures have achieved a certain degree of fishery resource protection. However, due to system limitations and fisheries law enforcement, engineering control measures have not been fully implemented. As a result, the fishing intensity is still far beyond the resilience of China's fishery resources, and China's fishery resources continue to decline.

3.3. Lessons from applying fisheries management systems and measures to Vietnam

Vietnam has a coastline of more than 3,260 km, an exclusive economic zone of more than 1 million square kilometers, more than 3,000 large and small islands (2,773 coastal islands and more than 200 offshore islands), 114 estuaries, 12 lagoons, 50 coastal coves/bays, of which internal waters and territorial waters account for 37% of the area, with many islands and island clusters interspersed creating a diversity of natural landscapes, ecology and aquatic resources.

Taking advantage of available advantages, Vietnam identifies fisheries as a key economic sector of the country. Over the years, Vietnam's seafood industry has made significant contributions to the economy, especially promoting exports, creating jobs,

improving livelihoods for fishing communities, and contributing to ensuring security and protect the country's sovereignty over the sea and islands. Currently, the fishery industry has created jobs for more than 4 million workers. In 2020 alone, the export value of seafood reached US\$8.5 billion, accounting for 9-10% of the total national export turnover. Vietnam's high exports. In which, seafood exports account for 30-35% of total seafood exports. (From 1998 to 2020: Turnover increased 10 times from 315 million USD to 3.2 billion USD; average annual growth of 11%). Vietnam's fishing production has increased over the years. From 1995 to 2020: Vietnam's fishing output has more than quadrupled, with an average annual growth of 6% from 929 thousand tons to 3.85 million tons. In 2020, there will be 94,572 fishing vessels nationwide. In which: 45,950 fishing boats 6-12m long, 18,425 boats 12-15m long, 27,575 ships 15-24m long, 2,662 vessels >24m long). The whole country has 4,227 teams operating with 29,588 fishing boats and 179,601 workers at sea. Trawl fishing 17,078 vessels, accounting for 18.1%; seine fishing 7,212 ships, accounting for 7.6%; gill netting 33,538, accounting for 35.5%; fishing 16,043 ships, accounting for 17%; other occupations 17,543 ships, accounting for 18.5%; logistics service ships 3,158 units, accounting for 3.3% (VASEP, 2021).

However, due to overexploitation and eradication (due to the excessive number of fishing vessels, especially small-capacity fishing vessels exploiting inshore with unfriendly fishing activities); aquatic products using electric pulses, explosives and poisons; fishing in the wrong areas by fishing vessels of large length operating in coastal waters; mesh size of fishing gears smaller than regulations) together with The increase in marine environmental pollution leads to a serious decrease in fishery resources in Vietnam today. According to the "Report on survey results on Vietnam's marine seafood resources for the period 2011-2015" published by the Institute of Fisheries Research in 2018, the comparative marine fish stocks in the period 2011-2015 and the period 2000-2005 showed that: reserves of major groups of marine resources were 13.9% lower (equivalent to about 710 thousand tons); the reserve of small pelagic fish group decreased by 3.2%; bottom layer seafood group decreased 41.7%; group of large pelagic fish decreased by 10.2% (Marine Research Institute, 2018).

In general, the fishery industry has made important contributions to the economy, due to prolonged over-exploitation, which has severely reduced aquatic resources in general and marine fisheries (seafood) in particular the bottom layer seafood group decreased sharply. Therefore, in the coming time, Vietnam's fisheries sector needs to make appropriate adjustments and drastically apply necessary measures in fisheries management in general and marine fisheries management in particular. Studying the experience of applying China's fisheries management system and measures can draw some lessons for Vietnam as follows:

Firstly, it is necessary to simplify fisheries management systems and measures. Because, like China, Vietnam currently has no shortage of management measures to protect aquatic resources, but what is lacking is that Vietnam has not implemented the existing measures well. Therefore, management measures need to be simplified and easy to implement. For example, a ban on fishing in the summer is one of the successful measures.

Firstly, there are two main reasons that made this measure successful: 1) Compared to other measures, fishing bans are easier to design and require less scientific data. 2) During

the suspension period, all fishing vessels must be anchored at the port, so that the law enforcement agencies can easily find out the illegal fishing vessels.

Secondly, It is necessary to strengthen the supervise capacity of all systems, measures to manage the fisheries. In fact, illegal fishing remains a major challenge in fisheries. Due to the pressure on real life income of some fishermen, the management cannot completely depend on their self-consciousness in order to achieve the goal of effective policy implementation. Therefore, strengthening the supervise capacity need to be considered four main aspects: 1) Strengthening the establishment of enforce teams and building the implementation infrastructure. 2) Enhancing self-discipline and transparency. 3) Strengthening, supervising and enforcing. 4) Increase penalties for illegal fishing to prevent the extension of that practices.

Thirdly, it is also essential to strengthen the settlement system for fishermen. According to the experience of China, this is a highly effective measure in fisheries management. The most important reason for fishermen to leave fisheries is to have an opportunity to access a new job, financial support for livelihood and resettlement to settle into a new life. For example, the settlement of fishermen policy was affected in 10 years because of the fishing embargo on natural waterways along the Yangtze River (China). Including a one financial compensation of over 200,000 yuan (US\$30, 562), the local government has assisted fishermen in changing their careers through job placement, insurance support and a monthly living allowance.

Fourthly, we need to strengthen management measures or technical control. Therefore, it is required that we apply the seasonal fishing restriction system, step up the establishment of protected areas, such as aquatic germplasm conservation areas, aquatic reserves, marine protected areas (MPA). In addition, we need to keep up to date and adjust the standards on fishing gear to suit the practical conditions that need to be protected of aquatic resources. Besides, strengthening the stronger level of handling with violations of time, fishing area, fishing gear and fishing method.

Fifthly, we need to consider and adjust the fees and charges for the exploitation and protection of aquatic resources in line with Vietnam. According to the experience of China, the fisheries resources protection fee plays an important role in the development and protection of fishery resources and building the fisheries law enforcement team in this country. The revenue from the free for the protection of aquatic resources is used for activities, such as stocking the whole seed, buying the necessary equipment to support growing breed fish, constructing of artificial coral reefs, fish house and other reclamation works in coastal and inland waters, loans to fishermen for production, relocation or business, subsidies for scientific research on the protection and development of fish resources and provide financial support to implement management approaches to enhance protect and monitor fisheries resources. Fishery resource protection fees have added to the operating costs of fishermen, therefore reducing their fishing efforts.

Sixthly, it is necessary to strengthen monitoring of offshore fishing activities through the application of advanced monitoring support tools such as electronic diaries. At the same time, creating an incentive to encourage offshore fishing activities to improve their

management systems, implement strict monitoring measures, and not commit illegal acts through reviewing ratings enterprises annually as a basis for granting offshore fishing permits.

Seventhly, to promote international cooperation in fisheries, in which to promote international cooperation in training, scientific research, technology transfer in the field of fisheries. At the same time, developing measures to protect, manage and sustainably use biological resources in fishing in the common fishing area.

4. Discussion and Conclusion

Although the scale and potential of fishing are not the same, they are similar in terms of challenges and pressures in fisheries management, so China is a good and typical case for Vietnam to consult and learn from experience. In fact, fishery management in China has implemented six groups of systems and measures, including: input control, output control, technical control or management measures, economic control measures, offshore fisheries management systems and international cooperation mechanisms on fisheries management.

However, China focuses on applying input control measures and technical control measures, the application of an output control system is still very limited. The actual results shows that China's input control system and technical control measures have achieved a certain degree of protection of aquatic resources. Nevertheless, because of system limitations and the law enforcement agencies, engineering control measures have not been fully implemented. As a result, the fishing intensity is still far beyond the resilience of China's fishery resources, and China's fishery continues declining.

From the experience of applying the system, China's fisheries management measures, we can draw seventh lessons for Vietnam, including: First, it is essential to simplify fisheries management systems and measures. Second, it is necessary to strengthen the supervise capacity of fisheries management systems and measures. Third, we need to strengthen the resettlement system for fishermen. Fourth, strengthening technical control or management measures. Fifth, we need to consider and adjust the fees and charges for the exploitation and protection of aquatic resources in line with current practical Vietnam. Sixth, it is necessary to strengthen monitoring of offshore fishing activities through the application of advanced monitoring support tools and annual assessment of offshore fishing enterprises. Finally, to promote international cooperation in fisheries management, in which to promote international cooperation in training, scientific research, and technology transfer in the field of fisheries.

RESPONSES TO GLOBAL CLIMATE CHANGE: VIETNAM'S INITIATIVE AND IMPRINTS

Dr. Nguyen Thi Anh

anh.nguyen.sphp@gmail.com

Thuy Loi University, Hanoi, Vietnam

Abstract

In recent years, the phrase “climate change” has been mentioned frequently to refer to negative changes in nature, weather, and climate that directly affect humans on a global scale. That practice requires all countries to reflect on their responsibility to climate change. The article is based on clarifying the manifestations and impacts of global climate change, the initiative, and the importance of Vietnam in coordinating with the international community to respond to climate change. Increasing resilience, adaptability, and minimizing the damage and causes of global climate change are the set goals.

Keyword: *Climate change, responses to climate change*

1. Introduction

Like many countries in the region and the world, Vietnam's climate in recent decades has changed significantly, with temperature warming, seawater penetrating deep into the mainland, and extreme weather events such as big storms and tropical depressions making landfall more often, causing serious consequences for people and property, not to mention the impacts on the ecological environment that can take many years to surmount. Finding solutions to limit the damage caused by climate change is mentioned in many agendas of the Communist Party and the Government of Vietnam. Along with promoting afforestation, greening bare land and bare hills, and protecting the ecological environment, Vietnam has been actively participating in activities of the international community implementing greenhouse gas reduction commitments., preventing the risk of increasing climate change. Vietnam's actions have left strong marks in the international arena in responding to climate change.

2. Method

To complete the research, the author uses analytical, synthesis, statistical, contrastive, and comparative methods to clarify the manifestations and consequences of climate change for the world and Vietnam today, affirm that responding to climate change is a common task of all nations and races around the world, and the initiative and imprints bearing the name of Vietnam in the process of joining the world community in responding to climate change.

Sources of materials are articles published in Journals, presentations at seminars, interviews, data from organizations, monographs, Resolutions of the Communist Party of Vietnam, Plans, strategies, and policies of the Government on responding to climate change.

3. Results

3.1. Global climate change and Vietnam's proactive response

3.1.1. Global climate change and its manifestations

Today, climate change or climate change in the Earth is mentioned a lot to illustrate the change in the climate system including the atmosphere, hydrosphere, biosphere, lithosphere, ice sphere, present and in the future by natural, man-made causes (Wikipedia, 2021). Climate change manifests itself mainly in the following issues:

Atmospheric warming and Earth's temperature in general. According to a report by the Environmental Protection Agency (EPA), the average temperature of the Earth in the late 19th century increased by +0.8°C and in the 20th century increased by 0.6±0.2°C. Climate modeling projects of the Intergovernmental Panel on Climate Change (IPCC) indicate that the Earth's surface temperature will likely increase by 1.1 to 6.4°C throughout the 21st century (Viet Lam, 2016). Sea surface temperatures have also tended to increase markedly since the beginning of the 20th century across the oceans.

According to the IPCC, an average increase in the earth's temperature of 1.5°C will put 20-30% of the world's species at risk of extinction because they cannot adapt to the changes in weather and temperature. Some other species are learning to change their habitat and body size in order to survive.

In 2020, rising temperatures set wildfires in Australia, Siberia, the US West Coast, and South America, creating plumes of smoke that circled the world. In 2021, a record heatwave rages in western Canada and the United States. In the Canadian state of British Columbia, temperatures higher than 49°C were recorded. Temperatures in many parts of the US also reached more than 50°C. Over 800 people have died in the two countries from heat-related causes (Electronic newspaper VTV news, 2021). It is forecasted that in 2022, the winter months's climate will be relatively hot. Wildfires will still persist in many areas, especially in the western United States. And not just in 2021 or 2022, it will probably be every year from now on that extreme weather patterns will persist on Earth.

High temperatures make the ice melt, and sea levels rise, leading to flooding in lowlands and small islands in the sea. Sea level increases in the direction of the following period faster than in the previous period. The main causes of sea-level rise are thermal expansion and melting ice. Worldwide, glaciers continue to shrink and in the spring snow cover in the Arctic Ocean and Northern Hemisphere continues to decrease (National Assembly of Vietnam, 2017, p.24). Scientific measurements from tidal stations and satellite images have shown that the rate of sea-level rise due to climate change is about 3mm/year with positive acceleration. It is expected that by the end of the next century, the sea level will rise in the range of 35-85 cm, causing global economic losses of trillions of dollars with many development consequences. Even if humans completely stop emitting greenhouse gases into the atmosphere, not only global temperature but also sea level will continue to increase in the long term, not decrease (Luu Quang Hung, 2020). In the years 2020-2021, floods appear frequently and unexpectedly in many areas of Africa, China, and Southeast Asia. In the first 9 months of 2020, China experienced 21 floods, a record 1.6 times higher than in

previous years, setting a historic record since 1998. Flooding also took place seriously in the capital. Jakarta, the capital of the Indonesia, result in the death of 60 people and 60,000 others had to evacuate. In July 2021, floods stole the lives of more than 300 people in central China's Henan province. Meanwhile, in Europe, nearly 200 people were reported to be dead because of heavy rains that caused flooding in Germany, Belgium, and the Netherlands. By November, the worst flooding in 60 years in South Sudan had affected about 780,000 people. The scientists combined, that climate change increases the risk of higher levels of flooding by up to 20% (Tran Hong Thai, 2020).

The year 2021 also witnessed an unprecedented cold in the US state of Texas, with a thick layer of snow and ice with temperatures in many places dropping to -18°C , killing 125 people and millions of people having to live without power and lack of drinking water in the middle of cold weather. In March 2021, the sky of Beijing, China's capital turned orange, flights had to make emergency landings due to the worst sandstorm in a decade occurring here (Tran Hong Thai, 2020).

The change in the composition and quality of the atmosphere is harmful to the habitat of humans and organisms on Earth. Concentrations of carbon dioxide, methane, and nitrous oxide in the air have increased to levels not seen in at least the past 800,000 years. Carbon dioxide concentrations have increased by 40% since pre-industrial times, mainly due to emissions from burning fossil fuels and deforestation of land. The oceans have absorbed about 30% of the carbon dioxide emitted by humans, causing ocean acidification, with an average decrease in surface pH of 0.1 units (National Assembly of Vietnam, 2017, p.24).

Variation of tropical cyclones. The trend of increasing tropical cyclone activity is most pronounced in the North Pacific, Southwest Pacific, and Indian Oceans. In the period 1978 to 2015, the number of tropical cyclones reaching very strong storm intensity accounted for about 55% and 34% of the total number of tropical cyclones in the Northwest Pacific Ocean and the East Sea. Tropical cyclones are usually most active in late summer when the difference in temperatures between high terrain and sea surface is greatest. However, each region has its own storm season pattern. Globally, May is the least active tropical cyclone month, whereas September is the most active. November is the only month in which all tropical cyclone areas are in full-fledged activity.

In terms of consequences, in 2020, only the ten most terrible weather disasters occurred, causing damage of 150 billion USD worldwide, severely affecting countries, especially developing countries whose economic recovery speed is low. This leads to food insecurity. It is forecast that about 1.8 billion people around the world will face difficulties in accessing clean water and 600 million people will be malnourished due to food shortages in the coming years (Tran Hong Thai, 2020).

Vietnam is ranked 5th on the Global Climate Risk Index 2018 and 8th on the Long-Term Climate Risk Index (CRI). In recent years, Vietnam has continuously achieved new records in terms of temperature and rainfall. With regard to temperature, intense heat in the Northern and North Central provinces in 2014, with the common high temperature from $39 \div 40^{\circ}\text{C}$, in many places over 40°C , the longest period of heat in the past 60 years has just

appeared. In 2018, Hanoi recorded record numbers of temperatures within 46 years, the highest temperature sometimes reached 42°C. On April 20, 2019, the temperature observed at Huong Khe meteorological station (Ha Tinh) was 43.4°C, the highest temperature ever observed in Vietnam (Tran Hong Thai, 2020).

Along with the heat, drought taking place on a large scale, in the Cuu Long Delta and the Central region, the drought in 2019-2020 will be larger in scale and more severe than the drought and intrusion and salinity in 2016. In 2020, water resources in rivers, streams in the Central region the central highlands will decrease and lack from the average of many years in the same period from 35% to 70%, some rivers lack more than 80%. Along with that is the phenomenon of sea-level rise, and salt intrusion in a large area. In the year 2019-2020, saltwater intrusion is at the highest level in history in the Cuu Long Delta region, damaging about 58,400ha of rice, 6,650ha of fruit trees, 8,715ha of aquaculture and leaving about 96,000 households with 430,000 people to suffer from lack of drinking water. It is forecasted that by the end of the 21st century, the intrusion depth with the salinity of 1 ‰ can increase to over 20km in Dong Nai, Tien, and Hau rivers, and approximately 10 km in Hong river - Thai Binh. According to the data of Hon Dau national station, within 50 years, the sea level rises about 20 cm. And if this situation persists, when the sea level rises another 100cm, Vietnam will lose 40,000 square kilometers of land area, 10% of our population will be directly affected, the loss to GDP is about 10%, and this situation is expected to happen in 2100 (Nguyen Hong Diep, 2021).

Heavy rains occur frequently on a large scale and locally, causing large floods, inundations, flash floods, and serious landslides in many areas across the country. Large floods and historical floods continuously occurred in regions and regions across the country, typically in 1996, 2002, and 2015 in the North; in 1999, 2000, 2003, 2007, 2009, 2010, 2011, 2016, 2017 in the Central region and 2000, 2001, 2002, 2011 in the South. In 2017 and mid 2018, landslides were extremely serious on a large scale in the northern mountainous provinces; at Quan Son (Thanh Hoa) in 2019 (Tran Hong Thai, 2020). In 2020, Vietnam had 13 storms in the East Sea; 264 thunderstorms, whirlwinds, and heavy rain in 49 provinces and cities, of which 9 waves cover a large area in 21 provinces and cities in the North and Central Vietnam; 120 floods, flash floods, landslides (Nguyen Hong Diep, 2021). Especially, at the end of 2020, the phenomenon of floods, storms, and storms has caused enormous loss of life and property of the State and people in Central Vietnam.

Vietnam has a coastline of over 3,000km with nearly 110,000 fishing vessels, along with economic and transportation activities at sea and along the coast, so it is often directly affected by storms forming in the Pacific Ocean. On average, there are 11 to 12 storms and cool down in the East Sea every year, of which 5 to 6 storms directly reach the mainland. In 2013, there were 14 storms and 05 tropical depressions affecting our country, including super typhoon Haiyan (Tran Hong Thai, 2020). Especially, in 2017, there were 16 storms, and 04 tropical depressions appeared and operated in the East Sea. According to the summary of the National Steering Committee for Natural Disaster Prevention and Control, from the beginning of 2021 until now, Vietnam has had 8 storms, 3 tropical depressions in the East

Sea, 109 light earthquakes, 316 hail and lightning storms, lightning; 140 heavy showers of rain, local floods, of which 9 floods, flash floods, 157 riverbank heat waves, 7 sunny spells, and 6 cold airwaves, northeast monsoon. The estimated value of the damage is about 1,428 billion VND (Nguyen Hong Diep, 2021). Not only does climate change damage the property, but it also results in infectious diseases such as malaria, hemorrhagic fever, etc., increasing many lungs, cardiovascular and dermatological diseases in humans. According to statistics, the death rate due to time-saving in Vietnam ranks 11th in the world, with a loss of 0.6782% of the country's GDP (Bui Phuong Linh et al., 2022).

Bitter cold bad cold also occurs frequently and lasts for many days, especially in the northern and northern mountainous regions. In particular, the first cold wave of 2016, was assessed as having the lowest temperature in the past 100 years (Tran Hong Thai, 2020). It is predicted that unusual cold waves may occur more in the future.

Climate change is a complex issue that not only affects people's lives in the present but also threatens the living environment in the future. With its wide-ranging effects and exponential growth, climate change is exacerbating the world's problems today. The solution is both immediate and long-term. The scope of influence of climate change is wide, in all fields, from natural to socio-economic of the country, region, and the world. Therefore, the response to climate change must be fully understood, with the participation of ministries and branches from central to local levels, close cooperation with the international community can bring about positive results certain results.

3.1.2. Vietnam actively cooperates with the international community to respond to climate change

Realizing that climate change is one of the urgent global issues related to human destiny. Responding to climate change requires the cooperation and high sense of responsibility of all countries in the world. As a responsible member of the international community, Vietnam has always actively and proactively coordinated with other countries and international organizations to limit and minimize negative impacts on the environment, climate, and environment, reduce the level and intensity of greenhouse gas emissions, is the main cause of climate change. Adjusting natural or human factors in response to changing environmental circumstances, along with actively coordinating with the international community to respond to climate change.

Immediately after the United Nations Framework Convention on Climate Change (UNFCCC) was adopted at the United Nations Conference on Environment and Development in Rio de Janeiro, Brazil in June 1992, to stabilize greenhouse gas concentrations in the atmosphere at a level that would prevent dangerous anthropogenic interference with the climate system. And the Kyoto Protocol was adopted (December 1997), and entered into force on February 16, 2005, requiring industrialized countries and countries with transition economies to commit to reducing the total amount of greenhouse gas emissions was lower than in 1990, at an average rate of 5.2%, during the first commitment period (2008-2012) under specific reductions. Vietnam actively joined and signed the Climate Convention on June 11, 1992, ratified on November 16, 1994; signed the Kyoto Protocol on December 3, 1998,

and ratified it on September 25, 2002. At that time, Vietnam was not obliged to commit to a quantitative emission reduction of greenhouse gases (“GHG”) but actively implemented the contents according to the signed documents. Vietnam proactively develops a national notice on climate change; a national inventory of GHGs from anthropogenic sources and the amount of GHG absorbed by sinks; assesses the impacts of climate change on socio-economic fields; identifies domains and areas vulnerable to climate change and sea-level rise. Conduct research and monitoring activities on issues related to climate and climate change; updating and disseminating information to raise awareness of agencies and people about climate change, clean development mechanism (CDM)...

Actively implement the CDM, which is a new method of international cooperation under the Kyoto Protocol to reduce GHG emissions on a global scale through investment mechanisms between developing countries, increasing incentives for agencies, organizations, and businesses of developed countries to implement GHG emission reduction projects in the form of “Certified Emission Reductions (CERs)”. Contrast to recent decades, official development aid (ODA) has become popular and is considered a measure to promote economic growth in developing and least developed countries, the CDM is a tool for implementing national environmental policy in many countries that are party to the Kyoto Protocol. To create a legal corridor for domestic as well as foreign organizations and individuals to implement CDM activities, the Prime Minister of Vietnam issued Decision No. 47/2007 on approving the plan to organize the implementation of the Kyoto Protocol under the UNFCCC for the period 2007 - 2010; Directive No. 35/2005 on the implementation of the Kyoto Protocol under the UNFCCC. The Ministry of Natural Resources and Environment has issued legal documents on the CDM with specific instructions and is regularly updated following international regulations. Therefore, the operation of the CDM in Vietnam has achieved high efficiency.

Join the NAMAs Mechanism. Since the 13th Conference of the Parties to the UNFCCC in 2007 (COP 13 in Bali, Indonesia), a new approach to GHG mitigation for developing countries has been established and referred to as “nationally appropriate GHG mitigation actions (NAMA)”. By COP 17 in Durban, South Africa, NAMA registration was established. Accordingly, developing countries should participate in the GHG mitigation process and should receive technical, financial, and capacity-building support from developed countries. On November 21, 2012, the Prime Minister of Vietnam issued Decision 1775 approving the project on the management of greenhouse gas emissions and carbon credit business activities to the world market. To implement the above project, on February 21, 2013, the Ministry of Natural Resources and Environment issued Decision No. 187 to establish a Working Group to prepare to integrate NAMAs with the task of advising and proposing with the Minister of Natural Resources and Environment, relevant ministries, branches and agencies on measures to establish an institutional framework including policies and documents to facilitate the integration of NAMAs into programs, master plans and plans sustainable development plans of ministries, branches, agencies, and localities. On March 4, 2013, the Government issued Decree No. 21/2013, according to which the Ministry of Natural Resources and Environment is responsible for: Building and implementing domestic

and international MRV systems; organizing national GHG inventory; proposing and recommending policies and measures to reduce GHG emissions of Vietnam suitable to socio-economic development in each period; Guide, inspect and organize the implementation of measures to manage carbon credit business activities following the law and international treaties to which Vietnam is a signatory, issue certifications to the investment projects under the clean development mechanism and other international mechanisms on GHG emission reduction of all economic sectors. The Department of Climate Change under the Ministry of Natural Resources and Environment is the national focal point for NAMA registration with the UNFCCC Secretariat. Currently, several NAMAs are being deployed in the fields of wind power, construction, waste management, biogas.

Intended Nationally Determined Contributions (INDCs) are new to the Decision at the 19th Conference (COP19) in Warsaw, Poland in 2013. Vietnam has submitted INDCs decided by the country to the UNFCCC Secretariat at COP21 in Paris. Following the ratification of the Paris Agreement on climate change, the INDCs officially becomes the Nationally Determined Contribution (NDC). Viet Nam submitted INDCs early in 2015 to the UNFCCC and subsequently submitted NDC update in 2020. Vietnam is also one of the first 20 countries to complete the review and update of the NDC, and at the same time significantly increased its contribution to GHG emission reduction in line with the country's socio-economic development up to 2030. Accordingly, with domestic resources, by 2030, Vietnam will reduce its total greenhouse gas emissions by 9% compared to the normal development scenario. Compared to the NDC submitted in 2015, Vietnam's updated NDC has increased its GHG emission reduction efforts by 2%, matching the overall increase of the 75 countries that have submitted the updated NDC up to December 2020. 2.8%. Recently, Vietnam has issued the National Plan to adapt to climate change for the period 2021-2030, with a vision to 2050 with the common goal of reducing vulnerability and risks to the impacts of climate change through strengthening resilience, and adaptive capacity of communities, economic sectors, and ecosystems; promote the integration of climate change adaptation into the strategy and planning system. Vietnam's national-determined contribution includes the GHG emission mitigation component and the climate change adaptation component. The GHG emission mitigation component includes unconditional contributions and conditional contributions. Unconditional contributions are activities that will be carried out with domestic resources, while conditional contributions are those that can be completed if new and additional financial support is received and technology and capacity transferred building from abroad.

The United Nations Climate Change Conferences, are held annually to assess the process of coping with climate change and develop legally binding obligations for developed countries to reduce the amount of greenhouse gas emissions (from 1995 to the present). Vietnam always participates as a responsible member and has a consistent view: climate change is happening and will have a strong impact on all people, ecosystems, and countries around the world; climate change is anthropogenic, due to excessive emissions of greenhouse gases into the atmosphere; Humans can limit or solve the problem of climate change by reducing greenhouse gas emissions. Reducing greenhouse gas emissions is the responsibility of nations.

To strengthen bilateral cooperation activities on climate change, Vietnam and Japan signed a Memorandum of Understanding on Cooperation on Low Carbon Growth in July 2013. On the Vietnamese side, the Ministry of Natural Resources and Environment was assigned by the Government to assume the prime responsibility for, and coordinate with concerned ministries and branches in, negotiating with the Japanese side to establish a Joint Committee and issue Guidelines for the implementation of the Joint Crediting Mechanism (JCM) in Vietnam. According to the content of the Memorandum of Understanding, Japan and Vietnam will conduct consultations and close policy cooperation at all levels towards low-carbon growth within the United Nations, regional and bilateral frameworks. The two sides also promote investment and development of low-carbon technologies, products, systems, services, and infrastructure in Vietnam. Following the direction of the Prime Minister in Official Dispatch No. 10728 dated December 19, 2013, of the Office of the Government, the Ministry of Natural Resources and Environment has coordinated with relevant agencies to implement JCM. Currently, the Circular guiding the implementation of JCM has been developed by the Ministry of Natural Resources and Environment to regulate activities related to the construction, registration, and implementation of projects under the JCM within the framework of the Memorandum of Understanding on Cooperation on Low Carbon Growth between Vietnam and Japan.

Sponsored by the Dutch Government, the Government of Vietnam has proposed to coordinate the development of the Cuu Long Delta Plan to learn from the Dutch experience in responding to climate change and developing safely, prosperously, and sustainably in both economic and environmental terms and respond to climate change. The Cuu Long Delta Plan has been developed by Dutch and Vietnamese experts and submitted by the Vietnamese Ministry of Natural Resources and Environment and the Dutch Ministry of Environment to the Government of Vietnam at the 3rd meeting - December 16, 2013) of the Vietnam - Netherlands Intergovernmental Committee. The Cuu Long Delta Plan is built with a 100-year vision based on synthesizing strategies, master plans, and plans of sectors and fields into one master plan. The Ministry of Natural Resources and Environment in collaboration with Dutch experts completed the 2nd Recommendation for the Cuu Long Delta Plan with 9 proposals to ensure the sustainable development of the Cuu Long Delta. On November 17, 2017, the Government approved Resolution No. 120 on Sustainable development of the Cuu Long Delta to adapt to climate change, which sets out a vision and goals of turning the Cuu Long Delta into a region with a good level of development compared to the whole country in 2050, with an advanced level of social organization; per capita income is higher than the national average, people's livelihood is guaranteed; the proportion of ecological agriculture, high-tech agriculture accounts for over 80%, forest coverage is over 9% (compared to 4.3% at present), important natural ecosystems are preserved and developed.

With specific actions, the Party, Government, ministries, and branches according to their functions and tasks have issued many legal documents to carry out activities to respond to climate change. Practical actions Vietnam has been contributing to the fight against global climate change. Besides the action plans and programs to respond to climate change such as National Strategy on Climate Change (1911-1920); Project “Management of greenhouse gas

emissions; manage carbon credit business activities to the world market” according to Decision No. 1775 dated November 21, 2012, published, to effectively implement the Climate Convention and other treaties. International organizations that Vietnam participates in, take advantage of opportunities to develop a low-carbon economy, and green growth, work with the international community to reduce GHG emissions and implement the goal of sustainably developing country; Target programs to respond to climate change and green growth for the period 2016-2020; On October 28, 2016, the Prime Minister issued Decision 2053 promulgating a plan to implement the Paris Agreement on climate. In which, ministries, branches, and localities have been assigned to implement 68 tasks related to climate change response; Greenhouse gas emission management scheme; The national plan to adapt to climate change for the period 2021-2030, with a vision to 2050... was in turn approved. Vietnam also legislates issues of response to climate change such as the Law on Natural Disaster Prevention, the Law on Irrigation, the Law on Water Resources, the Law on Economical and Efficient Use of Energy, and the Law on Environmental Protection. The National Assembly adopted the 2013 Constitution, which for the first time included the task of responding to climate change into the Constitution, in Clause 1, Article 63 “The State has an environmental protection policy; manage and use effectively and sustainably natural resources; nature conservation, biodiversity; proactively prevent and combat natural disasters and respond to climate change”. Vietnam also develops and replicates ecosystem-based, community-based, and nature-based climate change, adaptation models. Some of the main goals, tasks, and targets of the National Strategy on Climate Change for the 2011-2020 period have achieved important results. Greenhouse gas emissions from energy activities are reduced by 12.9% compared to the normal development scenario. Along with that, energy consumption per GDP decreased by 1.8%/year on average; the percentage of industrial enterprises with awareness of cleaner production has increased from 28% in 2010 to 46.9% in 2020; the forest cover rate in 2020 will reach 42% (Ministry of Planning and Investment, 2021).

In the region, Vietnam actively signed and implemented commitments signed in the Agreement on Disaster Management and Emergency Response (AADMER) 2010. This is considered a breakthrough in strengthening cooperation within the bloc for disaster control, emergency response coordination, and search and rescue. Vietnam has gradually affirmed its role in implementing the AADMER and putting the ASEAN Coordination Center for Humanitarian Affairs in Disaster (AHA) into operation.

Participating in cooperation programs in Asia-Europe, Asia-Pacific, East Asia, within ASEAN, and the Mekong sub-region in response to climate change, resource management, and environmental protection. Promote cooperation with relevant countries, international organizations, and forums to protect transboundary water sources, access new technologies and mobilize resources for GHG emission reduction, adaptation to climate change, and environmental protection. As a developing country, Vietnam soon proactively set out guidelines and solutions to respond to climate change, and at the same time made specific commitments to adapt to climate change and mitigate greenhouse gas emissions, gradually receiving enthusiastic support from countries in the region and around the world. Vietnam's proactive coordination with the international community to respond to climate

change is affirmed by the Communist Party of Vietnam in the Resolutions of all congresses and symposiums on climate change response and environmental protection.

Climate change is a global issue, one of the major challenges that Vietnam and many countries around the world are facing. Realize that climate change will be severe and complicated, causing many consequences for the development of the country in the forthcoming time. Therefore, “Proactively adapting to climate change, preventing, combating and mitigating natural disasters and epidemics”, “implementing international commitments, contributing to the international community's adaptation to climate change”, “protect the global ecosystem” (Communist Party of Vietnam, 2021, p.155) is also the task that Vietnam is strongly implementing today.

3.2. Vietnam's imprints in responding to global climate change

3.2.1. The 21st Climate Change Summit (COP 21) and Vietnam's strong commitments

Since signing the Climate Convention on June 11, 1992, and the Kyoto Protocol on December 3, 1998, Vietnam has always actively participated in international activities, conferences, seminars, and negotiations on climate change and has made important imprints.

2015 marked a major event in Vietnam's international cooperation on climate change, which was the participation in the COP 21 Climate Change Conference in Paris (France). The Paris Agreement focuses on comprehensively addressing the contents of the UNFCCC, which is expected to replace the Kyoto Protocol in 2020. The Agreement reaffirms the goal of controlling levels increase in the average global temperature below 2°C and calls on countries to make efforts to limit the increase in global average temperature to 1.5°C. In addition, the parties also reached an agreement on issues such as: converting the INDC into NDC, periodically reporting on emissions levels and “progress made in NDC implementation”; through an international review process every five years, the first being in 2023.

At the Conference, Vietnam committed to:

Firstly, in the period from now to 2020, Vietnam will continue to actively implement strategies, programs, and plans for responding to climate change in many fields with practical measures. Strictly execute the obligations under the UNFCCC and the Kyoto Protocol. Vietnam will contribute 1 million USD to the Green Climate Fund for the 2016-2020 period.

Secondly, for the period after 2020, Vietnam still commits to reducing greenhouse gas emissions by 8% by 2030 and can reduce them by up to 25% if it receives effective support from the international community. Vietnam will periodically review and adjust in accordance with actual conditions.

Regarding the solutions that Vietnam will implement, including: In the energy sector, which is considered the main source of emissions, efficient and economical use of energy, and the use of renewable energy. In transportation, towards increasing the use of public transport, reducing private vehicles in big cities, switching to low-emission fuels such as using new fuels, gasoline, etc. biology... In the forestry sector, Vietnam develops options to increase the absorptive capacity of forests through sustainable forest conservation, planting mangroves in coastal areas to increase carbon sinks; at the same time, it also increases the ability to prevent natural disasters when storms and floods occur in estuaries and coastal areas.

As for the goal of sustainable development, Vietnam is actively implementing the National Strategy on Sustainable Development 2011-2020, restructuring the economy, and transforming the growth model to improve economic efficiency and ensure social justice. Accordingly, Vietnam is moving towards a green industry with the principle of maintaining efficient economic activities, based on minimizing the use of energy and resources, through the use of renewable energy and implementing energy efficiency; reducing pressure on the environment, developing forests, changing land usage purposes, and change wasteful consumption habits.

With these commitments, Vietnam demonstrates political determination and close cooperation in seriously, fully, and effectively implementing its national commitments to the Global Climate Agreement. Participating in COP 21, demonstrating the responsibility and strong commitment of the Government of Vietnam, has been and will continue to be proactive and responsible with the international community to join hands in efforts to respond to climate change using concrete action both at the national and international level.

3.2.2. At the 26th Climate Change Summit (COP26) - Vietnam's mark

Climate change is increasingly complex, COP 26 is expected to be the “best and last hope” to save the planet. At the Conference, 197 countries affirmed that the top priority is to limit the increase in global temperature to 1.5°C above pre-industrial levels - the goal set out in the 2015 Paris Agreement on climate change. Exceeding this threshold, scientists warn, poses the risk of deadly heatwaves, violent storms, drought, and ecosystem disruption. Earth's temperature has now increased by 1.1°C. According to politicians and some activists, the results achieved at COP 26 show the consensus of all countries and send a strong message about the need to step up climate action...

COP 26 calls on countries to come up with more aggressive deflation targets by 2030, aiming to be carbon neutral by mid-century. To accomplish this goal, countries need to accelerate the process of phasing out coal use, limiting deforestation, accelerating the transition to electric vehicles, and encouraging investment in renewable energy.

The climate has been changing and will continue to change with more devastating effects, even as the world struggles to cut emissions. Many communities are vulnerable to and most at risk from climate change, even though they are not the biggest contributors to climate change. Therefore, COP 26 calls on the international community to do more, unite and support those most vulnerable to the impacts of climate change. Facilitate and encourage countries affected by climate change, to protect and restore ecosystems; as well as build a system of natural disaster prevention, control and warning, infrastructure development, and agriculture that is resilient to climate change.

The focus of the negotiations at COP 26 was to finalize the rules needed to implement the 2015 Paris Agreement, including solutions to promote carbon markets, with a higher focus on both actions to reduce emissions and adaptation to climate change. Here, Vietnam made a strong commitment to responding to global climate change. For the first time, Vietnam is committed to developing and implementing strong greenhouse gas emission reduction measures with its resources, along with the cooperation and support of the international community, especially developed countries in both finance and technology

transfer, including implementing mechanisms under the Paris Agreement, to achieve net-zero emissions by 2050.

The declaration of net emissions of “zero” by 2050 demonstrates the determination and political commitment of the Party and State in accelerating the economic transformation to contribute to solving the climate crisis. Vietnam's commitment is highly appreciated by the President of COP 26 and countries around the world for its strong and very practical determination. We have emphasized responsibility, ethics, and awareness of organizations, collectives, and individuals on climate change and environmental protection.

At the same time, Vietnam pledged to reduce methane emissions by 30% by 2030. And called on all rich countries and developed countries to share, support, and help developing countries and poor countries in perfecting the institution; training workforces associated with innovation; appropriate and effective green finance arrangement; green technology sharing; national governance to implement methane reductions. Vietnam has also joined the Declaration focusing on the role and interrelationships between forests, biodiversity, and sustainable land use, contributing to achieving a balance between anthropogenic greenhouse gas emissions and natural greenhouse gas absorption, climate change adaptation. Participating in the Global Declaration of Transition from Coal Power to Clean Energy, the Glasgow Declaration of Leaders on Forests and Land Use... demonstrates the acumen and vision of the era of Party and State leaders. These commitments have been highly appreciated by the international community because Vietnam's commitments are completely in line with the common trend of mankind to choose a development model that does not harm today and tomorrow's generations.

Not only had Vietnam had strong commitments at the Conference, but we had also prepared a roadmap for implementation in advance, such as the inclusion of content to respond to climate change, and commitments to contribute to the implementation of the Paris Agreement on the Law of Environmental Protection 2020, Decree on mitigation of greenhouse gas emissions and protection of the ozone layer along with documents and projects to be submitted to the Prime Minister for promulgation in 2021; develop regulations for the implementation of climate change mitigation and adaptation that meet transparency requirements. “This is an important legal basis for mobilizing the entire population to respond to climate change.”

The Prime Minister of Vietnam has proposed that responding to climate change and natural restoration must become the highest priority in all development decisions, and the highest ethical standard of all levels, industries, businesses, and people. This decision represents the vision of the leader of the Government on socio-economic development of the country in the coming period, the orientation of development investment activities in the coming period in order to achieve the goal of making Vietnam become a high-income developed country by 2045 as set out by the Resolution of the 13th National Congress of Deputies. The path to that goal must be a “green” path, in line with the general global development trend.

4. Conclusion

Today, climate change is affecting people's lives all over the world. Responding to climate change is a major concern of countries. From a very early age, Vietnam has actively

participated and is strongly committed to the international community in responding to climate change. In the journey with the international community to respond to global climate change, many events have marked Vietnam in the international arena. Especially at COP 21 and most recently, COP 26. The responsible contributions of Vietnam are highly appreciated by the international community, draw many opportunities for cooperation on low-emission growth and promoting the development of the circular economy, and reducing the possibilities of climate change./.

Abstract

Today, environmental pollution and environmental issues are a topic of interest to the world in general and Vietnam in particular, especially in the context of complicated epidemic developments in recent years. brought the world economy to a standstill. Therefore, green start-up is a solution that is considered to be very suitable for the world economy and our country today. This study will clarify the commercial and political legitimacy of the green economic model and the results of applying the green economic model to a developing country, Vietnam, in the context of covid 19. is still complicated.

Keywords: *Green proactiveness orientation; green performance*

1. Introduction

Green start-ups are increasingly recognized as the solution to environmental degradation, climate change and resource shortages - important challenges globally. Economic performance, environmental performance and social responsibility are all important factors to consider. For green startups, it is vulnerable to take into account both business performance and social responsibility. At the system level, there are limits. Whether these restrictions on legality benefit green business. Current research suggests this is not the case. The question of whether a country is in transition is particularly important for economies in transition. Green businesses that proactively face legitimacy constraints and institutional uncertainty can succeed. More research on green performance is needed. As a result, a theoretical model to determine the association has been developed. Green proactive orientation (GPO), green performance, legitimacy and transition issues. The subject of economics has been suggested. Based on information from new green businesses in Vietnam.

For governments, universities and businesses worldwide, balancing economic expansion with environmental conservation presents a significant challenge. Several incidents have occurred, including the Deepwater Horizon Oil Spill on April 20, 2010, Elk River Pollution, West Virginia 2014, Domestic Benzene Pollution in Lanzhou (China) In

2014,... especially in a developing country like Vietnam 2020 was a year of many fluctuations, the economy was heavily influenced by During the Covid-19 pandemic, however, the process of industrialization and urbanization is still on the rise, along with negative impacts on the environment, such as: declining natural resources, increased CO2 emissions. It is estimated that the total amount of greenhouse gas emissions in the four sectors: energy, agriculture and waste will be 466 million tons of CO2 equivalent in 2020 and increase to 760.5 million tons of CO2 equivalent in 2030 [4]. In addition, Vietnam is currently facing negative impacts of climate change and some challenges in ensuring energy, food and water security. Facing the above consequences of the brown economic model with the trend of green economic development in the world, in recent years, Vietnam has focused on shifting from the brown economic model to the green one.

Green start-up is defined as a company's business activity in green innovation for goods, services and market development in order to generate profits while paying attention to environmental protection [5,6]. . Green entrepreneurship theory emerged as a result of the growing fusion of the concepts of enterprise and social enterprise. Green entrepreneurship is not likely to burden enterprises due to its dual effect of being eco-oriented and market oriented, as it will bring abundant resources for their development., 8]. According to the definition of Miller and Friesen (1983) [9] on business orientation, green businesses need to have a green business orientation (GEO), including green innovation, green risk taking and green initiatives. Because green companies must be socially responsible, it is important that they do the same.

This study focuses on two topics as a result of this investigation. For startups, the "GEO - legitimacy - resources - business growth" causal model does not reflect the essence of legitimacy in green startups; A comparative exploration of the effects of different levels of legitimacy on the impact of GEOs and green activity seems more worthwhile, and such studies are rare. As a result, we investigated the link between green proactive orientation (GPO) and green performance, as well as the influence of regulation on legitimacy. More importantly, the establishment of stable and effective system standards for assessing legitimacy is necessary to integrate the theory of legitimacy with the theory of green entrepreneurship; this is not suitable for many countries in transition, including Vietnam. Because of significant institutional uncertainties.

2. Literature Review

2.1. Green Entrepreneurship and Green Entrepreneurial Orientation

Green enterprise (GE), understood as environmental, ecological or sustainable entrepreneurship, is the process of identifying, analyzing and exploiting the economic possibilities that result from market failures, as well as such as creating conditions for the long-term development of enterprises. similar companies. GE's primary mission is to identify the next market opportunity for green product development, while also committing to corporate social and environmental responsibility [5]. Due to GE's extended repayment period and social obligations, it is often required. Enterprises also have a role to play in policies that encourage, support and be generally accepted by society; It has a dual role in

both ecological and enterprise construction. Furthermore, businesses for GE must strive to meet the two goals of proactive environmental management and marketing, green participation and entrepreneurship.

2.2. Green Proactiveness Orientation and Green Performance

2.2.1 . Green Proactiveness Orientation

Green proactiveness orientation (GPO) is an essential characteristic of GEO that shows the willingness to take action on behalf of the environment. Enterprises have a propensity to be more proactive in adopting GE habits than their rivals [9]. Green proactiveness-oriented businesses are often industry leaders, according to research. industry trends, anticipating possibilities, and adopting proactive measures to deal with change. GPO stands for proactiveness and is a blend of initiative and behavior orientation. Rather than simply accepting, businesses can take action on the environment. It indicates a forward-thinking attitude. tendencies in entrepreneurial businesses, such as successfully foresee industry developments and avoiding low-green-potential product manufacturing, leading customer adoption of green products, and [5] Consumption trends, for example. As a result, implementing green activities ahead of competitors, such as developing innovative green goods, service models, and management practices.

2.2.2. Green Performance

Green performance is defined as a reduction in a company's negative environmental effect. while striking a balance between economic and environmental concerns. As a result, green performance assesses an organization's ability to balance commercial and environmental goals. Getting to the green zone Enterprise performance necessitates not just a reduction in pollution, waste, and energy consumption, but also a reduction in the number of employees. not just to increase consumer safety, but also to survive and grow. Green performance encompasses a variety of factors. Indicators of measurement, each indicating a variable, in accordance with a lower negative influence on the natural world. Reduced consumption of water, energy, and non-renewable resources are among these factors. hazardous inputs, solid waste, soil pollution, wastewater emissions, air emissions, and noise, to name a few odor/odor emissions, landscape destruction, and the possibility of serious accidents.

The association between proactiveness orientation and entrepreneurial performance has been the subject of several research. Proactiveness-oriented startups seek proactive advantages and a demand premium. Customers are left with a powerful and enduring image, strong brand awareness, and the high cost of customers switching to another company. Early entrants in the sector have a low-cost advantage by having a technological lead and downshifting the learning curve. Enterprises that are proactive can earn huge performance advantages. GPO, therefore, inherited the important features of proactiveness orientation, as seen by adopting GE action ahead of the competition. Choosing advance activities with a green orientation as the goal will provide you a green proactive edge and put you ahead of the pack in terms of green performance.

Hypothesis 1: Enterprises with higher levels of GPO will have more improved green performance.

2.3. Legitimacy

Some scholars have considered the question of legitimacy. Generalizing or assuming that the behaviors of an entity are appropriate, desirable or appropriate according to some system of norms, values, beliefs and definitions created by society, such as Suchman (1995) [10] did. Legal restrictions, such as those on sociopolitical legitimacy and perceived validity, apply to startups. Low social legitimacy leads to difficulty in registration, public rejection of product standards, financial difficulties, etc. Sociopolitical legitimacy refers to the degree of acceptance of a startup's behavior and products by key stakeholders, the public, and government officials; low social legitimacy leads to difficulty in registration, public rejection of product standards, etc. The degree of social acceptance and acceptance of startups, mostly controlled by society's knowledge of new companies and products, is known as perceived legitimacy.

The combination of legitimacy and opportunity is common in the startup world. To see the commercial potential of the possibilities; Experienced entrepreneurs appreciate commercial opportunities more than others. According to the authors, low commercial legitimacy is a major problem that makes it difficult to materialize. measure the value of an opportunity This is making seasoned businesses pay more attention to this issue. Because a higher degree of commercial legitimacy ensures stiffer competition,

The more innovative a company is, the better its chances of achieving a competitive advantage. For green behavior to be of practical importance, commercial legitimacy is particularly important. as supported by the win-win approach, but this approach has not been experimentally proven for various reasons leading to hypothesis 2, 3.

Hypothesis 2 (H2+): The positive association between GPO and green performance is higher in businesses that have a large number of employees. Firms with greater levels of political legitimacy have higher levels of political legitimacy than enterprises with lower levels of political legitimacy.

Hypothesis 3 (H3+): The positive association between GPO and green performance is higher in businesses that have a large number of employees. Enterprises with greater levels of commercial legitimacy have higher levels of commercial legitimacy than those with lower levels of commercial legitimacy.

2.4. Institutional Uncertainty in a Transitional Economy

The term "transitional economy" refers to the period of transition from a planned economy to a market economy. Many emerging countries, unlike the rich Western countries, have a combination of planned and market economies, government involvement and market processes, as well as traditional and existing institutions. grand. Modern modes of economic growth [66–68]. Entrepreneurship is crucial in times of economic transformation. have traits of ingenuity, such as juggling between trade and commerce, conservation of the environment, specialization and diversity, entrepreneurship and conservation the status quo In With economies in transition, companies in emerging countries, such as Vietnam, exhibit a distinctive character in their business practices. As a result, mature Transition economies are not based on Western notions. There is no question that a thorough investigation is needed. in transition economies will have a significant impact on GE's entrepreneurship and behavior.

As a result, the transitional economy has a significant influence on green entrepreneurial ventures. The emergence of a private economy boosts market competitiveness and vitality by breaking the restraints of a planned economy. In a competitive market, businesses are more likely to seek short-term performance goals rather than long-term ones, and business conduct is more likely to be related to company success than than environmental performance. When institutional uncertainty is high, regulatory constraints for businesses become less rigorous, and businesses will continue to seek for and exploit legislative loopholes and gaps. Institutional pressure on green businesses falls along with the need to obtain political legitimacy, especially when industry standards are unclear, resulting in poor green performance (H4). Formal and informal institutions, on the other hand, are studied in the study of institution theory.

Formal and informal institutions, on the other hand, show a mutual substitution impact in the process of regulating economic behavior in the study of institution theory. When formal institutions fail, informal norms and values take over. As a result, when institutional uncertainty is high, it becomes even more critical for businesses to obtain a competitive advantage. Public, supplier, and partner recognition. In this case, informal influences are a factor. Institutions are more important, as is the influence of commercial legitimacy on GPO.

When the benefits of going green become more apparent (H5). Hypotheses 4 and 5 follow as a result of this.

Hypothesis 4: As institutional uncertainty grows, the moderating influence of political legitimacy on the connection between GPO and green performance becomes more negative, resulting in a negative three-way interaction between GPO, political legitimacy, and institutional uncertainty.

Hypothesis 5 (H5+): As institutional uncertainty increases, the moderating effect of commercial legitimacy on the relationship between GPO and green performance becomes stronger, resulting in a three-way interaction between GPO, commercial legitimacy, and institutional uncertainty that is positively related to green performance.

2.5. Impact of covid 19 on the economy in green performance transformation

Since 2019, Vietnam has been affected by the covid 19 pandemic, causing the Vietnamese economy to stagnate. At that time, the brown economic model was being applied by Vietnam. However, due to the impact of epidemics and natural disasters, Vietnam's economy fluctuates and somewhat declines, especially environmental pollution is at a serious level. In order to promote the economy combined with environmental protection and attract foreign investment, Vietnam has promoted the transformation towards a green economy and has had certain successes: especially attracting FPI in 2021. reached 31.5 billion USD, up 9.2 percent compared to 2020.

Hypothesis 6: The impact of covid has severely affected the world economy, but for Vietnam, the focus on shifting to a green economy has brought certain successes during the covid 19 pandemic and strongly attracted FDI.

3. Method

3.1. The current situation and reasons for choosing Vietnam as a research base

Vietnam's economy has progressed and accomplished significant milestones during the last 30 years, with an average annual economic growth rate of 5.8% for the period 2016-2020. The economy is badly hit by the Covid-19 pandemic in 2020, however based on the aforementioned economic growth data, Vietnam remains in the group of countries with the greatest growth in the region and throughout the world. This is a positive indicator, but it should be noted that the higher the economic development, the greater the influence on the environment and society. In particular, the processes of industrialization and urbanization have had severe environmental consequences, such as the depletion of natural resources and the growth in CO2 emissions.

Total greenhouse gas emissions in the four sectors of energy, agriculture, and trash are expected to be 466 million tons of CO2 equivalent in 2020, rising to 760.5 million tons of CO2 equivalent in 2030 [4]. Furthermore, climate change is having a detrimental influence on Vietnam, as well as certain issues in guaranteeing energy, food, and water security. Prior to the above repercussions of the brown economic model colliding with the global trend of green economic growth, Vietnam has concentrated on changing from the brown to the green economy in recent years.

Vietnam is a country with potential and developing economy, so I chose Vietnam as the subject of research and survey for this topic.

3.2. Survey tool development

In order to prevent performance measurement bias, Murphy et al. (1996) recommends using suitable control variables in studies of entrepreneurial success. As a result, the control variables in this study were the size of the company, the period since it was founded, the industry, the size of the business, and the stage of development.

This research discovered the following variables based on the rich theoretical framework presented in the preceding section. in accordance with the specifications All of the items were evaluated using a five-point Likert scale. One implies that the statement did not correspond to the reality of the respondent's business. belongs to, and a five-star rating denoted a good match. In addition, the EO measures have been discussed. before, in a research project. Covin and Slevin (1989) developed a proactiveness measure for their investigation. use and orientation.

Variable	Items	Questions	Source
Political legitimacy	The enterprise was highly praised by government departments	Is your business highly rated by the government?	
	The enterprise was recognized by regulatory bodies.	Has your company's business activities been recognized by state management agencies?	
	The government frequently recommended us as a model enterprise	Is your business often referred to as a model business by the government?	

Variable	Items	Questions	Source
	The government regularly visited our enterprise.	Does the government regularly visit your business?	
Commercial legitimacy	The enterprise is widely recognized by customers.	.Is your product popular with customers?	
	The enterprise is widely recognized by suppliers.	Is your business widely recognized by suppliers?	
	The enterprise's products have been highly evaluated by peers	Are your products highly appreciated by other businesses?	
	The enterprise's products have been highly evaluated by customers	Does the government regularly visit your business?	
Institutional uncertainty	Key policies related to business operation are not comprehensive.	Policies mainly related to business activities are not comprehensive	
	Relevant industry standards are not clear.	Relevant industry standards are not clear	
	Relevant industry policies are fuzzy	Related industry policies are still vague	
	There are gaps in related institutions and policies.	There are gaps in relevant institutions and policies	
	Relevant policies lack specific guidance and operational advice for implementation	Related policies lack specific guidance and operational advice for implementation	
Reen activity	Compared to peers, we cause less air pollution.	Who feels the high affirmative meaning of the statements?	
	Compared to peers, we release less sewage.	.Who generates the most wastewater in your business?	
	Compared to peers, we show a high significance affirmative of the statements	Who feels the high affirmative meaning of the statements?	
	Compared to peers, our cost of handling poisonous, harmful and hazardous materials is lower.	Is your business's cost of handling harmful and dangerous substances lower than other companies in the same industry?	
	Compared to peers, our cost of energy consumption is lower.	How is your company's consumption cost compared to other companies in the same industry?	

Variable	Items	Questions	Source
	Compared to peers, we have a lower rate of environmental accidents	How does your environmental accident rate compare to your colleagues?	
Proactive orientation	We usually spearhead green initiatives to which peers followed or reacted.	How often do you launch green initiatives?	
	We tend to be the industry "leader", often launching new green products, new technologies or green management before peers	Do you want to be the "leader" in the industry and launch new technology products, or green management before your peers?	
	Corporate executives frequently look at future industry trends, understand green development opportunities and take early action to manage change.	Do directors at your company regularly review future industry trends, understand growth opportunities, and take action to manage change?

4. Discussion and Conclusion

Green Economy is a concept that has become familiar to economies around the world. It is an economy that improves people's lives and social assets; at the same time, focusing on minimizing environmental hazards and resource scarcity (according to the United Nations Environment Program - 2010). Currently, the green economy is understood as a combination of three factors: economy - society - environment. Green economy has a sustainable nature, which means that it is activities (in the economy) that create profits or beneficial values, aimed at developing the life of the human social community (especially the cultural factors); at the same time, these activities are environmentally friendly (the key ingredient). These 3 factors are balanced to satisfy sustainability.

The green economy recognizes natural values and the role of investment in natural capital. Natural capital is natural resources such as forests, lakes, land, water, etc., which play an important role in human existence and development. Natural capital brings benefits to agriculture, soil fertility, value to crop production... especially the livelihood of poor households because their livelihood and security depend heavily on nature. course. Thus, the transition to a green economy not only recognizes and demonstrates the value of natural

capital, but also enables the investment and construction of natural capital towards a sustainable economy. Green economy contributes to poverty reduction. According to the experience of many developing countries, one of the greatest opportunities to accelerate the transition to a green economy is to invest in the provision and storage of clean water, sanitation services for the poor, and energy. renewable energy to be economically viable and as a means of poverty alleviation and overall quality of life improvement. Green economy encourages the use of renewable energy, low carbon technology and encourages more efficient use of resources and energy. As natural resources are increasingly depleted and biodiversity declines, and environmental pollution increases, the use of renewable energy will help reduce greenhouse gas emissions and risks of chemical fuel price fluctuations.

From the above arguments, the author proposes the following recommendations to raise awareness and implement green economy:

First, change the growth model from a broad-based growth model based on investment, capital increase and natural resource exploitation with low efficiency to a model of in-depth growth based on various factors. productivity is related to resource use, environmental protection and improvement of people's quality of life.

Second, to achieve a green economy, economic sectors must be green, economic sectors must be green. The green economy must be consistent in all areas of the economy, from production to consumption. It is necessary to restructure economic sectors in the direction of being environmentally friendly, focusing on transforming the internal structure in the direction of prioritizing low-emission and energy-saving industries.

Third, renovate production technology in the direction of being environmentally friendly, low carbon, prioritizing investment in the development of a number of spearhead green economic sectors such as organic industry, eco-tourism, etc.

Fourth, set technical criteria to create green products, products with national and international brands, meeting the requirements of trading partners.

Fifth, calculate the allocation of investment resources to sectors, thereby promoting the "natural capital" advantage of renewable resources.

DIFFERENTIATING PRODUCTS TO EXPLOIT INTERNATIONAL MARKET OPPORTUNITIES FOR NATURAL FLAVORING INSECT REPELLENT PRODUCTS

Assoc. Prof. Dr. Nguyen Thuong Lang
langnt@neu.edu.vn

Nguyen Hoang Duong
hoangduong257.neu@gmail.com

National Economics University, Hanoi, Vietnam*

Abstract

Currently, products of natural origin, safe for users and environmentally friendly are increasingly popular and consumers are increasingly aware of the choice of products that are beneficial for family health. Enterprises also aim for sustainable development when cutting emissions through each stage of production. The trend of using natural flavoring products is also applied in insect repellent products because the features of some plants can both produce scents and have the effect of repelling insects. However, the use of this natural flavoring insect repellent still makes consumers wonder about its true use as well as there are many rampant products without a clear origin. Therefore, the study of natural flavoring insect repellent devices is also of interest to many researchers and pharmacists at home and abroad. Other studies have also found that many factors affect the choice of natural flavoring products but are inconsistent, have not focused on the product factor, and do not reflect the level of consumer awareness. Based on theory, this study analyzes and evaluates the effect of product differentiation on exploiting the opportunity for international market integration of natural flavoring insect repellent products by combining qualitative and quantitative methods. Thereby, the study clarifies the impact of product differentiation on consumer perceptions of products. Results achieved, Perceived Environment; Perceived Usefulness; Perceived Difference and Social Influence have a positive effect on consumers' purchasing intentions. In contrast, Perceived Risk has a negative effect on consumers' purchasing intentions of natural flavoring insect repellent products. Finally, the article proposes how to enter the market, position products, develop the strengths of products in the domestic and international markets.

Keywords: *International Business, Natural Products, Product Differentiation, Sustainable Development.*

1. Introduction

The trend of using flavoring products, natural scents is increasingly popular with the useful features and uses that it brings, both creating natural scents and having the effect of

repelling insects and helping to relax. Products carrying chemical, artificial flavorings are gradually being replaced because of their long-term harm.

The use of natural flavoring products has been quite popular in developed countries and there are initial advances in developing countries as personal income and consumer consciousness increase. However, currently, natural flavoring products have not made many improvements in product differentiation, including quality, style, price, shelf life, convenience, and no specific instructions for consumers to use properly.

For that reason, the authors implement the topic: "*Differentiating products to exploit international market opportunities for natural flavoring insect repellent products*" to determine how the factors of product differentiation impact the market exploitation opportunities of natural flavoring insect repellent products in the country and also international.

This article was structured into five parts: (1) Introduction; (2) Literature Review; (3) Research Methods; (4) Findings and (5) Discussion, Conclusion and Suggestions.

2. Literature Review

Product differentiation is a process of distinguishing one good and service from other products and services, making it more attractive to the product's target market. This involves distinguishing it from the product of the competitor as well as of the product itself in the company (Edward Chamberlin, 1993). Although a niche market can lead to changes in a product to improve velvet those changes are not different. The difference here is the uniqueness of the product which creates a sense of value. Any difference is valued by the buyer (the term Unique Selling Advantage refers to advertising to communicate the difference of the product).

Michael Porter (1980) stated that "Any product (tangible or intangible) is considered a unique product of a certain group of customers. Therefore, it depends on their perception of how different the product is." Miller (1986) proposed marketing and innovation as two differentiated strategies, supported by some scholars such as Lee and Miller (1999). Mintzberf (1988) proposes more specific but broader categories: quality, design, support, image, price, nice, and nondiscriminate products, supported by Kotha and Vadlamani (1995). IO Documents (Ethiraj & Zhu, 2008; Makadok, 2010, 2011) further analyzed the theory and explored the obvious difference between the widespread use of vertical and horizontal differences.

Several studies related to the effect of product differentiation on market exploitation. Research of Duong Anh Tung (2007) analyzes the competitive situation in the industry, assesses the strengths and weaknesses, causes of limitations, and proposes solutions to improve the competitiveness of the company's fruit and vegetable industry in the EU market, strategic findings, environmental awareness. Master Phan Thanh Xuan's (2011) study on the synthesis of liquid materials presented an overview of the literature on biofuels, catalyzed for the cracking process, an overview of waste cooking oil, and waste animal fat. Finding the usefulness of the product makes a difference.

Schmalensee, R. (1982). Product Differentiation Advantages of Pioneering Brands. *The American Economic Review*, 72(3), 349-365 presents and explores a relatively simple market model in which buyer rational behavior in the face of imperfect information about product quality can bring long-term advantages to pioneering brands.

Shaked, A., & Sutton, J. (1987). Product Differentiation and Industrial Structure. *The Journal of Industrial Economics*, 36(2), 131-146 points to "vertical product differentiation" that developed the idea that if the nature of technology and tastes in certain industries have a certain form, then that industry must necessarily be "focused"; and must remain so, no matter how big the economy becomes.

Krugman, P. (1980). Scale Economies, Product Differentiation, and the Pattern of Trade. *The American Economic Review*, 70(5), 950-959 argues that the widespread trade among developed countries as well as the popularity in this two-way exchange trade of differentiated products shows much in terms of theoretical standards.

Beath, J., & Katsoulacos, Y. (1991). *The economic theory of product differentiation*. Cambridge University Press said: "Few industries in the modern market economy do not produce differentiated products." This book systematically analyzes the widespread popularity of this important type of product and focuses on models in which product selection is endogenous.

Berry, S. (1994). Estimating Discrete-Choice Models of Product Differentiation. *The RAND Journal of Economics*, 25(2), 242-262. Retrieved February 5, 2021, Research paper looks at the problem of analyzing "supply and demand" on a cross-section of exclusive markets with differentiated products. The basic methodology is to assume that the need is described by a discrete selection model and the price is determined endogenously by valuation companies.

Anderson, S. P., & De Palma, A. (1992). The logit as a model of product differentiation. *Oxford Economic Papers*, 44(1), 51-67. In the paper, the authors evaluate two alternative models of international trade in differentiated products. A growing pattern of profitability in which varieties are linked to companies predicts the housing market effect.

Through the above studies, each study has a variety of factors and discovered that new factors are uneven and uniform. Moreover, studies show a direct link between factors on the product but there is no analysis of the interaction of each factor. Therefore, to have a deep and complete research model, overcoming limitations, the authors propose a complete research model based on cognitive biases. The team inherited the research model that preceded the appropriate variables in the course of the study: Perceived Environment (Kim and Choi, 2005); Perceived Usefulness (Davis, 1985, Chutter, M.Y., 2009); Perceived Difference (Michael Porter); Social Influence (Morton Deutsch and Harold Gerard, 1958); Perceived Risk (Bauer, R.A., 1960); Substitute Goods (Stephen J. Durako et al., 2016).

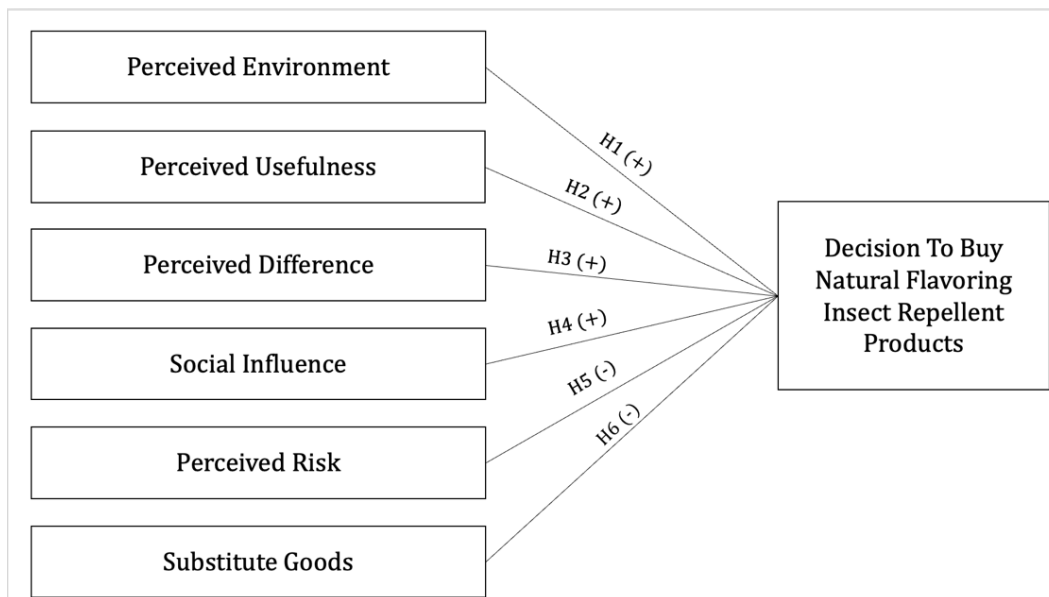

Figure 1. Proposed research model

Source: Aggregated author group

The research hypotheses are as follows:

Environmental concerns denote an individual's orientation toward the environment and their level of interest in environmental issues (Kim and Choi, 2005). In response to market demands, eco-products are designed to help save energy, reduce emissions, and subsequent waste disposal needs. Eco-products are also designed to ensure the recyclability, reuse and recovery that people care about. The proposed research hypothesis:

H1: Perceived Environment has a positive effect on the behavior of purchasing natural flavoring insect repellent products.

Perceived Usefulness (PU) is the level at which individuals believe that using a particular system will enhance their performance (Davis, 1985, quoted in Chuttur, M.Y., 2009, p.5). Perceived usefulness is a factor that motivates consumers to buy products that repel natural flavored insects. On that basis, the proposed research hypothesis:

H2: Perceived Usefulness has a positive effect on the behavior of purchasing natural flavoring insect repellent products.

According to Michael Porter's 5-force competitiveness model, buyer power is one of those five factors, which includes the company's product differentiation from competitors and price sensitivity. On that basis, the study proposal:

H3: Perceived Difference has a positive effect on the behavior of purchasing natural flavoring insect repellent products.

Morton Deutsch and Harold Gerard 1958 described two psychological needs that make people conform to the expectations of others. These include our need to be right (information society influence) and our need to be preferred by others (ordinary social influence). Standard influence is an influence to match the positive expectations of others. On that basis, the study proposal:

(H4): Social Influence has a positive effect on the behavior of purchasing natural flavoring insect repellent products.

Bauer, R.A. (1960) mentions that belief in risk perception as a major factor in consumer behavior can be a major factor influencing the transition from web browser to the rue shopper. Perceived risk is debated to be highly correlated with consumer perceptions of adverse and uncertain risks (Dowling & Staelin, 1994). From there, the study *proposes*:

(H5): Perceived Risk has a negative effect on the behavior of purchasing natural flavoring insect repellent products.

Stephen J. Durako et al. of Westat "Assessing the status of compliance with international law on the marketing of breast milk substitutes by companies that make breast milk substitutes" (2016) argue that breast milk substitutes have the same value of public benefits, elements of compliance with international law and marketing in the media help let this replacement commodity become superior. So, when the price of the substituted goods goes down, the demand for the goods we are analyzing will decrease and its demand line will shift to the left. From there, the study *proposes*:

(H6): Substitute Goods has a negative effect on the behavior of purchasing natural flavoring insect repellent products.

3. Method

In terms of qualitative research, the authors conducted face-to-face interviews with 10 individuals living and working in Hanoi, who have demand and experience in purchasing insect repellent products. The subjects of the interview were of different ages, different cultural levels. At the same time, consult with 5 experts at the forefront of product development research.

The results of the qualitative study showed that all six factors that influenced the purchase behavior of natural flavoring insect repellent products were accepted and no new factors were proposed. The factors included in the quantitative study are: (1) Perceived Environment (5 variables); (2) Perceived Usefulness (4 variables); (3) Perceived Difference (4 variables); (4) Social Influence (7 variables); (5) Perceived Risk (5 variables); (6) Substitute Goods (3 variables). A total of 28 observational variables of 6 factors influencing the decision to buy natural flavoring insect repellent products were included in quantitative research.

In terms of preliminary quantitative studies with a direct survey slip with a small sample (20 people). The majority of subjects accepted the survey slip but needed to adjust some words accordingly and design the question more rationally.

The author built the originally planned sample of 280 surveys. This number of observations both met the sample size requirements of Hair et al. (2014) with 145 observations and Green's study with 109 observations. The expected number of observation slips of the group is greater than the minimum sample size. The more valuable research is done.

Of the 243 consumers who responded to the survey, 62.8% were female and 37.2% were male. The survey age ranged from 18 to 60 years old, with the highest proportion of 18-25 years old (58.8%), the second was the group of customers aged 26-30 (22.6%),

followed by the group of 31-35 years old (11.5%), from 35-40 years old (5.4%) and the over-40 group accounting for only 1.7% of the overall study.

The data is processed using SPSS 20 software. Data from independent variables are analyzed through steps: Cronbach Alpha scale reliability testing, EFA discovery factor analysis, correlation analysis, and linear regression analysis.

4. Results

Factors influencing the behavior of purchasing natural flavoring insect repellent products.

Analysis of Cronbach's Alpha reliability factor showed that there were 5 scales used in the study with Cronbach's Alpha coefficient greater than 0.7 satisfying reliability and a total variable correlation coefficient greater than 0.4; The Replacement Goods scale has a Cronbach's Alpha reliability factor of $0.27 < 0.6$. As such, remove the Replacement Goods scale. So it can be determined that the scale ensures reliability and is suitable for use for further analysis.

Table 1. Cronbach's Alpha Reliability Test Results Table

Scale	Number of Variables	Cronbach's Alpha	Smallest Corrected Item-Total Correlation
Social Influence	7	0,866	0,587
Perceived Environment	5	0,917	0,692
Perceived Usefulness	4	0,824	0,442
Perceived Difference	4	0,768	0,533
Perceived Risk	5	0,828	0,443
Substitute Goods	3	0,270	-0,530
Purchasing Decision	4	0,796	0,553

Source: Aggregated author group

The scale consists of 25 observation variables, after testing the scale reliability using Cronbach's Alpha, which is included in the EFA factor analysis.

The EFA factor analysis showed that there were 5 factors extracted at the Eigenvalue value of 1,574 and the total variance of 66.063% indicating that the model was appropriate. The KMO coefficient = $0.803 > 0.5$ so the EFA factor is consistent with the study. In addition, the actor loading factor is > 0.5 , so the observation variables have good statistical significance and are important in the elements, have practical meaning. Sig. (Bartlett's Test) = $0.000 < 0.05$ shows that observed variables are correlated with each other overall.

Table 2. KMO and Bartlett Test Results for Independent Variables

	Result	Compare
KMO Measure of Sampling Adequacy	0,803	$0,5 < 0,803 < 1$
Sig.	0,000	$0,000 < 0,05$
Average Variance Extracted	66,063%	$66,063% > 50%$
Eigenvalue	1,574	$1,574 > 1$

Source: Aggregated author group

EFA factor analysis showed that the four variables all converged on one fact statistical significance and are important in the factor, all have practical significance. Sig. (Bartlett's Test) = 0.000 < 0.05 shows that the observed variables are correlated with each other overall.

Table 3. KMO and Bartlett Test Results Dependent Variables

	Result	Compare
KMO Measure of Sampling Adequacy	0,702	0,5 < 0,702 < 1
Sig.	0,000	0,000 < 0,05

Source: Aggregated author group

Based on the results of quantitative research, the authors decided to modify the research model.

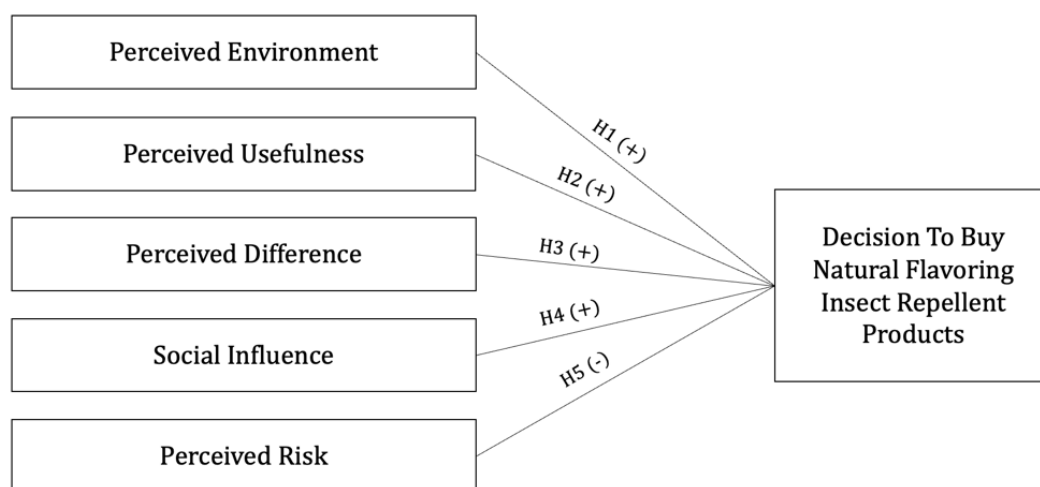

Figure 2. Modified research model

Source: Aggregated author group

The authors used the Pearson coefficient to analyze the correlation between quantitative variables. Pearson correlation coefficients between variables run from -0.133 to 0.471. That demonstrates the distinguishing value achieved, suggesting that the relationship between dependent variables (Procurement Decisions) and independent variables is statistically significant (Sig. <0.05). It can be seen that the dependent variable Purchasing Decision is positively correlated with the variables Social Influence, Perceived Environment, Perceived Usefulness, Perceived Difference and has a negative correlation with the variable Perceived Risk. So other statistics can be used to find a link between independent variables and dependent variables.

The linear regression equation with the dependent variable is Purchasing Decision (QD):

$$QD = 0.106MT + 0.271HI + 0.100KB + 0.233XH - 0.037RR$$

MT: Perceived Environment

HI: Perceived Usefulness

KB: Perceived Difference

XH: Social Influence

RR: Perceived Risk

QD: Purchasing Decision

The model consists of 5 independent variables XH, MT, HI, KB, RR, and one dependent variable QD (Purchasing Decision). Based on the standardized Beta coefficient, the authors found that the factor Perceived Usefulness had the strongest impact on the consumer's decision to buy natural flavored insect repellent products (Beta = 0.281). In contrast, the factor Perceived Difference has the weakest impact (Beta = 0.111), the factor Perceived Risk negatively impacts Purchasing Decision (Beta < 0). At the same time the Sig. value of the factors is less than 0.05, all hypotheses are accepted.

Table 4. Analysis of factors influencing purchasing decision

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
(Constant)	0,863	0,391		2,205	0,028		
MT	0,106	0,051	0,119	2,065	0,040	0,897	1,114
HI	0,271	0,064	0,281	4,203	0,000	0,663	1,508
KB	0,100	0,055	0,111	1,826	0,000	0,801	1,248
XH	0,233	0,071	0,216	3,303	0,001	0,692	1,446
RR	-0,037	0,79	-0,026	-4,466	0,041	0,960	1,042

Source: Aggregated author group

The results of the study showed that 5 factors influenced consumers' decisions to buy natural flavored insect repellent products, of which Perceived Usefulness had the strongest impact.

5. Discussion and Conclusion

In accepted hypotheses, the factors influencing product differentiation on consumers' purchasing decisions vary to varying degrees with the strongest impact from the perception of usefulness. The article also removes the perception of alternatives that affect consumers' purchasing decisions. It can be seen that the conclusion also explains the views on the effect of product differentiation such as Michael Porter (1980) when it is suggested that the product is different from a particular group of customers and when there is enough awareness of that difference that in turn impacts buying behavior. Or as Lee and Miller view (1999), product differentiation is a marketing strategy, further confirming the perception of usefulness is in a favorable relationship with product shopping behavior. This study has conjured up implications for corporate governance under a differentiated strategy, forecasting market exploitation opportunities for products. From there, orienting and forecasting market demand for businesses to take advantage of opportunities, improve product quality and have appropriate customer outreach plans, constantly improve marketing to raise awareness for consumers about natural flavoring insect repellent products.

5.1. Orient and forecast opportunities to exploit the market from product differentiation

The trend of using green and environmentally friendly products is increasingly popular not only in Vietnam but also around the world especially after the Covid-19, pandemic. Keeping up with the trend for enterprises producing natural flavoring insect repellent equipment not only creates opportunities for rapid development, expanding market share but also enlists large investments from investors and the Government's support for businesses.

The results of the survey from Vietnam's No. 1 R&D Company – Nielsen, announced at the seminar "Brand strategy associated with green development": "Vietnamese consumers are willing to pay more for brands with a commitment to "green" and "clean". Specifically, up to 80% of consumers are concerned about the long-term harm of artificial ingredients and 79% are willing to pay more to buy natural ingredients that do not contain toxic substances that they do not want."

Therefore, to improve the efficiency of trade and production activities, enterprises need to learn how to build trust through commitments to social and environmental responsibility, putting consumer health at the heart of product development, linking product development with a commitment to sustainability. On the other hand, enterprises will build an image of the brand and comply with Vietnamese laws, especially environmental and labor laws.

5.2. Solutions to promote product differentiation

5.2.1. Technical Solution

Production techniques are the most important factor for product differentiation, the application of technology needs to be studied and applied more in the coming time.

The status of the product to repel insects carrying natural flavoring product is still in a manual shape, the shape is still large and raw, so it is necessary to apply automation technology, adjust the temperature automatically so that the fuel burning time takes place faster; replace some bulky parts on the machine by integrating two of the machine's functions; set the timer mode as well as improve the design so that the product is both compact, easy to carry, suitable for both in narrow places or offices. Promote R&D activities, research and improve products by developing features and characteristics for products.

5.2.2. Market Solutions

For the domestic market, expanding the market not only in urban areas but also in rural areas, construction sites, farms, households living especially in places where many fields and hills, provides local distribution convenient for transportation and installation.

For international market expansion, analyze international business opportunities, assess the level of readiness and ability to participate in international business. Analyze the status quo and opportunities based on the SWOT chart, analyzing the suitability of business opportunities with strategies, resources and competencies to differentiate products that facilitate international market integration.

The mixed export marketing strategy needs to be implemented by the resources of the business. Develop a sales strategy, types of gifts, or a combination of ancillary items to encourage purchases from customers.

5.2.3. Financial Solutions

For the product to be improved in terms of use, design, techniques, it is necessary to have investment capital for long-term development towards the goal of sustainable development for insect repellent equipment carrying natural flavorings. In the short term, the project should be called on investors who are paying attention to green, clean and natural energy products. The funds are funded, the technology equipment is supported to improve and differentiate products to exploit market opportunities.

Policies on accounting, administration and auditing of loans, revenues and expenditures should be carefully considered in terms of local and foreign currencies. The source of capital that determines the choice of accounting method and how to report to the funder all need details.

5.2.4. Human Resource Management Solutions

There are policies to attract high-quality human resources, ensure good skills, professional skills to produce and improve products, create differences in terms of features and uses for products.

Policies on human resource management and international human resource management should be taken care of, first training a team of skilled, conscious and passionate human resources to develop products bearing natural flavorings to gradually replace toxic chemicals. Policies to develop a network of production receiving units, suppliers, transport and distribution units. Reasonable calculations are needed to increase the competition.

Human resource management not only domestically but also in the international market is also a challenge that requires understanding the culture of each region, institutions, political, economic, cultural and social situation,... to send personnel to management or policies to bring personnel to the international market to develop products and branches.

5.3. Recommendations

For investors, it is necessary to pay more attention to products bearing natural flavorings, ensuring the safety of consumers' families. Investors provide certain sources of capital with returns as a percentage of the company. At the same time, supporting both relationships, production, technology, advertising and brand identity, brand development, supporting procedural and legal issues.

For the Government, set out a legal framework for enterprises doing business across the country and for the import and export of enterprises oriented to international market integration. The government has policies to help protect businesses towards "green consumption" in the country, encouraging consumers to use for health benefits. Establish "specialized" government units to promote export activities. This activity is especially useful for small and medium-sized enterprises with limited financial resources in finding contracts with customers in other countries.

DETERMINANTS OF ENERGY CONSERVATION INTENTION IN VIETNAMESE HOUSEHOLDS BASED ON THE THEORY OF PLANNED BEHAVIOR AND THE KNOWLEDGE - ATTITUDE - BEHAVIOR MODEL

MSc. Le Bao Ngoc

lebaongoc.tuti@gmail.com

*Faculty of Marketing, Economic Research Institute of Posts and Telecommunications,
Posts and Telecommunications Institute of Technology, Hanoi, Vietnam*

Abstract

Vietnam is facing the risk of energy crisis in the future due to the mismatch between energy demand and energy supply as well as the heavy dependence on imported source put the national energy security in question. The need to understand factors that have the strongest influence on the daily energy-saving behaviors is increasing its importance. The objective of this paper is to provide an overview of energy conservation behaviors in Vietnam, then point out problems which require immediate attention, and later identify determinants of energy conservation intention at household level by integrating the Theory of Planned Behavior and the Knowledge – Attitude – Behavior model.

Keywords: *Energy behaviors, energy conservation, energy efficiency, energy saving, Vietnamese households.*

1. Introduction

Like many other developing countries in Southeast Asia, Vietnam is going through the high economic growth with annual growth rate of 6-7% (Huy and Nguyen, 2010). Vietnam was an economy star during 2020 and 2021 because it was one of the only economies to record two consecutive years of growth since the start of the Covid-19 pandemic. The rapid economic development, coupled with the high urbanization process, industrialization and population growth has raised the energy demand for industries, transportation, and domestic activities (Nguyen, 2015). Vietnam is facing two key energy-related issues. First, domestic demand for energy is exceeding the domestic supply. Vietnam will lose its domestic balance, which is a threat to the national energy security (Nguyen, 2015). National electricity demand will grow at an average rate of 10%/year from 2016-2020 and 8%/year from 2021-2030 (Shigeru and Han, 2019). Vietnam has potential energy resources, but this resource is increasingly depleted, so since 2015, Vietnam has had to import electricity from other countries. According to forecasts, along with economic growth, in 2025, nearly 49% of electricity demand in Vietnam will be met through imports (Phan Anh et al., 2020). Dependence on imported electricity leads to an increase in electricity costs as well as a threat to national energy security. Large electricity consumption also leads to the risk that Vietnam will not be able to fulfill its commitments to reduce greenhouse gas emissions and climate change under international agreements (Nguyen, 2015).

The second problem that Vietnam's energy industry is facing is low energy efficiency. Energy efficiency investment and energy saving behaviors, or sometimes termed as energy curtailment behaviors are two types of energy behaviors. The distinction is made based on whether the effort requires monetary investment. Energy saving behaviors involves repetitive efforts but no monetary investment. Daily energy behavior is measured by better energy behavior, for example, put a lid on saucepan while boiling and curtailment of comfort behavior, for instance, wearing a jumper instead of turning up the heater (Yue et al., 2013; Trotta, 2018; Boek et al., 2019). Thus, daily energy behavior is habitual and has automatic nature. However, energy curtailment behaviors require a change in lifestyle. Energy efficiency is divided into two forms, commonly understood as the purchase of energy-saving appliances, such as LED lights and energy efficient retrofits measure investment which requires more investment in money and time, for instance, installing an insulation system for a building (Yue et al., 2013; Trotta, 2018; Boek et al., 2019). In Vietnam, the energy efficiency is low due to the old, outdated equipment, which consumes power has not been replaced and the community has low level of knowledge and awareness of saving electricity in daily life (Nguyen, 2015). Based on the Vietnam Energy Overview Report 2019 of the Ministry of Industry and Trade, an investment in energy efficiency is a measure to save electricity costs in the long run (Nguyen, 2021). However, Urban and Scasny (2016) unveiled rebound effect which may occurs when the money saved by reducing energy consumption is spent on energy-intensive appliances, hence increasing overall energy use. Besides, rebound effect also refers to a situation in which people increase energy consumption after buying energy-saving technology (Urban and Scasny, 2016; Gao et al., 2017)

Manufacture, household activities and transportation are among the sectors that consume the most electricity. In 1990, the energy consumption of Vietnamese households accounted for 63% of the total energy consumption because the majority of households used biomass fuel for cooking. This share will decrease to 23.2% in 2017 and 20.6% in 2050 because under the impact of economic development, modern fuels with higher energy efficiency have replaced biomass energies (Nguyen, 2015; Nguyen, 2021). Awareness of the risk of electricity shortage in the future, Vietnam policy makers have taken numerous measures to reduce electricity consumption. The most prominent legal interventions so far are the Law on Economical and Efficient Use of Energy, launched in 2011 and the National Target Program on Economical and Efficient Use of Energy for the period of 2019-2030. The Law on Economical and Efficient Use of Energy provides a solid legal basis for the implementation of efficient energy production activities while the goal of the National Target Program aims to improve energy efficiency of organizations, communities and individuals (moj.gov.vn, 2010)

The mismatch between energy demand and energy supply in Vietnam has evidenced the need to examine the intention to save energy in households as households are consuming energy heavily in daily activities and exploring factors underlying their energy saving intention can help provide significant guidelines and insights about the households for policy makers to design appropriate campaigns and interventions to encourage energy conservation

practices. Empirical studies related to energy conservation behaviors in Vietnam households are limited. Research has flourished in recent years assessing the implementation and influence of policies that promote energy conservation behaviors and energy efficiency (Nguyen, 2015; Nguyen, 2019; Phan et al., 2020) but the research stream on energy conservation behaviors in households remained unexplored. Nguyen et al. (2020) studied external factors affecting energy-saving behavior in direct approaches in Hanoi City and the role of socio-demographic factors but this research focused on situation factors only, leaving psychological factors being overlooked. Nguyen et al. (2016, 2017) focused on consumers' purchase behavior of energy efficient household appliances which is only one form of energy saving behaviors.

This research delves into the question concerning the role of attitude, perceived behavioral control, subjective norm, personal moral norm, descriptive norm and knowledge in the context of energy-conservation behaviors. This study will focus on both forms of energy conservation behaviors (energy curtailment behavior and purchase of energy efficiency appliances).

2. Method

This section describes the methodology of the study which highlights the development and approach of research models and hypotheses.

2.1. Research model and hypothesis development

The Theory of Planned Behavior and Knowledge – Attitude – Behavior Model

Decade's worth of research has employed rational choice-based theory to examine energy consumption behaviours. Researchers followed rational choice-based theory view energy conservation as outcome of a rational process in which consumers will evaluate benefits and costs associated with energy conservations. Major rational choice-based models in the field of energy consumption behaviours are the Theory of Planned Behaviour, Knowledge – Attitude – Behaviour model and Technology Acceptance Model. Theory of Planned Behaviour is a prominent theory put forward by Ajzen (1991). It was the descendant of a similar model known as the Theory of Reasoned Action (Fishbein and Ajzen, 1975). Within the TPB, intentions are determined by three variables, namely attitude, subjective norm and perceived behavioural control (Ajzen, 1991).

Attitude could be defined as an individual's positive or negative feeling towards a particular behaviour (Fishbein and Ajzen, 1991). Attitude reflects the positive or negative evaluation of an individual's perception of energy conservation behaviours.

Subjective norm refers to an individual's perception of social pressure from important people over whether to perform a particular behavior (Fishbein and Ajzen, 1991). Subjective norm is related to external comments and opinions (Kaushik and Rahman, 2015).

Perceived behavioral control is conceptualized as the convenience or difficulty that the individual perceives when doing something. It also means whether a person has enough resources, time and opportunity to perform an action (Chen, 2014).

Existing literature highlighted the significant relationship between attitude, subjective norms, perceived behavioral control and behavioral intention concerning energy saving behaviors (Liu et al., 2020; Gao and Wang, 2017; Zhao et al., 2019). Therefore, the following hypotheses are formulated:

H₁: Attitude is positively correlated with intention to save energy of households in Vietnam

H₂: Subjective norm is positively correlated with intention to save energy of households in Vietnam

H₃: Perceived behavioral control is positively correlated with intention to save energy of households in Vietnam

Knowledge – Attitude – Behaviour model has been extensively used in health and environmental education, which posited that behaviour change, is affected by knowledge and attitude (Schneider and Cheslock, 2003). Knowledge, according to Merriam-Webster online dictionary (2011) refers to “the fact or condition of knowing something with familiarity gained through experience or “the fact or condition of being aware of something” or “the range of one’s information or understanding” or “the sum of what is known: the body of truth, information, and principles acquired by humankind. Knowledge could be measure by self – report data which is criticized for measuring people’s confidence in their knowledge, not how they actually know about the subject. Another way to measure knowledge is through multiple choices or other similar forced choice item formats. However, knowledge does not always translate into actual behaviour (Kyu and Van der putten, 2005). The past literature suggested that exclusive dependence on knowledge change is likely to have little behavioural impact (Schneider and Cheslock, 2003). Extant literature found people with greater environmental knowledge was more likely to demonstrate energy saving attitudes (Pothitou et al., 2016). Hence, the hypothesis below is proposed:

H₄: Environmental knowledge is positively correlated with energy conservation attitude of households in Vietnam

Although being widely cited by previous scholars, these models assumed consumers go through rational choice, weighting cost and benefits before making decision, thus the impact of unplanned, irrational factors are largely overlooked. Another shortcoming of TPB is this model treat social norm as subjective norm. Social norm in fact is made up of subjective and descriptive norm. Exclusion of descriptive norm thus reduces the explaining power of social norm. Two new variables, namely personal moral norm and descriptive norm are added to the integrated model between TPB and KAB to better explain energy conservation intention in Vietnam.

Personal norm

Personal norm is originated from an individual’s own responsibility or obligation (Klockner and Blobaum, 2010; Gao et al., 2017; Zhao et al., 2019). The positive correlation between personal norm and energy-saving intention has been evidenced by Gao et al. (2017) and Du and Pan (2021). Thus, the following hypothesis is postulated:

H₅: Personal norm is positively correlated with intention to save energy of households in Vietnam

Descriptive norm

Descriptive norm depicts the perception of which behaviors are typically performed within a given context (Cialdini et al., 1990). Individuals are more likely to allocate themselves into a specific group and imitate the behaviors that others have done in that group to avoid being isolated by others (Gao et al., 2017).

H₆: Descriptive norm is positively correlated with intention to save energy of households in Vietnam

2.2. Research approach

Sampling and data collection

Sample consists of households with an interest in energy-saving behaviors. Convenience sampling is used to select research participants in 2 big cities: Hanoi and Hochiminh City. Selection of these cities is appropriate because consumers and households here are usually aware of environmental and energy-saving issues. They also have stronger financial resources to afford energy-efficient appliances.

As COVID-19 outbreak has just been under controlled and the society reverts back to normality recently, both online and direct questionnaire survey will be carried out. In case the pandemic get worse, all surveys will be done in online setting. An online survey will be created using Google Form or Survey Monkey. This survey link will be uploaded to social media or emailed to representatives of households. Personal information of research participants is kept confidential and participants have the right to withdraw from the study anytime. Research participants are encouraged to fill out the survey at the research setting with the support of research investigators. Besides, they can choose to fill in the survey by themselves and research investigators will contact them later to collect the complete survey form.

Measurements

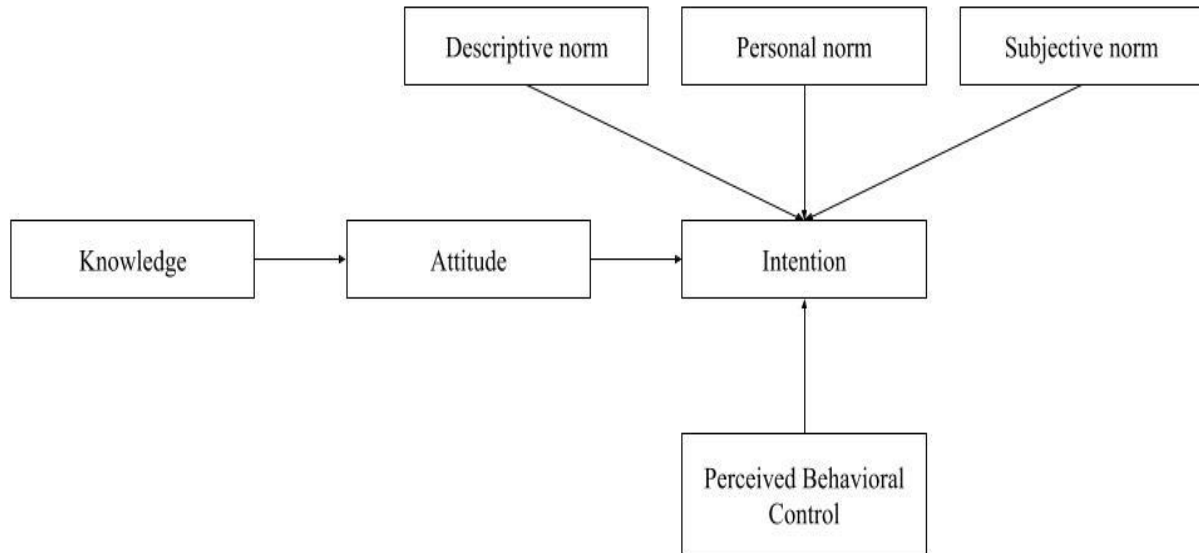

Each variable of this study's proposed conceptual framework was operationalized using multiple items. The items were developed using inputs from existing validated scales in the literature. For attitude, 3 items were adopted from Chang (1998) and Armitage and Corner (1999). For environmental knowledge, 3 items were operationalized from Mostafa (2009). For subjective norm, 4 items were taken from Wang (2014). A total of 3 items from environmental knowledge was taken from Wang et al. (2014) to measure behavioral intention. Perceived behavioral control was operationalized using items from Wu and Chen (2014). Items to measure personal norm were taken from Klockner and Blobaum (2010). Descriptive norm was measured using items from Tang et al. (2019). The influence of social norms among neighbours are relevant to energy conservation behaviours (Alcott, 2011; Hage et al., 2009; Nolan et al., 2008) and are addressed in this study. All the items were measured using a 7 – point Likert scale, which ranged from 1 for “Strongly disagree” to 7 for “Strong agree”. Regression analysis would be employed for data analysis.

Variables and their measurement items are summarized in the table below:

Variables	Items	Sources
Attitude	Energy saving is a smart choice Energy saving brings many benefits Energy saving is a good thing to do	Chang (1998) Armitage and Corner (1999)
Environmental knowledge	I can tell if appliances I bought are good for the environment I know more about recycling than other ordinary people I thoroughly know about environmental issues	Mostafa (2009)
Subjective norm	Most of people who are important to me think that I should save energy Most of my acquaintances expect me to save energy Most of the people who are important to me would support me saving energy The people I listen to could influence me to save energy	Wang (2014) Lopez – Mosquera and Sanchez (2012)
Behavioral intention	I am willing to participate in “Earth Hour”, the global lights-off event, for 1hour I would like to be a volunteer of energy conservation and emission reduction publicity in the community I will pay attention to turning off the power when the appliance is not in use, instead of letting it stand by	Wang et al. (2014)
Perceived behavioral control	I have enough ability to save energy I believe I can save energy if I want to Whether or not to save energy in life depends entirely on me	Wu and Chen (2014)
Personal norm	Due to values important to me, I feel obliged to use energy as little as possible Due to my value/principles, I feel personally obliged to save energy Saving energy is solidly anchored in my value system	Klockner and Blobaum (2010)
Descriptive norm	People in my neighborhood have taken actions to save energy A number of people in my neighbour I know have participated in energy saving behaviors Highly ranked people in my neighbourhood have participated in energy-saving behaviors	Tang et al. (2019)

3. Results

Based on the rationale of these above hypotheses, a proposed model can be established as the following to test all mentioned hypotheses:

The following hypotheses are examined:

H_1 : Attitude is positively correlated with intention to save energy of households in Vietnam

H_2 : Subjective norm is positively correlated with intention to save energy of households in Vietnam

H_3 : Perceived behavioral control is positively correlated with intention to save energy of households in Vietnam

H_4 : Environmental knowledge is positively correlated with attitude to save energy of households in Vietnam

H_5 : Personal norm is positively correlated with intention to save energy of households in Vietnam

H_6 : Descriptive norm is positively correlated with intention to save energy of households in Vietnam

4. Discussion and Conclusion

4.1. Discussion

This study has not conducted an empirical research yet, so proposed hypotheses are not confirmed. Therefore, an empirical research as a follow up should be undertaken soon. Once the research is conducted, it will contribute to the current literature of energy conservation behaviors by two ways. First, it unveils the relationship between environmental knowledge, attitude, subjective norm, personal norm, descriptive norm, perceived behavioral control and intention to save energy. Second, there has been a lack of studies about energy conservation behaviors in Vietnam, so this study will be a significant contribution.

Policy implications

This study also has a practical implication because it will provide insight into consumers' motivation to conserve energy and give recommendations to policy makers on which public campaigns can be done to promote energy conservation in household level. At the moment, most of energy intervention policies could be classified into two groups, namely antecedent and consequence interventions (Abrahamse et al., 2005). Antecedent interventions influence one or more determinants prior to the performance of behaviour. Four main types of antecedent interventions are commitment, goal – setting, information (mass media campaign, energy audit) and modelling. Consequence interventions based on the assumption that pro-environmental behaviours will become more attractive when positive consequences are attached to. Two types of consequence interventions are feedbacks and rewards.

Limitations

Due to actual research has yet to be undertaken, proposed hypotheses are not confirmed yet.

4.2. Conclusion

To sum up, the objective of this research is to study energy conservation behaviours in household level by integrating the theory of planned behaviour with the knowledge – attitude – behaviour model.

This study will contribute to the current literature in two ways. First, to the author's best knowledge, this is the first research to study energy conservation behaviours in households by combining the theory of planned behaviour and the knowledge – attitude – behaviour model. Second, it complements current body of knowledge of energy conservation behaviours by providing an insight into Vietnam, an emerging economy which is facing serious energy issues.

Abstract

Heavy metal contamination in the aquatic ecosystem is currently a major worldwide concern because of its high concentrations in water, stability, and toxicity. Rivers are considered the main pathway of heavy metals transportation to the oceans. The increase of heavy metals concentration in seawater and sediment through riverine inputs have certain effects on aquatic ecosystems and depends on their loads as well as the biogeochemical processes at the river mouths. Climatic studies have predicted the impact of climate change on the hydrology of worldwide rivers which consequently affects on riverine heavy metals transport to the oceans. This paper presents the results of our study on the flux of some heavy metals (Cu, Fe, Mn, Zn Pb) in dissolved and suspended form by Cai river (Nha Trang, Khanh Hoa) in the dry and rainy season of 2021 by using LOADEST model. The data showed that there was an increase in total concentrations of studied heavy metals in the rainy season due to the rise of the contribution of suspended concentration. Of all the heavy metals, Fe was a concern as both its concentration and load were the highest and there was the contamination of Fe during this period.

Keywords: *Cai river mouth, heavy metals, load, LOADEST*

1. Introduction

Coastal areas are crucial transition zones linking terrestrial with the oceanic system, therefore they reveal sensitive responses to anthropogenic impacts on ecosystem functioning and human health (Audry et al., 2004; Bauer et al., 2013). Since the Industrial Revolution, heavy metal pollution has been acknowledged to be a major worldwide environmental crisis in past decades due to their abundance, toxicity, and persistence (Schwarzenbach, 2006). Once released, they are present in the environment including air, water, soil, and sediment

(Huang et al., 2018; Chowdhury et al., 2016; Birch, 2016; Wu et al., 2016) but most are eventually deposited into marine sediment via riverine runoff or atmospheric precipitation (Pan and Wang, 2012; Yin et al., 2016; Wu et al., 2018)

Rivers represent the most complex aquatic systems in terms of transport and interactions of heavy metals with geochemical and biological processes but most importantly delivering the heavy metals into the sea mainly through estuaries. Annually, the elemental flux of some heavy metals such as Al, As, Cu, Cd, Fe, Pb transported by riverine suspended matter from the continents to the oceans is 1308000 tons of Al, 544 tons of As, 23 tons of Cd, 1140 tons of Cu, 871500 tons of Fe, 916 tons of Pb and 1200 ton of Al, 23 tons of As, 55 tons of Cu, 3 tons of Cd, 2470 tons of Fe, 3 ton Pb is delivered in a dissolved form (Viers, 2009). However, such transportation has been influenced and changed considerably by rapid urbanization and industrialization like land-use changes, dam construction, and water withdrawal... but most important is the effect of climate change which alters the hydrology of worldwide rivers (IPCC, 2013). Particularly, because of atmospheric warming, it is likely that river discharge will increase for monsoon-influenced rivers such as Mekong, Yellow River, Indus, Ganges, Yangtze, Brahmaputra... As a result of elevated rainfall and snowmelt, the discharge of rivers (Mackenzie, Lena) flow into the Arctic ocean will also increase. Meanwhile, rivers like Niger, Murray, and Danube tend to have a decrease in discharge due to a shortage of precipitation (Sperna Weiland, van Beek, Kwadijk and Bierkens, 2012). Moreover, heavy precipitation events will become more frequent and intense over many areas in the 21st century (Seneviratne et al., 2012) which may affect the transport rates and pathways of heavy metals (Middelkoop 2008). For example, intensification of precipitation may result in larger proportions of quick flow, which could accelerate the leaching of heavy metals to surface waters. However, despite the numerous publications dealing with the fate of metals in the estuaries and the contaminations of adjacent coastal waters, the metal fluxes discharged by rivers remain uncertain as they rely on a limited number of data. Therefore, more attention should be paid to loads of heavy metals rivers in response to climate change.

The interest in studying heavy metal loads started quite early in the world. One of the first calculations and assessments was given by Martin và Meybeck (1979) for most of the rivers worldwide. According to these authors, Br, I, S, Cl, Ca, Na, Sr, Li, N, Sb, As, Mg, B, Mo, F, Cu, Zn, Ba, and K are mainly transported in the dissolved form, whereas for P, Ni, Si, Rb, U, Co, Mn, Cr, Th, Pb, V, and Cs, more than 90% of the total load is carried by river particulates. Fe, Al, and the rare earths are almost exclusively carried as particulates. Over the past 40 years, the data has been continuously updated (Martin and Whitfield, 1983; Poulton and Raiswell 2000; Carey et al., 2002; Gaillardet et al., 2003; Viers et al., 2009...). Recently, more research focus on the impacts of climate change on the transport of heavy metals by rivers. In particular, many studies were conducted to examine heavy metal loads in different hydrological conditions: summer flood, spring flood, baseflow... (Miller et al., 2003; Pokrovsky 2006, 2010; Bagard et al., 2011...)

For Khanh Hoa province, Cai river is the largest river in the province (total flow is about 2.078 billion m³/year) and is the main source of supply for irrigation and domestic water in the

province. Heavy metal loads from the Cai River have an important effect on water quality and sediments in Nha Trang Bay, home to many well-known ecosystems and a major source of food. Some previous studies showed that, annually, Cai estuary transports to the sea about 42095 tons of suspended matter, 965 tons of Fe, 5 tons of Cu, 4 tons of Pb, 51 tons of Zn, 9 tons of As (Nguyen Huu Huan, 2010). However, this data is quite old and in the context of climate change and economic development demands and thus needs to be updated. This paper presents new data on loads of heavy metals (Cu, Fe, Mn, Pb, and Zn) transported through Cai river mouth, to accessing the impact of these metals on the environment of Nha Trang bay.

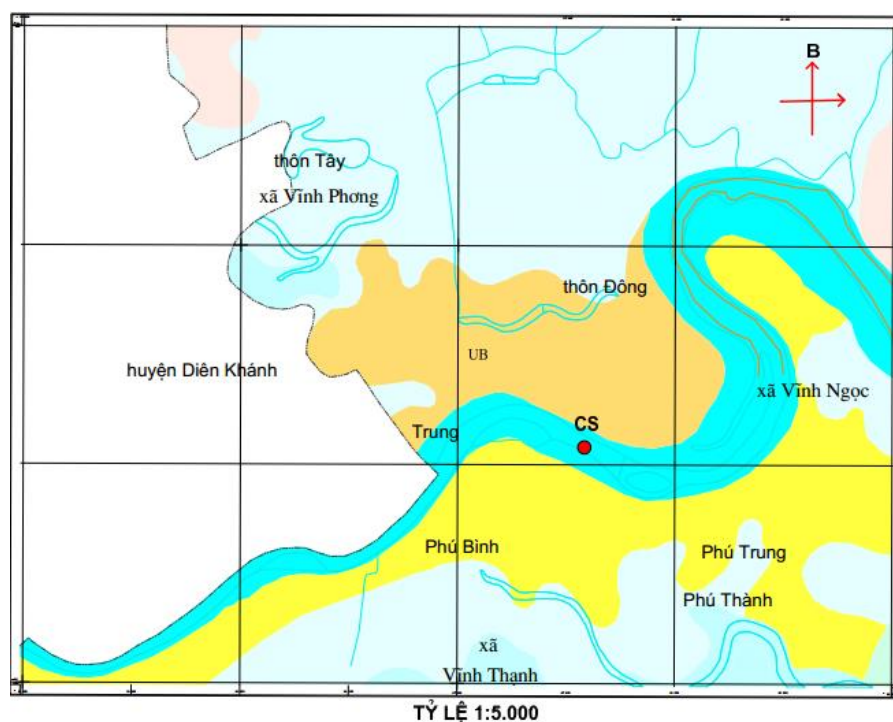

2. Method

2.1 Sample collection and sample analysis

Sample sampling and analysis were undertaken by authors followed the protocols described in Standard Methods for the Examination of Water and Wastewater (APHA, 2005)

Samples were collected bimonthly from January to December 2021 at Cai river mouth (Figure 1). Vertically integrated samples for analysis of dissolved metals were collected at the center of the flow and were contained in PE bottles previously washed in 10% HNO₃ and then with mili-Q water. pH was measured in situ and later the samples were filtered through 0.45 μm pore teflon filters. The samples were acidified with HNO₃ and all of the samples remained refrigerated until analysis.

Concentrations of dissolved heavy metals were analyzed by direct injection, inductively coupled plasma spectroscopy (ICP-MS). For particulate heavy metals analysis, suspended sediment was separated from whole water by filtering, the sediment was then dried and digested with the acid mixture HNO₃:HCl (1:3). Acid digestates were then analyzed by ICP-MS.

CS (109.147033°; 12.270806°)

Figure 6. Sampling station

2.2. Load estimation method

The flux calculation requires two key elements: the concentration of the element of interest, and the discharge of the river. One common method of calculating monthly contaminant load is to average the monthly analytical results and multiply it by the monthly discharge. This method, however, can produce large errors in periods where there has been flow rate variation, for example, if the same analysis value obtained during low water is applied in storm periods the contaminant load is overestimated, because in storms the volume of water is supposedly much greater. Another method of contaminant load estimation is to establish relationships between flow and the concentration of the elements, nevertheless, these correlations are not consistent over the entire year and are not always simple to establish as they rely on high-resolution campaigns which are very costly. A much more complicated and expensive method is modeling which provides precise results. Some worldwide widely applied models for water assessment can be named: AGPNS (Agriculture Non-Point Source Pollution Model), STEPL (Spreadsheet Tool for Estimating Pollutant Load), HSPF (Hydrological Simulation Program - FORTRAN), SWAT (The Soil and Water Assessment Tool).

In this study, we used LOADEST (Load estimator) which is a FORTRAN program and was developed by the United States Geological Survey (USGS) for estimating pollutant loads through regression models using flow and water quality concentration data (Runkel et al., 2004). Although LOADEST requires significant effort to prepare model inputs, it is an efficient software for loads calculation and is used in many studies (Oh & Sankarasubramanian, 2012; Brigham et al., 2009; Dornblaser & Striegl, 2009) and provides precise results (Park & Engel, 2014).

3. Results

3.1. Heavy metal concentrations

In this section, first, the regime of the hydrological regime of Cai river in 2021 was examined. With the obtained data, the average flow rate calculated for the year 2021 is approximately 91.9 m³/s. Figure 2 demonstrated that the flooding period of Cai river started on September 4th and lasted until the end of the year. This is important to accurately estimate the heavy metal fluxes later.

Figure 7. Hydrological regime of Cai river in 2021

Throughout the year 2021, there were a total of 40 water samples collected. Analytical results of the studied metals are presented in table 1. In agreement with previous studies (Nguyen Hong Thu et al., 2010, Nguyen Huu Huan, 2010, Pham Hong Ngoc et al., 2022) the total concentrations of those metals showed a clear seasonal variation. In the dry season, the average value of pH was 7.52, content of Cu 3.9 ($\mu\text{g/l}$), Fe 288 ($\mu\text{g/l}$), Mn 37 ($\mu\text{g/l}$), Pb 3.8 ($\mu\text{g/l}$), Zn 25.4 ($\mu\text{g/l}$). In the rainy season, there was an increase in these values due to the increase of the heavy metal concentrations in both dissolved and suspended forms (main supplement), particularly: Cu 4.5 Fe 304 Mn 51 ($\mu\text{g/l}$), Pb 4.0 ($\mu\text{g/l}$) Zn 29.3 ($\mu\text{g/l}$). The reason is that in the dry season the discharge of Cai river is primarily from base flows (domestic wastewater is mostly absorbed into the ground) meanwhile during the rainy period, higher terrestrial runoff carrying waste increases the number of suspended matters in the river water, thus increases the concentrations of heavy metals. However, in the studied period, the water quality of Cai river remained good, all the recorded values were lower than the criteria given in the National technical regulation on surface water (QCVN 08:2015/BTNMT) except for the case of Fe.

Table 5. Total concentration of the heavy metals

Metals ($\mu\text{g/l}$)	Dry season				Rainy season				Criteria
	n	Min	Max	Average	n	Min	Max	Average	
Cu	20	3.5	4.2	3.9	20	4.3	4.8	4.5	100
Fe	20	100	579	288	20	104	992	304	500
Mn	20	19	63	37	20	39	75	51	100
Pb	20	3	4.7	3.8	20	3.5	4.3	4.0	20
Zn	20	19.7	33.9	25.4	20	23	34.3	29.3	500

3.2. Heavy metal loads estimation

Table 3 presents loads of Cu, Fe, Mn, Pb, and Zn of Cai river estimated by LOADEST. The loads were separated into components that are contributed in the rainy and dry season as well as the dissolved and particulate fluxes of each metal. The data showed that these metals were transported mainly in the suspended form and their loads during the rainy season made a higher proportion of total loads which implied that the contribution of heavy metals released from human activities in the dry season was negligible. Load of Fe was the highest with 273 tons in the dry season and 508 tons in the rainy season. According to some previous studies, a part of these heavy metals is accumulated in the sediment at the river mouth, the rest is transported into Nha Trang Bay (Le Thi Vinh, 2007; Nguyen Hong Thu et al., 2010) and thus causing some effects on the water quality of the bay seawater. For example, the contamination of Fe was usually observed in the coastal area (Le Thi Vinh et al., 2007; Le Thi Vinh, 2013).

Table 6. Heavy metal loads

Metal	Cu (ton)	Fe (ton)	Mn (ton)	Pb (ton)	Zn (ton)
Dissolved					
Dry season	2	95	14	2	8
Rainy season	3.5	114	23	5.5	20
Suspended					
Dry season	2	178	10	2	32
Rainy season	13	394	22	8	115

Table 7. Loads of the heavy metals of Cai river in other studies

Metal	Dry season			Rainy season		
	1995 ⁽¹⁾	2010 ⁽²⁾	2021	1995 ⁽¹⁾	2010 ⁽²⁾	2021
Cu (ton)	10	2	4	11	3	17

4. Discussion and Conclusion

The metals Fe and Mn are abundant in the earth's crust and relatively insoluble under the oxidizing condition in surface water. Total loads of Fe and Mn were strongly dominated by the particulate forms and consequently mobilized in the high water period. Zn concentration was higher than the values measured in previous research (Nguyen Hong Thu et al., 2010; Pham Hong Ngoc et al., 2022), one possible explanation would be an unidentified point source of this metal that continuously loading Zn into the river water. The distribution of the load of Pb was quite similar to that of Fe because of its solubility under some oxidizing conditions it absorbs strongly to solid phases and thus partitions particularly well with Fe oxyhydroxides and clay phases.

As mentioned above, the studies on contaminant loads from Cai river remain scarce. Presented in Table 4 for comparison are fluxes calculated in 1995 and 2010 by other publications. The data showed that for the case of some heavy metals that usually have high concentrations in the river water such as Fe, Mn, and Zn, the result of this study differs to some extent from the results of previous studies. This could be explained by the dissimilar load calculation methods. The use of average seasonal contaminant analytical results and multiplying it by the seasonal discharge (Pham Van Thom, 1995; Nguyen Huu Huan, 2010) can produce a large error, especially with few samples and the hydrological regime is not well defined. For example, at the start of the rainy season, the first rains produce the dissolution of products accumulated during the summer and thus the heavy metal

concentrations tend to increase, whereas, later during the rainy season, they fall below those measured at the beginning due to strong dilution. In this case, if the load is calculated using a monthly or seasonally average value, the load is overestimated. Figure 3 is an example of the relationship between Cu and flow for the year 2021. As can be seen in this river, the concentration of Cu gradually decreased as the volume of river water increased.

Figure 8. Relationship between Cu concentration and flow

In this study, we used a high-frequency sampling, twice a month, and daily discharge as inputs for LOADEST. Based on the data, the daily elemental concentration for each daily discharge is calculated and from this, the daily heavy metal load transported is calculated. The sum of these daily contributions will therefore give the more precise seasonal or yearly contribution for each element.

In summary, this research provided further evidence that the change in river discharge can influence the transport of riverine heavy metals transport. The total loads of Fe, Cu, Mn, Pb, and Zn were higher during the rainy period due to the increase in their concentrations, particularly in suspended form. Of all the studied heavy metals, the load contribution of Fe was the highest and there was also the contamination of this element. Besides, the flux estimation by LOADEST in this model suggests that the model could be considered an efficient tool for developing contaminant monitoring and forecast, especially if the basin is influenced by climate change.

INTERNATIONAL LAW ON FIGHTING CLIMATE CHANGE AND EXPERIENCE FOR VIETNAM

LLM. Huynh Thi Hong Nhien

hthnhien@hcmulaw.edu.vn

LLM. Nguyen Thanh Quyen

ntquyen_hc@hcmulaw.edu.vn

*Faculty of Administrative - State Law, Ho Chi Minh City University of Law,
No.2, Nguyen Tat Thanh Street, District 4, HCMC, Vietnam*

Abstract

The law against climate change is not an independent discipline but an institution of international environmental law. The provisions of international law have been adjusted in a comprehensive way to issues related to combating climate change. The article presents the essential issues of international law on fighting climate change from the formation process to the provisions of international law on climate change. In addition, the article also discusses how various countries throughout the world, such as Thailand, China, and Japan, have used international law on fighting climate change, as well as lessons gained for Vietnam.

Keywords: *Law, climate change, International.*

1. Introduction

Climate change is the greatest threat to human civilization that has ever existed. Flooding, droughts, rising border waters, and rising global temperatures are all possibilities. These are all extreme signs of climate change, the “rage” with which nature is reacting to humans, the primary cause of global warming. To learn the most important knowledge about climate change, the authors present the fundamental issues of climate change and the profound impacts of climate change on social life, thereby seeing the urgent need of developing and perfecting climate change legislation both Internationally and nationally.

2. Method

The article uses dialectical materialism research methods, such as data gathering methods, synthesis methods, statistics, comparison, and analysis... The author will be able to consider many aspects of the problem and synthesis them to have a comprehensive and objectively honest assessment of climate change under international law and Vietnamese law by combining these methodologies in the content. Use analytical methods to understand climate change concepts; comparative methods to compare climate change regulations in legal documents; statistical methods to collect environmentally relevant data, relying on the aggregation method to gather information and make an objective assessment of the provisions of the law on combating climate change, for example.

3. Results

3.1. Fundamental concerns of international law about climate change mitigation

3.1.1. The process of shaping international law on combating climate change

First, in June 1972, the United Nations Conference on the Human Environment was convened in Stockholm, Sweden. The conference highlighted the worldwide environment's degradation, which necessitates steps to safeguard and repair it; it shows humanity's awareness of the global environment. The Stockholm Declaration consists of seven articles and twenty-six principles that serve as the foundation for global environmental preservation and improvement policies. Participants also agreed to establish the United Nations Environment Programme (UNEP), whose major mission will be to coordinate environmental protection operations, monitor the state of the environment, and codify international environmental legislation. The research approach reveals that climate change issues have received insufficient attention. The conference primarily addressed topics such as chemical pollution, nuclear testing, and whaling⁹¹.

Second, The United Nations Conference on Environment and Development (UNCED), also known as the “*Earth Summit*”, was held in Rio de Janeiro, Brazil, from 3-14 June 1992, to investigate issues concerning sustainable economic development and the environment. The Rio Declaration of 1992 was adopted here, encompassing 27 principles⁹², the core of which is that the emphasis on economy and social growth is highly dependent on the conservation of natural resources with effective measures to prevent environmental deterioration. Following that, on May 9, 1992, the United Nations Framework Convention on Climate Change (UNFCCC) was established, creating a legal framework for collaboration while also affirming a qualitative shift in the international community's perspective of the necessity of countering climate change actions⁹³.

Third, the United Nations Climate Change Conference (COP) is an annual conference held within the framework of the United Nations Framework Convention on Climate Change (UNFCCC) that serves as the official gathering place for UNFCCC parties to examine the climate change mitigation process. The Kyoto Protocol on Climate Change was adopted in December 1997 in Kyoto (Japan), detailing its duties to reduce greenhouse gas emissions to implement the UNFCCC convention⁹⁴. The Kyoto Protocol's commitments, however, had no prospect of being met in the 20th century because the United States, Australia, Lichtenstein, and Monaco did not sign-on. The Kyoto Protocol entered into force

⁹¹ *Conferences: Environment and Sustainable Development*, retrieved April 10, 2022, from <http://www.un.org/en/conferences/environment>.

⁹² The Rio Declaration of 1992 lays out a set of principles for an approach such as:

- “*Prevention is vital*” to require projects to carry out an environmental impact assessment.

- “*Discriminatory shared responsibility*” for developed countries, with responsibilities unique to putting strain on the global environment and resources depending on the country.

- “*Polluter pays*” means that individuals and businesses who use resources and pollute the environment must bear financial responsibility in order to reduce the likelihood of triggering environmental incidents.

⁹³ Global Sustainable development report, (2019), *The future is now: Science for Achieving Sustainable Development*, p.31.

⁹⁴ *National Targeted Gender and Climate Change Training Manual: Policy, Strategy and Program Development*, 978-92-9257-534-2 (e-ISBN), ADB, 2015, p.34.

on February 16, 2005, after being ratified by the Russian Federation. Then, in the hope of drafting a new international treaty to replace the Kyoto Protocol, which expires in 2020, a series of UNFCCC parties met. COP21 was held in Paris (France) from November 30 to December 12, 2015, as part of the Paris Agreement⁹⁵, which manages strategies to minimize climate change beginning in 2020⁹⁶.

Fourth, The 2002 World Summit on Sustainable Development in Johannesburg adopted a Political Declaration and Implementation Plan which included provisions covering a set of activities and measures to be taken to achieve development that takes into account respect for the environment. In doing so, this Summit, which saw the participation of more than a hundred heads of state and government and tens of thousands of government representatives and non-governmental organizations, resulted, after several days of deliberations, decisions that related to water, energy, health, agriculture, biological diversity and other areas of concern⁹⁷.

Fifth, The Climate Summit, hosted by US President Joe Biden, took place online on April 22 and 23, 2021, with more than 40 leaders from around the world in attendance. The event is being held in the context of the COVID-19 pandemic, which has slowed the fight against global climate change. It is an opportunity to ensure that the 26th Conference of the Parties to the United Nations Framework Convention on Climate Change (COP 26) in the United Kingdom in November 2021 has clear results, with specific action plans for 2030. The United States reaffirmed its commitment to the 2015 Paris Agreement on Climate Change and declared a new aim of decreasing emissions by 50-52 percent by 2030 compared to 2005 levels⁹⁸.

In summary, international law on climate change is an institution of international environmental law that includes a system of principles and norms of international law that govern the relationships that arise between the themes of international law in the process of cooperation in the field of climate change combat⁹⁹.

3.1.2. Provisions of international law on climate change

First, on May 9, 1992, the United Nations Framework Convention on Climate Change (UNFCCC) was adopted in Rio de Janeiro, Brazil. This Convention includes the following major provisions: (1) Some fundamental principles for cooperation¹⁰⁰; (2) Parties'

⁹⁵ The Agreement has passed the adoption threshold, with more than 55 countries ratifying it, representing at least 55 percent of global greenhouse gas emissions.

¹⁰⁰ Includes the following principles: Parties must engage in the equitable protection of the climate system for the common welfare of humanity, commensurate with shared but differentiated duties; Principles of special consideration for developing countries; Principles of sustainable development...

commitments to combat climate change; (3) Several initiatives targeted at addressing climate change; and (4) Dispute resolution measures emerge. All States Parties to the Convention agree that human activity has increased the concentration of greenhouse gases in the atmosphere, resulting in warming of the Earth's surface and atmosphere, as well as negative effects on natural and human ecosystems. Historically and presently, wealthy countries account for the vast majority of global greenhouse gas emissions. As a result, climate change is global and necessitates the broadest possible collaboration of all countries, with developing countries given priority to achieve sustainable economic growth and the most inclusive parties to achieve economic progress.

Second, the Kyoto Protocol on Reducing Greenhouse Gas Emissions (KP) was signed in Kyoto, Japan, in December 1997 and went into force in January 2005. The Protocol includes (1) Common policies and measures aimed at promoting sustainable development; (2) Emission reduction targets for developed countries and countries with convertible economies; (3) The principle of binding between the Group of Developed Countries-Annex and the Group of Developing Countries-Non-Annex; (4) List of controlled substances¹⁰¹ and (5) Mechanism for implementation of commitments¹⁰². Countries that have signed the Kyoto Protocol are subject to supervision and regulation by the UN principles on emission reductions, and participating states must commit to achieving the goals through the three key mechanisms outlined in the Marrakesh Accord: (1) The emissions market mechanism, also known as emissions trading; (2) The clean development mechanism; and (3) The co-implementation mechanism. This Decree is one of the principles that gave rise to the concept of “*climate diplomacy*”, which occurs when complicated climatic processes and their implications have a substantial impact on international relations¹⁰³.

Third, the Paris Agreement was adopted on 12 December 2015 with the following main contents: (1) Reaching the largest emissions level as soon as possible and lowering the level of emissions in the second half of this century; (2) Keeping global temperatures from rising more than 2 degrees Celsius and attempting to limit the increase to 1.5 degrees Celsius; (3) Evaluating the implementation process every 5 years; and (4) Giving another specific number of financial contributions by 2025¹⁰⁴. The Agreement emphasizes that to accomplish this goal, the world must reduce greenhouse gas emissions as soon as practicable. The particular aim is that by the middle of this century (sometime after 2050), the globe must achieve a balance between human activity emissions and the earth's absorption capacity, as well as “*emission collection*” technologies. The accord also states that after 2018, governments would reassess their established targets every five years beginning in 2023. Furthermore, the agreement states that wealthy countries have a legally binding commitment

¹⁰¹ Includes: Carbon Dioxide (CO₂), Methane (CH₄), Nitrous Oxide (N₂O), Hydrofluorocarbon (HFCs), Perfluorocarbon (PFCs) and Sulfur Hexafluoride (SF₆).

¹⁰² These include: Joint Implementation (JI), Emissions Trading (ET) and Clean Development Mechanism (CDM).

¹⁰³ Thanh Tam (2020), *Challenges with the climate agreement*, retrieved April 13, 2022, from <https://nhandan.vn/baothoinay-hosotulieu/thach-thuc-voi-thoa-thuan-khi-hau-579769/>.

¹⁰⁴ Japan International Cooperation Agency (JICA), (12/2015), *Historical Agreement on Climate Change and Political Commitment of the Vietnamese Government*, JICA Vietnam Office Bulletin, No. 4, p.2.

to offer financial resources to underdeveloped countries for climate change mitigation. As a result, member countries should strike a commitment by 2025 to pay at least \$100 billion per year to developing countries to adapt to climate change¹⁰⁵.

Fourth, the Glasgow Agreement: On November 13, 2021, the 26th Conference of the Parties to the United Nations Framework Convention on Climate Change (COP26) finished in Glasgow with a new climate agreement known as the “*Glasgow Agreement*”, which made new promises. For the first time, a COP agreement has identified fossil fuels as the primary cause of global warming. The deal specifies tangible steps, such as halving carbon emissions by 2030, lowering methane emissions, and developing a new set of regulations that keep countries accountable, despite even though no sanctions for noncompliance. Finance is also an important issue at COP26, with the most contentious being poor countries' demand that rich countries “*compensate*” for losses incurred by extreme weather events, thereby assisting countries in responding to the serious implications of climate change. Many countries, like India and Indonesia, have stated that they are willing to limit their use of coal in exchange for financial assistance. One of the breakthrough points of the Glasgow Agreement compared to the 2015 Paris Agreement is that this agreement allows countries to buy carbon credits from other countries, opening up the potential to generate trillions of dollars in funds to protect forests, develop clean energy, and projects to combat climate change¹⁰⁶.

Fifth, *New-generation free trade agreements* (FTAs), such as the European Union (EVFTA) and the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP). Within the framework of the CPTPP, the 11 members are committed to effectively implementing environmental laws and not degrading the legal system of environmental countries to encourage trade and investment. Specifically, Chapter 20 of the CPTPP sets out regulations on promoting trade, protecting the environment and effectively enforcing environmental laws, as well as strengthening the capacity of the parties to solve environmental issues related to trade, including through cooperation¹⁰⁷. CPTPP specifically calls for strengthening cooperation among member states to protect and preserve the environment, as well as sustainable management of natural resources, which contributes to sustainable development; focusing on several common environmental challenges that threaten human health and biodiversity in the Asia-Pacific region; calling for government cooperation to address environmental threats and crimes, and assisting countries with low per capita incomes. The most significant disadvantage of environmental issues is that the CPTPP has yet to define precise procedures for implementing these standards and does not address climate change, which is an environmental and human rights burden for CPTPP member nations¹⁰⁸.

¹⁰⁷ Article 20.2 of the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP)

¹⁰⁸ Nguyen Thi Thanh Hai (2018), *The Comprehensive and Progressive Agreement for Trans-Pacific Partnership and its Impact on Human Rights in Vietnam*, retrieved April 15, 2022, from

Furthermore, the EVFTA agreement contains 17 articles in the trade and sustainable development chapter, with the main contents including biodiversity, climate change, forest resource management, forest product trade, sustainable management of marine biological resources and aquaculture products, labor, and transparency. On climate change, the Parties agree to implement and collaborate to achieve the climate change objectives outlined in several international environmental treaties, including the 1992 United Nations Framework Convention on Climate Change, the Kyoto Protocol to the UNFCCC Convention, and the Paris Agreement. The Parties will work together in key areas such as (i) Developing, implementing, and operating carbon pricing mechanisms; (ii) Promoting domestic and international carbon markets through mechanisms such as emissions trading programs and reducing emissions from deforestation and forest degradation; and (iii) Enhancing energy savings, low-emission technologies, and renewable energy¹⁰⁹.

3.2. Practical application of international law on fighting climate change in several countries around the world and experience for Vietnam

In Thailand, the country assigned the Department of Industry (DIW), the focal agency to implement the protocol to develop an implementation plan including legal measures and plans to cut ozone-depleting substances (ODS), specifically introducing: new regulations on vehicle safety currently including air conditioning inspection; inspection and emergency import quota of CFCs and ban the use of CFCs for production areas. Following that is the establishment of the National Ozone Office (NOU), which will be in charge of executing the Montreal Protocol's ODS reduction. NOU employs both legal and financial methods to limit ODS imports and to assist firms in transitioning to ods-free equipment. Furthermore, in response to climate change, Thailand achieved six additional significant national successes¹¹⁰. Thailand's First Assessment Report on Climate Change (TARC) was issued in 2011 by the Thai Research Foundation to examine the level of climate science in Thailand. The report used the style and structure of the Intergovernmental Panel on Climate Change (IPCC), the UNFCCC's intergovernmental body for the synthesis of global climate knowledge. Thailand has reacted to the UNFCCC's appeal through a collaboration between the Office of Natural Resources and Environment Planning and Policy (ONEP) and the German development agency - Deutsche Gesellschaft für Internationale Zusammenarbeit (GIZ). Thus, the Thailand Climate Change Master Plan 2015–2050 was officially launched to create a low-carbon society by reducing greenhouse gas emissions to 20-25 percent below “*business as usual*” by 2030, as well as developing

<https://www.tapchiconsan.org.vn/web/guest/the-gioi-van-de-su-kien/-/2018/493331/hiep-dinh-doi-tac-toan-dien-va-tien-bo-xuyen-thai-binh-duong-va-tac-dong-cua-no-den-quyen-con-nguoi-o-viet-nam.aspx>.

¹⁰⁹ K.D (2019), *Promoting the signing and implementation of FTAs*, retrieved April 15, 2022, from <https://dangcongsan.vn/thoi-su/thuc-day-ky-ket-va-thuc-thi-cac-hiep-dinh-fta-590988.html>.

¹¹⁰ Strategy 1: Using a variety of policies, build resilience to climate change and reduce vulnerability. Strategy 2: Encourage actions that reduce greenhouse gas emissions while promoting sustainable development. Strategy 3: Encourage adaptation and mitigation research and development by gathering and disseminating climate change knowledge. Strategy 4: Increase community awareness and participation. Strategy 5: Increase the capability of authorities and personnel. Support international cooperation in order to realize the joint goals of climate change mitigation and sustainable development.

action plans to address climate risks, maintain competitiveness in economic growth, agricultural production, and sustainable development¹¹¹.

In China, the National Program was devised in 1992 and approved by the State Council in 1993, outlining the project¹¹² and industrial approach¹¹³ to reducing Ozone Depleting Substances (ODS). In 2000, China amended the Law on Air Pollution Prevention and Control to restrict the production, import, export, and consumption of ODS¹¹⁴. Furthermore, the 2006 outline of the medium and long-term scientific and technology development plan emphasized the energy and environment sectors in the process of science and technology development, as well as expanded development and training, increasing financial support for scientific research activities and technology transfer connected to climate change response specialists and research institutes. By June 2007, the National Climate Change Program had been charged with significant duties such as reducing greenhouse gas emissions, building capacity to adapt to climate change, and promoting climate-related research, among other things. On November 22, 2011, the Chinese government issued a White Paper on reacting to global climate change, emphasizing several significant political solutions to mitigate the effects of climate change. induced by climate change; adaptation to climate change; and outstanding outcomes throughout the 11th 5-year plan implementation period (2006-2010)¹¹⁵. The Ministry of Ecology and Environment was founded in 2018, working closely with the Ministry of Foreign Affairs on climate problems. Declare at the 2020 “*Climate Ambition*” conference that by 2030, China's CO2 emissions intensity per unit of GDP will be decreased by more than 65 percent compared to 2005, and that non-fossil energy will account for around 25 percent of primary energy consumption. From the establishment of ecological civilization in the “*13th Five-Year Plan*” to the distinct planning of energy and electricity to respond to climate change in the “*14th Five-Year Plan*”, it is clear that the Chinese Government has identified climate change response as a strategic activity¹¹⁶.

In Japan, the previous draft revised climate change adaptation plan was drafted in 2015, to create a social society that can keep up with global climatic changes. The Japanese leader stated that Tokyo officials' objective of becoming carbon-neutral by 2050 is an important goal, adding that this will also assist increase economic growth. Through an assistance package of 2 trillion yen (\$19 billion), Japan assists companies in developing “*green technology*” such as carbon capture and recycling, hydrogen fuel production, and

¹¹⁶ Nguyen Thu Phuong (2021), *Fighting climate change: Joining hands before it's too late*, Communist Journal.

next-generation batteries, and is committed to minimizing plastic waste in the ocean¹¹⁷. The Japanese government also established the Committee to Combat Climate Change, to which the Environment Minister has been assigned, to try to include the goal of reducing net carbon emissions to zero in a bill that emphasizes the government's priority on environmental issues and combating climate change. The paper also addresses the implementation of climate change measures established in the 2015 Paris Climate Agreement¹¹⁸. The Southeast Asia Research-based Network on Climate Change Adaptation Science (SARNCCAR) was founded at the end of 2018 by a network of researchers from four countries: Japan, Vietnam, and Thailand. Lan and the Philippines with a diverse range of expertise areas to encourage diverse voices, participate in research and community-based research, and create a shared narrative for the aim of climate change adaptation¹¹⁹.

In the United Kingdom, the British Government passed the Climate Change Act in 2008 as the foundation for regulating the implementation of climate-change-response initiatives. In policies and legal papers, the British government is also continually striving to identify efficient and cost-effective solutions to climate change. Using the MAG solution method, incorporate mitigation, adaptation, and geoengineering into a single integrated strategy to address the UK's national and international climate change challenges¹²⁰. This method allows the UK government to meet its aim of reducing GHG emissions by 80% by 2050 while transitioning to a low-carbon economy robust to the effects of climate change. If mitigation strategies provide beneficial effects, the use of geosynthetic technology will decline over time. CO₂ removal technology, on the other hand, can be maintained for longer than necessary to lower the historical amount of CO₂ already in the atmosphere¹²¹.

In the Federal Republic of Germany, the German government has revised the Regulatory Framework on Climate Change to reduce overlap in legal documents, facilitate decision-making, and analyze issues with relation to climate change. Furthermore, with the implementation of an emission charge system in the industry and active engagement in the Economic System, the German government has expanded the integration of market issues

¹²⁰ Specifically:

- Mitigation: Focus on reducing GHG emissions in all areas of society, such as energy production, transportation and the built environment;
- Adaptation: Ensure adaptation and protect critical assets such as power plants, transportation networks, residential areas against floods, rising temperatures and NBDs;
- Geoengineering: Using technology to slow the rise of global temperatures by removing CO₂ directly from the atmosphere or reflecting solar radiation back into space.

¹²¹ XIV National Assembly Committee on Science, Technology and Environment, (2017), *Responding to climate change in Vietnam (monograph)*, Publishing House Youth, Hanoi, p.159.

into climate change measures. The emissions trade in Europe. At the same time, the government of this country is committed to supporting and investing in the energy industry, environmental actions such as rising energy costs and collecting pollution fines and strengthening environmental rules to promote environmental protection. Green products and technologies are in high demand¹²².

4. Discussion and Conclusion

Some lessons learned for Vietnam

First, increase agency coordination in promulgating, executing, monitoring, investigating, and resolving trade and environmental concerns to construct a national multi-sectoral organization. The establishment of the National Environment Committee to coordinate interdisciplinary efforts, and activities connected to Thailand's environment, is a positive experience that Vietnam should learn from. These bodies will be in charge of organizing actions connected to the treaty's subject matter, as well as having legal, political, and financial authority, as well as advising on planning and policy direction. Vietnam, on the other hand, has announced the National Plan for Climate Change Adaptation for the period 2021-2030, with a vision to 2050, with the common goal of minimizing susceptibility and hazards to the consequences of climate change. Climate change adaptation will be promoted by enhancing the resilience and adaptive ability of communities, economic sectors, and ecosystems, as well as by promoting the integration of climate change adaptation into the strategy and planning system. In addition, the Ministry of Natural Resources and Environment is working on a draft of the Draft National Climate Change Strategy for the period up to 2050. Going forward, carbon pricing and the development of a carbon market-Carbon must be considered and regulated in specific and comprehensive detail in the Decree guiding the implementation of the Law on Environmental Protection in 2020 and the Law on Climate Change (according to the schedule that will submit this Law project in 2025). The concerned ministries and branches must focus on researching and proposing the development and application of a set of forest environmental indicators and CO₂ indexes; to the promulgation of legal regulations for the establishment of a GHG inventory system, a GHG emission monitoring system, and an emission estimation system at the national, regional, sectoral, and sub-sectoral levels by international standards and requirements; and to the completion of the set of criteria for detection¹²³.

Second, create a National Strategy and Action Plan to help the country internalize international accords. The challenge of translating international treaties into national legislation must be solved to concretize the commitments of the treaty's acceding parties. Vietnam has been a Party to the United Nations Framework Convention on Climate Change (UNFCCC) since 1994, fully fulfilling its obligations as a Party to the UNFCCC, the Kyoto Protocol, and the Paris Agreement on Climate Change. In 2015, Vietnam submitted its

¹²² XIV National Assembly Committee on Science, Technology and Environment, (2017), *Responding to climate change in Vietnam (monograph)*, Publishing House Youth, Hanoi, p.159.

¹²³ Thao Le – Thanh Tra – Bong Mai (2021), *Vietnam makes efforts with the world to fight climate change*, retrieved April 17, 2022, from https://special.nhandan.vn/Vietnam_nolucchong_biendoikihau/index.html.

Intended Nationally Determined Contribution (INDC) to the UNFCCC, in addition to fulfilling its obligations as a developing country Party to the UNFCCC, and then submitted an update of the Nationally Determined Contribution in 2020¹²⁴. Experience in building country action plans demonstrates that: Strategies and plans to combat climate change must be prepared by a diverse team of specialists from across the country, in collaboration with several experts. Foreign countries have a thorough awareness of the country's natural conditions. The formation of Expert Groups or Executive Groups aids in the elimination of inappropriate viewpoints, the creation of a coherent direction throughout the writing and planning process, and the harmonization of the country's views with those of other countries and international organizations. It should be noted that the level of success in implementing the National Strategy and Action Plan is heavily dependent on the awareness and determination of the entire political system, particularly at the highest levels¹²⁵.

Third, to establish and build a local environmental management system that integrates resource management and environmental management. Most international treaties only take national, regional, and international approaches, but not local ones. As a result, by the general advice of the national focal agency for treaty implementation, each province should prepare strategies and action plans tailored to the unique needs and features of its locations, with precise targets and operational methods¹²⁶. Consider consolidating strong enough environmental management units in provinces and centrally-run cities, establishing environmental management departments in conjunction with resource management at the district level, and having specialized staff in charge of environment and natural resources at the commune level. By 2030, Vietnam will reduce total greenhouse gas emissions by 9 percent compared to the conventional development scenario, equivalent to 83.9 million tons of CO₂, and by up to 27 percent, equivalent to 250.8 million tons of CO₂ (equal to Vietnam's total national emissions in 2014), if international support is provided through bilateral cooperation, multilateralism, and business investment¹²⁷.

Fourth, promote international cooperation and information exchange. Always utilize integrated measures (administrative, economic, and political) to reduce greenhouse gas emissions, as well as “Greening” activities that can be found in enterprises and workplaces. International treaties always include systems that allow members to consult and collaborate¹²⁸. Developing countries, in particular, continue to have limited financial,

¹²⁸ Nguyen Hoang (2019), *Strengthening cooperation and effective response to climate change*, retrieved April 19, 2022, from <http://baochinhphu.vn/Hoat-dong-Bo-nganh/Tang-cuong-hop-tac-ung-pho-hieu-qua-voi-bien-doi-khi-hau/443793.vgp>.

experience, and human resources in environmental resource issues; however, the expansion of international cooperation will bring the opportunity to receive resources to support environmental protection in general and to internalize international environmental conventions in particular. Many countries, particularly those reliant on fossil fuels and unsustainable industries, have chosen “Green” recovery as the emphasis of economic stimulus packages. Green policy and green investment can also help to create additional jobs, which can enhance economic activity. It is possible to minimize air pollution while increasing government revenue through taxation. According to international experience, there are seven potential policies and activities that might both influence the number of economic multipliers and enhance the criteria for quantifying climate impact: (1) Prioritize investment in clean energy or provide conditional support to businesses that drastically reduce emissions, particularly in carbon-intensive industries; (2) Regulate the pricing of nonrenewable or polluting resources to encourage responsible behavior, including eliminating subsidies and/or imposing taxes (carbon taxes); (3) Use the financial system to finance, lend, and provide tax incentives for sustainable transportation and transportation, water treatment, waste management, the circular economy, and clean energy research by requiring banks to invest less in fossil fuels and more in efforts to mitigate climate change and improve capacity resistance; (4) Financial assistance for households to improve energy efficiency and install renewable energy equipment; (5) Take supportive measures to facilitate ecosystem restoration, viewing it as an essential green infrastructure (for example, intact mangroves that reduce storm surges), including carbon-rich habitats and climate-friendly agriculture; (6) Ensure the development of new infrastructure while taking natural disaster and climate risks into account, while ensuring that design standards can withstand the effects of natural disasters to avoid creating new risks; (7) Invest in adaptation measures through combined investments in green and gray protection strategies to reduce risks to people and property from natural and climate risks¹²⁹.

Fifth, there should be procedures and policies in place to significantly stimulate financial investment. Raising public awareness about climate change and implementing numerous financial investment channels are equally essential actions for the success of national action plans and strategies. Continue to improve the Environmental Protection Fund's operating mechanism; increase revenue for the Vietnam Environmental Protection Fund; expand international cooperation to mobilize external capital, particularly capital from international financial institutions such as the Global Environment Fund and environmental funds from some partner countries¹³⁰; gradually increase the budget for environmental protection in line with the growth rate of the economy, increase the effective use of resources in environmental protection; Develop a breakthrough mechanism to mobilize investment from society for environmental protection, natural resource management, handling and overcoming

consequences of natural disasters and environmental incidents; develop financial mechanisms based on the principles of the market economy to promote adjustment, change of production activities, consumer behavior in an environmentally friendly direction¹³¹.

In the international legal system, climate change law is an institution of international environmental law rather than a separate discipline. The provisions of international law have been comprehensively adapted to issues concerning climate change mitigation. Although there are still many limitations, there is no denying that these principles and regulations serve as an important legal foundation for international cooperation against climate change, as well as reflect the international community's determination to combat the impact of climate change on sustainable development.

vanthanh20.nguyen@samsung.com

Automation Group, Samsung Display Vietnam, Yen Phong, Bac Ninh, Vietnam

Abstract

The Covid-19 pandemic has caused a negative impact on many domestic and international businesses. This is also the time when many domestic and foreign researchers propose sustainable development solutions for businesses to overcome the difficulties of epidemics and climate change. It was during this time that the ESG (Environmental - Social - Governance) ecosystem was proposed by many researchers in developed economies as an advanced model for the sustainable development of businesses. However, for developing countries, including Vietnam, technological innovation associated with environmental protection is a major concern today. Therefore, in this study, the author proposes to encourage businesses to apply ESG ecosystem, but take environmentally friendly technology as a key factor in order to increase competitiveness of businesses and towards the goal of developing a sustainable business model.

Keywords: *Environmental, Social and Governance (ESG); Environmentally Sound Technologies (ESTs); Sustainable Development Goals (SDGs); Sustainable business.*

1. Introduction

Research hypothesis: Sustainable development trend of Vietnam in general and of enterprises in particular to cope with climate change and epidemics in the future.

Research assumption: Applying environmentally friendly technologies, developing ESG models in enterprises to increase benefits for the sustainable development of enterprises.

Research history: ESG trend strongly developed in European countries, USA, Australia, Japan, Korea... so the research focuses on this area. In Southeast Asia, Thailand and the Philippines have been mentioned in research in a number of universities. In Vietnam, in March 2022, the embassies of 4 Nordic countries including Denmark, Finland, Norway, and Sweden collaborated with the National Academy of Politics in Ho Chi Minh City to

organize the Workshop "ESG - Modeling business model for sustainable development". In addition, in-depth studies on ESG in Vietnam related to business development and environmentally friendly technology have not been recorded by the author. Therefore, this is an urgent and important study in approaching new ecosystems to support in the sustainable development strategy of the Government of Vietnam.

2. Method

The author uses the proposed Prescriptive Analysis and then uses cluster analysis to analyze data on a group of customers based on purchase behavior, business attachment and evaluation of customers. Enterprises then synthesize and analyze in order to give the assessment and expectations of consumers about the business. In addition, the author uses additional methods of document synthesis and survey.

+ Method of synthesis of documents: Based on documents of researchers related to the impact of the covid-19 pandemic on production and business activities of enterprises in the period 2018 to present in Vietnam. Based on the documents of a number of international researchers on sustainable development, environmentally friendly technologies and the Environment - Governance - Enterprise model.

+ Survey method: Conduct two survey questionnaires with subjects being Vietnamese consumers and young Vietnamese workers in the impact of Environmental - Social factors - Management focuses on environmentally friendly technology. focus on constructing survey questions.

Results and findings

By this research, the author proposes a new Environmental Ecosystem of Corporate Governance with environmentally friendly technology as the focus to build a sustainable Vietnamese business model with the aim of protecting the environment, taking responsibility for the environment. social responsibility, sustainable governance, increasing competitiveness in the international market.

3. Results

3.1. Concepts of Environmental – Social – Governance (ESG) and Environmentally Sound Technologies (ESTs)

ESG:

According to the OECD in 2021 that: “ESG offers an effective measurement of environmental impact, carbon emissions and green investments. As market participants show greater awareness and concern that climate risks may present implications for long-term value and financial stability, ESG products are increasingly being used to assess companies’ commitments and actions to transition to renewable energy and green products. To meet this demand, asset managers and ESG rating providers increasingly integrate a host of metrics that are captured in the environmental ‘E’ pillar of ESG ratings and investing”. [1]

According to Lee Gap Soo, 2021, “ESG is an abbreviation for environmental, social, and governance, and is a measure of 'corporate sustainability'. The ESG term first became known to the world in late 2004 when it appeared in Who Cares Wins Connecting Financial

Markets to a Changing World, a report by the United Nations Global Compact. The UN believes that a systematic response to ESG is essential for companies to grow sustainably in the future”.[2]

Source: Anevis

Source: Anevis

According to the author of the study, ESG is one of the forms of sustainable development that combines the three factors of Environmental Protection, Social Responsibility and Corporate Governance in which the Environment is the main factor.

ESTs

According to OECD: The concept of environmentally sound technology is relative and normative. The term implies that the selected technologies will accomplish goals rather than just facilitate an industrial, surveillance, commercial or domestic process, and will bring benefits and broader use value than just productivity (UNCTAD, 1997a).

According to the author: Environmentally sound technologies are technologies that save fuel, raw materials, minimize the risk of causing environmental pollution, and technologies that create environmentally friendly products or solve problems. solve environmental problems.

3.2. Actual situation of the impact of the Covid-19 epidemic on Vietnamese businesses

According to the survey "COVID-19 impacts on enterprises in Vietnam 2020, by ownership" in 2021 by author Nguyen Ngoc Minh said that: “In 2020, around 72.3 percent of surveyed domestic private firms in Vietnam stated that the impacts of the COVID-19 pandemic on their business were mostly negative. In comparison, around 74.5 percent of surveyed FDI enterprises rated the impact of the pandemic similarly.” [3]

Figure 2. Survey of the impact of the Covid-19 epidemic on businesses

Source: Nguyen Ngoc Minh, 2021

Thus, according to the survey results published above, the number of unaffected domestic enterprises accounts for only 11% and the number of FDI enterprises that are considered unaffected is only 11.4%.

According to the General Statistics Office of Vietnam, the growth rates of GDP, exports and imports in the first quarter of 2020 were at the lowest levels in the past decade due to the impact of the epidemic.

Figure 3. Key economic indicators in the first quarter of 2020 compared to the same period last year (%)

Source: General Statistics Office, April 2020

In the Rapid Assessment of Impacts of the COVID-19 pandemic on businesses and workers in a number of key economic sectors: ILO response, adjustment and resilience[4] outlined the significant impacts of the pandemic on workers in Vietnamese enterprises and solutions to reduce working hours, leave without pay or terminate labor contracts to deal with the epidemic of many businesses domestic.

Thus, it can be seen that the impact on businesses including domestic enterprises and FDI enterprises in Vietnam during the pandemic is very large. Therefore, economic recovery after covid-19 and sustainable development trends in enterprises are of great interest to many international research institutions.

3.3. What are the benefits of developing an ESTs line in the ESG model?

ESG issues have become a fiduciary responsibility as economies grapple with multiple and compounding risks such as climate change, social justice, and COVID-19. According to many researchers who promote the ESG ecological model, ESG is a sustainable transformation as a part of responsible capital allocation, risk management, of investors and global governments pursuing a low-carbon and just economy. ESG equips businesses with the ability to be flexible in current and future situations and target consumers in a trend of improving service quality and brand image.

As per GreenPrint's Business of Sustainability Index[5] report released in March 2021, 75% of Millennials are willing to pay more for an environmentally sustainable product in the US and 77% of the overall sample size are concerned about the environmental impact of products they buy.

At the Korea Institute of Tax and Financial Research, author Han Dong Sook in a new study on ESG published in December 2021 said that the more investors actively disclose to outsiders about ESG management signals through ESG assessment or sustainability report, the more investors perceive the correspondingly high value of the business[6].

In 2016, author Lim Jong Uk in a report on examining the influence of profit management with 975 enterprises announced to participate in the ESG model, resulting in E-S-G indicators of environmental responsibility index environment, the social responsibility index and the management responsibility investment index have a positive effect on the business. In 2021, Lee Jung and Lee Yoo Kyung conducted a survey on the impact of ESG management on the stock market when there is an external impact such as the Covid-19 epidemic based on 2011-2020 data of listed companies listed on KOSPI stock exchange. The results show that ESG business does not affect the crisis index.

So what benefits will ESG bring to businesses?

+ Firstly, it is a matter of attracting talent, targeting future consumers, creating conditions for technological innovation in the direction of environmental friendliness and enhancing product brands. This is the condition to create flexibility for many businesses to deal with difficulties. Moreover, the younger generation is tending to choose companies that are responsible for social issues and develop towards sustainability, a good working environment.

+ The second is to take advantage of the Government's preferential policies on business licenses, tax exemptions and reductions, incentives in bank loans. These are incentives for environmentally friendly businesses. For example in the Law on Environmental Protection 2020 Article 141. Incentives and support for environmental protection; Article 113 of the Government's Decree 08/2020 dated January 10, 2022 detailing incentives and support for investment capital.

+ The third is to reduce business costs, when businesses apply solutions to take advantage of renewable energy sources, sustainable business will save costs in the production process.

+ Fourth, compliance with relevant parties' regulations. When participating in the ESG community, businesses will be less dependent on supervisory companies, so the Board of Directors can operate more freely and dynamically to develop the business. Moreover, they are also less likely to face strikes or dissatisfaction from union members that affect the operations of manufacturing enterprises. Their brand will also be preferred and used more by consumers.

+ Fifth, enterprises can easily penetrate new markets for business investment, especially in export activities to new markets. Below, the author summarizes the analysis of the benefits of enterprises when participating in the ESG model.

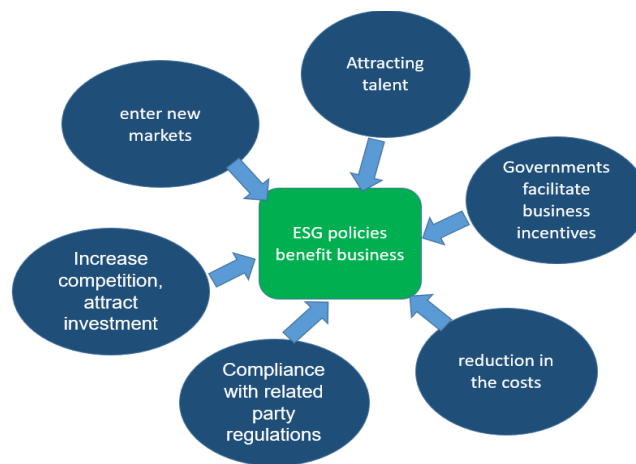

Figure 4. ESG development policy benefits businesses

The author conducted a short survey with Vietnamese consumers of all ages on the impact of Environmental, Social and Governance (ESG) indexes on Vietnamese consumers' buying behavior. Male. The results show that 48% are very interested and 28% are interested in deciding on products when reading information about environmental protection, application of environmentally friendly technology, carbon reduction rate, fuel saving, activities contributing to society are public. Thus, it can be seen that Vietnamese consumers are actually very interested in the social - environmental - governance responsibilities of domestic business enterprises. 76% consider that an important number for business enterprises to continue their orientation in sustainable development.

Figure 5. Survey results on the impact of the Environmental - Social - Governance index on Vietnamese people's intention to purchase and choose products

With a follow-up survey on job choice of workers aged 25 to 35 about three companies with the same salary and travel conditions. Meanwhile, company A on its website only has basic information about products, businesses, contact addresses, and organizational structure; Company B has more information about environmental protection activities, application of environmentally friendly technologies, reduction of energy consumption costs, and contributions to social activities, plans for sustainable development in the future of the business; Company C has more information about contributing to voluntary organizations, having fun activities during holidays and Tet holidays for employees. The results of public information about the company's Sustainable Development Plan and responsibility to contribute to society accounted for 78% of the employees' choice. Thus, the publicity of the company's sustainable development activities and social responsibility has attracted employees when choosing a working environment.

Figure 6. Survey results on the trend of choosing enterprises of Vietnamese workers

“Climate change risk is an investment risk,” said Larry Fink, President of BlackRock, the world's largest asset manager, in an annual letter, stressing the importance of sustainability. The environmentally friendly technology that businesses adopt is intended to produce results with indicators related to energy saving, carbon reduction, social responsibility and risk management.

3.4. Why have to focus on developing environmentally sound technology in the ESG model in Vietnam?

The policies of the Government of Vietnam always focus on investing in sustainable development, applying green, clean and environmentally friendly technologies. However, Vietnam is a developing country and there are many problems to be solved related to technology. Outdated, outdated or indirect technologies that increase environmental pollution are still being used. Therefore, in order to implement the zero-carbon policy and reduce environmental pollution, the first important thing is to innovate technology.

Technological innovation in the direction of environmental friendliness is the application of new technologies that ensure environmental standards. Production input – output ensures safe processes for the environment and green products. It is the foundation for businesses to build a sustainable ESG model.

3.5. How to start implementing ESG policies with businesses in developing countries including Vietnam?

It is first necessary for developing countries to identify the most important areas that ESG should focus on.

Figure 6. ESG model

Source: www.inews24.com Korea's online magazine

From Figure 6, we see the three components that make up the ESG. In which factor E - Environmental is the factor ranked first. Right from the title of the article, the author has focused on ESTs, because many countries in Southeast Asia, including Vietnam, give priority to the development of technology lines. Environmentally friendly, green and clean technology. Environmental technology is the means to implement solutions to cut greenhouse gases, reduce environmental pollution and develop sustainably. The identification of the main factors is concentrated in the above model.

Secondly, it is necessary to assess the current situation of enterprises when participating in ESG. For example, has the business ever applied ESTs? Have you participated in social responsibility activities? Does the corporate governance structure take into account the interests of employers and employees? That shows where your business is in the ESG model.

Thirdly, develop development policy for ESG based on reliability indicators. If you are a large enterprise, you can build your own set of indicators for the company. For small businesses, it is possible to link up with businesses in the same field and participate in publicizing the ESG index. Or the solution of hiring a company is a 3rd party directly participating in the assessment.

4. Conclusion

In short, if you want to develop a sustainable business, you must first encourage businesses to choose the right ecosystem. In this study, the ecosystem proposed by the author is Environmental - Social and Governance (ESG) with the focus on developing environmentally sound technology lines (ESTs) as the main factor. Sustainable national development must first develop sustainable businesses. Not only environmental protection, environmentally friendly technology will be the key to increase the competitiveness and sustainable development of enterprises in the future. The development of environmentally friendly technologies in the ESG ecosystem has not been mentioned by many domestic academic research works. However, this is an ecosystem that many developed countries are interested in, especially during the period when the covid 19 pandemic has adversely affected global businesses. In Asia, Japan and Korea

are the two leading countries in research related to ESG trends. Through two quick surveys with Vietnamese consumers and workers, it can be seen that Vietnamese people are very interested in sustainable development. Developing environmentally friendly, green and clean technology lines has long been a priority for investment by the Government. Laying the technology foundation that has been prioritized by the government to develop in the form of ESG to benefit businesses is an important issue that businesses need to pay attention to.

THE ROLE OF NATURAL RESOURCES IN THE INFORMATION SOCIETY

Dr. Dinh Thien Duc

ducdt@neu.edu.vn

Faculty of Economics, National Economics University, Hanoi, Vietnam

MA. Tran Thi Duong Ngan

ngantd@neu.edu.vn

Graduate School, National Economics University, Hanoi, Vietnam

Abstract

The natural resources have a vital role in the survival and development of human society and also in maintaining the ordinary parameters of ecosystems, biodiversity and health. Thus, the existence of an information society, in which the flow of information, goods and people is making rapidly and sometimes with harmful effects, the sustainable management of natural resources can contribute to the reduction of the negative impacts produced by humans. In this paper we have tried to highlight the role of natural resources in the development of society by addressing in a different way, primarily, the renewable resources and, later, the non-renewable ones. To emphasize their role, we analyzed the evolution of some indicators like agricultural area, total water resources, the production of fossil fuels and we presented their importance for a healthy economy and environmentally friendly.

Keywords: *fossil fuels, information society, natural resources, renewable resources, Vietnam, sustainable development*

1. Introduction

Natural resources play an undeniably high role in today's society as it affects the living standards of the population and is a key factor in the development of society. Unfortunately, as the population grew and the need for resources has become more acute, the importance of natural resources was better acknowledged. Moreover, the situation has even reached the point of wars between countries over natural resources some states are missing. However, currently, policies and strategies for sustainable management of natural resources are being implemented globally, so as not to restrict the absence of some society and raising living standards.

Emphasizing the importance of natural resources is increasingly evident in the present context of globalization and information society, so we considered interesting to analyze natural resources in Vietnam since we live in an information society and since information changes everything today.

We don't know the exact origin of the concept of information society, but "Duff (2000) presents two possibilities regarding its origin: the concept was first mentioned by either Americans or Japanese, appearing in both versions since the '60s". However, the perspective of those specialists who believe in American origins is influenced, not by the

exact appearance of the concept, but by the meaning ascribed to other phrases similar to the knowledge industry. But, as Duff and others specialists state (2000), the concept of information society has emerged for the first time in Japan in 1964. So, with the promotion of this term a major importance was given to information and other specific terms of the new companies, such as technology and time. Information society is identified by the speed with which information travels through globalization by harnessing time.

We structured this research into five parts in order to provide clearer evidence of the role of natural resources in the Vietnam society. In the information society, as the name suggests, information is a key element and knowing how to use is the most important. Internationally, there is more information about the sustainable management of energy resources. These are translated into policies and strategies, but their implementation is difficult for various reasons. Among these reasons are included the lack of information, the lack of financial resources for their promotion and implementation at local level, the indifference and the unconsciousness of humans and so on. Therefore, the information society offers us the opportunity to learn from the past and to update and disperse quickly the necessary information for a proper management of natural resources. As a result of their high importance and complexity, the natural resources are taken into consideration separately in international policies and represent the key areas from the green economy and sustainable development. Thus, in view of the fact that natural resources can be renewable and non-renewable, we considered necessary to analyze them separately at Vietnamese level, because their management must take into account the characteristics of each category.

2. Literature Review

In the green economy, the natural resources management represents a strategic variable necessary for the sustainable development of society and for the increase of people's living standards. Thus, in Asia, the land resources management, the water management, the biodiversity, the air pollution and the food resources management are part of the nine fields of action of the policies made due to the need of green economy's functioning. By adopting these policies, the Asian Pacific Environmental Network wishes to minimize the negative impacts of climate change on resources, to improve the quality of surface water and groundwater, to decrease and even stop the pollution from dumping the waste in waters, to reduce the current rate of biodiversity loss, to protect the ecosystems, the species and the genetic diversity, to efficiently manage the fisheries, to protect and to conserve the forests, to protect the local flora and fauna and to avoid overexploitation of natural resources. Thereby, we see why the natural resources play an important role in the European economy, but also how these are in an interdependent relationship with other fields of action of green economy, such as climate change, energy, transport, waste and chemicals. Sustainable management of natural resources is a requirement of green economy, that comes up with measures in order to diminish the dangers that society and natural environment are regularly subjected to. The role of natural resources not only contributes to the achievement of economic processes, but also at maintaining the biotic environment on Earth. With the emergence of information society the technologies that exploit natural resources have

multiplied, their exploitation was done in a fast rhythm and led to a decrease in stocks reserves, which ultimately led to resources over-exploitation and to their gradual depletion until the humanity acknowledged their limited nature. These issues were the basis for setting the objectives in the field of natural resources management and the basis of the necessity of decoupling the resource consumption from economic growth. The Asia has policies for a constant monitoring of biodiversity, of stopping the land degradation, the drought and the forest degradation and of protecting natural resources as a whole. “Bran et al. (2011) list these areas for which they made strategies, including air pollution, sustainable use of resources and land protection”. However, Vietnam still has much work to do regarding the implementation of strategies to sustainably manage the natural resources.

Today's world is constantly becoming industrialized as more and more countries make major technological breakthroughs. Industrial and technological advances have also driven the demand for raw materials for research, development and production. As a result, more and more resources are used to satisfy industrial needs, accelerating the depletion of natural resources and emitting toxins and chemical by-products. An inefficient use of natural resources can lead to natural capital degradation, to human health and biodiversity damage, to irreversible changes in nature, air pollution and climate change intensification, which ultimately can change the society that we know today. So, by adopting and implementing the green economy objectives also in Vietnam, there will be a joint effort for an efficient and rational use of resources.

3. Results

3.1. Renewable resources in Vietnam

In the category of renewable resources enters a part of land resources, food resources, water resources, forest resources, wind and solar resources. In order to highlight the role of renewables in the information society in Vietnam, we chose to analyze the potential of natural resources, as well as some statistical indicators that we considered relevant to the study, by showing their impact on the planet. Right from the early years of the 2011 - 2021 decade, Vietnam has focused on implementing many solutions to promote the effective use of natural resources in order to take advantage of opportunities for cooperation in accessing and receiving transfers. technology, digital transformation for the sustainable development of the country.

Currently, the land resources are facing a number of problems related to degradation and pollution, that could affect the people, because these can affect local biodiversity, can decrease the possibilities of obtaining food and thus can reduce the economic activities in the area. In Vietnam, by 2020, the agricultural area will account for about 27.3 million hectares, or 80.4% of the total land area, increasing steadily since 1994 (18.3 million hectares). The biggest change is that unused land has decreased sharply from 11.7 million hectares to 2.1 million hectares in the same period, which shows that the exploitation and use of land resources for different purposes has increased. and is being promoted. However, the structure of agricultural land has changed strongly due to the transformation of production structure and the structure of crops and livestock in agriculture in recent years.

In the period 2001 to now alone, although the area of agricultural land has increased sharply (from 8.88 million hectares to 11.53 million hectares, the area of rice land has decreased from over 4.34 million hectares to over 4.34 million hectares). 4.14 million ha), accompanied by an increase in land for other annual crops and perennial crops. The decrease in the area of rice land is partly due to urbanization and industrialization that has converted a part of agricultural land (including rice land) to non-agricultural land, the rest is due to the low efficiency of rice cultivation, do not bring attractive income such as shrimp farming, freshwater aquaculture, fruit trees, vegetables, flowers, ornamental plants, animal husbandry... Soil quality is very important in providing necessary food for the population. That's why Vietnam should reduce its degraded land surface and increase current productivity. These issues need to be considered when implementing sustainable resource management strategies, because land is an important resource in the context of increasing population, decreasing agricultural land area and thus decreasing production. food quantity. Today, a challenge to food security is directly dependent on the condition of the land and its efficient and sustainable use. The role of land resources in today's society is emphasized because more than 95% of people's food needs are provided by them. This highlights the fact that humanity cannot exist without land resources.

With regard to water resources, their role in the economy, but mostly in human existence is vital. We believe that its importance derives from at least three approaches: water as a necessity for human and biodiversity survival, the water needed in agriculture and the water necessary for producing renewable energy. Vietnam is a country with a dense river system, with a total annual surface water flow of 830 to 840 billion m³. The total volume of water from abroad flowing into Vietnam accounts for about 63%. As for underground water resources, there is a total reserve of about 189.3 million m³/day, concentrated in the Northern Delta, the South and the Central Highlands. However, we must not underestimate the fact that water sources are being polluted, affecting not only the quality but also the biodiversity and environmental landscape of the locality. Also, it should be noted that water availability is variable and limited, so during certain times of the year it becomes scarce or even unavailable in some local areas. On the other hand, because the flow is unevenly distributed according to the season and region, in which 70 - 80% of the total flow is concentrated in the flood season, the dry season lasts from 6 to 9 months with the total flow amounting to only about 20 years. - 30%, so basically Vietnam is still a country lacking water. This temporary water shortage coupled with population growth can lead to serious problems in water management and ensuring the water availability for local populations and biodiversity. According to the report of the Ministry of Natural Resources and Environment, the volume of wastewater being treated in industrial zones is currently only about 65%, urban areas 15%, agriculture 0%. This is a great risk causing degradation of surface water and groundwater resources. Another problem of water scarcity is related to agricultural activities, with their development at the right time and place. On the one hand, the lack of irrigation for crops leads to financial loss, and on the other hand, loss of food resources. In Vietnam, there is a lack of necessary infrastructure for irrigation of agricultural areas and therefore measures are needed to address these problems. Another role of water is to produce renewable energy

through the operation of hydroelectric power plants. Annual electricity production has increased more than 20 times, from 8.6 BWh in 1990 to 256.7 BWh in 2021. The annual rate of increase during this period is about 12 - 15%, almost twice the rate of increase. GDP growth. Hydroelectricity, natural gas and coal are the main energy sources for electricity generation. Coal accounts for the highest proportion of energy sources with 41.6%, followed by hydropower with 37.7% and gas with 18.8%. In addition to large and small hydropower, renewable energy accounts for only a very small part (0.5%). However, since the beginning of 2019, the share of renewable energy in the energy system has increased significantly and is largely thanks to solar energy; however, wind energy is also on the rise. Although Vietnam has a high renewable energy potential, it cannot fully exploit its potential because of limitations such as lack of adequate infrastructure and high initial economic investment. These resources thus benefit both natural capital and human health, as well as social development by raising people's living standards.

Forest resources also have a major role in the sustainable development of society, because contribute to preserving the natural capital within normal parameters, provides the raw material for construction, help reduce greenhouse gases which intensifies climate change and helps improving the health status of population. In Vietnam, in the period 2011 - 2021, the country can average about 230,000 hectares of forest each year; contributing to bringing the national forest coverage rate to about 42% by the end of 2021. But the area of natural forest has increased insignificantly (compared to only 9 million hectares in 1990, by 2021 it will be 10.3 million hectares). Out of a total of 10.3 million hectares, only 15% is rich in reserves; 50% is medium forest; the remaining 35% is poor forest. Even in some areas, the area of production forest increased sharply, but the area of natural forest decreased deeply. Of the 230,000 ha of forests planted each year, up to 215,000 ha are production forests. Thus, in 10 years, the whole country has added about 2.15 million hectares of forest to create raw materials for the wood processing industry. As a result, the output from plantation timber has increased from 5.16 million m³ (in 2011) to about 20.5 million m³ in 2021. Another problem is that pests are increasingly affecting forest resources. In addition to wood products, forest products also have by-products such as medicinal plants, mushrooms, and berries as food for humans and animals. The role of forest resources is undeniable for their benefit to society and the planet. Forest resources contribute to the protection of water, atmosphere, soil, improvement of climate factors, meaning benefits include purification and maintenance of its gas composition, erosion control, pollination and seed dispersal, maintaining species diversity. Forests protect human health, energize people and are a space for entertainment and relaxation. At the same time, protect historical and cultural relics. By the sanitary function of the forest, this stimulates the body and contributes to the healing of diseases (asthenia, respiratory diseases). Even considering only the economic benefits of forest resources, we can still say that forest resources play an important role in human activities and in the protection of natural capital. Another important role of the forest is to be a powerful fighter against pollution. Many studies have shown that forests really have a great role to play in absorbing large amounts of CO₂ and removing oxygen in nature, and when they are cleared, forests remove a large amount of CO₂ back into the atmosphere.

contribute to the greenhouse effect and global warming. So, the poor management of forest resources can lead to floods, landslides, climate change, desertification, food shortage, that's why it is important to pay more attention to these issues. this problem and need to implement more effectively measures to protect and conserve natural forests. The first step would be to pass tougher laws against those who don't care about these resources.

3.2. Non-renewable resources in Vietnam

In the category of non-renewable resources are the fossil fuels and some underground minerals. Their exhaustive character requires greater attention to resources management, since information society is based on far higher energy consumption. In Vietnam, the coal is used to prepare coke, synthetic gas and obtaining heat, the oil is the main source of global energy and the natural gas has various usages in industry. The Earth takes millions of years to create fossil fuels while the rate of human consumption is very fast, making this fuel source increasingly exhausted. In the world, if the current rate of exploitation and consumption is maintained, the estimated oil reserves will only be enough for another 53 years, natural gas for about 55 years and coal for 113 years. In Vietnam, if the current rate of exploitation is kept at the same rate, oil will only have 34 years left, natural gas will have 63 years and coal will only have 4 years (Vuphong energy 2021).

In Table 1, we present fossil fuel production for the period 2010-2020. It can be seen that oil production in 2020 has decreased by a third compared to 2010 and it also shows a decrease in natural gas production. Coal production tends to increase steadily during this period. This decrease in output is due on the one hand to the policies introduced by Vietnam and on the other hand due to the decline in activities in the industry. Since they already have this information, Governments are left to propose, adopt and implement measures as possible to protect natural resources.

Table 1. Fossil fuel output, period 2010 – 2021

	2010	2012	2014	2016	2018	2020	2021
Coal (million tons)	44.8	42.1	41.1	38.7	42.4	48.3	40.2
Crude oil (million tons)	15.0	16.7	17.4	17.2	13.9	11.5	10.9
Natural gas (million m ³)	-	9.355	10.210	10.610	10.010	9.160	-

Source: GSO, 2021

In the list of depleted resources, there is also a part of mineral resources, which with the process of industrialization also plays an increasingly important role. Vietnam has a wide range of such resources located throughout the territory and should be properly exploited.

Recently, minimizing the negative impact of fossil fuels on natural capital and human health has been one of the greatest challenges facing mankind today. The increase in the amount of CO₂ in the atmosphere since the industrial revolution worries international experts and governments because of its rapid rhythm of increase, a fact that has determined the emergence of studies in this field. shows that the increase in CO₂ emissions is the main source of fossil fuels, followed by land use. Given the fact that at the European level, targets to reduce CO₂ emissions have been set and measures have been taken in this regard, Vietnam

has also joined forces with countries fighting against greenhouse gas emissions. and against harmful effects that may arise in the future. Therefore, since 1990, Vietnam has almost halved its greenhouse gas emissions due to the implementation of environmental and other policies. So, in figure 2, we have illustrated the evolution of CO₂ emissions for a number of national economic activities related to the analysis of non-renewable resources.

Figure 1. Emissions of carbon dioxide on the activities of national economy (2010 - 2020)

Source: Andrews.edu.vn

It is easy to see that the biggest share of CO₂ emissions is generated by the production and supply of electric and thermal energy, gas, hot water and air conditioning, followed at some distance by metallurgical activities. Therefore, both the government and the population should pay attention to how are exploited and used the non-renewable resources because these are highly polluting and affect both the natural environment and human health.

4. Discussion and Conclusion

In a society bombarded with economic, social and environmental problems, the rapidity of information's circulation and its transparency allow each person to be able to analyze the current state of natural resources, to identify current and future challenges that, afterwards, to be proposed and implemented measures to prevent and control them and to be carried out strategies for a sustainable resource management. Both the non-renewable and renewable resources produce some positive and/or negative impacts on nature and on people, so they must be investigated separately. The Vietnam's opportunity lies in the fact that it has a diverse and significant amount of natural resources which exploited and used in a rational way, can contribute both to increase social welfare and the green economy requirements so that future generations do not have to suffer. The effects of these resources are amplified when all environmental factors are properly presented. Gradually, renewable resources can replace non-renewable resources and can lessen their negative effects, but this can be done by recognizing the need of sustainable policies for natural resource management. Therefore, the role of the Vietnamese renewables is to help to develop the society, to reduce negative impacts and to provide quantifiable information regarding the state of natural capital.

University of Economics Ho Chi Minh City, Campus in Vinh Long, Vietnam

Abstract

In recent years, circular economy has become a prominent topic and a model that many countries are aiming to replace the linear economic model. The orientation of the Party and Government of Vietnam can apply circular economy (CE) as the key to meet many sustainable development goals including reduce environmental pollution during development in output, respond well to resource depletion and climate change. The problem is how Vietnam can and Vietnamese enterprises exploit the opportunities and understand the challenges of the CE model well to position themselves for effective implementation. Therefore, this paper aims to identify challenges and opportunities of CE in Vietnam towards sustainable development. The paper provides an overview of the CE model and highlights the main challenges, opportunities and benefits of applying CE to Vietnam in sustainable development.

Keywords: *circular economy, sustainable development, Vietnam*

1. Introduction

Linear economy is the process of turning resources into waste, which inevitably leads to resource depletion and environmental pollution (Sariatli, 2017). In other words, from starting to exploit resources as inputs to the economic system, then to production, distribution, consumption and finally disposal. The linear economy has been causing pressures on resource depletion and increasing emissions. A large amount of solid waste, wastewater, and exhaust gases are released into the environment but there is no treatment, control and management of the waste, leading to serious environmental pollution in many places and areas (Sariatli, 2017). According to estimates of the United Nations Environment Program (UNEP), by 2030, if the development continues with a linear economic model, the world's resource use demand will increase 3 times compared to today. This will exceed the capacity of the earth to supply, the amount of waste will exceed the capacity of the environment to bear.

Vietnam has been facing many challenges in terms of resource depletion, pollution, environmental degradation and climate change. Recent statistics show the seriousness of that

such as the amount of plastic waste with about 1.83 million tons/year; daily-life solid waste with more than 61,000 tons/day, of which up to 71% of landfill waste (equivalent to 43 thousand tons/day); severe depletion of many resources, typically coal. Vietnam has had to import coal since 2015, possibly importing up to 100 million tons of coal by 2030 (Nguyen Dinh Dap, 2021). According to calculations by the World Bank, water pollution can cost Vietnam's GDP up to 3.5% by 2035. In particular, Vietnam is among the most vulnerable countries to climate change. Accordingly, it is forecasted that by 2030 climate change and natural disasters could cause losses of up to 11% of Vietnam's gross national product. That leads to an urgent need to find a more efficient and sustainable economic model in using resources, reducing pollution and environmental degradation, and responding to global climate change.

On the other hand, Vietnam is one of the countries heavily affected by the COVID-19 pandemic. According Japan International Cooperation Agency (2020), the developments of COVID-19 have had a strong influence on Vietnam's economic growth prospects both in the short and medium term. According to the General Statistics Office, Vietnam's GDP in 2020 has increased by 2.91%, which is the lowest increase in a recent decade period 2011-2020 (GSO, 2020). Currently, businesses and society face a shortage of production and consumption models that have had a lasting impact on the supply chain. Therefore, a sustainable development strategy, implementing a circular economy model is an inevitable choice. According to the report of the Organization for Economic Cooperation and Development (OECD) 2011, if we continue to develop according to the linear economy based on capital resources - production - consumption - disposal, even if we achieve As a result of high growth, Vietnam will still face natural and environmental disasters.

In recent years, the Vietnamese Party and Government have paid more attention to and mentioned the application of the circular economy in association with sustainable development, also known as green growth. Specifically, the content on building a circular economy was identified by the 13th Party Congress as one of Vietnam's development orientations in the period of 2021 - 2030 in order to achieve the sustainable development goals. The biggest benefit of this model is to help save energy and resources associated with the goal of fast but sustainable development and environmental protection in the present and future period. However, to develop a circular economy model requires a lot of strict institutional, legal and resource conditions of a country, especially in the post-COVID-19 economic recovery period. Therefore, this study provides a circular economy model of the previous countries, assessing the opportunities and challenges of this model is extremely necessary. From there, it helps to develop appropriate policies and measures to effectively apply to Vietnam's economic conditions.

2. Method

The article uses theoretical analysis and synthesis methods. This is a method of collecting scientific information on the basis of studying existing documents and documents and by manipulating logical thinking to draw necessary scientific conclusions. Accordingly, the article analyzes and synthesizes information and data based on arguments and previous

research results to clarify basic concepts of circular economy, collect and analyze data on the circular economy in Vietnam in recent times as well as summarize the opportunities and challenges that Vietnam faces in developing this model. From there as a basis to propose some recommendations to develop the circular economy in Vietnam in the coming time.

3. Results

3.1. Circular economy overview

3.1.1. Concepts and features

Circular economy is the opposite concept of linear economy in model and way of development. Linear economy is a way of economic development in a straight-line model, from the extraction of resources at the input for production, to distribution, consumption and finally waste at the output (Sariatli, 2017). Therefore, the linear economic model will accelerate the process of resource exploitation and waste generation, which inevitably leads to increasingly depleted resources and polluted environment (Hoang Nguyen et al., 2020).

The term circular economy has been around since the late 1970s, originating in Europe. Recently, it has been of particular interest to many researchers, starting with Chinese authors after implementing regulatory control measures in the country. The core of the circular economy is a closed cycle of raw materials at the input stage and waste at the output stage. (Yuan et al., 2006). It is important that this model has a foundation of design and manufacturing activities with the goal of extending the life of the material and eliminating negative effects on the surrounding environment (Potting et al., 2017). Cyclic systems embody the application of reuse processes through sharing, repair, refurbishment, remanufacturing and recycling to create a closed cycle in resource usage to minimize minimizing the amount of resources used at the input stage and the amount of waste generated as well as the possibility of causing environmental pollution and waste (Geissdoerfer et al., 2017; Potting et al., 2017).

Figure 1. Circular economy model

Source: National Agency for Science and Technology Information, 2021

This is an economic model towards long-term sustainable development that has been implemented in many countries around the world because it achieves three goals: (i) Responding to resource depletion at the input stage; (ii) Overcoming the problem of environmental pollution at the output; (iii) Harmoniously combine economic growth with environmental protection (Sehnm et al., 2019). Besides, the model also brings many other benefits to countries such as saving costs, reducing price fluctuations, reducing risks from suppliers, promoting innovation and creativity through substitute products. According to the United Nations Development Agency, by 2030, the benefits of the circular economy could bring in \$4.5 trillion and support 10 out of 17 of the United Nations' sustainable development goals (Truong Thi My Nhan, 2019). Sustainable development goals also known as global goals, universal goals designed to end poverty, protect the planet and ensure that everyone enjoys peace and prosperity in each country of the United Nations by 2030 (Assembly, 2015). In a word, the traditional economic model is only concerned with resource extraction, production and then disposal after consumption, causing a large amount of waste. Meanwhile, the circular economy model focuses on the management and regeneration of resources in a closed cycle to reduce the amount of waste generated. If circular thinking is fully applied in the process of designing, manufacturing and recycling products, the circular economy will open up growth opportunities for global businesses and create hundreds of millions of new jobs.

3.1.2. The multiple benefits of the circular economy

Developing a circular economy has become a trend of countries because it also brings many different benefits:

Economic and social benefits: In Europe, it is estimated that circular economic models can bring in €600 billion in net profit per year, create 580,000 new jobs and reduce emissions of greenhouse gases (MacArthur et al., 2015). In addition, the goal of increasing resource efficiency to 30% by 2030 from the European circular economy models will help create 2 million more jobs and increase the GDP of the whole bloc by 1% from efficiency resource usage and 3.9% from the creation of new markets and new products (COM, 2014). In Vietnam, the circular economy model in eco-industrial parks implemented in Ninh Binh, Can Tho and Da Nang saves 6.5 million USD annually (van Beers et al., 2019). The benefits of the circular economy are becoming increasingly evident, attracting the participation of businesses and investors.

In particular, the circular economy is an appropriate transition in the context of achieving the goals of sustainable development and responding to climate change. According to the European Environment Agency, managing materials such as the production and disposal of materials contributes to two-thirds of greenhouse gas emissions (Sehnm et al., 2019). The circular economy helps to mitigate this as the entire circular economy model revolves around the sustainable management of materials. This is demonstrated through the reuse of products and materials, the promotion of the use of renewable resources, the maintenance of development activities, and the control and containment of factors that can negatively affect natural resources and the environment.

The circular economy opens up many new business opportunities for businesses. Enterprises can enjoy a more secure supply of resources by reusing existing resources, rather than depending on finite resources. This can reduce material costs, allowing companies to operate more efficiently. Not only that, the circular economy allows businesses to apply an environmentally friendly business model, thereby expanding the network of consumers and creating a beautiful image in the eyes of customers.

The circular economy also benefits consumers. Because the reuse of materials can help consumers have more income from selling used products. Other more potential benefits to consumers are new products and new jobs. To achieve a circular economy, many new industries will have to emerge. Jobs in some industries such as coal mining will be lost in the future and replaced by green production and green consumption. Thus, the shift to a circular economy will create more jobs for workers.

3.1.3. Circular economy and sustainable development

Sustainable development is development that meets the needs of the present generation without compromising the ability of future generations to meet their own needs. (WCED, 1987). In Vietnam, Clause 4, Article 3 of the Law on Environmental Protection 2014 stipulates: “Sustainable development is development that meets the needs of the present generation without compromising the ability of future generations to meet those needs on the basis of a close and harmonious combination of economy growth, ensuring social progress and protecting the environment”.

The circular economy approach helps economies to solve the dilemma between economic development and the harmful effects of environmental pollution. Indeed, according to the Accenture Strategy estimates, the circular economy could generate benefits of \$4.5 trillion globally from 2015 to 2030 (Lacy & Rutqvist, 2016). Riêng tại Châu Âu, kinh tế tuần hoàn có thể đem lại 600 tỉ EUR lợi ích ròng hằng năm, tạo ra 580.000 việc làm mới và đồng thời giúp giảm một lượng rất lớn rác thải khí nhà kính của khu vực này (Within, 2015). Therefore, many researchers point out that the circular economy is an indispensable path to build an economy towards sustainable development in the future.

Besides, other research also shows that in order to achieve the goal of sustainable development, businesses must be able to produce products suitable for the circular economy (Hannon et al., 2016). Accordingly, enterprises must design products that are beneficial for reuse, repair and recycling. In addition, enterprises also need processes and systems to support customers when products are defective, damaged or no longer bring customer satisfaction. On the other hand, sustainability is a balanced combination of economic performance, social inclusion and environmental resilience for the benefit of present and future generations (Geissdoerfer et al., 2017). Previous researchers have shown that the circular economy is seen as a fundamental condition for sustainable development and there is a positive correlation between these two factors.

In addition, the ongoing COVID-19 epidemic exposes more and more the limitations of the traditional economy, which is based on profits and continuous resource consumption. This model raises many problems such as environmental pollution, effects on climate

change, loss of biodiversity or unequal distribution of wealth. Moreover, people's negative attitude towards nature protection also affects the increase in pollution levels (Malone & Truong, 2017). In 2015, the United Nations adopted 17 Sustainable Development Goals (SDGs) with the goal of improving livelihoods and the natural world by 2030, with the participation of all countries in the world. To succeed, the SDGs are based on two major assumptions: *globalization and sustainable economic growth* (Assembly, 2015). However, COVID-19 has hindered progress in achieving these goals (Sharma et al., 2021). Before COVID-19, progress on the SDGs was very slow. Following to Naidoo & Fisher (2020), two-thirds of the 169 specific goals will not be achieved by 2030, and some could become counterproductive as they are threatened by the COVID-19 pandemic. To achieve the SDGs, therefore, a circular economy approach to solid waste management needs to be a priority on the post-COVID economic agenda.

Naidoo & Fisher (2020) emphasized that it is no longer realistic for us to depend on globalization and economic growth as a driving force for green investment and sustainable development. The application of the circular economy - an industrial economic model that fulfills the multiple roles of separating economic growth from resource consumption, waste management and wealth creation is seen as a possible solution. The circular economy can enhance resilience to crises, make the economy more sustainable and competitive, reduce reliance on external suppliers, and reduce the impact of transportation. Rebuilding the circular economy model to move towards sustainability is an opportunity that all countries must seize. Any positive post-COVID-19 environmental impact must begin with a shift in our production and consumption habits towards cleaner and more sustainable models. As the global economy recovers from COVID-19, the world sees more clearly the close links between environmental, economic and social sustainability (Bauwens et al., 2020).

3.2. Circular economy development in Vietnam: opportunities and challenges

3.2.1. Actual situation of applying knowledge-based economy in Vietnam in recent times

Around the world, there have been a number of large corporations that have started operating under the circular economy model. IKEA (the world's largest furniture retailer) has committed to fully applying the circular economy model by 2030. Lego (a corporation famous for its toy assembly kits) has begun implementing a plan to green the ecosystem with the first assembly using plant plastic. Carlsberg (Danish Brewing Company) has improved its packaging solution to reduce the use of plastic. At Schneider Electric (France), circular economy activities account for 12% of revenue and have saved about 100 thousand tons of resources between 2018 and 2020.

Vietnam has had models close to the basic economy since very early, such as collecting and recycling scrap metal, collecting and recycling paper; In agriculture, there are models of garden - pond - barn, garden - forest - pond - barn, gas recovery from livestock waste. Although there are still many limitations such as environmental pollution, these models have also initially approached the basic economy. Specifically, the model of processing aquatic by-products (shrimp head, shrimp shell) produces SSE, Chitosan; eco-industrial park model in Can Tho, Da Nang, Ninh Binh; initiative to recycle Tiger beer cap

into iron to build a bridge in Tien Giang; Heineken Vietnam with initiatives to reuse waste or by-products to reduce emissions into the environment; DOW's model of using flexible plastic packaging for roads; Unilever's model of collecting, recycling and reusing 100% of waste from plastic packaging; model of processing aquatic by-products; Vietnam Packaging Recycling Alliance (Ha Van Thang, 2020).

Coca-Cola Company is still persistent towards the goal of collecting and recycling 100% of bottles and cans sold by 2030. In Vietnam, this goal is still being gradually realized by Coca-Cola through the efforts to design, collect and collaborate in the direction of a circular economy with the message “Recycle me” on the packaging of all products, to encourage consumers to join hands in recycling bottles/cans after rewarding drinks. These examples, when summarized and evaluated, will contribute to supplementing and perfecting the knowledge economy for our country in the coming time.

In addition, our Party and State have issued many documents related to the local economy and green economy: Decision No. 2149/QĐ-TTg dated December 17, 2009 of the Prime Minister approving the National Strategy on integrated solid waste management to 2025, vision to 2050; The National Action Plan for the implementation of the Sustainable Development Strategy 2011-2015; Decision No. 1216/QĐ-TTg dated September 5, 2012 of the Prime Minister approving the National Environmental Protection Strategy to 2020, with a vision to 2030; Resolution No. 24-NQ/TW, dated June 3, 2013 of the Central Committee on proactively responding to climate change, strengthening natural resource management and environmental protection; Decision No. 2612/QĐ-TTg dated December 30, 2013 of the Prime Minister approving the Strategy on using clean technology for the period to 2020, with a vision to 2030; Decision No. 622/QĐ-TTg dated May 10, 2017 of the Prime Minister on promulgating the national action plan to implement the 2030 Agenda for Sustainable Development; Decision No. 889/QĐ-TTg dated June 24, 2020 on approving the National Action Program on sustainable production and consumption for the period 2021 - 2030.

Many legal documents with regulations related to the eco-economy were also promulgated such as: Law on Environmental Protection, Law on Minerals, Law on Water Resources, Law on Land, Law on Consumer Protection, Law on Forestry, Law on Finance. Natural resources, marine and island environment, Law on plant protection and quarantine, Law on natural disaster prevention and control, Law on food safety, Law on economical and efficient use of energy, Law on chemicals, Law on product quality commodity products... Currently, the Ministry of Natural Resources and Environment is developing criteria, roadmap and mechanisms and policies to promote the knowledge economy in Vietnam. It is an economic model in which design, manufacturing, and service activities aim to prolong the life of matter and eliminate its negative impact on the environment.

The above legal documents and regulations represent a shift towards building a knowledge-based economy, responding to climate change and building a green and sustainable economy. The Resolution of the 13th Party Congress sets the target: by 2025, Vietnam will be a developing country with modern industry, surpassing the low middle income level; by 2030, Vietnam will be a developing country with modern industry and high

middle income; By 2045, Vietnam will become a developed and high-income country. Building a new economy was identified by the 13th Party Congress as one of the country's development orientations for the period of 2021-2030 to achieve the goals of sustainable development, environmental protection, and response to climate change in the world. large scale in the next 10 years.

3.2.2. Opportunity and challenge

Opportunities

Firstly, the circular economy model is a common development trend of countries around the world and has been successfully proven in many countries such as the European Union, Canada, Sweden, the Netherlands, Denmark, Singapore, Finland, China, Japan... Therefore, Vietnam will draw many lessons from previous countries and then apply it appropriately to its economic and social situation.

Secondly, Vietnam is in the stage of perfecting the institution of a socialist-oriented market economy, so the transformation from the traditional economic model to the circular economy model will contribute to promoting more sustainable economy development.

Thirdly, Vietnam has been taking advantage of many advantages from the industrial revolution 4.0, implementing circular economy development associated with a high-tech platform, moving from the real world to the digital world. This will be a great opportunity to help improve the efficiency of economic growth compared to previous methods.

Fourthly, the pressure on environmental pollution, shortage of resources, large emissions, especially plastic waste will be significantly reduced when developing a circular economy model. In addition, Vietnam is implementing the United Nations' sustainable development goals, so developing a circular economy model will help reduce substances that cause greenhouse effects. This is the development method that helps Vietnam achieve many criteria on sustainable development goals by 2030 as in the spirit of Decision No. 889/QĐ-TTg.

Fifthly, developing a circular economy model will receive high support and consensus of the whole society. The reason is that this is a way of economic development to help solve the scarcity of resources, protect the environment to cope with climate change and bring about high economic efficiency in the direction of long-term development.

Challenges

The COVID-19 epidemic has not yet determined an exact end time, but the economy has begun to accelerate recovery along with many risks. Therefore, the transition to a circular economy is inevitable, but the challenges for Vietnam are huge:

First, currently, Vietnam does not have a specific legal framework for circular economy. In addition, a set of criteria to identify, evaluate and classify the level of development of the circular economy has not been developed. Therefore, this challenge must be overcome as soon as possible, otherwise the development of a circular economy model is just a spontaneous action and has not really been effective.

Second, change the perception of people and businesses about the model and value of the circular economy. It is really difficult to create a general consensus on the correct

perception of the nature of the circular economy from design to implementation in industries and fields, for people, businesses, and levels of state management. Meanwhile, realizing the true nature of the circular economy, starting from design to implementation in all industries and fields, requires the coordination of each individual, business and state management to create a chain of links operating smoothly in each stage. This depends greatly on the efforts of the people, the business community and the policies of the state.

Third, circular economy development must go hand in hand with innovation and application of modern technology. Meanwhile, Vietnam is a developing country, most of the technology is outdated, and production scale is fragmented and small. On the other hand, Vietnam does not have a team of experts who are good at designing, recycling and reusing. Human resources are one of the important links, providing creative and innovative solutions that play a key role in the success of the circular economy. Vietnam is lacking a lot of technology experts and experts related to economics, research on circular economy policy. Therefore, at present, Vietnam largely relies on links and grants from developed countries in this field such as Japan, the UK, France, Canada, China and a number of countries in the European Union.

Fourth, the capacity of reuse and recycling technology of Vietnamese enterprises is still limited. In addition, people's long-standing habits in production and consumption of disposable plastic and plastic products are very large and difficult to change in a short time. This is really a big challenge for Vietnam in the economic transition because the circular economy model requires the classification and cleaning of emissions before being recycled and reused.

4. Discussion and Conclusion

Given the opportunities and challenges that Vietnam is facing as analyzed, the article proposes some recommendations to promote the development of the circular economy in order to contribute to sustainable development in the coming time. the following number of solutions:

First, to institutionalize the circular economy through a system of laws, policies, and administrative procedures... to implement the circular economy in a systematic and synchronous manner. It is important that the forms of incentives, incentives in terms of mechanisms, finance, access to resources and clear and transparent sanctions are established from the very beginning. Along with that are policies to encourage and promote the business community to invest, develop the recycling industry, renewable energy, and promote the use of environmentally friendly products. Experience from a number of countries that have been implementing circular economy shows that in their countries there are clear laws and regulations on this issue.

Second, develop a roadmap to implement the circular economy from micro to macro. In which, businesses are the central driving force. The circular economy development roadmap also needs to be associated with financial mechanisms to achieve the set goals such as public-private cooperation mechanisms, green financial mechanisms, etc. From there, a reasonable roadmap is determined. The purpose is to gradually replace fuels and products from hazardous materials with single-use products with environmentally friendly fuels and materials, and products with repeated use.

Third, it is necessary to conduct in-depth and extensive research on circular economy development right from the initial approach to implementation with the model's criteria in order to create a general consensus from all levels of government to the community of businesses and citizens. It is necessary to strengthen communication to raise awareness of people and businesses about the circular economy in order to change production and consumption thinking in the direction of increasing the use of renewable energy and recyclable or fully reused products; enhance resource recovery from used products, prolonging product life by providing product upgrade, refresh and redesign services. At the same time, it is essential to strengthen cooperation in research and development to connect consumers through the form of shared consumption to improve the efficiency of product use. Thereby, it will mobilize the participation of the whole community in the development of a circular economy, in which the role of the state and enterprises is of utmost importance.

Fourth, building a circular economy should be based on high technology. This is one of the prerequisites for building a circular economy because only modern technology can bring about a zero-emission future and sustainable development for future generations. Therefore, Vietnam needs to have policies to support businesses and individuals to innovate in production with environmentally friendly products with high reusability. Currently, Vietnam has implemented waste separation at source and garbage after sorting must be collected, cleaned and transported before being put into recycling and reuse. Separation of waste at source has really become a mandatory requirement, a criterion to evaluate Vietnamese people's culture and will gradually change the perception of the whole society, which contributes to develop circular economy process. Furthermore, it is vital to continue to improve one more step towards the circular economy models that have been present in Vietnam in the past time. Especially plastic and nylon products must be thoroughly implemented and resolved in the nearest time in order to minimize emissions to the environment.

In conclusion, it is clear that the circular economy offers many opportunities in addition to challenges. To develop a circular economy in Vietnam, it is required that all sectors of society understand the nature and purpose of this economic model. Therefore, the state and relevant departments need to summarize and re-evaluate the existing development models for a number of fields and industries, which helps to learn from experience and serve as a basis for establishing suitable criteria for the circular economy model in the near future. In addition, the state also needs to take advantage of opportunities in this model and take measures to overcome challenges in the process of developing a circular economy.

Abstract

Nowadays, few people think that the aviation industry causes serious pollution to the environment. This is a rather "delicate" issue related to the convenience of human beings in the modern era. The aviation industry consumes up to 5 million barrels of fuel per day. The burning of fossil fuels now produces about 2.5% of all Carbon Dioxide (CO₂) emissions – this share is estimated to increase to 22% by the year 2050 as other sectors produce less CO₂ emissions. Anybody can fly now, and in the generation of low-cost airlines, the demand for air travel will increase sharply, along with the number of planes on the air will be double by 2035. There is currently no way to carry 8 millions people per day in the sky without burning oils. This study investigated whether Vietnamese are willing to pay for an increase in their travel cost to reduce the carbon emissions from their flight to minimize the environmental impact. Using the contingent valuation method (CVM) and a survey of 200 Vietnamese residents to gate the willingness to pay (WTP) for CO₂ offsets when traveling by airplane. The results reveal that WTP is 16.56 USD (equivalent to 331,200 VND) per person; income and education were found to have a significant relationship with WTP. Besides, the regression results also show that there are 4 factors affecting Vietnamese willingness to pay namely age, marital status, income and education, in which income and education have the greatest influence on the willingness to pay.

Keywords: *Contingent Valuation Method (CVM), Willingness to Pay (WTP), Carbon Dioxide Emissions, Ariline Carbon Offsets, The Aviation industry Emissions, Airtravel.*

1. Introduction

Climate change is the change of the climate system including the atmosphere, hydrosphere, biosphere, lithosphere, and ice in the present and in the future due to natural and man-made causes. However, the main cause of Earth's climate change is the increase in activities that generate greenhouse gas emissions, and the over-exploitation of sinks and reservoirs of greenhouse gases such as biomass, forests, marine ecosystems...

The World Meteorological Organization estimates that the Earth's temperature will increase by more than 1.5°C within the next 20 years, leading to floods, storms, droughts and more severe heat. Entering the beginning of 2022, it is forecast that the winter months of this year will be relatively hot, and extreme weather patterns will also remain regular on the warming globe. Vietnam is one of the most vulnerable countries to the impacts of climate change, which is shown in detail by natural disasters such as the increased number of heavy rains, heatwaves and floods in the last three years in the country. In spite of the fact that Vietnam is a country that is severely affected by climate change, it is also a country that contributes to an increased risk of extreme events globally. Carbon dioxide (CO₂) emissions here are the main cause of climate change and the transportation industry is the main source of carbon emissions.

In recent years, with the improvement of living standards, many people choose to travel by air, specifically by plane, instead of other road means such as cars and trains. Therefore, the use of airplanes to travel is becoming more and more popular. People nowadays travel using air transportation not only for business purpose but also for leisure purpose, and it is getting the increase from year to year. This also can relate to the cost of travel where the price offered is affordable for all level income. Thus, people chose to travel more using air transportation rather than driving or used any road transportation. According to the study of Mayor and Tol in 2010, "Increasing incomes and lower travel costs lead to a boom in air travel".

The main objective of this study is to quantify whether air travelers, as a polluter, endorse increases in cost of their travel to reduce the CO₂ emissions from their flights. More specifically, the objective aims to find the determinant for the willingness to pay (WTP) and quantify the value of WTP in reducing CO₂ emissions. The results can be used as a reference to help the aviation industry take more specific steps in reducing CO₂ emissions. The cost that each airline passenger is willing to pay for reducing CO₂ emissions will help the aviation industry have more budget to improve technology, research new techniques, towards using clean, alternative fuels (e.g. biofuels), which produce less CO₂ emissions.

According to Mehedi Masud et al. (2015), quantifying an individual's willingness to pay to reduce CO₂ emissions will help decision-makers to identify alternatives to encourage individuals to participate in reducing environmental pollution. Besides, this study hopes to help the aviation industry or policy makers to design effective financial tools to take measures to reduce CO₂. To achieve this goal, the research team conducted a survey in Vietnam. Survey participants are Vietnamese people who have traveled by air.

The rest of the paper is structured as follows. The next section presents information about the survey methodology and the last section concludes the paper.

2. Method

2.1. Contingent Valuation Method (CVM)

The Contingent Valuation Method is a method of estimating the value of environmental resources and services that have no market value. This method is called "random" assessment because it tries to get respondents to say how they would act if they

were placed in a hypothetical situation. The CVM is quite commonly used, directly asking interviewees whether they are willing to pay a certain amount for non-market goods (Bateman and Willis, 1999). This method is widely used in economic fields such as environmental economics, health economics, natural resource economics.

Some studies also use contingent valuation method (CVM) to quantify the monetary value of CO₂ offsets in the aviation sector. Brouwer, Brander and Van Beukering (2008) suggest that the average value of WTP among 400 passengers at Amsterdam Schiphol Airport in 2006 was €26,601 or RM132.76, as a CO₂ tax. His research also used double-limited CVM questions. Lu and Shon (2012) interviewed 1339 international Taiwanese tourists using a double-limited CVM questionnaire. Depending on the destination of different flights, the average value of WTP per ton of CO₂ emissions is different, which is clearly shown in this study.

2.2. Sampling technique and data collection method

The survey was conducted from February to March 2022. All participants in this survey were Vietnamese citizens and the target respondents of the study were employed people filtered from the list. The questionnaires were distributed and information was collected through face-to-face interviews as well as telephone interviews or online questionnaires.

According to Hair et al. (2006), the sample size is determined based on: (i) the minimum level and (ii) the number of variables included in the model's analysis, with the minimum level (Min) = 50. Ratio of observations relative to an analytic variable (k) can be 5/1 or 10/1. If $n < \frac{k}{\text{Min}}$ the minimum is calculated, the minimum level of the study to be selected is 50 observations.

This study is oriented to build a model with 9 variables, including 1 dependent variable (WTP) and 8 independent variables (described in detail in the following section), so when choosing the ratio $k = 10/1$, the minimum of sample size would be $10 \times 9 = 90$ observations.

Due to limited resources, the research team plans to collect 100 observations for each study subject who are employed and currently attending at university/college. Thus, the total number of observations of the study was 200 observations.

Out of a total of 300 questionnaires distributed, 282 responses were obtained, of which 82 were not accepted due to unsatisfactory requirements. Therefore, only 200 questionnaires were used, in which, 106 answers came from the employed and 94 answers came from people going to university/college. Basic information about the survey sample is shown in Table 1.

Table 1. Sampling method, capacity and some characteristics of the sample

Order	Classification criteria	Unit	Frequency		Percentage (%)	
			Employed	Students	Employed	Students
	Total number of respondents	people	106	94	51.5	48.5
1	Gender				100	100
	- Male	people	53	50	50.00	53.19

Source: Summary of the authors' survey data, 2022

Primary data used in this study was collected by non-probability sampling method, in which, the choice of sample depends on the characteristics of the population and the needs of the survey. There are sampling techniques used, including Convenience sampling; Quota sampling and Snowball sampling.

Convenience sampling is a way of selecting elements that are accessible to the researcher, taking the full number of observations according to the sample size required by the research. Besides, Quota sampling is a way of dividing the research sample size with a certain ratio, applying a convenient sampling technique for the necessary number of observations. In this study, the authors divide the sample into two research subjects who are working and studying to apply convenient sampling technique until there are enough observations. In addition, snowball sampling is a way of selecting a number of known elements, and then asking their opinions through these people to introduce other elements to the research sample.

In this study, interviewees were asked to respond to three bound price scenarios, the questionnaire included prices for five scenarios (Figure 1). The starting value of 10\$ (approximately 200,000 VND) was established by the average value of the first 15 survey respondents. The price increase or decrease is calculated at 50% of the starting price (\$ 5 equivalent to about 100,000 VND).

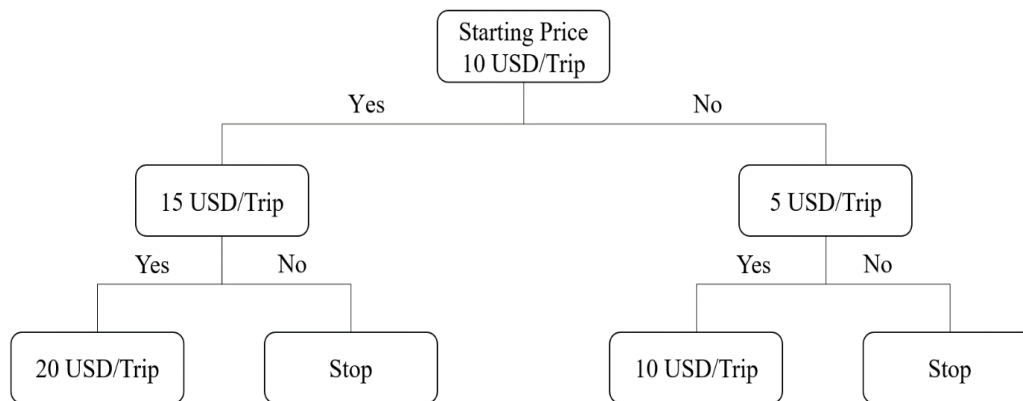

Figure 1. Interview scenarios for willingness to pay

Source: Synthesized from the authors' research, 2022

2.3. Data analysis methods and Model Framework

After collecting, the data is processed through SPSS and EXCEL software. During the analysis of the data, the contingent valuation method (CVM) was used to estimate their willingness to pay for their own air travel carbon offsets. Descriptive statistical methods are also used to analyze people's understanding and views on air pollution as well as carbon offsets when traveling by air.

For this research topic, the authors use Binary Logistic model to analyze the influence of each factor on people's willingness to pay for carbon offsetting and provide recommendations and solutions.

This is a common model in studies used to estimate the probability that an event will occur. The feature of binary regression is that the dependent variable has only two values: 0 and 1. Different from the multivariable regression model, the research team will estimate the probability that survey participants are willing to pay with the dependent variable, belongs to WTP. Specifically:

- With $WTP = 0$, it means that survey participants are not willing to pay for CO₂ offset when traveling by plane.

- With $WTP = 1$, it makes sense that survey respondents are willing to pay for CO₂ offset when traveling by plane.

The probability function applied in the study:

$$P_i = P(WTP = 1) = E\left(WTP = \frac{1}{X}\right) = \frac{e^{(\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_n X_n)}}{1 + e^{(\beta_0 + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_n X_n)}}$$

In which, $P_i = P(WTP = 1) = E\left(WTP = \frac{1}{X}\right)$ is the probability that survey respondents are willing to pay for CO₂ offsetting.

After transformation, we have the Binary Logistic regression equation as follows:

$$\log_e \left[\frac{P_i}{1 - P_i} \right] = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_n X_n$$

The variables included in the study are described in detail in Table 2 below.

Table 2. Expected variables in the model

Variables	Sign	Expected Sign	Explanation	Base on
Dependent Variable	WTP		The willingness to pay for reducing carbon emissions when traveling by plane	
Travel costs	Price	-	Travel costs are expected to have a negative impact because of the increase in fares, air travelers will not be willing to pay as this will reduce their income.	Abdul Rahim and Nur Fatihah Shaari (2017)
Gender of respondents	Gen	+	Females will pay more for carbon offset and are more sensitive towards environment compared to male because female will be more worried about their children future and environment. The expected sign for this variable is positive. (1-male; 2-female)	Abdul Rahim and Nur Fatihah Shaari (2017)
Age of respondents	Age	+	As people are getting older, they will pay more for carbon offset, which they are more concern and aware about the importance to take care of the environment for today and future generation. Thus, the expected sign will be positive.	Fatihah and Rahim (2017)
Marital status	Sta	+	Married people will have a higher willingness to pay because they consider about their family and children in the future. The expected sign for this variable is positive. (0-Single, 1-Married)	Abdul Rahim and Nur Fatihah Shaari (2017)
Income of respondents	Inc	+	As the income of passengers increases, they are willing to pay more because they might have a higher level of education and holds a high position in a job, thus making them feel more responsible towards the environment. Thus, the expected sign for income variable is positive.	Choi (2015); Fatihah and Rahim (2017)
Literacy of respondents	Edu	+	A person with a high level of education are more aware and responsible towards the environment and they are willing to pay for extra money to take care of the environment. The expected sign is positive. (1-University and below, 2-Postgraduate degree)	Jou and Chen (2015); Choi and Ritchie (2014)

Variables	Sign	Expected Sign	Explanation	Base on
Number of flights/year	Fly	+	The larger the number of flights per year, the higher the willingness to pay, because people who move a lot will feel they need to take more responsibility for offsetting CO2. The expected sign for this variable is positive.	Araghi et al.(2016);Jou and Chen (2015)
Purpose of trip	Pur	+	Passengers whose purpose of flight is to travel will have a higher willingness to pay than passengers who fly for business or other purposes. The expected sign for this variable is positive. (1-Business, 2-Travel, 3-Other one)	Lucia Rotaris and Marco Giansoldati (2019)

3. Results

3.1. Rate of interest

In the survey, interviewers raised an issue related to air pollution around the area where the participants lived, so that they ranked the most serious emission source. The ranking results of these subjects are listed in Table 3. Thereby, we have an overview of their level of interest in emission sources, which they consider to be the main causes.

Table 3. Ranking of respondents' interest in air pollution issues

Problem	Choosing which is the most serious problem	
	Number of people selected/issue	Percentage/issue
Air pollution due to smog from road traffic	95	47.50%
Air pollution due to construction activities	45	22.50%
Air pollution from factories	99	49.50%
Air pollution due to agricultural production	14	7.00%
Air pollution due to changing seasons	14	7.00%
Air pollution due to daily routine	37	18.50%
Air pollution is caused by airplanes releasing exhaust gases directly into the atmosphere	24	12.00%
Total number of observations per issue	200	100%

Source: Synthesized from the authors' research, 2022

The data shows that up to 49.50% of survey respondents believe that air pollution is caused by manufacturing plants, followed by dust from road traffic (47.50%). Air pollution from construction activities also accounts for a relatively high proportion with 22.50%,

equivalent to 99/200 survey respondents. The difference in proportion between the most serious cause of air pollution from road traffic dust and that from manufacturing plants is not as high as 2%. This is relatively consistent with the actual situation in a developing country like Vietnam.

In the process of industrialization and modernization, industrial growth is inevitable, for that reason, the number of manufacturing factories have rocketed in recent years. On the other hand, the problem of road traffic is always a Gordian knot for Vietnam, with the number of motorbikes and cars accounting for a much larger proportion than environmental friendly vehicles. Therefore, it is inevitable that survey participants evaluate these emission sources as having the most serious impact on the air environment.

However, from the demonstrated table, we can see that the number of survey respondents who think that air pollution from emission sources is aircraft accounts for a low proportion with only 12%, equivalent to 24/200 research subjects. This proves that people do not recognize how serious the emissions from airline account for.

Only 7% of people surveyed said that air pollution is caused by agricultural production and the same portion said that air pollution is happened by natural causes. This is quite reasonable because they are seasonal activities, appearing only at certain times of the year, so not many people show interested. Agricultural production, such as burning straw, takes place only in rural areas, so if the respondents were in the city, this risk would be underestimated. Similar to seasonal changes that prevent air circulation from low to high, causing the rising of dust concentration, it only occurs at certain times, especially at the change of seasons in the North of Vietnam. The level of concern about this issue is also low.

3.2. The attitudes and views of respondents on current air quality

3.2.1. The satisfaction current air quality

Figure 2 depicts the satisfaction level of the respondents about the air quality in the places that they live and work.

Figure 2. Satisfaction with air quality of respondents

Source: Synthesized from the authors' research, 2022

Research shows that 16% of survey participants are very dissatisfied with the air quality in the living area; 34.5% replied that they were not satisfied. This ratio clearly reflects people's views on the fact that the air is becoming increasingly polluted, endangering the health of the interviewees as well as their family members.

The percentage of people who accept with the current quality of drinking water is at an average level, accounting for 30%. But few respondents were very satisfied (only 8 survey respondents answered very satisfied, accounting for 4%). The results of this survey show that the current air quality is really concerned, and there is a need for mechanisms to reduce environmental pollution, especially the air environment.

3.2.2. Perspectives on how air quality affects family health

Figure 3. Perspectives on the influence of air quality

Source: Synthesized from the authors' research, 2022

A relative number of interviewees said that air quality has a great influence on health, accounting for 32.5%; along with 35.5% saying it has an influence. There are few respondents that air quality does not affect their family's health (only 6.5%) and only very few people think that air quality has no effect on their family's health (only 3 people) people and accounted for 1.5%. This shows that people have a certain understanding of the role of air quality in particular and environmental quality in general, and at the same time have a high awareness of the dangers of poor air quality seriously declining.

This is an inevitable result, because with information technology, people are better informed and know more about the increasing pollution and the importance of better preserving the environment.

3.3. Respondents' understanding of air pollution and carbon offsets

Out of 200 survey samples with 106 working people and 94 studying people participating in the survey, up to 68.5% of the survey respondents received propaganda information corresponding to 137 people. The remaining 63 participants did not receive propaganda information, accounting for 31.5% of the total survey respondents.

Figure 4. Actual situation of receiving propaganda information on emission reduction

Source: Synthesized from the authors' research, 2022

For survey respondents who have occupation, there are 77 people receiving enhanced information on reducing emissions into the environment, but the number of people who did not receive this information accounted for nearly 50%. These figures reflect the reality of this subject in a relatively realistic way. In terms of knowledge, these subjects have undergone the same period of knowledge acquisition as school subjects, and now they spend more time at work, so the problem of receiving this high of information will be limited.

For those attending school who participated in the survey, 66 people received propaganda information and the remaining 28 people did not receive information, accounting for about 30% of the total 94 respondents. This situation shows that young people, especially students, pay much attention to air pollution issues. This reflects the current situation in Vietnam, where students have more free time to receive information than working people, which is reflected in their active participation on social networking sites and television. ...At the same time, at this student's school, many volunteer activities related to environmental protection will be organized to raise awareness and the spirit of preserving the green environment for the young generation.

Table 4. Sources for receiving propaganda information on reducing air pollution

Sources	Employed		Students	
	Frequency	%	Frequency	%
Television	67	94.37	59	89.39
Books and newspapers	43	60.56	34	51.52
Communal Radio station	67	94.37	59	89.39
Mass organization	19	26.76	24	36.36
Friends, neighbors	22	30.99	19	28.79
Voluntary	26	36.62	32	48.48
Other (Social Media...)	2	2.82	10	15.15

Source: Synthesized from the authors' research, 2022

The table above shows that the survey respondents mainly receive propaganda information from television and radio. The number of people receiving information from television and radio stations of school and employed people is similar. For employed people, 67 respondents receive information from television and radio, accounting for 94.37% of the total number of people who receive propaganda information, in contrast, 59 students receive information from these sources, accounting for 89.39 %. The remaining receiving sources also account for a relatively high number such as books and newspapers; propaganda, volunteers. These sources are reliable, so the quality of information will be guaranteed, people will focus on receiving information from this source.

Besides, other sources such as social networks or from friends and neighbors with a low trust level which publish a lot of false information would lower individuals' capability of receiving information. However, according to the table, young people and individuals who are going to school that prefer information from these sources account for a higher percentage than employed people (10/28 accounting for 15.15%). This fact is easy to understand, because students are using social networks more often, the level of information filtering of these individuals is not as guaranteed as those of employed people. Therefore, the number of people going to school receiving information from this source is higher than that of employed people.

Table 5. Evaluating the effectiveness of information communicators

Propaganda effective influencers	Voters	Percentage (%)
Responsible authorities figures	56	40.88
Women Union and National United Front Figures	8	5.84
Youth Union	14	10.22
Reputable figures	28	20.44
Influencers/KOLs	32	22.63

Source: Synthesized from the authors' research, 2022

According to the assessment of the people participating in the survey, 40.88% of the respondents think that the local leaders will be the most effective propagandists on reducing air pollution. A rather large proportion in the survey sample corresponding to 56 people selected. Next, 22.63% of survey respondents think that celebrities are also effective propaganda objects. This situation is because, in the current technologically advanced age, the influence of Influencers or KOLs has a great impact on those receiving information, especially young people.

3.4. Analysis of willingness to pay and influencing factors

3.4.1. Statistics of survey respondents' willingness to pay

The percentage of survey participants willing to pay to offset CO2 emissions when traveling by plane is 200/300 survey samples, accounting for 66.67%, which is a relatively

high rate. The survey team conducted a survey of people with prices of \$20 equivalent to 400,000VND/flight, \$15 equivalent to 300,000VND/flight, \$10 equivalent to 200,000VND/flight and \$5 equivalent to 100,000VND/flight.

Table 6. WTP statistics for CO2 offsets when traveling by civil aircraft of the employed

Price (VND/flight)	Number of surveys collected	The answer to the question of WTP			
		Willing		Not willing	
		Frequency	%	Frequency	%
100,000	106	12	11.32	94	88.68
200,000	106	17	16.04	89	83.96
300,000	106	3	2.83	103	97.17
400,000	106	74	69.81	32	30.19

Source: Synthesized from the authors' research, 2022

From the data table we can see that, in general, the number of people willing to pay at the price of 400,000 VND/flight is the highest, followed by the level of 200,000 VND/flight, the lowest is the price of 300,000 VND/flight, accounting for only billion rate 2.83%.

With the price of 400,000 VND/flight, the number of people willing to pay reached the highest rate, accounting for 69.81%, the remaining 32 people who were not willing to pay will be asked again with decreasing prices.

Similarly, when the minimum price is 100,000 VND/flight, the number of people willing to pay has decreased to only 12 people working and 94 people unwilling to pay this price. This means that these individuals are still willing to pay but their payment level is less than 100,000 VND/flight, they think that the price will be more suitable for their income.

Table 7. WTP statistics for CO2 offsets when traveling by civil aircraft of student

Price (VND/flight)	Number of surveys collected	The answer to the question of WTP			
		Willing		Not willing	
		Frequency	%	Frequency	%
100,000	94	15	15.96	79	84.04
200,000	94	20	21.28	74	78.72
300,000	94	8	8.51	86	91.49
400,000	94	46	48.94	78	82.98

Source: Synthesized from the authors' research, 2022

Out of 200 satisfactory survey samples, 94 participants are attending school. The proportion of students participating in the survey accounted for 33.34%. These individuals,

mostly possess unstable income, are still dependent on their family or have low income, so the WTP of them is invisible and has no statistical significance. This individual's decisions are based on a sense of responsibility to the community, for the purpose of protecting the environment according to the awareness and concern of these individuals to the issue of CO₂ offset when traveling by plane.

Table 8. Reasons for willingness to pay for CO₂ offsets when traveling by air

Reasons	Frequency	Percentage (%)
The air is now heavily polluted, affecting the health of me and my family.	119	86.86
I believe I am not responsible for paying extra to reduce carbon emissions from aircraft.	73	53.28
I wish that the next generation can breathe fresh air.	114	83.21
I think this price is reasonable for each of my flights to reduce carbon emissions.	85	62.04
I believe the extra payments will effectively fund the Government's carbon reduction programmes.	67	48.91
I believe that the environmental protection tax is too low to effectively fund the current carbon reduction programs.	42	30.66
I believe that reducing carbon emissions from aircraft is essential.	80	58.39
Other reason	2	1.46

Source: Synthesized from the authors' research, 2022

In the study, a total of 200 people were willing to pay for CO₂ offsets when traveling by air. The main reason that people are willing to pay is mainly because "The current air is heavily polluted, affecting the health of me and my family" with 119 people choosing, accounting for 86.86% of the total number of people willing to pay. With the same number as the above reason, the surveyor who wants the next generation to be able to breathe fresh air also accounts for a high proportion with 83.21%, equivalent to 114 answers.

The remaining reasons also account for a relative proportion, specifically: I believe that I should be responsible for paying more for reducing carbon emissions from aircraft (53.28%); I think this price is reasonable for each of my flights to reduce carbon emissions

(62.04%); I believe the extra payment will effectively fund the Government's carbon reduction programs (48.91%); I believe that the environmental protection tax is too low to effectively fund the current carbon emission reduction programs (30.66%); I believe that reducing carbon emissions from aircraft is essential (58.39%).

Table 9. Reasons for unwillingness to pay more for CO₂ offsets when traveling by air

Reasons	Frequency	Percentage (%)
My income is not enough to pay for the above expenses.	3	33.33
I am satisfied with the current air quality.	1	11.11
I believe that saving money for the future is more important.	3	33.33
I don't think it's my responsibility to reduce carbon emissions from planes, it's the responsibility of the airlines and the Government.	5	55.56
I think the above cost is too expensive and will incur more costs in family living.	1	11.11
I don't think paying the extra money will contribute to reducing carbon emissions and increasing existing air quality.	7	77.78
I believe this cost is already included in the current airfare.	6	66.67
Other reason	0	0.00

Reason for unwillingness to pay higher: This reason is for survey participants who are willing to pay for CO₂ offsetting, but their willingness to pay is less than 100,000 VND/flight (does not accept all the price set by the authors).

Source: Synthesized from the authors' research, 2022

Table 9 lists the reasons that respondents to this survey are not willing to pay at the level suggested by the research team based on the contingent valuation method (CVM). In general, the number of survey participants who did not pay at the prices offered by the survey was relatively small, about 9 out of 200 participants.

In which, 7/9 individuals said: I do not think that paying more will contribute to reducing carbon emissions and increasing current air quality, which is the reason why they do not pay at the stated price with 77.78%.

3.4.2. Analysis of willingness to pay and influencing factors

Test the fit of the variables in the model, the results are described in the following table:

Table 10. Omnibus test of Model Coefficients for the employed

Omnibus Tests of Model Coefficients

		Chi-square	df	Sig.
Step 1	Step	64.866	8	.000
	Block	64.866	8	.000
	Model	64.866	8	.000

Source: Research result, 2022

The Omnibus Tests of Model Coefficients table gives us the results of the Chi-square test to evaluate the hypothesis of appropriateness of the regression model. The sig value of Chi-square test in the Model row is $0.000 < 0.05$, so the regression model is suitable.

The Model Summary table gives the model fit results. The value of -2LL for the empty model is 144,789, while the -2LL for the last proposed model is 79,923. This shows that the independent variables included in the model have significantly reduced -2LL compared with the empty model. Therefore, the regression model is suitable.

The Cox & Snell R Square and Nagelkerke R Square values are both quite good, in which the Nagelkerke R Square value of 0.616 is relatively high. Thus, it can be concluded that the regression model has a rather high fit.

Classification Table for classification results of Observed and Predicted cases.

- In 48 observed cases of unwillingness to pay, 41 cases of non-payment are predicted, the correct prediction rate is $41/48 = 85.4\%$.

- In 57 actual cases of willingness to pay, 49 cases of willingness to pay are predicted, the correct prediction rate is $49/57 = 86.0\%$.

Thus, the average willingness-to-pay ratio for the whole model is $(85.4 + 86.0)/2 = 85.7\%$.

The Omnibus Tests of Model Coefficients table gives us the results of the Chi-square test to evaluate the hypothesis of appropriateness of the regression model. The sig value of the Chi-square test in the Model row is $0.489 > 0.05$, so the regression model is not suitable.

The Model Summary table for Cox & Snell R Square and Nagelkerke R Square values are both very small, with a Cox & Snell R Square value of just 0.056 and a Nagelkerke R Square value of just 0.109. Thus, it can be concluded that the regression model is not suitable.

3.4.3. Regression results

Table 11. Description of WTP of the employed

Criteria	Observations	Average	Standard deviation	Minimum	Maximum
WTP	106	16.56	0.53772	5	20

(Source: Synthesized from the authors' research, 2022)

Therefore, **meanWTP = 16,56 USD x 20.000d = 331.200 VND**

Regression model includes explanatory variables: price, gender, education level, income, number of family members.

We have the following regression model results:

Table 12. Results of the regression model of the employed Variables in the Equation

		B	S.E.	Wald	df	Sig.	Exp(B)

	Pur	-.213	.577	.136	1	.712	.808
	Constant	-6.969	2.295	9.223	1	.002	.001

a. Variable(s) entered on step 1: Gen, Sta, Inc, Edu, Fly, Age, Price, Pur.

(Source: Research result, 2022)

The results of the Binary Logistic regression model with the variables selected above, we can estimate the general model:

$$WTP = \log_e\left(\frac{WTP_i}{1 - WTP_i}\right) = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \dots + \beta_n X_n$$

As a result, we have the model:

$$WTP = \log_e\left(\frac{WTP_i}{1 - WTP_i}\right) = -6,969 - 0,107 \text{ Age} + 1,757 \text{ Sta} + 1,607 \text{ Inc} + 1,947 \text{ Edu}$$

The probability level of willingness to pay:

$$P_{(WTP)} = E(Y=1/X) = \frac{e^{(-0,107 \text{ Age} + 1,757 \text{ Sta} + 1,607 \text{ Inc} + 1,947 \text{ Edu})}}{1 + e^{(-0,107 \text{ Age} + 1,757 \text{ Sta} + 1,607 \text{ Inc} + 1,947 \text{ Edu})}}$$

*** Interpretation of the results in the regression model:**

Regression results show that there are 4 statistically significant variables, which are marital status, age, income and education:

Age: Sig. = 0.059 < 10%, so the price variable is statistically significant at the 10% level, showing that the age of the respondents has an effect on the willingness to pay (as expected). The slope coefficient $\beta = -0.107$ has a negative sign, showing that price has a negative effect on willingness to pay, that is, the older the age, the lower the willingness to pay. This can be explained by the fact that the elderly have rich life experiences by going through hard time, so they have more rigor in spending compared to the young, who have a more generous spending. The value $\text{Exp}(B) = 0.899$ is significant, it means if increasing by 1 year, the willingness to pay will decrease by 0.899 times.

Marital status: Sig. = 0.095 < 10%, showing that the marital status variable affects the willingness to pay for carbon offsets when traveling by plane. The slope coefficient $\beta = 1.757$ shows that the marital status variable has a positive influence on the willingness to pay, which means that married people will tend to be more willing to pay. The value $\text{Exp}(B)$

= 5.794 indicates that if marital status changes (from unmarried to married), the willingness to pay increases by 5.794 times.

Income: Sig value. = 0.000 < 10%, this indicates that the income variable has an effect on the respondents' willingness to pay (as expected). The coefficient $\beta = 1.607$ means that income has a positive effect on people's willingness to pay, from the coefficient β_3 indicating that the higher the income, the higher the probability that the surveyed people are willing to pay. The value $\text{Exp}(B) = 4,986$ explains that if income increases by 1 step, the willingness to pay increases 4.986 times.

Education: Sig. = 0.005 < 10%, so the education given in the questionnaire has an impact on the respondents' willingness to pay as expected. The slope coefficient $\beta = 1.974$ this shows that education has a positive influence on willingness to pay, that is, the higher the education, the higher the probability that the surveyed people are willing to pay and vice versa. The value $\text{Exp}(B) = 7.010$ explains that if education increases, the willingness to pay also increases by 7.010 times.

The remaining variables are Gender variable, Price variable, Flight Number variable and Intent variable are not statistically significant because of Sig value. > 10%. This is different from the initial expectations of the survey. These variables are not statistically significant, implying that with different genders, different prices, different number of flights and different purposes of travel, people are still willing to pay the same. It is initially expected that an increase in fares will cause a decrease in willingness to pay, or by gender there is an expectation that women will be more willing to pay than men, an increase in the number of flights will increase willingness to pay. or Purpose of travel will have a higher willingness to pay. However, in the research sample, there was an equality in gender between men and women participating in the survey, showing that gender is not related to the level of concern about people's living environment. And because the survey targets a relatively high-educated population (from college/university or higher), the respondents' awareness of environmental issues will also be better, so the demographic variables This study has no impact on willingness to pay.

Table 13. Results of the regression model of the students
Variables in the Equation

		B	S.E.	Wald	df	Sig.	Exp(B)
Step 1 ^a	Gen	1.008	.762	1.749	1	.186	2.741
	Sta	18.582	40192.942	.000	1	1.000	117478077.89
	Inc	.075	.582	.017	1	.897	1.078
	Edu	-.066	.218	.092	1	.762	.936

	Age	-.204	.957	.045	1	.831	.816
	Price	-19.401	40192.942	.000	1	1.000	.000
	Pur	1.008	.762	1.749	1	.186	2.741
	Constant	18.582	40192.942	.000	1	1.000	117478077.89

a. Variable(s) entered on step 1: Gen, Sta, Inc, Edu, Fly, Age, Price, Pur.

Source: Research result, 2022

Table 13 shows that the variables included in the model of students are not statistically significant. This can be explained by students who are still surrounded by their families, do not have much life experience.

The fact that the students surveyed are willing to pay and have awareness about environmental protection is because they have access to the mass media and listen to propaganda about the seriousness of climate change. as well as measures to protect the environment.

Students do not have financial autonomy, are completely dependent or partially dependent on their family, so financial decisions have not been properly considered, leading to many students taking surveys despite using very few aircraft, dependent income but very high willingness to pay.

4. Discussion and Conclusion

The research topic shows that although Vietnamese people have not received much propaganda about offsetting carbon generated by air travel, they are aware of the important role of environmental protection. The environment, especially the air, is now more polluted than ever, especially pollution from vehicles as well as pollution from construction activities.

Most people are dissatisfied and distrustful of the current air quality, and they are of the opinion that air quality affects the health of themselves and their families. Through the research topic, if there is a program to offset aviation carbon generated by flying, many people will support it. Besides, the average price that people are willing to pay is also relatively at 331,200 VND/flight.

According to the model results, the marital status, age, income and education are the factors affecting the willingness to pay of the respondents, which are shown specifically as follows: Married people will have the ability to pay. the higher their willingness to pay; As age increases, willingness to pay for CO₂ offsets decreases; The higher the income, the greater the willingness to pay for the CO₂ offset; The higher the level of education, the greater the willingness to pay for CO₂ offsets.

In which, the influence of Education and Income has the greatest influence on people's willingness to pay for the cost of offsetting CO₂ when traveling by plane. Therefore, it is necessary to have special solutions to improve the education level, people's awareness about environmental protection and CO₂ offsetting policies in the future. What needs to be done is to raise the awareness of staff, passengers and children - the future "preschools" of the nation. In addition, it is necessary to further promote propaganda policies to raise people's sense of responsibility in paying polluters, along with measures to protect the environment, especially the air environment. gas. In the era of digitalization and the rise of social networks, propaganda needs to be deployed in a diverse, in-depth, multi-platform, helping to better reach all people, especially exploiting idol psychology. to have special promotion campaigns from famous young singers, idols, KOLs on social networks, to help optimize campaign effectiveness.

In addition, the Government should pay more attention to people's living standards, stabilize the macro-economy, and improve the purchasing power of the economy. When life is improved, real income increases, people will feel more responsible for preserving the environment for future generations.

Abstract

The development of solar energy in Ninh Thuan province is considered a breakthrough solution on the basis of utilizing value of resources toward development of green economy, forming motivation for territory development; and increasing job opportunities, converting job for Ninh Thuan residences. However, this is new sector and Ninh Thuan has limited resources, especially quality of human resource so Ninh Thuan has not been utilized job opportunities. Therefore, in order to improve access to job opportunities, Ninh Thuan must have comprehensive development policies, diversifying types of industrial development along the product value chain, combined with develop human resources proactively, in accordance with local capacity.

Keywords: *Job, Renewable energy, Solar energy, Ninh Thuan*

1. Introduction

Solar energy is a process converting sunlight into electrical energy; is encouraged to develop in order to reduce greenhouse gas towards a long-term carbon-neutralized economy through limiting fossil fuel.

Ninh Thuan's great advantages in developing solar energy, combined with the effectiveness of investment-attracting policy has opened up development opportunities for different economic branches; including the opportunity to change jobs. Nevertheless, renewable energy in general and solar energy in particular is a new branch, causing unsynchronized response from local resources, leading to challenges in development process, especially in taking advantage of the opportunity to change jobs.

This study focuses on clarifying content in development of solar energy as well as jobs associated with solar energy; hence, proposing solutions to improve jobs associated with solar energy in Ninh Thuan province, based on results of synthesizing, analyzing and investigating sociological in December, 2021 with 2 subjects: (i) Group discussion conducted at levels of administration department: province level at Department of Industry and Trade, Department of Resource and Environment; commune level at People's Committee in Bac Phong commune, Thuan Bac district in order to collect general data on

policies, progresses and results of energy-development policy; (ii) Questionnaire interview with 100 families randomly chosen in Bac Phong commune, Thuan Bac district.

2. Method

This study based on results of synthesis, analysis and sociological investigation in December, 2021 in Ninh Thuan with 02 methods: (i) Group discussion implemented at Department of Industry and Trade, Department of Natural Resources and Environment and Bac Phong Commune People's Committee; (ii) Questionnaire interview with 100 households at Bac Phong Commune People's Committee, Thuan Bac district.

3. Results

3.1. Development of solar energy in Ninh Thuan province

Ninh Thuan is a coastal province in South Central Coast, located deep in tropical region of Northern hemisphere with the highest annual number of sunny hours all across the country; on average is 2,837 hours per year, dry seasons is 230 sunny hours per month, which is about 9 hours per day. High number of sunny hours, lasting during day with radiation intensity 4.4 – 5.7 kWh/m²/day; in which, potential of electricity generation is 3.3 – 4.4 kWh/kWp/day, the highest across the country, distributed equally between locals in the province [4,17,18].

On the basis of effectively manipulating strategies, orientations in national energy development and advantages of radiation and thermal resources, especially after the Government agreement of Ninh Thuan development policy to the national centre of renewable energy, taking advantage of electricity-price policy according to Decision no.11/2017/QĐ-TTg on April 4th 2017, Decision no.13/2020/QĐ-TTg on April 6th 2020 of the Prime Minister about solar-energy electricity projects and peculiarity policy mechanism assisting the province in developing socio-economy according to Resolution no.115/NQ-CP on August 31st 2018 [1,10]. Ninh Thuan has actively deployed construction, promulgated break-through policies in order to turn potential to competitive advantage; step by step creating national centre of renewable energy [7,11]. With solar-energy electricity, chosen investors must obey several requirements; including priority to investors who are large-scale, socio-economically effective and have policy assisting in local social security work, training commitment and labor use [16].

Result in 2021, the whole province had 35 solar-energy electricity projects, accounting for 78.6% of total capacity and 71.9% of renewable-energy investment capital, equal to 65,701.9 billion VND. Solar-energy electricity plants were located in 6 districts; majorly in Thuan Nam, Thuan Bac and Ninh Phuoc district with capacity and investment capital making up more than 85%; particularly, Thuan Nam district accounted for 51.4% of capacity, roughly 50% of investment capital; following was Thuan Bac district with 20% of capacity and investment capital. In 2022 is expected to have 6 more projects with 646MW, accounting for 53% of total renewable-energy electricity in national grid [5,9]. Simultaneously, the province has actively removed “bottlenecks” in terms of clearing capacity of above-mentioned energy projects basing on mobilization of budget capital and private economic sector in order to improve the infrastructure of synchronized electricity

transmission, integrate wind-energy and solar-energy electricity in national electricity grid according to Resolution 115, until late 2020 had basically solved reducing generation of energy projects in the province.

Table 1. Overview of solar-energy development according to district boundary

No.	District	Quantity	Capacity on demand COD (MW)	Investment capital (billion VND)
1	Ninh Hai	1	28	854.10
2	Bac Ai	1	40	1,291.70
3	Ninh Phuoc	10	348,01	10,268.70
4	Ninh Son	4	264	7,540.00
5	Thuan Bac	4	484	13,034.40
6	Thuan Nam	15	1228.8	32.713.00
	Sum:	35	2392.81	65701.9

Source: [12]

Solar-energy projects have become important source of electricity generation, in time supplemented the load demand of local and flown into national electricity grid, contributing to ensure energy security, decrease greenhouse gas amount, especially, enhance advantages for local economy, create job opportunities and change jobs for labor force. On calculation, the market share of renewable-energy projects accounts for one-third of total budget revenue in 2021-2025 period, solar energy particularly is 79%, equal to more than 3.8 trillion VND per year; in which, the year 2022 is predicted to achieve the highest contribution with roughly 40%. Those electricity plants having enormous contribution, making up of nearly 40% of total revenue, are: solar-energy electricity plant BIM (14%), solar-energy electricity plant Trung Nam (12.4%) and solar-energy electricity plant Xuan Thien (8.5%); On average every MW of solar-energy electricity will create 0.32 billion VND for local budget [5].

Although, developing solar energy has achieved remarkable outcomes, contributing to support production and people's life; nevertheless, there still are challenges affecting on the progress of turning advantages of solar energy into one of local motivational development solutions. As follows:

On the mechanism, policy: Energy-development policy has not associated with relevant ones, which results to unsynchronized investment attraction, not having long-term solutions ensuring effectiveness for investors, especially private economy participating in renewable-energy market and taking part in constructing the system of electricity transmission. Work of planning and predictions have been unsynchronized, inappropriate with practice; therefore, impact on the effectiveness of investment; which appears clearly in the practice of developing electricity source with electricity grid system and human resource' ability. There has not yet stable price mechanism, dependent on the State leading to limits on policy effectiveness.

On the infrastructure of electricity grid: remaining limits, resulting to grid jams; major reason is that the construction progress of electricity-transmission projects, capacity release have not kept pace with the construction progress of solar-energy plants; accordingly, transmission system took 36 months with lines, 110kV station; 60 months with lines and 500kV station; whereas finishing construction of energy plant only took roughly 12 months.

On the human resource: remaining limits, quality of the human resource has not caught up with the development requirement; training work has not met demand, in province only Ninh Thuan Vocational College is the high-quality labor training facility in fields of mechanics, technology, economy and service with target of relevant professional training is 765 people per year, whereas the demand is up to 40 thousand [18].

3.2. Job opportunities associated with the development of solar energy

Job opportunities associated with the development of solar energy increase with the diversification of energy-development supply chain. Comparing to fossil fuel industry branches that have already been mechanized and required large amount of capital, renewable energy industry branches use more labors to generate same electricity unit. Until 2020, Vietnam has been one of 5 nations with large number of jobs in solar photovoltaic field, about 126,300 jobs in total in 2020; in which, 99.7 thousand of jobs are in rooftop solar energy field; centralized in manufacture and installation components in supply chain with approximately 25 thousand jobs, the rest work in operation and maintenance components. Vietnam is assessed as a nation with increased job demands in the field because more solar-electricity projects will be exploited in near future [6,8].

Target of increasing renewable energy market 10% in electricity planning will create opportunity for more than 315 thousand of jobs per year; about 25% of which will be for skilled labor. In which, solar energy accounts for 87.4% total jobs created nationally, in Ninh Thuan particularly there will be up to 36 thousand jobs, equal to 3,402MW of electricity generated from solar energy.

Table 2. Estimation of direct jobs created until 2025

No.	Territory	Amount of generated electricity (MW)	Coefficient	Sum of jobs
1	Vietnam	12,000	10.56	117,744
2	Ninh Thuan	3,402		35,925

Source:[15]

In Ninh Thuan province, solar-energy development projects are majorly constructed on agricultural land with an acreage of more than 3 thousand ha of acquired land, nearly 970 families affected; in which, Thuan Nam district makes up the largest proportion - 51.4% with 15/35 plants; following is Thuan Bac district accounting for 20.4% acquired land for 4/35 plants [9]. According to research in Bac Phong commune, Thuan Bac district: Acreage of acquired land majorly cannot be proactive in water source, ineffectively producing and productivity is low. For example, acquired land for project of Trung Nam solar-electricity plant, with capacity of 204MW, is approximately 223.7 ha; equal to 1ha per MW, including

agricultural land accounting for 97% of 192 families. Agricultural land acquired in dry season is 90% without producing; 9.75ha of which is 1-crop rice land.

Figure 1. Ratio of acquired land for construction of Trung Nam solar - electricity plant

While deploying solar-energy development projects, activities ensuring harmonious rights among the Government, people and investor were conducted correctly with regulations of the State, especially in ensuring social security, job improvement. As follows:

Propaganda for enhancing awareness of the role of solar energy development: This has been organized since the start of project basing on cooperation of the local government and investors, in order to ensure the consensus and unity while in progress, especially policies relevant to acquired land and impact of project on environment, socio-economy in the province and where project is constructed. According to investigation result, 99% of investigated people have understood the role of solar energy, agreed with province policy in construction of solar-energy plants.

Opportunity to change job: Developing energy projects means decreasing agricultural land acreage and impacting on people’s life; about 60% of investigated people said acquired land had little impact on jobs but remarkable on income; only 8.5% of investigated those responded it had no impact on their jobs and income. Nevertheless, with compensation and assistance policy, acquired land has reduced negative effects, especially people are assisted with an enormous amount of expense to change or improve jobs. Accordingly, province has policy that prioritizes investors having assistance policy in work of social security, committing to train and use local labor (Clause 7, Article 4) [16]. In addition, according to Article 31 about compensation, assistance, resettlement in Ninh Thuan province (Decision no.64/2016/QĐ-UBND date 09/26/2016), family, person directly participating in farm is assisted in changing and finding job with the amount of money equal to 2 times of agricultural land price with total acreage of acquired agricultural land; assisted acreage must not exceed local quota of agricultural land. Assisted people if are still in working age, having demand to be trained, then in addition to money, province also assists

in vocational training and vocational handling according to Decision no.63/2015/QĐ-TTg date 12/10/2015 of the Prime Minister about policy in assistance of vocational training and vocational handling for acquired-land labor.

According to compensation plan of solar-energy projects in Bac Phong commune, Thuan Bac district: Expense assisting in changing jobs, finding jobs for each family is fairly great, majorly from tens of millions to billions VND, for instance Tapur Bai family (1.1 billion VND) to construct Trung Nam solar-electricity plant; in case of Xuan Thien plant, families are assisted with more than 700 million VND (Nguyen Thi Thi family, Pham Thi Thuy family,...) [13,14]. Together with receiving money, local people have been instructed by Commune People's Committee how to efficiently take advantage of money source; some people use assisted money combined with compensation to purchase land to re-produce agriculture, families with remaining land invest to improve productivity. Nevertheless, majority of them do not have demand to be trained, change jobs, find jobs because they are mainly elder ones, ethnic minority with limited academic level, refusing to change. Annual vocational training programs of Vocational Centre have integrated vocational fields basing on demand of solar-energy plant, announced widely in people community, yet, no one has participated in vocational class to change and improve vocational skills (Cadres of Bac Phong commune at group discussions, 2021). Investigation result from questionnaire is similar to ideas from above-mentioned discussions, 100% investigated people agreed with form of counselling and assisting in changing jobs, find jobs by money, 55% in which assessed satisfied and very satisfied; the rest assessed normal.

Job opportunities in solar-energy plants are limited, have not met expectation of local authority and people. If we take consideration of the life-cycle of a solar-energy plant, including construction, operation and demolition stages, people have the biggest amount of job opportunities in construction stage with the ground work, auxiliary works; attracting 30-40 labors; operation stage is limited in potential with jobs, such as: grass cut, guarding, battery wash but majorly are seasonal, do not have stable contracts. Bac Phong commune has 2 solar-energy plant but only creates jobs for 49 labors. Xuan Thien solar-energy plant uses up 260ha per 150 families with acquired land but only creates 9 jobs for 18 labors, which from Ninh Thuan province is 15/18, mainly are middle-level managers and staff; top-level managers (Director and Chief Technical) are from other provinces, permanent residents of Bac Phong commune account for 27.8%; equal to 5 labors (01 middle-level manager – shift leader and 04 staff in accountancy, repairment and maintenance) [3].

3.3. Solutions to promote job opportunities associated with the development of solar energy in Ninh Thuan province

With the potential and advantage of solar energy, Ninh Thuan gradually improves regional conditions to exploit effectively, converting natural potential to development motivation, central solution performing Resolution 115/NQ-CP of the Government about performing peculiar mechanism and policy assisting Ninh Thuan province in developing socio-economy, stabilizing people lives in 2018-2023 period. Result of performing favorable policy for solar-energy development is rather positive with total contribution to province budget

stably increasing, opening up opportunities for the economy. However, since Ninh Thuan is a province with low starting point, limited infrastructure and human resource, so taking advantage of opportunity is not efficient; including opportunity to change jobs. Hence, to use more effectively job-development opportunities associated with solar-energy development, it is needed to have development orientation, synchronized solution. As follows:

First, creating more job opportunities through the efficiency of favorable mechanism, policy for the province; combined with policy deployed in stimulating exploitation and use of solar energy. Good use of investment resource will create infrastructure assisting in developing in supply-chain way; becoming a local not only a generating source but also supplying science-technology advances and equipment for other regions, becoming indeed National Centre of renewable energy in solar energy and wind power.

Second, promoting work of forecast to create proactiveness in implementing, deploying suitable policy, especially forecast in human resource to meet the development demand of renewable energy in general and solar energy in particular in different methods, such as: determine direct labors that can use factor-approach method with the database of new-installed capacity, energy production and working coefficient; determine indirect jobs that can approach value chain, integrated with statistics of corresponding skills. To determine the number of jobs in order to develop branch, including direct jobs, indirect jobs and intermediary jobs provide can use input-output analysis (IO) [15].

Third, continuing to boost work of propagande, deploying policy, especially having solution to instruct people in using reasonably assisted expense to change and find jobs. Solution for people to improve relevant professional level, vocational skills, ensuring the stability of choosing jobs, not only in renewable energy branch but also others in society, suitable to practical conditions of people and locality. According to investigation survey, people desire province to develop industrial zones, diversify industrial types in Thuan Bac district in order to attract and solve on-site labor.

Fourth, vocational training policy and labor market need to associate with energy-converting process to create jobs with fairness, commensurate remuneration. Ninh Thuan also needs to increase monitoring in performing regulations about prioritize projects developing solar energy in training commitment, use of local labors and labors must have stable, long-term contracts from projects.

4. Conclusion

Developing solar energy has been considered a break-through solution to perform development strategies of province basing on effectively taking advantage of thermal, radiation resource and favorable policy of the State. So far, solar energy and wind power have become two renewable energy sources contributing greatly to budget, important power to deploy development policy of the province. Nevertheless, in development progress has exposed challenges, especially in making use of opportunities associated with branch development, including opportunity to change, improve jobs, majorly because this is a new branch, infrastructure cannot meet development pace, people having low academic level and conservative in changing and improving vocational skills. Hence, to diversify jobs,

effectively use the job opportunity associated with branch development, Ninh Thuan needs to have synchronized solutions in order to enhance the quality of resources according to value chain of energy product and diversify different industrial types to solve jobs issue for people at project-development place.

Note: The research on which this paper is based is a result of the scientific research project “*Stable job associated with renewable energy in Ninh Thuan province*” according to Contract no.371/HDKH-KHXH, date 12/30/202 of Vietnam Academy of Social Sciences.

Abstract

The electronics manufacturing industry in Vietnam is on the rise to move towards integration with the global economy. The electronic product life cycle is unique due to the rapid and continuous change in electronic technology. Moreover, the manufacturing process of electronic products has several impacts on the environment. This paper synthesizes several product life cycle concepts and introduces reasons why the electronic product life cycle affects the environment. The authors conducted a case study at two Vietnamese electronics manufacturers to clarify the content of the product life cycle. Since then, the authors expect the findings to serve as a premise for the implementation of later studies on factors affecting the electronic product life cycle in enterprises manufacturing electronic products in Vietnam.

Keywords: *life cycle, product life cycle, case study, electronic product, Vietnamese enterprises.*

1. Introduction

1.1. Product Life Cycle (PLC) or Life Cycle

The content of the product life cycle is considered a crucial tool for analysis and marketing mix planning (Wells, Burneth, & Moriarty, 1995). According to Morden (1991), the product life cycle emphasizes that most products can only be finite in the market - it can be short-term (for example, fashion items) or long-term (some types of industrial machinery) (Morden, 1991). Regarding the product life cycle, according to Kofler (2000), the concept of life cycle includes the following contents:

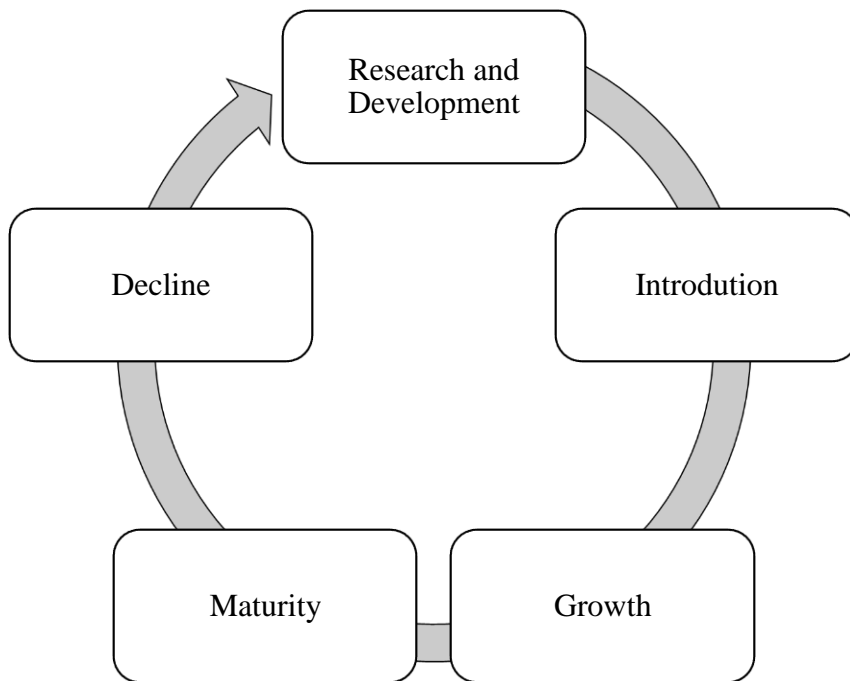

(a) That a product has a finite life, that is, it cannot indefinitely exist unless specific strategies are developed to reinvent and re-establish its relevance.

(b) The product sale goes through several stages, each with its issues and concerns.

(c) Profit fluctuates depending on where the product is in its life cycle.

(d) These products necessitate various marketing, financial, manufacturing, purchasing, and personal tactics or assistance from marketing personnel at many phases to optimize the benefits or potentials available to the product. (Kofler, 2000)

The product life cycle is categorized into five main phases (ACCA F5, 2015):

Source: ACCA, F5

Figure 1. Product life cycle

Phase 1: Research and development: The product is researched and designed for advancement. In this phase, costs are incurred; however, it does not generate revenue because the product has not been placed on the market.

Stage 2: Introduction: The product is introduced to the market. At this stage, because potential customers are not aware of the new products, the business will have to invest in marketing and advertising costs so that customers can pay attention to their products. In addition, extra capital investment costs may incur and increase production capacity as customer demand increases.

Phase 3: Growth: The product starts to take a larger market share, the revenue will increase, and the business begins to be profitable.

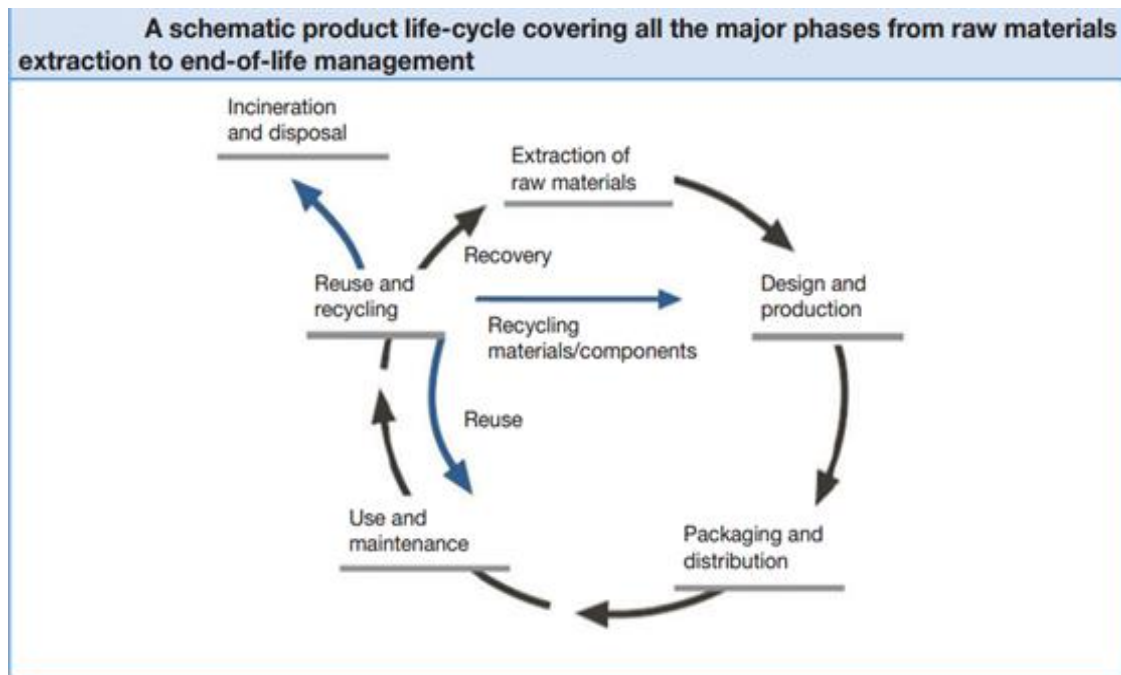

Stage 4: Maturity/Saturation: Customer demand for the product starts to decrease while revenue and profit reach the highest level and remain stable. It is the most profitable period in the product lifecycle. The product may be modified or improved in some functions to maintain its demand and extend the product lifecycle as long as possible.

Stage 5: Decline/Recession: Demand for products drastically reduced, and enterprises reached *saturation* point. Eventually, the business may be at a loss. Hence, this is when they consider the decision to stop selling the product.

1.2. Specificity of electronic product life cycle affecting the environment

Currently, the demand for modernized products/services tends to be increasing. However, some people are interested in how the production and consumption of such

products/services affect the environment and society. Besides, others think about disposing of products/services after they no longer need to use them, including how to recycle, reuse, or dispose of waste properly. Regarding the sustainability of a product or service, it is essential to use a lifecycle perspective and assess all relevant impacts of that product/service from the beginning to the end of the “from cradle to grave” life cycle (European Commission, 2010a). Therefore, it is critical not only to consider the environmental and social aspects of the product/service in use but also to assess the level of natural resource consumption (use of resources for the production process) as well as the emission of pollutants into the environment (concerning the recycling and waste disposal phases). For example, when manufacturing laptops, the actual production stage consumes a much more significant amount of resources than the actual weight of the computer. Therefore, if recycling is not under regulations, it can cause waste of resources, depletion of metal resources for production, and cause significant damage to people and the environment. (European Commission, 2010b)

Source: (UNEP/SETAC 2005)

Figure 2. A schematic product life-cycle covering all the major phases from raw materials extraction to end-of-life management

The majority of electronic products are part of a complex industrial network, starting with raw material extraction, component manufacturing, parts assembly, distribution, retail, use, recycling, and scrap disposal. Each phase of the network consumes energy and natural resources and then discharges pollutants into the environment. The product life cycle perspective looks at all the contents of the value chain. From there, provide effective solutions for the phases of the overall network. For example, study the wastewater treatment and solid waste treatment system ...(Menikpura, Gheewala, & Bonnet, 2012). The

governments are particularly concerned about these environmental pollution abatement issues and are willing to invest in high-profile projects. A life cycle perspective can indicate which stage of the product life cycle is causing the most extensive environmental burden. Therefore, creating motivation to improve less effective phases.

2. Method

2.1. Research methodology

Case study method

Case studies are considered an important research method, typical in comprehensive and in-depth investigations. It is a tool in social science research, the role of which is more prominent when studying issues related to education (Gulsecen & Kubat, 2006), sociology (Grassel & Schirmer, 2006), and community-based issues (Johnson, 2006). One of the reasons for recognizing case studies as a research method is that researchers have become more concerned about the limitations of quantitative methods in providing comprehensive and insightful explanations of social and behavioral issues. Through the case study method, the researcher can go beyond the quantitative statistical results and understand the behavioral conditions through the aspect of the research object. By analyzing both quantitative and qualitative data, case studies help explain the process and outcome of a phenomenon through observation, re-establishment, and comprehensive analysis of the cases investigated (Tellis, 1997). The case study method is widely used in academia by researchers interested in qualitative methods (Baskarada, 2014).

A case study is a study in which: (a) there is a single case study or a small number of comparative case studies in the context of the research selected and (b) the results obtained from the study are analyzed by qualitative methods. (Dul & Hak, 2008)

According to (Yin, 2003) has classified several case studies, namely descriptive research, explanatory research, exploratory research, and empirical research. In this topic, the authors use descriptive method to observe and describe the activities related to the product life cycle in Vietnamese electronic products manufacturing enterprises. The descriptive study shows the actual situation and infinite descriptions of the phenomena in the selected context. When carrying out descriptive research, the researcher should listen, learn and understand the participants' experiences in the situation (Kohlbacher, 2006).

To investigate the two actual situations, the author uses hand-to-hand discussion tools and group discussions. Hand-to-hand discussions were conducted by the author with the company's administrators (Chairman of the Board of Directors, CFO, Director/Head of R&D) and group discussions were conducted with department heads and accountants.

3. Results

3.1. Study case selection

The companies selected for research are operating in the field of producing electronic products, electronic products with distinctive characteristics in terms of technology and

continuous innovation (because the research project focuses on product life cycle research). Focusing on case studies at these companies will help provide a clearer view of the electronic product life cycle, showing how many stages the electronic product life cycle goes through and what work needs to be carried out in each separate phase.

On the other hand, the selected companies are young enterprises, with a good investment in the R&D department, research and development costs account for a large proportion of the total expense. The companies have specialized R&D departments, develop clear and comprehensive new product development processes, and explicit tasks to different departments. Therefore, the work to be done in each stage of the product life cycle is also clearly and meticulously defined from the beginning when coming up with new product ideas.

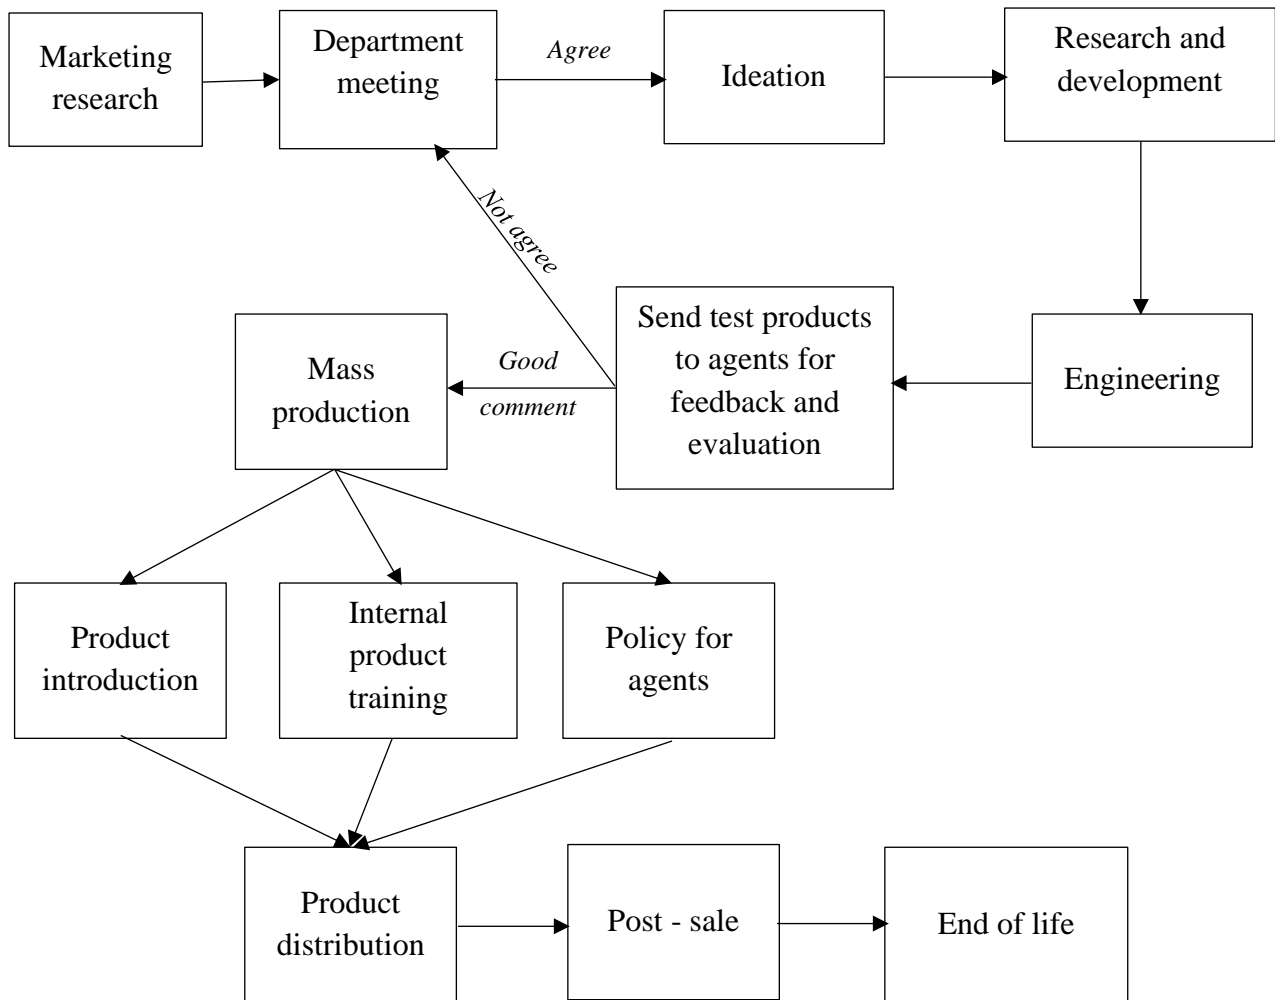

3.2. Case study on electronic product life cycle at Lumi Vietnam Joint Stock Company

Owning core technology and outstanding research capacity, Lumi Vietnam Joint Stock Company has confirmed its pioneering position in the smart-home electronics technology market - smart home by product innovations leading the trend and the ability to integrate into the world's leading ecosystem such as Apple, Google, Amazon... Constantly adopting the strategy of "gambling", Lumi is almost the only one to continuously launch the first Smart home products and pioneer in the market to keep the competitive advantage, including with international brand smart home competitors in Vietnam. Lumi's solution offers superior convenience to customers through its simplicity and ease of use but at only about 1/3 the price of similar products in the market.

Lumi Company is a young company founded in April 2012 with three founding members. However, with continuous effort, strive, and research, in August 2016, Lumi achieved the European standard certificate - CE. Lumi has also obtained UL certification, CE -RoHS certification - a global trade passport that helps Lumi export high-tech products to Europe and foreign markets. Currently, Lumi has spread a distribution network of more than 135 agents nationwide and exports its products to 08 other countries, including Thailand, Australia, India, Brazil, Laos, Cambodia, Lebanon (Li Gang), and Singapore.

Lumi works on a pioneering mission to provide superior and safe living and amenity solutions for customers, operate efficiently and collaborate on sustainable development with partners in tandem with spreading positive sentiments to the community. Intending to build a comprehensive smart home ecosystem, Lumi raised the idea of the new product AI Camera Hub - the first advanced artificial intelligence application security solution in Vietnam. Artificial intelligence (AI) is one of the breakthrough technologies applied to many life areas, especially smartphones and surveillance cameras. As a pioneer in developing the smart home ecosystem, Lumi has focused on research and artificial intelligence application for anti-theft security solutions and identified this as a spearhead technology in 2021.

**Describe the life cycle process of electronic products at
Lumi Vietnam Joint Stock Company**

Source: author group

Figure 3. Diagram of the life cycle process of electronic products at Lumi Vietnam Joint Stock Company

3.3. Case study on electronic product life cycle at HTP High-Tech Product Development Investment Joint Stock Company

HTP - high-tech product development investment joint-stock company established in 2014 with the slogan "change to be the best", HTP aims to improve the product, always accompany and listen to customers to bring actual benefits and satisfaction to them. HTP constantly innovates, develops, and aims to contribute to raising the technological level of Vietnam to the world market. The products of HTP contribute to the application of security, military, and defense administration.

Types of the company's products and services include:

- Network and network security solutions;
- E-government and e-commerce;
- IT services and solutions for Small and Medium Enterprises.

HTP Company cooperates with three leading scientific research centers in Vietnam: Military Engineering Academy, Post and Telecommunications Academy, and Vietnam Institute of Science and Technology.

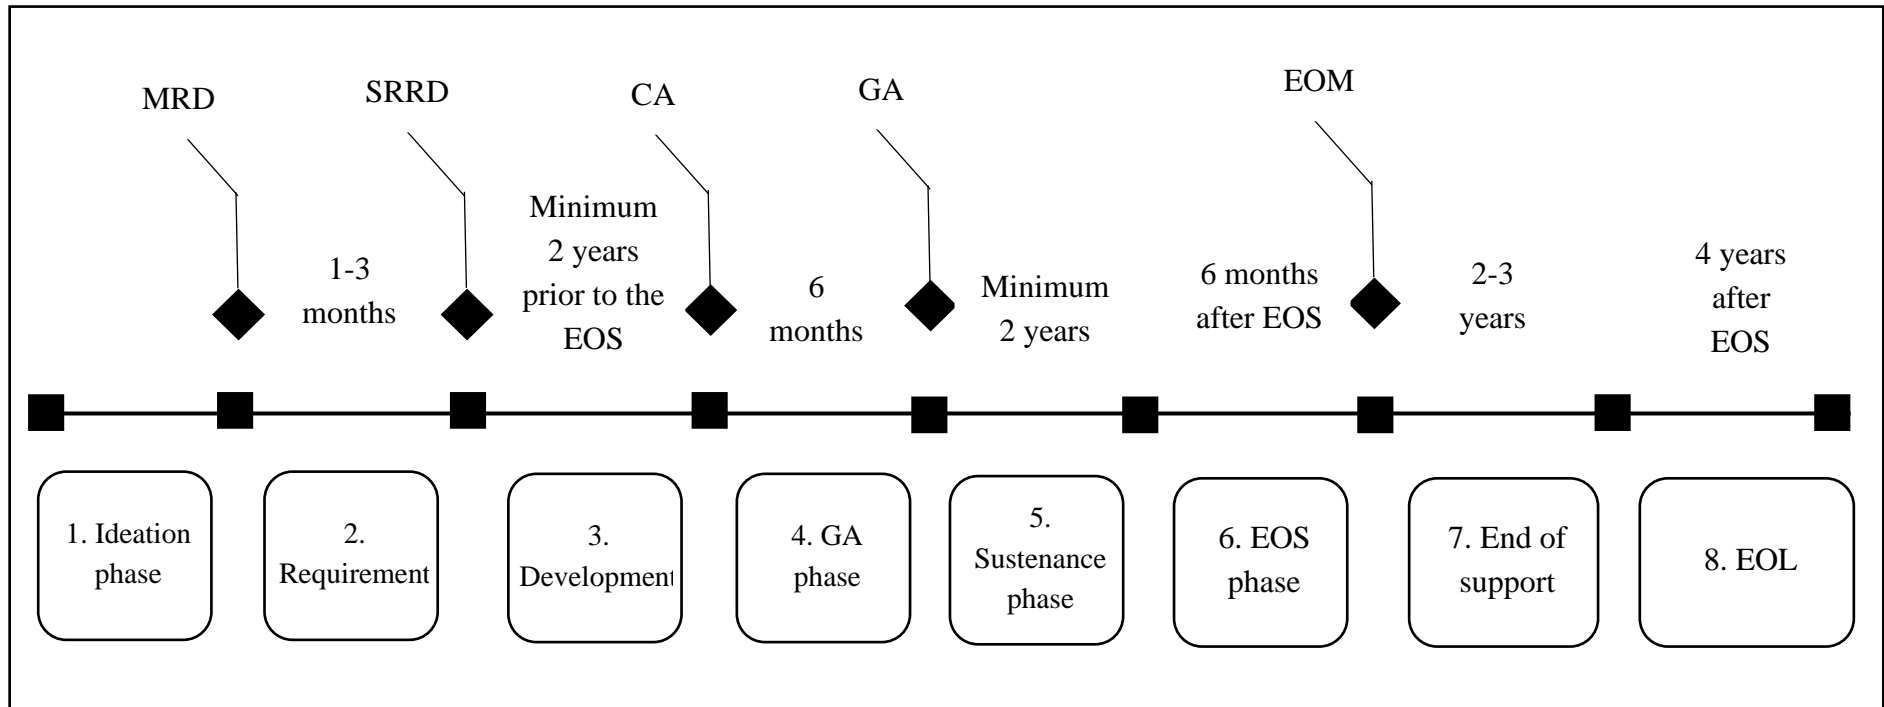

The company's product development division consists of more than 60 highly skilled engineers, of which the most prominent are the network equipment development team and the cybersecurity development solution of 25 engineers (six PCB design engineers, five software development engineers, 12 FPGA development engineers, and two testers).

From 2019 - to 2020, the company has achieved the goal of consuming more than 30,000 products for businesses and government organizations in Vietnam. It is expected that, by 2022, the company will expand its product consumption market to Southeast Asian countries and beyond Vietnam's territory, with the estimated amount of consumption reaching about 70,000 - 80,000 products/year, equivalent to a growth of over 20%/year.

The definition of product life cycle is defined by the company to ensure and standardize the effort to improve and develop a complete product from idea to distribution to the market. To ensure comprehensive product development, the life cycle is subdivided into stages. Each phase represents the achievement of a milestone in the product lifecycle development, which is the input to the next phase until the completion and delivery of the product to the market. The phases are:

- Product Ideation (Ideation)
- Product Feature Analysis (Requirement)
- Product Development
- Production
- Support & Sale
- Obsolescence

Describe the life cycle process in HTP High-Tech Product Development Investment Joint Stock Company

EOS: End of sale

EOM: End of manager

EOL: End of life

4. Discussion and Conclusion

The authors study the actual situations of the electronic product life cycle to compare the results with the published studies as a prerequisite to developing further studies related to the electronic product life cycle (for example: research factors affecting product life cycle along with cost accounting by product life cycle). The author found that R&D and technology are factors that directly affect and have an extensive impact on the product life cycle. Both Lumi and HTP have separate research and development departments and professional product development processes. The work to be done by each department in the different stages is clearly and specifically specified. The R&D department plays a significant role in formulating the product idea (which is the first and most decisive phase in the product life cycle) because, in this phase, 80 - 85% of the life cycle costs will be estimated. The product technology is the factor that creates the position and success of the product in the market. Besides, R&D is also directly related to product technology, which establishes technology trends for new products. The conclusion drawn is consistent with Cooper and Slagmulder (2004) regarding the decision-making efficiency in the design phase. And the study influences the success of cost control throughout the system life cycle.

To create a complete product feature sheet, both companies must rely on the market demand report by the marketing department/product marketing department to identify through surveying the needs and tastes of customers at present. After assessing market demand, and factors that may create or influence consumer trends, the new company offers ideas on new product development for consideration and consideration. Therefore, it can be seen that customer taste is also an extensive factor affecting the product life cycle. Customers' tastes can create a new consumer trend, which means that new products will be developed based on the consumer trend, replacing the equivalent old product in the market. It is in line with the research by Hanna et al. (1995), Lagrosen (2001), Gruner and Homberg (2000) point out the importance of the customers' interaction in the process of developing new products since they can become a regular source of ideas and customer satisfaction is a sustainable and profitable opportunity of the business. The new product life cycle will start after or possibly earlier than the time when the old product disappears in the market (production stops).

The paper clarifies some concepts about the product life cycle and why electronic product manufacturing enterprises must pay attention to environmental issues. The authors classify the product life cycle process based on two case studies of Vietnamese electronics manufacturers Lumi and HTP. Since then, the authors have a clearer understanding of the electronic product life cycle to facilitate the implementation of further studies on the product life cycle in enterprises manufacturing electronic products in Vietnam.

Abstract

The study has extended the theory of planned behavior (TPB) to consider the factors affecting Vietnamese households' electricity-saving behavior. The study used large-scale surveys at a number of households throughout Vietnam. 538 valid questionnaires from households were used in the study to investigate relationship among factors in the research model. Collected data went through quantitative analysis steps including measurement model and structural model assessment to test scales and hypotheses using PLS-SEM software. Research results show that all hypotheses in the research model have been supported with the collected data. From there, the authors make some suggestions to promote Vietnamese households' electricity-saving behavior.

Keywords: *Electricity-saving behavior, theory of planned behavior, Vietnamese households.*

1. Introduction

Energy saving and emission reduction are important issues in formulating a long-term energy strategy (Yu et al., 2016). Environmental policy makers are increasingly emphasizing the responsibility of consumers for the environmental side effects of their behaviour, and many environmental claims are expressed in terms of related activities of households such as recycling, purchasing of green-labeled products and activities reduce household electricity use (Ek & Söderholm, 2010). The potential for energy savings (for residential electricity consumption) is considered very important (Alfredsson, 2004; Gardner & Stern, 2008). Household is the basis of changes in the use of energy-saving behavior in urban areas because this is the sector with the largest number of electricity users, so if electric energy is reduced by households, the national electricity consumption will decrease significantly (Fithri et al., 2015).

Vietnam is one of the countries with the highest energy consumption intensity in the region and in the world (Hien & Chi, 2020). According to Decision No. 428/QĐ-TTg dated 18/2016, approving the adjustment of the national electricity development plan for the period 2011-2020 with a vision to 2030, electricity demand in Vietnam will continue to grow at a rate of 7.4% to 8.4% per year from 2021 to 2030. According to statistics of the electricity

industry, electricity consumption in households accounted for about 35-40% of the total national electricity consumption. Therefore, the economical, safe and effective use of electricity by each person and household has a very important role, not only contributing to reducing electricity consumption and saving costs for the family, but also protecting the environment and saving national resources. Currently, in Vietnam, large hydroelectric resources have been fully exploited; nuclear power projects have been halted; but still only account for a small part of total generating capacity (Le & Pitts, 2019). The demand for electricity continues to increase, but the potential for development of electricity supply in Vietnam faces many limitations such as environmental problems, resource depletion, sustainable development... Therefore, saving electricity becomes an important factor. Priority should be given to all sectors of the economy, including in the residential sector, particularly among households in Vietnam. A deeper understanding of the process and factors that drive households' energy-saving intentions is needed for electricity-saving policy-making and efficient household electricity behavior (Liu et al., 2020).

Currently, there are three main types of measures to promote electricity-saving behavior in households: economic orientation, technology orientation and psychological and behavioral orientation (Arawomo, 2017; da Silva & Cerqueira, 2017). Economic orientation mainly consists of price measures and financial incentives, but some studies have pointed out the limitations of both measures. Cheung et al. (2016) pointed out that most people are not sensitive to changes in electricity prices and are not willing to change comfortable living habits to save electricity because compared to other household consumption expenditures, the proportion of electricity expenditure is small, so it cannot attract the attention of residents. Handgraaf et al. (2013) believe that financial incentives can promote energy-saving behavior of residents in a short period of time. Technology orientation mainly popularizes energy-saving equipment and technology to improve efficiency, but the promotion and use of energy-saving technology and equipment has a strong "rebound effect" (Sorrell & Dimitropoulos, 2008). Due to the lack of economic and technologically oriented measures, more and more researchers are paying attention to the studies of energy saving behavior based on psychological and behavioral perspectives (Hong et al., 2019; Shi et al., 2017; Van de Broek et al., 2019). Psychological and behavioral orientation emphasize psychological factors including attitudes, social norms, and environmental perceptions (Fornara et al., 2016; Zhou & Yang, 2016) to promote household electricity-saving behavior. Currently, when investigating the factors affecting the intention and behavior of households to save electricity, a number of theories are widely used, including the theory of rational behavior (TRB), norm activation model (NAM) and theory of planned behavior (TPB). TRB only pays attention to conditionally driven factors while ignoring non-controlling factors such as time and chance (Lam & Hsu, 2004). Similarly, NAM only pays attention to internal factors and ignores external factors such as social environment and resources (Shi et al., 2017). However, unlike other models, TPB takes both non- controlling and external factors into account and is considered the most overarching theory to understand environment-related behavior (Rivis et al., 2009).

Therefore, the study has extended the theory of planned behavior (TPB) to consider the factors affecting Vietnamese households' electricity-saving behavior.

2. Literature Review

Electricity-saving behavior encompasses the full range of consumer choices and actions to reduce their domestic electricity consumption. These include everyday eco-friendly gestures in areas (e.g: heating, cooking, lighting, electrical equipment) and installation and equipment choices (e.g.: household appliances, insulation, heating, renewable energy use) (Abrahamse et al., 2007; Urban & Ščasný, 2016).

TPB is a classical model for explaining or predicting behavior and behavioral change (Ajzen, 1991). The TPB model suggests that the immediate determinant of an individual's particular behavior is behavioral intention (BI), which reflects an indication of an individual's willingness to take action. The model also shows that BI for a particular behavior is a function of three predictors, namely attitude (ATT), subjective norm (SN) and perceived behavioral control (PBC). TPB effectively encompasses an individual's prosocial and non-necessary behavior and adequately demonstrates the performance of explanatory power (Chen, 2013; Hassan et al., 2016). Therefore, the model has been widely used in studies of various pro-environmental behaviors, including energy conservation (Chen et al., 2016; Wang et al., 2015); water conservation (Han & Hyun, 2018; Lowe et al., 2015; Wells et al., 2016); recycling and waste management (Oztekin et al., 2017; Wan et al., 2014). Therefore, we hypothesize that:

H1. There is a positive relationship between electricity-saving intention and behaviors of Vietnam households.

According to Ajzen (1991), attitude is the degree to which an individual has a favorable or unfavorable assessment of a particular behaviour. The more positive an individual's attitude toward a certain behavior is, the stronger their intention to perform that behavior (Shi et al., 2007). Attitude refers to the level of people's perception of the practice of energy saving behavior, largely depending on the degree of preference for energy saving and the information held by the individual towards this behavior (Wang et al., 2011). The more positive people's attitude towards energy saving, the more effectively they can reduce their energy consumption (Oikonomous et al., 2009). According to Ek and Söderholm (Ek & Söderholm, 2010), residents' attitude towards the environment is an important factor in predicting their energy-saving activities. Zhang et al. (2018) studied the factors affecting households' electricity-saving in Shandong, China, and found that attitude has a positive relationship with the intention to save electricity in the households. Based upon these findings, we hypothesized that:

H2. There is a positive relationship between attitude and electricity-saving intention of Vietnam households.

Perceived behavioral control refers to the degree to which an individual perceives performing a particular behavior as easy or difficult (Kaffashi & Shamsudin, 2019). When an individual believes that a certain behavior is easy to perform or that he or she is capable of performing that behavior, the higher the intention to perform that behavior (Wang et al., 2018). It mainly depends on the costs and benefits in implementing a particular behavior, such as financial costs, effort and time (Lindenberg & Steg, 2007). Dianshu et al. (2010) conducted a study regarding the relationship between electricity price and consumption in China and the results show that economic benefits have a great influence on energy saving

behavior. This conclusion has been confirmed by several studies regarding the effect of financial costs on household s'energy consumption (Banfi et al., 2008; Scarpa & Willis, 2010). Darby (1999) who conducted research on energy-saving behavior in residential areas in the UK, found that cost savings and improved comfort for residents significantly improved energy-saving behavior. Anker-Nilssen (2003) affirmed the decisive role of time saving, convenience, comfort and mobility in an individual's energy saving decisions. The higher the level of perceived behavioral control related to energy saving, the better the people's response to energy saving (Oikonomos et al., 2009). Wang et al. (2018) demonstrated perceived behavioral control positively affected residents' intention to save electricity. Based on these previous findings, we hypothesized that:

H3. There is a positive relationship between perceived behavior control and electricity-saving intention of Vietnam households.

Subjective norms are social pressures that influence people to perform certain behaviours. Ajzen (1991) recognizes that there are two important factors behind whether or not a person performs a behavior, namely behavioral intention and the degree to which the he/she is aware of the decision to perform a certain behavior. Midden and Ritsema (1983) surveyed Dutch residents, finding that subjective norms and personal ethical attitudes are important influencing factors on household energy savings. Black et al. (1985) argues that the energy-saving behaviors of households are largely influenced by norms. This view was further tested by Webb et al. (2013) who consider subjective norms to be an important predictor of household energy saving intentions and behavior. Personal and social relationships with family, friends and colleagues are also important factors influencing residential energy consumption behaviour. Wang et al. (2011) also found that the subjective norms and energy saving behavior of residents are positively correlated, in other words, residents are willing to listen to suggestions by people close to them. The more an individual believes that significant others want them to engage in a particular behavior, the more likely that individual is to engage in the behavior (Wang et al., 2018). Hence, we hypothesized that:

H4. There is a positive relationship between subjective norms and electricity-saving intention of Vietnam households.

Environmental knowledge is defined as an individual's understanding of energy issues (e.g. environmental pollution due to excessive energy consumption) and the individual's level of understanding for energy issues will affect their level of interest in energy use. Energy literacy is also defined as the stage where individuals perceive and understand the energy crisis (Sugandini & Djawoto, 2018). Knowledge is thought to be able to enhance the ability of consumers to understand and appreciate specific advertising messages and is sufficient to encourage the formation of a consumption process (Miller & Russell, 2004). Lack of knowledge can lead to negative attitudes from consumers (Childs & Poryzees, 1998). Previous studies have revealed the importance of understanding energy issues and found that it has an essential role in influencing households' energy saving intentions and behaviors (Han et al., 2013; Urban & Ščasný, 2012). Consider these findings from previous studies, we hypothesized that.

H5a. There is a positive relationship between environmental knowledge and electricity-saving intention of Vietnam households.

H5b. There is a positive relationship between environmental knowledge and electricity-saving behavior of Vietnam households.

Increasing psychological research suggests that repetitive or habitual behavior is easily influenced by past behavior or habits. When behavior is performed repeatedly, it takes less consideration for it to become a habit (Russell et al., 2007). According to Verplanken and Holland (2002), habits refer to relatively stable patterns of behavior, which can be triggered by past behavior and performed without rational judgment. Habits are important, and once individuals form habits, they are more likely to perform the behavior. According to the study of Wang et al. (2018), when learning about the factors that affect the intention and behavior of households to save electricity, the results show both intention and behavior to save electricity are influenced by habit. In the study of Maréchal (2010), the author showed that many energy consuming behaviors, such as turning off the lights, are believed to be under the control of habit. Huebner et al. (2013) also show that people do not identify habits as important barriers to behavior change. In the study of Broek et al. (2019), habit was also concluded as one of the factors affecting both intention and behavior to save energy. Hence, a hypothesis can be proposed as follows:

H6a. There is a positive relationship between habit and electricity-saving intention of Vietnam households.

H6b. There is a positive relationship between habit and electricity-saving behavior of Vietnam households.

3. Method

3.1. Research context

In Vietnam, in the past period, energy demand has continuously grown at a high rate compared to other countries in the region and the world, in which, primary energy demand in the period 2010 – 2019 increased about 6%/year, especially the average growth rate of commercial power output was 10.9% in the period 2010 - 2015 and 10.1% in the period 2016 - 2019. With great efforts of all levels and sectors, basically, Vietnam always ensures to supply enough energy and electricity for production, business activities and people's life, contributing to economic growth and ensuring the safety of the people. According to forecast in the next 5 years, electricity demand will still grow at about 8.5%/year.

To ensure sufficient supply of electricity demand in the country, to meet the socio-economic development goals of the whole country with the average GDP growth of Vietnam about 6.6%/year in the period of 2021 - 2030 and about 5.7%/year in the period 2031 - 2045, the National Power Development Planning Project 2021 - 2030, with a vision to 2045 (Power Master Plan 8) gives an annual calculation that Vietnam needs to invest the power industry is about 13 billion USD/year in the period of 2021 - 2030 and over 12 billion USD/year in the period 2031 - 2045. This requirement poses a huge challenge for the electricity industry in arranging sufficient investment capital to develop the electricity sources and power grids, to meet the development needs of the economy and to ensure energy security.

Therefore, in parallel with the exploitation of primary energy sources to meet the energy needs of the economy and society as a whole, economical and efficient use of energy plays an important role in ensuring national energy security. Every household in Vietnam has been campaigning to save energy in general and electricity in particular. However, in order for each household to have the intention and behavior to save electricity, the state management agency needs to have a policy to promote it based on factors affecting these intentions and behaviors.

3.2. Sample and data collection

We used quantitative research method in this study. To collect quantitative data, an online survey was conducted using a structured questionnaire. The variables used in this study were measured using validated items and then collected and analyzed. The demographic characteristics of the respondents were also collected using the questionnaires. Through a network of friends and colleagues, the questionnaire was sent to a total of 600 residents living in Vietnam via e-mail. Respondents are internet users over 18 year-old who are interested in saving natural resources and energy. This ensures that the participants have a certain level of knowledge and interest in the problem energy. Respondents were asked to volunteer to complete the questionnaire in the email. Respondents were assured that their anonymity and privacy would be respected and there were no right or wrong answers. Data was collected within 2 months from January to March, 2022. The total number of questionnaires collected was 557, the number of valid votes for processing is 538.

3.3. Measures

Behavior (BE). The author uses the scale of four items of Hien và Chi (2020) to measure behavior. Each item of the scale was rated from 1 (strongly disagree) to 5 (strongly agree), and a sample item from the scale was “I always turn off electrical appliances when there's nobody in the room.”

Intention (IN). The four-item scale by Hien và Chi (2020) was used for intention. Each item of the scale was rated from 1 (strongly disagree) to 5 (strongly agree), and a sample item from the scale was “I plan to save electricity in my home.”

Attitude (AT). For attitude, the authors adapted Hien và Chi (2020) with five-item scale. Each item of the scale was rated from 1 (strongly disagree) to 5 (strongly agree), and a sample item from the scale was “Saving electricity in my home is important to reduce CO2 emissions.”

Subjective norms (SN). The authors used Zhang et al.'s (2018) three-item scale to measure subjective norms. Each item of the scale was rated from 1 (strongly disagree) to 5 (strongly agree), and a sample item from the scale was “My energy-saving behavior will be affected by my families, friends and teachers.”

Perceived behavioral control (PBC). The three-item scale by Li et al. (2020) was used for perceived behavioral control. Each item of the scale was rated from 1 (strongly disagree) to 5 (strongly agree), and a sample item from the scale was “I am capable of saving electricity in my home. ”

Environmental knowledge (EK). Environmental knowledge was measured with Wang et al. (2014) with three items. Each item of the scale was rated from 1 (strongly

disagree) to 5 (strongly agree), and a sample item from the scale was “I know the meaning of the labels affixed on the energy-efficient devices.”

Habit (HB). Habit was adapted from Wang et al. (2018) with five items. Each item of the scale was rated from 1 (strongly disagree) to 5 (strongly agree), and a sample item from the scale was “I turn off the light even if I just leave the room for a while.”

4. Results

4.1. Profile of respondents

Table 1. Profile of respondents (N = 538)

Demographics	Frequency	Percentage (%)
Gender		
Male	259	48.1
Female	279	51.9
Age		
18-28	136	25.3
29 - 38	172	32.0
39 - 48	124	23.0
49 above	106	19.7
Educational background		
High School Graduate	78	14.5
University Graduate	387	71.9
Post Graduate	73	13.6
Monthly Income (USD)		
Less than 500 USD	126	23.4
500 – 1000 USD	216	40.1
1000 – 2000 USD	118	21.9
More than 2000 USD	78	14.5
Marital Status		
Married	298	55.4
Single	240	44.6
Living area in Vietnam		
North	189	35.1
Central	112	20.8
South	237	44.1

Table 1 shows the demographic characteristics of the respondents. Of the 538 household representatives surveyed, 48.1% of respondents are male and 51.9% of respondents are female. 32% of respondents are between the ages of 29 and 38, followed by those aged 18 to 28. The majority of respondents (71.9%) have a University Graduate

education. The average monthly income is less than 500 USD, accounting for 23.4% of the survey sample, over 40% of respondents have an income of 500 - 1000 USD. The number of married people (55.4%) is higher than the number of single people (44.6%). A larger proportion (44.1%) of respondents live in the South, followed by 35.1% of those living in the North, with the remaining 20.8% living in the Central region.

4.2. Results

4.2.1. Measurement model

Table 2. Convergent validity

	Cronbach's Alpha	Composite Reliability	Average Variance Extracted (AVE)
BE	0.877	0.916	0.730
IN	0.873	0.922	0.798
AT	0.908	0.935	0.784
SN	0.822	0.893	0.737
PBC	0.896	0.935	0.828
EK	0.876	0.924	0.802
HB	0.884	0.893	0.736

Cronbach's Alpha, composite reliability (CR), and average variance extracted (AVE) were presented in Table 2. All variables' Cronbach's Alpha values were acceptable for testing reliability of the scale (Nunnally, 1978). CR values were greater than the minimum threshold of 0.60 (Bagozzi & Yi, 1988), ranging from 0.893 to 0.935, thus confirming their reliability. AVE ranged from 0.730 to 0.828, all of which were above the suggested threshold of 0.5 (Anderson & Gerbing, 1988; Fornell & Larcker, 1981). These results indicated that all measurement items had high convergence values. The discriminant validity is defined as the extent to which a construct was truly distinct from other constructs by empirical standards. The Fornell-Larcker criterion compares the square root of AVE with the correlation coefficients of the two latent variables. It has been highlighted by Hair *et al.* (2014) that the higher value in the diagonal line settles the validity of discriminant. For the analysis of table 3, the model of our research study indicated acceptable discriminant validity.

Table 3. Fornell and Larcker [64] criterion

	AT	BE	EK	HB	IN	PBC	SN
AT	0.885						
BE	0.384	0.855					
EK	0.270	0.411	0.895				
HB	0.315	0.485	0.257	0.858			
IN	0.403	0.588	0.379	0.462	0.893		
PBC	0.300	0.401	0.274	0.306	0.441	0.910	
SN	0.325	0.471	0.273	0.293	0.524	0.293	0.858

4.2.2. Structural model assessment

Table 4 shows the variance inflation factors (VIF) values, which were smaller than 5, which confirmed that there are no issues of multicollinearity in our estimation model. According to Cohen *et al.* (Cohen, 1988), the values of f-square between the range of under and 0.020 had a super small or no effect, between the range of 0.020 and 0.150 had a small effect; between the range of 0.150 and 0.350 had a medium effect; between the range of 0.350 and above had a substantial effect on an endogenous latent variable. In our model all relationships between variables are confirmed. Besides, the other variables of the model have the values of f-square between the range of 0.020 and 0.350, which shows a significant effect on the constructs and validity of the model (Table 5).

Table 4. Collinearity assessment (VIF) – Inner VIF

	AT	BE	EK	HB	IN	PBC	SN
AT					1.249		
BE							
EK		1.180			1.178		
HB		1.284			1.227		
IN		1.401					
PBC					1.226		
SN					1.234		

Table 5. Hypotheses testing results

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (O/STDEV)	P Values
AT -> IN	0.128	0.127	0.040	3.195	0.001
EK -> BE	0.196	0.194	0.042	4.703	0.000
EK -> IN	0.143	0.144	0.038	3.774	0.000
HB -> BE	0.250	0.251	0.034	7.440	0.000
HB -> IN	0.231	0.231	0.037	6.230	0.000
IN -> BE	0.398	0.398	0.048	8.226	0.000
PBC -> IN	0.200	0.199	0.039	5.084	0.000
SN -> IN	0.317	0.318	0.034	9.270	0.000

Figure 1. Research model

In the analysis of Table 5 and Figure 1, all hypotheses of the research model are accepted due to the satisfactory index of T and P values. In which, SN has the strongest influence on IN ($\beta = 0.317$), followed by the influence of HB and PBC ($\beta = 0.231$ and 0.20) and the influence of EK and AT ($\beta = 0.143$ and 0.128). IN, HB and EK all had a positive effect on BE ($\beta = 0.398$, 0.250 and 0.196 respectively).

5. Discussion and Conclusion

5.1. Discussion

Overall, as expected, the extension of the basic TPB model has been verified on electricity-saving behavior in the context of households in Vietnam. The research results show that the factors of attitude (AT), cognitive behavioral control (PBC) have an impact on intention (INT) thereby affecting behavior (BEH) in energy saving behavior. The above conclusion is also reached by Ru et al. (Ru et al., 2018); Webb et al. (2013).

We have improved the model further by introducing two more determinants of Vietnamese household energy saving behavior, HB and EK. HB and EK are also shown to have a positive effect on the intention and behavior of households to save (regression coefficients are 0.159 and 0.165 , respectively), which means that when people perform repetitive about electricity-saving, they will form a habit. However, turning a habit does not have too great an impact on the intention (Wang et al., 2018; Tetlow et al., 2015). At the same time, EK plays a crucial role in encouraging individuals to participate in energy efficiency. This finding is also consistent with previous studies (Han & Cudjoe, 2020; Han et al., 2013; Cai et al., 2019; Ding et al., 2019). They believe that EK is an important factor influencing the decision to save electricity. An individual with an understanding and knowledge of the environment will have more obvious energy-saving behavior.

5.2. Conclusion

Firstly, consider the importance of SN, PBC and AT for energy saving intention and behavior. State management agencies need to promote savings programs aimed at all households, encourage people to propagate and mobilize family members, friends and colleagues to use electricity economically for themselves, family and society.

Secondly, consider the importance of HB for energy saving intention and behavior. State management agencies guide households through many channels such as television, radio, books and newspapers so that people build the habit of turning off electrical appliances such as lights, fans, and computers when leaving the room. ... and during the day try to open all the doors to illuminate the room with natural light. Opening the doors not only saves a small amount of electricity but also helps to open the atmosphere, giving us a sober and optimistic spirit. Another habit should also be noted, which is to periodically check once a week electrical equipment to promptly repair and replace, because the use of inefficient equipment is also the cause of failure and increased energy consumption.

Thirdly, consider the importance of EK to the intention and behavior of households to save electricity. We see that it is necessary to add knowledge of saving electricity to the knowledge frame for students. Educating students, students form awareness and create habits for them right when they are still at school. Thereby, they will have awareness and habits of saving electricity in the future. If students support the propaganda and implementation of energy saving, they will be the force to spread the energy saving activities to other subjects such as friends, teachers, parents...

Abstract

This research discusses payments for environmental services in Vietnam, especially payments for forest environmental services in the period 2011-2020. First of all, the research represents conceptual approaches in terms of payments for environmental services. Then, the research applies a variety of research methods to make use of secondary and primary data in order to analyze the current status of payments for forest environmental services in Vietnam in the 2011-2020 period, in which describing people's perceptions about payments for forest environmental services. Based on the actual situation of payments for environmental services and from urgent requirements of the environmental protection as well as existing advantages, the research proposes recommendations to establish and develop the marketization of payments for environmental services in general and payments for forest environmental services in Vietnam in particular. This is considered as a solution for sustainable environmental protection in the coming time.

Keywords: *environmental services, experience, payments for forest environment services.*

1. Introduction

Environment and environmental protection is no longer a concern of a single country, it has been a global problem because of the rapid rate of environmental degradation over the past 50 years. This degradation situation is caused by many different reasons, including both subjective and objective; however, the main cause is due to people's weak awareness of environmental protection. People exploit the environment without any calculation, resulting in the serious exhaustion and it is difficult to make compensation. Even there was a time people considered the environment as a reward given by the Mother Nature, and the works of restoration and environmental protection are the State's responsibilities. This kind of thinking has led to the uncontrolled use of the environment, which even harms the environment.

In the world, right from the 90s of the 20th century, many countries in Africa, Asia, Eastern Europe and Latin America have piloted environmental service payment programs in many areas such as the protection of water resources, forests, beautiful landscapes, biodiversity conservation and protected areas. This is very meaningful because it affirms that people's thinking about using natural resources has been gradually changed, natural resources are considered as a kind of property, and payments are required for using them.

In Vietnam, along with the economic mechanism transition from the centrally planned economy to the market mechanism, in the early 2000s, the payment mechanism for environmental services has also been set up. First of all, the payment for environmental services has been piloted in Son La and Lam Dong provinces since 2008. By 2010, the payment policy for forest environmental services has been officially performed across the country. Vietnam's achievements in payments for forest environmental services shall be suggestions for Thailand in applying this tool for environmental protection and sustainable development.

2. Method

2.1. Formation of the theoretical framework

To form a theoretical framework, the author summarizes and analyzes theories of domestic and foreign authors on the issue of payments for environmental services and the marketization of payments for environmental services, including basic issues such as the need for the marketization of payments for environmental services, the State's roles in the process of marketizing payments for environmental services, contents and criteria for assessing the degree of marketization of payments for environmental services, conditions to carry out the marketization of payments for environmental services and other factors affecting the process of marketization of payments for environmental services in Vietnam.

2.2. Material sources

2.2.1. Primary material sources

To obtain primary material sources, the author collects information from different sources, especially information on the understanding level of people across the country about environmental services and payments for environmental services through Personal interview questionnaires on payments for environmental services.

Personal interview questionnaires are used to achieve information on age, income and occupation of interviewees, especially concentrating on the understanding of people in terms of environmental services in particular and payments for environmental services in general, assessments of environmental service users about the current payment level for environmental services, environmental service users' willingness to pay an additional amount to benefit better environmental services (such as fresh air, more beautiful natural landscapes and so on). All collected information is used to study the current situation and serves as a basis to indicate limitations of the implementation process of payments for forest environmental services in Vietnam.

The authors issued 300 questionnaires to survey some highly representative areas such as Hanoi, Ho Chi Minh City, Thai Binh, Pleiku and Dak Nong. In which, Hanoi and Ho Chi Minh City are two large cities of the country with high population density and higher education background compared to other provinces, beneficiaries of environmental services in these two cities are high, namely: Hanoi (60 questionnaires) and Ho Chi Minh City (60 questionnaires). The author also selected Thai Binh Province (60 questionnaires) - a purely agricultural province without forest areas, to study the population's understanding of environmental services, and two provinces that have large forest areas and implemented

payments for forest environmental services are Pleiku (60 questionnaires) and Dak Nong (60 questionnaires). The survey was conducted in 2019 by the authors of this research.

To guarantee high accuracy from respondents, the author designed such questionnaires based on both qualitative method and content analysis method. It means that questions raised are not only in the form of multiple-choice questions but also open-ended questions so that respondents can propose their additional opinions. On the other hand, the author also represented many answers in each question to avoid inadvertent answers of respondents. The age of subjects ranges from 24 to 60 years old, their average income is from 5 to 10 million VND/month. Research subjects are selected at this age because they are the main subjects of payments for environmental services, most of them already have stable jobs and incomes; thereby they can clarify the issue: Whether service beneficiaries (who must pay for services they use) understand services and amounts they are paying for. This expresses the reliability of answers. In addition, the author also used the random interview method for research samples. This method will guarantee the reliability of research results.

2.2.2. Secondary material sources

The formation of this theoretical framework is commenced from reading and studying a lot of domestic and foreign articles, journals, and monographs on payments for environmental services. In addition, the author also searched and consulted many Ph.D. dissertations on environmental services and payments for environmental services. However, this type of material is very limited because the payment for environmental services is still a large research gap in Vietnam. As a result, the Internet is used as a useful research tool because material sources on payments for environmental services, especially the marketization of payments for environmental services that the author can access are mainly from documents abroad, in which a lot of useful information is found from the website <https://www.sciencedirect.com>, links of this web also take the author to full researches of foreign authors.

Information and data relating to the marketization of payments for environmental services in Vietnam are summarized and analyzed from reports of the Vietnam Forest Protection and Development Fund (VNFF), reports of leading experts specialized in payments for forest environmental services in Vietnam, reports of experts of the Center for International Forestry Research (CIFOR) and many other related documents.

3. Results

3.1. Approach to the concept of payments for forest environmental services

There are many approaches to the concept of environmental services.

The first approach, environmental services are understood as environmental pollution and degradation treatment services. Based on this approach, the World Trade Organization (WTO) proposes 7 main groups of environmental services including wastewater services; waste services; cleaning and other similar services; emission reduction services from vehicles; noise reduction services; nature and landscape protection services and other services.

Under the commitment to market opening after joining the World Trade Organization (WTO), Vietnam has determined to open the market for environmental services in 5 sub-sectors in the WTO, including (1) Wastewater treatment services; (2) Waste treatment services; (3) Carbon cleaning services; (4) Noise treatment services and (5) Environmental impact assessment services. In the second approach, environmental services are those that the environment provides to people. According to Forest Trend, Katoomba, UNEP (2008), environmental services are those provide services (foods, clean water, raw materials, fuels, fibers, and genetic resources); regulatory services (watershed protection, flood control, climate regulation, water regulation, water purification, pollination, disease prevention etc.); supporting services (soil construction, nutrient regeneration, nutrient regulation, basic production etc.); cultural services (aesthetic values, social relations, entertainment and ecotourism, history, science and education etc.).

According to the opinions of Sven Wunder and many other scholars, environmental services include watershed protection services; biodiversity conservation services; beautiful landscape services; carbon capture and storage services.

This research approaches the concept of forest environmental services from the point of view of Sven Wunder. Therefore, forest environment services are those that the forest environment will provide benefits for people and society; or in other words, it is the direct or indirect interests that people benefit from functions of the forest environment. To benefit from these services, people have to pay a certain amount of money to the people who maintain and provide such services. That is the payments for forest environmental services. Table 3.1 expresses the types of forest environmental services.

Table 3.1. Classification of forest environmental services

Environmental services	Characteristics	Buyer	Provider
Watershed protection	Provided by the forest ecosystem. Watershed forests provide many kinds of services including soil erosion control, water quality maintenance, and water flow regulation.	Hydropower plants, clean water supply and production facilities, industrial production facilities directly use water sources, and other downstream organizations and individuals	Forest owners (forest-allocated households or State authorities) and local residents (who are paid to stop or minimize the deforestation).
Biodiversity conservation	Disease prevention, ecosystem value etc.; for example, paying for local communities to set aside natural restoration areas for the formation of biodiversity corridors	Government and beneficiaries, tourism companies, national parks, and protected areas	Local communities, residents, national parks, and protected areas.

Environmental services	Characteristics	Buyer	Provider
Beautiful landscape/ Ecotourism	Tourists travel to beautiful natural landscapes/protected areas/national parks where preserve landscape and biodiversity values that are paid for landscape maintenance and diversification	Tourist companies, tourists, national parks and reserves, accommodation and transportation companies	National parks, reserves, local communities and households
Carbon storage and absorption	Climate change (forests absorb carbon to reduce greenhouse gases), etc.; for example, hydropower plants make payments for farmers to plant and protect forests;	Government, local people and hydropower plants benefit;	Local communities, residents, land owners, forest owners and agencies assigned to manage land areas and forests.

Source: Summarized by the authors from reports of VNFF, CIFOR and articles of other authors.

3.2. Achievements and limitations in payments for forest environmental services in Vietnam in the 2011-2020 period

3.2.1. Fundamental achievements

Firstly, the Government has made great efforts in promulgating legal regulations and policies to form a legal corridor to promote the marketization of payments for environmental services.

Vietnam is one of the first countries in Asia to promulgate the National program on payments for environmental services. Many difficulties still exist; however, thanks to great efforts of the Government and ministries as well as significant supports of international organizations, Vietnam has initially built a policy system for payments for environmental services (the first is payments for forest environmental services) as the legal basis for implementing payments for forest environmental services in Vietnam. The most prominent policies are Decree No. 05/2008/ND-CP and 4 attached guidelines, and Decree No. 99/2010/ND-CP and 13 attached guidelines. In addition to these decrees, the government also issued Decree No.147/2016/ ND-CP in 2016 amending and supplementing Decree 99/2010/ND-CP and Decree No.156/2018/ND-CP to clarify regulations on payment for forest environmental services in the Forest Law 2017. In particular, payment for environmental services is receiving much attention from the government. Article 138 of the Law on Environmental Protection 2020 has expanded the scope of payment for environmental services: in addition to payment for forest environmental services, there is payment for marine ecosystems, mangrove ecosystems, and rocky mountain ecosystems.

Although these policies are still insufficient; they have formed a basic ground for the implementation of the payment market for environmental services in Vietnam.

Secondly, the institution and organization of the enforcement apparatus for the environmental service market have been initially established, Forest Protection and Development Funds from central to grassroots levels have been established, creating an intermediary in the payment mechanism for environmental services.

The Steering Committee of Vietnam Forest Protection and Development Fund (VNFF) is formed in most of the provinces where the Forest Protection and Development Fund is established (44 Forest Protection and Development Funds at the provincial level have been established in a total of 60 provinces). In addition, VNFF has also signed 659 authorization contracts on payments for forest environment services with facilities in charge of using payments for forest environment services. This is an important momentum to implement the marketization of payments for environmental services.

After 10 years from the effective date of Decree No. 99/2010/ND-CP, the Forest Protection and Development Fund has been established in 45 provinces nationwide; of which the organizational apparatus of 39 Funds at the provincial level has been stabilized and formed specialized departments with headquarters and put into operation [2]. Such Forest Protection and Development Funds have performed successfully their authorized tasks of payments for forest environmental services; acting as an important and indispensable link in the authorized payment of forest environmental services, from the user to the FES provider. The Forest Protection and Development Fund has actually promoted its important roles and trusted address in mobilizing social resources for forest protection and development, contributing to the policy implementation of forestry socialization.

Currently, 478 hydropower companies, 151 clean water supply companies, 239 industrial companies and 76 tourism companies have signed contracts on authorized payments for forest environmental services with the Central Fund and provincial funds, reaching 16,746 billion VND [2]. On average, from 2013 up to 2020 the collection from FES is about 1,600 billion VND/year. This is a great resource, contributing to better forest protection and income improvement for local people who directly protect forests, most of them are ethnic minority households and poor households; playing the main role in implementing the socialization of forestry and poverty reduction.

Thirdly, the awareness of environmental service providers has been improved strongly.

Forest owners who do not understand what forest environmental services are, now have realized their responsibilities for providing and paying for environmental services that are to clarify areas, scope and boundaries of forests for providing and paying for environmental services and payments for environmental services must be corresponding to payments for environmental services to be received, it means that it is necessary to clarify responsibilities in association with rights. From there, the capacity and efficiency of forest management, use and protection are improved, contributing to the implementation of forestry development strategies. According to the survey of the authors on people's understanding level of environmental services, the majority of respondents is interested in

the environment and understands the importance of forests and other ecosystems to their life (92.66% of respondents believe that forests play a role in land protection, soil erosion and flood prevention; 84.56% of respondents think it is necessary to make payments for environmental services to be provided; and 81.47% of respondents are willing to pay additional amounts for better environmental services). This is the basis for moving towards the marketization of payments for environmental services in Vietnam in the coming time.

Fourthly, the number of market participants has grown remarkably.

Thanks to the implementation of payment programs for forest environment services nationwide since 2011 and other State policies, the number of buyers and sellers in the environmental service market (or the market of forest environmental services) has increased significantly.

In the period 2011-2016, there were only 471 buyers and 141,932 sellers in the whole country, then in 2020, there were 887 buyers (an increase of 188.3% compared to the period 2011-2016) and 179,891 sellers (an increase of 126.7 % compared to the period 2011-2016) [2].

Fifthly, the number of transactions has increased and the revenue from environmental service transactions has also increased significantly.

In the period 2011-2016 , the number of transactions was 471 contracts, and the number of transactions increased by 197%, equivalent to 928 contracts in 2020 [2].

In 2020, revenue from transactions of environmental goods and services is 2,820 billions VND (an increase of 996.4% compared to 2011) [2].

The total expenditure for forest owners also increased year by year. The total expenditure for environmental service providers from 2011 to 2020 was 13,764 billions VND.

All impressive figures as mentioned above express that the performance results of payments for forest environmental services in Vietnam in recent years have obtained positive achievements for the formation and development of the forest environmental service market in particular and environmental services in Vietnam in general in the next years.

3.2.2. Some limitations

Although Vietnam is the first country in Southeast Asia to issue the National program on payments for environmental services, the Government, ministries and agencies at all levels have paid great attention to this field since the 2000s, the process of marketization of payments for environmental services in Vietnam still faces many problems so far. Specifically:

Firstly, the legal framework for operating payments for forest environmental services in Vietnam is still short and weak.

Current regulations related to payments for forest environmental services are only guidelines. There are a few circulars on guiding the implementation but insufficient for participants to implement the payments for environmental services; for example, ownership rights, environmental service prices and so on, have not been specifically guided. The formation of a payment market for environmental services requires the development of a full legal institutional framework. The unclear determination of the ownership of natural resources of individuals causes difficulties in preparing payment contracts for environmental services because natural resources, especially land resources, are owned by the State, and

individuals do not have property rights to these resources. A comprehensive and consistent legal basis and database on land and forest use rights is incomplete and has not been established. One of the major contents of signing payment contracts for environmental services is that the seller shall have the right to sell goods provided; it means that the seller shall have property rights. In Vietnam, this is a difficult problem because the land is owned by the State. Therefore, the State should enact appropriate mechanisms to allocate long-term land use rights to people.

Secondly, the payment level is still low and Vietnam doesn't really have a true-PES

The payment mechanism for environmental services in Vietnam is still not qualified to be an actual payment mechanism for environmental services when it still lacks a market-based payment system and the payment is still short of mandatory criteria. Researches on payments for environmental services in Vietnam show that both buyers and sellers do not voluntarily participate in payment contracts for environmental services and the payment is not qualified (according to 5 criteria of a true PES as proposed by Wunder). In practice, the payment for environmental services in Vietnam can be seen as a “performance-based salary system for rangers” or as an “unconditional small-scale welfare subsidy”. In addition, environmental service providers (forest growers and protectors) are only paid an amount corresponding to compensation for labor opportunities, not for the value of services provided from forest areas.

The current level of payment for environmental services specified in Decree No. 147/2016/ND-CP is being integrated with electricity and water bills (specifically, 36 VND/kWh for electricity and 52 VND/m³ for water). Based on calculations by experts, this payment level is much lower than the value of services provided by the environment. Therefore, to operate the payment market for environmental services, it is necessary to develop a market-oriented price list for environmental services. In addition, the payment level for environmental services per hectare is determined on the basis of the total amount of payment for environmental services received from buyers divided by the total forest area for providing services. Based on this calculation method, places where forest areas are high will receive lower payments and places where forest areas are low will receive higher payments. A higher payment will generate greater driving forces for forest protection in low-forest cover areas; however, low payments will promote the forest conversion in high-forest cover areas. In addition, buyers of environmental services receive very little benefit from payments for environmental services because they have to pay the same fee regardless of the actual condition of the area.

The payment mechanism for environmental services does not clearly identify buyers, sellers and intermediaries, and there is no significant information exchange among these major groups. Especially, there is no response between service users and service providers. This is the disruption of information of subjects in the market.

Thirdly, people's understanding level of environmental services is still limited, and many population groups are not really willing to pay for the environmental services that they are receiving.

Although the payment for forest environment services has been applied across the country since 2010, the understanding of this service is very low, most of the relevant ministries and branches have not been trained to be familiar and raised the awareness about the payment for environmental services. Only a few communities in pilot areas under programs and projects on payments for environmental services, especially officers related to forest management, have been trained to be familiar with this activity. The majority of communities in pilot areas are ethnic minorities, they have been trained but their awareness of paying for environmental services is not really high. There is also a majority of the population that does not know or even hear about payments for environmental services.

People's understanding level of payments for environmental services is clearly expressed in the summary table of survey results (Table 3.2) as follows:

Table 3.2. People's understanding level of payments for environmental services

Questions	Answers					
	Ever heard	Never heard				No answer
Have you ever heard of the concept of payments for environmental services?	57.53%	40.15%				2.32%
How do you know understand about payments for environmental services?	Pay an amount to solve environmental pollution	Pay an amount to protect the environment	Pay an amount for benefits provided by the environment	Pay an amount for causing environmental pollution and degradation	Pay an amount for environmental pollution treatment, waste collection and treatment	Others
	52.12%	67.57%	44.02%	29.73%	45.95%	0.39%
Have you ever heard about Decree No. 99/2010/N D-CP (or Decree No. 147/2016/N D-CP) on	Ever heard	Never heard				No answer
	37.45%	61.78%				0.77%

Questions	Answers					
payments for environmental services						
Do you know that in each Kwh of electricity and m ³ of water, and entrance ticket, they have already included an amount of payment for environmental services?	Yes	No				No answer
	50.97%	48.61%				0.42%

Source: Summary of questionnaires by the authors

The survey results (Table 3.2) show that up to 40.15% of the respondents (the total number of issued questionnaires is 300, and the total number of votes collected is 259) stated that they have never heard of the concept of payments for environmental services, 61.78% of respondents have never heard or known about Decree No. 99/2010/ND-CP on payments for environmental services. This is a clear explanation for the fact that only 44.02% of the respondents think that environmental payment is to pay an amount of money for benefits provided by the environment, while the majority of people understand that payment for environmental services is to pay an amount of money to remedy pollution and protect the environment. Even up to 48.61% of respondents do not know that they are paying an amount of money for environmental services they are using (included in their water and electricity bills) every month.

The knowledge and understanding of market participants and people are still lacking and information access capacity is weak. To form and develop a market of payments for environmental services, it is essential to improve people's awareness because they are the participants in the market of payment for environmental services. To operate the market for payment of environmental services, the most important requirement is that economic subjects in such market must be fully informed. One of the reasons that direct payments have not been implemented (just in the form of pilot) is due to lack of information and negotiation skills in payment contracts on environmental services of environmental service providers.

Therefore, they are easily to be constrained by parties using environmental services when carrying out direct transactions.

All parties including sellers, buyers and intermediaries do not have a thorough understanding of requirements and contracts, and people’s understanding of payments for environmental services is still lacking, and people’s environmental information access is still limited. This makes environmental service providers (mainly residents in disadvantaged areas) face many difficulties when negotiating terms and conditions of contracts with users of environmental services. The summary of the survey results based on questionnaires shows that the majority of people are aware of the importance of the environment; however, people's understanding of environmental services and payments for environmental services is still restricted (refer to Table 3.3).

Table 3.3. People’s understanding about the importance of the environment

Unit: %

Question	Answer						
Which benefits (services) does the environment provide to you and your family	Provide foods, clean water, and raw materials	Act as a waste storage place	Mitigate natural disasters, climate regulation, watershed protection	Assure the soil improvement, soil nutrient regulation	Provide entertainment, aesthetic, cultural, and educational services	Guarantee the biodiversity conservation	Others
	82.63	48.26	77.61	67.18	50.58	58.30	2.70
In your opinion, what role does the forest play in the community?	Provide wood, timbers and other forest products other than wood	Absorb and store carbon	Protect and prevent soil erosion, floods	Store and supply water sources for daily life and production	Keep the climate fresher and cooler	Provide giving-birth places, natural breeds and foods	Provide tourism products
	78.38	79.54	92.66	73.75	81.85	65.64	64.09

Source: Surveys by the authors

It can be seen that most people (over 60% of the respondents) are well aware of the role of the environment in general and the forest in particular in their life. However, when in-depth questions are proposed in regard to payments for environmental services, a high rate (around 40.15% of the respondents) had never heard of the payment for environmental services, many respondents said that payments for environmental services are amounts to remedy environmental pollution or pollution treatment and waste treatment services (52.12% of the respondents). These figures show that people’s understanding of payments for environmental services is insufficient.

Furthermore, surveys of population groups in two big cities including Hanoi and Ho Chi Minh City and some other provinces across the country show that most people are aware of the importance of environment and environmental protection but they do not understand exactly about environmental services. Many people believe that payments for environmental services are amounts paid for environmental damage and pollution (accounting for 52.12% of the respondents); or for pollution treatment and waste collection and treatment (accounting for 45.95% of the respondents). Many people consider that benefits from the environment such as climate regulation, regulation of water sources, biodiversity preservation and so on are obvious ones, they don't have to make payments for these services. Some residents are not willing to pay additional amounts to benefit services provided by the environment (10.42% of the respondents are not willing to make an additional payment for benefits provided by the environment). Table 3.4 shows in detail people's willingness to make payments and their perspectives on subjects who have to pay for environmental services:

Table 3.4. People's willingness of payment and their understanding of subjects in charge of payments for environmental services

Unit: %

Question	Answer					
	Yes	No				Others
Are you willing to pay an additional amount to take advantage of more benefits from the environment?	81.47	10.42				7.43 (still thinking)
In your opinion, who should pay for benefits provided by the environment?	Everyone	State authorities and agencies	Tourism companies	Hydropower companies, clean water production companies	Industrial production facilities	Others
	82.63	21.62	33.98	27.41	25.10	0.77

Source: Surveys by the authors

The survey results show that most people know that they are the ones who have to pay for environmental services (accounting for 82.63%), but only about 30% of the respondents think that tourism companies, hydropower plants, clean water supply plants and industrial production facilities are also subjects that have to make payments for environmental services. This expresses that people still don't really fully understand payments for environmental services.

Fourthly, the State's role has not been clearly defined and still characterized by administrative natures

The State of Vietnam currently still takes the dominant role in terms of payments for environmental services through setting fixed prices for forest environmental services and operations of Forest Protection and Development Funds. The implementation of payment transactions for environmental services is imperative and administrative orders. Vietnam's economy has been transitioning to the market mechanism for more than 30 years; however, the subsidy mechanism still exists in many sectors, including environmental services. In this sector, some transactions of forest environmental services have been marketed since the early 2000s, but it is still at the early stage. This means that the State is still the main provider of environmental services and goods and is also the main buyer of such services and goods; while people can use environmental services without paying fees in many cases, or they have to pay fees but not equivalent to the actual value of environmental services and goods. Once all goods exchange relations among countries are carried out on the basis of market principles, Vietnam will not maintain this situation any longer. In other words, the development of a global unified market requires Vietnam to urgently shift the payment mechanism for environmental services from the State to the society. However, due to the serious influence of previous mechanisms on Vietnamese people's thinking and actions, this will be a big difficulty in the process of marketizing environmental services in Vietnam.

In practical terms, not only in Vietnam but in all countries, if the State is still a major subject in charge of implementing payments for environmental services, the efficiency of forest protection and uses will be low. Because the State's payment implementation is often carried out on a large scale with many targets, leading to a spread distribution of resources, and programs are not designed in detail to make a difference among localities as well as different types of environmental services, as a result, the efficiency is low. Therefore, the payment for environmental services transferred from the State to the society is an inevitable trend and also a long-term process.

4. Discussion and Conclusion

The first, a legal framework is essential to clearly regulate market participants such as services to be provided, service users, service providers and relevant parties.

The second, a payment mechanism must be developed in accordance with the national management regime; however, it also must be flexible to generate opportunities for local communities and people to participate. This is considered a basic condition for sharing benefits provided by environmental services and a key to form and develop the market of payments for environmental services.

The third, in the early stages of formation of the market of payments for environmental services, it is impossible to conduct it simultaneously in all sectors; on the contrary, it must be carried out gradually and step by step. It is required to choose a sector with potential conditions of goods, supply and demand, and human resources, then implementing the marketization and then spreading to other sectors.

The fourth, it is essential to legalize property rights for entities providing environmental services. One of the conditions for the implementation of PES is that participants providing environmental services must have their property rights; for example,

there should be a mechanism to assign long-term land use rights to people, especially local people in difficult areas. For successful performance, it is necessary to raise the understanding and awareness of relevant parties in terms of indispensable roles of providing environmental services.

The fifth, regardless of the payment mechanism for environmental services, countries still highly appreciate the State's role in regulating PES models. The State always plays an important role in formulating legal and policy frameworks, assuring the technical and financial support through integrated programs, improving processes related to policy performance; supervising the transaction process of environmental services; developing policies to support PES, and making investments in ecological investigation programs and researches, economic evaluation of ecosystem services and so on. However, in the market mechanism, the State should only play a macro-regulatory and supervisory role in terms of payments for environmental services.

tienngt@ueh.edu.vn

Faculty of Management, UEH University - Vinh Long Campus, Vietnam

Abstract

One of the greatest scourges of our time is air pollution, not only because of its impact on climate change but also its impact on public health and the economy. socioeconomic. The only way to solve this problem is through public awareness along with the multidisciplinary approach of scientific experts, the relevant local ministries and agencies must soon detect the cause and promptly solve it. the emergence of this threat and suggest sustainable solutions.

Keywords: *air pollution, environment, health, public health, gas emission*

1. Introduction

According to the 2021 National Status Report, Vietnam has made an important development step, achieving impressive socio-economic achievements, although the end of 2020 and 2021 are heavily affected by the COVID-19 pandemic. -19 globally, but Vietnam is still in the group of countries with high economic growth in the world. In which, our country's economy in 2020, economic growth will reach 2.91%, in 2021 economic growth will reach 2.58% (Vietnam Economic Institute, 2022). However, in addition to economic development, an important challenge for Vietnam today is how to manage rapid and sustainable economic development while combining it with preventing negative impacts. extremes of environmental degradation and climate change. Besides that, Environmental protection work in Vietnam has achieved certain results in the control and prevention of environmental pollution. However, the situation of environmental pollution continues to be complicated in some areas such as: air pollution in some big cities, industrial parks, production and business areas.

The study provides a picture of the current status and evolution of environmental components that increase emissions in the air under the pressure of economic development, industrialization and urbanization.

2. Method

The article describes the current state of Vietnam's environment in the 2016-2020 period, assesses an overview of Vietnam's environmental situation, from socio-economic development activities, causes and main sources of impacts on the environment. impact on atmospheric emissions. Thereby, identifying challenging issues in the management and

protection of the environment and proposing solutions to implement effectively and sustainably in the coming years.

The article is built based on the model of Motivation - Pressure - Status - Impact - Response. (Country Status Report, 2021).

The driving force is socio-economic development activities, population growth, urbanization speed, structural shift of economic sectors in urban and rural areas, changes in service delivery forms. services, commerce, etc., these forces together with climate change, natural disasters and environmental incidents.

Pressure changes the quality of the environment.

Current status: assessed including changes in quality of environmental components: air, arising status. The quality of environmental components is assessed by comparing the actual results of the environmental status through environmental parameters with current environmental technical regulations, and at the same time comparing between years in the period. period 2016 - 2020 and compare with the previous period to assess the evolution of environmental quality.

Impact on community health, socio-economic development activities. The analysis of the current situation and shortcomings in the management and protection of the environment is the basis for content development.

Response: includes solutions to prevent and minimize air pollution, and effectively manage environmental quality in line with sustainable development goals in the next period.

The information and data used in the article are synthesized from official sources, in which, socio-economic data: from statistical yearbook reports; data related to the environment and climate change: from the Ministry of Natural Resources and Environment, a number of ministries, branches and reports of 63 provinces and cities directly under the Central Government.

3. Results

3.1. Environment in Vietnam: pressure on air pollution

3.1.1. Socio-economic development

Population and urbanization

Vietnam is going through one of the fastest urban transitions in the world. It is the main driver of economic growth. According to the report of the Ministry of Construction, by the end of June 2021, the coverage rate of urban zoning planning compared to construction land area in urban areas across the country will reach about 53%; in which, 2 special urban areas (Hanoi, Ho Chi Minh City) and 19 grade-I cities reach about 80-90%; in urban areas of grades II, III and IV, about 40-50%. The Resolution of the 13th Party Congress has set a target that the urbanization rate of our country will reach 45% by 2025 and about 50% by 2030. The increased urbanization rate creates favorable conditions for socio-economic development, promotes the transformation of economic structure and labor structure towards industrialization and modernization.

Urbanization means concentration of population and industrial development, contributing to economic growth. Total population growth is not high, but people are moving rapidly to urban centers and leaving agriculture for industry and services (World Bank 2011a).

Besides the positive aspects, according to the National Status Report in 2021, the urbanization process in Vietnam also creates many challenging problems such as: controlling urban development and building unsynchronized infrastructure according to the planning; inefficient use of land resources; the speed of migration to urban areas increases faster than the rate of urbanization and socio-economic growth, creating great pressure, causing overload in the use of infrastructure; traffic jams, flooding; especially the issue of environmental pollution and the impacts of climate change. Urban development in our country is uneven among regions and there are many disparities between different regions in terms of geographical characteristics. The increase in population causes the number of circulating personal vehicles to increase accordingly; Many old and outdated vehicles are still used and released into the environment a large amount of dust and emissions.

Another feature of urban development and urbanization is the concentration of industrial activities, industrial parks with different types of production and services. The sharp increase in industrial production leads to an increase in soil, water, air pollution, and disease burden. In addition, ecosystems in many urban areas are broken down to serve socio-economic development, such as leveling lakes and ponds, reducing green areas and parks to serve infrastructure development. Urban development means an increase in the number of roads, means of transport, buildings and utilities serving urban areas, thereby reducing air circulation leading to accumulation of toxic wastes, causing environmental pollution. urban air pollution, especially dust pollution.

Industrial development

Asia Pacific Energy Research Center (2006), strong industrialization contributed to a strong economy during two decades of growth fueled by vigorous exploitation of natural resources. In 2008, the share of industry in gross domestic product (GDP) reached 40% while agriculture's share fell to 22%. Vietnam's industrial growth has driven an increase in annual energy consumption and corresponding emissions (Figure 1).

Figure 1. Carbon Dioxide Emissions in Vietnam by Sector, 1980–2030

Source: Asia Pacific Energy Research Centre. 2006. APEC Energy Demand and Supply Outlook 2006. Tokyo

In 2008, energy consumption growth was 11.3%, a consistent trend over the past decade (Asia Pacific Energy Research Center 2011). Energy consumption mainly consists of oil and coal, and 28,479 kilotons of oil equivalent. Due to the growth trend in total energy use and the heavy dominance of fossil fuels, national greenhouse gas emissions, 177 tonnes of carbon dioxide equivalent in 2005, are expected to triple by 2030. (World Bank 2011).

According to the Statistical Yearbook 2020, industry is an important contributor, accounting for a large proportion in the economic structure. In the 2016-2020 period, industrial production accounts for more than 30% of the country's GDP, continuously growing at a relatively high rate, averaging 8.2% per year. The processing and manufacturing industry continues to affirm as the bright spot of the industrial sector with an average growth rate of 10.6% per year in the 2016-2020 period.

The structure of industries has changed positively, increasing the proportion of the processing and manufacturing industry and decreasing the proportion of the mining industry. A number of industries have had strong development, especially electronics, textiles, footwear, food processing... Many private enterprises and industrial groups formed and developed in the country have potential. Good force operates in the fields of manufacturing and assembling cars, food processing, iron and steel, metals. Currently, although the number of enterprises with high technology level is increasing, however, there is still quite a distance compared to some other countries in the region. Therefore, in order to produce goods, it is necessary to consume more raw materials and energy, generate more waste, and put pressure on the environment.

Industrial Park

Ministry of Planning and Investment - Report on establishment and development of industrial parks and economic zones in 2020 By the end of 2020, there are 369 industrial parks established nationwide (including 329 industrial parks). Industrial parks are located outside economic zones, 34 industrial parks are located in coastal economic zones, 06 industrial parks are located in border gate economic zones) with a total area of about 114 thousand ha. Of which, 284 industrial parks have been put into operation, an increase of 72 industrial parks compared to 2015. In general, the number of industrial parks put into operation tends to increase over the years, of which the largest increase is in the years 2018 and 2019.

According to the Government's report on environmental protection in 2020, 90.69% of operating industrial parks have concentrated water treatment works, of which 90.9% have installed monitoring systems. automatic wastewater. Some localities have focused on selecting and attracting environmentally friendly, advanced technology projects with high investment in environmental protection. However, many projects and facilities are currently investing and operating in industrial zones with the risk of causing environmental pollution such as metallurgy, mineral extraction, ship demolition, paper and pulp production. Paper, textile, dyeing, tanning, petrochemical refining, thermal power, steel production, chemicals, chemical fertilizers,... This is a big challenge for the control of waste sources causing environmental pollution.

Figure 2. Number of cars nationwide in the period 2016 - 2020

Source: Website of the Vietnam Register of Administration - General traffic in the country (2016 - 2020)

Motor vehicles using gasoline and diesel fuel give rise to many air pollutants such as CO, volatile organic matter (VOC), SO₂, NO_x, dust... Currently, the increase in road motor vehicles, especially cars and motorbikes, along with the unsatisfactory quality of the roads, the low quality of fuel used is one of the main causes of air pollution.

In order to control environmental pollution from traffic activities, the Ministry of Transport has promoted environmental protection through inspection and certification of environmental protection for means of transport. According to the report on environmental protection in 2020 of the Ministry of Transport, by the end of 2020, the emissions have been tested for 1,736,188 gasoline engine cars and 1,749,387 diesel cars are being tested. circulate.

+ Craft villages

According to the report on environmental protection in 2020 of the Ministry of Agriculture and Rural Development, the whole country currently has 4,575 craft villages, of which 1,951 are recognized trade villages.

Table 1. Number of recognized craft villages by 2020

No.	Group of craft villages	Quantity	Percentage
1	Group of craft villages producing bamboo and rattan products, ceramics, glass, textiles, yarn, embroidery, knitting, small mechanics, sculpture	935	47.9
2	Group of craft villages processing and preserving agricultural, forestry and fishery products	640	32.8
3	Other groups of craft villages	376	19.3

Source: Report on environmental protection in 2020 of the Ministry of Agriculture and Rural Development

Environmental protection in craft villages has not been paid due attention, very few craft villages have solid waste collection and treatment systems. According to the report on environmental protection of the Ministry of Agriculture and Rural Development in 2020; the percentage of craft villages with industrial solid waste collection points reached 20.9%.

Table 2. Amount of waste generated from craft villages

No	Craft villages, traditional craft villages	Amount of waste treated			
		Solid waste (ton/day)	Rate of treatment (%)	Wastewater (m3/day)	Treated rate (%)
1	Processing and preserving agricultural, forestry and aquatic products	4.21	81.0	7,000	45
2	Production of handicrafts	3.6	79.5	1,800	55.3
3	Handling and processing raw materials for the production of rural industries	4-4.5	42.5	-	-
4	Producing wooden furniture, bamboo and rattan, ceramics, glass, textiles...	2-5	-	-	-

Source: Official Dispatch No. 2250/BNN-KHCN dated March 27, 2020 of the Ministry of Agriculture and Rural Development

The source of air pollution in craft villages is mainly from the use of coal as fuel (commonly low-quality coal), and the use of chemicals in production technology lines. In which, the group of craft villages that emit the largest amount of pollution are recycling (metal, plastic), recycling and processing, surface treatment, spray painting, product surface polishing, firing, drying, etc. bleaching, forge flue gas... generates dust and emissions such as SO₂, NO₂, acid and alkali vapors. Typically, Trung Van plastic recycling craft village (Hanoi), Dai Bai bronze casting craft village (Bac Ninh province), Binh Yen aluminum recycling craft village (Nam Dinh province).

✚ Construction development

According to data from the Ministry of Construction, the average growth rate of the construction industry in the period 2016 - 2020 is 8.5 - 8.7%/year. Construction activities, traffic, technical infrastructure, transportation of materials, construction waste... take place in many places, especially big cities. In the field of building materials production, cement production is one of the industries with the highest risk of environmental pollution, in which the main source of pollution is dust arising from the process of calcining and grinding cement. . Exhaust gas flow at cement production facilities varies depending on the technology and operating mode; According to an estimate on 10 large cement production facilities across the country, the emission volume is about 10.8 million m³/h. According to Decree No. 40/2019/ND-CP of the Government, clinker production facilities belong to the list of types of industrial production that are at risk of causing environmental pollution and need special control and supervision measures. For activities such as transporting materials, dumping construction waste, although there are regulations on environmental protection, the

implementation is still inadequate. Construction materials are scattered during transportation, causing very serious dust pollution, affecting the surrounding air environment. Construction solid waste is discharged in large quantities, over a large area, if not treated, in the long run, it will change the soil and soil properties, potentially affecting the growth of plants, and at the same time. adversely affect landscape ecology. Although there are regulations on environmental protection, the implementation is still inadequate. Construction materials are scattered during transportation, causing very serious dust pollution, affecting the surrounding air environment. Construction solid waste is discharged in large quantities, over a large area, if not treated, in the long run, it will change the soil and soil properties, potentially affecting the growth of plants, and at the same time. adversely affect landscape ecology. Although there are regulations on environmental protection, the implementation is still inadequate. Construction materials are scattered during transportation, causing very serious dust pollution, affecting the surrounding air environment. Construction solid waste is discharged in large quantities, over a large area, if not treated, in the long run, it will change the soil and soil properties, potentially affecting the growth of plants, and at the same time. adversely affect landscape ecology.

Transport development

Our country's transport infrastructure has developed quite rapidly, especially the road transport system with many key projects put into operation and put into use. However, the level of transport infrastructure development has not yet met the needs of socio-economic development; high transportation costs; connectivity between regions as well as connections between expressways is still limited; Urban transport has not been developed, public passenger transport in urban areas is still limited, traffic jams still occur in big cities such as Hanoi, Ho Chi Minh City... Besides, the quality of the infrastructure is low. The low traffic level, along with the development and construction of residential areas and industrial zones along national highways have led to air pollution. (National Status Report, 2021).

Accompanied by a high rate of urbanization and the mechanical increase of population in urban areas is a rapid increase in the number of motorized vehicles. According to data from the Vietnam Register, by the end of 2020, there are 4,180,478 cars and tens of millions of motorbikes and motorbikes in circulation nationwide.

Motor vehicles using gasoline and diesel fuel give rise to many air pollutants such as CO, volatile organic matter (VOC), SO₂, NO_x, dust... Currently, the increase in road motor vehicles, especially cars and motorbikes, along with the unsatisfactory quality of the roads, the low quality of fuel used is one of the main causes of air pollution.

In order to control environmental pollution from traffic activities, the Ministry of Transport has promoted environmental protection through inspection and certification of environmental protection for means of transport. According to the report on environmental protection in 2020 of the Ministry of Transport, by the end of 2020, the emissions have been tested for 1,736,188 gasoline engine cars and 1,749,387 diesel cars are being tested. circulate.

✚ Energy development

In Vietnam, energy sources are quite abundant (fossil fuels, hydroelectricity, biomass, wind energy, solar energy...); however, the current power supply is mainly based on hydroelectricity and coal-fired power. Large hydroelectric power plants are concentrated mainly in the North due to the mountainous terrain and hydrological advantages. Most coal-fired power plants are also built in the North. According to the revised Power Plan VII, by 2020, the total electricity capacity to be put into use will be 60,000 MW, 96,500 MW by 2025 and 129,500 MW by 2030. In the 2016 - 2030 period, the average annual total capacity of the power source to be completed and put into operation is 7,000 MW. For thermal power plants, each type of technology will generate different types of waste. The amount of waste generated depends on the type of fuel used and production technology. In which, coal-fired power emits a large amount of dust and SO, NO; FO oil-fired thermal power plants emit mainly SO₂, NO₂ gas; gas thermal power - mixed gas turbine emits mainly NO_x gas.

✚ Medical activities

According to the report on environmental protection in 2020 of the Ministry of Health, the whole country has about 13,674 medical facilities, of which there are about 1,253 hospitals. The total amount of hazardous medical solid waste generated is about 23,925 tons/year. The increase rate of medical solid waste depends on the number of hospital beds, the implementation of medical techniques and the people's access to medical services (about 9.3%/year). The amount of medical solid waste increased in most localities, stemming from a number of reasons such as: an increase in the number of medical facilities and an increase in the number of hospital beds; increase disposable medical products. Some localities have a large number of central and provincial hospitals with a large number of beds, corresponding to a high amount of waste generated.

Medical solid waste is mostly collected and treated by incineration, however, some incinerators do not operate to meet the requirements for environmental protection, causing emissions to pollute the environment.

3.1.2. Dust

According to the report of the General Department of Environment for the period 2016 - 2020, air pollution continues to be one of the hot issues, always receiving the attention of many countries around the world. In Vietnam, air pollution is mainly dust pollution in big cities, urban areas and industrial areas. In particular, fine dust pollution in some big cities such as Hanoi and Ho Chi Minh City still occurs frequently. In the Northern region, pollution levels tend to increase from 2017 to 2019 (the highest in 2019) but by 2020 it has decreased more.

3.2. Environmental quality in big cities

In the 2016-2020 period, although the air quality is different each year, dust pollution often occurs in big cities, urban areas, craft villages and rural areas.

3.2.1. Dust

According to the national status report 2021, compiled from monitoring data of the Vietnam Environment Administration for the period 2016-2020. It shows that in urban areas,

the outstanding problem for the air environment around industrial zones is still dust pollution. The parameter value of total dust in the air in many industrial zones has exceeded the threshold of QCVN 05:2013/BTNMT. Comparison of data shows that the value of the total dust parameter in the air around the industrial zones in the North is much higher than that of the industrial zone in the South, while the value of the parameter of the total dust in the air around the industrial zones is significantly higher. There is not much difference between central and southern industries. The reason may be due to the structural characteristics of the type of production, technology, fuel, and location of different regions. In the North, near industrial zones, there are also many thermal power plants, Large-scale cement production consumes a lot of fossil fuels, which leads to large dust emissions. In addition, compared with other regions, the North still exists some old industrial zones with outdated technology, generating more pollutants. Many industrial parks in the North are also located near urban areas and major traffic axes, so the value of the total dust parameter in the air around these industrial parks is also affected by the construction of urban infrastructure and traffic. transportation.

In industries, mining activities, power generation, and cement generate much larger amounts of dust than in other industries. The most polluted areas are usually about 1.5 - 3 km from the chimneys of these factories. In construction materials mining areas, the TSP parameter value often exceeds the threshold of QCVN 05:2013/BTNMT many times; The reason is that the stages of mining, crushing, transportation... have released a large amount of dust into the environment.

3.2.2. Values of SO₂ and NO₂ parameters

According to the national status report 2021, compiled from monitoring data of the Vietnam Environment Administration for the period 2016-2020. The measured SO₂ parameter values around the northern industrial parks are much higher than those in the southern provinces, in the northern provinces there are many types of industries that use a lot of fuel such as heat and fuel. electricity, leading to large SO₂ emissions.

In contrast to the SO₂ parameter, the NO₂ parameter value around the southern industrial zones is higher than the northern industrial zones. The reason may be due to the concentration of industries in the South such as chemicals, metal products, electronics... However, in most regions, the values of both SO₂ parameters and NO₂ is still within the threshold of QCVN 05:2013/BTNMT.

3.2.3. Air quality in craft villages and rural areas

- The atmosphere of the craft village

Air pollution in craft villages compared to the previous period has generally not been controlled. In some craft villages, there is an increasing trend. The main reason is that the fuel used in popular craft villages is low-quality coal, outdated production technology, and not yet invested in waste treatment. Air pollution in craft villages is mainly dust, toxic gas, metal vapor, odor and noise, depending on the nature, scale and products of each type of industry. In some craft villages, odor pollution is still a prominent problem. Odor pollution occurring in craft villages varies widely in type and extent, depending on the production

characteristics of the craft village. In the agricultural and food processing craft villages such as Phuc Lam slaughter village (Bac Giang), Duong Lieu agricultural product processing village (Hanoi), Odor pollution due to the decomposition of organic matter in the production waste gives rise to a rotten, unpleasant odor and causes odor pollution over a large area. In some craft villages such as Chang Son and Bang Huu carpentry villages (Thach That, Hanoi), Phu Nghia and Truong Yen rattan and bamboo craft villages (Chuong My, Hanoi), Phu Yen leather and footwear villages (Phu Xuyen, Ha Noi). Internal odor pollution arises mainly from the use of organic solvents in the process of painting and polishing products. However, the problem of pollution occurs from time to time, not continuously. (Country status report 2021). Odor pollution arises mainly from the use of organic solvents in the process of painting and polishing products. However, the problem of pollution occurs from time to time, not continuously. (Country status report 2021). Odor pollution arises mainly from the use of organic solvents in the process of painting and polishing products. However, the problem of pollution occurs from time to time, not continuously. (Country status report 2021).

- Rural air environment

The air quality in rural areas is still quite good, in many areas there are no signs of pollution. The values of typical parameters for the surrounding air environment are mostly within the threshold of QCVN 05:2013/BTNMT. However, some rural areas are affected by the activities of craft villages, industrial sites interspersed in residential areas, landfilling and burning of biological solid waste as well as infrastructure development as in some rural areas. Provinces such as Bac Ninh, Vinh Phuc, Quang Ninh, Dak Nong, Gia Lai, Ba Ria - Vung Tau, Hau Giang, Ben Tre... have shown signs of local air pollution. Besides, after each crop, there is a large amount of by-products arising from crops, but only a part is recycled and reused, the rest is often burned in the field, causing air pollution. local (haze phenomenon).

3.3. Impact of environmental pollution

Environmental pollution has been causing many negative impacts on public health, economic losses as well as social problems. The degree of influence of each object depends on many factors such as health status, concentration, type of pollutant and time of exposure to the polluted environment. In addition to economic losses due to disease burden, environmental pollution also affects production activities (focusing on fisheries, agriculture, tourism, etc.) and damages due to cost of quality improvement. environment.

3.3.1. Impact on public health

The Global Burden of Disease Report (IMHE, 2017) has pointed out the risk factors for death and disability in Vietnam, in which air pollution ranks 6th, up 1 place compared to 2007., behind causes such as high blood pressure, blood sugar, smoking and alcohol use. According to the latest update in 2019, air pollution has increased 1 place to 5th in the ranking of the risk of death and disease in Vietnam (IMHE, 2019).

Air pollution, especially fine dust pollution, is becoming a problem for developing countries like Vietnam. There has been much research around fine dust as well as the ill effects of fine dust pollution. Exposure to high levels of dust in the air, especially PM2.5, increases the risk of diseases such as acute lower respiratory tract infections, stroke, heart

attack, chronic obstructive pulmonary disease, and chronic obstructive pulmonary disease. lung cancer. For the age group 65 and older, the disease burden from fine dust is myocardial infarction, and chronic obstructive pulmonary disease. Meanwhile, fine dust is the cause of lower respiratory infections with the age group under 01 and 05 years old.

Exhaust gas from traffic and industrial activities contains many toxic components such as CO, NO₂... which can cause cancer or irritation, some other toxins can also be absorbed into the blood, causing serious effects on human health. human health. Exposure to NO₂ gas will damage the lining of the lungs, increase the risk of respiratory diseases, and aggravate the symptoms of bronchitis in children with asthma. SO₂ gas is a gas that is a strong respiratory irritant, affecting lung function, causing pneumonia, chronic bronchitis, chronic disease, increased sensitivity to people with asthma... When inhaled SO₂ gas (even at low concentrations) can cause spasm of the rectus bronchial muscles. In addition, workers in some industries such as mining, construction, and production of building materials are often at risk of occupational diseases such as lung dust.

3.3.2. Socio-economic effects

According to a report of the World Bank (2016), the global economic losses due to air pollution each year are in the trillions of USD, of which the loss of labor capacity is caused by premature death and related diseases. to air pollution is about 225 billion USD. For Vietnam, air pollution in Vietnam has caused damage up to 5-7% of GDP annually. Besides, according to research by Fulbright University Vietnam, air pollution in our country has caused economic losses of about 9.86-12.45 billion USD in 2013 and increased significantly in recent years. In Hanoi alone, it is estimated that the cost of medical examination and treatment for respiratory diseases and economic losses due to sick leave for inner-city residents is 1,500 VND/person/day. With about 3.5 million people in the inner city, the total economic loss due to respiratory diseases is about 2000 billion VND/year (Ministry of Natural Resources and Environment, 2019). At the same time, according to the survey results of the research team from the National Economics University at the seminar "Economic losses of air pollution and pollution reduction policies" in 2020, from the perspective of At the current economic level, air pollution is due to the current structure of Vietnam's economic growth model, which is still based on resource intensiveness and foreign direct investment (FDI). In the process of exploiting resources, our economy brings low added value, limited energy efficiency, leading to pollution is inevitable. In addition, the FDI sector in our country in recent years has often concentrated in industries such as processing and manufacturing with low technology content, making use of manual labor and causing environmental pollution. Air pollution is due to the current structure of Vietnam's economic growth model which is still based on resource intensiveness and foreign direct investment (FDI). 4. Discussion and Conclusion

4.1. Proposed environmental protection in the following years

4.1.1. Building and perfecting the system of policies and laws

In the following years, the Party and State continue to promulgate many important policies for environmental protection in order to create favorable conditions for environmental protection in the locality, in which focusing on environmental issues. environment such as technical regulations on the local environment to ensure conformity with the socio-economic development situation, natural conditions and requirements for environmental management and protection of each locality; regulations on fees and charges for solid waste collection and management; urban and rural environmental issues; inspect and handle establishments causing environmental pollution; local green growth and sustainable development.

Continue to invest in supporting projects on environmental protection such as waste collection and treatment; improve infrastructure, to limit emissions to the environment from industrial parks, craft villages or from means of transport.

4.1.2. Environmental pollution control

Must be actively implemented through mechanisms, policies and inspection and examination activities. Inspection and testing are carried out on a regular basis; implementing public transparency in order to detect and promptly handle problems related to causing environmental pollution.

Strictly control large waste sources; strengthen measures to prevent the risk of environmental incidents; proactively monitor objects and projects with potential risks of causing environmental pollution and environmental incidents

4.1.3. Scientific research activities

The Ministry of Natural Resources and Environment continues to call for scientific researchers to conduct research at all levels to research science and technology topics in the field of environment, focusing on research research and transfer technology for waste treatment, clean production, energy saving, environmental friendliness, green economic development models; coordinate with relevant ministries and branches to support research activities and technology transfer projects.

4.1.4. Application of technology in waste treatment

The Government and Ministry of Natural Resources and Environment actively coordinate with relevant ministries, branches and localities in selecting solid waste treatment technology suitable to practical conditions of Vietnam in the direction of reducing the waste

rate, increasing the rate of waste being recycled and reused. Invest in local waste treatment plants, put garbage treatment plants into operation; develop and implement programs and plans for waste separation at source.

4.1.5. Mobilizing the participation of the community

Promote the implementation of communication programs on green growth, low-waste, low-carbon economic development, circular economy in the direction of content innovation, diversifying forms of communication suitable to each audience, regions; promote the socialization of training and communication activities on the environment.

Implement a strong communication program to form a broad movement of the entire population to participate in environmental protection, especially in sorting waste at source, limiting the use of plastic and non-degradable plastic bags, and using Once, protect the wild species.

Discovering, setting an example, creating a movement, replicating good and good environmental examples, regions, models, and ways of doing things; promoting positive factors, bright spots, typical areas, areas and fields of the environment in order to create positive changes, gradually reducing or narrowing polluting areas, types and objects, adverse impact on the environment.

4.2. Conclusion

In the period 2016 - 2020, Vietnam's economy maintains a high growth rate, which means that a large amount of waste has been generated to the environment, negatively affecting the economic situation of the region and the environment. has had a very serious impact on environmental components. The relevant Ministries and sectors have synchronously implemented many important and effective solutions to step by step control the pollution increase rate, overcome problems and environmental hot spots. Although many of the above positive results have been achieved, the situation of environmental pollution continues to be complicated on the environmental components of which the most significant is air pollution. Therefore, in order to do well in environmental protection in the coming time, it requires drastic direction, the participation of the whole political system with very high determination from the central to local levels.

FACTORS AFFECTING THE SUSTAINABLE DEVELOPMENT OF RENEWABLE ENERGY: CASE STUDY ON SOLAR POWER IN DA NANG CITY

PhD Candidate. Nguyen Duc Duong
duongnguyenvkt@gmail.com

MSc. Nguyen Tu Anh
anhnguyen90@hotmail.com

Hanoi University of Natural Resources and Environment, Hanoi, Vietnam

Abstract

Vietnam is currently one of the fastest-growing economies in the world. Along with the development of the economy, Vietnam's electricity consumption demand has increased significantly in the recent decade. According to EVN, the average annual growth rate of electricity consumption is about 11%. According to data about the climate of Da Nang city from RETScreen software provided by NASA: Da Nang is located in a tropical climate zone, with an average temperature of about 26°C and a relatively high number of sunny hours a year around 2000 - 2600 hours/year, has a high solar heat radiation potential of about 4.87 kWh/m²/day. This is favorable for exploiting solar power to serve industries in Da Nang city. Solar power will partially replace electricity and other forms of fossil energy such as coal, oil, gas, etc., to reduce production and operating costs and use energy economically and efficiently. The study has identified the factors that affect the sustainable development of solar power in Da Nang; the results of this study help relevant agencies business owners to apply and replicate the application. Solutions to save energy using solar energy sources in

Da Nang city and a valuable reference document for provinces across the country to study and apply.

Keywords: *Solar power, Renewable energy, Danang, Vietnam*

1. Introduction

Energy-intensive companies can make a positive contribution to increasing solar energy usage if business owners actively participate in the work of replacing energy sources and using power by the electricity. application of the power of the face of the public host [2].

The identification of industrial fields with significant potential for solar energy application to meet business requirements is an inevitable trend in line with the Government's development policy to promote the development of solar energy. Rooftop solar power projects help reduce the load on the grid. Moreover, when installing solar power systems at factories, businesses not only save operating costs when they are self-sufficient in some of their electricity consumption needs, but also can sell to the national grid. family. Therefore, the potential application of solar energy for industries needs to be replicated nationwide

Da Nang is a political-economic center of Central Vietnam, according to a report by the General Statistics Office [3], in January 2018, Da Nang leads in industrial growth with a growth rate of 48, 7%. Along with the rapid growth of industries in the city, the demand for electricity is increasing rapidly, leading to an increase in investment capital to develop the power system to meet the reliability of power supply for industrial parks. Karma. The economical and efficient use of energy as well as the exploitation of solar energy to reduce the amount of electricity consumed from the national grid and fossil energy sources are essential to contribute to the goal of of the whole country on keeping the environment clean and reducing greenhouse gas emissions as committed

2. Method

Renewable energy is a broad, scientific concept that is currently being conceptualized in many different ways. A physical science approach, whereby renewable energy is understood as energy sources or methods of energy extraction that, if measured by human standards, are limitless. Infinite has two meanings: (i) energy exists so much that it cannot become exhausted because of human use (eg solar energy); (ii) short-term and continuous self-renewable energy (e.g. biomass) in processes that continue for a long time on earth. **renewable energy** approach, no matter how it is considered, shows that these are non-fossilized, renewable forms of energy, including: small hydroelectric sources, marine energy (generation electricity by waves, tides, ocean currents), wind energy, solar energy, geothermal energy; biomass energy and biofuels.

Regarding the theoretical models related to consumer behavioral intention, there are many theories, typically: Technology approach theory and model (TAM) was developed by FDDavis (1989) based on the theory. “Theory of Reasoned Action”, proposed by Ajzen.

Many researchers have developed components from this TAM model into new technology acceptance theory (TAM2). According to this technology acceptance theory, customers' desire to use technology depends on factors such as: (i) perceived ease of use; (ii) perceived ease of use. There are 3 factors that need to be taken into account constituting the TAM technology acceptance model, including: (i) Perceive Usefulness (PU); (ii) Perceive Easy of Use (PEU) and (iii) Attitude towards use

However, depending on the characteristics of the technology, many researchers have added some features in the use of different technologies (Adams, Nelson, Todd (1992); Venkatesh, Davis (2000). In high-tech services, in addition to the factors in the theory of technology acceptance, there are other characteristics, such as: the risk caused by the use of technology, the perceived cost... like Venkatesh (2000) , Venkatesh, Morris, Davis, Davis (2003), or Workman's (2007), Venkatesh, Bala, (2008),...

On the basis of previous studies, this study continues to use the technology acceptance model based on the concepts in the extended Davis (1989) TAM model to solve the behavior in the intention to use technology. solar energy technology in Da Nang city. The study has included specific variables affecting the application of this service based on the concepts of this TAM model, including perceived usefulness, perceived ease of use, perceived cost perceived risk. In there:

Usefulness: is the degree to which you believe that using solar technology in Danang will improve job performance.

Perceived ease of use: is the degree to which it is believed that using solar power technology in Danang will take no effort.

Perceived risk: is the risk that households perceive when using solar power technology in Da Nang.

Perceived convenience: is the convenience that households feel when using solar power technology in Da Nang.

Policies on the use of solar power: are the government's incentive policies when using solar power technology in Da Nang.

Perceived cost: is the cost that households perceive when using solar power technology in Da Nang.

Trust: is the belief in the use of solar power technology in Da Nang

Intent to use: expressing intention and interest in using solar power technology

3. Results

3.1. Current status of solar energy development

3.1.1. Solar energy, potential and technology to exploit solar energy

Solar energy is electromagnetic radiation produced by the sun. It is the cleanest, most abundant source of renewable energy available for use on earth and is estimated at 3.8 million EJ, more than 10,000 times the consumption of fossil fuels and nuclear fuel. consumed in 2002. Solar energy that keeps the earth's surface at a temperature warm enough to support human life can be converted into useful forms of energy through thermal conversion, photosynthesis electrically or through high-temperature centralized receivers. Solar energy has long been captured through collectors and used for heating purposes very efficiently. The total installed capacity of solar thermal energy systems in the world increased from 62 GWth (89x10⁶ m²) in 2000 to 472 GWth (675x10⁶ m²) in 2017, corresponding to an increase in heat production from 51 TWh. in 2000 to 388 TWh in 2017 [6].

Figure 1. Installed capacity of solar thermal systems in the world and annual thermal energy 2000 – 2017

Source: Solar thermal worldwide 2018 [6]

Figure 2. Installed capacity of wind and solar energy systems in the world and growth rate from 2010 to 2017

Source: AEE INTEC, Global Wind Energy Council (GWEC), SolarPower Europe, REN21 - Global Status Report 2011 - 2018

Solar radiation can also be converted directly into electrical energy through the use of photovoltaic cells [7]. The above data shows that the development rate of solar battery systems is much faster than that of solar thermal and wind energy systems.

3.1.2. Solar potential in Vietnam

Vietnam is one of the countries rich in solar energy potential. Scientists estimate the average solar radiation intensity about 5 kWh/m²/day (1,825kWh/m²/year) [8]. Solar energy in Vietnam is available all year round, is quite stable and widely distributed across different regions of the country.

Table 1. Solar radiation data in Vietnam

Region	Sunshine hour of the year	Solar radiation intensity (kWh/m ² /day)	Evaluate
Northeast	1600-1750	3,3-4,1	Medium
Northwest	1750-1800	4,1-4,9	Medium
North Central	1700-2000	4,6-5,2	Good
Central Highlands and South Central	2000-2600	4,9-5,7	Very good
Southern	2200-2500	4,3-4,9	Very good
National average	1700-2500	4,6	Good

The provinces from Da Nang on average have about 2,000-2,600 hours of sunshine, the amount of solar radiation increased by 20% compared to the northern provinces. Therefore, for localities in the South Central and South Vietnam, the source of solar radiation is a great resource to exploit and use. Solar energy can be used to successfully develop the solar energy industry, including solar photovoltaic (PV) as well as solar thermal (ST) applications for the production of heat for hot water. services for commercial, industrial and civil purposes. A

recent study by the German development cooperation agency in May 2015 [10] estimated that in two decades, rooftop solar PV systems could reach capacities from (2,000 -5,000 USD).) MW and solar power plants using solar cells can reach a capacity of 20,000 MW. Although the potential of solar thermal radiation in Vietnam is very high, in fact, the implementation of new solar energy applications is in the first stage, only a few projects with small capacity have been inaugurated and put into operation. into mining. According to statistics as of May 15, 2019, Vietnam has a total installed capacity of 866.5 MW including 10 solar power plants and 1800 rooftop solar power plants.

Table 2. Solar power plants put into operation

Source: Vu Quang Dang, energy expert, May 2019

In particular, after the Prime Minister issued Decision No. 11/2017/QĐ-TTg dated April 11, 2017 on the mechanism to encourage the development of solar power projects in Vietnam, many solar power plant projects According to data from Electricity of Vietnam (EVN), after 2 years of implementation, up to now, there have been 365 registered and supplemented solar power projects. added to the plan with the total expected capacity 29,000 MWp. Currently, there are 141 projects added to the plan with a total capacity of over 14.00 MWp, of which 95 projects have signed power purchase agreements with EVN. As for roof-mounted solar power, after 2 years, only 1,800 customers (offices, businesses, households...) have joined offices, businesses, households, and accumulated electricity output to the grid. is 3.97 million kWh. This capacity is very modest compared to the potential.

As for rooftop solar power, although the rooftop solar power potential is assessed to reach a capacity of (2,000 -5,000) MW, according to EVN data [11], by the end of February 2019, only There are 1800 rooftop solar power projects deployed across the country, with a total installed capacity of 30 MWp. Some typical grid-connected rooftop solar power projects for commercial and industrial purposes with a capacity of over 100 kWp have been deployed and put into operation.

Currently, the deployment and installation of equipment using solar thermal energy is quite popular [10]. About 30,000 to 40,000 domestic solar hot water systems are installed annually for small-scale residential and commercial purposes, totaling an estimated 100,000 systems operating nationwide, corresponding to installed capacity is about 280 MWth with an annual capacity of 340 GWh. Up to now, only a few large-scale commercial and industrial solar thermal systems have been mentioned in the reports.

3.1.3. Current status of solar energy use in Da Nang city

Currently, the deployment of solar energy exploitation applications in Da Nang is at the beginning stage, most of the solar energy exploitation systems are heating for hot water for domestic and commercial purposes, only one several systems for industrial purposes

The deployment and installation of rooftop solar battery systems has only just begun, according to data from Da Nang Power Company provided by July 2018, a total of only 29 agencies and businesses. Businesses and households have registered to sell rooftop solar power to Da Nang Power Company with a relatively small installed capacity of 192.79 kWp. In addition to the systems registered to sell electricity to Da Nang Power Company, a small number of rooftop solar PVs with larger capacity are installed to produce electricity to serve the needs of the units.

After issuing Official Letter 1532/EVN-KD dated March 27, 2019 of the Electricity of Vietnam on guiding the implementation of rooftop solar power projects, Central Power Corporation (CPC)) held a seminar "Developing rooftop solar power" on April 19, 2019, DSED organized a training program "Developing rooftop solar power in Da Nang towards efficient and sustainable energy use". sustainable" on April 25, 2019, and especially on May 16, 2019 Vietnamese television station in Da Nang city VTV8 organizes a live TV program following the current news with the theme "Use electricity to get more money" , the awareness of people and businesses about rooftop solar power increased very quickly, by the end of May 2019, there were 157 households and businesses in Da Nang installed rooftop solar power. with a capacity of 1,028 kWp. With the rapid development of rooftop solar power, people and businesses in Da Nang aim to use energy efficiently and sustainably.

3.2. Research model and hypotheses

On the basis of theory and empirical studies as mentioned above, the research model of factors affecting the intention to use solar power in Da Nang City is as follows:

The proposed hypotheses to be tested in this study are as follows:

H1: Perceived usefulness of solar power technology has a positive (+) impact on intention to use solar energy.

H2: Perceived ease of use of solar power technology has a positive (+) effect on intention to use solar energy.

H3: Perceived risk of solar power technology has a negative (-) impact on intention to use solar energy.

H4: Perceived convenience of solar power technology has a positive (+) impact on intention to use solar energy.

H5: The policy on the use of solar power has a positive (+) impact on the intention to use solar power.

H6: Perceived cost has a negative effect (-) on intention to use solar power.

H7: Trust has a positive effect (+) on intention to use solar energy.

3.3. Research Methods

The methodology in this study consists of two steps: preliminary research and formal research. Preliminary research using group discussion skills to calibrate the model and design the questionnaire. The formal study used closed-ended questionnaires modified during the preliminary study to collect and analyze data to test models and hypotheses. All research data will be supported by SPSS software.

3.3.1. The scale

To measure research concepts, the author uses a 5-point Likert scale with 1: completely disagree to 5 completely agree for 26 observed variables.

H1: Perceived usefulness is measured by 4 observed variables, including: Using solar power as a renewable and inexhaustible source of energy, using solar power as a renewable energy source less polluting the environment, using solar power saves costs in the long run, using solar power helps to be more active in daily life and production.

H2: Perception of the ease of use of solar **power technology** measured by 3 observed variables, including: Easy installation and maintenance of solar power equipment, using solar power is easy to use, given that solar power equipment is easy to operate.

H3: Perceived risk is measured by 6 observed variables, including: Products and services are not the same as guaranteed under warranty, the quality of solar panels is not as expected. Expectations about longevity, poor quality, slow payback, solar panels can produce harmful substances into the environment, the use and sale of solar energy depends on the government. According to the State's policy, the life of solar panels is reduced compared to the transaction.

H4: Perceived convenience is measured by 4 observed variables, including: Solar energy can be used anywhere, solar energy is active in daily life and production, installation Installing solar power is easy to implement, not technically difficult, and the production and use of solar power matches the time frame of high demand.

H5: The policy on the use of solar power is measured by 3 observed variables, including: The government needs to facilitate the deployment of solar power technology application, financial support for the development of solar energy. installed in Da Nang on the development of solar power, and it is necessary to issue regulations on the development of solar power in Da Nang

H6: Perceived cost is measured by 3 observed variables, including: Cost of installing solar power system in line with income. Cost is the most important factor when installing solar power technology, the cost of installing solar power technology is competitive compared to other energy sources.

H7: Trust is measured by 3 observed variables, including: complete trust in the consulting/providing services of consultants on solar power technology, complete confidence

in the provision of solar energy technology. power output from excess solar power (if any), fully believe in the mechanism and policy of investment in energy infrastructure.

3.3.2. Survey sample and study site

According to Bentler & Chou (1987), the minimum number of samples for an estimator is 5 samples. In this study, there are 29 observed variables, so the required number of samples is 145 (Nguyen Dinh Tho, 2011). However, to ensure representativeness of the population, this study will survey 279 samples. The study sample was selected by non-probability quota sampling method with a sample size of 279.

Scale test results

The scale is evaluated through the following methods: reliability assessment, exploratory factor analysis. Evaluating the scale through Cronbach's Alpha coefficient allows assessing the reliability of establishing a composite variable on the basis of many single variables. To calculate Cronbach's Alpha for a scale, there must be at least 3 measurement variables. Cronbach's Alpha coefficient has a variable value in the range [0,1] and the total correlation coefficients are all greater than 0.3.

In the results of testing the reliability of the observed variable, the correlation coefficient of the perceived usefulness variable is 0.721; of perceived ease of use margin is 0.927; of the perceived risk variable is 0.987; of the perceived variable of convenience is 0.828; of the policy margin on the use of solar energy is 0.802; of the perceived cost of solar power system investment is 0.620; of the perceived variable of trust in buying, selling and using solar energy is 0.858; of intention margin for the use of solar energy in Da Nang is 0.831.

Thus, the observed variables are not uniformly required and no variables are excluded and the component variables in the study all have a fairly high confidence coefficient.

Exploratory analysis results

Exploratory factor analysis is used to test the validity of the scale's concepts. Observable variables with factor loading weights less than 0.4 will be excluded (Clack & Watson, 1995). In this study, the method of extracting the coefficients of the main components (Principal components) is used with the factor rotation is Varimax and the index represents the amount of variation explained by the factor greater than 1 (Eigenvalue > 1). (Ngoc & Trong, 2005). A total extracted variance value greater than or equal to 0.5 will be accepted (Hair et al., 1998).

In exploratory analysis, the analysis results draw out 5 factors. KMO coefficient = 0.913 with significance level of 0.000. Research results have given 5 factors with factor weighting coefficients greater than 0.4. At levels of Engenvalue greater than 1, 5 factors have been extracted with extracted variance of 71,666%. This means that 5 factors explain 71,666% of the variability of the data. Besides, most of the variables have factor loading coefficients greater than 0.4. Thus, the scales reach convergence value.

There are 5 factors drawn including: (i) Risks caused by using solar power equipment (RIST); (ii) Convenience and confidence when using solar power equipment (TRUSCONV); (iii) Ease of use of solar power equipment (EAS); (iv) Government utility and policy towards solar power (GOVUTIL); (v) Cost of installing solar power equipment (COST).

From the results of EFA analysis, it shows that the scale is extracted into 5 corresponding factors, these factors have factor loading coefficients of 0.4 or more, so the scales have convergence. However, there are a number of scale components that all belong to different factors. Therefore, the scales are not unidirectional.

Results of regression analysis and hypothesis testing

The results of regression model estimation by OLS estimation method with dependent variable BI and independent variables RIST, TRUSCONV, EAS, GOVUTIL, COST, showed that the data set explained the variation of the dependent variable. The dependence on the independent variables of the model is quite good. From the R^2 Adjusted index, it shows that the data set has explained 65.5% of the influence of the independent variables on the dependent variable, the statistical index $F = 34,137$ at the significance level of 0.000 (Sig. = 0.000) with the assumptions of multiple regression being satisfied. In which, most of the explanatory variables have the expected sign and have statistical significance at 1% significance level. Factors with positive regression coefficients imply that, if other factors are constant, an increase of one unit of the independent variable will increase the intention to use solar technology by β units (where β is the regression coefficient). In contrast, for factors with negative sign (-) regression coefficient, an increase of 1 unit of the independent variable will reduce the use of solar technology by β unit (with β is the regression coefficient).

The results show that, 4 out of 5 factors of the model have a statistically significant influence on the intention to use solar power technology in Da Nang city. In which, the factor Perceived cost of installing solar power equipment has the greatest influence; Perceived usefulness and Government policy has the second biggest influence; Perception of convenience and confidence when using solar power technology has the third biggest influence; Perceived ease of use of solar technology has the smallest effect. The results of the analysis are shown in Table.

Perceived factor of convenience and trust when using solar power equipment ($\beta = 0.446$): This factor has a regression coefficient of $\beta = 0.446$. Thus, if other factors remain the same, when the perception of convenience and trust when using solar power equipment increases by 01 point on the 5-point Likert scale, the intention to use solar energy increases by 1 point. Da Nang's solar power in Da Nang increased to 0.446 points. Thus, if Da Nang is locally aware of the convenience and confidence in using solar power equipment, they will increase their intention to use this type of energy for Da Nang. The analysis results of the scale components in this factor are the lowest 1 and the highest 5. The average score ranges from 2.9913 to 3.9561 points on the 5-point Likert scale.

Perceived factor about the ease of use of solar power equipment ($\beta = 0.250$): This factor has a regression coefficient of $\beta = 0.250$. Thus, if other factors are held constant, when the perception of ease of use of solar power technology increases by 1 point on the 5-point Likert scale, the intention to use solar power technology increases by 1 point. of Da Nang in Da Nang increased to 0.250 points. Thus, if local people perceive the ease of use of solar power technology, they will increase their intention to use this type of energy. The analysis

results of the scale components in this factor are the lowest 2 and the highest 5. The average score ranges from 3.3313 to 3.5826 points on the 5-point Likert scale.

Factor perceived usefulness and government policy ($\beta = 0.479$): This factor has a regression coefficient of $\beta = 0.479$. Thus, if other factors are constant, when Da Nang perceives the usefulness and the government's policy on the use of solar energy increases by 1 point on the 5-point Likert scale, the intention to use solar energy increases by 1 point. Da Nang's solar power in Da Nang city increased to 0.479 points. It can be seen that if the locality perceives the usefulness and the Government's policy on using solar power technology, they will increase their intention to use this type of energy. The analysis results of the scale components in this factor are the lowest 1 and the highest 5. The average score of the scales is quite high, ranging from 4,5304 - 4,991 points on the 5-point Likert scale.

Perceived factor about the cost of installing solar power equipment: This factor has a regression coefficient of $\beta = 0.368$. Thus, if other factors remain constant, when Da Nang's perception of the installation cost of solar power technology increases by 1 point on the 5-point Likert scale, then the intention to use solar energy technology Da Nang's sun in Da Nang City increased to 0.368 points. The analysis results of the scale components in this factor are the lowest 2 and the highest 5. The average score of the scales is quite high, ranging from 2.7977 to 3,956 points on the 5-point Likert scale.

Regression analysis results show that only 4 out of 5 factors have an impact on **use of solar energy** in Da Nang city, that is: perceived usefulness and ease of use have the greatest impact; Perceived trust has the second biggest impact; perceived convenience in using solar power has the third biggest impact; ease of use in installation, maintenance, operation with minimal impact. In which, 4 factors have a positive impact on the intention to use solar power in Da Nang and have statistical significance at the Sig.= 0.000 significance level.

The research results of the topic are quite similar to the studies of the author (Davis, 1989). These studies all use technology acceptance model (TAM) as the base model. In the author's research (Davis, 1989), there are perceived usefulness and ease of use, Da Nang's trust factor and perceived risk factor mentioned similar to the research results. . In which, the perceived usefulness and ease of use and the trust factor of Da Nang have a positive influence on Da Nang's attitude in using solar power technology. In the author's study, the factors of perceived usefulness, perceived ease of use, convenience, trust of Da Nang and perceived risk are similar to the research results. The perceived usefulness, perceived ease of use, convenience, and trust factors of Da Nang all have a positive impact on the intention to use solar power technology. The risk perception factor was not statistically significant. Through relevant studies at home and abroad, the author can draw conclusions and research results that are quite consistent with the reality and the factors that affect the intention to use solar power technology. heaven in Vietnam in general and in Da Nang city in particular.

4. Discussion and Conclusion

First, promote the usefulness and ease of use of technology. Promote propaganda and dissemination of knowledge, documents, leaflets, brochures, organize seminars, training and

training on the usefulness and ease of use of solar power technology. First of all, propaganda for cadres, civil servants, public employees and business sectors in the city; Next are the people about the usefulness and ease of use of the technology of solar power. In addition, propagandize the importance, about the great economic, social and environmental protection of the development and use of renewable energy in the process of sustainable development, so that there are practical actions to contribute to the development and use of renewable energy.

Second, reduce risks in using solar power. In fact, there are many factories at home and abroad that manufacture solar panels. Therefore, for Da Nang who intend to invest in solar power (attic), choosing solar panels is a difficult problem for them, because there is not enough information to determine What are the good or bad quality products? Da Nang needs to pay attention to the following information: (i) Certificate of quality insurance issued by independent insurance companies. This is common practice in international trade, especially for high-tech products; (ii) Manufacturers of solar panels must be certified to meet international standards IEC (International Electrotechnical Commission) and UL standards (Underwriters Laboratories Inc.). IEC and UL standards differ greatly. IEC standards specify minimum equipment safety requirements. UL standards by contrast provide comprehensive specifications for product safety and application; (iii) Solar panels must have a design solution against potential inductive degradation - PID (Potential Induced Degradation); (iv) For each shipment of solar panels, upon delivery, the seller must provide the buyer with an ex-factory inspection report for each model indicating the product's serial number; (v) After the purchase - sale contract is signed, the seller must facilitate the buyer to visit/survey at the manufacturing plant at the right time to test the output and pack the products for release. solar battery.

Third, support the cost of investing in solar power equipment for Da Nang. The development of rooftop voltage energy has many obstacles, such as high investment costs; lack of information on product quality, construction unit, installation and operation and maintenance mode. In the coming time, authorities or management agencies need to step up propaganda work so that each Danang can understand the economic benefits as well as investment capital, the usefulness and ease of use of technology. and environmental friendliness. Since then, the State should have mechanisms and policies to support the investment costs of rooftop electric energy equipment for Da Nang and a number of other policies, specifically: Credit support policies; support each Da Nang to install 1 kWh roof voltage energy, support 3 million VND but not more than 9 million VND from the environmental protection fund; or exempting Da Nang from tax for the period not yet paying back; at the same time, establish a center to support operation, maintenance and consulting on rooftop voltage energy...

In addition, promulgating mechanisms and policies for preferential loans (low interest rates), simple and convenient loan procedures for all Da Nang; create conditions for domestic and foreign donors to support Da Nang to install roof voltage.

Fourth, there is a policy of buying - selling electricity for **Da Nang** using rooftop voltage energy. In the context that the power system is under a lot of pressure to ensure electricity supply, especially after 2020, when there is no new source of exploitation in the

whole country, the development of rooftop solar power for Da Nang is considered an important consideration. is one of the solutions contributing to reduce pressure on the Power industry; At the same time, this is also a favorable condition to accompany the country's economic development in the future.

With the goal of developing solar power to reach 1GWp by 2020, the Prime Minister issued Decision No. 2068/QĐ-TTg dated November 25, 2015 approving Vietnam's renewable energy development strategy to 2030, vision to 2050; Decision No. 11/2017/QĐ-TTg dated April 11, 2017 on the mechanism to encourage the development of solar power projects in Vietnam (Decision 11) and Decision No. 02/2019QĐ-TTg dated January 8 2019 of the Prime Minister on amendments and supplements to a number of articles of Decision No. 11; The Ministry of Industry and Trade issued Circular No. 16/2017/TT-BCT dated September 12, 2017 stipulating project development and sample power purchase agreement applicable to solar power projects (Circular 16) and Most recently , Circular No. 05/2019/TT-BCT was issued on March 11, 2019 on amending and supplementing a number of articles of Circular 16. In order to improve the mechanisms and policies of electricity purchase and sale between units. electricity with Da Nang investing in rooftop electric energy for living and doing business.

The application of the expanded technology acceptance theoretical model in explaining the intention to use new solar power technology stops at the survey level in Da Nang city, which is one of the localities in the world. selected to be the national center of renewable energy, and at the same time used the traditional regression analysis method to test the intention to use solar power technology in Da Nang for the research variables. The generality and persuasiveness of the study will be higher if the research model evaluates the impact shown from the intention to use the service to the actual installation investment. This is also a direction for further research.

VIETNAM IN RESPONDING TO CLIMATE CHANGE: PERSPECTIVES, PRACTICES AND SOLUTIONS

Assoc. Prof. Dr. Dinh Xuan Ly
dinhxuanly2012@gmail.com

University of Social Sciences and Humanities, National University, Hanoi, Vietnam

Abstract

The research focuses on the topic of Vietnam's response to climate change from the perspective of contemporary political theory, based on reliable and latest sources, using basic research methods of political science which are logic and history. The conference paper explores the following points: (1) The core perspectives and policies of the ruling Party (Vietnam Communist Party) and the Vietnamese Government through international commitments and the process of responding to climate change in the context of global political wills are “not enough” to respond to climate change and the world is still standing on “the verge of climate catastrophe”; (2) Practical implementation of activities, international cooperation and initial results on responding to climate change, as well as Vietnam's leading role in the global fight to respond to climate change; (3) Detecting some problems posed by Vietnam's response to climate change over the past few years and suggesting some solutions with the expectation of contributing to improving the effectiveness of climate change response in Vietnam in the future.

Keywords: *Climate change, climate change response, Vietnam's perspective*

1. Introduction

The article is written on the basis of political research arguments and theories; documents used in the research are collected from highly reliable official sources; this article is a product of individual research.

The objective is to clarify a) world's view and the current state of climate change response in the world; thereby contributing to identifying the challenges that the world is facing when responding to climate change; b) perspective and current state of Vietnam's climate change response; thereby suggesting solutions for Vietnam to responding to climate change in the coming time.

2. Method

The basic research methodology of the article is political jurisprudence; the evidence-based analysis, interpretation, and assessment of climate change responses; assessment of the current situation of climate change response in chronological order, thereby clarifying the progress of climate change response in Vietnam over the years.

3. Result

The article has answered the following research questions: The threats of climate change to humanity; The world's political views about climate change response? Perspectives and current state of Vietnam's climate change response? Effective solutions for Vietnam to responding to future climate change and other problems.

3.1. Vietnam's perspective on climate change response in the global political context

✚ Global political will is "not enough" to respond to climate change

Climate change is a global threat, no country can live in peace with the rapid shift in the climate system. US President Joe Biden called climate change an "existential threat to human existence". In December 2015, at the United Nations Climate Change Conference, more than 190 countries ratified the Paris Agreement on climate change. The Agreement's goal is to limit global temperature rise to 1.5 to 2 degrees Celsius. The Paris Agreement has been hailed as "an unprecedented victory on the environmental issue" (Phung, 2021). But difficulties and obstacles came from a number of countries in the process of implementing the Paris Agreement. Specifically, less than a year after the Paris Agreement was signed, US President Donald Trump officially announced the US withdrawal from the Paris Agreement; China is the world's largest carbon dioxide emitter, but China's current actions are considered "very inadequate" to achieve the target it has committed to (David Brown, 2021); and the status of many countries participating in the Paris Agreement has been more of an "empty commitment". United Nations climate envoy Christiana Figueres said that the implementation of the Paris Agreement on climate change still seems to be "stagnant" (Anh, 2020).

Facing the direct threat of climate change to human life, the United Nations has issued a statement calling on the international community to urgently scale up actions and strengthen cooperation to reduce the impacts of global warming; Pope Francis, Archbishop of Canterbury Justin Welby and Patriarch Bartholomew I issued a joint statement (September 7, 2021), stating, "We call on everyone, whatever their belief or worldview, to endeavour to listen to the cry of the earth and of people who are poor, examining their behaviour and pledging meaningful sacrifices for the sake of the earth" (Anh, 2021) at the same time an environmental movement was started because of the warning that climate change is negatively affecting the Earth. In particular, the Swedish environmental activist, Greta Thunberg (17 years old) crossed the Atlantic Ocean by sailing boat to convey the message of reducing carbon emissions.

Rome - the The Group of Twenty (G20) Summit. Although the Group of 20 meeting reached an agreement on climate, this agreement was assessed as "lacking significant breakthroughs on concrete commitments" (Trang (2021) because of its general commitment language such as "stepping down investment on coal power production as soon as possible"... The progress and agreement of the Summit showed that the G20 countries, although they have felt the "threat" and the "urgency" of responding to change climate, they do not have enough political responsibility and will to solve the problem (An, 2021).

Another important environmental event also took place during this time, which was the United Nations Climate Change Summit (COP26) on November 1, 2021, in Glasgow (Scotland, United Kingdom). Many argue that COP26 is the last chance we have to save humanity's destiny from the "climate catastrophe". After two weeks of intense negotiations, the Glasgow Climate Agreement was approved by 197 countries with wording compromises (such as the demand for "gradual elimination of coal" being revised down to "gradual reduction of coal"). Commenting on the Glasgow Climate Agreement, United Nations Secretary-General António Guterres affirmed that progress made by the Glasgow Climate Agreement was still

not enough "We are still on the verge of climate catastrophe" (Tien, 2021) and COP26 President Alok Sharma said: The Glasgow climate treaty is "not perfect" (Binh, 2021)

 *Vietnam's perspective on responding to climate change*

In a study on the impact of climate change on developing countries by World Bank, forecast from 2007 shows that Vietnam is one of the 10 countries most vulnerable to the impacts of climate change.

According to the forecast, "by the end of the 21st century, when the temperature increases by 3.4 degrees Celsius, the sea level increases by 1 meter, about 40% of the land area of the Mekong Delta will be permanently inundated, about 10% of the population will be directly affected because of land loss. The Red River Delta will have 240,000 hectares of agricultural land affected. For coastal areas, the biggest impacts of climate change are storms, tropical depressions and more intense droughts, floods and landslides" (Nham, 2021).

Table 1. Forecasted impacts of 1 meter sea level rise in Vietnam

	Total	Impact (absolute value)	Impact (%)
Area (km ²)	328.535	16.977	5,17
Population (millions of people)	78,137	8,437	10,8
GDP (billion USD)	154,787	15,805	10,21
Urban area (km ²)	5.904	634	10,74
Agricultural area (km ²)	192.816	13.773	7,14
Wetland (km ²)	46.179	13.241	28,67

Source: Do Nam Thang extracted from the study of Dasgupta et al. 2007 (Excerpt from Assoc. Prof. Dr. Nguyen The Chinh: Impact of climate change on our country: Current situation, new problems and solutions, updated on June 17, 2020, <http://hdl.vn/en/nghien-cuu---trao-doi/anh-huong-cua-bien-doi-khi-hau-doi-voi-nuoc-ta-thuc-trang-nhung-van-de-moi-dat-rava-giai-phap.html>).

Climate change affects many economic activities of the country such as: Affecting production activities of the agricultural sector (drought and saltwater intrusion reduce crop yields; negatively affecting livestock production, forestry, biodiversity, forest fires, wetland ecosystems, aquaculture); affecting transportation activities; affecting urban development, industrial zones and housing; affecting tourism and trade; affecting the industry in many ways (if the sea level rises by 1 meter, most of the coastal industrial zones will be flooded)

Climate change also affects people's lives, such as women's jobs, health, household economy and migration.

The ruling Party (Communist Party of Vietnam) and the Government of Vietnam are increasingly aware that climate change is not only a challenge for Vietnam, but also the biggest challenge for humanity. Vietnam considers responding to global climate change a political responsibility of all countries, especially the responsibility of developed countries and countries that emit a lot of greenhouse gases in the world.

Vietnamese Government has joined the signing of the Climate Convention on June 11, 1992 and the Kyoto Protocol on December 3, 1998; At the 21st Conference of the Parties

to the United Nations Framework Convention on Climate Change, December 2015 (COP21), Vietnam committed to actively implementing the national target program and strategy on responding to climate change in many areas; commit to strictly comply with the obligations under the United Nations Framework Convention on Climate Change and the Kyoto Protocol; committed to reducing greenhouse gas emissions by 8% by 2030 (Anh, 2015); Vietnam joined the signing of the Paris Agreement on climate change on April 22, 2016. At the online G20 Summit (November 22, 2020), the Prime Minister of Vietnam suggested that "the G20, with the cooperation of the United Nations, WB, IMF, WTO... should actively create new foundations for development, such as transforming the digital economy, circular economy, green growth ... to overcome challenges and narrow the development gap between countries" (Tuan, 2021). At the United Nations Climate Change Summit (COP26) in 2021, the Prime Minister of Vietnam affirmed: Climate change has really become the biggest challenge facing humanity, even threatening the perils of many countries and populations, forcing us to act forcefully and without delay on a global scale; Vietnam recommends that all countries make strong commitments to reduce greenhouse gas emissions; Vietnam believes that, to win the global battle with climate change, global solidarity is the only way (Tien Phong Newspaper, 2021). Although Vietnam is a developing country that has just begun industrialization over the past three decades, it will "build and implement robust GHG emission reduction measures with its own resources.", with the cooperation and support of the international community, especially developed countries, both in terms of finance and technology transfer" (Nhan Dan Electronic Newspaper, 2021); Vietnam is committed to implementing mechanisms under the Paris Agreement, to achieve net emissions of "zero" by 2050" (Nham, 2021). Vietnam has joined "more than 100 countries in the commitment to reduce global methane emissions by 2030; join 140 countries in the leaders' Glasgow declaration on forests and land use; join 48 countries in the global declaration on converting coal power to clean energy; together with 150 countries participating in the Global Adaptation Action Coalition" (Chinh, 2022).

Strong commitments demonstrating Vietnam's political determination at COP26 have been highly appreciated by the United Nations and many countries, which strongly supported and affirming their readiness to cooperate with Vietnam in implementing response measures to address climate change. Ms. Tatiana Valoya, General Director of the United Nations Office in Geneva, said: "Vietnam is a developing country, but it has demonstrated its leading role and is a role model in combating climate change" (Thuong, 2021). US President Joe Biden also highly appreciated Vietnam's active participation and strong commitment at COP26; The US pledges to promote cooperation with Vietnam to tackle climate change (Thanh, 2021).

Regarding the perspectives of the ruling Party, the Communist Party of Vietnam has set forth many guidelines and decisions to respond to climate change. The 11th National Party Congress (January 2011) advocated: Bringing environmental protection into strategies, master plans, development plans for sectors, fields, regions and investment programs and projects; new construction investment projects and works must strictly comply with environmental protection regulations; actively research, evaluate and forecast the impacts of climate change; effectively implement the national target program on responding to climate

change (Communist Party of Vietnam, 2011). At the 12th National Party Congress (January 2016), the policy on responding to climate change was planned in more detail, such as formulating, deploying, inspecting and supervising the implementation of programs and plans to respond to climate change; appropriate investment and effective use of international assistance for national key projects and programs to respond to climate change (Communist Party of Vietnam, 2016)

The XIII Party Congress (January 20, 2021), affirmed that climate change adaptation is an urgent requirement and huge challenges for Vietnam in the coming time (Communist Party of Vietnam, 2021); Adaptation to climate change and environmental protection is one of the determinants of Vietnam sustainable development. Since then, responding to climate change has been identified as one of the six key tasks of Vietnam, with the following requirements: Strengthening and improving environmental protection; proactively and actively implementing solutions to adapt to climate change; building a legal system, policy and mechanism to monitor climate change; developing green economy, low waste, reducing greenhouse gas emissions; encouraging the development of a circular economic model (Communist Party of Vietnam, 2021). The issue of proactive and effective adaptation to climate change; resolutely eliminating projects that cause environmental pollution, ensuring the quality of the living environment, and protecting biodiversity and ecosystems; building a green, circular and environmentally friendly economy (Communist Party of Vietnam, 2021), which is considered as one of the country's development orientations in the 2021-2030 period. The Party's view considers responding to climate change as the highest priority in national development policy decisions; is the highest ethical standard of all levels, industries, businesses and people (Tien Phong Newspaper, 2021).

3.2. Current status of response to climate change and solutions

🚩 Actions to respond to climate change

Vietnam has issued strategies, policies, programs and plans to respond to global climate change, such as: National strategy on climate change; Target program to respond to climate change and green growth for the period 2016-2020; Plan for the implementation of the Paris Agreement on climate change; greenhouse gas emission management scheme; National plan to adapt to climate change for the period of 2021-2030, with a vision to 2050...

At the same time, Vietnam has developed and passed laws on responding to climate change, such as the Law on Natural Disaster Prevention, the Law on Irrigation, the Law on Water Resources, the Law on Economical and Efficient Use of Energy, Environmental Protection law.

In terms of practical actions, Vietnam has developed and replicated climate change adaptation models based on ecosystems, based on community and based on nature.

The implementation of the National Strategy on Climate Change for the period 2011-2020 has achieved results, such as: The amount of greenhouse gas emissions in energy activities decreased by 12.9% compared to other normal development options; energy consumption per GDP decreased by 1.8%/year on average; the percentage of industrial enterprises aware of clean production increased from 28% in 2010 to 46.9% in 2020; forest coverage rate reached 42% in 2020 (Nham, 2021)

Effective implementation of Vietnam's commitments at international conferences on combating climate change, especially at COP26, requires Vietnam to change its climate change response model. Taking the grassroots level as the foundation in implementing the commitment to respond to climate change and all actions must be "based on nature and people-centered, being the subject and driver of sustainable development" (Nhan Dan Electronic Newspaper, 2021).

Currently, the Government of Vietnam is implementing the National Strategy on Green Growth for the period 2021-2030, with a vision to 2050. With the goal by 2030, the intensity of greenhouse gas emissions per GDP will be reduced by at least 15% compared to by 2014 and by 2050, the intensity of greenhouse gas emissions per GDP will decrease by at least 30% (Nham, 2021); implement the Action Plan for Sustainable Agricultural Development Adapting to Climate Change in the Mekong Delta to 2030, with a vision to 2045.

At the first meeting (January 13, 2022) of the National Steering Committee to implement Vietnam's commitments at COP26, the Prime Minister requested that in the first quarter of 2022, ministries and sectors must actively develop programs and plans with the main tasks of focusing on "handling 8 issues: Green energy transformation, clean energy; reduce greenhouse gas emissions; reduce methane emissions; develop electric cars; planting forests to absorb CO₂; construction materials and urban development suitable for green and sustainable development; communication to encourage all people and business community to participate; accelerate digital transformation" (Chinh, 2021); In the second quarter, it will organize the methodical, drastic and effective implementation of the proposed tasks.

The Ministry of Natural Resources and Environment, as the standing body of the National Steering Committee, focuses on building capacity for forecasting, warning, proactively preventing, combating and mitigating natural disasters, and adapting to climate change. climate change; develop and replicate climate change adaptation models; implement measures to prevent, combat and limit the impact of high tides, floods and saltwater intrusion; implement solutions to limit groundwater exploitation in order to reduce subsidence and salinity in coastal areas, especially in the Mekong Delta; reduce greenhouse gas emissions and enhance the ability of ecosystems to absorb greenhouse gases (Minh, 2021).

The Ministry of Planning and Investment develops a national action plan on green growth for the period 2021-2030, with a vision to 2050, which sets out orientations for building and implementing a circular economy model in industrial parks, ecological industrial clusters and sustainable craft villages.

The Government promulgates policies to encourage local governments to actively respond to climate change with many renewable energy projects such as wind power and solar power. In March 2019, the Serepok solar power project in Ea Wer commune, Buon Don district (Dak Lak) was inaugurated with an annual capacity of supplying the national electricity grid with about 150 million kWh, investment budget of about 300 billion VND; Wind energy in Dak Lak is also deployed along with the Central Highlands wind power project in Dlie Yang commune, Ea H'leo district with a capacity of 436MW, an investment of about 13,000 billion VND; From October 2020, Dak Nong province has invested in 6

wind power projects with a total capacity of 430 MW; Quang Tri province is determined to be an energy center in the central region with potential for renewable energy development (29); At the beginning of March 2022, the People's Committee of Da Nang city in collaboration with the Korea International Cooperation Agency (KOICA) held the kick-off ceremony of the project to build the Integrated Center for Controlling the Resilience of Green Urban and Urban Resilience. smart (Ensure Center). The Center's primary function is to enhance resilience to natural disasters; provide a comprehensive solution for integrated monitoring of natural disasters that Da Nang may face; detect early warnings, forecast trends in natural disasters and help Da Nang leaders direct and operate; provide information and notify people quickly and accurately, and proactively prevent it; helping to restore green urban areas based on the application of information technology in planning, planning and sustainable development of ecological urban areas and environmental protection (Bang and Trung, 2022)

Issues and solutions to respond to climate change

In general, over the past time, Vietnam has actively reduced natural disasters, adapted to climate change and achieved many positive results in responding to climate change. However, the reality shows that there are still many problems that require the ruling Party and the entire political system in Vietnam to strive to overcome.

First of all, how to successfully implement Vietnam's commitments at COP26, in the context that Vietnam is a country heavily affected by climate change and a developing country with a middle income;

Secondly, how to take full advantage of the support from other countries and international organizations on responding to climate change considering that national resources invested in climate change response are limited;

Thirdly, how to respond to climate change in the context of modern technology, especially when the team of experts and technicians in Vietnam still has limited knowledge about coping with climate change (especially at the local level).

Fourthly, what are the solutions that can contribute to reducing the impact of climate change and at the same time adapting to climate change effectively in the context of Vietnam's resources and current international support capacity?

The practice and the problems that Vietnam faced when responding to climate change in the past suggest some solutions to improve the effectiveness of climate change response in Vietnam in the future.

Firstly, establish effective communication so that the entire population and business community understand the risk of "catastrophic climate change" not only for the operation of a country but also for human health to proactively mitigating and adapting; being fully aware of the State's position and Vietnam's commitment at COP26 on responding to climate change, thereby creating a consensus of political determination throughout the political and social system.

During the meeting of the National Steering Committee to implement Vietnam's commitments at the Conference (COP26), the Prime Minister requested that "perception must be unified, thoughts must be understood, determination must be high, efforts must be made, act decisively and effectively, determine the central focus, finish what we start" (Huong, 2022).

Secondly, to review, adjust and amend the system of legal documents on climate change response to ensure synchronism and suitability with domestic requirements and international context; in planning and policy formulation, special attention should be paid to appropriate proactive response measures; create a legal basis for mobilizing the synergy of state and private resources, resources of the whole socio-political system, effectively mobilizing domestic and foreign resources; research agencies need to come up with demands and proposals for cooperation on climate change response in line with the country's development strategy and capabilities and the responsiveness of international partners, create a foundation for coordination with other countries, regional and international organizations.

Thirdly, promote the systematic training of experts and technicians on climate change at the central and local levels; receive modern technologies, develop modern technologies for climate change monitoring; increase investment in financial resources, facilities, and systems to respond to climate change (the Prime Minister's guiding ideology is climate finance, technology transfer and capability development play a very important role in the successful implementation of climate change response (Chinh, 2022) the cooperation of responsibilities among ministries, branches and localities to deal with issues of responding to climate change; create a mechanism to encourage business and private sectors to invest in climate change adaptation activities.

Fourthly, in order to reduce the impact of climate change and adapt to climate change in the current resource condition, it is necessary to limit the use of fossil fuels, increase the use of environment-friendly energy sources (wind volume...); save energy and efficiently exploit energy and resources; encourage production and daily activities, and housing models that minimize the impact of climate change and adapt to climate change; invest in and encourage the use of public transportation, gradually reduce the means of transport that cause a lot of environmental pollution; apply scientific achievements and products adapted to climate change such as clean production technology; "Strengthening cooperation with upstream countries and international organizations in the protection and effective use of water resources in the basins of transboundary rivers, especially the Mekong and Red Rivers" (Nhan Dan Electronic Newspaper, 2021).

The XIII Party Congress set out the requirements: "By 2030, basically achieve the goals of sustainable development in terms of resources, environment and response to climate change. The rate of establishments causing serious environmental pollution treated reaches 100%; the rate of hazardous waste destroyed and treated reaches 98%, of which the rate of treated medical waste alone reaches 100%; the percentage of industrial parks and export processing zones that have been put into operation with a centralized wastewater treatment plant meeting environmental standards reaches 100%; the rate of reuse and recycling of domestic solid waste is over 65% (Communist Party of Vietnam, 2021).

4. Conclusion

Combating climate change is an urgent fight to "save humanity, save our children and grandchildren", but this is a difficult fight that requires very high political responsibility of all countries, especially those with high emissions that cause the greenhouse effect.

From a political perspective, it shows that global politics will is "not enough" to respond to climate change, especially political will from developed countries, such as the US, UK and many countries in Europe and Asia.

Vietnam is one of the 10 countries most vulnerable to the impacts of climate change, and is a developing country, but has shown a strong political will through international commitments, through actively implementing many activities with encouraging results in response to climate change, and at the same time, Vietnam is also proving its leading role in the global fight to respond to climate change.

Abstract

Agriculture plays a crucial role in the socio-economic development of Vietnam, but this sector is increasingly threatened by climate change impacts. Climate change adaptation is critical, particularly for natural resource-dependent farmers in Vietnam. The significant vulnerability of the rural poor and women groups to climate change impacts suggests the great need for gender-responsive adaptation based on gender-sensitive vulnerability to manage climate-induced risks in Vietnam. In agriculture sector, gender transformative adaptation can enhance food and nutrition security and bring other benefits such as increased socio-economic well-being and poverty reduction. It is necessary to increase the participation of women in the workforce and decision-making bodies on climate change, disaster risk management and emergency relief efforts. Women's awareness and engagement in responding to natural disaster events and climate change impacts in the agriculture sector should be enhanced to ensure food security in the future. In addition, studies on the gender-sensitive impacts of climate change and natural disaster events in the agriculture sector should be conducted to design appropriate gender-responsive adaptation measures in Vietnam.

Key words: *climate change, agriculture, gender equality*

1. Introduction

Agriculture is an essential driver of economic growth, employment, poverty reduction, and food security, particularly in rural areas and least developed countries. Climate change will supplement to many economic, social, and environmental challenges already being faced by agriculture. Climate change is expected to negatively affect crop, livestock, and fishery production systems and intensify food insecurity in most regions even though some countries may benefit from the changing climate conditions. Increased natural disasters and climate extremes produce different impacts on women and men due to differences between women and men in terms of relationships, roles, responsibilities, access to and control over resources, participation in planning and decision making to take adaptation measures. Climate change is a significant concern for the sustainable agriculture which calls for accelerating and upscaling actions to strengthen resilience and adaptive

capacity of farmers' livelihoods and agricultural system to climate variability and extremes, of which gender-responsive interventions play a vital role.

Vietnam contributes moderately to greenhouse gas emissions that cause climate change. Data from the World Bank shows that Vietnam's greenhouse gas emissions per capita is approximately 2.7 tons of carbon dioxide equivalent in 2018. However, Vietnam is one of the countries most exposed to the effects of climate change, particularly extreme climatic events. Agriculture plays a crucial role in the socio-economic development of Vietnam, contributing 12.36% to the national GDP and employing 29% of the national labor force in 2021 (GSO, 2021b), but this sector is increasingly threatened by climate change impacts. As a result, climate change adaptation is critical, particularly for natural resource-dependent farmers in Vietnam. The significant vulnerability of the rural poor and women groups to climate change impacts suggests the great need for gender-responsive adaptation to manage climate-induced risks in Vietnam. To address gender inequality, adaptation must therefore address gender-based vulnerability. With little attention paid to an increasingly female workforce, current gender inequities may worsen, jeopardizing rural lives and the viability of Vietnam's growth into global markets.

The paper presents a literature review on gender-responsive roles and responsibilities in agriculture in the context of climate change, analyses climate change and agriculture in Vietnam from a gender perspective and propose recommendations on gender-responsive interventions in the agriculture sector in the context of climate change in Vietnam.

2. Methodology

2.1. Literature review

Acknowledging the differences in relationships, roles and responsibilities between and among men and women in the society is a critical factor for policy analysis and intervention in agriculture sector in the context of climate change. Studies suggest that tasks that are divided by gender are motivated by the perception of "natural abilities". There are different responsibilities assigned by age in society, with older people doing more housework than younger people, regardless of gender. Women are thought to be better suited for certain tasks, while men are seen as naturally skilled in others. For example, society generally assumes that women are better at doing things like cleaning, cooking, taking care of children and elderly and trading small items, while men are better at thinking strategically. In agriculture sector, female farmers are mainly responsible for cultivation and animal husbandry, while male farmers are responsible for fishing and aquaculture.

Although gender division of labor restrict choices and opportunities for both women and men, the way in which these restrictions play out in practice often affects women more than men. This is due to underlying patriarchal norms that disadvantage women. For example, men have more space for self-expression than women. Gender differences in free time and mobility play a significant role in creating the unequal division of labor.

With regards to climate change, women's lower mobility, fewer opportunities for knowledge exchange and limited access to and control over resources (land and capita) has a significant impact on the intrinsic value of women themselves, and also their adaptation

potential. Gender-based division of labor and responsibilities extends to family finances, where women are responsible for everyday transactions, such as accounting, while men are responsible for making strategic purchases, investments, and business expansions. Men's control over household purchases limits women's self-determination, which can lead to fewer opportunities and weaker jurisdiction. This could also hamper climate change adaptation because women have less power to make decisions. As food producers, high dependency on land and natural resources for agricultural livelihood generation makes women more vulnerable to climate change impacts. Higher risks and greater uncertainty in agricultural production due to weather patterns change and increased incidence of extreme weather conditions such as droughts, heavy rainfalls and typhoons, will directly affect women's agricultural activities. Climate change adds to water insecurity which increases the work level of women involved in subsistence farming, as they spend more time and effort on land preparation, crop watering and protection from disease. When facing losses in agricultural activities, migration has become an emerging trend as a key coping strategy for people facing hardship and environmental changes in agriculture. Especially, male migration especially worsens the situation for women and children left behind; and women migrants often earn less than men and have less access to basic services. In rural areas, migration is seen as a consequence of a shortage of arable land, lack of employment, low incomes from rural non-farming jobs and rural poverty once their areas are affected by climate extreme events. But regarding the vital role of women in agriculture, migration of male farmers would cause more burdens for women.

Generally, the gender-sensitive labor division and social discrimination against women have put women in a more disadvantaged position as compared to men. The women's double burden (paid work and unpaid work) is also a serious obstacle preventing women's participation in economic opportunities. In addition, women are often disadvantaged in terms of their access to, and control over, resources and in the availability of associated economic opportunities. In the context of resource scarcity and weather extremes and climate change impacts, women are generally more vulnerable as compared to men which emphasis the need for gender-responsive adaptation to address gender inequalities.

2.2. Analytical method

A desk-based approach combined with statistical, descriptive, and comparative methods are applied to address the research question. The study uses secondary data and information which were collected from a variety of sources, including reports from Vietnam's Government Statistics Office, Vietnam's Ministry of Natural Resources and Environment (MONRE), books, journals, papers, and research reports of individuals and organizations related to the research topic.

3. Results

3.1. Women in the economy in Vietnam

3.1.1. Labor force participation

Viet Nam is well noted for the absence of restrictions on women's freedom of movement, decision to work, starting and running a business, owning property and assets,

and marriage related-barriers (e.g. exclusions on women from certain work once married). MOLISA (2020) reported that from 2011-2019, women accounted for at least 47.3 per cent of the new jobs created over this period, across a widening range of sectors. With jobs created for an estimated 1.51 million workers in 2019 alone, this amounts to new jobs for nearly 714,000 women (UN Women, 2021a). Labor force participation of women is remarkably high in Viet Nam compared to the global average. In 2019, 70.9 per cent of Viet Nam's working-age women were in the labor force while the corresponding rate at the global level was 47.2 per cent, and the rate for Asia and the Pacific even lower, at 43.9 per cent (UN Women, 2021a). Additionally, with an estimate of 45 per cent of labor income accruing to women, the Global Gender Gap Report 2020 noted that Viet Nam had 'one of the largest shares' globally (World Economic Forum (2020)). By 2021, Viet Nam ranked 26th out of 156 countries on the Economic Opportunity and Participation Sub-index (World Economic Forum, 2021). Generally, women's high labor force participation rate in Vietnam reflects the presence of enabling factors and attitudes for women to undertake paid work.

However, while the gender gap in labor force participation is narrower in Viet Nam than the global and regional average, it does still exist. In 2020, around 74.4 per cent of the population aged 15 and above participated in the labor force, but the labor force participation rate differs significantly between men (79.9 per cent) and women (69.0 per cent). The average labor force of the whole country was estimated at around 54.84 million people in 2020, of which 53.6 million people were employed and more than 1.2 million people were unemployed. Women (47.4 per cent) accounted for a lower proportion than men (52.6 per cent) in the labor force (GSO, 2021d). The proportion of the population in retirement age participating in the labor force was 42.7 per cent in 2019 (44 per cent for men compared to 42.1 per cent for women). This rate in rural areas was 1.5 times as high as in urban areas among both male and female (GSO, 2021a). Women participate in the labor force at a lower rate than men, and the reason for this gap is likely to be the uneven gender division of labor in family responsibilities in Viet Nam society (UN Women, 2021a). Despite their high labor market participation overall, women in Viet Nam still face unequal opportunity to engage in economic activity compared to men.

In addition, participation rates by gender offer only a partial picture of women's engagement in the economy. While the upsurge in women's waged employment in the recent period is a clear positive, participation does not equate to empowerment. For instance, participation rates do not reveal whether women are in full or part time work, whether they are working by choice, poverty or economic crisis, nor the conditions, pay or future of their work. A similar perspective can be applied to women's entrepreneurial activity, and the reasons behind the clustering of women in micro, small and medium enterprises. The quality and security of current and future jobs, the drivers and prospects of business activity, and women's leadership in the economy are better measures for understanding women's economic progress in Viet Nam (UN Women, 2021a).

3.1.2. Employment

Employment status by gender: Female employment accounted for 47.2 per cent of the total employed workers compared to 52.8 per cent for male employment in 2020. In

terms of employment structure, in 2020, wage workers (a job category typically considered more secure) were 43 per cent for female compared to 57 per cent for male; contributing family workers were 68 per cent for female and 32 per cent for male; cooperative members were 26 per cent for female and 74 per cent for male; women-headed organizations were 27 per cent compared to 73 per cent for men-headed organizations; and own-account workers were 47 per cent for female and 53 per cent for male (GSO, 2021d). In general, women mainly engage in contributing family workers and own-account workers; and the percentages of women-headed organizations and cooperative members are still low.

Informal sector: The country's sizeable informal economy plays an important role in creating easy access to income-generating opportunities for women and men, which contributes to a high level of economic activity and low unemployment in Vietnam. However, employment status has a strong impact on job quality and the economic risks faced by workers. Jobs in the informal economy are unprotected and informal workers can face significant poverty and occupational risk. Men are more likely to be in informal employment than women (the informal employment rate in 2019 was 67.2 per cent among women, and 78.9 per cent among men). However, women are over-represented among an especially disadvantaged category of informal workers, that of contributing family workers that is associated with particularly high risks of intensive work hours and none or irregular remuneration (UN Women, 2021a).

Vulnerable employment: Own-account workers and contributing family workers face greater economic risks. These two categories constitute vulnerable employment. Women face a greater likelihood of being in vulnerable employment than men. Women are more than twice as likely to be contributing family workers. In 2019, 5 million family workers (67 percent) in Vietnam were female. They represented almost 24.1 percent of rural female employment, as opposed to 13 percent of male rural employment (GSO, 2021a). In 2020, 68 per cent of contributing family workers in Viet Nam were female. The proportion of female own-account workers and contributing family workers (52.2 per cent) were higher than that of men (47.8 per cent) in 2020 (GSO, 2021d).

Unpaid work: In Viet Nam, the perception that women and girls should be responsible for unpaid care work is deeply embedded in society. Women on average spend twice as many hours as men working to produce 'services for own/family use'. These include activities such as cleaning, washing, cooking and shopping, and family care. In addition, almost all women spend at least some time in these activities on a weekly basis, while a much lower proportion of men do, and close to 20 per cent of men reported they do not spend any time in these activities at all. Among those individuals who engaged in such activities, women spent an average of 20.2 hours a week on them, and men an average of 10.7 hours. While only 9.2 per cent of men are unpaid family workers, the figure for women was twice as high, 19.4 per cent in 2019 (GSO, 2021a).

3.1.3. Unemployment

In Viet Nam's labor market before COVID-19, there was no significant gender-based difference in unemployment rates. In 2019, unemployment rates were 1.97 per cent for men

and 2.01 per cent for women (in rural areas, 1.53 per cent for men and 1.54 per cent for women) (GSO, 2021a). The high labor force participation rate and low unemployment rate obscure the relatively poor quality of employment among women. Employment status data mentioned above show that women make up the majority of unpaid family workers, especially in rural areas, where they also have limited access to services. This also partly explains the lower employment rates in rural and urban areas. One of the most visible effects of the Covid 19 on labor markets across the world, including Viet Nam, has been a reduction in working hours. Viet Nam's workers faced a severe reduction in working hours during the second quarter of 2020, especially women. In 2020, total weekly hours worked by women were 88.8 per cent of the total for the fourth quarter of 2019. Men, on the other hand, worked 91.2 per cent of the total weekly hours worked in the fourth quarter of 2019. Lower labor force participation was a determinant of the reduction in working hours in the second quarter, with larger numbers of women than men leaving the labor force, increasing Viet Nam's gender participation gap. Although women were relatively active in the labor market compared to other countries in the region, or those at the same income level as Viet Nam, a gender gap was still visible. Since the advent of COVID-19, labor force participation fell sharply for both women and men, but women experienced the greater fall (UN Women, 2021a). In 2020, the country had more than 1.2 million unemployed people; in which the number of unemployed women accounted for 56.1 per cent; and unemployment rates were 2 per cent for men and 3 per cent for women (GSO, 2021d). Thus, when the labor market has been impacted, female workers are more disadvantaged than men.

3.1.4. Pay gap

Persistent gender inequalities in income are found in almost all labor markets. The principle of equal pay for work of equal value is an important aspect of equality in the world of work, as emphasized by SDG 8.5. Viet Nam made a commitment to pursue this principle when it ratified ILO Convention No. 100, on Equal Remuneration. On average, women in Viet Nam earn less than men. In 2019, the weighted gender pay gap based on monthly wages was 13.7 per cent. This is relatively low compared to the latest global figure (20.5 per cent) (UN Women, 2021a).

Vietnamese women face a significant gendered income gap. Average income among women is lower than that of men in Vietnam. While the average income of an employee in 2019 was 5.6 million VND, this rate stood at is 6.5 million among men and 4.6 million among women. The average income of female workers in rural areas is especially low, at only 3.7 million VND compared to 5.7 million VND for men. The monthly average pay of female workers is nearly 30% lower than that of male workers (GSO, 2021a). In 2020, average monthly income from salaried workers was 6.6 million VND, of which men have higher average monthly income (6.92 million VND) than women (6.17 million VND) and the gender income gap was 10.9%. Men's income is higher than that of women in all economic sectors, professions and positions. For example, looking at the workers' income by occupational groups, in 2020, the unskilled/low-skilled labor (where women are over-represented) received the lowest income (4.4 million VND and

5.2 million VND for women and men, respectively) and the group of leaders (where men predominate) had the highest income (9.5 million VND and 10.8 million VND for women and men, respectively) (GSO, 2021d).

Gender gaps in income are a result of a range of gender differences. These include differences in the type and level of education and professional training, and types of employment, which are shaped by women's need to accommodate unpaid care work and stereotypes that cluster them into undervalued occupations or in part-time or informal employment because they need to balance work and family. These time and opportunity costs contribute substantively to income gaps between women and men, and they can restrict women's access to decent work (UN Women, 2021a). In Vietnam, the number of working hours per week of women is lower than that of men (the average number of working hours of the whole country was 41.9 hours per week; of which men worked 43.2 hours per week and women worked 40.4 hours per week) (GSO, 2021a) due to their significantly higher engagement in unpaid productive work at home. The percentage of trained male employees (26.9%) was higher than that for female employees (20.9%) in 2020 (GSO, 2021a).

3.2. Women in the agriculture sector in Vietnam

3.2.1. The role of agriculture in the Vietnam's economy

Viet Nam is one of the fastest growing economies in the world. The economic reform initiated in the late 1980s largely replaced the former centrally planned system with market mechanisms and promoted economic diversification and private sector development, and opened the economy to trade and international markets. Viet Nam has experienced considerable economic growth in the last 30 years, paving way to its development towards being a lower middle-income country in 2015. Access to basic infrastructure, including electricity, water and sanitation, has also significantly improved. Massive restructuring, especially public investment, state-owned enterprises and the banking sector, has taken place in recent years. Information and communication technology have developed rapidly, which is a key instrument for maintaining and promoting the competitiveness of the economy. Exports also constitute an increasingly significant contribution to Viet Nam's GDP, and certain sectors, such as industrial production, textile, electronics and seafood production, have been growing rapidly. This led to a rapid expansion of manufacturing and service industries, which quickly became the primary source of job creation. In addition, *Viet Nam has increasingly been integrated into global production and value chains, with female-intensive export-oriented light manufacturing being a major stimulus of GDP growth (UN Women 2021a).*

With 63 per cent of the Vietnam's population living in rural areas in 2021, the agriculture sector plays a vital role in the country's economy, contributing 12.36 per cent of the country's GDP in 2021 (GSO, 2021b). The agricultural sector is being restructured to shift away from low value and subsistence agriculture towards more knowledge-based agricultural technology, mechanization and value-added processing to produce and export high-standard food products. Viet Nam's economic transformation has led to a substantial labor market shift for both women and men. The accelerated economic growth is resulted

from labor shifting from agriculture towards manufacturing and services, private investment, a growing tourism sector, higher wages in non-agriculture sectors, and accelerating urbanization. Paid employment and higher earnings attracted a large share of workers away from agriculture, a shift that is on-going. The shift from agriculture to industry and services, which began in the 1980s, has continued to transform the labor market over the past decade. The proportion of workers in agriculture, forestry and fishery decreased from 62.2 percent (in 2000) to 49.5 percent (in 2010) and 33.1 percent (in 2020) (GSO, 2021d).

3.2.2. Gender-disaggregated employment in the agriculture sector in Vietnam

Although the proportion of labor in the agriculture, forestry and fishery sector is decreasing, it still accounts for 35.9% among employed women and 33.2% among employed men in 2019 (GSO, 2021a). Employed women are only marginally more likely than men to be working in agriculture, forestry and fishery. However, there is an important difference between the situation of men and women employed in this sector. The majority (85.9 per cent) of women in agricultural employment are primarily involved in subsistence agriculture while the corresponding share in male agricultural employment is 59.2 per cent. In rural area, 63.4% women working in agriculture, forestry and fishery compared to 57.5% male farmers (UN Women, 2021a).

The agricultural sector also has a predominance of part-time work and women are more likely to be working part-time than men. Around 25 per cent of the men and 39 per cent of women are part-time workers in agriculture, forestry and fishery compared to less than 6 per cent for both in other sectors. Furthermore, part-time workers are more likely to be contractual workers with less job security and social benefits (UN Women, 2021a). Despite their predominance in the agricultural sector, only 10 per cent of rural women are employed in the category ‘skilled agriculture, forestry and fishery workers’, compared to 15 per cent of rural men. In contrast, rural women are over-represented in the occupational category of unskilled labor (elementary workers) where they are 52 per cent of this occupational group. ‘Elementary workers’ is the occupational group that accounts for 51 per cent of all employed rural women compared to 43 per cent of rural men. The rate of employment of ethnic minority populations as skilled agriculture, forestry, and fishery workers is slightly higher at 17.7 per cent for ethnic minority men and 16.7 per cent for ethnic minority women largely due to their greater representation as workers in the agricultural sector as a whole. Ethnic minority populations are also predominantly employed in the category elementary occupations with the rate as high as 61.6 per cent for ethnic minority women (UN Women, 2021a).

3.2.3. Gender-sensitive access to technical trainings in the agriculture sector in Vietnam

Women groups have less access to the technical training that is needed as the agricultural economy becomes less labor intensive and more knowledge-based. The agriculture, forestry and fishery sector is associated with lower technical qualifications than other sectors of the economy and women workers are in an even more disadvantaged position compared to their male counterparts. For example, in 2019, rate of trained workers in the agriculture-forestry and fishery sector was 4 per cent (4.9 per cent for male and 3.1 per cent

for female). These rates for industry and construction were 18 per cent (20.7 per cent for male and 14.2 per cent for female) and for services were 44.7 percent (49.6 per cent for male and 39.9 per cent for female) (GSO, 2021a).

Rural women are more likely to have no technical qualifications compared to rural men and to urban women. Close to 90 per cent of rural women in the workforce have no qualification compared to just over 80 per cent of rural men. Ethnic minority groups are less likely to have technical qualifications, in particular women. Only 6.1 per cent of ethnic workers complete programs to acquire technical qualifications, just a third of the rate for the majority Kinh population. The rate of skilled ethnic minority women is even lower, at 5.7 per cent. Ethnic minority populations have a lower literacy rate, especially women, which is a constraint to participating in training. Ethnic minority women had a literacy rate of only 73 per cent, compared to 86 per cent for ethnic minority men. A greater portion of rural women have a professional college degree than rural men, but rural women are less likely than rural men to have vocational training of 3 months or more (UN Women, 2021a).

3.2.4. Gender-sensitive access to resources in the agriculture sector in Vietnam

Access to land: With 63 percent of the Vietnam's population still living in rural areas, land title is a crucial and essential form of property in Viet Nam. Land ownership and control is fundamental to livelihoods, and it endows individuals with an asset for collateral, independence and social security. For the past decade, Viet Nam has enacted provisions to improve the protection of women's land rights. Women's equal land rights are institutionalized in several laws, including the Land Law (2003, 2013), Marriage and Family Law (2014), Gender Equality Law (2006) and the Civil Code (2015), and a series of decrees and decisions guiding implementation. The Land Law (2003) decreed that all new land use rights certificates (LURCs) for married couples, 'must state the full names of both husband and wife'. A 2020 study with 2,567 Vietnamese men, found lower rates of sole land ownership overall, but a six-fold chasm between the proportion of female and male sole owners of land and/or residence, at 4.5 per cent and 28.2 per cent respectively. Even though these findings do not refer specifically to titling on LURCs, they reinforce the predominance of men in land/house ownership, and potentially also point to requisite change in land ownership patterns overall. Rural women's access to and control over land, a direct source of livelihood, is therefore contingent upon men (UN Women, 2021a).

Access to finance: Availability of access to preferential credit for women in poor rural areas has been provided over years in Vietnam. The Government of Vietnam provides to the rural poor, including women, access to credit through the Viet Nam Bank for Social Policies (VBSP) via the Farmers' Association, Women's Union, Veteran's Union, and Youth's Union. The Women's Union also provides some sources of preferential loans for members from poor and near-poor households. Approximately 2.5 million poor women are eligible for loans each year, making up 42% of the loans from VBSP (UN Women, 2021b). In addition, the Bank of Agriculture and Rural Development (AgriBank) is another important channel of credit provision for women. This financial policy is aligned with several targets set in the National Strategy on Gender Equality for 2011-2020, including 80% of women

laborers in poor rural areas or ethnic minority regions being able to access preferential credit through employment or poverty reduction programs.

3.3. Women in the agriculture sector in the context of climate change in Vietnam

3.3.1. Climate change in Vietnam

Vietnam is predicted to be particularly sensitive to global climate change and is considered as one of the ten countries most negatively impacted by climate change. In recent years, climate extremes continue to be recorded with higher intensity and frequency. Data over the past 60 years (1958-2018) shows that the annual average temperature of the whole country rose by about 0.89°C; rainfall decreased in the Northern regions from 1 per cent to 7 per cent while increased in the Southern regions from 6 per cent to 21 per cent; the number of strong typhoons was on the rise; the daily maximum and minimum temperatures increased; the number of hot days rose in most areas; droughts in the dry season occurred more frequently across the country; the number of cold and freezing cold days decreased; extreme rain increased; and average sea levels at coastal and island monitoring stations increased by 2.74 mm/year, particularly 3.0 mm/year during 1993 – 2018 (Socialist Republic of Vietnam, 2020).

Economic damage has resulted in an average annual loss of 1 to 1.5 percent of the country GDP over the past three decades (Socialist Republic of Vietnam, 2020). Over the period 2000-2019, Viet Nam was ranked 13th of 180 countries on the Global Climate Risk Index with average losses of 11 million USD (PPP) in 2000-2019 (Germanwatch, 2021). It is also argued that the impact of climate change on the ASEAN region, as a whole, is likely to be acute in Viet Nam, due to its ‘high dependence on agriculture... along with recent trends towards lower crop diversity, and the erosion of social safety nets’. With a need for agricultural restructuring for food and livelihood security, and for population settlements to be safeguarded, impacts are neither distant nor minor for Viet Nam, including for women (UN Women, 2021a).

Vietnam has developed and implemented many national laws, strategies, and action plans to promote a low-carbon development pathway, reduce vulnerability to the impacts of natural disasters and climate change, enhance green growth and sustainable development, notably the Law on Natural Disaster Prevention and Control (2013), the Law on Meteorology and Hydrology (2015), Law on Natural Resources and Environment of Sea and Islands (2015), the Law on Environmental Protection (2020), the Party’s Resolution 24/NQ-TW dated June 3, 2013 on climate change response, natural resource management and environmental protection, the Party’s Resolution No. 08/NQ-CP dated January 23, 2014 on Action Plan to implement the Resolution No. 24 -NQ/TW dated June 3, 2013 of the 11th Party Central Committee. Efforts and initiatives of climate change response in Vietnam have also been reflected in Vietnam's Agenda 21 on Sustainable Development (2004), the National Strategy and Plan on Disaster Management and Mitigation (2001-2020, 2021-2030), National Climate Change Strategy (2011-2020, fourth coming 2021-2030) and related Action Plans, National Strategy on Green Growth (2011-2020, 2021-2030) and related Action Plans, the National Target Program to Respond to Climate Change (2008,

2012-2015, 2016-2020), the Support Program to Respond to Climate Change (2010-2015, 2016-2020), the National Action Program on greenhouse gas emission Reduction (referred to as REDD+ Program) in the period 2011-2020, and the Community-Based Disaster Risk Management Program. Response to climate change has been included in the Socio-Economic Development Strategy (2011-2020, 2021-2030) and Nationally Determined Contribution (NDC).

3.3.2. Impact of climate change on women in the agriculture sector in Vietnam

Climate change, increased natural disasters and climate extremes produce different impacts on women and men. The poor, ethnic minority groups, people whose livelihoods depend on the climate, the elderly, women, children, and people with chronic illnesses have the highest level of vulnerability (Socialist Republic of Vietnam, 2020). Women, especially ethnic minority women, are highly vulnerable to climate change impact for several reasons (UN Women, 2021a).

First, because women dominate the agricultural sector, they are taking on a larger amount of workload in agricultural production as the sector becomes more vulnerable to the risks and impacts of natural disasters. Women are generally more likely to depend on small-scale and subsistence agriculture such as vegetable production and smallholder livestock that are vulnerable to disasters. Women's small and medium enterprises have low capital investment and focused on the retail and food sectors, which are more vulnerable to the impact of natural disasters. In addition, women are more likely to have perishables or small retail operations that suffer more losses during disasters.

Second, women have few assets to support them cope with shocks. Women, especially those from poor households and ethnic minorities, have fewer savings or other resources to encounter with the damage. It is worth noting that women had limited access to land and the necessary assets for financial security at such times. The lack of formal land tenure can limit women's access to post-disaster financial or in-kind assistance after disasters. Due to their lack of access to formal financial mechanisms, women are more likely to take out small, informal loans to meet family needs. This debt can be a burden for women when repeated natural disasters occur, as they do not have an income source to repay the loans. In addition, when disaster strikes, women not only face a loss of production to meet their family's food security needs, but also an increased amount of recovery workloads.

Third, women have greater responsibilities for household chores that become more difficult and time-consuming after climate events. Women have to take on more responsibility for daily tasks such as water collection which becomes much more difficult during floods or droughts. In the event of a tornado, flood, or other disaster requiring mobility, responsibility for family care (children and elderly relatives) may hinder women's access to shelter or health care. Over time, more frequent and severe climate change-induced floods and droughts will increase women's labor and limit the time available to diversify livelihood options. This is compounded by women's low access to agricultural extension, including knowledge of adaptive agricultural techniques and more resistant cultivars.

Fourth, women's relatively limited access to and control of household assets and resources limits women's options in diversifying their livelihood options to respond to climate change. Rural women are more likely to be involved in subsistence low-yielding agriculture, which is more vulnerable to disaster and climate change impacts. Without access to land, women are limited in accessing the financial resources needed to obtain higher quality new inputs, equipment or production technology. Due to their underrepresentation in technical training, women have less access to agricultural services that are important for building resilience and developing adaptation options. In addition, limited access to land and capital has limited women's options to invest in more climate-resilient livelihood options by diversifying their production to high-value crops or supplementing their income by small-scale processing enterprises or off-farm activities.

Fifth, women's situation related to climate change is aggravated by their lower adaptive capacity than men. Women face more challenges than men in planning and decision making, especially at the local level. In addition, socio-cultural norms often limit women's access to the information and skills needed to address climate-related hazards. Overall, women have unequal access to resources and capacity building opportunities to help them adapt to climate change impacts.

It can be seen that the increased frequency and severity of natural disasters and the impacts of climate change are posing new challenges to gender equality and women's empowerment in rural areas. Gender inequality is also a determinant of exposure to climate change risks as women and girls are more vulnerable to the impacts of extreme events. Acknowledging the differences between the conditions of men and women is important in addressing climate change issues, because these differences create differential climate change impacts on women and men. Generally, climate change impacts create additional burdens on women. Addressing the above gaps is significant in Viet Nam.

3.3.3. Integrating gender concerns in existing climate change policies in Vietnam

Viet Nam has strong commitments on gender equality and promotion of women's rights through implementation of international and national commitments on gender equality. Viet Nam has committed to a number of key international conventions related to the human rights of women, and children and gender equality, including the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW), the Beijing Declaration on Women's Rights, International Covenant on Economic, Social and Cultural Rights, International Covenant on Civil and Political Rights, etc. Since the adoption of CEDAW in 1982, Viet Nam has undertaken significant efforts to bring about international recognition in promoting gender equality and protecting the rights of women and girls. In the context of climate change, the General Recommendation No. 37 on Gender-related dimensions of Disaster Risk Reduction was issued in 2018 pursuant to Article 21 of the CEDAW by the Committee on the Elimination of Discrimination against Women. This General Recommendation provides guidance to States parties and agencies on the implementation of their obligations under the Convention in relation to DRR and climate change. The General Recommendation No.37 is expected to leverage these efforts in the

area of climate change, especially as Viet Nam is one of countries in the world being most severely impacted by climate change.

Integrating gender concerns in climate change policies and actions bring about more efficient implementation, as this brings focus to the needs, challenges, and capacities of both men and women. Viet Nam has initiated efforts towards this goal, for example, the specific reference in Viet Nam's NDC (2020) on the gendered impacts of climate change. Likewise, gender issues have been incorporated in some climate change related plans and policies in the country. For example, the National Climate Change Adaptation Plan (NAP) for 2021-2030 contained the provision for "raising awareness and knowledge about climate change and disasters of administrations of various levels, social organizations and communities; building capacity and developing female human resources, and boosting gender equality in climate change adaptation".

4. Discussion and Conclusion

There are key barriers facing women in the economy and in agriculture sector in the context of climate change in Vietnam. In the economy, despite advances for women in the legal framework for labor and enterprises over the past years, in Viet Nam as elsewhere, the economy remains a gendered structure. Women in Vietnam are in a more disadvantaged position than men in the economy. Women participate in the labor force at a lower rate than men. Women on average spend twice as many hours as men working to produce 'services for own/family use'. Women mainly engage in contributing family workers and own-account workers; and the percentages of women-headed organizations and cooperative members are still low. Women are over-represented among an especially disadvantaged category of informal workers (contributing family workers that is associated with particularly high risks of intensive work hours and none or irregular remuneration). Women face a greater likelihood of being in vulnerable employment than men as the proportion of female own-account workers and contributing family workers are higher than that of men. When the labor market has been impacted (e, g. by Covid 19), female workers are more disadvantaged than men in terms of unemployment. In addition, men's income is higher than that of women in all economic sectors, professions and positions.

Agricultural sector employment remains characterized by limited earnings and few worker protections, within which women are particularly disadvantaged, making gender-mainstreaming extremely relevant to agricultural restructuring in Vietnam. More women work in agriculture, forestry and fishery than men. Women is engaged in more labor intensive agricultural activities as compared to men. Women have fewer opportunities to migrate to urban areas to find income-generating jobs due to their responsibilities in taking care of children and the elderly. Women groups have less access to the technical training. Rural women are over-represented in the occupational category of unskilled labor and also less likely than rural men to benefit from agricultural extension services and short-term training. The majority of land/house URCs and agricultural LURCs remained in the husband's name. Women have limited land ownership which constrains their access to credit and secure livelihoods.

Viet Nam has been performing well in terms of gender equality. In 2021, the World Economic Forum ranked Viet Nam 87 out of 156 countries in terms of overall performance in closing the gender gap, with a score of 0.701. This ranking contained separate scales for economic participation and opportunity (score of 0.765, rank 31), educational attainment (score of 0.982, rank 94), health and survival (score of 0.945, rank 152), and political empowerment (score of 0.113, rank 110) (World Economic Forum (2021). *The UNDP Gender Inequality Index measures indicators where Viet Nam has performed well and stably, namely maternal survival, educational parity at secondary level, and the share of working age women in the workforce.* With the Gender Development Index (GDI) value of 0.997 in 2019, Viet Nam ranks 65th out of 162 countries and is the highest among five country groups. However, Viet Nam is still facing gender inequality challenges: the country ranks in the bottom third globally in terms of sex ratio at birth (1.12), violence against women by intimate partners (34.45 percent) and women with accounts in financial institutions or with a mobile money service provider (30.45 percent). Disaggregated data show larger disparities within geographical locations and ethnic minority groups (UNDP, 2020).

Persistent gender gaps remain in rural Vietnam in terms of social discrimination against women, increased vulnerability and limited opportunities for women, unfavorable land ownership for women and low involvement of women in business development, governance and decision –making. In the context of climate change and natural disasters the gender gaps will likely increase, as for several reasons women and girls are more vulnerable to climate change impact. Climate change exacerbate gender inequalities, but gender inequalities also contribute to greater negative impacts from climate change. The overall burden and restrictions on rural women will likely increase as a result of continued gender inequality, increased production requirements, and climate change impacts.

The significant vulnerability of the rural poor and women groups to climate change suggests the great need for adaptation. Good adaptation provides options to manage climate-induced risks. To address gender inequality, adaptation must therefore address gender-based vulnerability. In agriculture sector, gender transformative adaptation can enhance food and nutrition security and bring other benefits such as increased socio-economic well-being and poverty reduction. The type of adaptation measures or interventions to be introduced should account for the characteristics of the rural poor and women groups. In particular, due to immense vulnerability to climate change of women, the rural poor, and ethnic minority groups, climate change actions necessitate consultations with these groups. Interventions would need to account for these groups' needs and conditions, and include activities that may provide these groups possible opportunities for adaptation. Finally, designs of climate change actions would need to incorporate the knowledge, skills, and practices of these groups for better likelihood of success.

In recent years, there has been an increased integration of gender equality as a cross-cutting consideration in climate change and natural disaster-related policies. Specifically, climate change is mentioned in the analysis of the National Strategy on Gender Equality 2011-2020 and 2021-2030, but not in detailed. The climate change adaptation and disaster

risk management are being male-dominated in Viet Nam. Therefore, there is a collective call to shift the focus to action planning to practically ensure women's engagement so that they can benefit from the preparedness and adaptation activities and from the opportunities arising from transitions in the agriculture and rural development.

Women's priorities are underrepresented in disaster risk reduction and adaptation planning because they are underrepresented in local government positions that are assigned to these decision-making bodies. Gender inequality, lack of training and lack of formal mechanisms to promote women's leadership lead to underrepresentation of women in decision-making bodies at all levels. Women's lower participation in community organizations hinders their participation in preparedness and adaptation activities. It is necessary to increase the participation of women in the workforce and decision-making bodies on climate change, disaster risk management and emergency relief efforts. Women's awareness and engagement in responding to natural disaster events and climate change impacts in the agriculture sector should be enhanced to ensure food security in the future. In addition, studies on the gender-sensitive impacts of climate change and natural disaster events in the agriculture sector should be conducted to design appropriate gender-responsive adaptation measures in Vietnam.

Abstract

This study focuses on examining the influence of land acquisition policy on the satisfaction and life of people in the suburban areas of Hanoi city through the linear structural model PLS-SEM. The research sample was collected from 430 people whose land was acquired in 03 districts of Hanoi city: Gia Lam district, Thuong Tin district, and Long Bien district. The analysis results show that there are four factors affecting people's satisfaction with the land acquisition policy, including Knowledge, Willingness, Living conditions before and after the acquisition, and Compensation Process. In which, Willingness factor has the strongest impact on satisfaction with land acquisition policy. The results also prove that Policy Satisfaction will have an impact on Life Satisfaction. Based on the analysis results, the article proposes solutions and recommendations to improve the State's land acquisition policy.

Keywords: *land acquisition policy, satisfaction, people's life, urban periphery.*

1. Introduction

In a country that is heavily dependent on the agricultural economy and the proportion of the population living in rural areas accounts for 65.4% (Results of the 2019 Census) like Vietnam, the land is always a hot and sensitive issue, especially in the process of land acquisition, there are more and more controversies and inadequacies. The process of industrialization and urbanization requires the conversion of a part of agricultural land to non-agricultural land (Tan et al., 2009). Moreover, the urban expansion will gradually create a wave of encroachment of land around the city (Wu et al., 2016). The greater the need for socio-economic development, the higher the demand for land use. Meanwhile, the land fund

is limited, when urban land cannot be met, the expansion to the periphery of the city is inevitable and the main driving force for the development of the peri-urban area is the available land fund that is suitable for low cost (de Wit, J.W., 2013).

The acquisition of land in peri-urban areas will have a stronger impact on people's lives and livelihoods than in urban areas because peri-urban areas are home to a lot of agricultural lands - the main production tool generating income to help them maintain their livelihoods daily. The loss of agricultural land and the narrowing of arable land for the construction of agricultural zones and residential areas have forced farmers to change occupations and also adapt to changing lives. Farmers are the main stakeholders during the implementation of the land acquisition policy, their attitude is the main factor affecting satisfaction (L. Cheng et al., 2018). Therefore, whether people can participate in the negotiation process when acquiring land or not and how will be an important factor affecting satisfaction with the State's policies and satisfaction with the State's policies. life. Because only when satisfied, will people have faith and support for the State's policies, contributing to solving the problem of delayed site clearance, and creating land funds for urban development. However, exploitation from the perspective of people's participation in the implementation of a land acquisition policy is still quite new in Vietnam.

In addition, identifying and knowledge the factors affecting people's satisfaction in the land acquisition process, and considering life satisfaction in many different aspects will become the basis to help the State have more perspectives on the current situation, thereby making appropriate policy decisions. And thanks to that, people will have a more positive view of the issues before, during, and after the expropriation, contributing to reducing disputes, complaints, and frustrations of people having their land recovered.

2. Method

2.1. Research model

The model includes the variables of Knowledge, Willingness, and Living conditions of people before and after the withdrawal, The process of implementing compensation after the recovery affects Satisfaction in the policy based on the Analytical Model factors affecting farmers' policy satisfaction (L.Cheng et al., 2018). The authors propose a new variable that policy satisfaction will affect people's life satisfaction after land acquisition.

Research hypothesis:

H1: Knowledge of policy has a positive relationship with satisfaction with policy.

H2: Willingness has a positive relationship with satisfaction in the policy

H3: People's living conditions before and after withdrawal have a positive relationship with satisfaction with the policy.

H4: The process of making compensation has a positive relationship with satisfaction in the policy

H5: Policy satisfaction has a positive relationship with life satisfaction.

2.2. Qualitative research

Qualitative research methods to build, calibrate the scale, and build survey questionnaires. The results of the study are the scale tables used in the official research presented in Table 1 below:

Table 1. Research scale table

Variable names	Code	Questions' Content
Knowledge (KN)	KN1	Policy Knowledge
	KN2	Propaganda of the local government
	KN3	Knowledge of policy goals
	KN4	Participation in policy implementation
	KN5	Policy making consultation meetings
Willingness (Wi)	Wi1	Willingness to participate in the land acquisition process
	Wi2	Civilian's concerns
	Wi3	Attachment to the current house
Living conditions before and after recovery (LC)	LC1	Satisfaction with the new quality of life
	LC2	Possibility to find a new stable job and higher income than before
	LC3	Living environment conditions, social relationships are better than before
	LC4	Conditions for accessing people's knowledge are more favorable than before
	LC5	Access to traffic, cultural works, public welfare is more favorable than before
	LC6	The conditions of cultural and spiritual life are better than before
Compensation Process (CP)	CP1	Level of satisfaction with compensation policy
	CP2	Compensation is paid high compared to the initial value
	CP3	Total compensation
	CP4	Compensation for house
	CP5	Compensation for land
Policy Satisfaction (SaP)	SaP1	Satisfaction with the implementation of the land acquisition policy
	SaP2	There is an agreement on land acquisition
	SaP3	The process (procedure) for land acquisition is very simple
	SaP4	Satisfaction with the attitude of local authorities when acquiring land
Life satisfaction (SaL)	SaL1	Satisfaction with the new quality of life
	SaL2	Satisfaction with the facilities at the new place
	SaL3	Satisfaction with the transportation system at the new place
	SaL4	Satisfaction with the quality of the environment at the new place

2.3. Quantitative research

Survey design

On the basis of closely following the research objectives, problems and research questions, the authors design the survey form into two main parts:

Part 1: General information about survey participants (including questions about living area, gender, age, education level, number of family members). The format for the answers in this section is multiple-choice questions. Selected answers are given according to the nature of each question.

Part 2: Assess the impact of land acquisition policy on people's satisfaction and life. The beginning of this section includes questions to understand the situation of land acquisition such as the area of land acquired, the amount of land that is compensated after acquisition. The answers to these questions are in self-completed format. Then there are questions about jobs, main source of income before and after acquisition (multiple choice answers) and whether land use has a great influence on people's jobs or not. The group used a 5-point Likert scale for survey participants to rate the statements given with the following levels: (1) Strongly disagree, (2) Disagree, (3) Neutral, (4) Agree and (5) Totally agree.

Sample size

Research by Comrey (1973) and Roger (2006) concludes that: “The sample size is at least 5 times the total number of observed variables”. In this study, the total number of observed variables used is 27, so the minimum sample size is $27 \times 5 = 135$. However, because the rate of agreeing to answer the survey is usually low, it is important to ensure the requirements. Regarding the minimum sample size, the research team distributed 500 survey questionnaires. However, taking into account the risks of sample filtering and incomplete questionnaires, in order to ensure the sample size for the research paper, the total number of questionnaires distributed was 500. After the survey, a total of 495 ballots were filled out. Through the cleaning process, only 430 eligible votes were retained for analysis. Specifically, in Gia Lam, there are 160 valid votes, Thuong Tin has 131 votes and Long Bien has 139 votes. The specific characteristics of the study sample are presented in Table 2 as follows

Table 2. Descriptive statistical results of the study sample

CRITERIA		FREQUENCY	RATIO (%)
GENDER	Male	176	40.9
	Female	249	57.9
	Other	5	1.2
ACCOMMODATION	Gia Lam	160	37.2
	Long Bien	139	32.3
	Thuong Tin	131	30.5
AGE	From 18 to 30 years old	29	6.7
	From 31 to 40 years old	54	12.6

CRITERIA		FREQUENCY	RATIO (%)
	From 41 to 50 years old	149	34.7
	From 51 to 60 years old	132	30.7
	Over 60 years old	66	15.3
EDUCATION	High school	195	45.3
	College	124	28.8
	University	81	18.8
	Master's degree	30	7.0
NUMBER OF FAMILY MEMBERS	From 1 to 3 people	101	23.5
	From 4 to 7 people	277	64.4
	From 8 to 10 people	50	11.6
	Over 10 people	2	0.5

3. Results

Cronbach's Alpha test

The results of the reliability test by Cronbach's Alpha coefficient from Table 3 for the components of the scale all have Cronbach's Alpha > 0.7 and no measurement variable has a correlation less than 0.3. Qualified.

Convergence value test results

The measurement and evaluation of the convergent value of the latent variables is based on the indicators of external factor loading (outer loading) and variance extracted (AVE - Average variance extracted). According to Hock & Ringle (2010), the scale reaches the convergent value if the AVE is 0.5 or higher. The analysis results in the table below show that the measured CR values range from 0.866 to 0.918 and the smallest AVE index is 0.565, the largest is 0.737, both are larger than the required value of 0.05, showing that the model has achieved convergent value.

Table 3. Convergence value test results

	Cronbach's Alpha	rho_A	Composite Reliability (CR)	Average Variance Extracted (AVE)
CP	0.807	0.808	0.866	0.565
KN	0.842	0.864	0.886	0.608
LC	0.884	0.887	0.912	0.632
SaL	0.881	0.883	0.918	0.737
SaP	0.874	0.875	0.914	0.726
Wi	0.776	0.797	0.868	0.688

Hair et al. (2016) believe that the external loading coefficient needs to be greater than or equal to 0.708 for the observed variable to be of good quality. Looking at the results from the table of loading factors of the factors above, it can be seen that the scale components all have load coefficients > 0.708, so the scale components for each factor are consistent with the remaining indicators and are measured. retained in the model.

Discriminant validity test results

According to Henseler et al (2015), if the HTMT index is below 0.9, the discriminant value is guaranteed. From the table of discriminant test results, it can be seen that the HTMT index is all less than 0.9, so the discriminant value can be assessed.

Table 4. Discriminant validity test results

	CP	KN	LC	SaL	SaP	Wi
CP						
KN	0.219					
LC	0.351	0.359				
SaL	0.291	0.148	0.414			
SaP	0.507	0.392	0.534	0.597		
Wi	0.441	0.237	0.360	0.350	0.626	

Check the fit of the model

To measure the fit of the research model, it is necessary to consider the SRMR index (the difference between the actual data part and the predicted model part). According to Hu and Bentler (1999), the SRMR index must be less than 0.08 or 0.1. Also, Henseler and fortifications. (2015) also suggested that the SRMR index is the "level conformity" index of the PLS-SEM model that can be used to avoid parameter bias in the model. In the result table, the SRMR index is < 0.08, so the research model is suitable.

Table 5. Model fit test

	Saturated Model	Estimated Model
SRMR	0.051	0.056
d_ ULS	0.992	1.178
d_ G	0.334	0.340
Chi-Square	847.477	860.028
NFI	0.851	0.849

Hypothesis test results

PLS-SEM estimates the model path for each Bootstrap template. The PLS-SEM results for all bootstrap samples provide the mean and standard error values for each of the pathway model coefficients. The information of the T-test and P-value represents the statistical significance of the relationship of the path model. The total number of samples is 430 samples and the test results are as follows:

Table 6. Impact coefficient test results

	Original Sample	T Statistics	P-values	Result
CP-> SaP	0.199	4.792	0.000	Accept
Wi -> SaP	0.343	7.644	0.000	Accept
KN -> SaP	0.165	4.110	0.000	Accept
LC -> SaP	0.259	5.249	0.000	Accept
SaP -> SaL	0.526	11.314	0.000	Accept

The results of the impact coefficient test can show that the impact of the variables CP, Wi, KN, LC on the intermediate variable SaP is as follows: The strongest impact is the variable Willingness with the path coefficient (impact factor) is 0.343; followed by the variable Living conditions before and after recovery with $\beta = 0.259$; The third strongest variable is the Process of Compensation ($\beta = 0.199$) and the last is the Knowledge variable with the weakest impact ($\beta = 0.165$). Thus, it can be affirmed that the research hypotheses H1, H2, H3, and H4 are accepted and no hypothesis is rejected. This also explains that all factors CP, Wi, KN, and LC have an impact on Satisfaction in policy (SaP).

The results also show that there is a strong and positive correlation between the variable Satisfaction in policy (SaP) impact the variable Life Satisfaction (SaL), specifically:

$$\text{SaP} \rightarrow \text{SaL} \text{ with coefficient } \beta = 0.526$$

From the results of the analysis of the linear structural model (SEM) and the tests, it is shown that the research hypotheses from H1 to H4 and H5 are accepted. All factors Knowledge, Willingness, Living conditions before and after withdrawal, Compensation process has a positive impact on Satisfaction with the policy. Policy satisfaction will impact Life satisfaction after withdrawal.

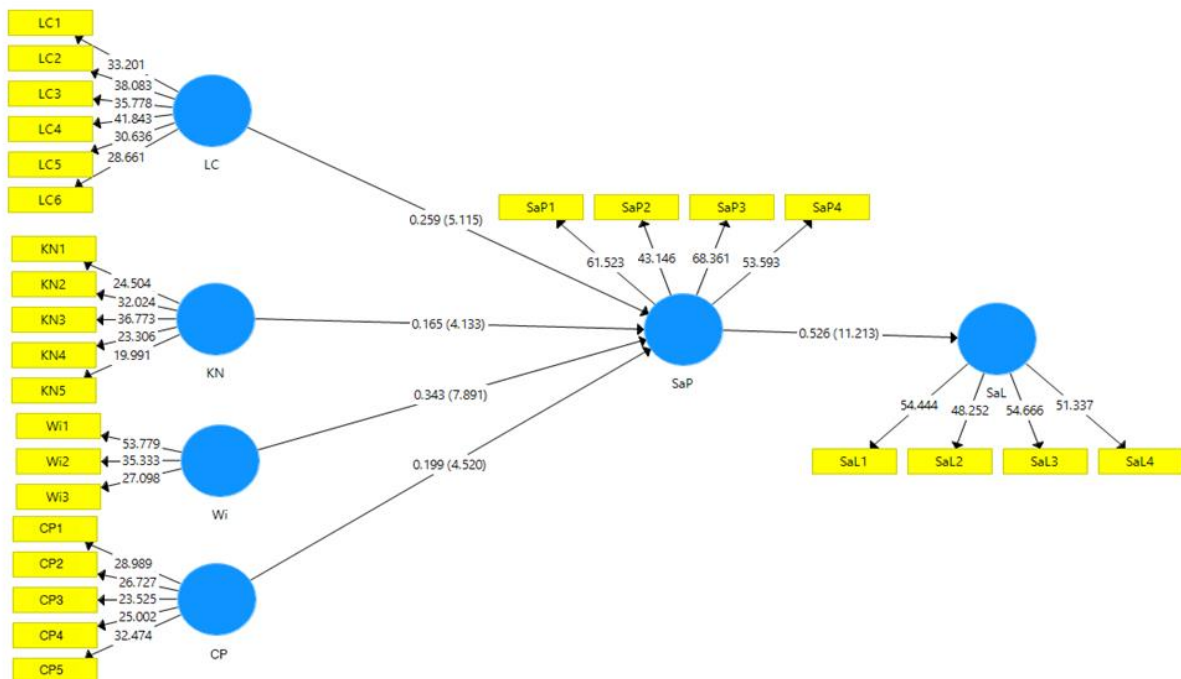

Figure 2. Linear Structural Analysis Model (SEM)

R-Square Test:

Table 7. R-Square evaluation results

	R-Square	Accuracy in forecasting
SaL	0.277	Average
SaP	0.446	High

The closer the R-Square value is to 1, the more accurate the prediction is. However, determining how much R-Square is difficult and depends on the research environment and research model. In the above table, the forecast accuracy of SaP to SaL is at an average level with the value R-Square = 0.277 and with the value R-Square = 0.446, the accuracy in the forecast of the independent variables KN, Wi, LC, CP to variable SaP is high.

Multi-group analysis results

Table 8. Results of multi-group analysis between Gia Lam and Long Bien

	Path Coefficients-diff (Gialam - Longbien)	p-Value new (Gialam vs Longbien)
CP-> SaP	-0.107	0.221
KN -> SaP	-0.003	0.980
LC -> SaP	-0.125	0.328
SaP -> SaL	-0.058	0.617
Wi -> SaP	0.221	0.034

The results of PLS - MGA between Gialam and Longbien groups show that the relationships between CP and SaP, KN and SaP, LC and SaP, SaP and SaL have p-Values greater than 0.05, respectively, so there is no difference between the two groups. There is a difference in the impact of Wi on SaP because p-Value new is $0.034 < 0.05$, so the way in which Willingness affects Policy Satisfaction is significantly different in Gialam than in Longbien. After evaluating the new p-Value considering the Path Coefficients-diff difference from Wi to SaP is $0.221 > 0$, this shows that Wi has a weaker effect on SaP in Longbien than Gialam.

Table 9. Results of multi-group analysis between Gia Lam and Thuong Tin

	Path Coefficients-diff (Gialam - Thuongtin)	p-Value new (Gialam vs Thuongtin)
CP-> SaP	-0.125	0.228
KN -> SaP	0.041	0.666
LC -> SaP	-0.121	0.282
SaP -> SaL	-0.002	0.976
Wi -> SaP	0.246	0.023

In the analysis of PLS - MGA results between two groups Gialam and Thuongtin, it showed that the groups CP and SaP, KN and SaP, LC and SaP, SaP and SaL, respectively, had p-Values greater than 0.05, so there was no difference between these two groups.

In the impact relationship between Wi and SaP, there is a p-Value of 0.023, less than 0.05, so there is a significant difference in the impact of Wi on SaP between Gialam and Thuongtin. After evaluating the new p-Value, it was found that there is a difference in the relationship between Wi and SaP, we consider that the difference in the normalized impact coefficients (Path Coefficients-diff) from Wi to SaP is $0.246 > 0$, this means Willingness effect on Policy Satisfaction is stronger in Gialam than Thuongtin.

Table 10. Results of multi-group analysis between Long Bien and Thuong Tin

	Path Coefficients-diff (Longbien vs Thuongtin)	p-Value new (Longbien vs Thuongtin)
CP-> SaP	0.565	0.871
KN -> SaP	0.331	0.662
LC -> SaP	0.474	0.948
SaP -> SaL	0.308	0.615
Wi -> SaP	0.417	0.834

In the multi-group analysis between Longbien and Thuongtin, it shows that the groups CP and SaP, KN and SaP, LC and SaP, SaP and SaL, Wi and SaP respectively have p-Value new greater than 0.05, so it can be concluded that the effects between Knowledge, Willingness, Living Conditions before and after withdrawal and Compensation Process on Policy Satisfaction and between Policy Satisfaction and Life Satisfaction is not difference.

4. Discussion and Conclusion

4.1. Discussion

Firstly, for people's satisfaction with the policy

Research results have shown four factors affecting people's satisfaction with land acquisition policy, including Knowledge, Willingness, Living conditions before and after the acquisition, and the Process compensation.

Among these factors, Willingness is the most important factor affecting people's satisfaction with land acquisition policy (coefficient 0.343); that is, people are willing to participate in land acquisition policy. The land return shows high satisfaction with the policy. The knowledge of land acquisition policy is the second most crucial factor with a coefficient of 0.259, followed by the Compensation process with a coefficient of 0.199, and finally, Living conditions before and after the acquisition with a coefficient of 0.166

Second, for people's satisfaction with life after recovery.

Compensation level and resettlement support are two factors that significantly affect people's satisfaction with life after recovery. After the land is taken, people will be compensated for land, house, or money, sometimes two out of three. Satisfaction with compensation level and resettlement sites significantly affect satisfaction with life after acquisition.

Some proposals and recommendations

Firstly, for the policy on compensation and support levels after the State's land acquisition.

The State needs to review, amend and supplement legal documents on compensation and resettlement support levels.

Continue to amend and supplement the contents, order, conditions, and procedures for applying specific land valuation methods or calculating compensation prices when the State recovers land (direct comparison, deduction, income, surplus, land price adjustment coefficient).

Focus on implementing solutions to ensure transparency and develop a healthy and stable transfer market parallel with strict regulations and penalties for law violations.

Second, policies support people whose land has been recovered to ensure a stable life and long-term livelihood.

The State's support policy should be reviewed and revised to increase the level of support for job training and job change for those whose agricultural land has been recovered to ensure stable life and long-term livelihood. More specific regulations on the level of support appropriate to people according to the area's characteristics and occupation of the person whose land is recovered.

Third, the organization of compensation and support for people when the State recovers land.

Strictly implement, ensure transparency and fairness for all households whose land is recovered during the implementation process, and collect people's opinions in formulating compensation and support plans. Hold policy-making consultation meetings in a marketable, responsible manner, requiring full, well-founded explanations in both legal and practical terms for unreasonable, unacceptable opinions.

The State and local authorities need to supplement appropriate methods of propaganda and education so that all people can understand and grasp more clearly the policy of resettlement, support, and resettlement. Regularly organize training courses and staff training for staff doing recovery, compensation, and support tasks.

Fourth, about the people's living conditions after the land is recovered.

For people whose lives, jobs, and livelihoods are affected, the State needs to pay attention and have timely solutions to support adequately, solve employment problems, and create favorable conditions for people to live and work. Convenient in accessing people's knowledge, traffic, cultural works, and public welfare. Particular attention should be paid to the people's living environment to ensure the unpolluted environment of factories in the vicinity of resettlement areas. In addition, it is necessary to listen to and promptly deal with suggestions and reflections to ensure the physical and mental quality of local people.

4.2. Conclusion

The study has shown four factors affecting people's satisfaction with the land acquisition policy: Knowledge, Willingness, Living conditions before and after the acquisition, and Compensation process. Through the analysis methods of the PLS-SEM model, the study has shown the influence of the factors and the relationship between the variables together and tested the model. Accordingly, four factors affecting people's satisfaction with land acquisition policy all have a positive impact, and the factor that has the most substantial impact on people's satisfaction with the policy is Willingness.

DETERMINANTS OF RESIDENTIAL LAND PRICES: AN EMPIRICAL STUDY IN VIETNAM

Pham Phuong Nam

ppnam@vnua.edu.vn

*Faculty of Natural Resources and Environment,
National University of Agriculture (VNUA)*

Abstract

The study aims to determine the impact of factors on residential land prices in the period from 2020 to 2021. The study investigates 250 officials, real estate investors, credit officers, and real estate agents on factors affecting residential land prices. The research results have shown 12 groups with 47 factors affecting land prices. The rate impact rate of the factor groups ranges from 1.58% to 31.34%. The COVID-19 pandemic factor group has the strongest impact on residential prices, followed by groups of factors: real estate brokerage; urbanization, industry, and handicrafts; upgrading administrative and planning units; real estate market; economical factors; infrastructure; environment; legal elements; social factors, location factors, individual factors. To harmonize the interests of the State, investors, and land users when valuing land, it is necessary to pay attention to the factors that strongly affect the land price first, followed by the factors that have a smaller impact.

Keywords: *Bac Ninh, COVID-19 pandemic, determinants, residential land prices.*

1. Introduction

According to the provisions of Vietnamese law, the land belongs to the entire people and is managed by the State on behalf of the owner. Individuals and organizations, collectives referred to as land users, are not entitled to land ownership, only have land-use rights. Land users are entitled to exercise their rights and obligations as prescribed. Therefore, land price is understood as the value of land use rights of an area unit at a specific time and a specific location. Land price is one of the bases for calculating land use levy, land rent, taxes, fees, charges, and other financial obligations related to land such as purchase and sale of land use rights, land lease, mortgage, capital contribution, etc (National Assembly of the Socialist Republic of Vietnam, 2013). Residential land prices in particular and land prices, in general, are affected by many different factors that influence land prices, and the extent to which they affect land also varies for different types of land and at specific locations and at certain times. So far, there have been many studies on the factors affecting land prices to different degrees. Some studies focused on assessing the factors affecting agricultural land prices or non-agricultural land prices (Dirgasov et al., 2017; Downing, 1973; Hultkrantz, 1991; Le, 2017). Several studies evaluated the impact of one or more factors on land prices. Studies pointed out groups of factors affecting land prices including location and characteristics of land plots, supply, and demand of the real estate market, and economic, social, environmental, security, and order factors. self, legal, etc. Even so, other factors have

not been assessed for impact, including the COVID-19 Pandemic, real estate brokerage practices, industrial development, handicrafts, etc. Therefore, assessing the impact of factors affecting land prices to answer the questions: *What factors are affected by land prices besides traditional factors? What is their impact and impact rate on land prices? What are the recommendations related to land prices to harmonize the interests of the State, investors, and other people in the process of land management and use?*

The study focused on factors affecting land prices during the period of the COVID-19 Pandemic (the 2020 - 2021 period). The research model was tested in Bac Ninh city, Vietnam because residential land prices were simultaneously affected by many factors, including urbanization, industrial development, handicrafts, the COVID-19 Pandemic, etc. In particular, Bac Ninh city is also the political, economic, and cultural center of Bac Ninh province with a population of over 247702 people. It also has many industrial parks and industrial clusters in its area and adjacent to it. This is also a factor affecting the price of residential land. However, until now, there has been no research on its impact as well as the impact of other factors in the context of the COVID-19 Pandemic. The main content of this paper includes a literature review, research methods, results and discussion, conclusions, and policy implications.

2. Literature Review

According to the provisions of Vietnamese law, residential land is a land for the construction of houses, construction of works in service of life; gardens and pond land attached to houses in the same land plot in a residential area (including the case of gardens and ponds attached to separate houses) has been recognized as residential land. In Vietnam, there are four main types of residential land prices, including land prices in the land price framework, land prices in the land price list, specific land prices, and market prices. Residential land prices in the land price framework decided by the Government are applied nationwide for all types of land. The land price belongs to the land price list issued by the Provincial People's Committee every 5 years and is applied when determining fees, charges, fines for administrative violations on land, etc. Specific residential land prices are also decided by the People's Committees of provinces and are applied in specific cases such as calculating compensation for land when the State recovers, determining the starting price for the land auction, land use levy, etc. prescribed land rent, etc. The land price in the market is the land price agreed upon by the parties to a civil land transaction when signing the contract. Land prices are affected by many different factors. Factors affecting land price are elements that would increase or would decrease the land price of a particular land parcel or change the land price in a particular area. Factors affecting land prices are classified according to the characteristics of the factors. Land prices are affected by specific groups of factors at defined locations and at specific times.

Research by Hai & Huong (2017) showed 4 groups of factors affecting land prices including location, area, the width of the frontage of the land plot, and security factors. The location of the parcel of land includes its distance to the center, the supermarket, school, hospital, amusement park, sports hall, etc. Research by Phan et al. (2017) also pointed out four groups of factors affecting land prices, namely neighborhood, individual, economic, and social factors. The studies of Ho & et al. (2020) indicated the influence of 6-factor groups

on residential land prices, including infrastructure, individual, economic, location, social, and legal factors. According to Nguyen (2017), many factors also affected land prices, including urbanization. Urbanization is associated with an increase in the urban population over time and the upgrading of technical and social infrastructure and also increases the price of residential land. According to (Huang & Du, 2020) in urban areas, high-speed railways increased land prices in suburban areas of the city due to convenient transportation, so the demand for land in suburbs increases, causing land prices to increase. Besides, economic, financial, environmental, and demographic factors also affected residential land prices (Kheir & Portnov, 2016; Mitsuta et al., 2012; Scott, 1983).

The above studies showed some main groups of factors affecting land prices, including the location of the land plot, the group social factors, the group of legal factors, the group of economic factors, the group of personal factors particular, and the group of infrastructure elements, etc. Each factor group usually had 3 to 6 specific factors. However, the names of groups and the number and names of factors might differ due to the classification of the authors and due to the specific conditions of each study area, and also due to different study times. Even so, no studies have yet assessed the impact of factors on land prices during the COVID-19 Pandemic including COVID-19 pandemic factors. Therefore, this gap needs to be addressed.

3. Method

Secondary data on natural, socio-economic conditions in the 2020-2021 period were collected at state agencies in Bac Ninh city. Primary data on factors affecting residential land prices were collected in 2 steps in April 2022. Step 1 surveyed by randomly printed questionnaires of 250 people including officials directly related to residential land prices, real estate investors, and real estate agents. The content of the questionnaire included basic information about survey respondents, and 39 hypothetical factors affecting residential land prices inherited from previous studies.

Each factor had 2 corresponding options (affecting and not affecting the price of residential land) for respondents to choose one of the two. In addition, respondents were asked to add other factors that might affect the price of residential land in their opinion. The data processing results showed that 52 factors might affect the land price, of which 13 factors were added to 39 factors. Even so, only 47 factors had an evaluation percentage greater than 50% of the total number of respondents and were selected to conduct the assessment, the remaining 5 factors had a percentage less than 50%. were disqualified. The selected factors were classified according to their characteristics into 12 groups. Each group was considered as a latent factor or independent variable and had 3 to 6 factors. The factors belonging to the groups were called observed variables (Table 1). Some additional factors that might affect residential land prices include the magnitude of the impact of the COVID-19 pandemic, its prevention and control measures, and its repeatability; industrial development, handicrafts; orientation of the land plot; factors related to real estate brokerage, and upgrading of administrative units and land use planning (Table 1). The model of the hypothetical factors affecting the price of residential land was shown in Figure 1.

Table 1. Groups of factors affecting residential land prices

Group of factors	Group of factors	Group of factors
H1. Group of COVID-19 pandemic factors	Construction planning	Loan amount
The impact level of the pandemic	Planning and plan of land-use	Land finance
Measures to prevent and fight the epidemic	H6. Group of infrastructure factors	Buyer's income level
A cycle of the pandemic repeats	Transportation system	H10. Group of particular factors
H2. Group of factors of urbanization, industry, handicrafts	Energy power supply system	Area of the land plot
Urbanization	Water supply and drainage system	The shape of the land plot
Industrial development	Communication systems	Width of facade
Handicraft development	System of educational and medical facilities	Length of the parcel of land
H3. Group of real estate market factors	System of cultural, physical training and sports facilities	The direction of the land plot
Real estate supply	H7. Group of social factors	H11. Group of legal factors
Real estate demand	People's understanding and observance of the law	The legal status of the land plot
Forecast of real estate supply and demand	Security	Restrictions on construction planning
H4. Group of factors of land plot location	Social Order	Restrictions on land use rights
Distance to the city center	H8. Environmental factors group	H12. Group of factors of real estate brokerage
Distance to markets and supermarkets	Smoke and dust	Real estate brokerage methods
Distance to schools	Noise	Professional qualifications of brokers
Distance to medical facilities	Waste collection and treatment	The broker's sense of compliance with the law
Distance to entertainment facilities	H9. Group of economic factors	
Distance to fitness and sports centers	The income-generating ability of the land plot	
H5. Group of administration and planning factors	Loan interest rate	
Administrative unit upgrade plan	Loan procedure	

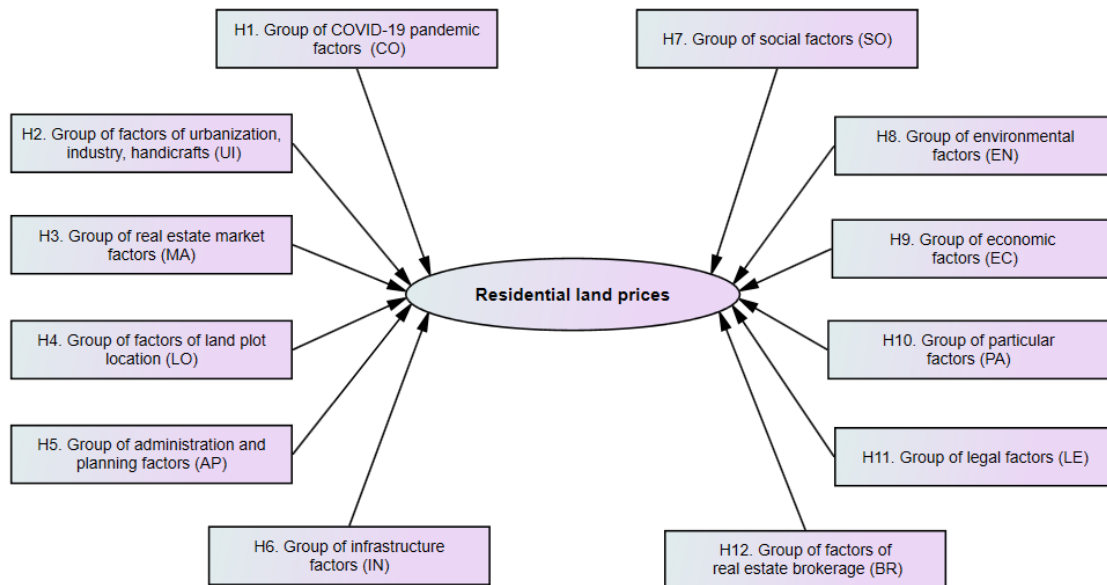

Figure 1. Hypothetical model of factors affecting residential land prices

The equation evaluating the factors affecting residential land prices was shown in formula 1.

$$Y = \beta_0 + \beta_1 * CO + \beta_2 * UI + \beta_3 * MA + \beta_4 * LO + \beta_5 * AP + \beta_6 * IN + \beta_7 * SO + \beta_8 * EN + \beta_9 * EC + \beta_{10} * PA + \beta_{11} * LE + \beta_{12} * BR + \varepsilon \quad (1)$$

Where Y: The dependent variable represents the price of residential land; β_0 : Constant; β_1 ; β_2 ; β_3 ; β_4 ; β_5 ; β_6 ; β_7 ; β_8 ; β_9 ; β_{10} ; β_{11} ; β_{12} : The regression coefficients of the independent variables are the following groups of factors: COVID-19 pandemic; urbanization, industry, handicrafts; real estate market; the location of the parcel of land; administration and planning; Infrastructure; social factors; environment; economic factors; particular factors; juridical; and real estate brokers. CO; UI; MA; LO; AP; IN; SO; EN; EC; PA; LE; BR: Independent variables, respectively COVID-19 pandemic; urbanization, industry, handicrafts; real estate market; the location of the parcel of land; administration and planning; Infrastructure; social factors; environment; economic factors; particular factors; juridical; and real estate brokers. ε : impact value of unknown factors.

To have data for testing the hypothetical research model, Step 2 conducted a survey using pre-printed questionnaires of those who had responded to the survey in Step 1. The content of the questionnaire included 47 elements that had been selected in Step 1. Each factor had 5 corresponding ratings according to the Likert scale (very impactful – 5 points, quite impactful – 4 points, little impact – 3 points, very little impact – 2 points, no impact) – 1 point) (Likert, 1932) for respondents to choose 1 out of 5 levels for each factor. In addition, respondents were also asked to write down their analysis comments on the impact of factors on residential land prices. The number of survey samples was determined based on the requirements of the exploratory factor analysis (EFA) with at least 5 observations for 1 measurement variable (Hoang & Nguyen, 2005). Therefore, with 47 measuring variables belonging to 12 groups of influencing factors, the sample size was 235. For multivariable

regression analysis, the minimum sample size to be achieved is $50 + 8 \cdot p$ (p is the number of variables - $p = 12$) (Tabachnick & Fidell, 1996), and the minimum number of survey samples was 146. To ensure both the requirements of exploratory factor analysis and multivariate regression analysis with higher reliability, investigative research 2nd time all 250 people had responded to the survey in Step 1. The impact level of each factor on land prices is determined according to the value of the impact index according to 5 levels (Very impactful - *the impact index* $\geq 4,20$; quite impactful - *the impact index* $3,40 \div 4,19$; medium impactful - *the impact index* $2,60 - 3,39$; little impactful - *the impact index* $1,80 \div 2,59$; not impactful - *the impact index* $< 1,80$) (Likert, 1932). The impact index of each factor is determined according to formula 2.

$$G_i = \frac{1}{n} * \sum_{i=1}^q \sum_{j=1}^n x_{ij} \quad (2)$$

Where G_i is impact index of the i factor; n : number of respondents; q : number of impact factors; x_{ij} : the j^{th} respondent's score for factor i . The impact index of k^{th} factor group is determined according to formula 3.

$$Gav_k = \frac{1}{p} * \sum_{k=1}^m \sum_{z=1}^p G_{kz} \quad (3)$$

Where Gav_k is average impact index of k^{th} factor group; m : number of factor groups; p : number of factors of group k ; G_{kz} : the impact index of the z^{th} factor in the k^{th} group. The general impact level on land prices is determined by formula 4.

$$Gav = \frac{1}{m} * \sum_k^m Gav_k \quad (4)$$

Where Gav is the average impact index of all the factor groups (*general impact level on land prices*); m : number of factor groups; Gav_k : average impact index of the k^{th} factor group.

The testing of the reliability of the scale by Cronbach's Alpha coefficient was to measure the internal consistency of variables in the same group. The scale can be used when the Cronbach Alpha coefficient is greater than or equal to 0.6 and the variables have a total correlation coefficient greater than 0.3 (Hoang & Nguyen, 2008; Hair et al., 2009). The exploratory factor analysis (EFA) is used to shorten many measurement variables into a set of variables (factors) to make them more meaningful but still contain most of the information of the original set of variables. The EFA was assessed through KMO appropriate coefficient, Bartlett test, Eigenvalues coefficient, total explanatory variance, and load factor. Variables are only accepted when KMO is in the range from 0.5 to 1.0 and its weight factors in other factors are less than 0.35 (Igbaria et al., 1995). According to Hair et al. (2009), with a sample size of about 250, weights of 0.35 should be chosen, so for a sample size of 250, in this study, a load weight must be greater than 0.35. Besides, the scale is only accepted when the total variance explained is greater than 50%; Bartlett's coefficient with Sig significance level less than 0.05 to ensure the factors are correlated with each other; Eigenvalue coefficients must be greater than 1 to ensure the groups of factors are different.

4. Results

According to Table 2, the factors affecting the price of residential land had variable impact indexes with a large range from 1.65 to 4.76 (from low impact to very high impact). The average impact indicators of the groups also varied from 2.45 to 4.41 (from low impact to very impact). The group of COVID-19 pandemic factors had the strongest impact on residential land prices due to the application of social distancing measures, so the land market was frozen, with very few successful transactions. Real estate brokers could not do in-person brokerage and switched to online brokerage. Therefore, providing real estate information was also difficult. Therefore, the price of land during the gap period tended to decrease significantly (down to 20% compared to the price before the pandemic). The survey results also showed that the group of real estate brokerage factors with a strong impact occupied the second position (impact index 4.33). In particular, administrative and planning factors also had a strong impact on land prices (impact index 4.18). Specifically, according to the plan by 2022, Bac Ninh city will become a city directly under the central government, so investment in socio-economic development takes place strongly to facilitate production and improve the living standards of people. This had pushed demand for land to increase during the end of the Pandemic and in areas with low levels of social distancing. Besides, the process of urbanization and development of industry and handicrafts had led to an increase in the mechanical population and also increased the demand for housing, leading to an increase in the demand for residential land. The remaining groups of factors also affected the price of residential land with the impact index from 3.70 to 1.92. The group of social factors that had the smallest impact on land prices was due to the good understanding and observance of the law by the people and good security and order.

Table 2. Impact indexes and impact levels of factors

Group of factors	impact index	Impact level	Medium impact index	Medium impact level	Group of factors	impact index	Impact level	Medium impact index	Medium impact level

The results of evaluating the reliability of the scale through Cronbach's Alpha coefficient for 12 groups of factors showed that Cronbach's Alpha coefficient ranges from 0.704 to 0.901. The total variable correlation coefficient was greater than 0.3 (Table 3). Thus, the scale used to evaluate the factors affecting the price of residential land is reliable and suitable for further analysis. The suitability test of EFA was carried out through the KMO suitability coefficient. Research results had determined $KMO = 0.742$ and satisfying the condition $0.5 < KMO < 1$, so exploratory factor analysis was appropriate with actual data. Besides, the results of the Barlett test for the Sig value. Were equal to 0.00 and less than 0.05 (Table 4). This proved that the measured variables were linearly correlated with the representative factor.

Table 3. Results of reliability analysis of the scale

Variables	Total variable correlation	Variables	Total variable correlation

4	LO1	0.679		IN4	0.663		EC4	0.636	12	BR2	0.667
	LO2	0.748		IN5	0.718		EC5	0.749		BR3	0.780
	LO3	0.691		IN6	0.689		EC6	0.881			

The results of multivariable regression analysis in Table 6 pointed out the coefficient Sig. equal to 0.00 was less than the significance level $\alpha = 1\%$, so the regression model was significant, and the independent variables had an impact on the dependent variable Y. The adjusted R^2 value of 0.869 indicated the scale affected 86.9% of the change of the dependent variable (residential land price), the remaining 13.1% was due to variables outside the model and random error. Besides, the Durbin Watson coefficient had a value of 1.783, ranging from 1.5 to 2.5, so no first-order sequence autocorrelation occurred (Table 6). The magnification of variance (VIF) of all variables included in the model was less than 2, so the research model did not have multicollinearity. In addition, the variables included in the study were statistically significant (Sig. is 0 and less than 0.05). From the standardized regression coefficient (Table 6), the study had determined the regression equation of the following form:

$$Y = 0.947*CO + 0.351*UI + 0.169*MA + 0.071*LO + 0.270*AP + 0.121*IN + 0.083*SO + 0.110*EN + 0.146*EC + 0.048*PA + 0.108*LE + 0.598*BR + 3.527 \quad (6)$$

Table 6. Results of multivariable regression analysis

Independent variables	Standardized regression coefficients	t	Multicollinear Statistics		Impact rates	Impact order
			Error (Sig.)	VIF		
CO	0.947	4.672	0	1.673	31.34	1
UI	0.351	5.439	0	1.983	11.63	3
MA	0.169	3.530	0	1.775	5.58	5
LO	0.071	5.472	0	1.703	2.36	11

PA	0.048	5.579	0	1.752	1.58	12
LE	0.108	4.673	0	1.693	3.57	9
BR	0.598	4.032	0	1.562	19.78	2
β_0	3.527					
Sig. F = 0,000; Coefficient $R^2 = 0,902$; Corrected R^2 coefficient = 0,869; Durbin-Watson = 1,783						

The results in Table 2 and Table 5 showed that residential land prices were affected by 57 factors belonging to 12 groups of factors. Compared with the results of previous studies, this study showed more factors and groups of factors. Groups of factors that were different from the previous ones include the group of COVID-19 pandemic factors; a group

of real estate brokerage elements; groups of factors of urbanization, industry, and handicrafts; a group of administrative and planning elements. Some groups had the same name, but their factors might also be similar to, and different from those pointed out in previous studies, including real estate market factors; a group of economic factors; a particular group of factors. The research results also showed that the impact rates of factors on land prices were also different and also different from the impact rates of the groups of factors that had been shown in previous studies. The COVID-19 pandemic factor group and the real estate brokerage factor group were both new factors and had the highest impact rate (Table 6). Moreover, their factors also had a strong impact on land prices (Table 2). This was the difference compared with the research results of (Tra et al., 2020) because the infrastructure factor had the largest impact rate. Nguyen's research (2017) showed that the distance to political centers, schools, hospitals, etc had the strongest impact on land prices. According to Phan et al (2017), regional factors had the strongest impact. The main reasons were because the studies had been carried out in different locations, with different natural, and socio-economic conditions and different epidemic situations.

The rate of impact of 12 groups of factors on land prices ranged from 31.34% to 1.58% (Table 6). The group of COVID-19 pandemic factors had the largest impact rate, followed by the group of real estate brokerage factors, the group of factors of urbanization, industry, handicrafts, and other groups of factors. The group of individual factors including the area of the land plot, the shape of the land plot, the width of the facade, etc. had the smallest impact ratio because the land plots had the same area, shape, and width as the facade met the requirements and the needs of land users.

5. Discussion and Conclusion

The price of residential land in the study area was simultaneously affected by 47 factors belonging to 12 groups of factors. The groups of factors that had the strongest impact on residential land prices were the group of factors related to the COVID-19 pandemic, the group of real estate brokerage factors, and the group of factors of urbanization, industry, and handicrafts with impact rates respectively from 31.34% to 11.63%. 09 groups of factors also had a smaller impact rate (from 8.94% to 1.58%). The degree of impact on land prices of each factor in the groups of factors ranged from low impact to very strong level (impact index ranges from 1.65 to 4.76). For residential land prices to be more consistent with the interests of the State, real estate investors, land users, credit institutions, and other organizations and individuals related to land, when determining land prices need to pay attention to the level of impact and rate of impact of factors on land prices. It is necessary to pay attention to the groups of factors that have the strongest impact on land prices, followed by groups of factors with a smaller impact rate. In particular, when making financial policies on land, the State needs to pay attention to the epidemic factor and measures to prevent it to have solutions to ensure appropriate budget revenue and achieve the set plan. The research methods in this report can be used as a reference when researching issues related to residential land prices in other areas.

Abstract

Smart city infrastructure in Vietnam is transforming into a more efficient and dynamic way with digital technologies and services with the aim of enhancing and improving the quality of life of citizens. However, project implementation requires the Government of Vietnam to attract new investment capital in addition to traditional public finance. Therefore, Public-Private Partnership (PPP) is considered the most appropriate solution and become a global trend to solve the financial difficulties for smart cities today. The application of PPP forms for smart city projects in Vietnam has not yet fully met the criteria and is only on the rise so far. With the current smart city sector, the Government prioritizes mobilizing capital resources from private enterprises, including PPP in Vietnam. Hence, this newspaper will forecast and propose some PPP financial instruments, emphasizing the opportunities and challenges involved. In particular, recommend the use of 3 reasonable alternatives including Financing Projects (PF), Revenue Sharing (RS), and Social Impact Bonds (SIB) are suitable sources of funding for smart city projects in Vietnam. This is a qualitative secondary study based on the data and information provided by the official websites and previous studies along with national analysis and international experience to draw further conclusions.

Keywords: *Finance, Smart City (SC), Public-Private Partnership (PPP), Project Finance (PF), Revenue Sharing (RS), Social Impact Bonds (SIB), Viet Nam.*

1. Introduction

Historically, the city appeared to have become a place of trade for the surrounding agricultural production areas and industrial production had pulled people from rural areas to work, creating conditions for the emergence of urban areas more and more day by day. Industrialization and electrification have led to the trend of urbanization. The content of the

urbanization trend is the expansion of the city, expressed as a percentage of the urban population or urban area over the total population or area of an area or area. It can also be calculated as the ratio of the increase of those two factors over time. If calculated in the first way, it is also called the degree of urbanization, and in a second way, it is called the urbanization rate. Thanks to urban areas, industrial production, services, culture, science... develop, people's income is enhanced. As analyzed, a high urbanization rate is a sign of the country's prosperity. Therefore, urbanization is considered a very important and urgent issue for Vietnam. Research shows that the urbanization rate in 2020 will increase to 39.3%, an increase of more than 9% compared to 2010 (GSO); The degree of urbanization is increasing rapidly and constantly increasing and it is forecasted that by 2030, 4.9 billion people, equivalent to 60% of the world's population (United Nations) live in urban areas, creating favorable conditions for urban living. socio-economic development, promote the transformation of economic structure and labor structure towards industrialization and modernization; The target of the urbanization rate is to reach 45% by 2025 and about 50% by 2030 (Resolution of the XIII Party Congress). Urban space has been expanded, forming a number of major growth positives in large cities, especially in two special urban areas, Hanoi and Ho Chi Minh City. The urban technical infrastructure is focused on investing in asynchronous and gradually modernized direction, urban social infrastructure is diversified, scaled up and service quality improved. The quality of life in urban areas has been gradually improved, and the urban economy has grown at a high rate.

However, urbanization, urban development, and urban economic development in our country still have many limitations. Urbanization is uneven among regions and regions; the urbanization rate is still low compared to the average rate of countries in the ASEAN region and the world average. The process of urbanization develops in width mainly with low density and dispersion, causing waste of land, limiting economic accumulation. While urbanization in Vietnam is happening more and more strongly, so building a smart eco-city is becoming more and more urgent, an inevitable trend in the context of increasingly severe climate change. . This is also the development trend of modern cities in the world to meet the needs of residents and investors.

The smart city is a conceptual urban development model that means building a city based on information and communication technology (ICT). There are different definitions of a smart city depending on the level of urban economics and policy, but a simple definition is the use of ICTs to improve competition and quality of life in cities. pursue urban sustainability (Myeong 2018). In more general terms, a smart city is a city based on the "Internet of Things" technology platform; daily processes are managed through the latest technologies in the world. The creation of cities Intelligence has become an important solution to promote national development and social progress. Human society has entered the era of intelligence supported by information technology. Cities around the world are capable of adopting new digital tools. The use of digital tools is expected to provide solutions to urban challenges and play an important role in promoting smart city construction. Smart cities have basically completed digitization and networking, and are moving towards intelligence. The development of smart cities cannot be separated from the core idea of

sustainable development towards people. The smart city is home to civilized, law-abiding, and honest citizens.

In the past 5 years, the trend of smart city development is still a hot topic and has received investment attention from economies in the region. The Covid-19 pandemic has not only failed to restrain the smart city trend, but even accelerated the development of this process. Cities are considering smart cities and digital transformation as a key factor in helping cities quickly recover from the pandemic. However, smart city development is a new issue not only for Vietnam but also for previous countries, requiring us to constantly learn, exchange, and draw practical experiences both domestically and internationally. economy for implementation. In fact, the implementation of smart cities is only fragmentary and there is no tool to assess the development situation of smart city projects as well as compare the correlation between cities. In the situation that the need for investment capital for the technical infrastructure of Vietnam in general and each locality, in particular, is very large, while the state budget is limited, the capital of donors is increasingly narrow. investment model in the form of Public-Private Partnership (PPP) and Project Finance as a tool to mobilize resources from the private sector both at home and abroad for infrastructure investment in the current situation. now on.

In the following sections, we first review the literature regarding the concept of PPP and regarding the various existing definitions of Smart Cities. Second, we analyze the state-of-the-art performance of current PPP applications for Smart Cities initiatives and present some case studies. We then explore some of the selected PPP financial instruments applicable to projects, namely: PF, Revenue Share (RS), and Social Impact Bonds (SIB). . For each category, we present a case study analysis and indicate applicability, weaknesses, and strengths. Finally, we discuss the potential of proposed PPP financing mechanisms to overcome the inherent limitations of traditional funding for innovation and draw conclusions.

2. Method

Our team has tried our best to look at different aspects of the problem, going from the general context to each problem, so that we can come to the right conclusion and reasonable solution to the problem topic. , and at the same time study individual issues to consider the overall picture of the research topic. This study includes an overview of Vietnamese cities in general, and PPP models for smart cities in Vietnam in particular, through which there may be advantages and disadvantages: identifying barriers in different levels, including levels of policy/institutional, operational and financial support. Essential issues are analyzed and discussed from the perspectives of stakeholders in the preparation and implementation of PPP projects, including policymakers, public institutions, and investors. individuals and financial companies. And the suitability of the methods according to the specific type and main characteristics of smart city projects. This study focuses on PPP, so other aspects of this model are also analyzed, the most important of which is Project Finance (PF); Revenue Share (RS), and Social Impact Bonds (SIB). The conceptual model of the study is presented in the following figure:

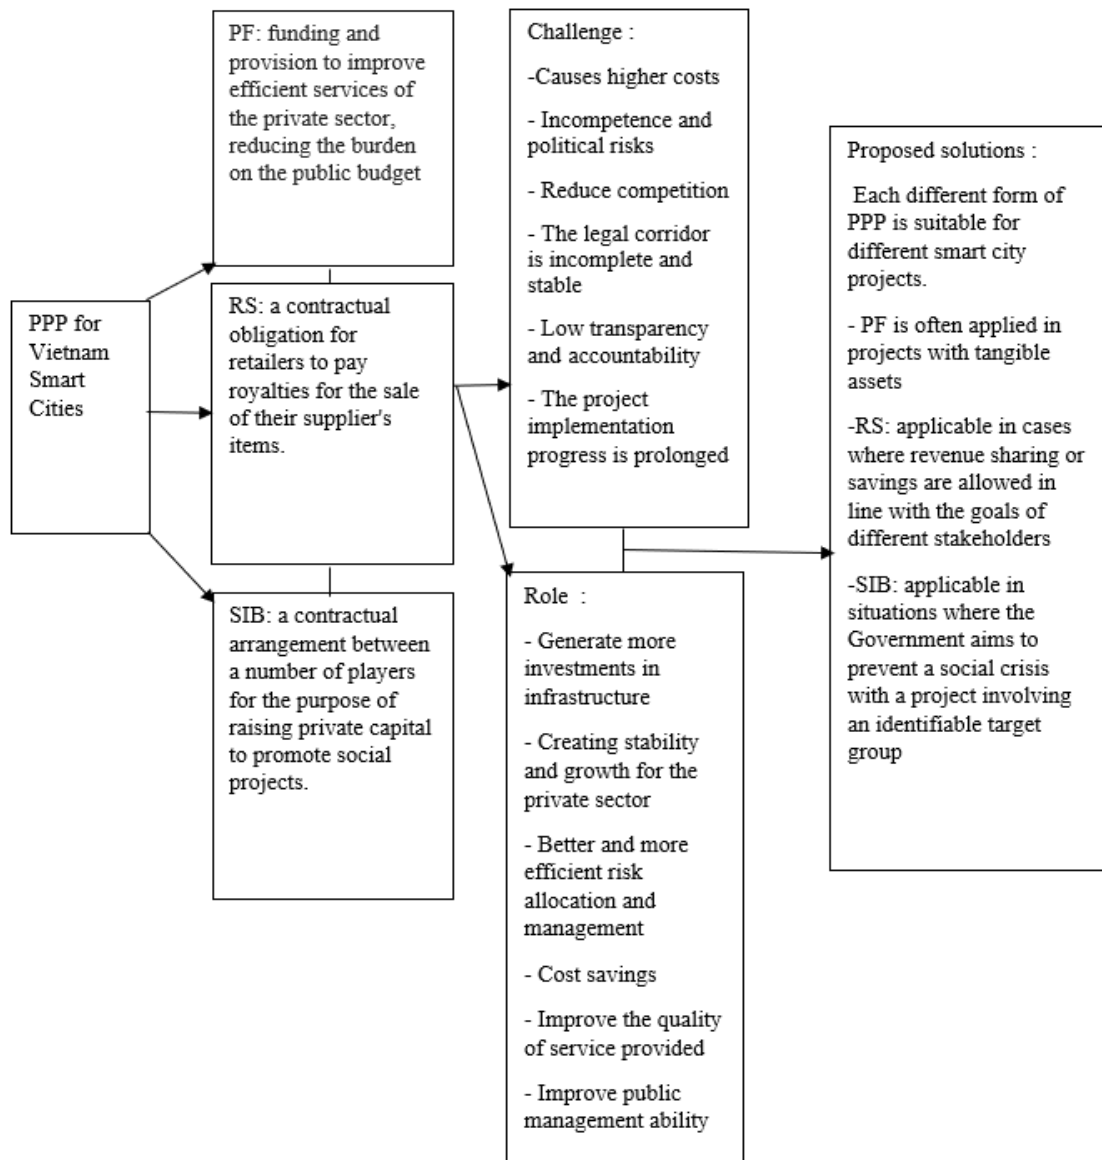

Figure 1. Conceptual research model

Although the research team has tried to gather as much information as possible to understand urbanization policies and practices (or practices) in Vietnam and has taken great care to present this data objectively, However, this study still has limitations. Public finance is a complex and very sensitive field. Urban managers have no incentive to share financial information with outsiders: because the benefits are not directly visible, the potential risks are great. Thus, there are clearly significant data gaps that, when filled, could change the team's findings and recommendations. At the same time, cross-country comparisons are often misinterpreted as proposals to replicate practices in one country that may not be appropriate in another, due to different historical and economic contexts as well as environmental conditions. political, social, and institutional arenas are dissimilar. We should not see the similarities and differences between Vietnam and European countries as “best and worst practices”, but as a source of discussion and reflection in the hope that experiences elsewhere will be useful. can help us better understand our own situation, as well as give us ideas that can be adapted to our needs and abilities.

3. Results

3.1. Urbanization in Vietnam

Urbanization is an inevitable trend of each country in the world, including Vietnam. Urbanization contributes to accelerating economic growth, economic restructuring, and labor structure, changing population distribution. Urban areas are not only a place to create jobs and income for workers but also to consume large and diverse goods products, which use high-quality workforce and technical facilities. Modern infrastructure has attracted strong investment in the country and abroad.

According to the aggregate Department of Urban Development from 63 provinces and cities, the national urban system has a positive change in volume and substance. In 1990 the whole country had about 500 urban areas until 2000 of this figure reached 649. The Urban Network to 2009 has 752 urban areas, of which 02 urban areas are especially in Hanoi and Ho Chi Minh City, 09 urban grade I, 12 urban grade II, 45 urban grade III, 41 urban grade IV, and 643 urban-type V.

In 2010, 772 urban areas increased to 862 urban centers in 2020 including 2 special graphs in Hanoi city and Ho Chi Minh City, 23 Type I urban centers, 32 urban grade II, 48 cities III, 90 Type IV, and 668 urban centers are mainly towns in the province or town. The rate of urbanization in 2020 to 39.3%, increased by more than 9% compared to 2010.

Figure 1. Urban in the period 2010 - 2020

Source: Ministry of Construction

The Ministry of Construction said that by the end of June 2021, the urban system nationwide has 867 urban areas. In particular, there are 2 special cities, 22 types of grade I, 32 urban grade II, 48 urban grade III, 89 urban grade IV, and 674 cities V type of national urbanization estimated at about 40.4%.

However, the urbanization process is uneven between regions and locals. Production in rural areas is stalled due to labor moves to the city. In urban areas subject to unemployment, overload for infrastructure, environmental pollution, social security does not guarantee and occurs social evils.

Referring to the important orientation of the Party and the State in urban development, it can be seen that the Government of Vietnam is very interested in urban planning and development. The Prime Minister has approved and implemented many projects and programs for the period 2021 - 2030 such as a sustainable intelligent urban development plan (Decision No. 950 / QD-TTG dated August 1, 2018); The project of developing Vietnamese cities to respond to climate change (Decision No. 438 / QD-TTG dated 25/3/2021); Plan to raise the national urban type (Decision 241 / QD-TTG dated February 24, 2021). Soon, the Politburo will issue a resolution on "Urbanization, Urban Development, and Urban Economic Development in Vietnam until 2030, Vision to 2045". This will be the highest level in urban development.

In the context of Covid-19 and climate change continues to be a major challenge for the model and the development of urban areas in the world in general and for Vietnam in particular. The cities of Vietnam need to choose the appropriate development model, in a sustainable, intelligent, and resistant to disaster, epidemic, climate change adaptation, reducing commune inequality Assembly, reorganizing urban space in the direction of green and sustainable growth, converting the model of economic development in urban areas, promoting digital conversion and intelligent urban development, sustainably and embraces and embraces Especially strengthening the linkage and support between cities in the urban network.

Developing a comprehensive infrastructure system is one of Vietnam's key tasks to serve the goal of sustainable development and strengthening the country's competitiveness in the direction of synchronously and modernly meeting the requirements of Socio-economic development, especially during the Covid-19 epidemic period.

However, the state budget investment capital is limited to challenge the ability to meet the investment needs. In this context, PPP is considered a suitable financial mechanism to maximize resources for intelligent urban development infrastructure investment in Vietnam.

3.2. The development of Smart Cities in Vietnam

3.2.1. Development orientation of Smart Cities in Vietnam

The development of Smart Cities has become a practical choice in urban areas to improve the quality of life and competitiveness. In particular, in the war against Pandemic Covid-19 recently, the Smart City (SC) has helped urban economies quickly recover.

In 2021, the project of urbanization, urban development, and urban economic development in Vietnam to 2030, vision to 2045 has been submitted to the Politburo to consider promulgating resolutions. Some other important tasks have been completed, including Summarizing the implementation and proposal of amending and supplementing Resolution No. 1210/2016 / UBTVQH13 on May 25, 2016, of the National Assembly Standing Committee in urban classification; Develop a Decree to replace Decree No. 11/2013 / ND-CP dated January 14, 2013, on urban development investment management; Completing the national urban classification plan for the period 2021 - 2030 and the project of developing Vietnamese cities to respond to climate change in the period 2021-2030; Develop a national urban development strategy until 2030, vision to 2050; Implementing laws to manage urban development; Implementation of national urban and rural systems in

the period 2021-2030, vision 2050; Amending and supplementing legal regulations on cutting, simplifying administrative procedures.

The Ministry of Construction is urgently developing the basic criteria of SC to apply all urban areas and urban areas in accordance with Vietnam; Building legal platforms, standards, and standards for SC; Building inter-database (digitization) on land, planning, transportation, population, and other urban space data; Develop SC planning, application of geographic information systems (GIS); Development of SC infrastructure system; Manage and operate SC.

Deploying the Sustainable SC Development Project in Vietnam in the period of 2018 - 2025 and orientation to 2030 needs to build a system of database management systems on GIS; Research to develop SC development pilot program; Deploying activities of SC ASEAN Network (ASCN) promotes information sharing activities and experience as well as establishing cooperative relationships and partners. In particular, the Investment Law Project by the Public Partner (PPP Law) is constantly being completed, edited, and supplemented.

3.2.2. PPP Law

The Investment Law by the Public Partnership (PPP Law) is passed by the XIV National Assembly at the 9th session (takes effect from January 1, 2021). Pursuant to the PPP Law, the Government issued Decree No. 35/2021 / ND-CP dated 29/3/2021 detailing and guiding the implementation of PPP Law. Besides, the Government issued Decree No. 31/2021 / ND-CP dated March 26, 2021, detailing and guiding the implementation of a number of articles of the Investment Law in 2020, including edited content Change and supplement a number of articles of the Government's Decree No. 25/2020 / ND-CP of February 28, 2020, detailing the implementation of a number of articles of the Bidding Law on investor selection.

The issuance of the above documents, along with the implementation of other relevant documents in the past, has created a high, synchronous, and stable legal framework for investment attraction of private sectors Participation in implementing projects on socio-economic infrastructure development, public service provision, especially projects for construction of transport infrastructure, energy, urban infrastructure, water treatment discharge, waste,...; At the same time, improving transparency, competition, economic efficiency in choosing investors to implement investment projects with land use and efficiency of land resources.

However, the implementation of investment legal documents on investment according to the method of PPP and bidding for selecting investors surviving some limitations. Documents on bidding for selecting investors in a number of specialized areas have not been promptly issued; The formulation and approval, announcing the list of land use investment projects at the request provisions of Decree No. 25/2020 / ND-CP has not been actively conducted, promptly, effective and said ensure the Ministry with the Planning and List of the State Project to recover land ... leading to awkwardness and problems in determining the form of investor selection and carrying out procedures for approving investment policies. Some ministries, branches, and localities have not really drastically implemented the network of bidding through the network according to the roadmap specified

in Resolution No. 01/ NQ-CP dated January 1, 2021, of the Government; The organization of propaganda and awareness-raising for the community is not effective, leading to high and unified consensus in the way of understanding and organizing the implementation of the investment project model according to the partner method Private and bidding activities selected investors of projects with land use and projects in the field of specialized and socialization. In addition, many specific procedures in the process of implementing the PPP project are also adjusted by different laws such as the State Budget Law (for the use of state budget capital participating in PPP projects), Investment Law Public (Public investment capital in PPP project), Enterprise Law (Operation of Project Enterprises), Construction Law (Appraisal, Approval of Design, Estimation), Public Debt Management Law (ODA loan use in PPP project) ...; Many overlapping regulations between laws together lead to difficulties implemented in practice. The contents specified in these relevant laws are developed towards the Public Project or Pure Private Investment, which has not been considered to invest in PPP investment; Procedures and procedures are also separately implemented, not guaranteed to harmonize the PPP project implementation process.

In order to continue to improve and promote the implementation of policies and laws on investment according to the method of PPP and bidding for selecting investors, the Prime Minister requested Ministers, heads of ministerial-level agencies and heads Overview of the Government, Chairman of the People's Committees of provinces and cities directly under the Central Government, related organizations focusing on directing the synchronization and efficiency of tasks assigned by the Government in Article 93 of Decree No. 35/2021 / ND-CP and Point b, Clause 7, Article 108 of Decree No. 31/2021 / ND-CP.

3.2.3. Some projects have been implementing SC development by PPP

🚧 North-South Highway Project of Nha Trang-Cam Lam route (Khanh Hoa)

The project to build a number of high-speed roads on the North-South route in the East of the 2017-2020 period by PPP investment method signed the BOT contract on May 6, 2021, between the Ministry of Transport, Son Hai Group Limited Liability Company, and Construction Investment Company Limited Nha Trang-Cam Lam Highway. This project was built as a spine axis of the national highway system to avoid the connection of the connection too small when circulating into the highway will be overloaded. Nha Trang-Cam Lam Highway is about 50km long with the first point at Km5+783, in Dien Tho commune, Dien Khanh district, the endpoint at km54 in Cam Thinh Tay commune, Cam Ranh city (Khanh Hoa province). The total investment capital of the project is about VND 5,524 billion, including investor capital to mobilize about VND 2,556 billion (in which the equity of the investor accounts for 20%) and the state capital is about VND 2,967 billion. The time to build a 2-year project, operation exploitation of payback is about 16 years 4 months.

🚧 North-South Highway Project of Dien Chau-Bai Vot route (Nghe An-Ha Tinh)

This is the second North-South High-speed BOT project signed by the Ministry of Transport with investors, after the Nha Trang - Cam Lam Highway project (Khanh Hoa). BOT contract is signed between the Ministry of Transport with the Joint Venture Company Limited Hoa Hiep Co., Ltd. - CIENCO4 - Nui Hong Investment Co., Ltd. - Truong Son

Construction Corporation - VINA2 Construction Investment Company and Phuc Thanh Hung Investment Joint Stock Company (Project Enterprise). The project has signed a contract to deploy and start on May 5/2021. Dien Chau-Bai Vot Highway is about 50 km long, going through the territory of 2 Nghe An Province (44.4 km) and Ha Tinh (4.9 km). Phase 1 of the project is divergently invested with a scale of 4 lanes, 17 m wide road floor, 80 km / h design velocity. This expressway is built to solve overload problems, traffic congestion, inhibiting development. North-South express projects have a particularly important role in the "Dai Phu Biological Highway", creating a huge motivation for socio-economic development of the country and each locality. The project has a total investment of about 11,157 billion VND, of which the investor capital mobilized about VND 5,090 billion, and the state capital participated in more than VND 6,067 billion. Construction time is about 3 years, the operation time of exploiting payback is 10 years 6 months.

Quang Tri Airport construction Project

Quang Tri Airport project was adopted on December 20, 2021, by the PPP method. This project is built to meet the demand for air transport increasing, contributing to promoting political and socio-economic development; Ensure high mobility in defense, as well as in rescue and rescue work; Ensuring national defense - security in the central region in general and Quang Tri province in particular; In accordance with planning and orientation of transportation development. Quang Tri Airport was built in Gio Quang communes, Gio Hai Commune and Gio Mai Commune, Gio Linh District, Quang Tri Province. The investment scale consists of 2 stages corresponding to the estimated total investment of VND 5822.9 billion. Phase 1 is VND 2,913.6 billion, including Capital mobilized by VND 2,680.5 billion (in which equity is VND 380 billion, credit loan is VND 2,300.5 billion) and capital the central budget supports to carry out clearance and resettlement is VND 233,103 billion. Phase 2 is VND 2,909.3 billion, including Investor capital, are VND 2,829.6 billion (in which equity is VND 1,080.1 billion, credit loan is VND 1,749.5 billion) and capital the state budget is VND 79.7 billion. Project implementation time is 50 years, operating with a payback fee of 47 years 4 months.

3.3. Finance for smart cities

3.3.1. Shortcomings of the public-private partnership model (PPP)

In matters related to smart city development, capital is considered a very important issue. The capital needs for smart city development are huge, even for developed countries. Therefore, for a developing country like Vietnam, the issue of capital for smart city development is even more important. The capital for smart city development is very large, but the budget capital can only meet a small part, while private enterprises are hesitant because of the high risk of investing in it alone smart city development projects.

The capital demand for infrastructure accounts for about 8-10% of GDP, of which the state budget only meets about 50% of the total demand, so the need to mobilize capital from both domestic and foreign private sectors is very large. According to the Asian Development Bank (ADB) and HSBC, the average annual infrastructure investment demand of Vietnam is about 16-17 billion USD/year (about 370-400 trillion VND) in the period 2020- 2025.

Accordingly, the demand for PPP capital in the period 2020-2025 can be up to 4-5% of GDP (about 10-12 billion USD/year), especially in the condition of big cities (Hanoi, Ho Chi Minh City) is focusing on developing smart cities, changing the urban appearance to meet the requirements of modern and creative economic development infrastructure. Specifically, in Hanoi, in the 2016-2020 period, it will spend 3,000 billion VND to build a smart city. In Ho Chi Minh City to build a smart city with a total estimated cost of 2,130 billion VND. To meet the needs of investment in the development and modernization of technology towards a smart city model, it is not possible to rely only on state budget investment, but also to mobilize investment capital from the private sector.

According to the General Statistics Office, the total investment capital of the whole society in 2016 was about 70 billion USD. That is, if divided equally among all provinces, each province will have more than 1 billion USD. This number is very modest compared to the capital needed to build a smart city with high costs as seen above, not to mention that this money is spent on many different socio-economic projects. not only focus on building a smart city.

In Hanoi, October 2019, a smart city project invested and developed by a joint venture between BRG Group (Vietnam) and Sumitomo Group (Japan) with a total investment of 4.138 billion USD on an area of 272ha in Dong Anh district has been started and is expected to be completed in 2028.

Currently, Ho Chi Minh City is continuing to implement and complete 5 projects under the smart city project. Specifically, the project "Building a smart city management center in Ho Chi Minh City" invested by the Department of Information and Communications, the implementation period is 2019 - 2022, the total investment is 958.67 billion VND. The second project is "Building a center to receive and handle emergency information of Ho Chi Minh City through a single telecommunications number in the period of 2019 - 2025" invested by the Department of Information and Communications. With a total investment of 992.54 billion VND. The implementation period of the project is the period of 2019 - 2025. The third project is "Building a centralized camera image monitoring system of Ho Chi Minh City for the period of 2019 - 2021", owned by the Department of Information and Communications. invest. The project implementation period is in the period of 2019-2022, with a total investment of 548.07 billion VND. The fourth project is "Implementation of the database management and storage system under the city's shared data warehouse - phase 1" invested by the Department of Information and Communications. The project implementation period is in the period of 2019-2022, the total investment is 48.78 billion VND. The fifth project is "Deployment of information security and safety solutions in the area of Ho Chi Minh City" invested by the Office of the City People's Committee. The implementation period is 2020-2022, total investment: 127,011 billion VND.

3.3.2. The role of public-private partnerships (PPPs)

The application of the form of public-private partnership (PPP) will initially reduce the burden on the state budget, contribute to improving investment efficiency, improve the quality of public services, promote sustainable development, improve competitiveness, markedly change the face of Vietnam's urban areas. This form opens up relatively attractive markets and investment opportunities for domestic and foreign private investors.

- Make more investments in infrastructure. With the PPP mechanism, the State will reduce the burden of searching, arranging, and allocating investment capital from the budget for infrastructure. Therefore, the State can conduct more investment projects or increase the size of investment projects for infrastructure.

- Creating stability and growth for the private sector. By participating in the PPP mechanism, the private sector has more long-term investment opportunities, possibly less risk with the guarantee and sharing from the State. From there, creating stability and growth for the private sector, promoting the development of the local industry as well as creating more jobs for workers.

- Allocate and manage risk better and more efficiently. The key principle of the PPP mechanism is that the risk will be distributed to the party that is best handled at the lowest cost. In many cases, the State will be the party responsible for dealing with risks related to the community, the environment, or guaranteeing loans by the State. In contrast, the private sector is superior in handling risks related to the management and use of capital...

- Cost savings. Firstly, by combining the two stages of design and construction in the same contract, the PPP mechanism allows designers and builders to establish a closer and deeper relationship. This combination, first of all, makes the design more creative and saves more costs; at the same time, it also helps to reduce the time of the construction process, so that the service can be put into use sooner, thereby also reducing costs. Secondly, most PPP projects need operation and maintenance services throughout the life of the project, and this is left to the private sector. Therefore, the private sector will have incentives and solutions (in terms of technology, management, use of resources...) to reduce operating and maintenance costs throughout the life of the building. Meanwhile, it is difficult for the State to ensure this due to budget constraints.

- Improve the quality of service provided. One of the clear benefits that many international studies and experiences have shown us is that the quality of PPP projects is often better than that of traditional investment firms. The reason for this is that the PPP mechanism takes advantage of the most advantages of the parties, with the State being "policy and governance", with the private sector being "technical factors such as design, construction, operation, and management". The European Commission (2003) argues that the better service quality of PPP projects is due to the service associated with supporting works, the application of new technologies in service delivery, or regulations. clear rewards/penalties based on the quality of service delivery in the PPP cooperation contract.

- Improve public management ability. The government will not have to do the day-to-day management of the project since it has been entrusted to the private sector but will focus on planning and overseeing the day-to-day management.

3.4. Challenges in mobilizing PPP for smart cities

Regarding the mechanism of management and use of investment capital in current PPP projects, there are many different views. From an investor's perspective, the project investment capital is their own investment or borrowing and must be responsible for debt repayment, so investors must have the right to be proactive in the management and use of

capital to invest in the project. The State should not control directly, but only control the total investment of the project and control the compliance with the law in the process of using capital, ensuring cost savings at the beginning of the project.

However, from a management perspective, competent state agencies believe that the sources of investment capital for PPP projects are essentially budget capital. Because in fact the state is the final payer for the investment value of the work, so after all, it is still an investment with the state capital, the investor is only the initial advance and will be paid by the state. payment in cash or the value of the corresponding land fund. There are some limitations when applying PPP as follows:

- Cause higher costs. First of all, this does not contradict the cost savings discussed above. The higher cost here may be that loans to the private sector will have higher interest rates than the State borrowing in previous traditional models. In addition, the costs of organizing the bidding process and contract negotiations, and the costs of paying legal consulting firms can also make the cost of applying the PPP mechanism higher. From the consumer's perspective, using products of the PPP mechanism directly, when setting a fee for using a service provided by the State (fee for using a road, a bridge...) in many cases, the State has not taken into account administrative costs, depreciation of works or simply has subsidies to compensate for those costs. While the imposition of a fee in the PPP scheme requires the inclusion of all relevant costs plus a calculation of the return on the private partner's investments. This will result in service users having to pay higher fees than using services provided by the State alone.

- Lack of capacity and political risks: The PPP mechanism requires both public and private parties to have strong enough capacity in PPP; but in many cases, one or both parties are incompetent. And it is possible that the combination of an incompetent, inexperienced government and a private partner is unfamiliar with the PPP presents political risks to that administration. The lack of capacity is also reflected in the fact that the PPP model is too dependent on external consultants and the risk that both the State and the private sector will not learn anything through the project implementation process.

- Reduce competition. High standards in selecting a private investor/entity, high transaction and bidding costs, and the need to sign long-term contracts are essential factors for participation in the PPP scheme; and not all units/private investors can meet this requirement. This leads to a narrower selection of the State's private partners thus creating a monopolistic market with less competitive pressure for the selected private partners to strive to reduce costs or improve the quality of service.

- The legal corridor is not complete and stable: the legal documents regulating the form of PPP investment currently only stop at the level of the Government's decree, so the legal corridor on this activity is still dependent on the government and laws such as: Law on Enterprises, Law on Bidding, Law on Public Investment,... from preparation to investment implementation, project operation and exploitation. Meanwhile, these documents are mainly developed to regulate public investment activities.

- Low transparency and accountability. One of the concerns when applying the PPP form is the transparency of the project. The reason is considered that it is difficult to access information of private partners, especially financial and commercial information that is considered as a business secret of private sector companies/groups. core. In addition, the evaluation of the entire project will also be very difficult due to the same reasons, plus the fact that information and data sources are held by many sources, making it difficult for the public to track and check. And when transparency and accountability are low, it can lead to public criticism of the State's cooperation with the private sector and demand that the State ensure the interests of the community.

- Long project implementation schedule: PPP projects are often large-scale, the process of promotion and research as well as the application file must go through many steps; while regulations and investment procedures step by step requires consulting many relevant agencies and units before summarizing and appraising, and submitting to competent authorities for approval, thus affecting the project implementation progress. judgment.

- The financial strength of domestic investors is weak, so they are very sensitive to economic fluctuations, leading to a low ability to mobilize finance on schedule. The feasibility study is not linked with development planning and forecasting, so the forecast results are unreliable and the risk of not recovering the investment is very large.

- Foreign investors have a strong financial capacity, high expertise but are very sensitive to the unclear investment environment, so they do not want to invest. In addition, Vietnam does not have commercial insurance for the areas that the project requires such as damage to construction materials, delay in starting construction, political risk insurance, etc., increasing risks. of project.

- In a partnership, risks are not shared appropriately. Investors tend to assign risks to the state to reduce liability; The stateside also has no specific policy to share risks fairly with investors.

- Unstable macroeconomics. The constantly changing macro policies, the escalating volatility of interest rates and exchange rates make it difficult for investors to control their expected profits

4. Discussion and Conclusion

In the past period, the research and improvement of the PPP mechanism and policy system have been identified by the State as a key task that needs attention and implementation. However, a number of normative documents related to PPP have not yet completely resolved the basic problems in the project implementation process. Therefore, it is necessary to set out solutions to overcome the following critical problems:

- Applying the experience of countries that have developed PPP Laws, including specific provisions on PPP in the field of infrastructure investment.

- In the process of researching and developing the PPP Law, it is necessary to focus on problems and contradictions in other relevant laws into the PPP law.

- Building a PPP management model from the central to local levels in each field in a professional manner.

- Specifying each function of each agency, each subject related to the entire process of project preparation and implementation.

- In addition to the general provisions in the Law on Enterprises, it is necessary to develop detailed mechanisms and policies on project enterprises to ensure the specificity of enterprises.

For specific mechanisms and policies, it is necessary to study, supplement, and perfect policies mainly on:

- Investment incentives and guarantees and investment support in order to increase the financial viability of the project and increase the attractiveness for participating private investors. To implement this solution, it is necessary to add incentives and ensure investment throughout the life of the project instead of just incentives at the project implementation stage. Strengthening support for private investors such as providing information, guiding administrative procedures, assisting in solving difficulties during project implementation; adjusting the method of determining the price of infrastructure services and the roadmap for the price increase, price subsidy conditions, subsidy level, and duration according to international practices, ensuring harmony between the interests of the State and investors. private and users.

- Minimum revenue guarantee and loan guarantee is not regulated and this is a big barrier in attracting private investors to participate in projects with low profit. This content needs to be researched and applied specifically to infrastructure projects with low payback in order to attract private investment resources, especially foreign investment.

- Regulations on conditions for deciding investment policies need to be adjusted to suit PPP projects in the direction of paying attention to factors of investment attraction and project revenue.

- Finalize the policy of selecting and announcing projects in the form of PPP in the direction of prioritizing projects based on the advantages and characteristics of the urgency of the project. Projects are selected when ensuring efficient use of financial resources, value for money for the state, and receiving the consent of the people.

- Regulations on the content of the Feasibility Study Report in the Law on Public Investment unifies the PPP project management mechanism with traditional projects, while a PPP project is a project formed between the state and the investor. private investment and focus on investment product of the project are different from the focus on traditional project inputs. Therefore, it is necessary to change the approach to management mechanism in order to amend the regulations on the content of the Feasibility Study Report in accordance with the characteristics of the PPP project.

- Risk identification, risk allocation, and risk management are some of the key factors to ensure the project achieves its investment goals effectively, but it has not been specified in the legal system. of Vietnam today. Therefore, it is necessary to stipulate this content in the legal document on PPP in the direction of identifying and distributing risks to

the party with better risk management capacity, ensuring a balance between the distribution of benefits and risks.

- The policy of balancing between mobilization and management of investment resources still contradicts the goal of resource mobilization and management activities to prevent loss and waste. Therefore, it is necessary to adjust these regulations in the direction of harmonizing the objectives of the state and private investors.

- Policies and regulations on investor selection need to be improved in the direction of overcoming the situation of appointment of contractors, ensuring competitive and transparent bidding in order to select qualified investors to implement projects. To implement this solution, it is necessary to strictly stipulate the order and procedures forbidding selecting investors, responsibilities, and obligations of related parties. For infrastructure projects, competent state agencies need to prepare and approve technological designs and total investment before selecting investors to control costs more effectively.

- The policy on project contracts needs to supplement the content and form of separate project contracts for the infrastructure sector separately for each major in the direction of detailing the rights and obligations of the parties involved. accompanied by a contract form with full quality of project products and services, risk division, and control...

Some solutions to remove difficulties in PPP investment activities in our country:

- Completing the legal framework for PPP investment: First of all, it is necessary to amend and supplement the Government's Decree in the direction of removing obstacles in the implementation process. Going forward, promulgate the Investment Law in the form of public-private partnership to create a strong and stable legal framework as a basis for effective implementation of the public-private partnership model.

- There must be a specialized department in the ministries, branches, and localities on PPP, and at the same time quickly foster and improve the capacity of PPP staff in ministries, branches, and localities.

- Accelerate the project preparation process: To contribute to speeding up the project preparation process and create transparency, ministries, branches, and localities need to soon form a source of investment preparation support to support State agencies in the preparation stage of project investment in the form of PPP,...

- Creation of land fund and other payment methods for BT projects: competent authorities should quickly review the implementation of regulations on land fund creation for payment for projects implemented in the form of BT.

Theory and practice of developing PPP forms show that this method is quite close to the socialist-oriented market economy development philosophy.

First of all, the goal is to put people at the center of development, enjoy the best services in terms of transport infrastructure, energy, environment, health, education, and at the same time improve competitiveness. of the country's economy, creating a premise for private economic development and attracting resources from outside.

Second, the entire population or the public maintains ownership. Mobilizing private participation improves the efficiency of public services and resources before the ownership transition. In addition, the State plays a key role in leading and orienting development, expanding fields, sharing risks to ensure harmony between the interests of the community and businesses. At the same time, through this mechanism, it is possible to create favorable business conditions, promote the role of the Government, and contribute to the stable development of private enterprises.

In fact, PPP project implementation shows that this is a form of continuous implementation in the process of adjustment and improvement. It is also a problem with many variables, the impact of which requires a high socio-political consensus, towards public activities serving the people's interests. From an economic point of view, this is also considered to be done completely according to the principles of the market: There is competition and benefit-sharing between the State and private enterprises. That is because ownership still belongs to the State. However, that has to be profitable for private businesses to make it work. Without publicity, transparency, and without the close supervision of the law and institutions, this cooperation is very likely to occur corruption and group interests.

The prerequisites for a successful PPP are compliance with the principles of market competition and the design of appropriate regulatory and institutional frameworks that ensure the roles of both owners and participants. There is risk-sharing between the State and businesses, for the sake of the people, it is necessary to have the supervision of the whole society.

Abstract

The study uses statistical data of cities with high urbanization rate of Vietnam in the period 2009-2020 and uses the method of ordinary least squares (OLS) to assess the impact of urbanization to the real estate market in Vietnam. The study shows that the speed of urbanization affects the real estate market in Vietnam in the same direction. Basing on the research results, the authors have proposed solutions to develop the real estate market in Vietnam during 2022-2030, and at the same time overcome the limitations caused by urbanization.

Keywords: *Urbanization, real estate market, real estate, Vietnam.*

1. Introduction

Urbanization is an inevitable process in every country, including Vietnam. However, the process of urbanization in each country also takes place at different speeds because it depends on the conditions and economic and social development level of that country. In Vietnam, over the past time, the process of urbanization has taken place strongly in large cities, promoting rapid urbanization to spread widely across provinces, regions and the whole country. Many new urban areas, were formed and developed; many old urban centers have been renovated, infrastructurally upgraded, etc. This shows that Vietnamese cities have been paid great attention to develop with modern architecture.

Overall, it can be seen that the urban system of Vietnam has developed rapidly, the urbanization rate has increased sharply from 19.6% with 629 cities in 2009 to about 36.6% with 802 cities in 2016. By the end of 2018, Vietnam has had 819 urban areas (an increase of 6 cities compared to 2017); the national urbanization rate reached about 38.4% (an increase of 0.9% compared to 2017). Urban growth is the fastest in two major cities, Hanoi and Ho Chi Minh City, followed by Hai Phong, Da Nang, and Can Tho. Until April 2019, the number of urban centers in the country has increased to 830, including 2 special cities, Hanoi and Ho Chi Minh City, 19 first-class cities, 29 second-class cities, 45 third-class cities, 80 fourth-class cities and 655 fifth-class cities. The urbanization rate of the whole country is estimated to be approximately 40% by the end of 2019. (Ministry of Planning and Investment, 2019).

The rapid and widespread urbanization process in many localities has impacted on the population growth in urban areas. In 2019, the estimated population of urban areas in our country was 33,059,735 people, accounting for 34.4% of the country's population. Since 2009, the proportion of the population in urban areas has increased by 4.8 percentage points. Vietnam's population density also increased by 290 people/km² (in 2019). Hanoi and Ho Chi Minh City are the two localities with the highest population density in the country, respectively 2,398 people/km² and 4,363 people/km². (Ministry of Planning and Investment, 2019)

In most urban areas, along with the process of high urbanization, the technical and social infrastructure architectures have not been invested or invested unsynchronizingly, causing the overload of technical infrastructure. and urban management such as: urban transport system, water supply and drainage system, environmental pollution problems... Housing is also one of the issues to be concerned. Not to mention whether the quality of housing is safe enough, enough to meet people's lives or not, regarding the number of houses is enough to meet people's needs or not. In recent years, the Covid 19 pandemic has made the world's economy enter a period of crisis. Despite Covid, in Hanoi, in 2020 many projects with good quality infrastructure investment have increased sharply, by about 5% compared to 2019. Some townhouse projects have established high recorded prices such as: : Kien Hung Ha Dong costs 200-250 million VND/m², Him Lam To Huu costs 300 million VND/m². (Report on the situation of the real estate market in Vietnam, 2020)

So what have make the real estate market in Vietnam still in a "hot" state in recent years? What factors are affecting the real estate market in Vietnam? And is the real estate market in Vietnam facing any difficulties and challenges? With the above paradoxes and questions, the group decided to choose the scientific research topic: "The impact of urbanization on the real estate market in Vietnam". The study will answer the following key questions: Does urbanization really affect the real estate market? And if there is an impact, does it make a positive or negative impact on the real estate market? What are solutions to develop the real estate market in Vietnam in the period of 2022-2030?

2. Literature Review

Studies around the world have confirmed the role and impact of urbanization on the real estate market, proving by the results showing that urbanization makes a strong investment in the real estate market. The study by Tie-Ying Liu, Chi-Wei Su, Hsu-Ling

Chang & Chien-Chi Chu (2018) showed the relationship between the degree of urbanization and real estate investment using a bootstrap panel Granger causality test between 1990 and 2014 in China. The main findings are as follows. We assume that the interaction patterns between urbanization and real estate investment vary across regions in China. The results show that urbanization makes a strong investment in the real estate market, mainly in the central and northeastern regions of China, while urbanization does not have a large impact on investment in real estate in the eastern and western regions, excluding four provinces. This means that urbanization can improve real estate investment through increasing demand for real estate, as population concentration and urbanization is independent of the investment in real estate in China. Our results do not support the theory developed by Saiz (2007) because China's real estate market is characterized by severe bubbles and urbanization in China is mainly affected by industrialization and policies of the Hukou system. These results could be useful for the government in seeking to increase urbanization and macro control over real estate investment in China. This article can also provide suggestions for the urbanization of other countries related to real estate investment level adjustment, especially for developing countries.

In Vietnam, the issue of the relationship or impact of urbanization on the real estate market has been paid attention in recent years, but the number of studies is still limiting. For example, research on the prospect of urbanization, real estate market development and land transformation during the period 2020-2030 by Tran Kim Chung (2019). This study shows the quantitative relationship between land displacement, real estate market development, urbanization and GDP growth, and at the same time, proposes solutions to improve urbanization tools to promote land transformation. land to meet the requirements of sustainable development. The author uses the least squares method to show the relationship between investment growth and value added in the real estate industry.

In the seminar "Developing the real estate market, transparent and sustainable housing to promote urbanization and urban development in Vietnam" (2021), coordinated by the Central Economic Commission, the real estate association Ho Chi Minh City and the Open University of Ho Chi Minh City also mentioned the impact of urbanization on the real estate market, and talked about the effect of real estate due to the speed of urbanization. cause. However, these analyzes are just qualitative, which means, they only provided opinions and arguments, but did not provide specific data to analyze this relationship. The research has also shown that with the increasing population, along with the cities that have attractive living conditions, the real estate market in these cities has a more "vibrant" level" than in real estate markets elsewhere. Therefore, with this analysis, it is only theoretical, observational but still subjective in the argument. Due to this fact, this is the limitation of recent studies.

3. Method

Research method

Two main methods used in this research are descriptive statics and quantitative research. The statistical method, helps provide simple summaries of samles and measures,

generally describing research subjects. Using quantitative research methods combining panel data models, helps design quantitative observations of variables, analyze, and explain the relationship between variables quantitatively.

Data collection method

Data used in this study is deducted from some sources such as “Completed results of the 2019 Vietnam population and housing census” of General Statics Office, Vietnam Real Estate Market report 2020 of Vietnam National Real Estate Association, the urbanization indicators of the cities mentioned in gov.vn, ...

Data processing method

Dependent variable is the developing speed of the real estate market. To measure the development of the real estate market, we consider the global demand for real estate in a particular time period. Reviewing the total demand of urban areas for real estate markets accurately reflects the property market development in Vietnam. To assess the dependence of the real estate market due to the impact of urbanization, the measure of urbanization we used are the local population, the migrated population, the average population growth rate from 2009 - 2019, and the population density of high urbanized areas. By that, we expect the urbanization variable to have positive effects on the real estate market.

We're going to analyze by ordinary least square (OLS) method using EViews software to assess whether urbanization affects real estate markets in Vietnam? And if there's an influence, how many percent is it? Are there other factors that affect the property market other than urbanization?

Choosing model

Since there is no theoretical framework in empirical studies presenting the relationship between urbanization and the real estate market in Vietnam, the evaluating model built by the authors based on the ascendant models evaluating the effect of urbanization on the real estate market of tie - ying liu, hsu - ling, hsu - ling, kim su & chien - chi (2018). The experimental model assessing the impact of urbanization on the real estate market in Vietnam built is:

$$\ln D_{it} = \theta_0 + \theta_1 * \ln(N_{it}+L_{it}) + \theta_2 * \ln M_{it} + \theta_3 * PGR_i + \theta_4 * T_{it} + u_{it}$$

Table 1. Explain the author' s model variable

<i>Variable</i>	<i>Meaning</i>
$\ln D_{it}$	Logarithmic base e of the general demand for the local real estate service <i>i</i> in year <i>t</i>
$\ln(N_{it}+L_{it})$	Logarithm of base e of the total number of indigenous inhabitants N and the rural-to-urban population L of locality <i>i</i> in year <i>t</i>
$\ln M_{it}$	Base e logarithm of local real estate purchase price <i>i</i> in year <i>t</i>
PGR_i	Average annual population growth rate from 2009 to 2019 of the locality <i>i</i>
T_{it}	Population density of locality <i>i</i> in year <i>t</i>
u_{it}	Indeterminate error

Source: Self-built by the author team

The research is based on several key aspects. Those are the studies that have been tested before. For example, research by Liu (2018) or Wu (2001) has concluded that immigration affects the structure and demand for the real estate market, so the study applies a dynamic panel data model in the experimental estimate. In addition, according to Saiz (2007), immigration increases property value and is positively correlated with rent increases when immigration is rampant over time. Saiz (2007) assumes that the preferences of local residents can be expressed as a separable utility function which is also able to examine the income effect on real estate consumption. The optimal individual consumption of real estate services for immigrants is assumed to be the same as that of local residents. Aggregate demand for real estate services D is equal to the number of residents multiplied by the consumption of each resident. Take the logarithm of this identity after substituting to obtain the optimal property consumption output.

Estimating the impact of urbanization on the real estate market by an empirical model is carried out by estimating the regression coefficient which is the ordinary least squares (OLS) method. In the model, the considered variable is $\ln(N_{it}+L_{it})$. If the analysis results show that the regression coefficient of the variable $\ln(N_{it}+L_{it})$ has a positive value and is statistically significant, it can be concluded that urbanization has a positive effect on the real estate market. On the contrary, if the regression coefficient of the variable $\ln(N_{it}+L_{it})$ is negative and statistically significant, it can be concluded that urbanization has a negative effect on the real estate market.

4. Results

Variables descriptive in the model

Table 2. Variables descriptive in the model

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
$\ln D_{it}$	32	7.30	12.21	9.6132	1.24137
$\ln(N_{it}+L_{it})$	32	11.69	16.00	12.8816	1.06057
$\ln M_{it}$	32	2.81	10.53	6.3841	3.37678
PGR_i	32	.31	4.08	1.7378	1.04276
T_{it}	32	574.00	4363.00	1621.7813	824.85744
Valid N (listwise)	32				

Results and reviews

Conducting an estimate of assigned regression model, the authors have received the following results:

Table 3. Estimation of regression coefficient in the model, significance level of 95%

Dependent Variable: TC					
Method: Least Squares					
Date: 03/25/22 Time: 14:01					
Sample: 1 32					
Included observations: 32					
Variable	Coefficient	Std. Error	t-Statistic	Prob.	
$\ln D_{it}$	-2.898850	2.051142	-1.413286	0.1690	
$\ln(N_{it}+L_{it})$	1.051086	0.160720	6.539843	0.0000	
$\ln M_{it}$	-0.026832	0.042218	-0.635550	0.5304	
PGR_i	-0.124025	0.140001	-0.885893	0.3835	
T_{it}	-0.000396	0.000210	-1.885803	0.0701	
R-squared	0.693525	Mean dependent var	9.617254		
Adjusted R-squared	0.648121	S.D. dependent var	1.242097		
S.E. of regression	0.736804	Akaike info criterion	2.369612		
Sum squared resid	14.65777	Schwarz criterion	2.598633		
Log likelihood	-32.91379	Hannan-Quinn criter.	2.445526		
F-statistic	15.27464	Durbin-Watson stat	0.899383		
Prob(F-statistic)	0.000001				

Regression results show that only variables $\ln(N_{it}+L_{it})$ are statistically significant ($p_value = 0.0000 < 0.05$). The test results show that there are sufficient grounds to remove $\ln M_{it}$, PGR_i and T_{it} variables due to the lack of statistical significance, which can be removed simultaneously from the model. The model after being shortened will take the following form:

The following model shortens:

$$\ln D_{it} = \beta_0 + \beta_1 * \ln(N_{it}+L_{it}) + u_{it}$$

Table 4. Results of estimation of regression coefficient after shortening, meaningful level of 95%

Dependent Variable: TC					
Method: Least Squares					
Date: 03/25/22 Time: 14:17					
Sample: 1 32					
Included observations: 32					
Variable	Coefficient	Std. Error	t-Statistic	Prob.	
C	-2.098920	1.738709	-1.207171	0.2368	
$\ln(N_{it}+L_{it})$	0.909210	0.134536	6.758138	0.0000	
R-squared	0.603554	Mean dependent var	9.613125		
Adjusted R-squared	0.590340	S.D. dependent var	1.241213		
S.E. of regression	0.794435	Akaike info criterion	2.438090		
Sum squared resid	18.93380	Schwarz criterion	2.529698		
Log likelihood	-37.00944	Hannan-Quinn criter.	2.468456		
F-statistic	45.67243	Durbin-Watson stat	0.597457		
Prob(F-statistic)	0.000000				

Make an estimate of the regression coefficient using the OLS regression model for results such as table 4. The model after shortening has the *p-value* of the variable $(\ln(N_{it}+L_{it}))$ of $0.0000 < 0.05$, which is statistically significant; R-squared coefficient = 0.603554 is negligible difference with this coefficient in the estimate of the original model, so the model can be accepted after shortening the variables that are not statistically significant.

The estimated results show that the regression coefficient of the logarithmic variable base e of the total number of local residents N and the population from rural to urban areas of the locality $(\ln(N_{it}+L_{it}))$ has a positive value and statistically meaningful implying that the higher the degree of urbanization, the greater the impact on the real estate market, which means that urbanization has a positive effect on the real estate market in Vietnam.

5. Discussion and Conclusion

5.1. Discussion

After giving the results, it can be seen that in Vietnam, the real estate market is also affected by the speed of urbanization. This outcome is consistent with the research results of Tie-Ying Liu, Chi-Wei Su, Hsu-Ling Chang & Chien-Chi Chu (2018). Similar to the above study, this study shows that in Vietnam, the influence of urbanization on the real estate market is very strong, but there are some special areas such as tourism development urban areas or industrial development urban areas, there are other factors affecting the real estate market. In addition to factors of economic development there are also a number of other factors influencing the development of the real estate market, such as topography, climate or social and environmental aspects. In Liu's study (2018) in China, the impact of urbanization on the real estate market is also inconsistent, there are provinces in the west and east regions that are not affected or have little influence. However, the research results of this research team this time give us the expected outcome that the effect of urbanization speed will positively affect the real estate market in Vietnam.

Recommendations

Through studying the impact of urbanization on the real estate market in Vietnam, the study offers solutions to develop the property market in the period of 2022-2030 in the ongoing urbanization period with high speed helping the real estate market overcome difficulties at the present time.

(1) Develop public housing and affordable shophouse:

Urban is the core factor affecting the real estate market. Rapid urbanization has led to an increase in housing demand in urban areas, especially housing development for low-income people such as public housing and shophouse. Therefore, developing these two housing segments is one of the solutions to solve the current housing shortage.

(2) Improving the institutional environment of the real estate market:

Improve investment policies in the direction of encouraging investors to invest in order to increase the "supply" for the real estate market so as to contribute to the market stabilization. Therefore, we can gradually create conditions to encourage foreign investors

to participate in the real estate market in the tendency of equality, in the same playing field with domestic investors.

(3) Prepare a plan for land acquisition regarding excess land area compared to the standard

The area of land that is inefficiently used for construction of offices, works needs to be acquired for the implementation of building industrial area, free-trade zones, urban areas, resettlement projects, etc. will increase the value of the land, not only in the areas where the land is acquired, but also the "satellite" areas of the project. This is the responsibility of the State in implementing land management policies, regulating the added value from land through shifting land position in economy and society development projects, transferring different types of land to land for project implementation.

(4) Orientation and prospects of urbanization and real estate market in the period of 2022-2030.

To realize the common goals of the whole economy during 2022-2030 with a vision to 2045, the field of urbanization and the real estate market will need to have their own specific contents:

Firstly, industrialization, modernization and urbanization. Modern industries and knowledge-based economies will thrive, placed in an effective and well-connected network in modern cities, where urban and rural policies will closely synchronized. Cities like Hanoi and Ho Chi Minh City will interact with the global economy and ensure urban diversity, thereby encouraging learning, innovation and new product development, connecting people and businesses around the world.

Secondly, it is forecasted that by 2030, over 50% of Vietnam's population will live in urban areas. The share of industry and services in GDP stands at more than 90% and contributes more than 70% of employment. Therefore, the problem of urbanization is essentially a matter of industrialization and urban migration. Urban system development leads to urbanization. However, how the urban system develops is not a concern of one party or in a short time, but of all parties, in the long run. Only when the urbanization rate reaches a high level (about 80% or more) can it be considered a success.

Associated with urban development is the operation of the real estate market. The interaction between economic growth, real estate market development and urbanization are issues that need to be solved at the same time. Only when the real estate market operates fully, the housing problem of urban people can be solved and at that time is the urbanization sustainable.

Thirdly, a favorable legal system for land transfer. In the coming years, Vietnam will enter a period of rapid economic development, followed by rapid urbanization. The land transfer, therefore, will also take place very strongly. To be able to meet the requirements of high and diverse land transfer, it is highly necessary to improve the institution, including the land legal system in the direction of promoting land transfer. Therefore, attention should be paid to completing the institutional framework on land to ensure that land is transferred quickly and smoothly.

5.2. Conclusion

Based on the research results of the topic, it can be stated that the activities of the real estate market in Vietnam are deeply influenced by the process of urbanization. Urbanization increases the value of real estate, opening up many investment opportunities for domestic and foreign business. Real estate products also become more diversified and effective. By that way is, the real estate market made vibrant. The appearance of Vietnam's urban areas is becoming more spacious, well-equipped and modern as real estate projects develop speedily. However, besides those positive changes, urbanization also causes negative impacts such as shortage of land area, high housing demand, imbalance between supply and demand of the market or problems related to management mechanism and policies, etc. After analyzing the relationship between urbanization and the real estate market, simultaneously through researching and grasping real estate difficulties, the group has proposed a number of specific solutions to remove those bottlenecks. The solution proposed in the study is based on approaching the effects of urbanization and looking at the reality of Vietnam's real estate market today.

Finally, the study has completed the initial goal of assessing the relationship and impact of urbanization on the real estate market in Vietnam and providing solutions for the real estate market. to meet the demand for housing and housing quality in Vietnam in the process of urbanization. With this article, we hope to bring useful information to readers, who are also interested in and study the above problem. To gether with the solutions proposed do we, hope that Vietnam's real estate market will have more new prospects in the future.

Abstract

This paper analyses the relationship between place attachment, residential satisfaction, and housing behavioral intention of people living in these apartment buildings in two big cities of Vietnam. Data were collected from 781 dwellers in Hanoi and Ho Chi Minh city. This study uses the Partial Least Squares structural equation modeling (PLS-SEM) approach to testing hypotheses about relations among observed and latent variables. These results have shown that there is a relationship between the three factors mentioned in this topic. Notably, place attachment has a stronger effect on housing behavioral intentions than satisfaction, and satisfaction is confirmed to have a mediating variable function.

Keywords: *Housing behavioral intention, Place attachment, Residential satisfaction, Viet nam.*

1. Introduction

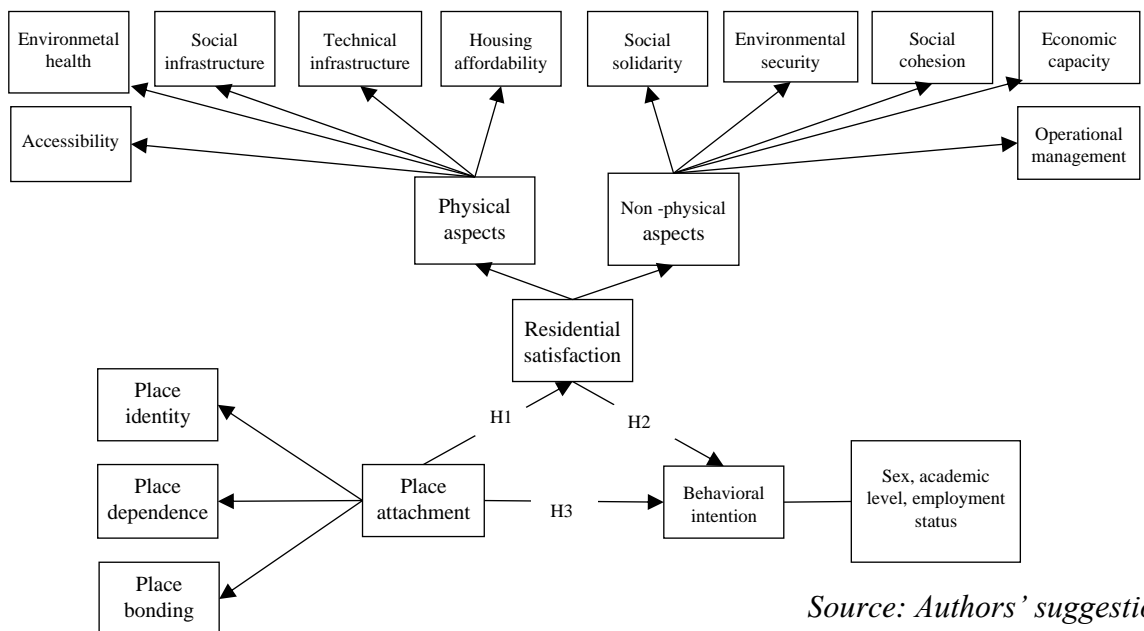

Viet Nam is experiencing a very fast rate of urbanization, especially in Ha Noi and Ho Chi Minh City. The shrinking of the land bank and the unstoppable population explosion are the reasons for the rising number of apartments in Vietnam's urban areas. These apartments are growing at a non-trivial speed which triggers more harm than good, for instance, the density in urban planning, legal status... On the other hand, the value of the apartment can reduce because of the normal wear and tear which shapes the law of housing demand and supply. This will be a prologue of dissatisfaction and weakens the feeling of place attachment. Therefore, the resident will tend to think about negative

housing behavioral intentions such as moving, selling... This research is to present several concrete suggestions to address the inadequacy and shortcomings of the housing market and support the analysis of social psychology, forecasting the rule of demand and supply at the same time.

This research will focus on analyzing the relationship between place attachment, residential satisfaction and housing behavioral intention of people living in apartment in Vietnam's urban areas. The topic about this relationship always receives attention from domestic and foreign scholars, so that there are many foundation theories was formed. Theory of place attachment was mentioned and developed by psychologists in 1970s. "Place attachment" was first proposed by John Kasarda and Morris Janowitz (1974) as an invisible tie between human and place. The theoretical framework of residential satisfaction is a branch of family housing adjustment theory (Morris & Winter, 1975), considering the needs and expectations of a family in order to gauge their behavior toward the current housing status (Galster & Hesser, 1981). Housing behavioral intention theory is based on the theory of reasoned action and the theory of planned behaviour. The theory of reasoned action (TRA) was appeared in 1967 and adjusted by Martin Fishbein and Icek Ajzen (1980) aims to explain the relationship between attitudes and behaviour within human action. The theory of planned behaviour was built off of what assumed of human behavior in the theory of rearsoned action (TRA). Both theories postulate that a person's behavioral intentions and their attitudes about a certain behavior are determined by being able to understand that person's behavioral and normative beliefs as well as the social norms for the society that they are within.

When researching the relationship between place attachment and residential satisfaction, Ringel and Finkelstein (1991) expressed enthusiastic support for distinguishing these terms. Place attachment was believed to stand apart from residential satisfaction (Lewicka, 2010). The later research of Byungsook Choi, Jung-a Park và Hyun-Jeong (2016); Ning (Chris) Chen, C. Michael Hall, Kangkang Yu và Cheng Qian (2019); Elif Aksel và Çağrı İmamoğlu (2020), all model have had a leg to stand on a positive relationship between place attachment and residential satisfaction. To give a specific example, the research of Femke Luitse (2021) given that place attachment had a positive impact on residential satisfaction, which means, that the more place attachment the residents have, the more satisfied they will be. Although there are many pieces of research mention the effects of the relationship between place attachment, residential satisfaction, and housing behavioral intention, they still focus on certain aspects such as mobility intention of Amelia Tri Widya, Hanson Endra Kusuma và Rizal Arifin Lubis (2019); pro-environmental behaviors of Haywantee Ramkissoon, Liam David Graham Smith, Betty Weiler (2013)... Most previous studies were carried out in developed countries such as the Netherlands, China, Korea. Meanwhile, there are very few studies conducted in developing countries like Vietnam. Besides, Vietnam has witnessed an increasing project of apartments in these big cities such as Hanoi and Ho Chi Minh city, after amended the Housing Law 2005. Therefore, Vietnam is likely to become a new potential context to research on the relationship between place attachment, residential satisfaction, and housing behavioral intention.

This research aims to measure the relationship between place attachment, residential satisfaction and housing behavioral intention of people living in these apartment buildings in Vietnam's urban areas. Therefore, our research model and hypotheses are suggested:

Source: Authors' suggestion

Figure 1. Research model

Hypotheses:

H1: Place attachment has a positive impact on residential satisfaction.

H2: Place attachment has a negative impact on behavioral intention.

H3: Residential satisfaction has a negative impact on behavioral intention.

2. Method

To test the developed hypotheses from the literature review, we used qualitative research and quantitative research. In the first stage, qualitative research aims to adjust the questionnaire survey. A questionnaire survey was formed based on previous research, which we separated into two parts: demographic information of the sample and the second part involved a range of questions using the Likert scale from 1 (strongly disagree) to 5 (strongly agree) for measuring the variables in the model.

In the second part, we continue dividing into three small groups. First, place attachment with these variables: place identity, place dependence, and place bonding which were perceived from Ning (Chris) Chen, C. Michael Hall, Kangkang Yu, and Cheng Qian's (2019) research. Second, residential satisfaction with scale items measured perceived by Amelia Tri Widya, Hanson Endra Kusuma, và Rizal Arifin Lubi (2019). The last one was the behavioral intention which items scale perceived by Amelia Tri Widya et al., 2019. Then, an interview with experts and individuals was taken to adapt and check the content, wording, and clarity before sending.

Data were collected by online surveys via Google Form and in apartments in Ha Noi and Ho Chi Minh City from 01/02/2022 to 21/02/2022. We obtained 781/850 valid responses for analysis. After that, we gather the data to measuring the variables presented in the research model, using the exploratory factor analysis (EFA), reliability, convergent validity and discriminant validity. Then, we using the PLS – SEM to test the appropriateness of the formative/reflective model and reliability analysis using bootstrapping with 1000 samples. Afterwards, the second qualitative research was implemented out by interview resident in apartments and experts to use as a basic for discussion. After that, we gather the data to measuring the variables presented in the research model.

3. Results

3.1. Research sample statistics

Table 1. Sex, gender, age, location, academic level, employment status, legal status, living time and household income statistics

Criteria		Frequency	Percent (%)
Location	Ha Noi	553	70.8
	Ho Chi Minh	228	29.2
Sex	Male	404	51.7
	Female	377	48.3
Academic level	High school	101	12.9
	Intermediate school/ Junior college	111	14.2
	University	427	54.7
	Postgraduate education	142	18.2
Employment status	Employed	585	74.9
	Retired	51	6.5
	Unemployed	43	5.5
	Student	48	6.1
	Housewife	54	6.9

Source: Authors' calculation from survey data

In 781/850 samples obtained, the number questionnaires taken in Ha Noi and Ho Chi Minh City was not the same so that the samples structure had a significantly difference. Especially, questionnaires collected in Ha Noi were 70.8% - 2.4 times more than in Ho Chi Minh City (29.2%).

There is not big gap in sex of the respondents, male constitute 51.7%, meanwhile, female made up 48.3%. The percentage of university made up more than a half of the academic level, 54.7%. Postgraduate education following with 18.2%; Intermediate school/ Junior college accounted 14.2% and the lowest percentage was high school level with 12.9%. In employment status, the highest percentage was employed with 74.9%. In contrast, the lowest percentage was unemployed with 5.5%. The rest status: retired, student and housewife accounted around 6% - 7%.

3.2. Results from analysis the exploratory factor analysis (EFA)

KMO returns value $0.832 > 0.5$ and $0.832 < 1$, this prove the accordance with the research data of the factors. Sig of the Bartlett test = $0,000 < 0,050$ referd the correlation of the observable variables.

There are 14 factors which has Eigenvalues > 1 means that these 14 factors will be kept in the analytical model. So, from the 43 factors at first had been condensed to 14 main factors. The total variance explained (Cummulative %) = $65.608\% > 50\%$, presented the percentage of variation in observable variables.

Convergence test and factor loading: The variables converged to one factors (column) and all the coefficient were $> 0.5\%$ so that none of the observable variables are removed.

In conclusion, there are 14 factors which satisfying the convergent validity and the discriminant validity.

3.3. Result of Evaluation of reflective measurement model (Smart PLS)

Table 2. The result of evaluating the Reliability of Scale

	Cronbach's Alpha	Composite Reliability	Average Variance Extracted (AVE)
AC	0.867	0.904	0.652
EC	0.886	0.929	0.814
EH	0.781	0.872	0.694
ES	0.844	0.928	0.865
HA	0.786	0.875	0.700
OM	0.815	0.890	0.730
PB	0.894	0.934	0.825
PD	0.898	0.936	0.830
PI	0.831	0.922	0.855
SC	0.834	0.923	0.858
SI	0.818	0.880	0.647
SS	0.756	0.891	0.804
TI	0.924	0.946	0.814

Source: Authors' calculation from survey data

According to Table 2, the scale is highly reliable because not only the Cronbach Alpha coefficient is greater than 0.6 but also both Composite Reliability (CR) and Average Variance Extracted (AVE) values are greater than 0.5.

Verification of Convergent validity shows that all outer loadings being > 0.708 means the lowest 50% of the variance from the observed variable are taken by the latent constructs in the model; both standardized – unstandardized outer loadings and all of the AVE values are more than 0.5, which indicates that each observable variable component is greatly accepted and the explanatory level of the factors for the latent variable is high.

Verification of Discriminant validity confirms that the manifest variable of this construct is distinct from other constructs in the path model through its cross-loading value in the latent variable being greater than that in any other constructs. Furthermore, the squared root of average variance exerted along the diagonals is greater relative to all of the correlations, and all heterotrait – monotrait (HTMT) is less than 0.9, implying satisfactory discriminant validity.

3.4. Result of Analyzing Partial Least Squares Structural Equation Modelling (PLS-SEM)

Multicollinearity phenomenon in original formative and reflective measurement model testing: Reflective measurement model is used for high order latent variables (PA and RS) and the remainder is for dependent variable BI.

Table 3. VIF value of reflective measurements model

	SS	ES	SC	EC	OM	PI	PD	PB	RS	AC	EH	SI	TI	HA	NP	PS	BI
NP	1.000	1.000	1.000	1.000	1.000												
PA						1.000	1.000	1.000	1.000								1.312
PS										1.000	1.000	1.000	1.000	1.000			
RS															1.000	1.000	1.312

Source: Authors' calculation from survey data

The table shows that the indicator variance inflation factors VIF of all coefficients are all less than 2 so there was no correlation among independent variables and obviously the research models do not get multicollinearity with all acceptance variables.

Table 4. VIF value of formative measurements model

	BI1	BI2	BI3	BI4
VIF	2.179	1.903	2.237	1.890

Source: Authors' calculation from survey data

According to the model test results, all VIF values are less than 5, thus, collinearity does not exist or there is no multicollinearity among independent variables in this estimation formative measurement model.

Adjusted R Square coefficient

Table 5. Results of R2 and \bar{R}^2 coefficient of dependent variables

	R Square	R Square Adjusted
AC	0.263	0.262
BI	0.490	0.489
EC	0.678	0.678
EH	0.193	0.192
ES	0.223	0.222
HA	0.235	0.234
NP	0.444	0.443

	R Square	R Square Adjusted
OM	0.238	0.237
PB	0.618	0.617
PD	0.509	0.509
PI	0.437	0.436
PS	0.802	0.801
RS	0.238	0.237
SC	0.344	0.344
SI	0.291	0.290
SS	0.142	0.141
TI	0.741	0.741

Source: Authors' calculation from survey data

As the result of Table 3.5, all values of Adjusted R^2 are less than or equal to the corresponding R^2 , which indicates that the model is relevant and suitable. In particular, the independent variables influence 80.2% of the variation of the dependent variable PS (physical aspect); the remaining 19.8% is due to the variables outside the model and random errors. The same goes for other dependent variables.

Verification of significance of regression coefficients in the model (PLS-SEM)

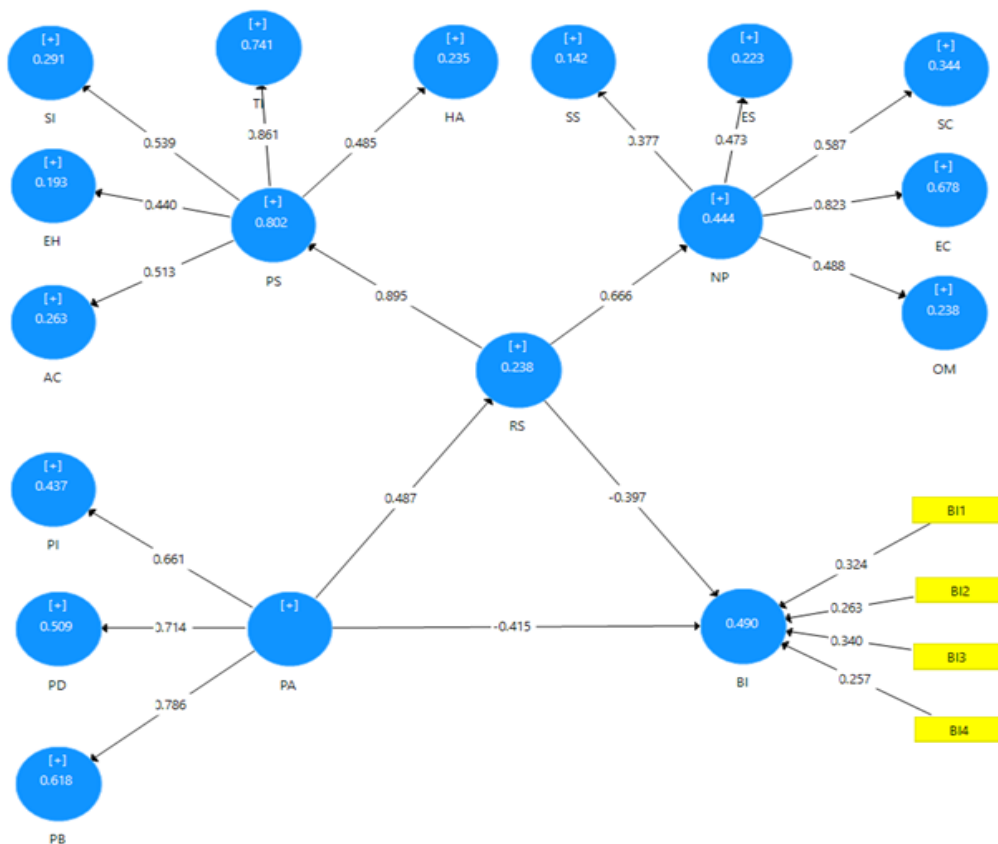

Figure 2. Regression coefficient results of the original model

Source: Authors' calculation from survey data

Running Basic Bootstrapping with a sample size of 1000, the significance level of each regression coefficient is less than 0.001, which means that the original model has high efficiency in explaining the relationship between the lower order latent variables and observed variables (except BI, all observations inner the latent variables have been hidden to easily evaluate the model measurement results).

Outer weights results: Outer weights are applied to the formative measurement model, and p-values of observed variables BI1 to BI4 are all equal to $0.000 < 0.050$. Thus, the observed variables contribute to the latent parent variable (BI) in a statistically significant way.

3.5. Repeated observed variable method results (Repeated indicator approach)

Approach the method through two stages approach, which is used to evaluate the relationship between a high-order latent variable and a low-order latent variable, but not a higher-order latent variable with repeated observations within it. After reduced the model twice cause of 3rd order latent variable (RS), the authors at the same time performing tests for the new model and obtain the following results:

Table 6. Result of regression coefficient in the new reduced model

	Original Sample (O)	Standard Deviation (STDEV)	T Statistics (O/STDEV)	P Values
PA -> BI	-0.413	0.028	14.959	0.000
PA -> RS	0.499	0.031	15.862	0.000
RS -> BI	-0.391	0.026	14.851	0.000

Source: Authors' calculation from survey data

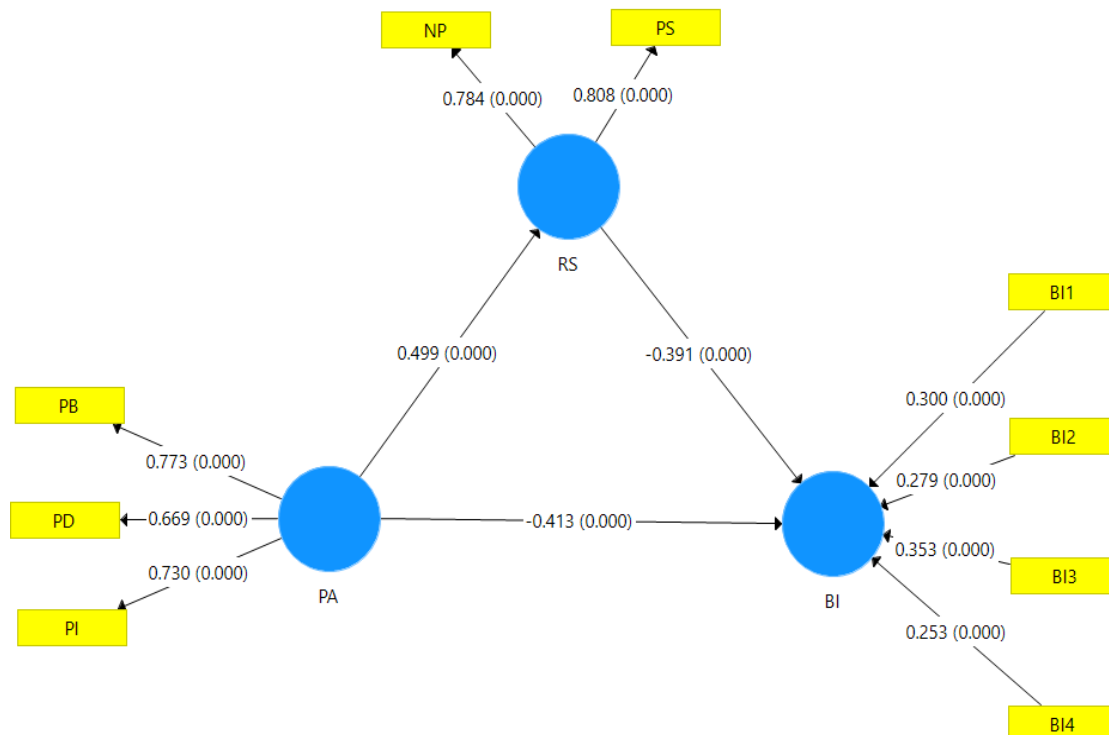

Figure 3. Result of regression coefficient in the new reduced model

Source: Authors' calculation from survey data

Based on the table results, all P-values of the new model's regression coefficients are < 0.001 , and the variables of the new model are all statistically meaningful. As the result, PA has a stronger indicator than RS when being in the relationship with BI ($|-0.413| > |-0.391|$). In other words, the higher the PA and RS, the lower the BI. PA affects RS positively at $0.499 > 0$ and RS is confirmed as a mediator variable of the PA and BI relationship.

4. Discussion and Conclusion

4.1. Discussion

After performing two phases of qualitative research, combined with quantitative research, the authors obtained data and descriptive statistics via SPSS to get an overview and then apply the structural equation modeling PLS-SEM to analyze the data. As a result, all three hypotheses are accepted: *Place attachment* has a positive impact on *residential satisfaction* (hypothesis 1); *Place attachment* and *residential satisfaction* affect *behavioral intentions* negatively (hypotheses 2, 3), in which the former has a stronger impact and the latter is a mediator variable.

The sample regression coefficient in the relationship between *place attachment* and *behavioral intention* is -0.413 , less than the one in the correlation between *residential satisfaction* and *behavioral intention* (-0.391). Thus, *place attachment* has a stronger impact than *residential satisfaction* on the negative *behavioral intentions* of urban residents living in apartments. This result is similar to the previous study by Amelia Tri Widya et al. (2019) on "The correlation relationship between people's satisfaction, place attachment and intention to move: Research preliminary study in Belawan, Medan", the similarity is believed to come from the scale and questionnaire of *place attachment* and *residential satisfaction*. However, Amérigo & Aragonés (1997) argues that residential satisfaction has a stronger impact, according to another previous study by Liang et al. (2014), even if *residential satisfaction* is a good factor to predict and determine, there was also no clear correlation between *residential satisfaction* and *behavioral intentions*, namely intention to move.

This study can be a premise for the future development of a model to measure the relationship between place attachment, residential satisfaction, and behavioral intention. Based on research results, some policy implications and recommendations are drawn below:

Firstly, real estate developers and investors can rely on research results to come up with ideas and implement the construction of apartment buildings that are suitable for residential needs as well as identify locations and designs to attract people to live. The efficiency of urban planning and construction can be improved by: improving the approach distance of apartment buildings, ensuring construction quality, water supply, and drainage system according to the regulations and population. The research results help the developers understand the factors that make residents more satisfied and engaged with their apartment, at the same time predict the psychological and behavioral intentions of residents to provide appropriate development strategies for increasing place attachment and satisfaction, reducing negative behavioral intentions toward housing.

Secondly, real estate managers can better understand the psychology and intentions of current apartment residents, thereby making modifications in terms of service quality and boosting the position and reputation of a professional real estate manager. Building management should focus on improving the quality of the operation management team through highly qualified recruiting and training staff, by the way, build up a professional apartment management model to easily solve problems arising during the management and operation process.

Thirdly, the investors, to ensure their reputation, should speed up the process of granting the House ownership certificate, they better fulfilling their responsibility to carry out the procedures to apply "So hong" for the customer of the apartment within 50 days from handing over, unless there is any other agreed and then properly perform their responsibilities and obligations to the state.

Finally, for state management agencies and policymakers, the research result is a useful source of information and references for planning the construction and improvement of urban quality and landscape. In addition, it is proposed to recommend to the state that, come up with policies to adjust supply for each specific segment, type, and demand to avoid massive and unbalanced development.

4.2. Conclusion

In general, this paper systematized and conveyed concepts of place attachment, residential satisfaction, and housing behavioral intentions. On top of that, partial least squares structural equation modeling PLS-SEM is utilized with quantifying place attachment and residential satisfaction variable by repeated indicator method to measure their attributes while formative measuring behavioral intentions by four observed variables. The results reveal all hypotheses are accepted, indicating that place attachment affects positively with residential satisfaction and negatively mentioned housing behavioral intentions.

Based on the above conclusions, four main recommendations are provided to enhance the housing attachment and satisfaction of residents, concurrently reducing negative behavioral intention. Related parties need to weigh improving urban planning and architecture construction efficiency; speeding up the process of issuing ownership certificates, regulating the supply and demand of apartments; upgrading the quality of operation management; and the last one is enriching the culture of each apartment.

RESEARCH ON THE INFLUENCE OF ONLINE KEY OPINION LEADERS ON VIETNAMESE TOURISTS' INTENTION TO REVISIT HOI AN ANCIENT TOWN

Le Thi Xinh

utxinh2009@gmail.com

College of Economics and Management,

Nanjing University of Aeronautics and Astronautics, Nanjing, China

Abstract

With the extreme development of e-commerce, the role of online key opinion leaders is becoming more and more critical in the advertising industry. In Viet Nam, the trend of advertising thanks to online key opinion leaders is being used powerfully in many industries, including tourism. It is the perfect combination of online marketing and online key opinion leaders' experiences. They share feelings and experiences about products and services on social media. It strongly influences customer behavioral intentions. Based on the previous theory, the research developed a conceptual framework and a research model of the influence of online key opinion leaders on tourists' intention to revisit Hoi An ancient town. Identify components of online key opinion leaders and the destination image of Hoi An ancient town. Analyzing the influence of online key opinion leaders on destination image; the influence of destination image on revisit intention. The study implements the online key opinion leaders as the exogenous variable and destination image as the intervening variable and intention to revisit as the endogenous variable. The samples would be collected by using convenience sampling technique, with up to 700 people responding to online questionnaires shared on the social media such as wechat, facebook and zalo. The method used to analyze was Structural Equation Modeling (SEM), using the SPSS and SmartPLS software. The study result pointed to the remarkable positive effect of both online key opinion leaders and destination image on tourists' intention to return. The results also focused on verifying the destination image such as cognitive image, affective image and overall image. Based on the results, the study also proposes some solutions to attract visitors to return Hoi An in the wave of a Covid-19 pandemic like now.

Keywords: *Online key opinion leaders, destination image, cognitive image, affective image, overall image, intention to revisit*

1. Introduction

The great development of the Internet has changed the obtainable information source related to the tourism, as well as impacted the method people access reliable and accurate information, making travel options [1]. Before, people found tourism information as well as travel agencies through book guides, newspapers, magazines and books. Now, they can find it through Internet by some the social media such as Facebook, Tiktok, Youtube, Instagram,

and Tripadvisor [1],[2]. Bloggers, reviewers, key opinion leaders and celebrity endorsements can share views, opinions, comments, places, experiences, and feelings related to their travel, including during the tour, finally serving as an information source for others in such the social media [2],[3].

Tourism is especially service intangibility because people cannot review them without having practical experience. Therefore, online comments can be used as proof before booking travel services and products and be factored into the decision-making process to decrease the risk when choosing tourism products. In the research of Wei & Lu (2013) [4], the authors also confirmed that customers turn to the Internet to learn about products and services before purchasing them. To have the best choice for travel, customers always use social media to search information about a destination, visualize images and read comments from others' previous tourist experiences [5]. Hence, key opinion leaders could become third parties who connect between products or services and customers, recommending and introducing the products or services through social media content, video, and images. This has impacted the customer's opinions, behaviors, and attitudes towards products [6].

Tourism development is of special significance to many countries in the world because tourism is the motivation for socio-economic development and one of the most important activities in the world [7]. Aware of the above problem, researcher S. J. T. m. Pike (2002) [8] in this field are not only finding improved product and service quality but also focusing on building and developing of image tourist destination because it is considered one of the most important point affecting the intention of customers. Visitors' intentions include the intention to visit in the future, intention to revisit, and willingness to recommend [9]. In economic terms, the intention to return makes an important distribution to decreasing advertising costs, and increasing revenue and profit of tourist destinations [10]. Therefore, how raise tourists' intention to revisit the same place is being researched more and more. Much previous research shows that that many variables influence tourists' intention to return such as destination image, destination quality, satisfaction, and loyalty [11]. Among them, the destination image is considered the most crucial factor that evokes the tourists' intention to return to the same place. Thus, studying the destination image concerning tourism intention in general and tourists' intention to revisit in particular is one of the most researched issues in the tourist industry [12],[13]. Influencers affect on destination image, and the tourism marketing field became a great topic for researchers and practitioners. This became a critical point in developing and promoting effective marketing strategies for tourism destinations and building destination images [3].

In 2021, the Covid-19 pandemic will continue to disrupt and break the tourism service supply chain, causing damage not only to the tourism industry but also to the agriculture, catering, entertainment, and food supply industries, products, specialties, crafts, souvenirs, transportation. In the tourism industry, 95% of travel companies stopped operating, 35% of travel companies applied to withdraw their business licenses; 90% of tourist accommodation are closed, the annual average capacity of the entire system of tourist accommodation is only 5%; millions of tourism workers will lose their jobs in 2021.

According to statistics, the number of domestic tourists in 2021 is estimated to reach 40 million, down 29% compared to 2020 and down 53% compared to 2019. The key tourist areas continued to record large declines such as Hanoi down 47%, Thua Thien Hue down 60%; Da Nang down by 60%; Quang Ninh down 37%; Ninh Binh down 49.5% over the same period in 2020. In 2021, total revenue from tourists is estimated at 180,000 billion VND, down 42% compared to 2020 and down 76% compared to 2019. Estimated contribution GDP of tourism in 2021 would only reach 1.97% (in 2019 it would be 9.2%, in 2020 it would reach 3.58%). The above figures do not fully reflect the heavy damage that Viet Nam's tourism has suffered in the past 2 years, leaving very serious consequences.

According to Vietnamtourist.gov.vn, Viet Nam is a tourist country, especially Hoi An is UNESCO World Heritage Site. In 2 years, 2019 and 2021, Hoi An tourism to be voted for and won many international awards such as Asia's Leading Cultural City Destination. However, due to the influence of the Covid-19 pandemic, in 2021, the total number of tourists decreased sharply, reaching just over 300,000 arrivals, down 77% compared with the same period in 2020 and down nearly 95% compared with the same period in 2019, revenue reached VND 281 billion; social income from tourism reached VND 660 billion, down 73% compared with the same period in 2020 and down 93% compared with the same period in 2019; tourism damage is about VND 15,000 billion .

Faced with this situation, the tourism development strategy to 2030 has pointed out the need to be necessary to "Create an image of Viet Nam's tourism" to contribute to improving the competitiveness of the industry and enhancing the Vietnamese tourism brand. Specifically, in 2022, Hoi An ancient town is selected to kick off the National Tourism Year with the theme Quang Nam – A Green Tourism Destination. This event is the most significant annual tourism events in Vietnam's tourism sector with an expectation of improving national tourism potential. How to attract visitors traveling to Hoi An and returning after many times visiting Hoi An is a critical problem and challenge for managers and marketers.

To explore the influence of key opinion leaders and destination image on visitors' intention to return to Hoi An ancient town is the general goal of this study. The result of this study helps managers improve destination image and increase visitors to Hoi An.

2. Literature review and Hypothesis development

According to Alisa Alessia Comendulli (2020) [39] a key opinion leader, sometimes called an influencer, is an expert in a particular field provides information related to their field, when they promote products and service, they bring credibility, authenticity and influence to them. The author Rogers (1962) [14] showed that KOLs affects the decision of each customer differently. Other authors Kotler P, Bliemel F (2001) [15] defined opinion leaders are individuals who have a direct impact on other individuals in the social circle, possibly related to their technique, knowledge, personality, and other attributes. Author Rogers (2003) [16] pointed out those opinion leaders as individuals influencing others' opinions about innovations. Although their influence is unofficial, opinion leaders play a critical part in the information acquisition process of consumer decision-making and, as a

consequence, can affect the outcome of marketing strategies [17]. Consumers said that they found the information they received from communications reviewed by opinion leaders to be more credible than an advertising message [18].

Moreover, authors Brown D, Hayes N (2008) [20] also showed that the motivation of influencers use firms messages which cooperate them if company messages are valid. Most importantly, it increases the worth of their influence. This is also an important part of an effective influencer marketing plan. Thanks to the appearance and development of key opinion leaders on social media, marketing strategies that use key opinion leaders have become progressively well-known and influential recently

The majority of literature on key online key opinion leaders mostly focuses on their character, recognition, and influence on social media.

First of all, the author will talk about the character of online key opinion leaders. The theoretical framework of online key opinion leaders, according to Burson-Marsteller (1999) [19] who has brought forward e-fluentials to explain opinion leaders whose behaviors breaded out information through the Internet. The past research found that online key opinion leaders and offline key opinion leaders have the same characteristic. In comparison to regular people, and online opinion leaders have remarkable benefits in term of long-term involvement, innovation, pioneering behaviors, and self-perceived knowledge. Definitely, there are certain variations in between two groups, online key opinion leaders possess excellent computer abilities, as well as a wealth of information, expertise, and internet application frequency [21],[22]. Secondly, about the recognition of online key opinion leaders we have two kinds. One is based on a typical characteristic of online key opinion leaders. For example, as reported by author Xi R (2008) [23] attached key online opinion leaders' recognized statistical characteristics, personal characteristics, social characteristics, risk perception characteristics, buying motivation characteristics and personal value characteristics, and then the author will make an outline for online key opinion leaders scale. The other one of recognition is network theory [24], for instance, using sentiment information to analyze social networks, and the result shows that sentiment factors do have a significant effect on social network analysis. In the last of the literature, we will focus on the effect of online key opinion leaders. The past study demonstrated that famous and well-known participants' online comments on sites like Amazon had a significant impact on book sales volume. [25]. The search of authors Wang Z, Liu H, Liu W, Wang (2020) [26] showed that online key opinion leaders played vital roles in information diffusion, mostly in the original period in Sina Weibo. When the number of KOLs' sharing and interactions memorably rises, it brings about a scale of rapid network increase. Moreover, when the top KOLs forward a game related to hot keywords, the number of keyword-related them also increases quickly. Actually, in company with the strong growth of online social networks, specifically in worth-of-mouth (WOM) marketing such as providing information, giving personalized recommendations, sharing information, forwarding information become the consequences of online key opinion leaders' behaviors and online social blogs are one of the good channels where opinion leaders show their influence [27].

Based on antecedents and previous studies about online key opinion leaders, authors Meng F, Wei (2015) [28] innovatively designed an online key opinion leader leadership model on purchase intention. Those authors had considered some factors such as the character of opinion leaders, the perceived value of customers, opinion leaders' recommendation information, trust, and purchase intentions; in this has twelve variables, including professional knowledge, product involvement, visual cue, timeliness, and functional value. In order to measure how the characteristics of opinion leaders, opinion leader recommended information affects purchase intention, author Meng F, Wei (2020) [29] had conducted to design the questionnaire items for the variables in the key opinion leader influence model and create the primary scale. The results pointed out that the key opinion leader variable that affects customers' buying decisions are professional knowledge, product involvement, visual cue, interactivity, functional value, and trust. In addition, author Le Giang Nam (2018) [30] also found that consumers have a tendency to trust influencers vigorously and customers' purchasing intention is significantly affected by four factors: credibility of influencers, quality of information, customer participation, and interaction between influencers and products. Moreover, some similar studies showed a great impact of key opinion leaders on buying intention [31], [32], [33].

Destination image can be defined as a traveler's general impression of a place [34]. It is the sum of beliefs, ideas, and impressions that a traveler has toward a particular place [35],[36],[37]. Moreover, authors Agapito, Oom do Valle et al. (2013) [38] defined that destination image is as a subjective description of a place kept in a tourist's mind, which impacts their behavior during three stages including *priori*, *loco*, and *posteriori*. There are many different approaches to the conception of a destination image. According to Echtner and Ritchie (1991) [41] suggested that three continuum components of destination image are functional-psychological, common-unique and attributes-holistic. However, Gartner (1994) [42] clarified that destination image consists of affective, cognitive and conative. Some believe that only two components of destination image, namely cognitive and affective [43]. The cognitive can be explained as beliefs and knowledge about a place's physical features, while the affective identified that it is individual's emotional response and emotions regarding features and their surroundings [36]. In Spite of the definition of destination image as two or three dimensions, researchers tend to high point the composite and formative characteristics of destination image by referring to them overall image. Thus, overall image is the general impression of a destination image [44] that contains the cognitive and affective image [45] or is have effected by cognitive, affective and conative [46]. Overall image is also pointed out as the third component of destination image same as cognitive and affective [36] and the overall image is defined as an individual's general evaluation perception of a place. Despite that some authors already used overall image dimension like destination image construct [47]. To put it another way, the destination image is a summary component made up of two-three sub-dimensions. In this research, author develop destination image through three dimensions such as cognitive, affective and overall image.

Destination image impacts subjective perception of the destination and the future behavioral intention of tourist [51],[52]. Authors Rittichainuwat, Qu et al. (2001) [48]

defined that the better their opinion of the destination image, the higher their rate of returning to that destination. Author Lee, Lee et al. (2005) [53] said that a positive destination image will help visitors have a good perception of the experiences at destinations, leading to increased satisfaction and optimistic intention; Chen and Tsai (2007) [9] researched the relationship between destination image, tour quality, value perception, satisfaction, and behavioral intent. The consequences showed that there are influence positive and negative of destination image on behavioral intent.

Author Di Marino (2008) [54] said that the effect of destination image on tourist intention the perception process has 3 stages: perception “a priori”, perception “in situ” and perception “a posteriori”. It considered the influence of internal and external factors that can impact the tourists’ destination image. Perception “a priori” is the perception about a place from source of information without having a physical connection with the place. Then, perception “in situ” is the key moment in the tourists’ experience, tourists can be satisfied or not. The perceptions in this stage will impact on the third stage perception “a posteriori”. Of course tourists’ experiences do not have to end with the trip; they may incorporate some components into their daily lives. For example, the important role of photos of the destination.

In research, hindering tourists’ perception were neglected dimension or researchers have not been interested [55],[56]. As an example, in research of authors Rittichainuwat, Qu et al. (2001) [48] defined that tourists are well aware of Thailand’s image dimensions such as safe destination, activities and natural beauty scenic, rich culture, good-value food and accommodations, access and shopping has a significant impact on a return visit and sharing with their friends. The authors also showed that Thailand has a dissatisfaction image of environment and social problems.

Chen and Tsai (2007) [9] pointed that tourist intention is indicated through three stages: (i) choosing a place to visit, (ii) evaluation after visiting and (iii) intention in the future. In which, choosing a destination to visit is usually the intention of first-time visitors; the following evaluations are the perceived value or satisfaction of tourists about the tourist experiences at the destination; intention in the future refers to the visitor’s intention to choose the next destination, such as the willingness to return, suggest the destination to others or choose a new destination.

Intention to return is the willingness to return to a destination visited by a visitor to experience [57], or it is the possibility that a visitor will return to visit a defined destination specified for a specific period of time [58].

Hypothesis development

Internet development has changed the method people make a planned journey and buy tourism services and products. Besides, it has significantly changed the function of the middleman, now the role of the influencer has been enhanced. The key opinion leaders in social media are being utilized as marketing tools to build, develop and promote its image [59]. They will share information related to destination such as products and services, prices, activities, utilities, transportation, other services [60]. Then, visitors will communicate with them on social media in the travel process including during planning, expending, and after

visiting [61]. Positive online feedback, comments, or reviews from key opinion leaders will enhance the knowledge of travel products or services among prospective visitors. Therefore, online comments that provided by travelers on social media increase the perception of brand image and have a remarkable influence on destination image and purchase intent. [3].

In influencer marketing activities, the individual should spread the word through their social media networks. Consequently, influencer activities involve a content component that is mainly focused on building a brand image and influencing the purchase intent of their followers [62]. In research [31], authors Hermanda A, Sumarwan U, Tinaprillia (2019) [31] show a remarkable positive relation between social media influencers and brand image in those four variables (Visibility, Credibility, Attraction, Power) all accepted. Moreover, some authors such as Jaya I, Trisna PGI, Prianthara (2020) [63] also demonstrated that key opinion leaders have an optimistic and significant effect on destination image.

Based on previous studies above, the research already chose four characteristics that key opinion leaders should have to be a solid leader such as visibility, credibility, attractiveness and power.

Visibility

The essence of KOLs lies in the public's interest in them, which leads to their very high social media presence. According to Hughes (2006) [40] pointed out that visibility refers to how well a person or character is recognized or identifiable when presented to the public. From the standpoint of the target audience, visibility relates to how recognized the source is. Brand awareness and brand image are helped by visibility, especially when an opinion leader is used. In this study, visibility is measured by the frequency it appears in the media and its popularity and admiration. Visibility has a significant impact on the brand image of Marcks Venus Powder [85]. The author offered the following idea based on past research. The author offered the following hypothesis based on past research:

H1 Visibility has an optimistic and remarkable influence on cognitive image

H2: Visibility has an optimistic and remarkable influence on affective image

Credibility

According to Belch (1994), credibility is “the degree to which the reader regards the source as possessing relevant knowledge, skills, or experience and believes the source to provide unbiased, objective information”. Expertise and trustworthiness are the two most important aspects of credibility [64]. Authors Goldsmith RE, Lafferty BA, Newell (2000) [65] said that celebrities are trustworthy sources of information. The whole number of positive features that produce and increase the acceptance of the information is defined as a celebrity's credibility [66]. As a result, celebrity credibility has an influence on message acceptance and persuasion (Belch & Belch, 2001). Credibility can relate to a source's perceived knowledge and its level of objectivity, sincerity, or trustworthiness. Credibility has two components: expertise and objectivity. Expertise or the source's perceived understanding of what is being promoted. Objectivity or the source's regarded sincerity and trustworthiness in sharing what the source knows. The credibility of a person is determined by their amount of experience, expertise, honesty, and confidence. Author hypothesized that:

H3: Credibility has an optimistic and significant influence on cognitive image

H4: Credibility has an optimistic and significant influence on affective image

Attraction

According to Rosenbaum-Elliott (2021) [67], the attraction includes two components: the source's likeability and perceived likeness to the intended audience. Intellectual abilities, personality traits, style of life, athletic performances, and endorser talents are all factors that influence the attraction [66]. The level of appeal, personality, and lifestyle are all used to determine attractiveness in this study. Author posit the following hypothesis:

H5: Attraction has an optimistic and remarkable influence on cognitive image

H6: Attraction has an optimistic and remarkable influence on affective image

Power

The source's perceived capacity to persuade compliance from the target audience is referred to as power [67]. In this study, power was considered as the capability to improve a product's or service's image, inspire others, and remind people of the product or service. According to Rini and Astuti (2012) [49], power is related to the power possessed by celebrities to instruct the target audience to buy. The power that celebrities have can shape product image according to the character of the celebrity. The author offered the following idea based on past research. The author posits the following hypothesis:

H7: Power has an optimistic and remarkable impact on cognitive image

H8: Power has an optimistic and remarkable impact on affective image

Previous studies have agreed that a destination has an overall image [36],[41], which may be described as a person's overall evaluative impression of a place. Authors Akama JS, Kieti (2003) [68] proposed the overall image of a place may be more important than any individual image characteristic in determining its success. Many research have demonstrated that both cognitive and emotional factors have an effect on overall image [69]. Thus, the author posits the following hypothesis:

H9: Cognitive image has an optimistic and remarkable influence on overall image

H10: Affective image has an optimistic and remarkable influence on overall image

It has been demonstrated that the overall image impacts not only the destination choose but also visitor behaviors intentions [70]. The variables intention to return, intention to suggest, and word-of-mouth are frequently used to measure visitors' behavioral intentions related to the destination image [2],[50]. Intention to return is critical because it reflects consumer loyalty, which is one of the most crucial markers of successful destination development and aids in increasing a tourist destination's competitiveness [71]. Understanding the antecedents of visitors' destination image and purchase intention might thus provide managers with extra possibilities to improve the destination's image [2]. Many researchers have found that the image of a place effects on tourists' willingness to return the destination [72]. It is admitted that a person who has a favorable image of the place is always more willing to suggest it and visit it again [50]. Therefore, it is hypothesized that:

H11: Overall image has a favorable and significant influence on tourists' intention to return to the destination.

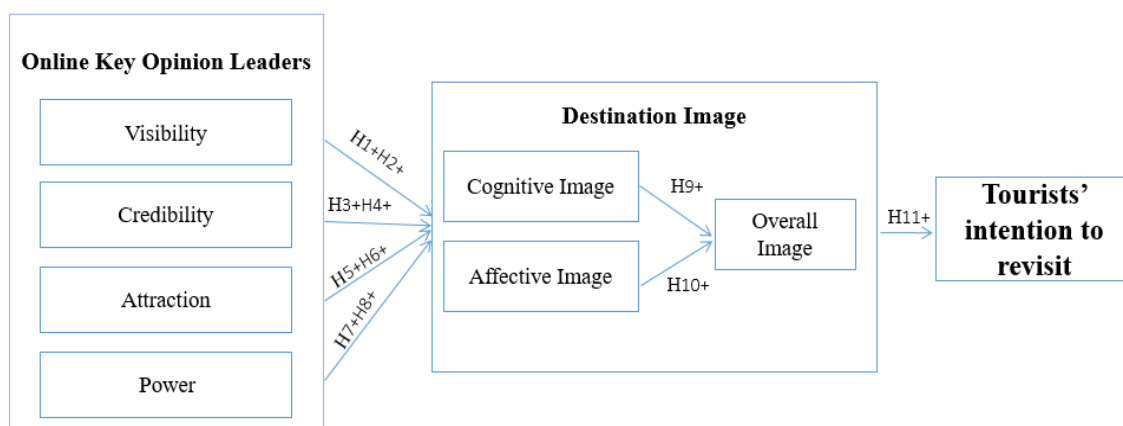

Figure 1. A model influences of online key opinion leaders on intention to revisit with hypothesized paths.

3. Method

3.1. Measurement

Before going to official research through the questionnaire, author design an unstructured questionnaire to explore some of new scales that can apply for this study such as the measurement of key opinion leaders and destination image. The goal of this qualitative research is to find, adjust, and add the observed variables that are utilized to measure the variables.

After collecting results from qualitative research, author will adjust the scale of the previous studies to fit with actual research in Viet Nam. All factors in the research model: Visibility (VI) – 4 observed variables from the research of [73] and qualitative research, Credibility (CR) – 4 observed variables from the research of [73] and [74], Attraction (AT) – 5 observed variables from the research of [73] and qualitative research, Power (PO) – 4 observed from the research of [73] and qualitative research, Cognitive Image (CI) – 12 observed variables from research of [75],[2],[41],[50], Affective Image (AI) – 4 observed variables from the research of [50],[44],[72], Overall Image (OI) – 4 observed variables from the study of [50],[44],[72], Revisit Intention (RVS) – 3 from the study of [76]. The observed factors will be quantified using a multivariate scale modified from prior studies to ensure compatibility with the social and cultural environment in Hoi An. The 5 point Likert scale will be used for this research with 1 represents strongly disagree, 2 represents disagree, 3 represents normal, 4 represents agree, 5 represents strongly agree.

3.2. Data collect and analysis

The study's target population is travelers who have already visited Hoi An. Because of time limitations, convenience sampling is estimated to yield 700 responders. Data will be collected using Google Form and sent to customers via Facebook, Wechat, and Zalo before being imported into SPSS.24 and SmartPLS software for analysis. In this research, method will be used for data analysis such as descriptive analysis, exploratory factor analysis, measurement model, and structural equation modeling (SEM).

4. Results

4.1. Descriptive analysis

The online survey reached a total of 700 complete. However, there are 200 responses who have not visited Hoi An before. Therefore, 500 questionnaires are usable.

The demographic information of the response is included in the table below, which showed that the primary of the answer is between the age of 25 to 35 (n = 222, 44.4%) and from 18 to 24 years old (n=215, 43%), with percentage of female responses is 90.4 percent. Bachelor's degree is the main education level in answer (n = 330, 66%). The largest daily time which interviewees spent to using Internet such as surfing Facebook, Youtube, Tiktok, Instagram is from 3 to 5 hours per day (n=263, 52.6%). Meanwhile, the highest time which participants used to read the commendations from KOLs from any fields (fashion, tourism, food, electronic products, high-clothes, cosmetics, books, movies, dramas) is more than ten times per a month (n=500, 100%). The majority of answer already visited Hoi An about one time before with 44%, 2-3 times with 26.4%, more than 5 times with 22.4%. In the future, they will definitely be back with 401 respondents (80.2%).

Designing the questionnaire, the frequencies online activities was used to evaluate frequencies use social media platforms to search information online before traveling or purchasing a travel product or service, which the social media platforms they access the most, they get experiences of finding knowledge and information because of influencers' recommendations, they will be attracted by items tagged some opinion leaders comment. As table 5.2 shows 82.8% of respondents will usually look for information through Internet before traveling or purchasing a travel product. The information is mainly from Facebook with 155 (31%), Google with 134 (26.9%) and You Tube with 111 (22.1%). Moreover, 53.6% of respondents also replied that they sometimes find tourism information because of online key opinion leaders' recommendations. Finally, when they are browse the webpage and see the label tagged some opinion leaders comments, they perhaps will be interested in labeled.

Table 1. Demographic information of the answer (N=500)

Demographics	Category	Frequency	Percent
Gender	Male	48	9.6
	Female	452	90.4
Age	Less than 18 years old	19	3.8
	From 18 to 24 years old	215	43.0
	From 25 to 35 years old	222	44.4
	More than 35 years old	44	8.8
Marital Status	Single	387	77.4
	Married	113	22.6
	Divorced	0	0.0
Education Level	High school	41	8.2

Demographics	Category	Frequency	Percent
	College	26	5.2
	Bachelor	330	66.0
	Master or higher	103	20.6
Using the Internet	From 1 to 2 hours per day	147	29.4
	From 3 to 5 hours per day	263	52.6
	From 6 to 8 hours per day	55	11.0
	More than 8 hours per day	35	7.0
Reading the recommendations for KOLs	From 1 to 3 times per month	0	0.0
	From 4 to 6 times per month	0	0.0
	From 7 to 10 times per month	0	0.0
	More than 10 times per month	500	100
Number of past visits to Hoi An	1 time	220	44
	From 2 to 3 times	132	26.4
	From 4 to 5 times	36	7.2
	More than 5 times	112	22.4
They are going to travel to Hoi An in the future	Yes, of course	401	80.2
	I do not know	96	9.2
	No, I do not like	3	0.6

Question	Answer	Frequency	Percent
Search for information online before travelling.	Occasionally	5	1.0
	Sometimes	81	16.2
	Usually	414	82.8
The information is mainly from	Travel agent (website, catalogues, pamphlets, magazine,...)	80	16
	Recommendations from experts, reviewers, bloggers,...	166	33.2
	Recommendations from friends/family	163	32.6
	Company advertisements	22	4.4
	Company advertisements	53	10.5
	Other	16	3.3

Question	Answer	Frequency	Percent
The platform of social media use to search for information about tourism.	Facebook	155	31
	Instagram	50	9.9
	Youtube	111	22.1
	Google	134	26.9
	Twitter	2	0.4
Finding tourism information because of the comments of online key opinion leaders.	Tiktok	49	9.7
	Never	26	5.2
	Occasionally	67	13.4
	Sometimes	268	53.6
To be interested in labeled with “some opinion leaders recommend”.	Usually	139	27.8
	Certainly	58	11.6
	Maybe	352	70.4
	Never pay attention that	90	18

In this study, we want to measure the reliability of the variables using the Cronbach Alpha in SPSS in the Reliability Analysis function. A variable has a Cronbach's alpha value of greater than 0.6 so this variable is thus reliable. According to Hair & ctg (1995) and Nunnally (1978) indicated that the scale evaluated as reliable when composite reliability is larger than 0.5 and average variance extracted value is from 0.5 above. The table shows all

of the values are above 0.5 so the scale is reliable. According to Fornell & Larcker (1981), convergent validity is assessed by two criteria is outer loading and average variance extracted (AVE). Hair & ctg (2016) showed that outer loading should be exceeded or equal 0.708 are believed to be greatly accepted. The table below it is seen that all outer loadings were more than 0.708. Average variance extracted (AVE) for all constructs should be from 0.5 above so convergent validity is confirmed. According to the result above, the average variance extracted ranged from 0.649 to 0.847. We can be said that this research is satisfied both for convergent validity. Authors Fornell & Larcker (1981) recommended that discriminant validity of the scale is confirmed when the square root of average variance extracted (AVE) for each latent variable is more significant than all correlations between the latent variables. Seeing from the AVE value in the table above all variables are above 0.5, so it can be said that the discriminant of the scale is confirmed. In summary, the measurement model demonstrated reliability, convergent validity, and discriminant validity.

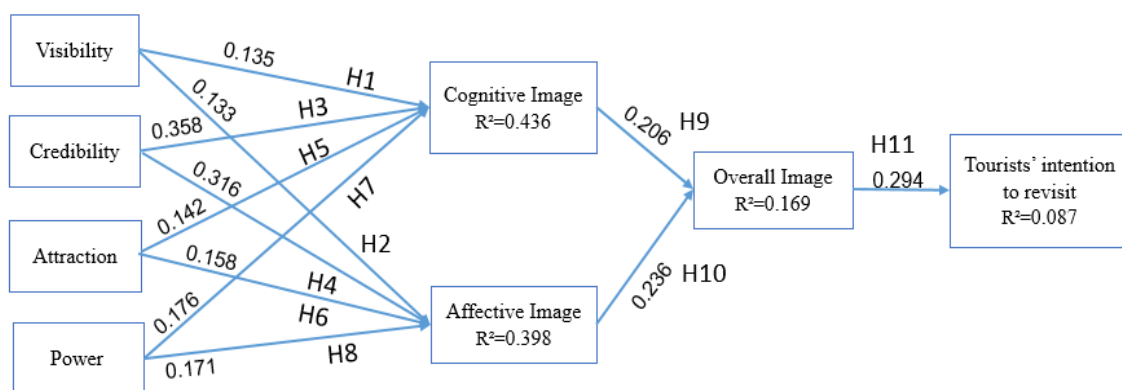

Figure 3. The influence of online key opinion leaders on tourists' intention to revisit

4.3. Hypothesis testing

The result indicates all hypotheses are supported.

Firstly, visibility H1 ($\beta=0.135$, T-value=2.126, $p=0.034 < 0.05$), credibility H3 ($\beta=0.358$, T-value=7.116, $p=0.000 < 0.05$), attraction H5 ($\beta=0.142$, T-value=2.904, $p=0.004 < 0.05$) and power H7 ($\beta=0.176$, T-value=2.995, $p=0.003 < 0.05$), all have remarkable positive relationships with cognitive image. The R-square statistic for the cognitive image variable showed that four variable explained by 43.6% of the variance in the cognitive image variable.

Secondly, visibility H2 ($\beta=0.133$, T-value=2.608, $p=0.009 < 0.05$), credibility H4 ($\beta=0.316$, T-value=6.465, $p=0.000 < 0.05$), attraction H6 ($\beta=0.158$, T-value=2.750, $p=0.006 < 0.05$) and power ($\beta=0.171$, T-value=2.937, $p=0.003 < 0.05$) are all significantly positively related to affective image. The R-square statistic for the affective image variable showed that four variables explained by 39.8% of the variance in the affective image variable.

Thirdly, cognitive image H9 ($\beta=0.206$, T-value=3.436, $p=0.001 < 0.05$) and affective image H10 ($\beta=0.236$, T-value=4.101, $p=0.000 < 0.05$) are all significantly contributed to overall image. Consequently, R² of overall image demonstrates that two variables explained by 16.9% of the variance in the overall image variable.

Finally, overall image H11 ($\beta=0.294$, T-value=6.887, $p=0.000 < 0.05$) has remarkable positive relationship with tourists' intention to revisit. Thus, the overall image explained by 8,7% of the variance in the tourists' intention to revisit variable.

Table 3. Hypothesis Testing

Hypo		Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (O/STDEV)	P Values	Result

5. Discussion and Conclusion

5.1. Discussion

Based on the derived results, hypotheses H1, H2, H3, H4, H5, H6, H7, and H8 which proposed online key opinion leaders have impact on cognitive image and affective image, was accepted by this research. In the study questionnaire, the highest mean variable visibility with the statement "Numbers of followers on social media for the opinion leader is large", the highest mean variable credibility with the statement "The opinion leader who is honest when making judgments about products/ services in the advertisement/when they experienced it", the highest mean variable attraction with the statement "The opinion leader who is able to bring inspiration to readers/respondents.", the highest mean variable power with statement "The opinion leader is a celebrity that makes readers/respondents follow their opinion.". From these results, it can be said that when key opinion leaders share or make judgments about services/products, then the audience follows their posts is very large, by using posts/recommends that they lead to audiences follow their opinion and bring inspiration and interest to readers. This indicates that the better the information that is spread about a tourist destination by a key opinion leader, the better the destination image of the place. The results of this research are in agreement with study conducted by I. Jaya, P. G. I. Trisna, and I. B. T. Prianthara (2020) [75]. Meanwhile, authors Godey B, Manthiou A, Pederzoli D, Rokka J, Aiello G, Donvito R, et al. (2016) [77] pointed out that the influencers had a great impact on the product or service's brand equity, emphasizing the importance of brand image in brand

equity. In other words, key opinion leaders worked as middlemen between firms and customers, effectively communicating product or service information to them. A study researched by Barreda AA, Bilgihan A, Nusair K, Okumus FJCihb (2015) [78] indicated that the firm's brand image can be improved via word of mouth on social media platforms. Furthermore, the presence of significant opinion leaders on social media enabled a two-way interaction that allowed consumers to connect with the company indirectly [79].

Based on the study results, H9 and H10 are accepted. This means there is a remarkable optimism between cognitive image, affective image, and overall image. Viewed from the variable mean, the cognitive image got a high mean value with the statements "Hoi An ancient town has many traditional cuisine/food (Banh My, Quang noodles, Banh Xeo, ...)", "Hoi An ancient town is a destination of the World Cultural Heritage", "Hoi An ancient town has attractive natural attractions and scenery (beautiful scenery, romantic, beautiful beach)", "People here are friendly". All means value of above statements are more than 4.0 (4.0 out of 5.0). However, the lowest means value is belong to the statements "Hoi An ancient town that has many historic sites, museums, architectural features of Chinese", "Hoi An ancient town has the good local infrastructure/transportation" and "Hoi An ancient town has reasonable travel service prices". Hoi An is near Da Nang city, with Da Nang international airport, very convenient for tourism. However, Hoi An does not have convenient public transport facilities, the roads in Hoi An are still narrow, so causes traffic jams. In addition, the prices of goods and services in Hoi An are not well controlled, companies arbitrarily raise the prices of products and services without the permission of state management agencies. Hoi An is characterized by historic sites, museums, architectural features of Chinese, but in the promotion of Hoi An tourism, domestic tourists still do not understand this clearly. This is one of the reasons that impact on tourists' perception of Hoi An. The affective image got the high mean value with the statements "Hoi An Ancient Town is a relax destination" and "Hoi An Ancient Town is a close destination". The overall image got the highest mean value with the statement "Hoi An is a peaceful and safe tourist destination". In fact, these characteristics are often associated with tourists when referring to the Hoi An tourist destination and are typical sentiments expressed in most promotional activities of Hoi An tourist destination. From that, it can be seen that the identification of affective image and overall image clearly is essential to promote the image messages of tourist destinations to visitors. The results of the research are in accordance with studies conducted by authors H. Zhang, X. Fu, L. A. Cai, and L. J. T. m. Lu (2014) [80]. Therefore, in order for the image of Hoi An tourist destined to become more and more attractive, it is necessary to increase affective image and overall image in the process of tourists' travel experiences.

Based on the results of the research that has been done, it is known that H11 is approved. It shows that there is a significant relationship between overall image and revisit intention. The tourists'intention to revisit variable got the highest mean value with the statement "I will revisit Hoi An within the next 12 months". It means visitors will return to Hoi An in the next times. This is correspondingly with the research conducted by Chen and Tsai (2007) and Qu and Kim (2011) [9],[50].

5.2. Practical Implication

The practical implications of this study are that, in order to increase intention to revisit levels related to tourism services and products, it is recommended that the management of a tourist destination try to set up an optimistic destination image of it through online key opinion leaders [31]. According to this research, positive destination image is constructed by highlighting interesting cultural attractions, infrastructure, traditional festivals, entertainment, a pleasant environment, people. Based on the correlation-coefficient values of each indicator, it can be seen Hoi An is a close destination with friendly people indicator, which is a principal indicator for shaping a positive destination image. Therefore, managers should work with online key opinion leaders to set up a positive destination image for their tourism business. It is crucial to note that this study would likewise help the tourism management pay keen attention to building tourism ambassadors or Miss tourism queen to promote Hoi An destination image, building a safe, close, friendly Hoi An ancient town.

Notwithstanding, a positive destination image for tourists should not only be based on advertising by KOLs, it must be formed from improving the actual perceived image of visitors. Therefore, in order to increase the ability to attract tourists back to Hoi An, it is necessary to focus on improving the overall image of Hoi An in the minds of visitors, in which enhancing the role of cognitive and affective image such as: continuing to promote the advantages of developing the image of a tourist destination in Hoi An through factors such as culture, history, festivals, and entertainment activities; increasing exploitation of natural resources around the ancient town creates attractiveness such as Cu Lao Cham island, coast, river, forest; improving and enhancing the factors of infrastructure, traffic, green tourist environment, safety, competitive travel costs.

Increasing tourists' awareness of the overall image of Hoi An tourism destination through tourism promotion activities. One of the effective ways of promoting tourism that many countries around the world are focusing on developing is promoting the image of a tourist destination through cinema. Cinema is likened to a “tourist ambassador”, along with a specific plot that goes into people’s hearts, beautiful frames with unique scenery become unforgettable impressions in the minds of viewers. In fact, many tourist destinations are very successful and attract a large number of tourists through famous movies that are not directly related to tourism promotion activities [81]. Movies can strongly influence tourists' decision to visit, and movies not only increase short-term tourism revenue, but also bring long-term prosperity to a destination [82]. To exploit this form of advertising, the destination of Hoi An needs to focus on a number of contents: building a separate budget for the promotion of tourism images through cinema; proactively order movie scripts with scenes shot in Hoi An and have support policies as well as commitments to the film crew; strengthen activities to introduce tourism images with domestic and foreign film crews; strengthen the Farmtrip form for domestic and international filmmakers; and enhance the initiative of tourist destinations in tourism promotion activities through films with scenes shot at the destination.

5.3. Limitation and Future Research Direction

As the research, we designed to evaluate the relationship between online key opinion leaders, destination image and tourists' intention to revisit in Hoi An ancient town. However, there were still some limitations that should be considered. The data collection was conducted during a period when the country was on lockdown by the epidemic, people were unable to travel and had to work from home. The study was conducted based on a convenient sample for domestic tourists across the country via the Internet, thus affecting the research results. In the future could pay attention to the method of direct sampling in Hoi An through surveys at the places to increase the objectivity of the research.

Secondly, the study only considers the influence of online key opinion leaders, destination image in relation to tourists' return intentions, but lacks the assessment of differences in demographics, travel experiences and psychological characteristics (self-worth, motivation, personality, travel motivation) affect the relationship. Therefore, the research results have not comprehensively considered the role of the above factors in the process of forming the destination image as well as the tourist intention of tourists. In the future, assessments of demographics, travel experiences and psychographic characteristics will be added. It is possible to add factors such as loyalty, satisfaction level and especially the factor "Tourism hindrance" in the research model to measure more fully the factors that actually affect the intention to return Hoi An destination. To conduct a survey of tourists who have not been to Hoi An to review secondary images; visitors who come to Hoi An for the first time to identify primary images from actual travel experiences; and visitors who come to Hoi An from the second time onwards to examine what motivates their repeat tourism activities. Comparison between three groups of tourists, as a basis for proposing marketing strategies to improve and develop tourism destination's image.

K60 Finance - Banking, Tay Bac University, Son La, Vietnam

Abstract

Based on the primary data set collected from the survey of 86 ethnic minority households in Van Ho district, Son La province, the study has clarified the basic characteristics of the livelihood problems of these households, the impact of natural and socio-economic conditions on their livelihood methods. Up to 46% of surveyed households have an average income of less than 1.5 million VND/person/month, much lower than the average income of the country and the whole province. Most of their income sources still focus on farming and ranching.

Keywords: *ethnic minorities, households, livelihood.*

1. Introduction

Although Vietnam has achieved many economic achievements, it still faces poverty. In recent years, the gap between the rich and the poor in urban and rural areas has widened, with nearly 90% of the poor concentrated in rural and mountainous areas. Due to the gap in distance, people in the mountainous areas in general and the Northwest in particular often face many difficulties in accessing information, markets, public services and education. Especially, for ethnic minority households, they often live in villages far from the center, they have little awareness with difficulties in geographical location, climate, natural conditions, facilities have made it difficult for them to find sources of income and stabilize their livelihoods.

Van Ho is a newly established district in Son La province. Recently, there have been many programs and projects to support ethnic minority communities to transform and improve their livelihoods in a sustainable way. The livelihood activities of the people here are also greatly influenced by many different factors, including factors of resources (natural, social, human, material and infrastructural...). Research on the status and livelihood characteristics of ethnic minority households in Van Ho district is an important basis for proposing effective and feasible solutions to transform and ensure sustainable livelihoods for ethnic minority communities in Son La province and other similar provinces and regions today.

2. Literature Review

Many years ago, the issue of livelihood was chosen by many previous authors to study, but in 1983, Chambers and Robert officially used the concept of "livelihood" officially: "Livelihood includes possibilities, assets (including physical and social resources)

and activities necessary for a living”. Since then, scientists and scientific research organizations have accepted the concept of livelihood and applied it in many current studies.

According to the Department for International Development - DFID, the concept of livelihood "includes capabilities, resources and activities necessary as a means of living for humans". The above concept shows that livelihood includes the natural, economic, social and cultural resources possessed by individuals, households, or social groups that can generate income to improve their material and spiritual life or can be used, exchanged to meet their needs in life.

By 1992, a sustainable livelihood was defined by Robert Chambers and Gordon Conway: “A livelihood consists of the capacities, assets and activities of earning a living. A sustainable livelihood is one that can cope with and recover from stresses and shocks, maintain or enhance capacities, assets and provide sustainable livelihood opportunities for the next generation, beneficial contributions to the livelihoods of others locally and globally in the short and long term”.

According to the researchers, the sustainable livelihoods framework can flexibly change in different contexts in many different countries and communities because each organization has different mission, vision and goals, they also develop different livelihood analysis frameworks. According to DFID's sustainable livelihood framework, people's livelihood assets are classified into 5 categories including: human capital, natural capital, financial capital, social capital and physical capital. These five types of livelihood assets are both constitutive factors for livelihoods and generalized factors that directly affect the livelihoods of households.

In Vietnam, household livelihoods are not a new issue in research in recent years. Many studies have used a combination of both quantitative and qualitative research methods to measure the impact of factors on household livelihoods such as: Nguyen Quoc Nghi et al (2011), Nguyen Van Tam et al (2018), Nguyen Tien Dung et al (2020),... However, previous studies have focused mainly on the provinces of the Mekong Delta with research subjects being ethnic minorities (Nguyen Quoc Nghi et al., 2011), or residents of drought-salt areas (Nguyen Tien Dung et al., 2020) or coastal sandy areas of Thua Thien Hue province (Nguyen Dang Hao, 2012) and many other studies. The provinces in the Northeast often focus on the livelihoods of people in Thai Nguyen province, with the subjects being tea farmers in Dai Tu district (Nguyen Van Tam et al., 2018) and the most recent is a study on the livelihoods of forest-dependent people in the special-use forest area of Dinh Hoa National Park (Nguyen Tuan Hung et al., 2020). With different research methods and range, studies have shown many factors affecting household livelihoods such as the education level of the household head, the education level of labor, the number of demographics, the number of income generating activities of the household, the age of labor and many other factors. However, there have been no studies focusing on ethnic minority households in the Northwest region in general and Van Ho district, Son La province in particular.

3. Method

Research results from the theoretical basis and overview of previous studies help the authors build a scale, constituting the content and status of the household's livelihood. On the other hand, the results of secondary data research from socio-economic, cultural and population reports of Van Ho district, Son La province together with other articles and

journals on livelihoods, living standards, income, etc. of ethnic minorities in Son La province, helps the study to form preliminary scales to suit local characteristics.

Organize in-depth interviews with experts from Son La Provincial Committee for Ethnic Minority Affairs, local leaders at district and commune levels and representatives of households to design a preliminary survey. After the in-depth interview process, the preliminary survey results will help build and complete the survey form, and at the same time, the research will also determine the appropriate survey scope and subjects.

Survey and interview representatives of 86 ethnic minority households in 03 communes in Region III of Van Ho district, including: To Mua, Xuan Nha and Chieng Yen. After data collection, descriptive statistical analysis of sample characteristics was carried out. All data is aggregated and processed on excel, conducting statistical analysis to describe sample characteristics, graphing to determine the livelihood characteristics of ethnic minority households in Van Ho district, Son La province.

4. Results

4.1. Basic characteristics of Van Ho district and ethnic minorities in Van Ho district, Son La province

Van Ho district is a new district in Son La province, established in 2013 under the Government's Decree on the basis of adjusting and dividing the administrative boundary of Moc Chau district with a total natural area of 97,984 hectares. Van Ho district was established, including 14 communes with 121 villages and sub-zones, including 01 border commune, 04 zone II communes, 09 zone III communes. In terms of geographical location, Van Ho district has administrative boundaries to the east by Mai Chau district (Hoa Binh province), to the west by Moc Chau district (Son La province), to the south by Muong Lat and Quan Hoa districts (province). Thanh Hoa) and Sop Bau district (Hua Phan province, Lao PDR), the north borders Phu Yen district (Son La province) and Da Bac district (Hoa Binh province). Van Ho district is about 140 km from Son La city, 170 km from Hanoi capital along National Highway 6.

Van Ho district has a total natural area of 97,984 hectares, the total population of the district as of December 2020 is 15,178 households, with 63,625 people and 06 main ethnic groups living together. In which ethnic minorities account for over 93%. The details of the ethnic structure are as follows:

Table 1. Structure of ethnic groups in Van Ho district in 2021

Ethnic	Number of households	Number of people	Ratio (%)
Thai	6.340	25.205	41,8
Kinh	1.284	4.143	8,4
Muong	3.475	14.054	22,9
H'mong	3.103	16.031	20,4
Dao	973	4.172	6,4
Tay	3	14	0,1
Total	15.178	63.625	100

Source: Van Ho District Statistical Office

Similar to other localities, ethnic minorities in Van Ho district often live in separate areas, focusing on creating a community of villages and communes with characteristics of the community, different customs and practices make up a rich culture. The ethnic minorities here have a tradition of solidarity and attachment in the struggle, production and cultural exchange, forming and developing a diverse, rich and highly humane community culture.

4.2. Natural and socio-economic conditions affect on livelihood methods of ethnic minority households in Van Ho district, Son La province

Van Ho district has an important geographical position, considered a special gateway of Son La province and the Northwest mountainous region. The district center is 130 km southeast of Son La city, 170 km northwest of Hanoi capital. The district has national highway 6, which is the lifeline of the Northwest region, connecting the important economic region of the Northern Delta - Hanoi with the northwestern provinces of Vietnam and the northern provinces of Laos. With that geographical position, Van Ho district is considered as the gateway of a key economic region, bringing many livelihood opportunities for local people in general and ethnic minority households in particular.

Compared to other districts in Son La province, Van Ho district has a small population size and very low population density (in 2020: 64 people/km²). The total natural area stands at 98,288.90 hectares. In which, the agricultural land area is 19,495 hectares, accounting for 19.89% of the total natural land area, the non-agricultural land area is 3,428 hectares, accounting for 0.35% of the total natural land area. In particular, the unused land area is still very large with 23,462 hectares, accounting for 23.9% of the total natural land area. Besides, Van Ho district is located in the tropical climate zone, winter is usually cold and dry for some communes along the Da River, wet for communes along National Highway 6 and upland villages, and summer is usually cool and wet with lots of rain. Although surface water is very limited because the district is located on the limestone plateau, the district has many main streams with steep slopes suitable for irrigation development.

With these advantages in both topography and natural conditions, the livelihoods of ethnic minority households here focus mainly on agriculture and forestry with the average income at 1,700,000 VND/ month (*Van Ho District Ethnic Minority Office, 2020*).

In addition, thanks to agricultural development policies and many support policies for ethnic minorities, although the district was just established in 2013, over the years, the local economy has achieved many achievements. important results with an annual economic growth rate of over 10%. During the same period, agricultural growth was maintained at 3-4% per year.

Van Ho district is one of the important traffic areas on National Highway 6, from Van Ho can conveniently connect with Moc Chau district, Son La city, Hoa Binh province, Dien Bien province and Lai Chau province. This location has helped people in the district to trade, trade and move to other districts and provinces conveniently. Therefore, in recent years, there has been a change in the livelihood of the people here in general and ethnic minorities in particular with the form of hired labor in big city centers, industrial parks in districts and many other provinces and cities.

Van Ho district has diverse climatic conditions, characterized by low temperature, similar climatic conditions to famous tourist resorts in Vietnam such as: Sa Pa, Tam Dao, Ba Na, Da Lat, White horse... Moreover, because it has not been established for a long time,

Van Ho district still has a fairly large land area, and the unused land area is still relatively large. Van Ho district has 14 communes with 121 villages and sub-zones, in which the proportion of 2/3 villages and sub-zones still retains the cultural identity of the ethnic groups and becomes a community cultural village.

The preservation and combination of cultural identities from 6 ethnic minorities have created an attraction for many tourists, along with the propaganda and advocacy on the policies and development orientations of the leaders, that has created favorable conditions for people to initially exploit and develop tourism in recent years, creating momentum for socio-economic development and ensuring security and defense of the district.

In recent years, thanks to the social security, hunger eradication and poverty reduction policies, preferential credits for poor and near-poor households have been implemented, Van Ho district has focused on mobilizing all resources, with many practical solutions, effectively implementing the National Target Program on sustainable poverty reduction, contributing to improving people's living standards, reducing the rate of poor households remaining 25.5% in 2020. Although the percentage of poor and near-poor households is still high, this is also a significant result for a district with many poor communes, with a low starting point in terms of economy and society like Van Ho district. From there, it can be seen that the living standards of the people here are improving.

However, people in this area are facing many great challenges due to low education level, lack of jobs and low income. In addition, natural resources are being seriously degraded due to people cultivate unsustainable agriculture, forestry and aquaculture, the pollution level increases rapidly. This situation is becoming more and more serious under the impact of climate change in adverse directions such as droughts and floods. Infrastructure such as roads, irrigation, information, markets and clean water in this area are also not guaranteed. Except for the main road on National Highway 6, inter-village and inter-commune roads are still very difficult, especially in the rainy season. Although the locality has invested and supported the construction of concrete and asphalt roads, due to the complicated mountainous terrain, erosion and landslides lead to damage to roads, causing traffic delays and difficulties for people when moving. Not only that, the system of electricity, roads, and schools in communes and villages is still much slower than in other areas, making it difficult for people to find opportunities as well as maintain livelihood activities.

4.3. Survey results on livelihood methods of ethnic minority households in Van Ho district, Son La province

4.3.1. Research sample characteristics

Table 2. Research sample characteristics

Numerical order	Criteria	Size (person)	Ratio (%)
<i>I</i>	<i>Gender of household head</i>	<i>86</i>	<i>100</i>
1	Male	74	86,05
2	Female	12	13,95
<i>II</i>	<i>Ethnic minority</i>	<i>86</i>	<i>100</i>
1	Thai	44	51,2
2	Muong	24	27,9
3	H'mong	19	20,9

Source: Compiled from survey results

Survey results of ethnic minority households in Van Ho district show that male-headed households account for the majority (86.05%) while female-headed households account for only 13.95%. This reflects local realities and it is also characteristic of ethnic minority households that men are often the most important, have a higher voice and decision-making power than women in the family.

Regarding ethnicity, the sample size of the study with 86 households all focused on the Thai, Muong and Mong ethnic groups. In which, the Thai ethnic group accounted for the highest proportion 51.2%, the Muong ethnic group accounted for 27.9% and the rest was the Mong ethnic group accounted for 20.9%. Compare with the statistical results on the ethnic structure of the whole district (the Thai ethnic group makes up the majority of the population 41.8%, followed by the Muong ethnic group with 22.9% and the Mong ethnic group with the percentage. 20.4% while other ethnic groups account for a very low percentage (less than 15%). Thus, the ethnic structure in the sample size is relatively consistent with the ethnic structure of the whole district.

4.3.2. Survey results on livelihood methods of ethnic minority households in Van Ho district, Son La province

* Average income of ethnic minority households:

Figure 1. Survey results on Average income/person/month

Survey results in ethnic minority households in Van Ho district show that 46% of surveyed households have an average income of less than VND 1.5 million/person/month, up to 33% of households have an income of over 1.5 to 2 million dong/person/month, 16% of households have an income of over 2 to 4 million dong and only 5% of households have a good income above 4 million VND/person/month. According to the survey data on population living standards in 2021 of the General Statistics Office, the average income per person/month is about 4.2 million VND. Thus, up to 95% of ethnic minority households in Van Ho district have an income much lower than the national average. Moreover, the average income of Son La province in 2020 is about 1.8 million VND/person/month, the survey results also show that more than 54% of ethnic minority households in Van Ho district are lower than the average income of the whole province in 2020.

* Methods and sources of household income:

Figure 2. Survey results on household income sources

Many ethnic minority households in Van Ho district have very low income, while most of these households have at least two sources of income, mainly focusing on farming and ranching. Nearly 31.4% of surveyed households have an additional source of income from hired labor. This source of income has only arisen in households in the past 3 to 5 years and mainly focuses on households with young and healthy workforce. With this method, labors often have to look for jobs in other localities, in district centers, towns or industrial parks outside the province. Only about 10.47% of surveyed households have a fourth source of income from services, tourism or other sources. Thus, it can be seen that the method or source of income of households here is quite limited, and job opportunities are not many. This may also be one of the reasons for the low average income of ethnic minority households in Van Ho district.

5. Conclusion

Van Ho district is known as a newly established district, located at the gateway of Son La province and the Northwest region, it is considered as a district with an important geographical position, so it partly helps local people to opportunities to find jobs, diversify livelihoods, and increase incomes. However, this geographical location is mainly convenient for densely populated areas, near the national highway 6. While in communes and villages far from the center, away from the main road, ethnic minority households here are still maintaining their monthly activities with the average income of just under 1.5 million VND/person. With this income level, ethnic minorities here cannot ensure the minimum basic conditions for life in terms of food, education, health care and many other issues.

Part of the cause of poverty is the limitation of the livelihood methods of the ethnic minorities here, when their income is mostly focused on farming and ranching. The study also shows that 18% of households have an additional source of income from wage work, but only focus on households with a young population, many of whom are of working age. Despite the advantage of a large area of arable land, before the impacts of climate change and the current extremes of weather, these 2 livelihood methods are very unlikely to help them stabilize their lives.

vuhoangvdh@gmail.com

Bui Thi Thanh Thuy
buthuyeco@gmail.com

Center for Development of Community Initiative and Environment (C&E), Hanoi, Vietnam

Abstract

Urban development has often been unsustainable with multiple issues which negatively impact wellbeing. This paper argues that gardening could feasibly and effectively promote sustainability in Vietnamese cities and urban areas, drawing on existing evidence from the literature and works of community and non-governmental organisations. It first examines the need to promote sustainability in urban settings and the urgency of these needs. It then looks at gardening and how it could address this need. The potential for wider applications and the conditions required will also be discussed.

Keywords: *Gardening, Sustainability, Urbanisation, Urban, Vietnam*

1. Introduction

Urbanisation, the development of cities and towns and their population is a steady trend (McGranahan & Satterthwaite, 2014). In 2018, the urban population accounted for 55.3% of the world's total population, reaching 60.5% in 2030 and 68.4% in 2050 (United Nations, 2019). With fast-growing, dense populations, however, cities and towns are facing multiple challenges including overcrowded conditions, environmental degradation, persisting disparities, exclusion and isolation, crime, and violence (United Nations, 2020a; 2020b). There are rising concerns about safety, food security, access to basic, quality amenities and services, infectious disease, and substance use (Crume, 2019). As part of this trend, Vietnam is already facing all these issues (Kataoka et al. 2020; Nguyen, 2020; Nguyen & Trevisan, 2020; Vuong et al., 2021).

To address these challenges, the United Nations (2016) call for a comprehensive shift in approach to urban planning, development, governance and management aiming at prosperity and sustainability for all. Among identified transformative actions, there is a focus on people, community, inclusion, coordination of stakeholders in service provision, public spaces, and the environment including the ecosystem, natural resources, and climate change.

Gardening has been a well-proven measure addressing the multi aspects of urban sustainability (Cabral et al., 2017; Schram-Bijkerk et al., 2018). In Vietnam, however, urban gardening is diminishing due to the urbanisation process where land traditionally used for gardening has been converted for construction (Kurfurst, 2019). This paper sets out to

examine gardening and its applicability to promote urban sustainability in this new context. It first looks at the need to promote sustainability and its urgency and gardening as a way to address this need in urban Vietnam. It then discusses recent urban gardening efforts, their potential for wider applications and the required conditions for them.

2. Method

The authors draw on data from existing literature and secondary information sources on the relevant sub-topics as briefly introduced in the introduction. The following keywords are used urban, sustainable, sustainability, garden, and gardening for the google scholar search engine and Vietnamese social media to identify relevant literature on gardening for urban sustainability, current gardens and gardening practices and their sustainability in urban Vietnam. Information is also drawn from current urban gardening projects that research team members are involved/ aware of through their networks. Then, thematic analysis is conducted to develop themes under each sub-topic.

3. Results

3.1. Sustainability in Urban Vietnam

Urban Sustainability

Sustainability is the development that meets “the needs of the present without compromising the ability of future generations to meet their own needs” (World Commission on Environment and Development, 1987, p. 43). Sustainability requires a balance among economic, environmental, social, and other interests. Changes to existing destructive practices, relations and conditions are needed (Wright & Nyberg, 2015) to protect the environment, enhance the quality of life, equity and justice, and resolve social issues (Barbosa et al., 2014).

Urban sustainability shares the above goal and involves the process to achieve it by the urban community and its stakeholders. Connection and cooperation are developed in multiple dimensions (Bossel, 1998) with various aims to accommodate stakeholder diversity and appropriate mechanisms to manage conflicts and struggles (Barbosa et al., 2014). Solutions are developed to address the multiple environmental, economic, and social issues of urban settlements (Jabareen, 2006).

Urban Issues in Vietnam

Vietnam experienced rapid urbanisation in the past 30 years. The proportion of the urban population in the total population increased from 20.1% in 1989 to 34.4 % in 2019 (UNFA Vietnam, 2019), reaching 43.3% in 2029 and 58.2% in 2049 (Tong cuc Thong ke & Quy Dan so Lien Hop Quoc, 2016). Urbanisation has had massive negative social and environmental impacts. “Weak urban infrastructure networks, restricted access to clean water, a deteriorated environment, bad urban sanitation, flooding, unmanageable solid waste, traffic congestion” are common in big cities (Nguyen, 2020, p.2). Troubling health issues include insufficient physical exercise, poor diet changes, increasing rates of overweight and obesity, and increased alcohol consumption rate. Heart diseases, road injuries, diabetes, and cancers are major causes of death and disability (Nguyen & Trevisan, 2020). Urban disparities are rising and ethnic minorities, older people, people with lower education or no

skills, and farmers are most likely to be poor or have low income (Nguyen, 2020; Tong cuc Thong ke, 2021). They also have much more limited, if no access to quality health care services, housing and education (see Kataoka et al., 2020; Vuong et al., 2021; World Bank, 2015). Despite these, there is a concerning contented attitude of state officials and residents toward these issues (Dang et al., 2021).

The above impacts pose serious threats to economic growth and achievement, public health, and social coherence and stability. The negative multi-faced impacts are most severe for the poor and near-poor group given their low income and education and limited or no access to health services and other basic amenities. These, in turn, widen the social disparities which are associated with greater instability which could lead to economic and social breakdowns and crises, as demonstrated in the past depressions (Landsley, 2012) and past and current conflicts and wars (Justino, 2012). They also reduce capacities to cope and recover from disasters and catastrophes, as well demonstrated under the current COVID-19 pandemic (United Nations, 2020a).

Actions for Urban Sustainability

The need for actions toward urban sustainability is urgent to avert the ongoing destructive direction of urban Vietnam. There require solutions to existing issues and a transformation toward sustainability. In response to this need, the state has developed a national legislative and policy framework and criteria for urban sustainability reflecting Agenda 2030 and Sustainable Development Goals (SDGs) (Dang et al., 2021).

Working with the local authorities and stakeholders, Vietnamese civil and private sectors have created bottom-up movements and actions for urban sustainability. The Center for Development of Community Initiatives and Environment (C&E), for example, in partnership with education and research partners, district authorities and community groups, has been running initiatives to promote urban eco-lifestyles and eco-initiatives. C&E also conducted research to assess and monitor sustainability progress and develop policy recommendations. Vietnam Green Generation Network by Live & Learn and multiple environmental urban volunteer campaigns and activities by Go Green are among other civil society highlights.

The private sector creates and runs various sustainable urban business models. Among them are Hoian Kayak Tour and Sapa O'Chau for sustainable tourism. Sen Shop, Nana Shop, Susu Xanh Shop and 3T Shop work on sustainable distribution and consumption of agriculture and local handicraft products. Tan Bamboo Workshop focuses on the production and distribution of bamboo-based products. Kilometre 109 specialises in sustainable and indigenous-based fashion. An Nhien Farm and Thanh Dong Organic Farm are urban organic gardening models while Think Playgrounds work to build urban public playgrounds and community gardens.

While the above actions and moves are significant, more efforts are needed to achieve urban sustainability. The state measures are weak with questionable applicability. Implementation has been slow and scanty given the lack of contributions and full participation from local authorities, businesses, the civil sector, and the community (Dang

et al., 2021; Nguyen, 2020). This is due to the long-existing centralized power structure which also hinders equity and justice for marginalised groups (Ngo et al., 2018). Besides, most stakeholders do not have sufficient awareness and capacity for sustainable thinking and actions (Thong et al., 2017). Part of the urban population possesses basic, common-sense knowledge of sustainability but has contented attitudes toward the multiple issues and disparities in their living areas (Dang et al., 2021). All of these need changing.

3.2. Gardening as a solution to urban sustainability

Benefits of Gardening

Gardening has been a well-proven solution to urban sustainability. As it involves land use, food production and consumption, and human-nature interactions, it can offer multiple benefits. Specifically, the gardens harbour wildlife and biodiversity, conserve waters, sink carbon dioxide, improve soil structure, produce oxygen and reduce concentrated heat and air pollution. They produce safe food for residents and reduce their food costs and dependency on markets, therefore, increasing their resilience. They allow residents to connect and exchange with each other, reduce social isolation and bridge social gaps. Gardening connects humans with nature. It improves the physical and mental health of participants. It helps to support sustainable thinking and actions at individual and community levels. Besides, it enables the transfer of eco-knowledge and skills across people and generations. Schram-Bijkerk et al. (2018) summarise the benefits of urban gardening in the picture.

Benefits might vary across types of gardens. Gardens in office buildings focus on decoration and relaxation. Home gardens allow opportunities for creation, relaxation, and food growing (Dunnett & Quaim, 2000). Community gardens tend to have more multi-benefits, including both those offered by home and office gardens and social benefits such as enabling community bonding and socialisation. Such benefits, however, might not be visible in the short term because the garden gathers diverse community members and might need to deal with conflicts and struggles, which is typical for a sustainable process (Veen, 2015).

Some benefits could reinforce or be against each other, thus affecting sustainability. A reinforcement example is that community gardens strengthened neighbourhood bonds and identity thus encouraging participants to look for and adopt sustainable practices and engage in more community activities. In this way, they made a positive contribution to environmental protection and social development (Wagner & Payne, 2019). A conflict example is when gardeners introduced non-native plant species that became invasive to the environment or used synthetic chemical pesticides and fertilizers which harm the environment and people's health.

Gardening Conditions and Other Contributing Factors

The gardening conditions are significant for sustainability. Rapid urbanisation and associated construction have narrowed urban green spaces, thus limiting people's opportunities to engage in gardening. Furthermore, as home gardens are more common than community gardens, social and environmental benefits of gardening could be small and difficult to transfer across the community given the limits of social contact and social learning of sustainable practices in private gardens.

Gardening in such conditions would need to use and adapt to available public and private land and spaces, both indoor and outdoor. Public parks, vacant/ abandoned areas, flower beds, traffic islands, reserved spaces for public work, community playgrounds, spaces in public and community buildings, residential houses and business facilities all could be used. This means gardens could be on the rooftops, indoors, on windowsills, and balconies.

Climate, location, geography, topography, socio-economic-cultural situation and farming traditions can have important influences. Soil fertility and contamination, for example, would determine if food growing is safe and feasible. Food production is usually a priority in poor urban areas while greening and decoration are a priority in wealthy urban areas. Insufficient material and social resources could significantly limit people's gardening activities.

Other factors exist and can influence the sustainability of urban gardens. Among them are gardening's hazards and hazard-control measures (Lin et al., 2017), awareness, knowledge and skills of involved parties and their relationship and available funding, infrastructure and resources (Giraud et al., 2021; Tharrey et al., 2020; Wagner & Payne, 2019). Such factors could either support or hinder sustainability. For example, poorly controlled hazards could lead to health and safety issues for gardeners and residents or interpersonal conflicts would lead to failure of cooperation efforts in the local community for gardening.

3.3. Urban gardening in Vietnam and its sustainability

In Vietnam, urban gardening has been an ongoing practice throughout history but urban garden slots are narrowed or taken away for building, thus limiting the residents' ability to grow vegetables, fruits and bonsai for their families in big cities such as Hanoi given the rapid urbanisation (Kurfurst, 2019). Still, the need for green space in daily life continued to urge people to do gardening in multiple types and forms using their homes and business spaces. Such practices have been observed in Vietnam urban and are captured briefly in the following photos.

Home and business gardening

Like elsewhere, home and business gardening depend much on the gardeners who decide on what types of plant species to grow and how to take care of them. This is connected to their knowledge and belief about gardening, such as how to grow, care for, and harvest different plant species and maintain gardens, the benefits and impacts of gardening, and gardening conditions and what they do to the gardens. Besides, existing resources such as plant nurseries, fertilizers and pesticides are also important which will condition their gardening. All of these would influence how such types of gardening contribute to urban sustainability. For some roof gardens, for example, water use and management cause leakages damage the buildings underneath and the gardens end up being removed. Currently, most fertilizers and pesticides supplied are chemicals and uncontrolled. This raises concerns about health and safety and environmental pollution. Furthermore, home and business gardens miss the various social benefits of community gardens, thus contributing less to community and social development.

Community Forest Garden(ing) (CFG)

Community forest gardening (CFG) is a new trend with more advantages for sustainability. A forest garden is a unique combination of forest trees and plants, also known as an agroforestry combination. With this model, the garden manager does not need to spend a lot of time taking care of the plants, and the plants and the natural ecosystem in them grow and develop themselves. The multi-layered canopy structure of the forest garden creates an ecosystem that contributes to a diverse, healthy, and abundant food source for humans. The community nature of the gardens enables community building and bonding and various positive interpersonal activities. Two gardens of this type, Xóm Phao and Bờ Vỡ in Hanoi demonstrate all these advantages with significant economic, social and environmental benefits for the community and various groups including the poor, marginalized, and disadvantaged.

Xom Phao CFG was built on an abandoned area that was occupied by the homeless, low-skilled labourers and their families by the accretion of the Red River in Ngoc Thuy ward, Long Bien district. The state leased this land lot to an elderly person in this community, Mr Nguyen Dang Duoc. Mr Duoc used to live on a boat along the banks of the Red River for decades. He and his neighbours realized the need for a play space for their children, so they called for the support of social organizations. With a small fund, the community, several NGOs and social enterprises built a forest garden of about 100 square meters and added a nearby playground space where children can dig the ground, do mud play, play with recyclables seesaws and other types of adventure. The playground also has a small library, with books donated by garden visitors. The garden hosts a variety of medicinal plants, shrubs, vines, rooting trees, low canopy trees, and overhanging fruit trees. Currently, Mr Duoc and Xóm Phao residents run the garden as a semi-free service. Children can use the playground, plant trees in the garden, and learn about agriculture for free, while adults are charged a token fee equivalent to US\$1.

Bo Vo CFG was developed on an unoccupied land area along the Red River in Bờ Vỡ, Chuong Duong Ward where illegal garbage dumping and land encroaching were

common with negative impacts on residents. To improve this situation, Chuong Duong ward authorities and social organisations such as the women's union mobilized residents and volunteers to clean the area and establish a community forest garden. Due to the complication of the land, which was filled with over three meters of deep garbage, the garden took more than four months to complete. After the garden is open to the public, it is placed under the management and regular care of the Women's Union of Chuong Duong ward. The garden is currently about 200 square meters, with an orientation to allow for further expansion. It is located in a spacious area with many facilities, such as a relatively convenient access road and has the potential to be a public park.

Zero-Waste Gardening (ZWG)

ZWG is part of the zero-waste community which is also recently developed, aiming at reducing landfills via waste management where the community garden plays an essential role. Organic waste from households and other human activities is directly managed on the garden site using its ecosystem and provides nutrition for garden plants. The garden produces foods and materials for daily life activities. It is a site for community communication and education and provides space for multiple community events and activities.

Morrison Street ZWG is an example. Located in An Hai Bac ward in Danang, the garden incorporates a zero-waste management procedure which is operated by local women. There is a café and vegetarian catering service with pop-up kiosks demonstrating a waste-conscious business model. This model has an on-site waste management system and uses the garden-grown herbs for its services, thus directing 16% of its net income to the project. The garden is open for public visitors and achieves financial sustainability thanks to the contribution from the business and visitors.

The garden is made possible under a zero-waste project led by C&E with funding from the European Union and sponsorship from GreenViet and Gustav-Stresemann Institute. It partners with the local authorities, civil society organisations (CSOs), local businesses, young people and youth networks, local women and households in the area in all stages who commit significant resources and build strong partnerships.

The garden promotes community development, young development, and gender equity. Community development is promoted through communications and education activities and diverse environmental and cultural events. Youth are involved in project decision-making and implementation. Women as the key participants are empowered with capacity training on waste treatment (such as waste classification and composting), communications, gardening, and opportunities to raise their voices.

Barriers and Success Factors of FCGs and ZWGs

The key success factors include firstly the creative use of abandoned/ vacant land which has enabled these gardens. Secondly, there are strong support and contribution from local people who are the main beneficiaries along with other city residents who want to have a place for their getaway, to visit and experience the forest garden model. In these gardens, the local people help with ground preparation, garden development, maintenance and protection, e.g. keeping them from becoming a place to dump garbage or be used for other

purposes. Thirdly, the contribution of CSOs is essential. They provide the required technical support in design and implementation to ensure that the gardens cater to the diverse needs of different groups while incorporating features to benefit the environment and reducing startup and running costs. For Bo Vo CGF and Morrison Street ZWG, the management and care are more regular thanks to the support of local authorities and the commitments of involved stakeholders including members of the community.

These gardens face different barriers. Xóm Phao CFG suffers from funding and human resource shortages and access issues. Because the area is accreted land, it is not under the management of any local administration, so no public funding is available. Access is also an issue: to get to this area, one must go through a steep stairway from Chuong Duong bridge. In terms of management, Mr Duoc, the leaseholder, is getting older and finds regularly care of the garden increasingly difficult. Future leaseholders might want to use the land for different purposes and terminate the garden.

The key issues of Bo Vo CFG are vandalism by individuals who used to dump rubbish or encroach on the land. This occurred to the garden's facilities' several times during the construction process with low intensity, causing damage to the bamboo slats surrounding the garden, prolonging the construction process and creating stress for participants. This, however, ended after the garden was completed.

The key issues for Morrison Street ZWG lie firstly in the requirements of the waste management procedure, including daily garbage sorting and collection. This requires a higher level of awareness and commitment from residents. Besides organic waste could decompose quickly in hot weather, create a bad odour, and attract flies which are nuisances that some people would find hard to get used to. Thus, more engagement, education, and awareness-raising efforts are needed. Secondly, the project is CSO-initiated so it takes time and effort to engage and gather support from other stakeholders including local authorities, businesses, and the community and gain their commitment. Diverse partners have diverse time schedules, commitments, needs, and orientations. This requires negotiation and compromise among parties to reach an agreement. Thirdly, the project initially plans to rely on volunteers for implementation. However, it turns out that volunteers are short of certain skills such as construction skills so there are more costs involved to do these tasks. More efforts have to be taken to secure funding from possible sources to add to the original limited fund.

4. Discussion and Conclusion

Existing gardening models currently developed in urban Vietnam have many similarities to those in the literature, particularly about people's willingness and engagement with urban gardening and adopting gardening to fit their living conditions. It demonstrates the different benefits between community and private gardening. It also confirms the importance of the private gardeners' perceptions and practices on gardening and their resources and materials to sustainability.

Private gardening is promising for urban sustainability in Vietnam. However, there is a need to fill in gaps in awareness, knowledge, skills and resources/ materials for gardeners so that home and office gardening can be sustainable. Public campaigns, state policies,

training, and technical support are known measures to motivate people and regulate the gardening markets to ensure sustainability in urban gardening and agriculture in general.

The CFG and WFG models possess similar barriers and success factors identified in the literature. They include the previously discussed space and environmental constraints (Lin et al., 2017). The lack of gardening knowledge and skills and awareness of gardening opportunities, time shortage, health problems and clashes with other gardeners might hinder participation (Tharrey et al., 2020; Wagner & Payne, 2019). No or insufficient support from local authorities which is linked to the lack of motivation and awareness of public officials and management can lead to a funding shortage, limited or no access to green spaces or short-lived projects (Hippolyte de Bellefroid, 2018). Other barriers are the lack of participation from stakeholders, especially the poor and marginalized group (Andal, 2022), insufficient or lack of funding and infrastructure (Giraud et al., 2021), and poor public communication and organisation (Wagner & Payne, 2019).

The CFG and WFG have great potential for urban Vietnam given all the benefits that they entail. These models could be applied widely across cities and urban areas, utilizing vacant/unoccupied land. For them to succeed, careful consideration of the cultural, economic and social settings and the gardening conditions is required in designing and developing gardens and gardening activities. Soil properties and contamination levels should be surveyed to determine suitable plant species (Wagner & Payne, 2019) or ways to improve the soil to make it suitable for certain plant species. Possible hazards and ways to mitigate risks should be considered. Proven strategies could be used to deal with issues and constraints such as making use of any available and possible spaces and innovative gardening models to resolve the green space limits (Lin et al., 2017). This could be done with technical expertise support.

The involvement and support of various stakeholders are important along with a facilitating/ coordinating agency. The community, authorities, and other stakeholders should have sufficient gardening knowledge and awareness and participate fully. Capacity building could be done via campaigns, education, training and technical support. A genuine participatory approach in design, planning and implementation could engage the community and stakeholders and support them to contribute properly (Mancebo, 2018) and cooperate well (Luetz & Beaumont, 2019). Good organisation and SMART targets are also important. Facilitators could be helpful to supervise and provide support in the related processes, including conflict management (Tharrey et al., 2020). Attention should also be paid to specific barriers in each area.

At the macro level, policy-makers should adopt the sustainability approach in dealing with cities and urban areas to facilitate urban gardening for sustainability. This includes attending to the poor and marginalized and their potential contribution (Andal, 2022) and promoting community participation (Tharrey et al., 2020). Community gardens should be created and maintained in the long term, especially in the most disadvantaged and vulnerable urban areas (Egerer et al., 2018). There should be changes to land use regulations to allow unused land to be used for gardening, mapping urban gardens, features, benefits, and issues, and monitoring and evaluating their impacts for public use (Lin et al., 2017).

The paper provides a broad picture of gardening as a solution to urban sustainability and reviews existing gardening models in urban Vietnam, barriers and success factors, and their potential for further application. Further studies would be beneficial, for example, on specific aspects such as the knowledge and practices of urban gardeners and the participation of different groups in gardening, or the quantitative contribution of different types of gardens to the environment, economy and society. They would fill in the knowledge gaps and provide evidence for better interventions. Besides, ongoing monitoring and evaluations are needed for suitable solutions to arising issues given the continuous evolvement of forms and practices of gardening and interventions for sustainability.

FACTORS AFFECTING THE LINKING SUSTAINABLE TOURISM IN THE NORTH CENTRAL REGION

Le Van Vien

levien.hunre@gmail.com

*PhD candidate at National Economics University,
Hanoi University of Natural Resources and Environment*

Abstract

Tourism is a dynamic and competitive industry that requires the ability to adapt to the needs and wants of customers as customer satisfaction, safety, and enjoyment are the primary focus of the tourism business. Tourism activities and tourism business also take place on a large scale, requiring the parties' cooperation in organizing tourism activities, business, and tourism management. The study uses the PLS-SEM model to determine the factors affecting sustainable tourism linkages in the North Central region. The test results identified five elements (1) Tourism products; (2) Branding strategy; (3) Human resources; (4) Transportation infrastructure; and (5) Government policy that has an impact on sustainable tourism links in the North Central region. From there, the study offers several solutions to develop sustainable tourism links in the North Central region.

Keywords: *Linking tourism, Sustainable tourism, Linking sustainable tourism.*

1. Introduction

In the development trend, tourism is increasingly valued in the economic balance of countries worldwide, including Vietnam. However, rationally exploiting and ensuring the long-term sustainability of tourism resources needs to be considered. Tourism development needs to rely on two factors natural resources and human resources. If one of these two pillars is lost, tourism faces the risk of a severe recession. Therefore, to develop tourism, one of the most effective solutions that many countries worldwide have chosen is "sustainable tourism development." The sustainable development of a country, in general, must be ensured uniformly and simultaneously in all three aspects: economic, socio-cultural, and environmental.

In our country, the concept of sustainable development has only been approached since the 1980s, confirmed during the country's socio-economic development from 1991 to 2000 and through policies over the years. The 10th, 11th, and 12th National Party Congresses have become critical orientations for industries, including tourism. A clear understanding of sustainable tourism, evaluation criteria, and factors affecting sustainable tourism development is essential for the next steps in the tourism industry. This is even more important when Vietnam has a vast tourism potential with the advantages of natural scenery and many attractive destinations for domestic and foreign tourists, but cannot avoid common problems tourism, especially environmental protection.

1.1. Sustainable tourism

Nowadays, tourism has become a widespread socio-economic phenomenon in developed countries and developing countries, including Vietnam. However, the perception of tourism content has not been unified so far (Winter, 2007). Due to different circumstances and research angles, different organizations and individuals have different understandings of tourism (Telfer, D. J., & Sharpley, R, 2015).

Tourism is the activity of people going to a place outside the environment regularly. For some time, less than the time prescribed by the tourism organization, the purpose of the trip is not to carry out monetization activities within the visited area.

Tourism means activities related to people's trips outside their regular places of residence for no more than 01 consecutive years to meet the demand for sightseeing, relaxation, entertainment, research, and discovery of natural resources. Tourism resources combine with other lawful purposes (Camilleri, M. A, 2018).

Tourism is a dynamic and competitive industry that requires the ability to adapt to the needs and wants of customers as customer satisfaction, safety, and enjoyment are the primary focus of the tourism business. The development objective of the tourism industry is to contribute to the improvement of the quality and variety of tourism products and services in the target destinations to increase the number of tourists, foreign currency income, and employment (Trauer, B., & Ryan, C, 2005; Medlik, S, 2012).

Tourism development is a concept that refers to the process of moving from low to high, from simple to complex, from less complete to more complete, of activities related to people's trips abroad. Residence to meet the needs of sightseeing, relaxation, entertainment, research, the discovery of tourism resources, or other lawful purposes (Bærenholdt et al., 2017)

The criteria for tourism development are also in the general socio-economic development criteria (Berno, T., & Bricker, K., 2001; Akama, J. S., & Kieti, D., 2007). Accordingly, tourism development is the process by which state agencies, business units, and organizations work together to promote tourism development, create jobs, and improve the living standards of local people. The development of tourism also needs to ensure factors for development, including (i) rational exploitation of tourism resources based on research, selection of attractive tourism resources, building into specific tourism products, main tourism products, and complementary tourism products; exploit tourism resources suitable to local and regional characteristics; exploit tourism resources in parallel with the restoration, embellishment, and protection of resources, preserving and promoting traditional cultural values; (ii) ensure economic benefits for stakeholders including the community, investors, businesses. At the same time, ensure close and equal links between localities participating in the supply chain of tourism products; (iii) protection of the natural and social environment in tourist sites/spots/routes; exploiting tourism resources in parallel with investing in activities to protect the natural and social environment in tourist sites/spots/routes (Tien et al., 2019).

Sustainable tourism minimizes costs and maximizes the benefits of tourism for the natural environment and local communities and can be implemented in the long term without adversely affecting livelihoods (Lansing, P., & Vries, P. D., 2007). On which tourism depends.

Sustainable tourism is environmentally responsible travel and visits to natural areas to enjoy and appreciate nature (and all its accompanying cultural features, be it in the process). Full consideration should be given to current and future economic, social and environmental effects to address the needs of visitors, industries, the environment, and host communities.

Sustainable tourism development is tourism development that simultaneously meets socio-economic and environmental requirements, ensures harmony between the interests of the subjects participating in tourism activities, and does not harm the ability to meet the needs of tourism in the future (Bukola, A. A., & Olaitan, L. L., 2018; Tien et al., 2021).

1.2. Linking tourism

Tourism is an integrated economic industry involving many sectors and many parties. Tourism activities and tourism business also take place on a large scale, requiring the parties' cooperation in organizing tourism activities, business, and tourism management (Tien et al., 2021).

Tourism area links include regional links and regional links. Intra-regional linkage is the cooperation, support, and assignment between sub-regions (if any), sub-regions, and localities in the region based on the comparative advantages of each sub-region (if any), sub-regions, and each locality to successfully implement the strategic orientations of tourism development of the sub-regions, sub-regions, and localities in the region. Inter-regional linkage is the cooperation and assignment between tourist regions based on the comparative advantages of each part to successfully implement strategic directions for tourism development, actively contributing to promoting tourism development (Lansing, P., & Vries, P. D., 2007). The calendar of the tourist areas themselves. Usually, the inter-regional linkage is made between two regions with adjacent boundaries. According to the author, tourism region linkage is the cooperation and assignment between the parties involved in several key areas of tourism development, including cooperation in reallocating resources and adjusting development planning to suit the needs of tourists (Amerta et al., 2018). Suitable to the strengths of each locality in the region, in each development stage; linking in the development of tourism products, especially products typical of groups of localities, of sub-regions in the province or between two adjacent tourist areas; associate in promotion, promotion and development of destination brands and tourism products; link and establish unity in regional tourism space (system of points, tourist routes) through the development of infrastructure connecting the territory; association in training and development of human resources; cooperate in mobilizing investment capital and formulating mechanisms and policies to invest in developing the region's general tourism; cooperate to improve the business and investment environment, enhance the competitiveness of tourist areas; cooperate in building an information system and exchange tourism information to serve the tourism development goals of the region; cooperation in environmental protection for regional environmental issues, disaster response and climate change in tourism (Engels & Job, 2005). Sub-regional linkage is the connection of territorial units belonging to tourist areas. However, some link-specific content for sub-regional links is not specified. However, linking regions and tourism sub-regions will be very difficult without an organization in charge of managing the tourism activities of the area and each sub-region. This also means that no specific actors will represent regions and sub-regions participating in the linkage.

Therefore, regional and sub-regional linkages sometimes only mean "symbols" and "ideas" in the tourism development planning of tourist areas, especially transport connections.

From the perspective of consuming tourism products and services, tourists often consume many different types of products and services, from products with specific characteristics of tourism, such as hotels, restaurants, and tours, to complementary products, which may be locally common goods.

1.3. Linking sustainable tourism

1.3.1. Tourism Products

Modern tourism theory refers to a new element in the composition of tourism products: the element of the experience. The experience dramatically affects the perception and image of tourists about tourism products (Liu, Z., 2003). It is necessary to study the methods of combining services to create a richness in the visitor's experience and bring an impression and difference to the region's tourism. Combining a variety of modern and traditional modes of transportation in one travel is one of the most suitable forms of linkage. It links industries and fields with strengths to build specialized potential tourism products. Applying the bases and characteristics of the vital sectors in the region to research and develop combined tourism products is an effective exploitation direction. The industries' production processes are also exciting sights for many groups of tourists (Müller, H, 1994). The joint tourism development program contributes to linking management and administration, training human resources, designing tour routes, exploiting tourism products, and promoting and promoting development: cluster tourism and tourism in each province. The joint tourism development program creates a driving force for tourism development for localities. At the same time, the linkage between localities has brought efficiency and cost savings while still ensuring the quality and scale of the programs (Nguyen, T. Q. T et al., 2019).

Affiliate activities aim to create products for visitors to visit, learn about many fields many tourist attractions, and participate in many different activities in a tourism program. It is necessary to study the formation of several tourism products in general linkages suitable to the region, such as the link between cultural learning with visiting historical sites and linking activities to learn about the history of formation and development. Regional development. With the system of specific tourism products being fully developed, many linkage methods need to be studied to create integrated tourism products that attract tourism programs. High competitiveness in the market. For these general tourism products, it is also necessary to pay attention to the product's consumption ability and the tourist's enjoyment ability, avoiding putting too many activities and purposes in a short visit time. Reduce the visitor's ability to experience each exercise; on the other hand, it cannot create highlights in each product detail.

1.3.2. Branding strategy

Affiliate sustainable travel, connecting events and festivals of each locality in the region to create a series of regional tourism events to attract tourists, especially in critical markets with high economic efficiency; organize tourism investment promotion forums throughout the area to promote foreign investment attraction, especially investment from transnational tourism business groups; promoting the establishment of an electronic portal, building a database of tourism and related fields, establishing a brand, and forming a

specialized tourism newspaper for general use in the whole region. Research to develop and position the image of tourism in the entire area in the market and investors (Timur, S., & Getz, D, 2009). Coordinating with state management agencies in charge of tourism, tourism enterprises, and regional tourism associations to promote and provide information to tourists at destinations; supporting each other in promoting specific tourism products of the region and each locality in the area; complete the regional tourism investment promotion system; create linkages and coordination between state management agencies in charge of tourism and tourism businesses, while ensuring harmony between the interests of each locality and promoting the joint tourism synergy of the whole country. Develop and regularly update a regional database on fundamental tourism development indicators, including the number of tourists (international and domestic); average expenditure and days of stay, the number of direct and indirect workers; total investment in tourism development (scale, structure by sectors and mobilized sources), compared with other tourist regions and the whole country. Exchange of socio-economic information among localities in the area on development situation, difficulties, and problems, requests for support and cooperation; study tourism development models and lessons learned from countries and territories around the world. Regularly organize exchange activities, exchange learning experiences between localities, tourism businesses, tourism associations in the region on professional activities, state management activities in tourism, tourism activities, tourism activities, tourism activities. Tourism development conferences and seminars to promote tourism advantages of each locality, each sub-region, and the whole region in the most effective way.

1.3.3. Human resources

Focus on training and developing human tourism resources, exceptionally high-quality vocational workers, and attracting highly qualified human resources, especially leading domestic and international experts working in tourism training institutions in the region. Strengthen linkages between training institutions, vocational training institutions, tourism enterprises, huge tourism groups, and enterprises to rapidly increase the scale and improve the quality of vocational training. At the same time, focus on high-quality vocational training according to the orders of businesses and national tourist areas in the region. Promote cooperation in training through various forms of association, linkage, and connection between training institutions, tourism research institutes, and related fields in the area and inter-region to open more specialties (Lordkipanidze, M et al., 2005). New training sectors, advanced training programs to exploit the resources of qualified and experienced teachers and lecturers; make use of existing facilities; exchange textbooks on scientific teaching methods to effectively develop highly skilled tourism human resources for the whole region. Focus on investing in reputable training institutions to form a high-quality human resource training system for the area and the country (Choi, H. S. C., & Sirakaya, E., 2005).

1.3.4. Transportation infrastructure

Cooperate in building a unified tourism space based on connecting tours, routes, zones, and tourist spots to develop diverse types of tourism (visiting, healing, ecology, extreme sports, etc.); exploit and preserve the natural and cultural heritage of the region; forming regional destinations with high competitiveness domestically, regionally and

internationally; linking key areas, national tourist zones, and spots, and urban areas in the region; establish a chain of tourism events in the region such as festivals, international cultural festivals, typical national festivals (Choi, H. S. C., & Sirakaya, E., 2005). To build new and modernize several international fairs, conventions, seminars, and general sports areas in localities in the region with sufficient infrastructure conditions and standards to organize cultural events, sports, tourism, and entertainment of regional and international stature. I am completing the tourism infrastructure system, especially the transport system for each locality in the region, connecting with the inter-regional, regional and international traffic systems and focusing on finding mechanisms for investment and development, and creating a breakthrough in the promotion and implementation of projects of significant influence, creating links in tourist areas. Based on the approved planning, localities in the region shall coordinate to build and perfect a regional tourism technical facilities system such as hotels, restaurants, and entertainment spots, forming a tourism system—synchronous technical facilities for tourism on a regional scale (McKercher, B., 2003). At the same time, upgrade traffic axes connecting with economic corridors and international border gates. Coordinate with Vietnam's national airline in promoting the opening of direct international routes to international airports in the region; opening more domestic routes connecting cities in the area with each other and with the national tourism center.

1.3.5. Government policy

Coordinate the development of regional policies and mechanisms for investment in tourism infrastructure and technical facilities, especially amusement parks and typical and high-quality shopping areas based on that facility is unified in planning specific tourism products of the region based on the advantages of each locality in the region (Ruhanen, L, 2013; Lee, T. H, 2013).

Therefore, the study hypothesized:

- H1: Tourism products have a direct impact on linking sustainable tourism.*
- H2: Branding strategy has an immediate effect on linking sustainable tourism.*
- H3: Human resources have a direct impact on linking sustainable tourism.*
- H4: Transportation infrastructure is having a direct impact on linking sustainable tourism.*
- H5: Government policy is having a direct effect on linking sustainable tourism.*

Figure 1. Model research

Source: Author suggests

2. Method

2.1. Research sample

According to Hair et al. (2014), the research sample is a significant factor in ensuring the research's quality. The minimum sample size should be ten times the maximum number of arrowheads pointing at a latent variable anywhere in the PLS path model (Hair et al., 2014). We collected 350 samples of survey questions from different managers of tourism companies in the North Central Region.

Table1. Respondent information

		Frequency	Percent (%)
Gender	Male	186	53.14
	Female	164	46.86
Age	21-30	35	10.00
	31-40	125	35.71
	41-50	136	38.86
	51-60	45	12.86
	60+	9	2.57
Occupation	State cadres	58	16.57
	Business	184	52.57
	Lecturer/Researcher	65	18.57
	Others	43	12.29

Source: Author's calculation

The survey and interview subjects included two groups of subjects: (1) experts (that is, tourism experts working at universities, research institutes, and state management agencies both at the central and local level, businesspeople, tourism business staff; (2) tourists (domestic and international visitors)

For the expert group, it is expected that the number of questionnaires and interviews will be 100 votes. Experts are selected selectively to ensure accurate information is collected. On the other hand, subjects were interviewed in many different locations rather than focusing on one place and different occupations to obtain diverse demographic information.

For tourists, 250 tickets are expected for both domestic and foreign visitors. The time to collect tourists' opinions chooses the time when it is crowded at tourist attractions in the North Central region. The principle of selecting tourists to interview randomly. (See Table 1)

2.2. Data analysis

Our research has provided empirical evidence for a framework that identifies critical aspects of linking sustainable tourism. After collecting the survey questionnaires, the data was encrypted, cleaned, and then imported into SPSS for reliability analysis and EFA discovery factor analysis. Then, we used a comprehensive, valid, and reliable tool (SPSS 26 and SmartPLS 3.0 software) to evaluate rigorous statistical tests, including convergence validity, discriminative validity, reliability, and AVE, to analyze and verify the gathered data the hypothesis developed.

3. Results

3.1. Reliability and Validity of Model

Construct validity, determined through the presence of convergent and discriminant validity, demonstrates how well the measurement items related to the constructs. To confirm convergent validity, we used three tests: item reliability, composite reliability, and AVE. Cronbach's alphas also provide evidence of composite reliability, and values above 0.6 demonstrate that it is adequate. Table 2 showed that all the composite reliabilities for our constructs were above 0.7, and all the Cronbach's alphas were above 0.6. The AVE represents the number of variances a construct captures via its items relative to the number of variations due to measurement error. We found that each construct's variance extracted was above the recommended value of 0.5 (Hair et al., 2016).

Table 2. Construct Reliability and Validity

	Cronbach's Alpha	rho_A	Composite Reliability	Average Variance Extracted (AVE)
Tourism products	0.877	0.880	0.916	0.731
Branding strategy	0.810	0.820	0.875	0.638
Human resources	0.885	0.892	0.920	0.743
Transportation infrastructure	0.854	0.862	0.902	0.698
Government policy	0.824	0.827	0.883	0.654
Linking Sustainable Tourism	0.891	0.893	0.915	0.606

Source: Author's calculation

Thus, we have concluded that all our constructs had satisfactory convergent validity. For testing the discriminant validity, we used two tests for discriminant validity: comparison of item loadings with item cross-loadings and comparison of the variance extracted from the construct with shared variance. Each item should load more highly on its intended construct than other constructs. The leading coefficients larger than the correlation coefficients in the same column (Fornell-Larcker matrix coefficient) have satisfied the condition suggested by Henseler et al. (2015). The result from Table 3 showed that all items met the requirement of discriminant validity.

Table 3. Discriminant validity (Fornell-Larcker Criterion)

	Branding strategy	Government policy	Human resources	Linking Sustainable Tourism	Tourism products	Transportation infrastructure
Branding strategy	0.799					
Government policy	0.648	0.808				
Human resources	0.636	0.801	0.862			
Linking Sustainable Tourism	0.716	0.742	0.777	0.778		
Tourism products	0.712	0.613	0.623	0.765	0.855	
Transportation infrastructure	0.676	0.669	0.668	0.819	0.709	0.835

Source: Author's calculation

3.2. PLS Structural Model Results

We next examined the overall explanatory power of the structural model. We explained the variance by the independent variables and the magnitude and strength of its paths, where each of our hypotheses corresponds to a specific structural model path. We used R Square Adjusted to measure the model's explanatory power, interpreted similarly as regression analysis. The analysis revealed that the structural model explained about 80.3% of the variation in linking sustainable tourism, suggesting that the structural model provided an adequate explanatory (see Table 4).

Table 4. R Square

	R Square	R Square Adjusted
Linking Sustainable Tourism	0.806	0.803

Source: Author's calculation

To evaluate the structure model, we conducted the test with a sample size Bootstrapping N = 5000 (Henseler et al., 2015). With p-value <1%, 5%, and 10%, the proposed hypotheses are considered statistically significant at the 99%, 95% and 90% reliability levels. The result is as follows:

Table 5. Hypothesis results

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (O/STDEV)	P Values	Hypothesis results
H1: TP→LST	0.227	0.224	0.040	5.613	0.000	Supported
H2: BS→LST	0.077	0.080	0.035	2.172	0.030	Supported
H3: HR→LST	0.269	0.269	0.045	6.006	0.000	Supported
H4: TI→LST	0.365	0.366	0.042	8.603	0.000	Supported
H5: GP→LST	0.093	0.080	0.035	2.001	0.046	Supported

Source: Author's calculation

The result from Table 5 and Figure 2 indicates that three in 5 hypotheses in our conceptual model are fully supported. H1 shows that tourism products have a positive relationship with linking sustainable tourism ($\beta = 0.227$, $t = 5.613$, $P < 0.000$). H2 shows that branding strategy has a positive relationship with linking sustainable tourism ($\beta = 0.077$, $t = 2.172$, $P < 0.030$). H3 shows that human resources have a positive relationship with linking sustainable tourism ($\beta = 0.269$, $t = 6.006$, $P < 0.000$). H4 shows that transportation infrastructure has a positive relationship with linking sustainable tourism ($\beta = 0.365$, $t = 8.603$, $P < 0.000$). H5 shows that government policy has a positive relationship with linking sustainable tourism ($\beta = 0.093$, $t = 2.001$, $P < 0.046$).

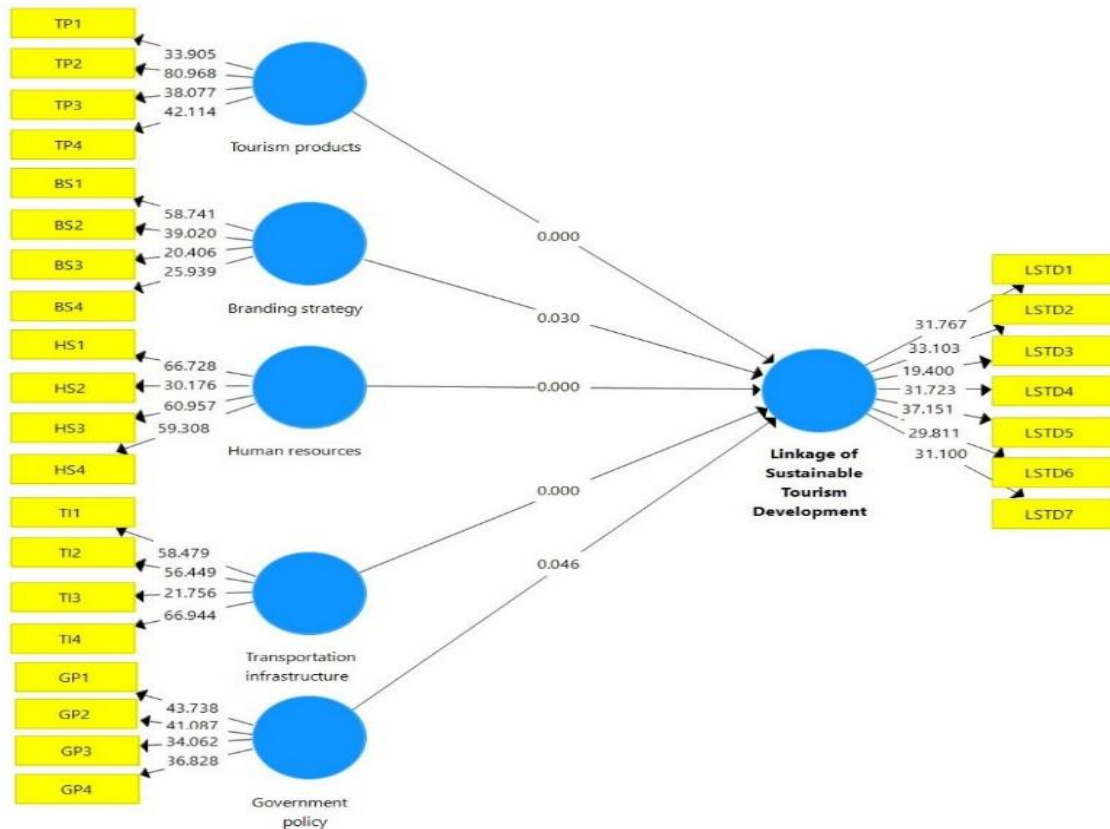

Figure 2. Research model results

Source: Author's calculation

4. Discussion and Conclusion

Although the tourism association program in the North Central provinces has initially been formed, the coordination on many important contents has not been implemented or qualified for implementation. The joint activities are mainly based on the annual meeting mechanism of the Steering Committees. The linkage programs still lack institutions and policies on regional linkage, and there is no effective mechanism for creating connections and implementing coordination commitments. Commitments between member provinces and localities, and businesses lack legally binding, mainly based on the voluntariness and awareness of the parties. Therefore, in some activities, the coordination between localities is still formal and administrative. On the other hand, the programs are challenging to operate due to the lack of resources (human resources, funding, and essential facilities).

The coordination between localities in implementing policies and plans for tourism linkage still emerges with many problems. The "strong, everyone runs" situation between provinces creates competition and racing to attract investors. Investors compete to "roll out the red carpet" to invite investors to their locality. Many forms of incentives are applied (tax reduction, land tax reduction, and even reduction of environmental conditions), reducing the benefits of overall tourism at the national level and in each tourist area and each locality in the region. According to the province in our country today, that is also the consequence of the thinking, management mechanism, and budget decentralization. Due to the lack of a

policy mechanism that is inter-regional and sub-regional by the specificities of the whole region and each sub-region, a joint governance institution for coordination on a global scale has not yet been established. Therefore, tourism activities are still basically closed in each locality. Due to weak linkages, tourism in the North Central provinces has not yet formed real growth poles that are strong enough to attract and spill over to other localities. Many tourist centers in the heart of the city have a new growth potential in the form of potential but have not yet been invested into the strong points of the region and sub-region, so they lack the spillover effect; There is no close link between the North Central region and national tourism centers and relations with neighboring countries such as China, Laos, Thailand and countries in Southeast Asia.

In the coming period, the view of the region's advantages and tourism resources in the international integration environment needs to change. This must be considered a property belonging to humans, the nation, not the locality in the region. The exploitation and enjoyment must be based on the global vision, within the national framework, in the regional and inter-regional linkages, at the international and national levels. To achieve that goal, businesses in the region need to take several measures as follows:

Firstly, develop a diversified tourist market, and promote the simultaneous development of domestic and international tourism. The domestic tourism market focuses on beach resort guests and source tourism. , weekend break, and spiritual festival; To encourage the development and expansion of the eco-tourism and official-duty tourism markets. As for the international tourist market, vigorously develop the almost Southeast Asian market, especially the needs in the East-West and Northeast Asian economic corridors, Increasing exploitation of traditional high-end markets from Western Europe, Northern Europe, North America, Oceania...

Second, focus on developing unique and diverse tourism products suitable to market needs, ensuring environmental and ecological sustainability. Based on the region's natural resource advantages, focus on developing cultural and historical tourism products to effectively exploit the region's world heritage system and cultural, historical - revolutionary relics; build beach resort tourism products. Diversify products to overcome the seasonality of tourism activities. Strengthen linkages to develop tourism products between localities in the area and neighboring localities such as Da Nang, Quang Nam, Ninh Binh, and other countries on the East-West Economic Corridor.

Third, increase the attraction of investment in tourism development: Having an appropriate investment strategy to promote the efficiency of investment capital, creating a favorable investment environment for development commensurate with its role as one of the vital economic sectors. Invest in building a system of high-quality, high-class, synchronous tourism facilities (accommodation, entertainment-sports facilities, means of transport, tourist service facilities, etc.). Other travel plans) to qualify to serve the needs of high-paying travelers.

Fourth, have mechanisms and policies to promote investment in infrastructure, especially infrastructure connecting tourist attractions of the region; have an open, airy, preferential tool to encourage businesses and people to actively and actively participate in

tourism infrastructure investment, idea creation, and resource investment to form tourism products. Tourism products: develop a coordination mechanism for regional linkage to jointly solve common problems to ensure the goal of harmonizing interests and equal competition among provinces in the region, implementing the role of a pervasive driving force in the North central region.

SOME SOLUTIONS TO IMPROVE INCOME ASSOCIATED WITH THE DEVELOPMENT OF GREEN ECONOMY FOR PEOPLE IN SONLA PROVINCE

Dr. Tran Thi Thanh Ha
thanhha@utb.edu.vn

Dr. Duong Van Manh
manhdv@utb.edu.vn

Dr. Pham Anh Tuan
phamtuan@utb.edu.vn

Tay Bac University, Son La, Vietnam

Abstract

Sonla is a province with large territory, diverse terrain and climate, creating favorable conditions for agriculture and tourism to become strengths to develop a green economic model. However, Sonla is still a poor mountainous province, people's lives are difficult, low per capita income, high percentage of poor households. Therefore, it is necessary to give practical solutions to hunger eradication, poverty alleviation and increase incomes to gradually improve the quality of life of ethnic minorities here. In particular, improving the income associated with developing green economy is a practical solution in the current context of Sonla province.

Keywords: *Green economy, Income, Sonla.*

1. Introduction

After 36 years of renovation and opening up for development, Vietnam has escaped from the top of poor countries and classified as middle-income countries, but Vietnam also has to pay the price for the decline of natural resources and environmental pollution. school. In line with the general development trend of the world economy with the adjustment of development models and changes in industry structure, Vietnam has become a member of the World Trade Organization (WTO). Therefore, the economic development of Vietnam must follow the general principles of commitments with the WTO in the development trend of Global Integration. Moreover, Vietnam is listed as one of the five countries most affected by climate change, so moving towards the "Green Economy" model is a reasonable choice.

For Son La province - although there have been many efforts from local authorities and people to improve people's living standards, by 2020 the province's per capita income will still be low compared to the average of the whole country. country. The rate of multidimensionally poor households is still very high, ranking 2/4 in the Northwest province, 4/14 provinces in the Northern Midlands and Mountains and 4/63 provinces in the country [5]. Son La's per capita income/month is very low, ranking 3/4 in the Northwest, 13/14 in the Northern Midlands and Mountains and 62/63 in the country. Therefore, the problem of

researching and analyzing the current situation of per capita income of the people of Son La province and proposing some solutions to improve income associated with green economic development for Son La province is a task, absolutely necessary. The research results will be the foundation in the process of assessing the current situation of people's living standards in Son La province, and an important scientific basis for state agencies to plan policies to reduce income disparity, import and improve the living standards of the people of Son La province in a sustainable way.

2. Method

Information data of the article is collected and synthesized by the author from: reports of Son La Provincial People's Committee, Son La Ethnic Minority Board, Department of Labor, Invalids and Social Affairs; decisions of the Ministry of Labor - Invalids and Social Affairs; the statistics of the Statistics Department of Son La province, the General Statistics Office; primary data through the author's sociological investigation.

This study uses the method of analyzing secondary documents, processing statistics based on available studies on households in Son La. The statistics are carefully processed and analyzed by the author. These are important proofs of the author's conclusions. The study also uses comparative methods to compare and evaluate research results, recommended solutions from reports with recommendations and solutions from State management agencies.

The study also uses the field method combined with sociological investigation to find out the actual situation and compare it with available documents. In addition, the author also uses the method of consulting experts and stakeholders: experts, managers and people living in Son La province. All of the above research methods are the foundation to help the author thoroughly analyze the income situation of the people of Son La province, thereby having a valid scientific basis to propose solutions to improve income associated with the situation, associated with green economic development for residents of Son La province.

3. Results

3.1. Actual situation of per capita income of residents in Son La province

Although Son La province's GRDP ranks first among the four provinces in the Northwest sub-region (VND 47,223 billion in 2020 – actual price), accounting for 39.7% of the sub-region, ranking fifth out of 14 provinces in the Northern Midlands and Mountains and 40/63 provinces and cities nationwide. However, due to the large population, Son La's GRDP/person in 2020 ranks 2nd/4th in the Northwest province (after Hoa Binh), 9th out of 14 provinces in the Northern Midlands and Mountains, and 57th out of 63 cities and provinces, country; and only 51% of the national average. And Son La's GRDP growth rate is the lowest in the country at 5.59% (in 2020).

As for the per capita income per month of the whole Son La province is very low, equal to 63.6% of the Northern Midlands and Mountainous region, only 45.8% of Thai Nguyen province (the province with the highest per capita income), highest in the Northern Midlands and Mountains) and equal to 41.1% of the national average.

Figure 3.1. Per capita income/month of Son La province and comparable objects in 2020 (current prices)

Source: author processed from [5]

When ranking, the per capita income per month of Son La province compared to other provinces in the Northern Midlands and Mountains shows that: Son La has a very low per capita income per month, ranked first. 13/14 provinces in the Region (just above Dien Bien province). Similarly, when compared with other localities in the country, Son La's per capita income/month is also ranked at the penultimate position at 62 out of 63 provinces and cities. In Son La, in 2020, the number of poor households is 62,068, leading the country. The rate of multidimensionally poor households is 21.6%, ranking fourth in the country and in the Northern Midlands and Mountains [2].

3.2. Some solutions to increase income associated with green economic development for Son La province

Firstly, it is necessary to raise people's awareness and consciousness towards production development

Through renewing economic thinking, implementing a new way of thinking and doing (through the survey, 41.9% of households still lack understanding of how to do business) are the key requirements in improving income. income associated with green economic development for residents of Son La province [4]. Specifically need:

Propaganda on commodity production, production linkages between producers and the state, scientists, insurers, banks, distributors... Forming a mentality of using high technology and participating in the whole world globalization for the people. Developing production according to value chains and agro-industrial, forestry-industrial production complexes, etc., etc., Son La province should regularly organize dialogue conferences to remove difficulties for production. agriculture for households, owners of agricultural cooperatives, aquaculture, etc.

Strengthening the organization of Brand Festival and honoring agricultural products such as Moc Chau Shan Tuyet tea, Song Ma longan, Yen Chau mango, Mai Son coffee, Phu Yen orange. With the project of developing fruit trees on sloping land, the whole province needs

to continue to reduce the area of corn cultivation with an income of only about 10 million VND/ha, switch to fruit trees, income from several tens to hundreds of millions of VND/ha.

Son La's new production approach must not only stop at the requirement of high quality and quantity of goods and ensure food safety, but also solve the problem of product consumption markets. up to 51.9% of households surveyed lack a place to consume products). The province needs to continue to transform specialized farming areas, produce raw materials, and build four large fields to link production with product consumption. Farmers have production land associated with enterprises with technology and product processing. Currently, the province has 6 large-scale factories processing vegetables, fruits, milk, tea and sugar cane. TH Group has started construction of a fruit processing factory with a total investment of 1,200 billion VND in Van Ho district, with the goal of becoming a large passion fruit production area for export to the European and American markets.

The province needs to have more preferential policies to encourage the development of agricultural production cooperatives, and supply chains of safe vegetables, fruits, meat and seafood. It is necessary to sustainably maintain agricultural products bearing the "Son La brand" to continue to maintain and dominate markets in Hanoi and other provinces in the region. In particular, maintaining export markets for agricultural products that require high quality in foreign countries that the province has access to, such as: exporting green mangoes and longan to the Australian market, passion fruit to the Australian market. French market, the label to the US market. The path of sustainable economic development and sustainable improvement of people's living standards has been opened up from the potential of the province.

Second, develop high-quality human resources

High-quality trained human resources is a particularly important factor in improving labor productivity, thereby contributing to income improvement. Developing high-quality human resources is a big, important, basic, long-term and pressing issue in the process of industrialization and modernization in Son La province today as well as raising income associated with economic development. green economy.

**** Professional labor development***

It is necessary to associate training and development of vocational workers in Son La province with enterprises and at the same time take into account the supply and demand factors of the labor market on the basis of fundamental and comprehensive innovation in vocational training. Expanding policy beneficiaries for ethnic minorities to contribute to poverty reduction, socio-economic development in ethnic minority areas, and attracting ethnic minority students to participate in vocational training is extremely important. necessary.

Exemption of tuition fees for vocational training is an important solution to create conditions for apprentices and attract apprentices, especially there is a need for a tuition fee waiver mechanism for all disadvantaged subjects when participating in vocational training. Son La province needs to support vocational training and job support for workers changing careers in agricultural and rural areas, which are necessary activities to prepare human resources for economic restructuring income improvement in order to raise living standards and change the face of rural areas.

In the resettlement areas, it is necessary to continue to pay more attention to social infrastructure, especially labor training, job creation, consulting, and support for people in production and business, cultural preservation, good national identity, not only concerned about the economy, taking care of three meals. It is necessary to "give the fishing rod, not the fish" because if you give a sum of money, rice, build infrastructure but do not organize production and create jobs, when people run out of rice, no money will return to poverty. To build agricultural and handicraft cooperatives in resettlement areas, industrial and agricultural extension centers, and support community tourism.

** Business Development*

Entrepreneurs in Son La have made an important contribution to the formation of a new social structure and social relations, a value system and a lifestyle suitable to the conditions of industrialization and modernization and international integration. The new social structure in Son La has added thousands of entrepreneurs with an important role in socio-economic development. They are an indispensable link in socio-economic links and cooperation, including the "5-house" link (the State, entrepreneurs, scientists, banks and farmers). Therefore, to develop a team of entrepreneurs, it is necessary to implement the following solutions:

It is necessary to be aware of the position and role of the business team. Create favorable conditions; promote the development of businesses and entrepreneurs in Son La, so that they truly become the core force, taking the lead in the cause of industrialization - modernization and economic integration, ensuring independence, economic autonomy.

Publicity and transparency of socio-economic development orientations and plans, support policies to ensure investment interests and reduce business risks for entrepreneurs and enterprises; and at the same time limit corruption, bribery, and group interests between businessmen and policy makers.

Promote the role of organizations representing the business community and the entrepreneurial team. Through a representative organization to gather opinions, aspirations and initiatives of businessmen, thereby advising Son La province in formulating and implementing socio-economic development policies, ensuring the interests of enterprises, businesses, entrepreneurs, employees, community interests and national interests.

Build business standards: patriotism, creativity, passion for business, proactive integration, dare to think, dare to do, responsibility to employees, the community, culture and compliance law enforcement. Formulate policies to promote enterprise development in rural, mountainous and ethnic minority areas; encouraging the use of local workers, ethnic minority workers, female workers, children of policy families, and people with disabilities. Encourage and support entrepreneurs to invest in technological innovation in the direction of "green technology", innovating products and services, and strengthening business links, focusing on building, honoring, promoting and affirming values goods and trademarks of Son La.

Third, have appropriate policies to raise the level of economic development

** Modernize the economic structure with key products of high volume, high quality and added value; Promote economic restructuring within each industry group*

In agriculture - forestry - fishery. Producing crops in the direction of intensive farming, bringing new varieties with high yield, quality and efficiency into production; building a belt of food, vegetables and beans in a clean direction for the city of industrial zones and moving them to the lowlands; focus on developing fruit trees such as plum, mango, longan, tangerine, persimmon... associated with the consumption market.

Select crops suitable to the terrain, soil, and highland climate (maize, coffee, tea...) with economic value in order to improve agricultural production efficiency. In Moc Chau district (especially Chieng Son and Loong Sap communes) and Muong La (especially Hua Trai and Ngoc Chien communes) the life of the Mong and Thai ethnic minorities in the border highlands here is very difficult. However, these localities have cold soil and climate conditions that are very suitable for growing temperate flower varieties with high economic value and rapid income improvement. Therefore, Son La province and districts need investment in capital and flower care techniques for the Mong and Thai people here.

It is necessary to strongly transform the structure between cultivation, husbandry and services in the direction of increasing value, actively applying technology to create great value of goods, ensuring sustainable agricultural development. To step up the development of livestock raising for goods with high economic value on the basis of taking advantage of mountainous provinces, continuing to focus on developing buffalo and cow herds (Moc Chau, Song Ma, Sop Cop, Bac Yen); pigs (Mai Son, Moc Chau, Song Ma, Son La city); goats (Thuan Chau, Mai Son, Bac Yen); poultry farming on a farm or household scale (Song Ma, Mai Son, Moc Chau). Besides, it is necessary to survey, test and invest in poor districts of Muong La, Bac Yen, Van Ho, Sop Cop so that the Thai, Khang, La Ha, Mong, and Muong ethnic minorities here know how to feed, breed animals suitable for local conditions.

Building a system of special-use forests, a system of watershed protection forests, combining new planting and zoning for regeneration, developing a system of production forests including forests of paper materials for industrial wood, anise, fruit, bitter tea, etc. bring forest cover to over 60% by 2025.

Exploit existing water surface area, especially effectively exploit hydroelectric reservoirs in Quynh Nhai, Bac Yen, Muong La, Moc Chau... Build more irrigation reservoirs combined with concentrated aquaculture for the purpose of producing goods, building fish hatcheries to serve the needs of the locality and neighboring provinces.

To attach importance to the development of commodity agriculture for poor areas, border areas, areas with many ethnic minorities; especially the two districts with the lowest per capita income are Van Ho district (especially Tan Xuan, Xuan Nha, Muong Men and Song Khua communes with mainly H'Mong ethnic groups), Sop Cop district (especially Dom). Cang, Muong Va, and Pung Banh are mainly H'Mong, Kho Mu and Lao ethnic groups. Need help and support farmers here with capital, seedlings and especially production experience.

In industry – construction. Exploiting and processing minerals, ensuring no destruction and causing environmental pollution, economical and efficient use of all kinds of minerals, encouraging investment in mining associated with the processing industry.

Continue to invest to further develop the food and food processing industry based on the advantages of locally available raw materials. Paying more attention to high value items such as dried fruit jams; wines, liquors, fruit juices; dairy products...

Hydropower development: survey, plan and promote the exploitation of hydropower potential in rivers and streams in the province, propose mechanisms and policies to attract investors to build hydroelectric power plants medium and small. Complete and put into operation the Xim Vang 2 and Muong Sang 2 hydropower plants in association with forest development and socio-economic development in rural areas.

Priority will be given to establishments producing high-value industrial products, making great contributions to the province's industrial production value such as: Moc Chau milk processing factory, tea processing factories in Moc Chau, Nickel ore processing factory, Mai Son cement factory, ... Attracting investors, industrial production facilities focus on Mai Son Industrial Park, industrial clusters, ...

Preserve and develop handicraft industries, restore traditional craft villages. Develop existing cooperatives such as brocade weaving in Son La city and welding mounds in Quynh Nhai. Traditional industries and occupations of ethnic minorities in Son La need to be developed, such as brocade weaving of Thai, Muong and Dao ethnic groups; weaving (making chests, boxes, trays, tables and chairs... out of rattan) of Thai, Kho Mu...; pottery and building materials (brick, tile) of Thai, Tay and Hoa people; forging and making production tools of the Mong and Dao people; jewelry making (silver rings and earrings of the H'Mong and Dao people; buttonholes and crossbones of the Thai people). These traditional products are not only to serve the daily needs of the people or sell to the Kinh people, but now they are also goods of high economic value when sold at attractions and tourist sites. This is a very feasible direction to create jobs and increase income for ethnic minorities in Son La.

In the service industry. Increasing investment in trade infrastructure, upgrading markets and shopping centers, promoting foreign trade by upgrading national border gates of Long Sap and Chieng Khuong based on a number of key export products. resources (agricultural products: corn, cassava, seaweed, fruits...).

Restore, maintain and well organize traditional festivals (Mong culture week, Love market in Moc Chau; Ban flower festival - Thai people in Son La city; Moi festival - Muong ethnic group in Phu Quoc) Yen; Mah grò festival - Kho Mu ethnic group...). Developing cultural and historical tourism (Son La Prison, Provincial Museum, Co Noi Victory Monument, Son La Hydroelectricity...); eco-tourism, landscape tourism (Moc Chau pine forest, Dai Yem waterfall, Moc Chau valley of love, Moc Chau tea village, Da river lake tour...), community tourism (Moc Chau, Van Ho, Son La city...), resort tourism (hot mineral springs in Muong La, Son La city...)

Upgrading infrastructure and further promoting financial, banking, insurance, post and telecommunications activities in localities, especially in four poor districts of the province... contributing to promoting product development export and business of the province.

** Modern production organization. Encourage cooperatives, organizations, and individual enterprises to organize production in a modern direction (according to value chains, to groups, to modern production forms) and to expand linkages outside the province.*

In Son La, from building a brand, applying science and technology to improve productivity and quality, has created local products of national significance such as: Moc Chau Shan Tuyet Tea exported to many countries in China Winter; Yen Chau green-skinned mango has been exported to the Australian market; Son La coffee is exported to some countries such as Japan, EU...

Develop programs, organize investment promotion, invite businesses inside and outside the province to participate in investing - raising - processing - consuming aquatic products. Towards effective exploitation of surface water in Song Da lake area of Son La hydroelectricity and Hoa Binh hydroelectricity to develop cage and raft fish farming with a focus on sturgeon; associated with market search, export promotion.

Building and replicating the model of safe production and food supply chain, agro-forestry-fishery products, applying VietGAP agricultural production process, forming a system of stores, trading and distributing agricultural and aquatic foods safe product.

The province needs to step up tourism promotion and promotion activities, develop tourism services associated with cultural and spiritual factors, lake-bed tourism and hydropower plants. Mobilize and attract resources to increase investment in tourism infrastructure and techniques in key tourist areas such as: Moc Chau National Tourist Area, Son La hydropower reservoir, tourist attractions community,... Associating tourism activities with commercial and service activities to promote the potential and advantages of tourism products (resort tourism, ecotourism, community tourism, tourism) historical culture, conference tourism – organization of events, adventure tourism). Building tours between Moc Chau National Tourist Area and Hanoi, with neighboring provinces (Lao Cai, Yen Bai, Thanh Hoa,...), with Sam Nua town, Hua Phan province, and the ancient capital of Luang Prabang Tape of the Lao People's Democratic Republic.

** Building geographical indications for goods and products*

The quality, prestige and reputation of the goods are due to the geographical origin. The registration for protection of geographical indications for agricultural products for key products of Son La is very important to promote sustainable production development, bringing Son La agricultural products to serve the needs of consumers. widely consumed domestically and entered the export market. Therefore, Son La needs to implement a continuous model between production, processing and preservation of high-tech agricultural products and to replicate economically efficient models associated with geographical indications and product branding. Son La strives to have 19 trademarked construction products with geographical indications by 2025.

Son La has now published guidelines for four products: Shan Tuyet Moc Chau tea, Yen Chau mango, Song Ma longan and Son La coffee. Son La needs to continue to focus resources to accelerate the progress of brand building for the province's key products, including: sturgeon in Son La hydroelectric lake, fish in the Da river lake (Quynh Nhai) and

custard apple. Son, Moc Chau avocado, Muong Va sticky rice (Sop Cop), medlar - apple meo (Bac Yen, Muong La), Phong Lai tea and Cu Cang taro (Thuan Chau).

According to the assessment, Son La has nearly 200 products of high economic and commercial value, which are favorable conditions for the development of the "one commune, one product" program (OCOP), which has attracted the participation of many people. enterprises, cooperatives, production and business households. Up to now, the province has 83 local specialty agricultural products certified by OCOP.

** There are priority policies for hi-tech application agriculture*

To well organize the implementation of preferential mechanisms and policies according to the State's regulations for high-tech agriculture, such as policies to support activities of high technology creation, development and application of high technology in agriculture. Karma; Policies to support the development of high-tech agricultural application enterprises; Support policies for hi-tech agricultural zones and zones; Policies to attract and use human resources... Especially policies in land management and use for the development of hi-tech agriculture.

Son La province needs to promote intensive farming, increase crops, apply science and technology, advanced farming processes and new varieties with high yield, quality, and resistance to pests and diseases into production. Developing and replicating models of safe vegetables and high-quality flowers in Moc Chau, Son La and Muong La cities and other areas with suitable natural and climate conditions, forming a chain of production and consumption, linked with domestic and regional markets. Converting some inefficient crops in the area to planting trees with high economic value.

Continue to implement the project to support the application of drip irrigation technology combined with soluble fertilizer application according to Israeli technology to improve productivity and export value of Arabica coffee in Son La and Mai Son cities. Thuan Chau.

Fourth, bring into play the potential and advantages of natural conditions

Most recently in 2017, Son La province had to experience two historic flash floods, causing heavy loss of life and property, total damage amounting to VND 2,600 billion. For a poor province with slow economic development, people's production life is still difficult, this is a big loss. Therefore, promoting together with the protection of natural resources and ensuring a sustainable environment is a very important requirement in moving towards a stable income standard of living for the people of Son La province.

About land: The province still has nearly a quarter of flat land and a part of hilly land that can be exploited to serve agricultural production and develop long-term industrial crops such as coffee, tea, fruit trees, etc. livestock... to improve income levels. In addition, it is necessary to strengthen the management of land.

Regarding hydrology: it is necessary to continue to make good use of surface water, especially in reservoir areas containing hydroelectric power plants for aquaculture. Continue to survey, evaluate and use hydroelectric potential of major rivers in Son La.

In terms of climate: the terrain is deeply and strongly divided, forming many climate sub-regions, allowing the development of a rich agro-forestry production. In particular, developing resort tourism in localities with high terrain, contributing to changing the structure and increasing income for people.

Regarding forest resources: it is necessary to hand over the entire forest area to households for self-management, care and protection. This job is not only important for the environment, but also has great significance in the fight against hunger and poverty reduction, contributing to improving the living standards of the people.

Fifth, replicate green economic models to create effective livelihoods

Table 1. Effective livelihood models need to be replicated in Son La

Model		Objects
By city - rural area	<i>City</i>	Service and trade industries Travel Handicraft
	<i>Countryside</i>	Producing clean agricultural products Exploration travel, resort travel, Home stay Handicraft
By ethnic group (by sub-region – topographical characteristics)	<i>Mong, Dao, Xinh Mun, Khang, La Ha, Laos (Upland, border – high terrain)</i>	Forestry Agro-forestry combination Handicrafts and handicrafts (forging, silver jewelry making, bamboo and rattan, ...) Breeding specialty fish that prefer cold water (salmon, sturgeon, ...)
	<i>Thai, Kho Mu, Muong (The area along the Da river - low hill and valley terrain)</i>	Planting special, clean fruit trees Breeding indigenous breeds (duck, black chicken, ...) Nutritional agriculture Breeding fish in cages Travel to explore the lake bed, community tourism Handicrafts and handicrafts (brocade weaving, bamboo and rattan)
	<i>Kinh, some other ethnic groups (The area along National Highway 6 – low terrain)</i>	Tourist Resort Processing clean agricultural products Planting high quality flowers

Cage fish farming model: With the goal of developing cage fish farming in an effective and sustainable direction, Quynh Nhai district has established a fisheries advisory group, directly supporting and consulting cooperatives, looking for some simple solutions. organizations and enterprises to consume products for cooperatives; mobilize, support and orient cooperatives to raise fish in cages on the lake bed according to VietGAP standards; promote the role of the Union of Fisheries Cooperatives to link cooperatives to support each other from the selection of breeds, to the care and consumption of products, especially the production of the cooperatives must be carried out. performed in the form of a pillow service to always ensure the quantity and quality supplied to the market. The district is supporting the district's Union of Fisheries Cooperatives to build a house for preliminarily processing and preserving fish to pack products to send to the provinces; building Da river fish brand, bringing Da river fish products to participate in fairs inside and outside the province...

Model of community tourism: According to the adjustment of the master plan for tourism development in the province to 2030, community tourism products are oriented to develop in 18 communes in 6 districts and cities: Moc Chau, Van Ho, Quynh Nhai, Muong La, Phu Yen, Son La city. In particular, focus on investment in infrastructure, environmental landscape suitable to the conditions and topography of each district and each location to attract more and more tourists to community tourism destinations. With synchronous solutions in developing development plans and promoting local products, community tourism activities in the area will have many changes, attract more visitors, and create stable jobs for tourists. labor in rural areas.

Some other sustainable livelihood models

The field of “Nutritional agriculture” needs to be developed in one of the most remote and poor ethnic minority areas in Sop Cop. These areas are very far from central areas, so the government needs to help people to become sustainable self-sufficient, while improving access to nutritious food especially for infants and women with low income. in the context of forests and natural resources being degraded.

The government supports knowledge and techniques for people to develop organic agriculture, produce clean agricultural products, and promote Son La's strengths in fruit production. In particular, guide people not to use pesticides as widely as today, especially people in the districts of Bac Yen, Mai Son, Song Ma, etc.

4. Conclusion

The analysis results show that at present, Son La is still a poor mountainous province, people's life is still difficult, the average income of the population is low. Therefore, the issue of raising income is still a very urgent requirement, requiring the attention of all levels, sectors and the whole society. In which, in the long term, changing the development mode towards the development of a "green economic model" is an approach that is suitable with the general development trend of the global economic system. And in Son La, in order to move towards a green economic model, it is necessary to rely on two pillars of strength: agriculture and tourism.

A STUDY ON THE FOREIGN DIRECT INVESTMENT STRUCTURE INTO HANOI CAPITAL REGION TOWARDS SUSTAINABLE DEVELOPMENT GOALS

PhD student. Bui Huy Cuong

bhcuong676@gmail.com

National Economics University, Hanoi, Vietnam

Abstract

The process of attracting Foreign Direct Investment (FDI) after more than 30 years (1998-2021) in Vietnam has achieved many positive results. However, the quality of FDI inflows has not yet met the requirements of the country's development process. Based on the research viewpoint which considers the FDI inflows structure as the core of quality, the researcher thereby determined a set of criteria for evaluating capital flow structure from the view of regions receiving capital investment. With a relatively detailed analysis of the current state of capital flow structure into the provinces of Hanoi, the researcher discovered issues related to the structure of FDI inflows into the capital region. Therefore, the researcher proposes some recommendations with an "open" orientation to improve the quality of FDI inflows towards sustainable development goals in the upcoming time.

Key words: *FDI, capital flow structure, sustainable development, Hanoi capital region*

1. Introduction

Attracting Foreign Direct Investment (FDI) has become an objective trend in the economic development strategies of many countries; and FDI is recognized as one of the important factors to promote economic growth and sustainable development. All countries in the world compete to attract more Foreign Direct Investment capital by constantly improving the national investment environment, creating the most favorable business and investment environment for foreign investors. In this context, Vietnam's accession to the World Trade Organization (WTO); the negotiation and signing of Free Trade Agreement (FTA) have created a strong investment wave in Vietnam. Many countries and investors have shown their interest in Vietnam and invested in various economic sectors. The fact that after more than 30 years of receiving FDI inflows since 1998 has made a significant contribution to Vietnam's socio-economic development.

“Accumulated to 2020, the whole country has had 33,070 valid projects with a total registered capital of nearly 384 billion USD. The cumulative capital of Foreign Direct Investment projects reached 231.86 billion USD (equivalent to 60.4% of the total valid registered capital). There have been 139 countries and territories with valid investment projects in Vietnam. Among that, Korea is at the top with a total registered capital of over 70.6 billion USD (accounting for 18.4% of total capital). FDI enterprises have invested in 19/21 industries in the industrial classification of national economic activities, in which the processing and

manufacturing industry accounts for the highest proportion with 226.5 billion USD (accounting for nearly 59% of the total investment); real estate activities came in second with nearly 60.1 billion USD (accounting for 15.6% of total capital investment); electricity supply with 28.9 billion USD (accounting for 7.5% of total capital investment). FDI capital has presented in all 63/63 provinces and cities in the country; among which Ho Chi Minh City still topped the list in attracting foreign investment with 48.2 billion USD (accounting for 12.5% of total capital investment)” (Ministry of Planning and Investment, 2021).

Hanoi Capital Region includes the capital Hanoi and 9 surrounding provinces: Hai Duong, Hung Yen, Vinh Phuc, Bac Ninh, Ha Nam, Thai Nguyen, Phu Tho, Hoa Binh, and Bac Giang with the total area of 24,314.7 square kilometers, population size is about 18.2 million people. This is a region of general economic development, with the Hanoi being the national politics and public administration center, a major center of culture, education, science and technology, economy, international transactions of the country, and an important international significance in the Asia-Pacific region. It is also the focal point for the national transport system and technical infrastructure, has an important position in terms of national security and defense, is the driving force of the national economic development, making a great contribution to the national budget and attract a large amount of FDI inflows into Vietnam. In recent years, the Hanoi capital region has still been an area that attracts a large amount of FDI inflows compared to the whole country. According to statistics on attracting FDI from the provinces in the Hanoi capital region up to now, there have been 8,521 FDI projects authorised to invest in the region with a total registered capital of 85.3 billion USD, accounting for about 38% of the number of projects and 29% of the registered capital compared to the whole country (in which Hanoi is still the leading place in terms of the number of FDI projects and registered capital, Hoa Binh is the place with the lowest number of FDI projects and registered capital in the region).

FDI inflows mainly focus on manufacturing industry, using a number of unskilled labors and low value of technology transfer, leading to the inability to maximize the benefits that FDI inflows can bring to the Hanoi capital region. FDI inflows rely on advantages in cheap labor costs and natural resources, concentrate in low value-added stages such as processing and assembly operations, and are unlikely to create positive spillover effects regarding technology. The structure of FDI flows is still uneven among investment sectors, especially in the service sector. Besides, there is a lack of connection and cooperation among domestic enterprises and FDI enterprises to form global value chains. Particularly, in the context of the Covid-19 pandemic occurring on a global scale, the strong impacts which stem from the shift of FDI inflows to countries with more favorable conditions have created competition in attracting quality FDI flows among countries craving for this capital flow in their development process. This requires a thorough research and assessment of the quality of FDI inflows into the socio-economic development of the Hanoi capital region.

Stemming from the aforementioned issues, it is apparent that there is a need for policy adjustments to attract quality FDI inflows with the aim of improving its quality, in order to promote the effectiveness of FDI's contribution and to achieve the sustainable development goals of the capital region in the upcoming time.

2. Literature Review

Quality issues and quality improvement have been mentioned repeatedly in economic books in Vietnam and around the world. Quality is both a familiar and controversial concept. Depending on the subject studied, the word "quality" has different meanings.

From the perspective of a manufactured product, the concept of product quality is understood as the beneficial values of products and services and is a complex concept, depending on the level of the economy, and on the perspective of the observer. *According to this perspective, quality is the degree to which regulations and standards are achieved for products or services that are suitable for the benefits of interested parties under certain conditions.*

From the perspective of services provided, it can be understood that service quality is the result of an accumulated evaluation of customer based on the comparison between the expected (or predicted) quality and the quality of service delivery. In other words: Service quality is always compared with the level of satisfaction of customers' needs after consuming the service. According to the above concept, *Service quality is expressed in the level of satisfaction of consumers compared to their expectations.*

The researcher does not view on the two aspects above, but from the perspective of economics development and dialectical philosophy. As mentioned above: quality is one of the two factors constituting development (quantity factor and quality factor), it "is an internal attribute of development, reflecting the structure, efficiency and the impact of that development on benefit-oriented objects" (Ngo Thang Loi, Development Economics for Post Graduate Study, Publishing House of Politics and Public administration, 2013). Based on this concept, the researcher's point of view on the quality of FDI inflows to the regions is: *"the internal attribute of FDI inflows, which is reflected in capital flow structure, capital flow efficiency and its impacts on the socio-economic development of the invested region"*.

Particularly in terms of capital flow efficiency: From the perspective of capital flows itself (which are foreign investors), it is the efficiency that this capital flow brings to investors themselves and the ability to maintain and develop this capital flow in the long term.

From the perspective of regions receiving FDI inflows, perhaps the efficiency of FDI inflows and its spillover effects are the efficiency of capital flows in the implementation of the local socio-economic development goals. These goals are associated with each stage of the local socio-economic development; however, they must be aligned with the trend of the sustainable and effective development process of the economy. The satisfaction of regions receiving FDI inflows is generally reflected in the efficiency of capital flows and the spillover effects of this capital flow on local socio-economic development.

The researcher will study the latter perspective that belongs to regions receiving FDI to study the quality of FDI inflows. Therefore, there are two noticeable points when studying the quality of FDI inflows:

First, the efficiency of FDI inflows will not be the financial efficiency of FDI enterprises, because that is the efficiency of investors. Instead, the perspective of economic efficiency of this capital flow for regions should be taken into account, which means how capital inflows contribute to local economic efficiency.

Second, the spillover effect of FDI inflows needs to be examined from the perspective of the whole economy, which are the objects affected by capital flow in regions, including economic, social and environmental spillovers.

Therefore, the researcher introduces the concept that “*Quality FDI is FDI that makes positive contributions to the sustainable development of the regions receiving investment in a modern direction, in line with the local development level in specific context and goals*”.

The quality of FDI inflows includes the structure of FDI flows and the efficiency of capital flows in invested regions. In this study, the researcher only analyzes and evaluates the structure of FDI inflows from the perspective of an internal attribute that reflects quality capital flows. The structure of FDI inflows is classified and evaluated according to the following criteria:

(1) Structure of FDI inflows according to the capital size: Normally, FDI inflows can enter a country or a region with different capital sizes. Basically, it is necessary to alternately spend these capital flows depending on the needs and development level of the invested countries or regions. Nevertheless, in terms of capital flow quality, larger-scale FDI projects will have increase opportunities of higher efficiency achievement, and the abilities to deliver more "original", modern and clean technology, and the spillover effect of large-scale FDI will be higher. The key performance indicator of the proportion of FDI by capital size will assist the evaluation of FDI quality from the view that if the proportion of large-scale FDI is increasing, the quality of capital flows will prove better.

According to the 2019 Public Investment Law, projects are classified to groups A, B and C. Regarding ordinary industrial production projects, the scale of Group A projects is over 1,000 billion VND; Group B is from 60 billion VND to less than 1,000 billion VND; group C projects are under 60 billion VND. Such classification of projects by capital size is appropriate and applied by international and domestic organizations. The researcher based on statistics to classify FDI projects by capital size, including 3 types: large-scale projects with a total registered capital of over 45 million USD (equivalent to about 1,000 billion VND); medium-scale projects with total registered capital from 2.5 million USD to under 45 million USD (equivalent to about 60 billion VND to less than 1,000 billion VND); small-scale projects with a total registered capital of less than 2.5 million USD (equivalent to less than 60 billion VND).

(2) Structure of FDI inflows from the perspective of investors: is the ratio of large investors to the total number of foreign investors to regions. Attracting FDI from partners with strong economic potential and advanced technology, the disbursement rate is usually on time and technology transfer is also higher, while helping the region to receive advanced and modern technology, increasing labor productivity and minimizing the negative impact of FDI on the environment, on the local economy and community benefits. Large companies with strong financial potential today are multinational companies, transnational corporations, or companies from countries with developed economies such as G7 countries (including the United States of America, Great Britain, France, Canada, Germany, Italy, Japan, Korea,...) these are the companies that countries as well as regions want to attract because of the benefits that they bring to the economy.

(3) Structure of FDI inflows by industry and business sectors: is the receipt of FDI inflows into three important sectors in the national economy, including: agriculture, industry and construction, service sectors. This criterion will show the structure of FDI inflows in each specific sector. Hence, we know how the investment trend of FDI inflows comes from investors. Industries and fields with high profit margins will often attract more investors than those with low profit margins or those dependent on weather and environment. If more FDI inflows are invested in manufacturing and processing industries, it will create spillover effects to other sectors to develop together.

(4) Structure of FDI flows by technological features: including proportion of FDI at different technology levels (low, medium, high), FDI based on clean technology (no pollution, technology or low energy consumption) or dirty technology (causing large environmental pollution and consuming a lot of energy). This indicator often uses the ratio of investment projects using high technology in investment projects in the locality; or the proportion of high technology in total technology in the regions with or without FDI. This will analyze whether technological capacity has been improved by FDI activities or remains at the original level. This criterion measures the impact of FDI on technological capacity improvement, comparing the local technology level with FDI inflows and the local technology level without FDI inflows. Here, the proportion of projects with high, modern and energy-saving technology compared to the total number of FDI projects in regions is considered. In fact, there is a situation of transferring outdated machinery, equipment and technology, weak competitive advantages, and even causes to environmental pollution.

3. Results

(1) Structure of FDI inflows according to the capital size

Table 1. Number of FDI projects to the capital region, until 2021

No.	Cities/ Provinces	Projects	Proportion %	Registered capital (Million USD)	Proportion %	Disbursed capital (Million USD)	Proportion %
1	Hanoi	6.381	59,77%	36.472,00	37,68%	23.487,00	32,68%
2	Hai Duong	542	5,08%	7.883,20	8,15%	6.288,80	8,75%
3	Hung Yen	487	4,56%	5.264,70	5,44%	4.100,00	5,70%

Source: General Statistics Office of Vietnam

The capital region is a dynamic area, having a favorable geographical position, synchronous transport infrastructure, high quality human resources with the Hanoi as the core to spread to other provinces in the region. Therefore, the capital region has attracted a large amount of FDI inflows into the provinces and cities in the region. By 2020, the provinces and cities of the Hanoi capital region had attracted 10,676 FDI projects with a total registered capital of 96.8 billion USD, disbursed capital investment so far has reached 71.8 billion USD (equivalent to 74.2% of the registered capital).

Compared to the whole country, FDI inflows into the capital area accounted for 32.3% of the number of projects and 25.2% of the registered capital. FDI flows mainly focus on Hanoi (accounting for 59.77% of FDI projects and 37.68% of registered capital) and Bac Ninh province (accounting for 15 24% of FDI projects and 20.67% in registered capital). The remaining provinces account for a small proportion with 24.99% of FDI projects, but the registered capital accounts for a relatively high proportion with 41.65%. Hoa Binh is the province attracting the lowest FDI inflows in the region with 43 projects and 574.19 million USD of registered capital. This shows that the number of FDI projects is unevenly distributed among provinces and cities in the region.

Based on the criteria analysed above, the researcher categorises FDI projects by capital size into 3 types, specifically shown in the following table 2:

Table 2. Scale of FDI projects in the capital region, until 2021

No.	Cities/ Provinces	Scale of projects						Average project size (million USD)
		< 2,5 million USD	%	from 2,5- 45 million USD	%	> 45 million USD	%	
1	Hanoi	5.807	91%	506	8%	68	1%	5,72
2	Hai Duong	209	39%	311	57%	22	4%	14,54
3	Hung Yen	227	47%	239	49%	21	4%	10,81
4	Vinh Phuc	197	48%	198	48%	15	4%	14,94
5	Bac Ninh	1.194	73%	388	24%	45	3%	12,29
6	Bac Giang	296	58%	185	36%	30	6%	11,87
7	Ha Nam	97	30%	214	65%	16	5%	13,26
8	Thai Nguyen	70	43%	79	49%	13	8%	52,99
9	Phu Tho	76	41%	103	55%	7	4%	7,93
10	Hoa Binh	11	26%	29	67%	3	7%	13,35
	Total	8.184	77%	2.252	21%	240	2%	9,07

Source: Ministry of Planning and Investment, Foreign Investment Agency

The majority of the FDI projects invested in the Hanoi capital region are small-scale projects (under 2.5 million USD) with 8,184 projects, accounting for 77% of the total number of investment projects in the region. table. Medium-scale projects from 2.5 million USD to under 45 million USD have 2,252 projects, accounting for 21% of the total number of

investment projects in the area. Large-scale projects account for only 2% of the total number of investment projects in the area with 240 FDI projects.

In general, FDI inflows into the capital region focus on small-scale and medium-scale projects (accounting for 98% of the total number of projects). This shows an imbalance in the structure of FDI inflows regarding scale into the capital provinces when FDI capital flows will not focus highly on investing in modern machinery, equipment and technology, but most of them only made use of leasing cost and cheap labor. The average size of the project's capital into the provinces and cities in the capital is quite high, reaching 9.07 million USD/FDI project. However, compared to the whole country (the average size of the project's capital is 11.6 million/FDI project) it is a significantly smaller number. This is also a limitation on the structure of FDI capital flows according to the size of capital investment in the capital region.

(2) *Structure of FDI inflows by investors:*

The provinces and cities in the Hanoi capital region receiving direct investment from many different countries and territories around the world. Accordingly, the researcher categorises FDI flows according to investors coming from countries with modern science and technology such as the G7 and Korea - a country with a fast pace of developing science and technology level. In addition, capital flows from ASEAN countries also play a vital role in forming a strong economic bloc in the region, benefiting from Free Trade Agreements in which Vietnam is also a member. The investment structure of FDI projects in the region by country of investment is shown in the following table:

Table 3. FDI structure by countries with investment, until 2021

No.	Country, territory	Total			
		<i>Project</i>	<i>%</i>	<i>Register Capital (million USD)</i>	<i>%</i>
I	<i>G7 countries</i>	<i>2.390</i>	<i>17,27%</i>	<i>21.909,60</i>	<i>15,96%</i>
1	The United States	202	1,89%	780,76	0,81%

Source: General Statistics Office of Vietnam

For the past years, there have been many countries and territories investing directly in the capital, making the FDI situation in the region more and more dynamic. Among the countries and territories investing in the Hanoi capital region, capital flows from G7 countries with developed economies, modern science and technology accounted for 17.27% of the total amount of projects with 2,390 projects and accounts for 15.96% of the total registered capital with 21.9 billion USD, the average investment rate is 9.17 million USD/FDI project. Among G7 countries, FDI inflows from Japan accounted for the majority with 1,834 FDI projects (17.18% of the number of projects) and \$19.3 billion of registered capital (accounting for 19.95% of the total registered capital).

FDI inflows from Korea also accounted for the majority of FDI capital invested in the capital provinces, accounting for 40.15% of the number of projects with 4,286 projects, the total registered capital accounted for 34.24%. with 33.13 billion USD, the average investment rate is 7.7 million USD/FDI project. FDI inflows from countries in the ASEAN region accounted for only 5.59% of the number of projects with 774 projects, but the total

registered capital accounted for 13.54% with 18.6 billion USD, averagely 24 million USD/FDI project. Meanwhile, the capital flow is mainly from Singapore with 12.9 billion USD, the average investment rate is 24.8 million USD/FDI project. In addition, FDI inflows from countries with large economies such as China and India also make an important contribution to the structure of FDI inflows in the provinces and cities of the capital.

In general, the structure of FDI inflows by investment partners is relatively good and highly effective. In the upcoming time, with open investment policies being implemented, especially the shift of FDI flows from other countries into Vietnam to exploit the strengths of signed free trade agreements, provinces and cities in the capital region will be the area to attract more and more FDI inflows from investors across countries and territories around the world, especially investors from developed countries.

(3) Structure of FDI inflows by industry and business sectors:

FDI inflows into the provinces and cities of Hanoi capital region are classified according to 3 basic sectors of the economy: agriculture, industry and construction, services. FDI inflows mainly focused on industry and construction and services. The structure of FDI inflows into the provinces and cities by economic sectors is shown in the following table:

Table 4. FDI structure by investment sectors, until 2021

No.	Invested fields	Total			
		Projects	%	Registered capital (million USD)	%
I	Agriculture				
	Agriculture, fishing and aquaculture	39	0,37%	204	0,21%
II	Industry and construction	5.430	50,86%	69.962	72,29%
1	Mining and quarrying	3	0,03%	29	0,03%
2	Processing and manufacturing industry	4.455	41,73%	64.767	66,92%
3	Electricity, gas, steam and air conditioning supply	27	0,25%	242	0,25%
4	Water supply, sewerage, waste management and remediation activities	30	0,28%	1.639	1,69%
5	Construction	915	8,57%	3.285	3,39%
III	Service	5.207	48,77%	26.618	27,50%
1	Wholesale and retail trade; repair of motor vehicles and motorcycle	1.838	17,22%	2.313	2,39%
2	Transportation and storage	222	2,08%	1.177	1,22%

No.	Invested fields	Total			
		Projects	%	Registered capital (million USD)	%
3	Accommodation and food service activities	403	3,77%	2.249	2,32%
4	Information and communication	672	6,29%	1.972	2,04%
5	Finance, banking and insurance activities	51	0,48%	688	0,71%
6	Real estate activities	220	2,06%	15.194	15,70%
7	Professional, scientific and technical activities	1.166	10,92%	1.139	1,18%
8	Administrative and support service activities	237	2,22%	310	0,32%
9	Education and training	241	2,26%	287	0,30%
10	Health and social work activities	40	0,37%	611	0,63%
11	Arts, entertainment and recreation	37	0,35%	409	0,42%
12	Other service activities	74	0,69%	262	0,27%
13	International organizations activities	0	0,00%	0	0,00%
14	Household paid-job activities	6	0,06%	8	0,01%
	Total	10.676	100%	96.783,59	100%

Source: General Statistics Office of Vietnam

The agricultural sector attracts very small amount FDI inflows with 39 investment projects of 204 million USD in registered investment capital, accounting for only 0.37% of the number of projects and 0.31% of the registered capital to Hanoi and Bac Ninh.

The industry and construction sector attracted the majority of FDI inflows to the capital provinces with 5,430 investment projects and 69.96 billion USD of registered capital, accounting for 50.86% of the number of projects but accounted for 72.29% of the registered capital. Among all fields, FDI inflows into the processing and manufacturing industry accounted for the largest proportion (accounting for 41.73% in terms of the number of projects and 66.92% in terms of registered capital). FDI inflows into the Construction sector accounted for 8.57% of the number of projects and 3.39% of the registered capital.

FDI inflows into the commercial service sector in the capital provinces with 5,207 investment projects and 26.6 billion USD of registered investment capital, accounting for 48.77% of the number of projects but only 27.5% of the registered capital. FDI inflows focused on *Wholesale and retail trade; repair of motor vehicles and motorcycle* accounted

for 17.22% of the number of projects and 2.39% of registered capital; *Professional, scientific and technical activities* accounted for 10.92% of the number of projects and 1.18% of the registered capital. FDI inflows into the field of real estate activities only accounted for 2.06% of the number of projects but accounted for 15.7% of the registered capital. The reason is that real estate projects require higher capital investment than projects in other fields. This is an area that has attracted a large amount of FDI inflows in recent times to regions in the capital, especially in Hanoi with the strong development of real estate projects and fast pace of urbanization.

(4) *Structure of FDI flows by technological features:*

FDI inflows into the capital provinces are classified according to 3 different technological levels (low technology, medium technology and high technology) in the total number of FDI projects in the field of processing industry. Investment in manufacturing and investment in the provinces of the capital is shown in detail in the following table:

Table 5. FDI inflows to technological level in the field of processing and manufacturing, until 2021

No.	Cities/ Provinces	Projects	FDI inflows to technological level in the field of processing and manufacturing					
			<i>Low technology</i>	%	<i>Medium technology</i>	%	<i>High technology</i>	%
1	Hanoi	499	201	40,28%	123	24,65%	175	35,07%
2	Hai Duong	296	137	46,28%	51	17,23%	108	36,49%
3	Hung Yen	259	83	32,05%	77	29,73%	99	38,22%
4	Vinh Phuc	268	36	13,43%	57	21,27%	175	65,30%
5	Bac Ninh	845	138	16,33%	293	34,67%	414	48,99%
6	Bac Giang	318	53	16,67%	91	28,62%	174	54,72%
7	Ha Nam	185	65	35,14%	47	25,41%	73	39,46%
8	Thai Nguyen	79	9	11,39%	28	35,44%	42	53,16%
9	Phu Tho	107	48	44,86%	37	34,58%	22	20,56%
10	Hoa Binh	21	9	42,86%	1	4,76%	11	52,38%
	Total	2.877	779	27,08%	805	27,98%	1293	44,94%

Source: General Statistics Office of Vietnam

FDI inflows into the manufacturing and processing industry in the capital provinces are mostly low- and medium-tech (accounting for 55% of the total number of projects). The number of projects using high technology accounts for 45%. Compared to the whole country, this is an area with great advantages for projects using high technology compared to the whole country due to its favorable geographical location and quality of human resources. Among all the provinces and cities in the capital region, Vinh Phuc, Bac Giang and Thai Nguyen provinces have a large number of FDI projects using high technology (over 55% of FDI projects in processing and manufacturing industry).

As for technology and equipment imported from overseas, the survey results of the National Economics University in Hung Yen province (in the capital region) in 2020 show that, "the majority of enterprises receiving technology and equipment originating mainly from China (accounting for over 90%), due to its low cost (10-30 times higher than technology from other countries), operating costs, appropriate transfer, versatility, low replacement cost". This result is also consistent with and similar to the recently announced results of the Ministry of Science and Technology (2016) on the origin of technology received and transferred from foreign countries by Vietnamese enterprises. Accordingly, Vietnamese enterprises mainly import machinery and equipment from abroad in which machinery and equipment are mainly from China (35%), the proportion of imports from other technologically advanced countries (such as Japan, EU, and the United States) are dramatically low (17%, 12% and 4.5%). It can be seen that the advanced and modern level of technologies and equipment imported by Vietnamese enterprises is still limited, mainly at the average level compared to the world.

Based on analysis, it can be assessed that FDI inflows into the provinces and cities in the capital region in recent years have contributed to the improvement of production capacity, labor productivity, valuable contribution to GRDP, industrial production value and export value for the provinces, contributing to budget revenue, creating jobs, increasing income and improving the quality of human resources in the capital region. At the same time, FDI inflows have spillover effects to other economic sectors in the region through the connection among FDI sectors and other regions; technology and business capabilities are also transferred.

However, FDI inflows also reveal some limitations such as the imbalance in capital flow structure by industry and location, some FDI projects have low investment efficiency, use a lot of unskilled labor and has not yet created high added value, limited technology and role in technology transfer, mainly outsourcing and assembly projects, so the source technology is not transferred to Vietnam. At the same time, FDI inflows also appear negative social manifestations as well as negative impacts on the environment.

4. Recommendation and Conclusion

4.1. Some recommendations

With the widespread of the 4.0 industrial revolution, the trade war among major countries, the wave of FDI movement into Southeast Asia, assurance of sustainable development. Economic development is closely associated with social development, economic growth is associated with equity, social progress, and economic development is associated with environmental protection and ecological balance. Provinces and cities in Hanoi capital need to have "open" orientations to improve the quality of FDI inflows. Some of the directions are as follows:

Firstly, focus on the direction of implementing attractions to capital flows with high technology content: Prioritize the development of the industrial production of products with high technology content, focus on developing and attracting investment in industries and

products with high technology content and high-added value. Investment attraction projects always place high technology factor as the top attraction criterion, along with implementing the highest preferential policies and mechanisms for this type of project as prescribed by the law on technology high tech.

Second, prioritize FDI inflows into the development of trade, service, and tourism industries: Encourage FDI into a number of advantageous, highly knowledge-rich service industries and sectors and a number of other fields. Selected services include: banking and finance, insurance, research and application of science and technology, research and development (R&D), consulting services for transportation infrastructure construction projects that require modern and complex techniques; the field of social services such as: health care, education and training, production and supply of clean water for daily life; a number of projects to develop key tourist areas of the region.

Third, focus on partners with FDI inflows that meet local requirements: Partners capability of bringing advanced technology, high technology, modern management system, creating positive spillover effects to the development of the domestic economic sector; contribute to the construction and formation of spearhead industries. Partners have great financial capacity and long-term experience have stable and long-term investment capabilities; the world's leading multinational corporations; investors come from developed economies, G7 source technology owners and emerging economies such as Korea, India, Russia, Brazil, etc.

Fourthly, focusing FDI inflows into key areas: in the upcoming time, it is necessary to take extensive measures to attract FDI inflows into difficult provinces such as Hoa Binh, Phu Tho, etc. to ensure the harmoniously balanced economic development among regions. FDI projects in the provinces and cities in the region must be consistent with the regional spatial development orientation and regional functions approved by the Prime Minister in Decision No. 768/QD-TTg dated on May 6, 2016 on the construction planning of the Hanoi capital region to 2030, with a vision to 2050.

4.2. Conclusion

It can be seen that attracting FDI inflows is considerably important to the development process of each country. Through this study, we can once again confirm the important role of FDI inflows in the socio-economic development process of the provinces and cities in the capital region, economic restructuring towards industrialization and modernization, creating jobs for local workers, increasing revenue for the provincial budget, increasing export turnover, transferring science and technology. State management agencies in charge of FDI in Hung Yen province need to be aware of the importance of improving the quality of FDI inflows in the process of attracting investment projects into the area, diverting from passively receiving to actively welcome foreign investors; this, hence, is to actively promote investment, mobilize large foreign investors to invest in the provinces and cities of the Hanoi capital region.

CHALLENGES OF PPP MODEL APPLICATION FOR THE URBAN WASTEWATER SECTOR IN VIETNAM

Assoc. Prof. Dr. Le Thi Bich Ngoc

lebichngoc25@yahoo.com

Business School, National Economics University, Hanoi, Vietnam

Abstract

Public-private partnerships (PPPs) are considered as an effective mechanism for governments seeking to achieve better value for money and fund the investments needed to provide wastewater infrastructure and manage wastewater services. This paper examines the PPP model application in the wastewater sector in the context of Vietnam's urbans. It also pointed out major shortcomings related to institutional, financing and public partners' competencies that hinder PPP application process. The paper then provided some suggestions to foster this process.

Key word: *Challenge, PPP, wastewater sector*

1. Introduction

Acceleration of population and urbanization in cities in developing countries have created growing pressure on infrastructure including wastewater infrastructure. More fund for wastewater infrastructure development is needed to reduce the adverse effects of environmental pollution due to the discharge of sewage. However, there is a significant gap between available investment fund from the governments and the investment required for the provision of services (Shrestha et al., 2019). Lack of wastewater treatment and proper sanitation facilities have a significant impact on the urban environment and the health of citizens and sustainable economic development of cities (Yang et.al, 2015). The private public partnership (PPP) model, serving as one of the fastest-growing mechanisms for public infrastructure and service provision in recent decades, is considered to be an effective way to alleviate the pressure of government funding shortages and to improve the efficiency of sewage treatment, especially in developing countries (Lima et.al., 2021). Researchers (eg. Carbonara& Pellegrino, 2014; Ismal, 2013) presented various advantages of PPPs such as private financing and project acceleration, integrated solutions for public services, risk transfer to private sectors, potential of accruing efficiency and value for money, rubric to measure cooperative ventures between state and private business.etc.

The PPP model application to replace the public provision of infrastructure and services in the wastewater sector has become increasingly common. In Germany, one-third of all urban sewerage treatment projects are based on the PPP models. In China, by February 2016, there were 630 sewerage treatment projects (Yang et al., 2016).

Vietnam urbans' environment is under severe pressure because of economic growth, urbanization and state budget shortage. Having recognized importance of wastewater

infrastructure and service, the Vietnamese government has encouraged and supported the participation of the private sector in the provision of the wastewater infrastructure and services. In 1997, the government issued Decree 77/Government to attract private sector participation in public goods through BOT. The decree has been improved and adjusted many times. In 2020, PPP law has been promulgated to replace all previous PPP regulations. Though PPP models introduced since 1997, to date, number of PPP model projects in urban wastewater sector are very few.

This paper aims at exploring the PPP application in Vietnam's urban wastewater sector in order to highlight challenges for PPP model application in this sector. To do this, paper will analyse three key dimensions that affect the PPP adoption and implementation, namely the institutional, financing and payment dimension, and related parties' competencies. The findings of this study may benefit practitioners to further enhance PPP implementation by eliminating or minimizing the negative factors that impede the benefits of using PPP in the wastewater sector.

PPP concept and Literature review

PPP is a broad concept used to refer to a partnership between the municipal government and a private investor in the provision of infrastructure in a country. Though the meaning of PPP is clear,

there is no single definition of PPP. World Bank (2017) defined PPP as a long-term contract between a private and a public partners, for providing a public asset or service, in which the private partners bears significant risk and management responsibility, and remuneration is linked to performance. Yang et.al., (2016) defined PPP as follows: Through cooperation among public sectors and private departments, a contract should be signed to provide public goods, share risk and profit, and to generate all types of social capital to actively participate in providing public goods and services, thereby achieving a win-win situation. According to Vietnam's National Assembly (2020) PPP investment is forms of investment based on term basis cooperation between the State and the private investor through signing and conducting PPP project to attract the private investor participating PPP project.

PPP covers a range of different structures which can be used to deliver service. Depending on the country and the politics of the time, PPP can cover a spectrum from relatively shortterm management contract (with little or no capital structure); through concession contract (which may encompass the design and build of substantial capital assets along with provision of a range of services and the financing of the entire construction and operation) to joint ventures and partial privatization where there is a sharing of ownership between the public and private sectors (World bank, 2017).

Compared with other public service infrastructure sectors, the field of wastewater service is characterized as a large capital investment in infrastructure. Wastewater assets also have a very long life of several decades or longer, and are often installed well in advance of demand. In addition, most of the wastewater field's assets are barried (Jennifer, 2005). That may cause information asymmetry and high risk that are challenges in PPP application.

Application of PPP model has attracted a lot of attention from both practitioners and scholars. Many researchers (eg. Al-shareem, 2014, Ismail, 2013, Babatude et.al. 2012) examined critical success factors for a PPP project. Examples of success factors are appropriate risk allocation and sharing, favourable condition, favorable legal framework, well organized public agency, government support and competencies, commitment of public and private party, strong private consortium, availability of financial market, transparency and competition in procurement and so on. This study groups factors into three dimensions: 1) institutional dimension, Financing and payment dimension; and related parties' competencies.

Institutional Dimension

Casady et al. (2020) stress that institutional constructs such as legitimacy, trust, and capacity are crucial to mature PPP market formation. Because institutions are influenced by a combination of regulative, normative, and cultural-cognitive pressures. Institutions establish the 'rules of the game' in society (North, 1990). Strengthening institutions is thus crucial for fostering private sector participation in PPP models (Carbona and Pellegrino, 2014). Prager (1994) believes that degree of private participation depends on their belief in the transparency and fairness of the government in the bidding process, and the implementation of commitments in contract enforcement. Thus, the institutions need to be transparent to create confidence in the fairness of the bidding process. In addition, Monga & Sharma (2016) argue that competition among bidders is very important, it increases the power of the principal and is the driving force for bidders to offer lower or improved contract prices, better service quality. Competition combined with competitive bidding reduces losses arising from collusion, corruption, and other abuses of position and power. Therefore, competition in bidding contributes to budget savings for urban authorities. This implies that the government needs to have policies to encourage and attract the private sector to participate in the field of public services and create a fair competition among bidders. Consistent with previous researchers' arguments (eg. Prager, 1994), Ngullie et.al (2021) listed factors including lack of regulatory or policy framework, lack of sufficient transparency and openness in the procurement process, and lack of public awareness, lack of fair competition, vague contracts, absence of competitive bidders, shortcoming of fixing qualification criteria, flaws in tendering process that have adversely impacted the performance of PPP projects in India.

Financing and payment mechanism Dimension

Compared with conventional provision, a PPP is characterized as a single long-term contract including investment and service provision. The PPP contract typically lasts several decades, the concessionaire manages and controls the assets, usually in exchange for user fees and government transfers, which compensate for investment and other costs. At the end of the concession, the assets revert to government ownership (Engel et. al., 2013). Large scale wastewater infrastructure investment with very highrisk level tends to present challenges. Investors only participating in PPP projects if they can access to an adequate financing (Ngullie et.al., 2021). Thus, on the one hand, investors' financial capacity themselves is very important. On the other hand, the availability and accessibility to

attractive and flexible instruments like equity, debt, securities, is also a critical factor facilitating private investor participation (Ngullie et.al., 2021).

As regards payment mechanism, there are various methods used to pay private parties for providing services to users. The fund used to pay can come entirely from users' fee, or be provided only by public partners, or combined by the two methods (World bank, 2017). In context of state budget's shortage, fund from users' fees is very important. There is a global trend "the polluters pay" and wastewater tariff systems that are on cost recovery basis are designed to transfer costs to users (Lima et.al., 2021). The payment mechanism is considered as central to a public-private partnership contract, providing the agreed means of allocating risk between the public and private sector partners

Related PPP parties' competencies dimension

All three stages of a PPP project including pre-bid stage; 2) the contractor selection stage; 3) contract monitoring phase are all complicated. The need for unique skills and competencies to effectively manage PPP arrangements is an important issue, especially for public partners. PPP contracts are generally medium or long term, so conflicts can arise if public partners fail to prepare adequately for projects, design contracts badly and neglect to develop effective monitoring plans (Ameyaw and Chan, 2015). Thus, for public partners, sufficient competencies of public relative authorities help reduce the risk of adverse selection, it enables to select the "right" contractors.

Mistarihi et.al., (2012) indicated four groups of competencies: 1) personal qualities and attributes; 2) experiences; 3) knowledge and 4) training and qualifications needed for both partners to effectively manage PPP arrangements. Specifically, for personal qualities and attributes, adaptability and flexibility, and patience and self-motivation were important. The PPP managers need a set of skills such as social and interpersonal skills, 'scoping in/out' ability, conceptual skills, project management skills, and communication and coordination skills. PPP managers should have sufficient technical and project management experience, as well as experience in negotiation and arbitration. In addition, PPP managers should be knowledgeable and qualified to manage the construction, operational and the financial aspects of the PPP project. They should also be familiar with, and use specialized programming and scheduling techniques.

The above analysis allows to develop an analytical framework on dimensions affecting the PPP model application. The analytical framework will orient the discussion on the current situation and causes of shortcomings in PPP model application in the urban wastewater sector of Vietnam.

2. Method

The research objective is to analyze the current situation and challenges in application of PPP models in the urban wastewater sector in Vietnam. The research applies a combination of methods, including policy analysis, interviews with experts and practitioners, and the author's practical experience from working with urban administrations and service providers in the urban wastewater sector. Specifically:

As regards policy analysis, the author analyzes regulations related to PPP application in general and for the wastewater sector, to assess institutional factors, consistency and clarity in policy.

As regards interviews, the author conducted interviews with GIZ project experts, leaders and officials of the Department of Construction of some provinces and cities under the GIZ projects

Collected data is aggregated, compared and analyzed in accordance with the dimensions shown in the analysis framework.

3. Results

3.1. Current status of physical wastewater infrastructure in Vietnamese urbans

In Vietnam, urban drainage infrastructure lags regional countries such as Indonesia, Thailand. Urban drainage systems in most cities in Vietnam are combined systems of storm water and wastewater and have no wastewater treatment plant. Until now, the State budget is the main financing source for construction, renovation and upgrading of wastewater infrastructure and also for operation (World Bank & AUSAID (2013). Due to budgetary constraints, the capacity of the system in urbans are lagging behind increasing requirements driven by the rapid urbanization and economic growth. That results a low service coverage of average 40-50 percent (MOC, 2016) and there is about 10 percent of wastewater has been treated. Poluted wastewater has been negatively impacting town people's health.

Vietnam is facing high demand for wastewater infrastructure. According to Lambert (2021), investment need to close the infrastructure gap (including wastewater infrastructure) in Vietnam is significant. By 2030 will need about \$237 billion for infrastructure investments that budget cannot afford it. Thus, PPP for infrastructure in general and for the wastewater sector could help to address the shortages.

3.2. Institutional setting and PPP application in the wastewater sector

PPP application has been implemented since 1997 in accordance to decree 77 (Government, 1997) and it is then amended several times. On June 18, 2020, the National Assembly of Vietnam passed the Law on Public-Private Partnership (PPP Law) which establishes an umbrella legal framework for all PPP projects and aims to attract more private investment to the development of Vietnam's infrastructure including urban wastewater infrastructure. The PPP Law was effective since January 1, 2021, and replaces the previously issued PPP regulations.

In line with international practice, the PPP Law no longer recognises the Build-Transfer model (BT) of PPP investment under which investors could recover their investment by exchanging BT projects for land use rights to be used for other projects. As a result, there are now seven types of permitted PPP investment models: Build-Operate-Transfer (BOT), Build-Transfer-Operate (BTO), Build-Own-Operate (BOO), Operations and Maintenance (O&M), Build-Transfer-Lease (BTL), Build-Lease-Transfer (BLT), and mixed contracts combining (a) BOT, BTO, BOO or O&M and (b) BTL or BLT.

As off January 2019, there was 336 PPP projects with total investment capital of VND 1,609,335 billion, of which PPP in transportation accounted for majority of 220 project with VND 672,345 billion. Of 336 PPP projects, there were 140 BOT, 188 BT and 8 others.

PPP contracts related to infrastructure were mainly paid by cash or by land (BT). Water, wastewater and environmental sector accounted for small part with 18 projects and VND 21,716 billion (MOC, 2021). Up to date the wastewater sector is not attractive for PPP contracts. There are few private companies participating BT contracts that that are land exchange for infrastructure and contractors were directly appointed but not through bidding process. Related to implementation, practical evidence showed that there are existing interest conflicts between the public and private sector due to not good contract preparation, not effective risk sharing mechanism and loose contract's terms.

3.3. Challenges for PPP application in the wastewater sector in Vietnam

The previous regulations and now PPP Law have paved the way for PPP application in the wastewater sector. However, evidences from the research indicated that there have been many difficulties and challenges for this process as follows:

Institutional challenges

The government has issued general policies to PPP application since 1997. However, legal framework is immature and still evolving. There is lack of specific incentive policies for firms participating into the wastewater sector. In addition, PPP project's implementation is affected by other laws and regulations such as Budget Law, Public investment law, Enterprise Law, Construction Law etc., and there are gaps, inconsistencies and overlaps in the policy and regulatory framework. Interviewees said that in bidding process, criteria for contractor selections are based more on input but not output factors of public goods and services. This limited competition as many investors can not meet requirements related to PPP project's experiences. In addition, regulated selection criteria are general for all sectors but not specific for the wastewater sector. This is difficult for application. Interviewees contended that there is still lack of transparency and in many cases, direct contracting arrangements instead of competition is still the major method to choose the contractor. That leads to some irrelevant contractor selection and reduce beliefs of investors

Financing and Payment challenges

Most private firms in wastewater sector are small and medium enterprises with limited financial capacity. In order to able to participation in PPP projects, accessibility and availability to financing sources are important. However, commercial loans from domestic commercial banks are not used extensively in the wastewater sector. In cases, domestic private investors can borrow from domestic commercial banks, they were charged with high interest rates of 9 to 11 percent meanwhile international investors can borrow in international capital markets with much lower interest rates of about 5 to 6 percent (MOC, 2021).

Though, bond and equity are methods commonly used to raise fund for municipal infrastructure in developed countries. However, capital market is still under-developed, application of these financing methods is limited in Vietnam, especially for firms in the wastewater sector. In addition, according to experts, under PPP law, introduction of minimum investment requirements and the removal of step-in rights for lending banks, investor's rights to transfer its rights and/or obligations under a project contract may affect the ability of investors to raise funds for a PPP project in private and international lending markets.

The government (2014) stipulated the application of wastewater tariff to replace the very low environmental fees (environmental fee as regulation to not exceed 10 percent of water tariff) to mobilise contributions from service users and increase capital for the wastewater sector and reduce municipal budget's pressure. However, to date most urbans still apply environmental fees of about less than VND 500 per m³ of water. Some urbans introduced wastewater tariff. However, most applied wastewater tariff is still low and can cover 30 to 50% of operation and maintenance costs. In addition, standard profit stipulated by MOC (2015) for contracts in the wastewater sector must not exceed 5%. Meanwhile, revenue guarantee, borrowing guarantee under PPP Law is still unclear. Experts believe that these factors are also the reasons, PPP models are not attractive for private investors' interest.

Challenges related to related partners' competencies

Though PPP models are commonly used over the world. This is still not popular in Vietnam. One important barrier is that relative parties both public parties and domestic private parties have very little knowledge, experience and skills related to PPP project management. This is more problematic for public parties. In Vietnam, most expertise for PPP and infrastructure is at the central level. However, province and city administrations do not have the capacity and human resources to effectively prepare PPP contracts including the calculation of the contract value.

The cost norms for O&M activities for all elements of the drainage/sewerage system are either lacking or inappropriate. This limits effectiveness and efficiency for provincial authorities to review and appraise the annual O&M costs and contract value. In addition, there is lack of clearly defined and measurable outcomes. The technical specifications for O&M of drainage/sewerage systems is a key obstacle. However, the existing specification are out-of-date or do not cover all elements in the drainage/sewerage system.

4. Conclusion

Application of PPP models for provision of wastewater infrastructure and service is a trend around the world. It is considered as efficient method for better service at lower costs at the same time reducing budget pressure for government. Nevertheless, there are still challenges related to institutional, financing and administration's competencies that make the PPP model application in the urban wastewater sector of Vietnam not attractive.

In order to foster PPP model application in the wastewater sector in incoming years, the government should enhance PPP legal framework. Policies, support mechanisms should be specific, transparent and feasible for the wastewater sector.

As regards financing channels, development of alternative financing scheme for the sector should be implemented. Specifically, wastewater tariff based on "cost recovery principles" should be widely applied to replace low environmental fees, capital markets including bond and stock markets should be improved and developed.

As regards the public sector, public administrators, especially at provincial and city level should be equipped with knowledge, skills to develop standard contract templates and draft PPP contracts, implement and control contracts through training courses. Lessons learned from best practices of PPP application in the sector around the world be also helpful.

INFRASTRUCTURE PLANNING AND IMPLEMENTATION IN VIETNAM

Dr. Nguyen Kim Hoang

hoangnk@neu.edu.vn

*Faculty of Environmental, Climate Change and Urban Studies, National Economics
University, Hanoi, Vietnam*

Abstract

Massive funds have been injected in infrastructure construction in developing countries to support economic growth and their integration into global markets. However, whether these funds would improve the nation's public infrastructure in the long-run depends on how well infrastructure is planned and built. Based on an extensive literature review, this paper identifies a number of deficiencies in the planning and policy making process, as well as in the implementation of infrastructure plans. This paper aims to show policymakers that the critical challenge faced by developing countries in infrastructure construction is thus not about the funding but should be more about effective planning and implementation for long-term benefits.

Key words: *urbanization, planning, infrastructure*

1. Introduction

Infrastructure is core to growth process in different regions across the globe. The outcome of economic growth due to advancement of infrastructure has welfare enhancing effects in a country and lowers inequality levels (Bhattacharya et al., 2015). Increased infrastructure development can promote economic growth by at least 2 percent per year; this is true for different developing economies in Africa, Latin America and Asia (Calderon and Serven, 2010). It increases the productive capacity and sustains development. Infrastructure consists of capital-intensive natural monopolies, physical or organizational structures, which are needed for the operation of a society and functioning of an economy. Examples include communication systems, highways, water and sewer lines, health, education and transportation facilities etc. Most of these systems are owned by government. Economic infrastructure includes transportation and communication facilities, whereas water and sewer lines, health centers and educational institutions are included in social infrastructure. However, the poor quality and inadequacy of infrastructure thus become one of the major development challenges in many developing countries. Considerable financing is required to meet large scale infrastructure expansions in developing economies. As a result, the literature is dominated by studies focusing on potential difficulties in project financing for infrastructure development (Davis, 2008; Arnold, 2011).

Globally, government investments accounted for 78% of total investments in infrastructure construction from 1994 to 2003 (Estache, 2006; Kenny, 2007). However, the empirical analysis by Flyvbjerg (2007) indicated that cost overruns, benefit shortfalls and

waste were found in most infrastructure projects around the world. The low efficiency and quality of public investments in infrastructure found in these studies suggest that there are important issues beyond the difficulties in project financing for infrastructure development. A focus on financing issues therefore does not provide a comprehensive answer to the infrastructure development problems in developing countries.

Some studies focus on the planning and policy making aspect of infrastructure development (Mustajab, 2009; Marshall, 2011). Other empirical studies show that there are still a number of issues (for example delay, cost overruns, quality, safety and productivity) in infrastructure construction to transform these master plans into physical infrastructure capital (Toor and Ogunlana, 2008; LaFraniere, 2011). Reviewing the literature on problems in infrastructure planning and delivery in developing countries thus would be important for the governments to cut down costs and waste, thus enhancing the efficiency of public investments in infrastructure, and meeting development goals.

Problems in infrastructure planning in developing countries

There are a number of issues relating to the quality of infrastructure planning outcomes, including the absence of an adequate problem analysis, lack of alternatives, ambiguities about the effects of improved infrastructure on the development of a wider area, inadequate research of the interaction across infrastructure sectors, and underestimated costs and overestimated benefits (Estache and Fay, 2007; Priemus, 2010). The poor quality of infrastructure planning outcomes would thus result in bad policy choices, which subsequently have a wider effect on the economy. Although infrastructure planning tools have recently been developed (Schweikert and Chinowsky, 2012; World Economic Forum, 2012), there are deficiencies in the capacities required for using these tools. Tackling deficiencies in planning and policy making capacities of governments can therefore play a crucial role in determining the efficiency of public investments in infrastructure for trade and economic growth in developing countries. Reviewing the literature on government planning, especially in the area of infrastructure development, the following factors can be attributed to deficiencies in the infrastructure planning and policy making process.

Capacity for estimation and monitoring of rates of return of projects

Unexpected infrastructure planning outcomes can first be explained by the lack of capacity for estimation and monitoring of rates of return of projects, including limitations of forecasting methods and appraisal techniques; inadequate data; inherent problems in predicting the future and monetizing external and indirect effects; lack of experienced forecasters; lack of quality checks on planning outcomes; and inadequacy in routinely ex post analysis and external audits on whether policies and projects meet objectives (Short and Kopp, 2005; Collier and Venables, 2008).

Politicized decision making

Besides these technical factors, failures of the planning process could be explained by the political factor (Devarajan and Swaroop, 1993; Todaro and Smith, 2003). Political leaders and government bureaucrats can use investments in infrastructure construction as a tool for securing political positions or competing for scarce funds. Lack of commitment of

political leaders and government bureaucrats to national goals could therefore make infrastructure planning and decision making politicized rather than rationalized. In addition, powerful groups with vested interests can create pressure to affect the planning that serves their own interests (Todaro and Smith, 2003).

Transparency and accountability

Infrastructure planning and policy making processes are rarely fully transparent to the public. Forecasting methods, criteria of project selection and the determination of planning objectives are often not made available for consultation with the interested or affected individuals or groups. Independent peer reviews and quality checks on forecasts and planning outcomes by independent-review bodies and the scientific and professional community are not sufficient. Lack of penal systems to enforce penalties on those that deliberately and consistently produce deceptive forecasts is also attributable to the accountability problem (Short and Kopp, 2005; Flyvbjerg, 2007).

Institutional weaknesses in planning

Since planning and policy making for infrastructure is a multi-actor process, nurturing of an institutional capacity that coordinates efforts and resources is considered one of the determinants of infrastructure development (Mody, 1997). However, there are a number of institutional weaknesses of the planning processes of most developing countries, including the poor communication between the planning agency and the day-to-day decision-making machinery of government; intersectoral rivalries; lack of interaction between political leaders, planners with non-governmental actors; incompetent and unqualified civil servants; as well as complicated and bureaucratic administrative systems (Todaro and Smith, 2003).

Problems in delivery of infrastructure in developing countries

While there may be widespread agreement with a policy of supporting the increase of infrastructure investments for trade and economic growth, there are concerns in infrastructure construction. In recent years, governments, especially those in developing countries, such as China and India, have initiated ambitious infrastructure investment plans (Arnold, 2011). Empirical evidence in developing countries has shown that even if sufficient investments are raised, there are still a number of issues in infrastructure construction (for example, delay, cost overruns, quality, safety and productivity) to transform these master plans into physical infrastructure capital (Long et al., 2004; Le-Hoai et al., 2008; LaFraniere, 2011). To improve the quality and efficiency of infrastructure investment and planning, these issues in the implementation of infrastructure development plans need to be examined.

Political commitment

Studies on infrastructure development in East Asia have emphasized that sustained and powerful government leadership is crucial (Mody, 1997). Infrastructure development involves a long-range vision that sustained commitment from the government is essential to support the development of a concrete strategy and subsequent actions. Lack of political commitment thus could have direct effects on the implementation of infrastructure

development plans (Waterston, 2006). Lack of political commitment could be the result of political discontinuity, political inconsistencies at the national level and between different tiers of governments, and lack of a high-powered government institution that provides an effective mechanism for implementing national infrastructure plans (Priemus, 2010).

Corruption in infrastructure construction

Construction, in particular infrastructure construction, continues to be ranked as one of the most corrupt sectors worldwide. Corruption in the sector occurs in all stages from securing government contracts to the delivery of infrastructure. Major impacts of corruption in infrastructure can lead to poor construction, limited occupational safety and low returns to government infrastructure investments (Kenny, 2007). There are a number of causes of corruption in infrastructure construction, including the lack of transparency and competitiveness in bid processes, the discretionary power of individual bureaucrats involved in the award of contracts, inadequate financial and physical auditing, and inadequate capacity of regulatory bodies to enforce regulations (Kenny, 2007, Dabla, 2011).

Land acquisition

Problems in land acquisition can cause substantial delays and cost overruns in infrastructure construction (Priemus, 2010). In many developing countries, land acquisition is considered one of the major barriers to governments' plans to develop infrastructure (Agrawal, 1999; Morris, 2007). Major problems in land acquisition for infrastructure in developing countries can include poor compensation and undervalued market price of land. Several causes for these problems can be identified, including lack of a negotiating mechanism to make land acquisition compensation more market-oriented; bureaucracy in settling land disputes and claims; lack of a land acquisition compensation monitoring system; and lack of clarity about compensation valuation methods, lack of law enforcement to regulate land price speculation (Chan, 2003; Raghuram et al., 2009; Widhiarto, 2011).

Building capacity of local firms

Various construction components, including finance, technology, management, materials and labour are required in the construction of infrastructure projects. The inadequate capacity of the domestic construction firms in developing countries to meet the level of construction activities required for the construction of infrastructure could thus affect the implementation of infrastructure development plans. Moreover, the inadequate capacity of the domestic construction firms could lead to increasing foreign participation, which in turn could limit the opportunities for local firms to win contracts and for the local labour to gain employment (Raftery et al., 1998). Current issues pertaining to the capacity that domestic construction firms in developing countries are facing include poor level of efficiency and quality of work; poor level of professionalism and entrepreneurship; and resources shortages, especially in construction technology, management and finance (Howes and Robinson, 2005; Ofori, 2012).

Institutional and legal weaknesses in infrastructure construction

Other concerns involve institutional and legal weaknesses in infrastructure construction, including obsolescence of building regulations, changing and inconsistent law

and regulations, ineffectiveness of implementation of existing statutes and codes, and bureaucracy in formal procedures relating to project planning, construction permissions and administration (Raftery et al., 1998; Ofori, 2012).

2. Method

Article implementing qualitative research methods, based on data and documents from ADB, WB, other agencies and organizations, the author synthesizes, analyzes, compares, evaluates, draws comments and recommends solutions according to the goals of the article.

3. Results

Quality infrastructure is central to economic development. Despite spectacular progress over the past two decades, Vietnam will need to invest more and better to catch up with more advanced countries in terms of infrastructure development. This will require spending existing resources more efficiently by improving the planning and execution of projects, including procurement, and greater attention to maintenance spending, which has been neglected.

The success of a country is often measured by the quality of its infrastructure. Prosperity requires connective infrastructure and good access to services such as electricity and water. All high-income countries are unambiguously among the economies with the best infrastructure (figure 1). The strong and positive correlation between infrastructure level and economic growth (as well as poverty alleviation) has been well evidenced by a number of empirical cross-country studies, which have estimated that a 1 percent increase in physical infrastructure stocks, given other variables, temporarily raises GDP growth by as much as 1 to 2 percentage points, although the growth acceleration gradually tapers off as the economy approaches its long-term per capita income.

Figure 1. The close and positive correlation between infrastructure quality and economic development, 2017

Source: World Economic Forum

Vietnam has made spectacular progress over the past two decades, building roads and ports and making access to electricity almost universal. However, the country will have to respond to the fast-growing demand for infrastructure services due to the rapid economic

growth and demographic transition. For example, current demand projections for electricity show a dramatic increase from 47.9 gigawatts of installed capacity in 2018 to 60 gigawatts in 2020 to 129.5 gigawatts in 2030. Vietnam will also have to invest more and better as it still lags more advanced comparators in most infrastructure indicators. According to the World Economic Forum’s Global Competitiveness Index, the quality of Vietnam’s infrastructure ranks about 80th out of 137 economies worldwide, ahead of some neighboring countries such as Cambodia, the Lao People’s Democratic Republic, and the Philippines, but behind other regional peers such as China, Indonesia, and Thailand.

To deliver more and better infrastructure, Vietnam is facing several strategic decisions. In an ideal world, infrastructure should be provided to everyone and everywhere. Yet, countries are facing difficult budget constraints that force them to make choices. For Vietnam, infrastructure needs are estimated at US\$25 billion to US\$30 billion per year over the past decade, which is greater than the government’s financing capacity, which has been about US\$15 billion to US\$18 billion per year in recent years (or around 7 percent of GDP, which is 3 percentage points higher than the world average). While these projected figures are debatable, they strongly suggest that improving the efficiency of spending, and ensuring adequate financing, will be critical in the coming years (figure 2).

Figure 2. Investment needs and financing, 2019 - 2040

Source: Global Infrastructure Outlook, <https://outlook.gihub.org/countries/Vietnam>

There is abundant evidence that Vietnam’s infrastructure investments are not as efficient as they could be. If the government has spent a large proportion of its budget on infrastructure— as much as 10 percent in 2010 and an average of 7 percent in recent years— the results have not been positive in all sectors. Benchmarking Vietnam’s utilities across other Asian economies shows that Vietnam has done relatively well in the energy sector, with good coverage of domestic needs, even though the transmission network still suffers from underinvestment and poor maintenance. The performance of the transport sector is also

viewed as reasonably good, with major improvements reported in roads, ports, and airports during the last decade. Weak planning and coordination across jurisdictions have, however, contributed to lower efficiency. For example, highway projects that provide access to inland container depots, marine ports, and airports are seldom planned and implemented as integrated systems. By contrast, reliability of the water supply has declined in recent years as more customers are experiencing water outages (from 3.2 percent to almost 10 percent) and suffer from a deterioration of quality. The performance on wastewater collection, treatment, and reuse is one of the worst in the region, with only 4 percent of urban households having piped sewerage, and only half of the wastewater collected being treated.

The uneven performance of the infrastructure sector in Vietnam is rooted in two major causes. The first cause is the selection and implementation of infrastructure investment projects that are not always adequately screened, well prepared with alternative analysis, coordinated to ensure their economic viability, or implemented at least cost. The second cause is the systematic shortfall in infrastructure maintenance, which increases lifecycle costs.

There is an unequal application of least-cost planning approaches in Vietnam. The selection of efficient projects is generally achieved through least-cost planning, which is a process in which demand is estimated and the most cost-effective interventions for meeting that demand are systematically identified. Ideally, demand management approaches should be considered alongside supply expansion as alternative ways of achieving supply-demand balance. Least-cost planning calls for strong local capacities to examine all available options in a comprehensive and even-handed manner. Good sector data and modeling tools provide a solid basis for least-cost planning. The analysis should use whole life cost accounting to ensure that solutions are found that are cost-effective to build and operate.

While such approaches are applied in the power sector, they are not used with consistency in other sectors. The main reason appears to be in the fragmentation of the decision processes between the central and local governments. Today, despite recent efforts to rationalize processes, the planning system in Vietnam is characterized as institutionally complex with overlapping and overproduction of plans—around 20,000 plans, guided by more than 70 legal documents and 70 decrees. These plans are prepared by different ministries or departments, often based on different schedules, and use inconsistent data and projections for planning. There are virtually no effective mechanisms for interprovincial, intercity, or inter-district coordination, resulting in over-competition for resources and duplication of infrastructure such as ports, airports, and industrial parks.

Another reason for the inefficiency in the infrastructure sector lies in the limited capacity of local governments and the lack of coordination among the different levels of governments. Local authorities are now responsible for 60 percent of total public expenditures, up from 35 percent in 1996 and well above the average of 25 percent in developing economies. While local autonomy and competition contributed greatly to the dynamic economic and social progress at the local level in Vietnam, it also exacerbated the need to strengthen planning and management capacity at the local level and to improve coordination across regions and between the local and national levels. Unfortunately, as recognized by top policy leaders, little progress has been realized in Vietnam.

Institutional fragmentation and limited local capacity greatly complicate the infrastructure planning process, and failures to coordinate across spatial or sectoral jurisdictions can lead to costly mistakes in project selection. This problem is particularly salient when it comes to transportation networks, because, while the transport network needs to function as a national multimodal integrated system, the division of institutional responsibility further prevents the relevant decision makers from optimizing and planning infrastructure accordingly. Vietnam has recently advanced its decentralization agenda, with a focus on planning and programming of infrastructure investments to the provincial level. However, recent studies suggest a significant disconnect between planned investments and effective demand. Individual provinces tend to identify and undertake their own infrastructure plans and projects, which end up competing against each other rather than being strategically coordinated. Worse, there is rarely adequate coordination of planning between port facilities and critical connecting infrastructure such as road and rail. In water supply, where cross-province solutions are required, the legal, regulatory, and institutional frameworks to share water resources are also lacking. Similar challenges arise in the planning of urban infrastructure and even irrigation, which is explained below.

Even when the right projects are selected, many suffer from long delays and excessive costs during implementation. These inefficiencies arise from different sources, but a problematic area appears to be procurement. Competitive procurement is legally the default mode of public procurement in Vietnam, but it is not typically adhered to. For example, in 2017, almost 70 percent of all public contracts were directly contracted, accounting for about 13 percent of the total value of public contracts. The preliminary results of an ongoing World Bank study on a sample of contracts indicate that even when competitive bidding was used, the level of competition was low due to a limited number of accepted bids. Furthermore, some legal documents issued for specific sectors still allow wide use of direct selection, which explains why direct selection accounted for 69.2 percent of the total number of contracts awarded, while the saving percentage from this procurement method is only 2.62 percent, much lower than the average of 6.98 percent. Another practice that compromises the value for money is the manipulation of evaluation criteria or choice of inappropriate contract types to allow adjustment of unit prices. While the application of e-Procurement (e-Bidding and e-Shopping) has generated some savings (on average 8.2 percent), the volume of contracts subject to competitive procurement was only 28 percent in 2018.

Insufficient maintenance spending of existing projects

Operational efficiency is achieved when the costs of running an infrastructure service are kept close to the technically feasible minimum. Once capital investments have been made, the resulting assets are used to deliver a variety of infrastructure services, typically incurring additional costs to operate the system. In the case of infrastructure, a major component of operating costs is asset maintenance. Good maintenance generates substantial savings, reducing the total life-cycle cost of transport and water and sanitation infrastructure by more than 50 percent, and also increases the lifetime of assets. As an illustration, a recent study by the OECD suggests that each additional US\$1 spent on road maintenance saves US\$1.5 in new investments, making better maintenance a very cost-effective option.

Despite high levels of infrastructure investment in Vietnam, maintenance budgets have typically not been adequately funded. Every time a new infrastructure asset is built, an ongoing maintenance liability is created, which is not factored in during procurement. The rule of thumb is that maintenance needs are approximately half of investment needs in the water and transport sector, which is far from reality in Vietnam. For example:

- **Water.** In inland waterways, despite the recent increase in the level of Vietnam Inland Waterways Administration operations & maintenance (O&M) funding allocated through the state budget, the backlog is significant and falls well short of the sector's needs. Similarly, the irrigation systems in Vietnam are servicing well below their designed capacities in part due to deferred maintenance. In fact, about 70 percent of the total O&M budget provided by the government is currently used to cover the administrative costs of irrigation management entities, and only the remaining 30 percent is used for maintenance activities, which is inadequate.

- **Transport.** While Vietnam has a complete road network with a relatively high road density of about 0.87 kilometers of road per square kilometer, the full potential of such a network is hindered by its poor condition due to low levels of maintenance and maintenance financing. The current level of maintenance expenditures is estimated at around 10 percent of capital investments in this sector, far from the 22 percent in Bangladesh, 30 percent in OECD countries, and 37 percent in Indonesia. This maintenance shortfall exists despite the dedicated Road Maintenance Fund in Vietnam established in 2012.

Vietnam has been relying primarily on public investment to finance infrastructure expansion, with private investment in infrastructure limited to less than 1 percent of GDP over the last decade, which was captured almost entirely by the energy sector. The government has justified its reliance on public investment on the grounds that it has a strong commitment to improve infrastructure and, thus, meet the basic needs of the population. It has also justified its reliance on the large amount of concessional financing made available by development partners, representing up to half of public financing in these sectors during the past decade.

However, this reliance almost exclusively on public financing may have reached its limits, for at least two reasons. First, the authorities have opted to disproportionately favor current users at the expense of taxpayers and future generations, by applying low tariffs and by subsidizing them. Second, concessional financing has almost disappeared for Vietnam as the result of its graduation from the World Bank and Asian Development Bank concessional lending programs. Going forward, the authorities will have to pay market rates to finance their investment program in capital markets.

4. Discussion and Conclusion

To meet the huge demand for infrastructure, increasing infrastructure investments are encouraged in developing countries. However, empirical evidence has shown that these development objectives might not be realized as expected due to the low efficiency and quality of administering these public investments. Several studies have found that the low efficiency and quality of public investments in infrastructure could be attributed to

deficiencies in the planning and policy making process (Todaro and Smith, 2003; Flyvbjerg, 2007; Priemus, 2010). In addition, there are concerns about the implementation of infrastructure development plans that could affect the quality and efficiency of public investments in infrastructure (Kenny, 2007; Dabla-Norris et al., 2011). This highlights the importance of bringing these issues in both planning and implementation processes together and looking at them through the role of the government as coordinator and facilitator of overall economic development. A number of issues were identified, notably inadequate capacity for estimating and monitoring of rates of return of infrastructure projects; politicized decision making; transparency and accountability problems; institutional weaknesses in decision-making; lack of political commitment in the implementation of infrastructure development plans; corruption in infrastructure construction; problems in land acquisition; local construction firms' capabilities and resource shortages; and institutional and legal weaknesses in infrastructure construction. In order to improve the efficiency of government funding invested in infrastructure to support trade growth and economic development, these issues must first be resolved.

LAND PRICES IN VIETNAM: INADEQUACIES, LIMITATIONS AND SOLUTIONS

Phan Thi Thanh Huyen

ptthuyen@vnua.edu.vn

VietNam National University of Agriculture (VNUA), Hanoi, Vietnam

Nguyen Thi Hue

nthue@hunre.edu.vn

Hanoi University of Natural Resources and Environment (HUNRE), Hanoi, Vietnam

Abstract

The purpose of the study is to clarify the current situation of residential land prices in Vietnam, the shortcomings and limitations of prices, and the valuation methods being applied in Vietnam; Identify the causes that lead to the difference between the regulated land price and the market land price, the shortcomings in the land valuation methods currently being applied in Vietnam, and then propose solutions to overcome the above shortcomings and limitations. The proposed solutions include: completing and comprehensively renewing the land valuation system; completing the legal framework to promote the implementation of land auctions for all purposes; researching to create official information channels, reliable enough, to meet practical needs to timely reflect fluctuations in market prices; strengthening the inspection and inspection of the implementation of the land use planning; detecting and promptly handling acts of using land in contravention of planning and using land for improper purposes.

Keywords: *Land values; Land price; Land price in Vietnam*

1. Introduction

According to (Verheye, 2009) land is one of the assets of great value. Land prices are determined by supply and demand mechanisms and profitability. Land prices are the primary basis for valuing real estate, determining the influence of the economy on land use policy, and calculating taxes on real estate revenues (David and Gabriel, 2013). The land price is determined by the economic principle of highest and best use of land which produces the highest net return in any term, over a period of time (Dang and Nguyen, 2005; Phan et al., 2017). The lack of reliable nationwide databases on land transactions also makes it difficult to estimate land price exactly (Phan et al., 2017). In Vietnam, the land is owned by the entire people, land price is the value of land use rights, calculated per unit of a land area prescribed by the State or formed in a land-use right transaction. Therefore, the implication of land price is not the same as that of countries with multiple land ownership (Phan and Pham, 2020). There are two types of prices, including land prices regulated by the state and land prices successfully traded in the market, also known as market prices. Both types of land prices mentioned above are closely related and influence each other, they are affected

by the laws of the market economy, in which the market land prices are usually established before land prices regulated by the state. State land prices are set in a relatively static state, while market prices are usually in a dynamic state (Ho, 2005). There is always a difference between the land price regulated by the state and the market price, the land price list next year is often higher than the previous year (Bui, 2004). Therefore, this article will illustrate the current situation of land prices in Vietnam and clarify the shortcomings related to land prices in Vietnam, thereby proposing solutions to limit the above shortcomings.

2. Method

Data related to land prices were collected from scientific articles, and research works published in prestigious domestic and international journals. In addition, the study also used official documents issued by state agencies. The study also used analysis, synthesis, and comparison methods to evaluate the strengths and limitations related to land prices in Vietnam as a basis for recommendations.

3. Results

3.1. Land price and some regulations of land prices in Vietnam

3.1.1. Land price

Price is a parameter to express the value of an object or a property. Price, expressed in money, is the generally accepted means to compare values in a market (Verheye, 2009). According to Walters (1983), the price of land corresponds the value of ownership of stipulated rights in perpetuity and is equal to the estimated present value of the expected future appropriations of rents. According to Phan et al. (2021), in countries with market economies, land prices are understood as an expression of the value of land ownership. However, it is also affected by uncertainties about net rent, interest rates and inflation. In other words, the value of land depends as well on the evolution of rent (Walters, 1983).

In Vietnam, according to the provisions of the Land Law 2013, land belongs to the entire people with the State acting as the owner's representative and uniformly managing land. The State shall grant land-use rights to land users. Thus, the land price means the value of land use rights, not the value of land ownership. Value of land use rights means the monetary value of land use rights over a specified land area during a specified land use term (The National Assembly, 2013). Many studies have shown that land value and land price are not synonymous but are closely related (Morris, 1979).

3.1.2. Some regulations of land prices in Vietnam

In Vietnam, the State shall prescribe the principles and methods for land valuation. Article 4 of Decree 44/2014/ND-CP stipulates 05 methods of land valuation: (i) direct comparison method; (ii) subtraction method; (iii) income-based method; (iv) surplus-based method; (v) land price coefficient using method. With each method of land valuation, the State has specific regulations on conditions to apply land valuation accordingly. However, there are still many shortcomings related to land prices, posing great challenges to the field of land management. The State shall promulgate land price brackets and tables, and decide on specific land prices (State regulated prices). Besides these prices, there are also market land prices.

The land price bracket shall be formulate by Ministry of Natural Resources and Environment and request the Government to promulgate it every 5 years. If the common

market price of land increases by 20% or more in comparison with the maximum land price in the bracket or decreases by 20% or more in comparison with the minimum land price in the bracket, the Government shall adjust the land price bracket.

Land price tables is also issued every 5 years. Provincial-level People's Committees, based on local realities, are allowed to set the maximum land price in the land price list, the adjusted land price list is no more than 20% higher than the maximum price of the same type of land in the land price bracket. Provincial-level People's Committees, based on local realities, are allowed to determine the maximum price in the land price list, the adjusted land price list according to the provisions of Decree No. 44/2014/ND-CP. The land price list is publicly announced on January 1 of the first year. During the implementation of the land price list, when the Government adjusts the land price bracket or the common land price in the market fluctuates, the People's Committee of the province shall adjust the land price list accordingly.

Specific land price is the land price determined according to a specific valuation method for a definite land parcel, at a specified time, to serve as a basis for determining financial obligations or for other purposes as prescribed by law. The specific land price is decided by the Provincial People's Committee on the basis of investigation and collection of information on the land parcel, market price of land, information on land price in the land database, and application of the suitable land valuation method.

Market land price is formed in the transfer of land use rights or the winning land price at the land use right auction when the State allocates or leases land or the land price is determined based on income from land use. The market price of land is one of the bases for determining specific land prices and determining financial obligations from land in specific cases as prescribed by law (Phan et al., 2021; Ho and Nguyen, 2006; Trinh et al., 2013). The specified price will be close to market value when certain assumptions are satisfied such as: there is no coercion on the buyer or seller in an attempt to force a buy or sell; knowledgeable buyers and sellers and acting in their own best interests; reasonable time for the transaction to take place; payment in cash (Eckert et al., 1990).

3.2. Some existence and limitations in the residential land prices in Vietnam

The Land Law 2013 stipulates that the land price in the framework must be equal to the market price, but the residential land price set by the State is separated from the market price, only about 30-70% of the market price (Tran and Nguyen, 2020; Ho et al., 2020; Phan et al., 2021). Besides, the site clearance work has been faced the difficulties due to land price to calculate compensation is too low compared to the market price. This causes many conflicts between land user and the State, complaints and lawsuits related to land. Although, the 2013 land law stipulates that the compensation land price is the specific land price along with many innovations in the principles and method of land price determination. However, the land price for compensation and support in most projects is inappropriate. The reason is that the land price determination lacks reference information. According to Point c, Clause 1, Article 112 of the 2013 Land Law, the principle of land valuation is to be "consistent with the popular land price in the market", but in reality, it is difficult to determine what the actual transaction price in the market is. Currently, there is no database to manage market land prices in all localities. Decree No. 117/2015/ND-CP dated 12/11/2015 stipulates that the

database on the local real estate market must include information on transaction volume and real estate transaction price. However, at present, even the provinces that have built information systems on housing and real estate market do not have this kind of information. Besides, the application of income-based method in agricultural land valuation is also a reason for low agricultural land prices.

Low compensation land price is one of the reasons for delay in project implementation. According to the Ministry of Planning and Investment, there are about 2.6% of investment projects in 2020, corresponding nearly 1,900 projects suffer from behind schedule and among them there are 1100 projects faced in "bottlenecks" of site clearance (Nguyen, 2021). According to the report of the Chief Justice of the Supreme People's Court in 2020, through the handling and adjudication of administrative cases, the causes are mainly related to complaints about administrative decisions and administrative acts. on land management (Supreme People's Court, 2020).

The Land Law 2013 stipulates that the land price bracket is applicable for 5 years. When the land price fluctuates by more than 20%, adjustments should be made. In fact, since the promulgation of the law, the Government's land price bracket has never changed even though housing prices in the market are constantly fluctuating, even increasing abnormally in land prices (Pham & Nguyen, 2022). Therefore, at any time, the prescribed land price is always far below the market price. Besides, the regulation on land price tables issued by the People's Committee of the province is used for a period of 5 years and can only be adjusted in case of the popular land price in the market increases by 20% compared to the maximum land price or 20% or more reduction from the minimum land price for a period of 180 days or more. In fact, the administrative procedures for adjusting the land price list are very complicated, such as having to go through the People's Council of the province, so the adjustment of the land price list in some localities is not timely while the change of land use purpose is not timely. Land use still active every day will cause great loss to the state budget or in some cases for the benefit of groups, but in some areas, when the market price of land increases, the locality still does not adjust the land price table to calculate land use levy from the change of land use purpose, recognition of land use rights of households and individuals for land areas in excess of land use quotas.

The land valuation methods are being implemented in Vietnam also used in countries around the world (except for the land price adjustment coefficient method). The methods of land price valuation in Decree No. 44/2014/ND-CP are methods of land pricing according to the market mechanism and are applied in the market economy, in which the subject of transactions is on the market is the land ownership (not land use right). Therefore, when applied in specific conditions in Vietnam, it is impossible not to avoid inadequacies and limitations. In addition, the application of land valuation methods brings about a large disparity in results, especially for lands with large added value (due to receive the high commercial advantages in urban areas, areas that are investing and developing infrastructure).

3.3. Solutions complete lang price valuation

To comprehensively reform the land pricing system, so that the land price set by the State must match the land price in the market, it is necessary to consider and perfect the renovation: to

overcome the shortcomings of the input factors of valuation. land; land price management method based on land price registration; perfecting the system of land valuation organization.

In order to ensure the principle of being consistent with the prevailing market price, consider abolishing the content of the government's regulations on land price brackets in Article 113 of the 2013 Land Law so that provinces and centrally run cities can determine land prices themselves. in accordance with the market price as prescribed by law. Promote decentralization for local authorities to proactively determine land prices. Increase the use of services of valuation enterprises. Valuation to conduct land valuation in the area to serve the construction of a specific land price list, closest to the market price. Associated with that is to form an effective mechanism to monitor the implementation of the construction of land price lists in order to eliminate the cases where a lower land price list is prescribed to attract investment, reduce compensation and support when the State land recovery according to regulations.

Research to create official information channels, reliable enough, to meet practical needs in order to timely reflect fluctuations in market prices. Accordingly, towards the completion of the land price system in the National Price Database, in which the data fields will be mainly formed on the basis of collecting prices through real transactions to ensure reliability. reliable for reference with the collected and survey results of the consulting unit.

Strengthening the rectification of the state management of land, strictly managing real estate projects; publicize information on master plans and plans; strictly comply with regulations on registration of land use right transfer and change of land use purpose.

4. Conclusion

The land price in Vietnam is the value of the land use right. There are two types of prices, the land price set by the state and the land price successfully traded on the market, also known as the market price, which is priced according to the land price. land valuation methods are prescribed in Article 4 of Decree 44/2014/ND-CP, specifying 05 methods of land valuation, including direct comparison method, subtraction method, income-based method, surplus-based method and method of using land price coefficient. At any time, the land price regulated by the state and the market price always has a large difference, causing many inadequacies in land management practice, especially in determining land prices for compensation and site clearance.; determine financial obligations in land allocation, land lease, land use right transfer, etc; In addition, it also leads to other socio-economic consequences such as the appearance of many speculators, land accumulation, pushing up land prices, arising long-lasting land lawsuits, compensation and settlement work. Delayed ground clearance, and loss of the state budget... led to many difficulties in the State management of land prices. There are many land valuation methods, each of which gives different results. Regulations on specific land price determination methods are not clear and reasonable, leading to the situation that localities arbitrarily choose land valuation methods, so there is no synchronization and consistency in the management of land. land price. Therefore, it is necessary to improve the land pricing system, and legal corridor, and invest in building official information channels, reliable enough to meet practical needs to timely reflect changes in land prices. market. Strengthen inspection and supervision of overland price determination, and at the same time develop sanctions to penalize violations of law in land price management and construction.

Abstract

For many years, the Party committees and authorities of Thai Nguyen province have determined that the motto of Party building is the key, economic development is the focus, since then there have been resolutions that are close, correct and suitable to the characteristics of locals creating a synergy that contributes to efficiency in all fields and enhances trust among the people. In particular, the industrial sector of Thai Nguyen was selected as a key to promote economic development in the area.

Built in 1959, Thai Nguyen iron and steel industrial park with the country's first closed integrated iron and steel production line which is considered a pioneering step for the province's heavy industry. Regarding the "smokeless industry", Thai Nguyen – as known as famous tea land is considered to have great potential for tourism development, which is expected to become an attractive tourist destination in the near future. While resource from the government budget was still limited, Thai Nguyen had been aware of mobilizing various investment resources for significant projects. On the other hand, the provincial government always takes care and supports businesses, creates equal opportunities for businesses to access to resources, especially emphasizes the creation of small and medium enterprises with the motto "3 accompanies, 5 supports".

Keywords: *Growth, Thai Nguyen, economy*

1. Introduction

Thai Nguyen province is the political and economic centre of Viet Bac region in particular, of the north-eastern midland and mountainous region in general, and a gateway for socio-economic exchanges between the Northern midland & mountainous region and the delta; the North of Thai Nguyen is adjacent to Bac Kan province, the West is adjacent to Vinh Phuc and Tuyen Quang province; the East is adjacent to Lang Son and Bac Giang province and the South is adjacent to Hanoi capital (80 km away); The natural area is 3,562.82 km². Thai Nguyen province has 9 administrative divisions: Thai Nguyen and Song Cong city; Pho Yen town and 6 districts: Phu Binh, Dong Hy, Vo Nhai, Dinh Hoa, Dai Tu, Phu Luong. The total includes 178 communes, including 137 communes, 32 wards and 09 towns.

2. Method

Methods of information gathering: Data and information about economic growth in Thai Nguyen province. The method of information synthesis and processing: All collected data and information will be classified, divided into groups to connect elements which make up a synthesis to build up theoretical basis and evaluate actual economic growth of Thai Nguyen province from many different perspectives, thereby making the most accurate judgments. The descriptive and comparative statistical methods aim to make statistics of the data and clarify the efficiency of the performance of the system according to the evaluation criteria as a basis for proposing solutions to change the growth quality of Thai Nguyen province in a sustainable way.

3. Results

3.1. Economic structure of Thai Nguyen

In the period of 2015 - 2020, the economic structure of Thai Nguyen province has had a shift of gradual reduction in the proportion of the agriculture - forestry and fishery sectors, and gradual increase in the proportion of the construction industry (Table 1). The average GDP growth of the province in the period 2015-2020 is 12.8%, showing that Thai Nguyen has achieved remarkable achievements in economic development, thereby creating a basis to improve people's living standards. In 2020, the province's GRDP scale will reach VND 116,008 billion, 1.8 times higher than in 2015, ranking 12th out of 63 provinces and cities in the country

Table 1. Thai Nguyen Gross Regional Domestic Product (GRDP)

Criteria	2015	2016	2017	2018	2019	2020	Average growth rate (%)
1. Segmentation by economic sectors according to current prices							
GRDP value (billion VND)	63.562,9 (100)	75.513,7 (100)	85.464,0 (100)	98.518,2 (100)	107.820, (100)	116.008,2 (100)	12,8

Note: Values in parentheses are contribution proportions (in %)

Source: Thai Nguyen Province Statistical Yearbook and the author's calculations

The economic situation of Thai Nguyen province in the period of 2015-2020 had changed remarkably. The average growth rate of the period reached 12.8%, in which the growth rate of construction industry together with the service industry contributed to the growth of whole province - which was a remarkable change of the construction industry. The shift from a purely agricultural province to an industrially developed province is due to the completing and running into production of the project of Samsung Electronics Vietnam Thai Nguyen (SEVT). The industrial added value of the province has suddenly rocketed, Thai Nguyen's economy is also associated with the growth of industries.

At the same time, it reflects the outstanding growth of the foreign-invested sector with an average growth rate of 16.0%, especially the contribution of Samsung Electronics Vietnam Thai Nguyen (SEVT) and hundreds of other satellite factories. In addition, the private sector and sole proprietorship have grown and contributed a large proportion to the overall growth of the province with an average growth rate of 12.7%. GRDP per capita in 2020 reaches 89 million VND/person - equal to 109% of the national average growth rate and 1.45 times higher than 2016.

Figure 1. Economic structure by sectors

In general, the province's economic sectors maintained their growth and development momentum, especially the industries, creating opportunities for economic restructuring towards industrialization. In terms of contribution levels of economic sectors, the non-state economic sector and the foreign-invested economic sector play important roles in the growth and development of the province. The requirement for Thai Nguyen is to have effective solutions to encourage all economic sectors in general and especially the foreign invested economic sector to invest and develop production and business.

Figure 2. Economic structure by economic in Thai Nguyen province 2015 - 2022

3.2. Thai Nguyen economic growth situation

The average economic growth rate of Thai Nguyen province in the period 2015-2020 is 12.8%, higher than the average growth rate of the whole country (2015-2020) with the figure of 6.8%. Thai Nguyen is assessed in recent years to have made great strides in the process of socio-economic development, especially in attracting foreign direct investment.

3.2.1. Thai Nguyen economic growth by industry group

Table 2. Economic growth of Thai Nguyen province by sectors in the period 2015-2020

Unit: %

Criteria	2015	2016	2017	2018	2019	2020
Growth in Agriculture, Forestry and Fishery	6,88	6,18	2,17	4,15	3,48	4,15
Growth in Construction Industry	60,45	23,54	17,52	13,22	10,94	4,76
Growth in Service	11,59	8,04	7,58	13,68	6,62	3,03
Growth of whole province	33,21	16,35	12,75	10,44	9,4	4,24

Source: Thai Nguyen Provincial Statistical Yearbook (2020)

The growth rate of Thai Nguyen province in the period 2015-2020 shows that the province has an especially high growth rate in 2015 reaching 33.21%, the reason for this is due to the construction project of Samsung went into operation, at the same time, it brought ancillary businesses to invest heavily in Yen Binh and Pho Yen industrial zones. But economic growth in Thai Nguyen province tended to decrease partly when the Samsung factory went into stable operation, reached the designed capacity and had no extra investment. Especially in 2020, due to the impact of the Covid-19 epidemic, the growth rate decreased even more to only 4.24%.

Figure 3. Thai Nguyen economic growth by sectors 2015 - 2020

The growth rate of economic sectors shows that in 2015, the economic growth rate of construction industry is the highest, with the data of 60.45 because of the remarkable investment of Samsung contributing to the overall growth rate of the province. However, the growth rate of this industry tends to fall sharply from 60.45% in 2015 to 4.76% in 2020, which indicates that the Samsung factory heavily influenced the growth rate of the construction industry and when the project was put into operation along with the terrible impact of the COVID pandemic, it had put a great burden on the industry. The province's economy is associated with the growth of this industry, however, the rapid growth of the industry makes the source of raw materials and supporting products in this area hard to keep pace with the demand. Therefore, industrial enterprises must import almost 100% of the value of raw materials and accessories causing depend on inputs from other countries; in 2020 the pandemic affected both input and output of the provincial industrial enterprises.

The service industry has an uneven growth rate, but there was a strong downward trend with the figure of 3.03 in 2020 due to the impact of the COVID-19 epidemic. So, after the epidemic, local governments should impose solutions to recover the awful situation which help the local economy take leaps and bounds. The Agriculture, Forestry and Fishery sectors account for a proportion which had been gradually replaced by other industries, partly due to economic restructuring which turn from Agriculture focus into industry and services focus. Besides, Agricultural sector tended to be high value agriculture, organic agriculture, and smart agriculture.

3.2.2. Economic growth of Thai Nguyen province by economic sectors by ownership

Thai Nguyen is now considered in terms of economic sectors contributing significantly to the growth of the province, including the state economic sector, non-state economic sector and the economic sector with foreign investment.

Table 3. Growth by economic sector by ownership in Thai Nguyen province in the period 2015-2020

	Unit: %					
Criteria	2015	2016	2017	2018	2019	2020
Growth of state economic sector	4,54	4,12	4,3	4,8	5,0	4,24
Growth of non-state economic sector	7,21	7,33	7,62	9,68	9,32	6,06
Growth of foreign invested sector	145,9	25,7	23,93	14,12	11,77	2,71
Growth of the whole province	33,21	16,35	12,75	10,44	9,4	4,24

Source: Thai Nguyen Provincial Statistical Yearbook (2019)

In the process of socio-economic development of Thai Nguyen province, each historical step from the economic sector has made significant contributions, for example, in the past, the state economic sector played a key role in growth. the province's economy, in recent years, when we integrate, open the door, and with open policies, with the principle of always reforming and improving the investment environment, the economic sector has investment capital. Foreign is the area with high growth rate and accounts for the proportion of value in the total value of the province.

Since the Samsung Factory Project went into operation, the growth rate of the foreign-invested group increased sharply in 2015 to 145.9%, then by 2020, the growth rate dropped heavily due to factors such as: Another important impact is the epidemic, the activities of the foreign-invested sector are only in moderation and maintained, but hopefully in the future there will be changes after we control the epidemic.

Figure 4. Growth by economic sector by ownership in Thai Nguyen province in the period 2015 - 2022

Economic growth in the non-state sector did not have large fluctuations and remained at a stable level, which also shows that most of the non-state enterprises have been operating in the province for quite some time. and has a stable operating environment, although it

accounts for a non-class proportion and the growth rate is not high, this is an indispensable component and also creates a lot of jobs for laborers in the province every year. contribute to the state budget of the province.

4. Discussion and Conclusion

Solutions to accelerate economic growth in Thai Nguyen province:

+ Focus on tourism development to become a key economic sector of the province

In the following years, Thai Nguyen tourism needs to be more professional and modern: Establishing a project of Culture and Tourism services in Thai Nguyen city center (according to the model of organizing a Night Market) with cultural activities, services, promotion and introduction of tea culture and well-known local products as a highlight to attract tourists and retain tourists staying in Thai Nguyen; along with policies research to promote the "night economy". Forming the Tourism Development Support Fund of Thai Nguyen province to provide resources to support businesses to invest in the tourism sector. Proposing to organize activities to implement Decision No. 203/QĐ-TTg of the Prime Minister approving the Project on Conservation and promotion of tangible and intangible cultural values of Thai Nguyen Tea. On the basis of the province's existing tourism potential, creating specific tourism products to attract tourists to Thai Nguyen (Eco-tour in Nui Coc Lake to exploit the landscape, resort to sports, especially golf courses); cultural tourism associated with activities, spiritual culture and cultural heritage; eco-tourism with tea cultural products, tourism to explore the landscape of East Tam Dao and Thai Nguyen caves).

Directing localities to well preserve and embellish historical and cultural relics, artistic architecture, scenic landscape associated with traditional festivals in localities to promote the value of historical sites to become an attractive destination for tourists (Monument of 60 martyrs of Vietnam Youth Union of 915 Company, special national relic complex of Dinh Hoa ATK; festivals: Communal House, Cau Muoi Temple, Temple Duom, Long Tong, Hang Pagoda, Van Mountain - Vo Mountain, etc). Professional training and improving the quality of human resources in tourism which focus on training people at the localities, especially in tourist sites; enhancing professional abilities, foreign languages and service skills for staffs and tour guides to ensure high professionalism. Training human resources according to the needs of enterprises, encouraging vocational training to shift labor from the agricultural sector to the service sector; attract high-quality human resources to quickly overcome the current weakness in the province's tourism industry.

With the characteristics of being the central province of Vietnam Northern midland and mountainous region, with 46 ethnic groups out of 54 ethnic groups living in Vietnam, Thai Nguyen is a land with rich revolutionary history and traditions throughout the warring periods to build and defend the country; a place for convergence and interference of many kinds of cultures with unique cultural features in the lives of ethnic minorities; nature endowed Thai Nguyen with many beautiful landscapes, etc., creating for Thai Nguyen a diverse tourism resource for the socio-economic development of the province in a sustainable way.

+ Reforming competitive indexes, attracting a strong wave of investment

Provincial authorities understand the situation to remove difficulties and obstacles for investors to promptly deploy through solutions and measures to speed up the

implementation of key projects; control prices of goods and services and efficiently use capital sources; promote administrative reform solutions, improve Provincial Competitiveness Index (PCI) and Provincial Governance and Public Administration Performance Index (PAPI); attract investment, organize conferences to implement new policies and mechanisms of the Government; inspect and review with specific solutions for delayed and prolonged projects in the area, step by step create idea conditions for enterprises to overcome difficulties and improve production and business efficiency. Many big investors have invested in the area, many big projects have been started; others have been completed and gone into production, contributing to improving production capacity, making great contributions to the economic growth of the province.

The province mobilizes the whole political system of the province to reform the investment and business environment; The provincial Department of Planning and Investment has applied the "inter-agency one-stop shop" mechanism. The Department of Natural Resources and Environment of Thai Nguyen province has applied the inter-agency one-stop-shop mechanism, so the time for the issuance of the first land use right certificate is reduced to less than 24 days, much lower than the provisions of the law...

To further promote the strength of agriculture

The agricultural development perspective of Thai Nguyen province has been determined in Resolution No. 10-NQ/TU dated October 21, 2019 of the 19th Provincial Party Committee on agricultural development in Thai Nguyen province in the period of 2019- 2025, orientation to 2030 and draft Resolution of the 20th Provincial Party Congress, term 2020-2025.

To be specific: Continuing to implement agricultural restructuring towards strengthening value addition, enhancing chain linkages and sustainable development in association with the goal of constructing a new rural area.

The main focus is on developing key agricultural commodities of the province; forming concentrated, large-scale commodity production areas, safe and organic agricultural production, applying high technology.

Improve the quality and value of tea and tea products. Encouraging and promoting all economic sectors which invest in the fields of agriculture, forestry, and fishery along with the concentration and accumulation of land which facilitate large-scale and high-tech agricultural production.

Forestry economy should be developed associated with sustainable forest management; improving the quality and effectiveness of the National target program on building new rural areas.

To synchronously develop agriculture with industry, commerce and services, there must be a close connection between governmental management agencies - enterprises - cooperatives - producers creating a link chain in production - processing - consumption market with branded products and high added value.

Agricultural development is associated with new rural construction, actively promoting the role of inhabitants in the process of restructuring and organizing production in the locality.

Abstract

Green development is not only a way for hotels to reduce the negative impact of business activities on the natural environment, towards sustainable development, but also an option to meet the growing needs of society. The study was carried out to explore the impact of institutional pressure on the behavior of hotels applying green practices under the moderate influence of environmental attitudes of the managers. The results show that coercive pressure and mimetic pressure are two factors of institutional pressure affecting the decision to implement green practices in the hotel business in Vietnam. At the same time, the research results also confirm the moderating role of managers' environmental attitudes towards the relationship between institutional pressure and the behavior of applying environmentally friendly measures in hotels.

Keywords: *Green practices, Hotel business, Institutional pressure.*

1. Introduction

Research in behavioral science and sustainability issues is often focused primarily on the manufacturing industry (Ayuso, 2006; Bohdanowicz, 2003). Even so, the hotel business is largely depends on the physical environment. There are many resorts that have taken advantage of natural resources to become unique in their products. As a result, the hotel business has increased the threat to the environment through the consumption of large amounts of energy, water, and non-renewable resources (Sloan, Legrand, Tooman, & Fendt, 2009).

Although in recent years, enterprises' green behavior has attracted many scholars' attention, but most of the researches are done in European countries and developed countries (Hamdoun, 2020). Very few studies are contextualized in developing countries, and especially in transitional or emerging market economies like Vietnam. Developing countries face more difficulties and challenges than developed countries in dealing with environmental (and social) issues due to lack of environmental legal framework, pervasive poverty, weak governance system and social infrastructure (Gunarathne & Lee, 2019). Furthermore, economic and sometimes social instability in transition economies creates ambiguity and unpredictable fluctuations in the external environment, so that the transition between formal institutions and informal institutions is difficult (Hitt, Dacin, Levitas, Arregle, & Borza, 2000). Formal institutions still play an important role in transition economies. On the other hand, the majority of firms

operating in emerging markets are still young and have limited resources (DeCastro & Uhlenbruck, 1997), so decision making in these firms will also differ from those in the firms in other developed countries.

“Green practice” is a term used to describe environmentally friendly actions. Its aim is to reduce the impact of business processes on the surrounding natural environment and bring several benefits such as economic benefits, improve the relationships with stakeholders.... There are various approaches to classifying green practices. A common and widely accepted classification divides green practices into: (i) operational practices (or technical practices); (ii) organizational practices (or system practices) (Dief & Font, 2010; Gonzalez-Benito & Gonzalez-Benito, 2006; Gil, Jiménez, & Lorente, 2001). Operational practices are measures attached to a specific stage or the operation, which change the production system and products of the enterprise, and directly reduce the negative impact of business activities on natural environment. They are generally classified into three main areas: water saving, energy saving, and waste management (Erdogan & Baris, 2007; Kirk, 1995; Stipanuk, 1996). Meanwhile, organizational measures do not directly reduce the negative impacts of the hotel operation on the environment. Its goal is to design processes and policies, to support operational measures working effectively, and to ensure compatibility and systematics between different measures across the enterprise (Park, Kim, & McCleary, 2014).

Theoretically, several theories have been applied to explain the decision to apply green practices in hotels, such as efficiency-based theories, stakeholder theory, institutional theory.... Performance-based theories provide little help in situations where it is difficult to quantify the profitability of environmental actions or when these actions serve non-profit goals. Whereas a responsibility-based approach is often criticized for the lack of a coherent theoretical framework for data collection and interpretation. In addition, the Neo - Institutional theory is also often used in the study of organizational behavior. This theory proposes that businesses operate in an institutional environment where a set of implicit or formal rules are set by actors such as governments, professional associations, the media, etc. The institutional environment puts pressure on businesses through three mechanisms: coercive, normative and mimetic corresponding to the pressures exerted by regulatory authorities, industry associations, and competitors (DiMaggio & Powell, 1983). Coercive pressure restricts the choice of enterprises, forcing them to comply with institutional expectations and perform specific behaviors. Meanwhile, normative pressure orients the behavior of enterprises based on values and behavioral standards, changing the thinking of enterprises so that they believe in and support those requirements. And mimetic pressure occurs when businesses want to achieve legitimacy and compete in the market, and voluntarily imitate the behavior of reputable companies having good operation results in their industry (DiMaggio & Powell, 1983; DiMaggio & Powell, 1991). Businesses must follow these institutional rules to maintain legitimacy, and are secured the resources necessary for survival and growth. On the contrary, if it is against such regulations and requirements, the enterprise will certainly not be recognized, isolated and removed from that institution (DiMaggio & Powell, 1983; DiMaggio & Powell, 1991; Meyer & Rowan, 1977).

Although the neo-institutional theory perspective can explain decisions in organizations, the response and decision-making mechanisms are passive, based on pressures from the institutional environment. Therefore, using the neo-institutional theory in analyzing corporate behavior will encounter two weaknesses that are often criticized: (i) ignoring the impact of subjective factors and (ii) not being able to explain the diversity of enterprises' responses (Colwell & Joshi, 2011; Delmas & Toffel, 2008; Greenwood & Hinings, 1996). Therefore, it is necessary to analyze and explore the impact of internal factors that can moderate the relationship between institutional pressure and actual corporate behavior (Greenwood & Hinings, 1996).

Environmental scholars argue that environmental management decisions in companies depend on the manager's view of environmental issues (Banerjee, 2001; Park et al., 2014; Sharma, 2000). According to The Upper Echelons Theory by Hambrick and Mason (1984), decision making associated with green activities can be influenced by the perceptions and attitudes of decision makers – hotel managers. Although senior manager (general director, director...) has a very important influence in making decisions in the enterprise, middle managers, such as department heads, also play a certain role in the decision-making process. Therefore, the reason for adopting particular green measure instead of other measures depends on the attitude of hotel managers, because they are the ones who have the ability to make decisions about resource allocation to carry out efficient business operations. In other words, although operating in the same institutional environment, the choice of green practices between hotels is not the same, possibly due to the views/attitudes of other managers. In particular, in service industries characterized by product differentiation and less pressure from regulations, the power of senior manager becomes even more prominent (Finkelstein & Hambrick, 1990).

Environmental attitude is defined as the set of beliefs, emotions, and behavioral intentions of a person regarding environmental activities or problems (Schultz, Shriver, Tabanico, & Khazian, 2004). Thus, manager's attitude to environmental issues is the result of their individual cognitive and interpretive processes (Park & Kim, 2014). Based on their views and perceptions, managers can consider environmental problems as threats or opportunities (Sharma, 2000), thereby affecting the strong or weak commitment of enterprises to the environmental issues (Banerjee et al., 2003; Park & Kim, 2014). If a manager has a positive environmental attitude, enterprises are more likely to participate in green activities, because of institutional pressures in line with the vision of the managers and enterprises. Furthermore, managers with strong environmental attitudes will be aware of the potential benefits of government incentives as well as regulatory pressures. At that time, enterprises will not be limited to meeting minimum environmental regulations, but actively change production in a greener direction to gain supportive resources (Cao & Chen, 2019). Conversely, in the case that managers expressing less positive environmental attitudes, firms will use their resources against institutional pressures (Colwell & Joshi, 2011; Finkelstein & Hambrick, 1990). Thus, despite the same economic, political and business environment, different managers' views on the environment will lead to different environmental behaviors in enterprises. Managers will rely on the pressures that the institutional environment creates,

along with their values and attitudes for or against environmental issues, to decide whether to implement green actions. In other words, the relationship between institutional pressure and the behavior of applying green practices in hotel business is positively regulated by the environmental attitude of hotel managers.

From the literature reviews and theoretical framework, the author proposes the research model below, with two hypotheses:

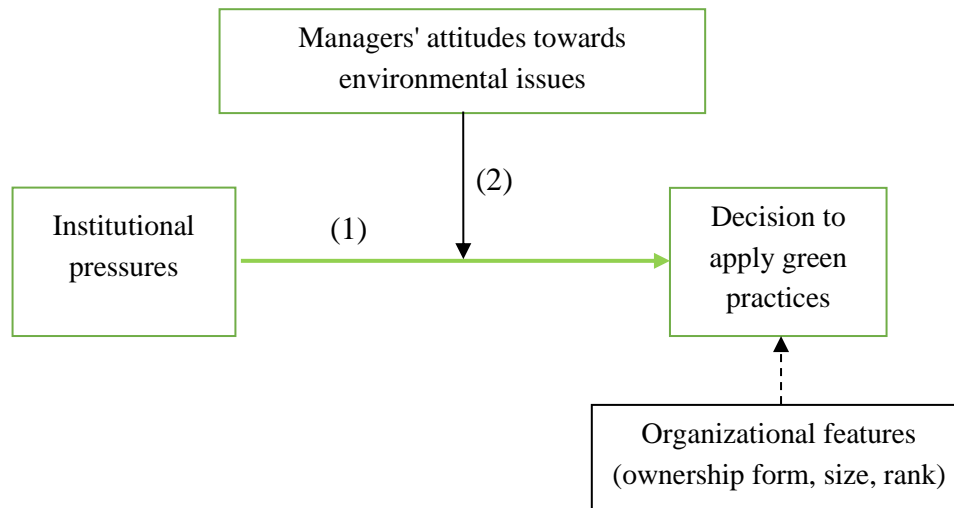

Figure 1. Proposed research model

Hypothesis H1: Institutional pressure has a positive effect on the decision to apply green practices in hotels.

Hypothesis H2: Managers' attitudes towards environmental issues have a moderating effect on the relationship between institutional pressure and the decision to apply green practices in hotels.

2. Method

A quantitative study was conducted by delivering directly questionnaires to hotel managers in 04 big and famous destinations in Vietnam, including Hanoi, Da Nang, Nha Trang, and Ho Chi Minh City. The items were mainly adopted from previous researches, with minor adjustments after interviewing managers of green hotels that were recognized for their efforts in protecting the environment.

The survey questionnaire aims to collect opinions of hotel managers on the factors affecting the decision to apply green practices in hotels. In addition to the introduction about the purpose of the survey, the questionnaire consists of three parts: part 01 asks about factors influencing the decision to apply green practices at their hotels includes (1) institutional pressure; (2) attitude to environmental issues; and green practices that the hotel is taking. The factors are rated using the Likert-7 scale based on the degree of agreement with several given statements. Green practices are ticked as 1 if their hotel have taken these actions, otherwise is 0. Part 02 includes questions to collect information about the hotel such as rank, management ownership, and number of rooms. Finally, the personal information of the respondents was collected in part 03, such as full name, age, gender, education level, and position.

Among 350 questionnaires that were sent, only 278 received answer sheets were valid, which formed data for the further research steps. The surveyed hotels are evenly distributed among different rankings, size and form of ownership, as well as geographical location. Specifically, the number of hotels 1-5 stars in ascending rank has 65, 67, 53, 42, 51 establishments respectively (corresponding to 23.4%, 24.1%, 19.1%, 15.1% and 18.3%). Independently owned hotels accounts for 186/278 hotels participating in the survey (corresponding to 66.9%), the rest are hotels owned by hotel chains. In terms of room size, there are 118 hotels with less than 50 rooms, representing the highest rate of 42.4%; followed by the number of large-scale hotels (over 100 rooms), 97 establishments, equivalent to 34.9%; and finally, there are 63 medium-sized hotels (from 50 to less than 100 rooms), accounting for 22.7% of the total sample. This ratio is quite reasonable because hotel business is quite new in Vietnam, so most of them are small and medium establishments, chain hotels or large corporations accounts for a small proportion. In terms of geographical location, each city of Hanoi, Da Nang and Nha Trang has about 60 hotels in the sample. The number of hotels in Ho Chi Minh City is about 1.5 times higher.

3. Results

3.1. Cronbach's Alpha and Exploratory Factor Analysis

After performing Cronbach's Alpha coefficient analysis, eliminating items have low item-total correlation, the measures of all 03 factors in the model ensure high reliability. Next, Exploratory Factor Analysis is conducted which results reveal that: (1) Institutional pressure to implement green practices in hotels in Vietnam includes only two groups of factors: coercive pressure and mimetic pressure; (2) Decision on application of green practices is divided into a decision on application of initial environmental practices and decision on application of enhanced environmental practices.

In contrast to some studies by Bansal (2005), Berrone, Fosfuri, Gelabert, and Gomez-Mejia (2013), or Wang, Wang, and Wang (2019), normative pressure has no impact on hotels' decision. Sustainable development and green is a fairly new topic for the hotel business, especially in a developing country like Vietnam. Although environmental issues have received the attention of the entire society, the values and standards of environmental management have not been formed and widely shared among businesses in the hotel sector. The lack of industry-specific regulations and standards is a major obstacle to corporate social responsibility, especially in developing countries, as pointed out by Christmann and Taylor (2001). Indeed, we often talk about service quality, comfort and convenience in hospitality, but not the ecological environment values. In Vietnam, the sustainable label "Green Lotus" was issued by the Ministry of Culture, Sports and Tourism in 2012, is considered a tool to evaluate environmental management among hotels. However, the program for granting the Green Lotus label has ended since 2015, and this set of criteria is currently used as a reference for hotels who wish to develop toward "Green". Therefore, it can be seen that normative pressure on the application of green practices seems to be absent for hotels in Vietnam. In other words, ecological values, norms and social expectations are not fully shared among hotel businesses in Vietnam.

Based on survey data, the results of the EFA analysis have discovered two new groups of green practices: initial environmental practices and enhanced environmental practices. The naming of these two groups of practices is based on the priority order of implementation. Initial environmental practices include: (1) hotel uses energy-saving devices (energy-saving light bulbs, electronic card key system, sensors...) and other types of alternative energy (such as solar energy, LPG...); (2) hotel applies recycling and waste reduction measures (separation of waste at source; use of containers for shampoo, shower gel...); (3) hotel gives priority to buying environmentally friendly products (biodegradable, reusable, recyclable...); (4) hotel creates favorable conditions for customers to cooperate in environmental management (voluntarily changing towels...). The common feature of these measures is their high recognizability. Guests can easily recognize the efforts that the hotel is making to protect the nature through the presence of energy-saving devices, recycling bins, biological or recycled products. Moreover, in addition to the direct environmental benefits, the economic benefits of these practices are also easily predictable. Therefore, these are all actions that the hotel should prioritize to apply first.

In contrast to the initial environmental practices, the environmental and economic benefits of enhanced environmental practices are not clear, and their identification is also more difficult. Enhanced measures include: (1) hotel records, analyzes and reports on its environmental activities; (2) hotel quantifies savings as well as environmental costs in its annual budget; (3) there is an individual/group in charge of environmental issues in the hotel; (4) hotel trains staff on environmental issues. It can be seen that enhancement practices do not directly help reduce the negative environmental impact of business activities. Besides, hotels can hardly calculate the

profit of applying these measures. Regarding the ability to identify, if not environmentally conscious individuals or experts, the majority of stakeholders rarely pay attention to the fact whether the hotel has assigned an individual/group to be in charge of environmental issues, or regularly report on their environmental activities or not. For all these reasons, hotels underestimate these enhanced environmental practices. These measures are usually taken after the initial environmental practices, when the hotel's environmental commitment is big enough or they notice this behavior from reputable, leading enterprises in the industry.

Compared with the previous classifications, the grouping of green practices based on the priority is appropriate in the context of the nascent hotel industry in emerging economies. In Vietnam, hospitality really became a business in the early 90s. Compared with the history of establishment and development of other hotel industries in the world, this field is still new. In particular, the trend of green development has not really been popularized in the hotel business in Vietnam. Therefore, the classification based on the priority clearly reflects the reality of green behaviors in the hotel business in developing countries like Vietnam. Moreover, the classification also helps to assess accurately the influencing factors and their influence on the decision to apply green practices.

Table 3.2. Result of EFA with dependent variable

Items		Component	
		1	2
EP10	The hotel gives the employees training on environmental issues	0,852	
EP9	The hotel involves a manager or team in environmental management	0,835	
EP5	The hotel quantifies environmental savings and costs in its annual budget	0,781	
EP4	The hotel records, analyzes and reports environmental performance	0,695	
EP3	The hotel applies recycling and waste reduction activities		0,845
EP8	The hotel facilitates customer collaboration in environmental protection (voluntary changing of towels, etc.)		0,829
EP7	The hotel gives priority to purchasing ecological products (biodegradable, reusable, recyclable, etc.)		0,787
EP2	The hotel uses energy-efficient equipment and alternative energy sources		0,576

3.2. Binary Logistic Regression and Hypothesis Testing

Logistic regression is analyzed for the dependent variable "Decision to apply initial environmental practices" and "Decision to apply enhanced environmental practices", respectively. If all the items in the group of dependent variable receive the value 0, the dependent variable will receive the value 0, this means that the hotel does not take any environmental measures. Conversely, if there is at least one item of the dependent variable with the value 1, the variable will receive the value 1, or in other words, the hotel has applied green practices in its business. The results of logistic regression are summarized in Table 4.3 below:

Table 3.3. Regression coefficients and Hypothesis testing results

Hypothesis results and			Hypothesis	IEP	EEP	Conclude

Institutional pressure has a positive influence on the decision to apply green practices in the hotel business in Vietnam. Among the institutional factors, coercive pressure is the most important factor affecting the decision to implement green practices (both initial and enhanced environmental practices). The coercive pressure is reflected in the actions of government agencies, such as establishing regulations and policies to control and prevent pollution; monitor the performance of enterprises through periodic inspection; impose penalties related to environmentally irresponsible acts or financial support measures for businesses that contribute to the environment management. Thus, the application of green practices helps hotels not only to receive support from the Government but also to avoid fines due to resistance or poor compliance with standards and regulations.

Moreover, the hotel's behavior of applying enhanced environmental practices is also affected by mimetic pressure. This is quite reasonable because, compared with initial environmental practices, the benefits derived from the enhanced measures are not clear. As a result, hotels tend to imitate the actions of leading, experienced and successful hotels in applying these enhanced environmental practices.

The impact of coercive pressure on the decision to apply green practices is more important than mimetic pressure. This greater influence is not only reflected in the scope (two groups of green practices versus one group of enhanced environmental practices) but also in the degree of impact (through the beta coefficient in the regression analysis). This is due to the fact that Vietnam is a transitional country, the power of government agencies is still very strong. They have the ability to establish a legal basis, impose economic penalties and even close businesses if they do not comply with the law. Moreover, in the initial stages when the environmentally friendly behavior is not really popular in business, the cost of

researching and applying green practices is still quite high, as well as the benefits are not clear, the enterprises tend to comply with the minimum legal requirements (Gunarathne & Lee, 2019), rather than follow the enhanced measures adopted by large enterprises. Therefore, the effect of coercive pressure is more direct and effective than mimetic pressure.

The relationship between institutional pressure and the decision to apply green practices is different among hotels, depending on the manager's attitude towards environmental issues. The higher the environmental attitude of hotel managers is, the greater the influence of institutional pressure on the ability to apply environmental measures. However, the moderating effect of the environmental attitude is only statistically significant with the relationship between coercive pressure and the decision to apply initial environmental practices. That is, if the manager's environmental attitude is at a high level, hotels are more likely to participate in initial green activities, and imitate enhanced environmental measures of reputable enterprises. Because at that time, the institutional pressure exerted by Government agencies and other leading enterprises are consistent with the vision of managers and businesses. Hotels will be more voluntary and proactive in applying these environmental measures.

Research results have not confirmed the influence of managers' environmental attitudes on the relationship between simulated pressure - the decision to apply initial environmental practices, or coercive pressure - the decision to apply enhanced environmental measures. In the first relation, since the benefits of the initial environmental measures are quite obvious, when hotel managers have a high environmental attitude, they are likely to use the business resources to explore and apply new environmental measures to gain competitive advantage, instead of imitating other enterprises. So in this situation, the environmental attitude of manager, instead of enhancing, can reduce the influence of simulation pressure. Secondly, with the difficult to recognize characteristics of enhanced environmental practices, even if the hotel manager has a positive attitude towards environmental issues, it is difficult for businesses to follow the coercive pressures. The finding is consistent with the "Agency theory" which holds that managers are representatives of shareholders whose interest is profit maximization. In other words, profit should be the sole concern of the managers when making decisions. Thus, there is a lack of consistency or a gap between environmental attitudes and the application of enhanced environmental practices in this case. This "good attitude" does not always translate into action because, as Schaper (2002) explains, even when business owners or managers have a positive environmental bias, the actual commitment of firms also depend on other factors such as consumer demand, availability of capital, information and time (Kasim, 2009).

4. Discussion and Conclusion

The purpose of this study is to explore the impact of institutional pressure on the behavior of deciding to apply environmental protection measures under the moderation effect of environmental attitudes of managers. The results of logistic regression analysis show that coercive pressure and mimetic pressure have positive impacts on the implementation of green practices in the hotel business in Vietnam. However, they can respond to this pressure differently, depending on the manager's attitude towards environmental issues.

The approach of the study complements institutional theory, as it suggests that managers' attitudes about the environment play an important moderating role in the impact of institutional pressures. This is a valuable resource for organizational behavior research in general and corporate social responsibility behavior in particular. In addition, the research results also reveal the mechanism that explains the actual behavior of hotels. Hotels primarily implement initial environmental practices in response to the requirements of institutional pressures. Meanwhile, enhanced actions heavily depend on mimetic pressures.

However, the study focuses on examining environmental behavior in hotels at the early stage of decision-making, with a top-down approach. Therefore, the following researchers may consider studying green decisions in hotels based on a bottom-up approach, such as surveying employees on factors affecting the implementation of green practices; or using longitudinal data to evaluate differences in the hotel's choice of environmental measures during different stages of development.

Abstract

Patent valuation is not a new matter in developed countries, but still a challenging task in Vietnam, due to the lack of practice and also inadequate regulation. The art and practice of patent valuation presents both an opportunity and a challenge in the process of new technology commercialization. On the one hand, some valuation of a patent is necessary for transacting parties to enter into a reasonable transaction regarding the use of the patent. But, valuations of patents on technology that has not been validated in the marketplace is fraught with risk that often hinders the negotiation of a patent transaction. In the US, patent holders and patentees don't rely mainly on patent valuations as the sole basis for license deals. A "pre-negotiation valuation" approach leading to a mutually designed "value capture/risk-sharing mechanism" (i.e., a license agreement) is a preferred path to commercialization of new technology. However, the difficulty in valuation of intellectual property assets is one of significant obstacles to the commercialization of patents, especially which are domestically developed by Vietnamese entities.

This paper describes the current practice in patent valuation and commercialization in Vietnam from a case study of remote waste treatment technology. This case study illustrates that in the current context of Vietnam, the valuation of a patent is still hard for the potential purchasers to accept, so the price should be adjusted flexibly through the negotiation, rather than a valuer providing a fixed valuation. Based on this case study, recommendations will be provided to improve the legal framework for patent valuation and commercialization.

Keywords: *patent valuation, remote waste treatment, technology transfer, commercialization of intellectual property rights*

1. Introduction

Following the development of the economy and the participants of foreign investors, the government is paying more attention to the status of domestic technology developed by Vietnamese entities, along with other aspects of intellectual property. However, the alarming fact is the Vietnamese inventors are facing many challenges in the exploitation and commercialization of their patents, although they are registered at the IP Office and assessed by independent valuers.

A typical case is the remote waste treatment technology invented and developed by Inventor Lai Minh Chuc in 2008 that was valued at US\$12.24 million by Dr. Robert Sanders in 2013. Unfortunately, despite the prospective value of the patent, the inventor took over 10 years to commercialize his technology, and the benefit generated from the transfer was not as expected.

The article clarifies the current practice in patent valuation and commercialization in Vietnam. Sections 2 and 3 provide a background on the literature review and legal framework for patent valuation in Vietnam. Section 5 studies the case of Mr. Lai Minh Chuc's invention, through an analysis of the need for an appropriate waste treatment technology and the main features of Mr. Lai Minh Chuc's technology. Thereafter, this section also describes the valuation for his patent number 12044 that was completed by Dr. Robert Sanders in 2013. The commercialization process of Mr. Lai Minh Chuc's technology was presented and followed up with additional discussions and findings. In section 6, the recommendations proposed included the long-term strategy for promoting domestic patent registration, as well as the restructuring of the legal framework for the establishment and operation of the intermediary organizations.

2. Literature Review

Patent valuation, and the legal framework governing patent valuation caught the attention of many scholars all over the world for decades. Most scholars discussed the three traditional valuation methods (i.e., cost, market, and income) and how they are applied to intellectual property rights in general. Dilip Sharma and Abhijeet Kumar (2021)¹³² summarizes modern valuation methods, including Monte Carlo, Royalty Rate, Loss of Profit Calculation, and Decision Tree Analysis. Specifically for patents, Prabuddha Sanyal (2005)¹³³ addresses patent valuation from the perspective of multinational enterprises (MNEs), while Maayan Perel (2014)¹³⁴ introduces a new approach to patent valuation which is to value patents based on the patent quality (i.e., "how well a patent meets the statutory requirements"). Alexander J Wurzer et al. (2012)¹³⁵ introduced tools for patent valuation (e.g., patent legal

¹³² Dilip Sharma and Abhijeet Kumar (2021), *Methods of Intellectual Property Valuation* in Irene Calboli and Maria Lilla Montagnani (editors), *Handbook of Intellectual Property Research: Lenses, Methods and Perspective*; Oxford University Press.

factors, the modeling of license relations, payment streams, and risks) along with case studies in different contexts: management-, company law-, transfer-, and finance-oriented contexts.

Those foreign studies have clarified theoretical issues on valuation in patent transfer, i.e., theories on patents, patent transfer, valuation in patent transfer, intellectual asset valuation methods, the relationship between competition law, intellectual property law, and contract law on governing agreements on price in patent transfer contracts. Even so, few scholars took an economics-law approach to the analysis of patent valuation or addressed legal tools to govern patent valuation in their studies.

Vietnam

Over the past 15 years, many Vietnamese scholars have researched on the valuation of intellectual assets in Vietnam. Between 2006 - 2013, three entities under the Ministry of Science and Technology, i.e., the Department of Technology Appraisal, Examination and Assessment (2006),¹³⁶ the Vietnam Intellectual Property Research Institute (2009),¹³⁷ and the National Agency for Technology Entrepreneurship and Commercialization Development (2013),¹³⁸ conducted in-depth studies on theories, methods and protocols in valuing technologies, intellectual assets and specifically patents in Vietnam. Doan Van Truong (2011),¹³⁹ Tran Van Hai et al (2006),¹⁴⁰ Vu Thi Hai Yen (2008),¹⁴¹ and Tran Van Nam (2020)¹⁴² analyzed valuation of intellectual assets in different niche contexts, i.e., in multinational companies, in equitization of state-owned companies, in business activities, and in startups respectively.

Hoang Lan Phuong (2012),¹⁴³ Duong Thi Thu Nga (2014),¹⁴⁴ and Le Minh Thai (2017)¹⁴⁵ pointed out some problems in the legal system of intellectual assets, specifically the incompleteness of regulations on intellectual assets' valuation in specific niche contexts (i.e., capital contribution, equitization of state-owned companies, and security interests), and the inconsistency in regulations or guidelines on the cost-based valuation method.

These studies managed to provide an overview of (i) intellectual asset valuation methods that are applied globally; and (ii) the valuation regulations and practice in Vietnam over intellectual assets including patents. They are also ambitious to fine-tune traditional methods of intellectual asset valuation to make them more workable and suitable for the Vietnam context. However, these studies have yet to address the distinctive legal and economic characteristics of patents and reflect them in their analysis and proposals.

3. Results

3.1. Vietnam's Legal Framework on Patent Valuation

By law, a patent means a technical solution in the form of a product or process which is intended to solve a problem by application of natural laws.¹⁴⁶ An invention must fulfill three criteria to be protected as a patent; novelty, inventive steps, and industrial applicability. However, an invention without inventive steps could be protected as a utility solution if it is not common knowledge and satisfies the other two criteria.¹⁴⁷ A patent can be protected in maximum 20 years from the filing date, while a utility solution can be protected in maximum 10 years from the filing date.¹⁴⁸

Vietnam has no specific regulation on patent valuation. However, Vietnam has general regulations on intellectual assets' valuation provided in different legal instruments. Such regulations can be categorized into four groups addressing the following issues: (i) circumstances where intellectual assets valuation is needed; (ii) methods of intellectual assets valuation; and (iii) entities providing intellectual assets valuation services. Circular No. 06/2014/TT-BTC¹⁴⁹ (Circular 06) provides valuation standard no. 13 specifically applicable to intangibles including technologies and patents. It remains the most comprehensive official guidance on the valuation of intangibles in Vietnam for purposes of

inter alia sales, purchases, transfers mortgaging, mergers and acquisitions, capital contributions, profit division, disputes, and bankruptcy proceedings.

The Price Law¹⁵⁰ and Decree No. 89/2013/ND-CP guiding the Price Law¹⁵¹ (Decree 89) provide general principles on “valuation”. The Technology Transfer Law¹⁵² and Decree No. 76/2018/ND-CP guiding the Technology Transfer Law (Decree 76)¹⁵³ specifically define “technology valuation”,¹⁵⁴ specify cases where technology valuation is required (i.e., contribute technologies in investment projects using state budget),¹⁵⁵ and provide requirements an organization must satisfy to provide technology valuation services.¹⁵⁶

Joint Circular No. 39/2014/TTLT-BKHCHN-BTC¹⁵⁷ (Joint Circular 39) and Circular No. 10/2019/TT-BTC¹⁵⁸ (Circular 10) regulate and provide guidelines for valuation of intangible assets obtained from scientific and technological tasks using state budget. Joint Circular 39 generally mentions the protection status of the patent and risks in using the patent (e.g. cancellation, invalidation, economic/technological obstacles in application/exploitation/commercialization) as distinctive criteria that must be considered in valuing patent-employed assets.¹⁵⁹ Both instruments address three traditional valuation methods (i.e., cost, income and market), yet Circular 10 adds a distinctive method called “valuation based on the amount of investment in the respective scientific and technological task”.¹⁶⁰

3.2. The Fundamental Problem with Patent Valuation and New Technology Commercialization

Although patent valuation methods can lead to relatively accurate predictions of future market value, these methods suffer from extremely high-risk factors, and the assumptions used in the calculations of value. These risks and assumptions are a major hurdle for patent owners and potential licensees to overcome. Despite the sophistication and reasonable quality of information underlying the various valuation methods, potential licensors and licensees have significant difficulty in agreeing on a transaction price. An alternative route is the use of a “pre-negotiation valuation” as a starting point to an effective negotiation of mutually-shared risk and value capture. In patent valuation approaches, a price is set by a patent owner who then expects potential buyers or licensees to meet that price. In

¹⁶⁰ Article 7 Circular 10.

a pre-negotiation valuation, the patent owner conducts a preliminary patent valuation and uses the patent's inventiveness, technology value proposition, and market share capture projections among other things to begin a fact-based, transparent and mutual design of a set of mechanisms that allow the parties to share the risk and value of new technology, unvalidated by the marketplace.

3.3. Case Study: Valuation of the First Remote Waste Treatment Technology in Vietnam

3.3.1. Current Status of the Treatment of Municipal Solid Waste (MSW) in Vietnam and The Need for Appropriate MSW Treatment Technology

Following the growth in economy and population, as well as industrialization and urbanization, municipal solid waste (MSW) has been produced quickly in developing countries, including Vietnam, and it is clear that MSW has severely affected the environment and community wellbeing¹⁶¹. MSW is defined as the wastes in solid form, which are generated in daily activities by households and commercial, industrial, and institutional establishments¹⁶².

Despite the efforts of the Vietnam Government, there is a concern that the National Strategy for MSW management is likely to fail¹⁶³. One given reason is the lack of appropriate technologies for MSW treatments in Vietnam, which is not easy to solve by importing advanced technologies from developed countries.

Particularly, the characteristics of MSW depend much on the socioeconomic features as well as the geographical area, so each local authority will have unique requests for the waste treatment process to fit with municipal and policy goals¹⁶⁴. In detail, some main characteristics of MSW in Vietnam are high humidity (in the range of 65-95%), the ratio of ash is about 25-30% of dry mass, the total volatile solid is about 70 - 75% of dry mass, and low caloric value (in the range of 900 - 1,100 Kcal/kg of wet mass)¹⁶⁵. Hence, the efficiency of imported technologies, which were developed for handling MSW with other characteristics, are still under question¹⁶⁶.

On the other hand, there are not many domestically developed technologies in the field of MSW treatment. On 06 February 2022, the authors searched for the keyword "solid waste" in the public database of the Vietnam Intellectual Property Research Institute at <https://ipplatform.gov.vn/database/sang-che/tra-cuu-nang-cao>, but found only about 40 granted

¹⁶¹ Ming-Lang Tseng, Tat-Dat Bui and Ming K. Lim, *Resource Utilization Model For Sustainable Solid Waste Management In Vietnam: A Crisis Response Hierarchical Structure*, Resources, Conservation And Recycling, 171 (2021)

¹⁶³ X. Cuong Nguyen and others, *Call For Planning Policy And Biotechnology Solutions For Food Waste Management And Valorization In Vietnam*, Biotechnology Reports, 28 (2020)

¹⁶⁴ Feng Ming Tsai and others, *supra* note 35, at 4.

¹⁶⁵ Ministry of Natural Resources and Environment of Vietnam, *supra* note 36, at 24.

¹⁶⁶ Tran Van Nam and Lai Minh Chuc, "*Barriers To The Commercialization Of Inventions, A Practical View From The WTM Made In Vietnam Start-Up*", Hanoi Law University, Conference Proceeding on Commercialization of IPRs, 2021

patents and applications concerning MSW treatment under the name of Vietnamese entities (please see Appendix 1 – Result of patent search for the keyword “solid waste” under the name of Vietnamese entities). In addition, such domestic technologies are normally developed by the private sector, so their applications in practice are quite limited and being challenged¹⁶⁷.

In light of the foregoing, it is clear that the selection of appropriate MSW treatment technologies, which meet the specific requirements for handling MSW in Vietnam, is necessary, not only for cost-efficient but also for avoiding the threats to the environment and human health¹⁶⁸.

3.3.2. General Background of the Remote MSW Treatment Technology Invented by Lai Minh Chuc

Lai Minh Chuc is known as one of the leading inventors of MSW treatment technology in Vietnam¹⁶⁹. He is also the Director of the Centre of Research and Development of Environmental Technology for Construction (aka “CIRDETC”) as well as the President of the Board of members of Vietnam Environmental Science and Technology Co., Ltd. During his career, Chuc has participated in the creation of nearly 20 inventions and utility solutions, and at least 04 of them have been protected under the Patent Nos. 1-0012044-000, 2-0001218-000, 1-0026501-000, and 1-0024299-000 (as the date of 07 February 2022), officially granted by the IP Office of Vietnam. Please find Appendix 2 – List of Author Lai Minh Chuc’s inventions and utility solutions extracted from the World Intellectual Property Organization (WIPO) Publish database of the IP Office of Vietnam at <http://wipopublish.ipvietnam.gov.vn/wopublish-search/public/patents>.

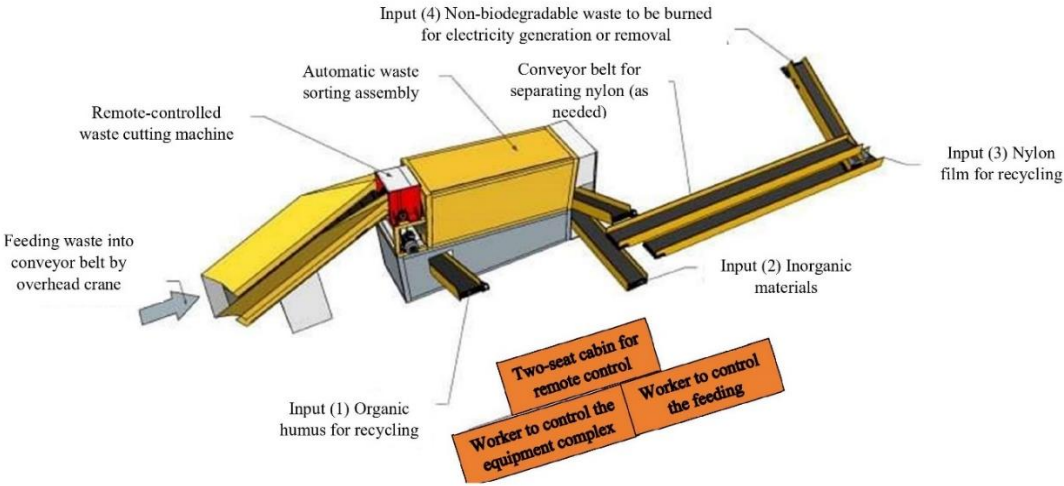

Figure 1. Model of automatic waste sorting equipment complex with remote control invented

Source: Inventor Lai Minh Chuc

¹⁶⁷Tran Van Nam and Lai Minh Chuc, supra note 36, at 4.
¹⁶⁸ Nguyen Huu Hoang and Csaba Fogarassy, *Sustainability Evaluation Of Municipal Solid Waste Management System For Hanoi (Vietnam) - Why To Choose The ‘Waste-To-Energy’ Concept*, Sustainability, 12.3 (2020).
¹⁶⁹ "Engineers Invented Environment-Friendly Automatic Rubbish Classification - News Vietnamnet", *English.Vietnamnet.Vn*, 2012 <<http://english.vietnamnet.vn/fms/environment/22990/engineers-invented-environment-friendly-automatic-rubbish-classification.html>> [Accessed 7 February 2022].

The point is that the quality of waste sorting of this technology is much higher than that of prior manually-operated devices, thus overcoming the secondary pollution situation of emissions and micro infectious bacteria for workers and the environment around the factory. According to the Director of Ha Nam Waste Treatment Plant, Ms. Nguyen Ngoc Hue, this is an automatic technology without manual labor, and it should be widely used in Vietnam¹⁷⁰.

3.3.3. The issued Vietnam patent No. 12044

The basis for any patent valuation is the patent (or patents) per se. The fundamental value of a patent lies in the claims – the “metes and bounds” of the property right that allows the patent owner to stop others from making, using, and selling the property. Therefore, the scope and quality of the claims are the defining characteristic of a patent’s legal and economic value.

The scope of claims has a large impact on the patent value. If the claims effectively cover the products or service items of commerce, they have value – if they do not effectively cover those items – the claims are not valuable, and neither is the patent. If a patent claims cover the toothbrush, the patent has value because all toothbrushes are covered by the patent. If a patent claims cover toothbrushes with blue-stripes, the coverage of items of commerce are significantly reduced – and therefore the patent value is commensurately reduced, from all toothbrushes to only blue-striped toothbrushes.

A basic question is whether this claim confers value on the issued patent, because the claim effectively covers the item of commerce. Of critical importance is the question of how easily others can “design around” the claims in order to avoid infringement. Without infringement, the patent owner cannot stop others from making, using, selling the claimed invention.

The value of Vietnam Patent therefore hinges on a close analysis of the claims and how easily it can be modified to avoid infringement. For example, Claim 1 includes “rectangular steel plates with a thickness of 1-2cm”; if another party uses plates that are more or less than this thickness, they arguably fall outside the patent claim – and avoid infringement.

3.3.4. The Illustrative Valuation and Commercialization of Remote Waste Treatment Technology conducted by an Independent Expert

As the claims of Inventor Lai Minh Chức cover the technology in a meaningful way, with enforceable claims, WIPO and her Vietnam counterpart arranged a pilot service to evaluate the invention that was already awarded titles of protection by the National Office of Intellectual Property of Vietnam.

The aforesaid waste treatment technology was valued by Robert Sanders, Managing Partner of Global IP Services LLP, Singapore, and Managing Director of Global IP Services Australia Pty Ltd, in an illustrative Independent Expert’s Report (IER) under the terms of a proposal extended during the WIPO IP Valuation workshop in Hanoi, Vietnam in June 2013.

a) Cost of Development

The total cost of developing the waste treatment technology was estimated at **US\$1.149 million**. The detailed breakdown is as the below table:

¹⁷⁰ Tran Van Nam, and Lai Minh Chuc, 2021; supra note 36

Table 1. The detailed breakdown of the costs for developing the waste treatment technology

Total Costs for Developing the Waste Treatment Equipment			
Activities		Cost (in million VND)	Cost (in million USD)
I	Labor costs	4,830	0.225
II	Loans without interest	8,062.5	0.375
III	Costs for purchasing supplies and facilities for manufacturing and testing	11,780.5	0.549
Total		24,673	1.149

Source: Inventor Lai Minh Chuc

The historical costs provided were reviewed and assessed in the context of the IER. This investment provides the owner, in the context of a nationally recognized and highly-regarded technology, with a capacity to leverage these in the context of a Vietnamese domestic market with well-researched and sustainable requirements for the solution that waste treatment technology represents.

b) Value of Vietnam Market for Waste Treatment Technology

The capital for establishing each waste treatment plant (with a notional 1000 tons of waste/per day handling capacity) is estimated at US\$24 million, according to other research by Inventor Chuc. Based on the provided information, a planning estimate (for calculation of fair value purposes) of 10 plants (across 03 cities: Hai Phong, Hanoi, and Ho Chi Minh City) was used.

Again, for calculation purposes, the valuer assumed a flatlined commissioning of waste treatment plants over a 5-year period, the following capital investment trend, with an upfront ‘spike’ in the first year as the first facilities (essentially 1 for each key metropolitan center) was commissioned, was envisaged.

Table 2. Capital investment trend in Vietnam market for waste treatment technology over 5 years

Value of Vietnam market for waste treatment Units (Capital Cost Basis)	US\$
Year 1	80,000,000
Year 3	160,000,000
Year 5	240,000,000

Source: Robert Sander ¹⁷¹

c) The Estimated Value of the Waste Treatment Technology

Firstly, the valuer argued that the cost-based approach was not appropriate for assessing the fair value of the waste treatment technology. The cost-based approach,

¹⁷¹ Robert Sanders (2013), *Valuation of Nominated Waste Treatment Machine (“WTM”) Intangible Assets*, An illustrative Independent Expert’s Report (IER) under the terms of a proposal extended during the WIPO IP Valuation workshop in Hanoi, Vietnam in June 2013

including the consideration of any component of the US\$1.149 million amount reported by the inventor in the context of this exercise as total costs associated with the development of the waste treatment technology, was rejected as it did not, in the reviewer's opinion, adequately reflect or indicate the enterprise fair value the technology would have in relation to the fair value of royalty-based, and other practicable income streams in relation to the 5-10 year plant rollout (and US\$24 million per plant capital model) outlined above.

Secondly, the market-based approach was constrained by the lack of an active and relevant "waste treatment technology" market. This market was inadequate for fair value purposes, as illustrated by the "Nil Response" results for direct comparable transaction (acquisition) searches.

Hence, for illustration purposes, the income-based approach was employed and calculated. Applying a notional 6% royalty rate (to depict the notional contribution of the Technology on a Relief-from-Royalty basis against the US\$240 million capital model relied upon) against the first 5 years of waste treatment plant roll-out revenues, a total revenue stream of US\$14.4 million was depicted. Applying a (straight line – for illustration purposes) discount rate of 15%, on a DCF basis, a fair value of **US\$12.24 million** in NPV terms was derived.

This depicts an appropriate (internal and illustrative) fair value for the subject waste treatment technology and is not meant, in any way, to establish or constrain their potential commercial market value to potential acquirers, especially those interested in exploiting an international (beyond Vietnam) market for its application.

4. Discussion and Conclusion

4.1. Conditions for a startup company to successfully transfer its patents' rights

An invention can be commercialized if it can produce a specific product or a process. Generally speaking, inventions require a combination of different technical fields, so a patent by itself is only one contributing factor. Therefore, to commercialize such inventions, it will take an inventor a long time from experimental research to create an application prototype on an industrial scale. From the scenario of remote waste treatment technology, the required conditions for a startup company to successfully transfer its patents' rights are:

(i) the technology must have a compelling "value proposition" that has been reasonably well-validated by the Company. The value proposition is the quantified benefits of using the technology minus the costs of implementation.

(ii) if The Company cannot rent facilities, it must obtain its own factory premises to manufacture waste treatment equipment according to the Company's inventions. Equipment expected to be produced and supplied to the market includes: (1) Automatic waste sorting machines (2) Machines for processing biological compost. (3) Waste incinerator.

(iii) There is a must that the Company acquires at least one real "buyer" to carry out the latest generation of waste sorting provided by the Company. This licensing contract will help to generate more potential licensees in the future.

(iv) The Company should find at least one real partner to cooperate with in order to process bio-composting organic waste. The Company's waste sorting equipment proves that the invention is effective and sustainable for the entire life cycle of urban waste treatment.

(v) There is a must that Company acquires at least 01 angel fund to allocate capital for manufacturing an incinerator of urban waste treatment on an industrial scale (see Figure 2).

4.2. The Benefit and Drawbacks of Valuation in Commercialization in Vietnam

Given the intangible and unique nature of a patent, its value is not easily assessed like other traditional properties. Therefore, there is no doubt that valuation is only a starting point for negotiation between a licensee and a licensor. In Vietnam, the patent valuation provided by a qualified appraisal organization is a reliable source for parties in their negotiation. In some complicated cases, the parties may obtain the valuation results from different service providers to get an average valuation accepted by both parties.

However, as seen in Mr. Lai Minh Chuc's case, the valuation of US\$12.24 million resulted from the income approach was not accepted by the potential purchasers. A commonly given reason is the income-approach valuation is very high, and even not realistic, in the eyes of potential purchasers. In general, the potential purchasers were very reluctant to pay such a high price, while there was no guarantee that Mr. Lai Minh Chuc's patent would bring the expected profits if applied in reality. Instead, the potential purchasers opted for choose the cost-approach valuation, which is just US\$1.149 million, much lower than the income-approach result selected by Lai Minh Chuc. Due to the big gap between these 02 amounts, the negotiations between Inventor Lai Minh Chuc and potential purchasers often came to a dead end. This proves our point that "patent valuation" per se is a dead-end for trying to enter into a license with unproven technology.

Hence, the lesson from Lai Minh Chuc's case is the patent valuation, whether it is calculated based on which approach, is still just a source of reference. To actively commercialize the patent, the inventors should not fix the price at their expectation, but adjust it to be reasonable and affordable, while considering the potential purchaser's perspective. As disclosed by the Inventor, the final price accepted by both parties was not high as his expectation, but still much better than a zero-income scenario if the negotiation fails.

4.3. Recommendations

It should be noted that Mr. Lai Minh Chuc is not the only inventor facing difficulties in patent commercialization in Vietnam. It is clear that the application and registration are meaningless if the owners could not commercialize their protected patents to recover expenses and gain benefits. Bearing this concern, Vietnamese entities are quite hesitant in developing their own technologies as well as applying for patents, and according to the Ministry of Science and Technology of Vietnam, the number of domestic patent applications and registration in the 10-year period, from 2010 to 2019, is 5,851 (including 5,020 applications and 831 registrations), just equivalent to around 10% of the total number (i.e., 58,085) of application and registration of the foreigners¹⁷².

At present, it is too soon to predict whether or not these targets will be achieved in 2030. However, there is an impression that the Vietnamese government is showing its efforts

¹⁷² Ministry of Science and Technology of Vietnam, *Proposal On Approving The Intellectual Property Development Program toward 2030* (Hanoi, 2020), pp. 4.

in realizing goals through many actions. Based on the Decision No. 2205/QĐ-TTg of Prime Minister, each local government made its own plans for implementation in their localities, with different targets and proposed solutions to be suitable to their specific conditions. In addition, the Ministry of Science and Technology is also drafting the Law on the amendment of Intellectual Property Law, in which many regulations could be changed to facilitate the domestic inventors in registering, protecting and commercializing their patents, in accordance with Decision No. 2205/QĐ-TTg.

Nowadays, Vietnam is in a phase of accelerating industrialization and modernization, thus, issuing new sub-laws to support technology transfer services conducted by intermediary organizations will help to fill the gap between Vietnam with other economies in the region.

4.4. Conclusion

A patent, even registered at the IP Office, is almost meaningless if it is not exploited and commercialized effectively by its owner, and patent valuation can be useful – or become a hindrance - in the commercializing process. However, from studying the case of inventor Lai Minh Chuc, it can be seen that patent valuation and commercialization are not straightforward tasks in the context of Vietnam, where the legal framework is still inadequate and the potential purchasers often refuse the valuation calculated by an independent valuer.

Facing this situation, in order to quickly commercialize the patent, the inventors are advised to adjust the price flexibly to meet the acceptable threshold of potential purchasers. Inventors should use a “pre-negotiation valuation” approach as the basis for a mutually designed (negotiated) value-capture and risk-sharing mechanism. Furthermore, it is necessary to improve the legal framework for patent valuation and commercialization, through the long-term strategy of promoting domestic patent registration, as well as the restructuring of the legal framework of the establishment and operation of the intermediary organization.

ANTECEDENTS OF SKILLED INTERNATIONAL IMMIGRANTS TO VIETNAM: THE IMPORTANCE OF GLOBAL NETWORK AND INSTITUTIONAL QUALITY

Ministry of Labour Invalids and Social Affairs, Vietnam

Abstract

This paper examines demographic, economic, and social antecedents of international migrations of skilled laborers to Vietnam. Using various econometric techniques for the sample of 63 provinces in Vietnam during the 2016-2020 period, our study highlights the importance of global network and institutional quality in promoting the international inflows of skilled workers to each province in Vietnam. However, the evidence of their roles is more likely to be evident in the long run. The income of the host city and the lack of skilled labor in these cities captured by the level of young employment and skilled worker also play a critical role in skilled immigrant's decisions. Furthermore, dimensions used to reflect different issues of institutional quality affect the migrants who work as a manager, CEO, specialist, and technicians differently. The condition to develop the career and the standard of living in the host country is essential for international immigrants with advanced skills, thus the Vietnamese government should focus on the policies to improve the standard of living in terms of both social and economic benefit for these groups of international immigrants.

Keywords: *skilled international immigrants; global network; institutional quality; short-term and long-term effects; Vietnam.*

1. Introduction

Population movement is still becoming more important as migration plays an increasingly important role in the contemporary world. Scholars are increasingly interested in the determinants affecting the distribution of foreign workers in this context. According to previous studies (Castles, 2002, 2006; Massey et al., 1993; Tóth & Kincses, 2011), migrants generally gravitate toward a small number of regions due to various specific economic, social, political, and also geographical factors. In this regard, international migration is likely to affect cities and metropolitan regions rather than rural and underdeveloped regions facing socio-economic challenges. Additionally, several studies have shown that the higher the number of migrants who have arrived in a particular area in the past, the higher the following influx of immigrants. This research examines the economic factors that drive the international migration of workers to Vietnam and their impact on skill gaps. We mostly focus on foreign investments and institutional quality influences on the probability of work-related migration flows, especially skilled ones.

The majority of research on labor migration is based on observations of migrants in the receiving country, hence emphasizing the magnitude of the phenomenon or associated

impacts rather than temporal migratory changes. A few studies have examined the factors of aggregated migrant flows: Karemera et al. (2000) and Clark et al. (2009), Hatton and Williamson (2001) for flows to the United States and Canada; Gross and Schmitz (2003), and Mayda (2005) for flows to Party OECD countries. The paucity of study is due to a general dearth of data about overseas immigrants with specialized skills. Whenever flow observations exist, they often do not correspond with the immigrant experience. In traditional immigrant countries, skill selection is often an administrative procedure that does not have to be considered market constraints. In Canada, for example, the points system assures that around half of all incoming immigrants possess a high level of education or competence. Due to the many impediments to entrance into the Canadian labor market, a high majority of immigrants admitted under the points system would likely wind up in low-paying employment (see Reitz, 2000).

Expanding Gross and Schmitt's (2012) immigration flow model in three directions helps us better understand what motivates different sorts of people with different skill sets to migrate. The three directions are: first build the link between global network as well as institutional quality and skill levels; second, we allow for relative income distribution to provide skill-specific selection bias which impacts the amount of the flows and third, we allow for an unequal effect of benefits and costs across skill classes.

To obtain this objective, various econometric techniques, such as the fixed effects (FE), the random effects (RE), the panel corrected standard errors (PCSE) model, and the feasible generalized least square estimates (FGLS) model, are applied to a dataset of 63 provinces of Vietnam from 2016 to 2020, with the aim of investigating the determinants of skilled international migrants to Vietnam. As indicated in the literature, these methods are useful for resolving the issues of heteroscedasticity and fixed effects. Distinguishing the short-term and long-term effects of determinants of international migrants, therefore we also employ the autoregressive distributed lag (ARDL) method using the fixed-effects estimate (DFE). The DFE-ARDL is an appropriate method for dealing with the causal relationship between variables and the heteroscedasticity across provinces arising from the potential existence of endogeneity (Pesaran et al., 1999).
