The paper is structured as follows. In Section 2, we provide a theoretical model that quantifies the determinants of skilled international migrants. Section 3 describes the data and empirical estimation strategies. The results are presented in Section 4, and finally, Section 5 discusses and concludes the paper.

2. Theoretical framework

A person of skill class si who is considering moving to country d is an example. Where L^o (L^d) is the wage in the country of origin (destination), migration's gross gain is $\{L^d(s_i) - L^o(s_i)\}$. When migrating expenses $CP(s_i)$ are taken into account, the chance of an individual belonging to the class of skill i gain due to migrating can be expressed as $XS_i = XS_i[L^d(s_i) - L^o(s_i), CP(s_i)]$. This probability is influenced positively by the salary differential between the country of origin and the country of destination and adversely by the cost of migration. In turn, these wages are heavily influenced by the wage distribution in these two countries (Borjas,

1987), as well as any potential wage premiums migrants with specialized talents may receive. The fact that earnings may vary within a skill class may be due to either disparities in ability (e.g., Gibbons and Katz, 1992) or to positions with varying pay across industries and companies. Below, we employ the capability. We, therefore, assume that an individual's wage in skill class s_i in the country of destination depends on the earnings distribution for this class of skills (i.e., the mean $\mu^d(s_i)$ and the variance $\phi^d(s_i)$ and on a wage premium associated with cultural clustering in the destination country ($sc^d(s_i)$), respectively.

$$L^d(s_i) = L^d[\mu^d(s_i), \sigma^d(s_i), sc^d(s_i)]. \quad (1)$$

In the country of origin, earnings for the same skill class are determined solely by the first two factors,

$$L^o(s_i) = L^o[\mu^o(s_i), \sigma^o(s_i)]. \quad (2)$$

A person's choice to migrate, then, relies on a variety of factors, not only on the average salary in their home country and on their new place of residence. We follow Borjas (1987) and Clark et al. (2007) in that the relative dispersion of earnings in the home country and the destination country may contribute to a bias in the sorts of immigrants that are imported. Rather than accounting for the earnings of all workers, in our scenario, the pay distribution is based on a specific set of talents. Suppose that the salary disparity between Vietnam and the place of origin is modest for skill class s_i and all other factors being equal. High-capacity employees in that class of skills are likely to find Vietnam appealing, whereas low-capability people in the same class of skills are likely to find Vietnam unattractive. When the nation of origin's variance is large compared to Vietnam's, migrants are more likely to have a selection bias. Changing salary distributions and the ensuing impact on migration patterns allow us to determine which way the bias is leaning. As an example, imagine that Vietnam's salary distribution is more variable, but it also increases compared to the home country. The shift favors high-ability workers more (more high-ability people and fewer low-potential employees are drawn to Vietnam), resulting in greater average migrant skill levels within that skill set category as a result of the shift.

We now analyze the conditions under which a skill-dependent premium linked with cultural clustering in the destination country occurs. We are especially interested in the connections between this potential premium and the conditions in which cultural clustering plays a larger role for low-skilled migrants than for high-skilled migrants. To do this, we expand Gross and Schmitt's (2003) model to skill classes. Assume, therefore, the presence of two labor markets in which a migrant can work: a labor submarket based on migrants' distinctive cultural knowledge or language and an anonymous but culturally neutral labor market. The wage in the country of destination, $L^d(s_i)$, relies on skills and can take two values: $L^a(s_i)$, the wage in the anonymous labor sub-market, or $L^e(s_i)$, the wage in the ethnically-specific labor sub-market. Appendix 1 has two results. First, regardless of the category of talents, the ethnically distinct labor market cannot be too broad to support a paid premium. Second, a positive pay premium in the ethnic-specific labor sub-market is more challenging to maintain for high-skilled classes than for low-skilled classes when earnings increase more with skill levels in the anonymous labor market than in the ethnic-specific

labor market. This may be because the anonymous labor market offers more chances for highly skilled workers than the ethnic-specific market. The consequence is that, up to an upper skill level \bar{s} , comparatively low-skill migrants get a positive premium, $sc(s_i)$, in the ethnic-specific labor market, which gives them an incentive to cluster in the destination country, but migrants with high skill ($s_i \geq \bar{s}$) do not.

Migration expenses, of course, play a role. Immigration regulations that limit the number of foreign employees allowed into one country have an impact on the likelihood that people will move. With free mobility inside the EU and a restrictive policy with other countries, we model the transition from limited to unrestricted mobility as a decrease in the cost of migration. Free movement of people has a direct impact on migratory movements. As a result, freer mobility has a greater impact on low-skill migration than on high-skill migration if the cost of migration is not dependent on one's level of education (see Clark et al., 2002).

The above description refers to an individual's likelihood of migrating to a certain nation and must be modified to the aggregate framework of migration flows. The number of individuals of a certain skill class who decide to move from one country to another ($DC(s_i)$) is the product of individual probability and the size of the relevant population such that,

$$DC(s_i) = XS_i DS(s_i) = XS_i \left\{ \mu^d, \mu^o, \frac{\sigma^d(s_i)}{\sigma^o(s_i)}, sc^d(s_i), CP(s_i), K^d(s_i) \right\} DS(s_i). \quad (3)$$

We expect μ^d to have a positive sign, μ^o to have a negative sign, $\frac{\sigma^d(s_i)}{\sigma^o(s_i)}$ to be ambiguous because it depends on the selection bias within a skill category, $sc^d(s_i)$ to be positive for lower skill levels only, and $CP(s_i)$ to be negative but with different elasticities across skill classes.

3. Model specification

To conduct empirical analysis, the author relies on the theoretical framework built in the previous section to build an experimental model as follows:

$$LDC_{j,t} = \beta_0 + \beta_1 W_{j,t} + \beta_2 U_{j,t} + \beta_3 R_{j,t} + \beta_4 FM_{j,t} + \beta_5 HC_{j,t} + \beta_6 YE_{j,t} + \beta_7 SE_{j,t} + \beta_8 FDI_{j,t} + \beta_9 FI_{j,t} + \beta_{10} LAR_{j,t} + \beta_{11} UR_{j,t} + \beta_{12} EDU_{j,t} + \varepsilon_{j,t}, \quad (4)$$

where $LDC_{j,t}$ is the log of the number of migrant workers to each province j of the 63 provinces of Vietnam. The details of the included variables are summarized in Table 1.

Since some variables are not stationary, all become stationary after taking the first-degree difference. The panel corrected standard errors (PCSE) model is used for the sample in this study to demonstrate the existence of cross-sectional dependence between each province, based on the studies of Beck and Katz (1995) and Canh et al. (2021). In addition, we apply the Feasible Generalized Least Squares (FGLS) model to solve the potential issue of heteroskedasticity or result differences due to sectional fixed issues (Gala et al., 2019; Sweet & Eterovic, 2019) presented in Equation (4) to confirm our findings. In addition, the differences between short-term and long-term effects are also considered in this article. We apply the ARDL method developed by Pesaran and Smith (1995). In this model, the fixed-effects estimate (DFE) is used because of the causal relationship between variables and the heteroscedasticity across Vietnam's provinces arising from the potential existence of endogeneity (Pesaran et al., 1999).

Table 1. Summary of variables used in the model

Dependent variables	Description	Data source	Count	mean	sd	min	max
$LDC_{j,t}$	Log of the number of migrant workers to each province j of Vietnam.	Ministry of Labour, Invalids and Social Affairs (MOLISA)	223	5.61	1.89	0.00	9.96
$LQL_{j,t}$	Log of the number of foreign migrant workers working in management positions in the provinces of Vietnam.	Ministry of Labour, Invalids and Social Affairs (MOLISA)	118	3.71	1.96	0.00	7.91
$LGD_{j,t}$	Log of the number of foreign migrant workers working as executives in the provinces of Vietnam.	Ministry of Labour, Invalids and Social Affairs (MOLISA)	115	3.45	1.93	0.00	7.37
$LCG_{j,t}$	Log of the number of foreign migrant workers working in specialist positions in the provinces of Vietnam.	Ministry of Labour, Invalids and Social Affairs (MOLISA)	125	5.10	2.04	0.00	9.63
$LKT_{j,t}$	Log of the number of foreign migrant workers working in technical positions in the provinces of Vietnam.	Ministry of Labour, Invalids and Social Affairs (MOLISA)	123	4.55	1.82	0.00	8.44
Independent variables							
$LFDI_{j,t}$	Log of the amount of FDI capital into each province.	General Statistics Office of Vietnam	223	3.52	2.11	0.00	8.30
$LU_{j,t}$	Log of the unemployment number in each province.	General Statistics Office of Vietnam	223	0.62	0.60	-1.47	2.24

Dependent variables	Description	Data source	Count	mean	sd	min	max
$LUR_{j,t}$	Log of the population living in urban area in each province.	General Statistics Office of Vietnam	223	3.23	0.51	2.28	4.47
$LW_{j,t}$	Log of the average income in each province.	General Statistics Office of Vietnam	223	8.06	0.58	0.74	8.91
$LYE_{j,t}$	Log of the young employment (ranged from 15 to 24) number in each province.	General Statistics Office of Vietnam	223	13.48	0.58	10.88	15.37
$LPOP_{j,t}$	Log of the population number in each province.	General Statistics Office of Vietnam	223	14.02	0.58	12.64	16.04
$LSE1_{j,t}$	Log of the employment numbers working as manager or CEO in each province.	General Statistics Office of Vietnam	223	8.72	1.17	1.20	16.07
$LSE1_{j,t}$	Log of the employment numbers working as technicians in each province.	General Statistics Office of Vietnam	223	9.84	2.53	-4.20	13.04
PCI	The provincial competitiveness index in each province.	Vietnam chamber of commerce and industry	223	62.93	3.58	52.99	75.09

4. Results

Breusch & Pagan Lagrangian test results for Equation (5) show that $\text{Prob} > \chi^2 = 0.000 < 0.05$, so the H_0 hypothesis is rejected. This implies that the pooled OLS model is not an optimal model, thus it is necessary to use either fixed effects (FE: Fixed Effects) or random effects (RE: Random Effects) models. With Hausman test results, the fixed effect (FE) model is considered to be more suitable for the construction model to estimate the factors affecting international labor migration with skills to Vietnam when $\text{Prob} > \chi^2 = 0.0000 < 0.05$.

Table 2 outlines the results of the model of factors affecting skilled international migrant workers to Vietnam when considering the specific issues of the institutional quality. First, in Panel A, we study the factors that influence the decision of international managers and CEOs to come to Vietnam. In general, the effect of *FDI* on *LQL* is positive and statistically significant. For the immigrants who work in the manager position in Vietnam, the influence of FDI is greatest. The quality of the institutional system of Vietnam also plays a critical role in their decision, in which the quality of business support service and the sound labor training policies in each province are the most evident. Similarly, for CEOs who are not Vietnamese, their decision is also significantly affected by FDI. However, the role of institutional quality is not confirmed in our sample. Furthermore, the unemployment issue in the province of Vietnam (*LU*) has a positive and statistically significant impact on their decision. The findings suggest that a lack of labor resource in the host country can be considered as an important opportunity for international immigrants that affect their decision to move to the host country.

Next, the study focuses on the influencing factors to move skilled international specialists and technicians to Vietnam as the different issues of the institutional environment are taken into account. The results are shown in Panel B. Similarly, the effect of FDI on their decision is positive and statistically significant at a 1% significance level. However, the institutional quality affects differently the decision of specialists and technician. In particular, the role of institutional quality becomes apparent for international specialists, whereas a similar finding cannot be found for the sample of technicians.

In Table 3, we also perform additional analysis, in which we concentrate more on other factors affecting skilled international migrant workers to Vietnam. In Panel A, the impacts of average wage (*LW*) in a particular province of Vietnam on the decision of managers and CEOs are statistically significant and positive. When there is a transparent business environment, the manager's decision is most affected by *LW* (4.418). In contrast, when there is a good labor training policy, the impact of *LW* on management is the smallest positive (2.009). The impact of *LW* on CEOs is positive and statistically significant. The results from columns (8)-(12) are 2.191, 2.209, 2.159, 2.149 and 1.796, respectively.

Similarly, *LYE* has a positive and statistically significant effect on the number of foreign employees working as managers and CEOs in Vietnam. Specifically, the influence of *LYE* on labor and management is strongest when there are policies to support enterprises (with a coefficient of 7.220) and the least when the business environment is transparent (5.101). Meanwhile, *LYE*'s impact on CEO workers' decisions in a transparent business environment is the least obvious (.,428); on the contrary, this impact is greatest when there is a good training policy. The results also show that *LPOP* has a negative and statistically significant effect on employees as managers and CEOs. Notably, this negative impact is smallest in the context of a transparent business environment. The adjustment coefficient for employees who are managers is -3.843, and for employees who are CEOs is -4.381. Moore importantly, the competition of skilled labor in the domestic country significantly negatively affects the decisions to move to Vietnam of skilled international immigrants. Perhaps, the competition pressure from the peer group is among the critical challenge for international workers.

Similar to Panel B, the results of the impact of *LW* on international workers who are specialists and technical workers when there is a change in institutions are all positive, statistically significant and more pronounced than the other variables. . Changes in time, administrative procedures lead to the largest influence of *LW* on LDC, with the adjustment coefficient of 2,539, however, this effect when having a good labor training policy is the smallest (2.229). For technical workers, the influence of *LW* on LDC is greatest in a transparent business environment (2,458) and least pronounced when there is a good labor training policy.

6. Conclusion

This study aims to examine the demographic, economic, and social antecedents of international migrations of skilled laborers to Vietnam. The study uses various econometric techniques to analyze Vietnam's economic development during the 2016-2020 period, emphasizing the importance of global networks and institutional quality in fostering the international inflow of skilled workers to the various provinces in Vietnam. However, the evidence of their role will most likely become apparent over the long term. An immigrant's decision to relocate to a particular city is influenced by the income of the host city and the availability of skilled labor in these cities as well as the level of young employees and skilled workers. Additionally, dimensions used to reflect different aspects of institutional quality impact migrants differentiating between managers, CEOs, specialists, and technicians.

On the policy front, our findings suggest critical insights to help economists and policymakers design policies better to attract skilled laborers from other countries. The policies aiming at enhancing Vietnam's global network, such as the policies to attract the inflows of foreign investments, and the policies to encourage the domestic entities to involve in the global trade network... play a vital role in helping the host countries to attract the international immigrants with advanced skills. More importantly, the authorities should build a strong and stable institutional system that guarantees the benefits while reducing the costs and time to deal with the administrative procedure for immigration or related documents to expand the time in the host countries.

Abstract

As the speed of the development of information technology becomes more and more powerful, more and more software is developed with the intent of meeting the majority of user demands and actively supporting all careers. Under the pressure to be competitive in the job market, students today are now wishing to develop more skills in using the supporting software related to their major to lay the foundation for their job in the future. Because of the above reason and many other reasons that tend to increase the willingness to use pirated software of many students. In this article, the influence level of these factors will be empirically investigated on universities in Hanoi. By using a linear regression model, the article shows that (1) there is no longer a distinction between genders, income and majors of students about the willingness to use pirated software, (2) the influence of those factors in the model is quite clear, especially the attitudes and subjective standards, (3) proposes solutions and recommendations for legal agencies, schools and to software enterprises.

Keywords: *Pirated software, software piracy, computer software, willingness to use.*

1. Introduction

Software technology is gradually being widely applied in all careers and is getting more attention because of the convenience they bring to the table. The age of digital economy technology booming brilliantly, which requires people to constantly innovate, fit in with the times and students are no exception. Each job has many types of software to use, this software is copyrighted software and the cost to own them is quite high, especially for students, a group of people who do not have stable financial resources. As a result, students

have consulted many ways to get the necessary software for themselves and one of the most popular ways has been to use pirated software, for which they don't have to pay but still retain all the features of the original. Students are gradually considering the unauthorized use of copyrighted software as inevitable because of the urgency of their work, as well as the era of the rapid development of computer network, also because they are attracted to the convenience of pirated software. This problem has appeared since the early days when software was put in use in Vietnam. Realizing the seriousness of this situation, the Government has already made efforts to change by supplementing the legal corridor and perfecting sanctions. Businesses have also issued warnings about using unorthodox software. In addition, in the higher education environment, many lecturers have made specific requirements for the correct use of software. But that did not bring any significant improvement, to the extent that it has not been completely resolved for many years. Therefore, the team has conducted a study on the students' willingness to use pirated software, thereby proposing solutions to allow the students fully understand the matter of respecting software copyright and prevent the situation of increasing unauthorized use of copyrighted software, based on a field survey of university students in Hanoi.

2. Method

2.1. Proposed Research Model

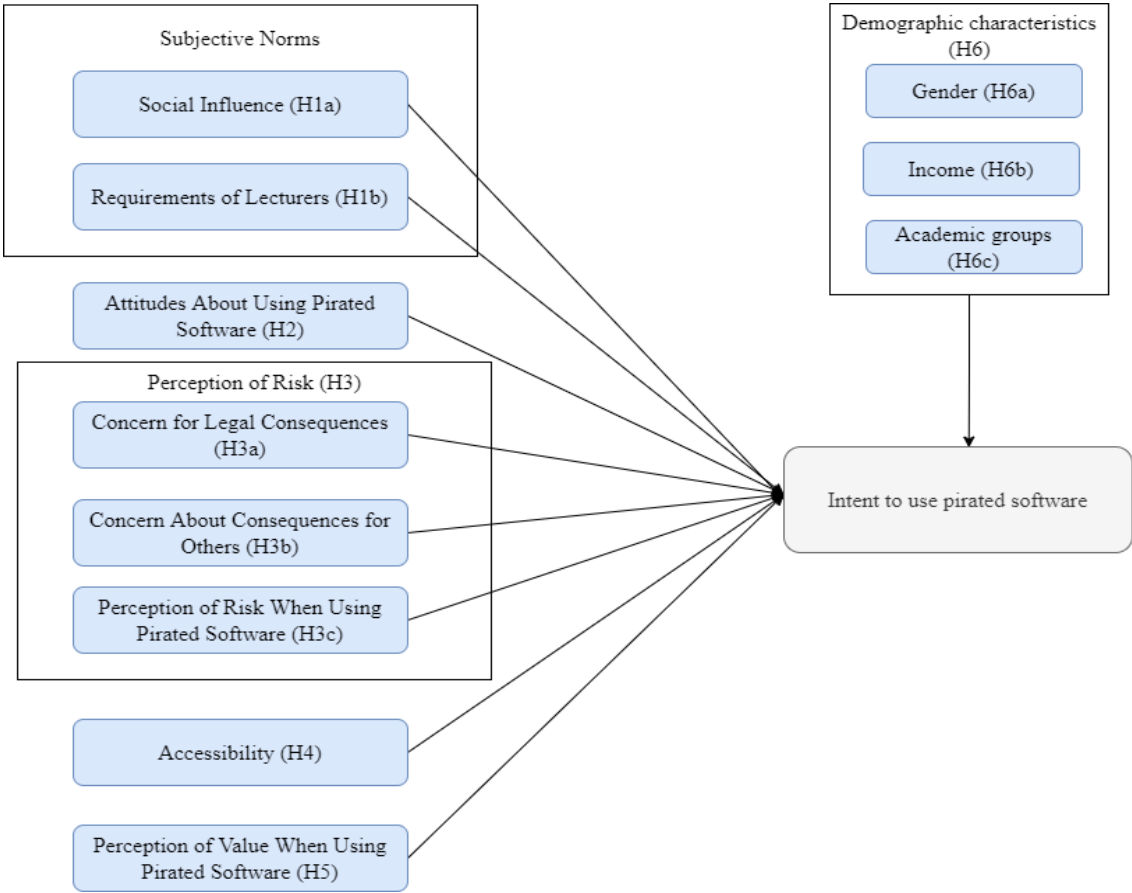

Figure 1. Research Framework

From an overview of previous studies on the factors influencing the willingness to make use of software piracy along with according to the behavioral theories and qualitative results through field monitoring, the research team proposed a model of factors influencing the willingness to use pirated software with 8 group of independent variables and 1 group of control variables as shown in Figure 1.

2.2. Data

The research article applies two methods: qualitative research and quantitative research on two data sources, with the main data source being primary data by sending out survey sheets and collecting back objective and multidimensional answer sheets from students at universities in Hanoi, and with a second source of data being secondary data collected from scientific articles, reputable research works at home and abroad, in addition to being referenced on electronic library platforms with high reliability and carefully selected information.

3. Results

3.1. Exploratory Factor Analysis – EFA

The results of KMO and Barlett tests from the first EFA analysis results of the research team has showed that the KMO coefficient = 0.893 > 0.5, with the coefficient sig = 0.000 < 0.05. Thus, the results of exploratory factor analysis (EFA) are appropriate. With Eigenvalue = 1,078, they managed to extract 7 factors from the original 8 groups of variables. The initial factors consist of the Requirements of Lecturers (RL): RL1, RL2; Social Influence (SI): SI1, SI2; Accessibility (A): A1, A2; Attitudes About Using Pirated Software (AP): AP2, AP3, AP4, AP5; Concern for Legal Consequences (LC): LC1, LC2, LC3; Perception of Risk When Using Pirated Software (R): R1, R2, R3; Concern About Consequences for Others (CO): CO1, CO2; Perception of Value When Using Pirated Software (V): V1, V2. Precisely, the research team had found that the observed variables like RL1, RL2, SI1, SI2 were converging on factor 2. These observed variables belong to two component factors in the Subjective norm group of factors (including Influences of Community and the Requirements of the lecturers). Average Variance Extracted of the independent variables for the first time reaches a value of 67.890% > 50%. This means that the variable level of the explained data is up to 67.890%, which is completely satisfactory.

Table 1. Rotated Component Matrix

	Factors							Factors						
	1 st time							2 nd time						
	1	2	3	4	5	6	7	1	2	3	4	5	6	7
AP2	.758							.745

<i>LC2</i>					.772							.778		
<i>LC3</i>					.758							.761		
<i>V1</i>						.836							.839	
<i>V2</i>						.836							.838	
<i>CO2</i>							.822							.824
<i>CO1</i>							.818							.821

Source: Research team's analysis results

The research team considered removing two bad variables, AP1 and R4. The observed variable AP1, two 2-factor loading coefficients with a difference of $0.119 < 0.3$, at variable R4 also appeared two 2-factor loading with a difference of $0.141 < 0.3$, both variables are not guaranteed discriminatory value between the scales, so they were excluded.

The results of the second EFA – exploratory factor analysis after removing two bad variables, AP1 and R4, gave the following results: The KMO coefficient in the KMO and Barlett tests gives the result 0.896 with a confidence level of over 95% ($\text{sig} = 0.000$). Thus, the results of the second EFA of the research team were completely satisfactory. Seven factors were extracted based on the Eigenvalue > 1 criterion. The total sum of the average variance extracted at the seventh factor group reached $67.855 > 50\%$, which means that the seven extracted factors mentioned above had explained 67.855% of the variation of the observed variables. The results of the rotated component matrix the second time showed that the observed variables all have a loading coefficient greater than 0.5 and there was no case of 2-factor loading. Therefore, it can be concluded that the scales of the independent variables guaranteeing the convergence and divergence.

To sum up all the results of the EFA analysis, there are 22/24 observed variables that satisfied the conditions of the given criteria, the initial 8 factors in the model are converged into 7 factors, the remaining variables (after excluding variables) all ensure the convergence, suitable to use for analysis in the next sections. A model that is included in further analysis consists of: Subjective Norms (SN): RL1, RL2, SI1, SI2; Accessibility (A): A1, A2, A3, A4; Attitudes About Using Pirated Software (AP): AP2, AP3, AP4, AP5; Concern for Legal Consequences (LC): LC1, LC2, LC3; Perception of Risks When Using Pirated Software (R): R1, R2, R3; Concern About Consequences for Others (CO), Perception of Value When Using Pirated Software (V): V1, V2.

3.2. Regression analysis

Table 2. Coefficient table of Regression Analysis

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	B	Std. Error	Beta (β)			Tolerance	VIF
(Constant)	2.171	.195		11.125	.000		
SN	.200	.023	.187	9.255	.000	.732	1.367
AP	.231	.025	.201	8.155	.000	.716	1.396

A	.185	.025	.163	7.479	.000	.715	1.399
Dependent Variable: IU (Intent to use pirated software)							

Source: Research team's analysis results

The regression result is presented below in Table 2. There are two regression coefficients presented in the table which are the unstandardized regression coefficient B and the standardized regression coefficient Beta (β). As shown in Table 2, the standardized regression coefficients of the independent variables are all different from 0 with significant level $\text{sig} = 0.000 < 0.005$, proving that all 7 independent variables are involved in influencing the willingness to use pirated software of the students. The VIF coefficients of all independent factors that are presented in the table are less than 10, which shows us that the independent factors in the model do not have multicollinearity.

Attitudes (AP) is the factor that has the strongest impact to the willingness to use pirated software, along with the Subjective Norms (SN), Perception of Value (V) as well as the Accessibility of the pirated software (A) are all factors with a positive impact, the remaining factors such as Concern for Legal Consequences (LC), Perception of Risk When Using Pirated Software (R), Concern For Consequences for Others (CO) is negative, and all variables have statistically significance. In reality, this is completely true, because there are

many people when mentioned about “pirated software,” they always have a positive attitude. Because they think that downloading and using cracked software means that not only do they not have to pay any cost, but they also can improve their computer skills, so they think that using pirated software is a positive thing for themselves. People’s attitude is always one of the important parts that determine the existence of a certain phenomenon or event.

The factor of subjective norms, Perception of Value and Accessibility of pirated software also contributes to a marked increase in the willingness to use pirated software. Subjective norms according to the research team’s model, consist of two groups of observed variables, namely “Community Influence” and “Requirements of Lecturers,” but when running the rotated matrix table while analyzing exploratory factor EFA, the observed variables of those two groups above all converge on one factor. In fact, the process of learning and researching of students has many modules, subjects that required specific software to be able to serve the subject. However, there are software with extremely high and expensive prices while according to the results that the research team had collected, up to 79.41% of 1051 survey participants have income of less than 2,000,000 VND/month (*Source: The research team’s survey results*). This leads to students, when required by the lecturers to get learning support software, especially some high-cost software, will seek to pirate software. Moreover, today with the development of informatics, there are more and more discussion forums, websites sharing pirated software, students can access pirated software now more than ever; in addition, the individual student is influenced by the crowd mentality: “if everyone else uses pirated software, then I can use them too” then the willingness to use pirated software of students are increasing.

Concern for Legal Consequences (LC), Perception of Risk When Using Pirated Software (R), Concern About Consequences for Others (CO) all have a negative impact on students’ willingness to use pirated software. When the legal consequences come up, this might be one of the most effective ways to minimize software piracy. Today, in the era of explosive growth in information technology, it’s not difficult to own a cracked software, but it’s also not quite difficult to impart warning information and educational measures to students. Therefore, the greater the concern of students for the legal consequences of using pirated software, the lower their willingness to use pirated software.

The risks during the process of using non-copyrighted software are also a concern for the students. It’s not difficult for the students to run the pirated software, but it’s also not difficult for those who share such pirated software to install malware (malicious software) on users’ computers as well as steal important information. Thus, the greater the perception of risk, the lower the students’ willingness to use pirated software.

In addition, the research team also proposed the group of variables Concern About the Consequences for Others. The research team had found that for an individual, besides acquiring opinions, views and standards from outer environment, there is also a self-assessment of the ways that his own actions influencing those around him, and this has an impact on the willingness to use pirated software. According to the results of the analysis, this variable has a strong negative impact on the willingness to use pirated software. Precisely, when the variable CO increases by 1 unit, the willingness to use pirated software

will decrease by 0.158 units. Students who fear that the pirated software they used is infected with malware, which in the process of running may affect the group's work or copy malicious software to others will then decrease the willingness to use pirated software.

From the results of the regression analysis, the research team presented the regression equation of the standardized modal as follows:

$$Y = 0.187*SN + 0.201*AP - 0.168*LC - 0.158*CO - 0.160*R + 0.178*V + 0.163*A + \varepsilon \quad (1)$$

4. Discussion and Conclusion

From the research results the research team had found out: There is no different in the willingness to use pirated software among the surveyed subjects belonging to different gender, income and academic groups. This means that whether male or female students, those who have low or high income, or regardless of majors, they all have the same willingness to use pirated software. This is absolutely true with the fact that improving skills in using the supporting software are mandatory for students of all professions in order to be able to compete in the labor market in the era of strong development in the field of information technology today.

From the results of the research, it can be summarized into the following findings. The first is that Positive Attitude when using pirated software will encourage the willingness to use them, which is the strongest influencing factor. Second, subjective norms also have a relatively enormous influence, and positively affect the willingness to use pirated software. Thirdly, the perception of risk reduces the willingness to use pirated software quite remarkably. Fourthly, the accessibility of pirated software also contributes to the increasing willingness to use them. Students will continue to use pirated software if they have an easy access to them instead of paying for the copyrighted ones. Finally, it's the perception of value when using pirated software, this factor completely has a positive impact on the willingness to use them with students.

Based on the research results and the current situation, the article proposes some solutions and recommendations to reduce students' willingness to use pirated software in the near future as follows:

For schools and training institutions: It's necessary to set specific requirements for organizing periodic programs, trainings and activities for clubs, faculties and classes to raise awareness about copyright infringement. Moreover, direct lecturers need to specifically request the use of copyrighted support software during the learning process of students. Continuing to organize contests, seminars and school newspapers related to respect copyright and intellectual property in general and software in particular.

For legal authorities: It's necessary to strictly enforce the laws on intellectual property in the field of information technology. Cooperating with school to propagate and equip the knowledge about the pirated software right at the Civic Education lessons at the beginning and the end of the course. Continuing to perfect the legal system, developing sanctions to handle violations and creating a clear legal corridor for the strict enforcement of intellectual property law. Creating favorable business conditions for domestic and foreign corporations, companies, forming a software market with appropriate access for students.

For businesses that provide the copyrighted software: Continuous software updates and feature development are needed to create unique value compared to older cracked software versions. The implementation of diverse Marketing strategies makes them be able to reach a wider audience. Enhancing software security, protecting consumer interests. Coordinating with universities and training units to offer support software for subjects with usage time last each semester to reduce costs to be paid at once.

Abstract

A service contract is a typical contract in daily life because it is a transaction that helps form a supply relationship between the service party and the customer to meet the customer's needs. The legal provisions on this contract are the corridor for the parties to establish the relationship and the basis for dispute settlement. The article focuses on analyzing and evaluating the legal provisions of service contracts to make complete recommendations toward building safe, legal service delivery relationships and best meeting customers' needs for the sustainable development of the service sector.

Keywords: *Service contracts, completing legal regulations, Vietnam Civil Code 2015.*

1. Introduction

Service is a specialized activity to meet the needs of subjects in society. The economies of countries and the world show that services play a significant and pivotal role in the economy.

A service contract legally entered into by the subject is the basis for forming a service contract relationship for the parties to perform their rights and obligations to each other. This implementation process will lead to inevitable results that meet the needs of the subject parties.

To regulate these service contract relationships, Vietnam specifically stipulates nine law articles for adjustment. The provisions from Article 513 to Article 521 of Vietnam Civil Code 2015 serve as the general principles and legal corridor governing negotiating, drafting, concluding, performing and terminating service contracts.

With the current role of services, service contracts will inevitably be a legal tool for entities to establish and form contractual relationships to meet their needs. For a service contract to be concluded quickly and effectively, the legal framework must be tight enough for the parties to have a sense of goodwill and cooperation and flexible enough to match the

nature of the service. A complete legal corridor on service contracts will be an essential factor contributing to the sustainable development of the service sector and the development of the economy in general.

2. Method

To achieve the research result, the authors use the following research methods:

Analysis method: The authors will analyze the provisions of the current law on service contracts to find out the inappropriate and limited points in these regulations. With the limitations found, there will be a way to overcome them to be complete and convenient in applying legal regulations.

Comparison method: Compare the provisions of the current Vietnam Civil Code with the law of other countries or regions like the European Union to be perfected in the direction of consistency and logic. Only then will the legal provisions be synchronous and convenient for application.

Inductive method: After analyzing and comparing, the author concludes the issue to recommend perfecting the legal provisions on service contracts, aiming to create a unified and appropriate legal framework for essential adjustments. It will help create sustainable development for the service sector in particular and socio-economic in general.

For this subject, some questions need to be answered and clarified, including:

(1) The first question is the role of service contracts, the law on service contracts in the development of the service field, and socio-economic life.

(2) The second question stipulates whether the current law on service contracts has any limitations, especially concerning the laws of other countries or regions of the world.

(3) The third question concerns the limitations in the regulations on service contracts in Vietnam Civil Code 2015, which direction should be completed to contribute to the sustainable development of the service business and the economy.

3. Results

3.1. *The role of services, service contracts and legal provisions on service contracts*

The role of service in socio-economic life. In the report on the socio-economic situation in the fourth quarter and 2021, the service sector contributes 22.23% to the country's total GDP¹⁷³. In the first quarter of 2022, the service sector accounted for 41.07% of the country's total GDP¹⁷⁴. This number proves that services play a significant role in the socio-economic life of Vietnam. From an economic perspective, a service is not simply an individual activity between the supplier and the customer. However, it is considered an economic sector, the activity of performing professional work and formed by profession and economic sector. In the current trend of global economic development, service has been, is

¹⁷³ Refer to the Socio-Economic Situation Report for the fourth quarter and 2021 at <https://www.gso.gov.vn/du-lieu-va-so-lieu-thong-ke/2021/12/bao-cao-tinh-hinh-Kinh-texa-hoi-quy-iv-va-nam-2021/>, accessed on 5/5/2022.

¹⁷⁴ Refer to the Socio-Economic Situation Report for the first quarter of 2022 at <https://www.gso.gov.vn/du-lieu-va-so-lieu-thong-ke/2022/03/bao-cao-tinh-hinh-Kinh-texa-hoi-quy-in-nam-2022/>, accessed on 5/5/2022.

and will be a spearhead and key economic industry and gradually becomes a trend of borderless services to supply all customers around the globe.

The role of service contracts. The service contract plays an important role because it is a civil transaction, creating the foundation for forming the service contract relationship. Main contents such as the object, the scope of rights and obligations of each subject, the case of contract termination, the types of legal liability arising if the contract is breached, etc., are all recorded in the service contract. Therefore, it can be said that the effective or ineffective service contract relationship ultimately depends on the service contract entered into by the subjects.

The role of current regulations of service contracts. Social relations are highly diverse and complex for management, and the State can only use laws. Therefore, like other relationships, the service contract entered into between the supplier and the customer is the foundation for establishing the contractual relationship, which must comply with specific conditions issued by the State. These legal provisions create a corridor for keeping balance their interests with the interests of the State, the public or the legitimate rights and interests of other subjects. However, it should be noted that legal regulations always need to be adjusted appropriately to promote the development of social relations. Hence, the provisions on service contracts that are appropriate, of course, are the supplier relationships. Service applications will promote. In the context of today's economy, services play an essential and leading role, so the role of law is also significant. Legal provisions on service contracts can be a driving force for development if regulations are appropriate or hinder development if regulations are not appropriate, especially when it is not suitable for the nature of the service.

3.2. Current status of regulations on service contracts in the current Civil Code

3.2.1. Regulations on the subject matter of the service contract

The object of a service contract is specified in Article 519 of the Civil Code 2015. Accordingly, the object of a service contract is a work, and it must satisfy the following conditions:

First, the work is doable. The condition "can be done" is understood in the ability of the service provider to perform that job. However, for group work that requires special conditions, the service provider must also meet these conditions. Therefore, the workgroup that is the subject of the service contract will have two groups: (i) The group of work that most individuals are capable of performing. This working group does not require different skills or expertise from the performer, such as cleaning the house, carrying furniture, etc. (ii) Group of work that only a few individuals or groups can perform. This group requires the practitioner to have particular expertise such as doctors' medical examination and treatment work, legal services, etc.

Second, working conditions do not violate the prohibition of the law. Currently, the law with prohibition is recorded in two forms: (i) the group of activities prohibited from implementation is codified in the legal regulations. For example, jobs such as prostitution, prostitution brokerage, illegal cross-border transportation of goods, etc. Prohibited acts will become crimes or acts that, when performed, have to bear legal consequences such as fines. Administrative Violations; (ii) The group of activities that the service provider does not meet the conditions to perform, such as medical services, insurance services, etc. If the person does not meet the conditions, the performance will be prohibited.

Third, working conditions are not contrary to social ethics. Article 123 of the 2015 Civil Code stipulates: "*Social ethics are common standards of conduct in social life, which are recognized and respected by the community*". These behaviours become ethical standards that must be implemented by a large community of people living in a particular area or location for a long, stable time. Subjects in legal relations use the typical behaviour of the residential community where they live to participate in and perform civil legal relations, including service contract relationships.

However, the provisions on the subject matter of the service contract do not show the boundary between service-related work and non-service work. These signs are not enough to identify a job as a service. While services are only a part of the job when the object is not clearly defined, it will naturally be difficult to identify the contracts that fall into the group governed by the provisions of service contracts.

3.2.2. Regulations on service prices and service payments

Regulations on service prices. In Clause 2, Article 519 of the 2015 Civil Code, respect for the agreement of the subjects on service prices is shown. In cases without discussion or indication of parties, it will be determined according to the same service type market price when the contract is concluded. Service prices can be identified in many different terms, such as service fees, tuition fees, fees, charges, and interest, depending on each type of service. However, the general principle in Clause 519.2 of Civil Code 2015 will be challenging to apply if the parties do not have an agreement, there are no instructions for calculating service prices, and there are no services of the same type provided at the same time and location. Moreover, even the same service performed by different suppliers has specific errors, so it is not easy to apply the price of the same service.

Regulations on payment for services. Service payment is an essential obligation of the customer to the service provider. The payment for services is based on the agreement of the parties. If the parties do not have an agreement, payment will be made at the job site upon completion of the service. This principle is stipulated in Article 519.3 Vietnam Civil Code 2015. It is worth noting that payment at service is usually only suitable if it is a cash payment. Moreover, other forms of payment will not be suitable such as wire transfer and payment authorization. Not to mention, services are provided across borders, so this principle is no longer relevant.

3.2.3. Regulations on service fee reduction

In Article 519.4, Vietnam Civil Code 2015 regulations on service fee reduction. Accordingly, service charges are reduced based on the principle that the parties agree on the cases to be reduced. When the service provided is not as agreed upon, the service is not completed on time. The service fee reduction is recognized as the right of the service user. That means that the service user has the right to choose whether or not to reduce the service fee. The service fee reduction is not a liability arising from the failure to complete the service on time or the service not as agreed upon. Because the service fee is reduced in proportion to the portion of the results that are not achieved or not completed on time, it cannot be considered an adverse liability for the service provider.

3.2.4. Regulations on rights and obligations of clients

Service users are legally recognized with fundamental rights and obligations. These regulations can ultimately be the basis for when drafting service contracts, which subjects can refer to and apply. Moreover, the subjects will use these provisions as a basis to determine the essential obligations and rights of the service user in case the parties do not precisely agree on the contract.

Obligations of the service user. In general, the current law stipulates the obligations of service users in Article 515 of the Vietnam Civil Code 2015. The client has two primary obligations: (i) Provide service providers service of information, documents and means necessary to perform the work as agreed by the parties or required by the performance of the work; (ii) the subject must also pay for the service to the service provider. Payment for services must be at the right time, in the right place, in the right way and the right amount.

The recognition of these essential obligations will have two meanings: First, the service user is aware of his obligations to perform. In case the parties do not agree, the provisions of the law are the basis for determining the essential obligations of this subject. At the same time, if a dispute arises, this provision is the basis for resolving disputes related to the obligations of the service user.

Rights of service users. The user has also recognized the fundamental rights in Article 517 of the Civil Code 2015. There are two primary rights: The right to request the service provider to perform the work following the quality, quantity, and time limit. Location and other agreement between the two parties; The right to unilaterally terminate the performance of the service contract and claim compensation if the service provider seriously violates the obligation. These rights are recorded, creating a basis for service users to determine their fundamental rights.

3.2.5. Regulations on rights and obligations of service providers

Obligations of service providers. In Article 517 of the Civil Code 2015, the service user must comply with the quality, quantity, time limit, location and other agreements between the two parties. Service providers are also not allowed to assign other people to perform their work. Both parties must agree upon the assignment of another person to perform. After completing the work, the service provider is also obliged to preserve and return the assigned documents and means. The supplier must immediately notify the service user of the incomplete information, documents, and inadequate quality means to complete the work. Service providers are also obliged to keep the information confidential. If the service provider commits a breach and causes damage, this subject must compensate the service user for the damage.

Rights of service providers. In Article 518 of Vietnam Civil Code 2015, the service provider's rights are specifically recognized with the following fundamental rights: The supplier has the right to request information, documents, and facilities from the service user. Service for the performance of the job. The service provider also has the right to change the service performance conditions if waiting for the opinion of the service user can ultimately cause damage to the customer. Service providers have the right to demand payment for services. This right corresponds to the obligations of the service user.

3.2.6. Regulations on performance of service contracts

The performance of a service contract is regulated in the following aspects:

The principles of performance of service contract. The principles of service contract performance must comply with the general principles in Article 3, Article 412 Vietnam Civil Code 2015. The subjects in the service contract must strictly perform the contract entered into by the parties. The parties must also perform honestly, in the spirit of cooperation and the parties' best interests, ensuring mutual trust. The parties are also not allowed to infringe upon the interests of the State, public interests, legitimate rights and interests of others.

Performance of a contract for the benefit of a third party. From Article 415 to Article 417, Vietnam Civil Code 2015, the performance of service contracts for the benefit of a third party needs to focus on the following essential contents: (i) The third party and the service user are the two entities that have the right to require the service provider to perform the contract. Thus, the third party that is not the subject of the contract has the right to request the performance of the contract; (ii) the right to refuse to enjoy the benefits of a third party when the service contract has not been performed will be the basis for cancelling this contract. Of course, if the contract has been partially or fully performed, even if the third party refuses to enjoy the benefits, the service contract will not cancel; (iii) The parties to the service contract have no right to modify or cancel the contract if the third party agrees to benefit from the service contract.

Continuing to perform the service contract. The continuation of service contract performance complies with Article 526 of the Vietnam Civil Code 2015. Accordingly, even though the service contract has expired but the work has not been completed, the supplier continues to perform the work. If the service user knows but does not object, the contract will continue to perform even after expiration. When the service contract is continued to perform, the time of termination of the service contract's continued performance must be when the work is completed.

4. Discussion and Conclusion

4.1. Evaluate and recommend improving the law on service contracts and toward the goal of sustainable development

4.1.1. Evaluate the advantages and limitations of service contract regulations

Advantages of legal provisions on service contracts. The provisions for service contracts are stipulated in principle in the current 2015 Civil Code. Some different services, such as insurance, and air transportation, are regulated by different laws. The provisions of the current Civil Code are the most basic and general principles governing the service contract relationship. With nine articles in the Civil Code in 2015 have shown a considerable role, specifically:

Firstly, these regulations are suggestive legal corridors so that the subjects in service contracts can refer to them to agree on the contents of each of their contracts. The parties will know their fundamental rights and obligations and which contents need to be further agreed upon in the contract.

Secondly, legal provisions are the basis for dispute resolution if the service contract subjects arise disputes. The subjects may not have a specific agreement on the settlement of disputes. At this time, can only rely on the principles recognized in the law, specifically the current Civil Code, to settle.

Limitations in the legal provisions on service contracts. Analysis of the current legal situation on service contracts shows the following fundamental limitations:

Firstly, there is a limitation in not giving an exact definition of the object of the service contract. In other words, the law does not have a clear distinction between service jobs and non-service jobs. The current service contract subject matter only provides three conditions, and all three are applicable to work for any contract that includes a work subject matter. The unclear delineation will make it difficult to determine the group of contracts that are considered service contracts and are subject to the provisions of service contracts.

Secondly, there is a limitation in stipulating the service price when no regulation has been made. In the absence of agreement, the parties cannot refer to the service price from the service of the same type provided at the time and place where the parties enter into the contract. Thus, it will create difficulties for the parties or the court when settling disputes related to service price determination.

Thirdly, restrictions in the regulation of payment methods. The current Civil Code has not yet recorded cases where it is not easy for the parties to make direct payment at the place of service performance. Moreover, many services today are performed not according to a specific location. For example, it does not matter where the service is performed in services associated with internet space or even difficult to identify. Determine the location of this service. Therefore, the legislators have not yet recognized the principle of payment for services in these cases.

Fourthly, restrictions in regulations on service fee reduction. The current law has not recognized the principle of priority to apply the provisions of the specialized law if this law provides for a reduction of service charges in a specific service. At the same time, reducing service charges is a sensitive legal issue, prone to disputes. Service users always want to reduce money a lot, but service providers always tend not to reduce or reduce as little as possible. Therefore, if the law does not follow the principle of determining the level of service fee reduction, there will be no basis for resolving disputes about service fee reduction.

Thứ năm, hạn chế trong quy định về nghĩa vụ của bên sử dụng dịch vụ. Các nghĩa vụ theo luật định dành cho bên sử dụng dịch vụ không đề cập đến nghĩa vụ cung cấp thông tin khi hợp đồng dịch vụ chưa được giao kết. Đồng thời, pháp luật cũng không buộc bên sử dụng dịch vụ phải cung cấp các chỉ dẫn là cơ sở để bên cung ứng dịch vụ thực hiện công việc. Bên sử dụng dịch vụ cũng không bị ghi nhận nghĩa vụ phải cảnh báo về sự kiện bất thường xảy ra. Những sự kiện này là hiện tượng tự nhiên xảy ra khách quan chi phối trực tiếp tới quá trình thực hiện công việc hoặc kết quả công việc là đối tượng của hợp đồng dịch vụ.

Fifthly, limitations in regulations on the obligations of clients. The statutory obligations to clients do not refer to the obligation to provide information when the service contract has not been entered. At the same time, the law does not force the service user to provide instructions as the basis for the service provider to perform the work. The service user is also not obligated to warn of an unusual event. These events are objectively occurring natural phenomena that directly affect the performance of the work or the results of the work that are the subject of the service contract.

Sixthly, restrictions on the rights of service users. A service user is a person who has no expertise and experience in performing the service, so it is challenging to anticipate risks. Therefore, the law that has not recognized this right as a fundamental right for service users will not create a basis for perceived subjects to request recognition of their rights during contract negotiations.

Seventhly, there are limitations in regulations on the rights and obligations of service providers. Regarding the obligations of service providers as professional and organized suppliers, the current law does not stipulate several obligations for suppliers corresponding to the role of service providers. Especially in comparison with international law like Principles of European Law Service contracts¹⁷⁵ (PEL SC), Vietnam's legal regulations on the obligations of suppliers are simple and not suitable for the context of the market economy. The essential obligations of the supplier have not been recognized in Vietnamese law, such as the obligation to warn of possible risks in the course of performing the work; the obligation to develop service implementation plans; the obligation to adjust the negotiated content in the event of a change in circumstances; obligation to gather information before performing work. Regarding the rights of service providers, the Legislator currently has not provided for the right to request a license to serve the service deployment or the right to be alerted to unusual events from the user.

Eighthly, there are restrictions on the performance of service contracts. The limitations include: (i) The principle of cooperation in the performance of service contracts should be strictly regulated precisely because the supplier and the user have certain obligations to the service contract before the contract is concluded. In particular, the supplier is a professional and organized subject, so the requirements for cooperation with customers are an essential requirement. Therefore, in the law, it is necessary to specify the obligations of cooperation in the performance of service contracts. The identification also ensures specific compatibility with international law, particularly with PEL SC¹⁷⁶; (ii) In

¹⁷⁵ Refer to Article 1:103: Pre-contractual duties to warn, Article 1:104: Duty to co-operate, Article 1:105: Circumstances in which the service is to be performed, Article 1:106: Duties of the service provider regarding input, Article 1:107: General standard of care for service, Article 1:108: Result stated or envisaged by the Client; Article 1:109: Directions of the Client, Article 1:110: Contractual duty of service provider to warn in Principles of European Law Service contracts.

¹⁷⁶ Refer to Article 1:104: Duty to co-operate:

- (1) The duty under Article 1: 202 PECL (Duty to co – operate) requires in particular:
 - (a) The client to answer reasonable requests by the service provider for information in so far as this is reasonably necessary to enable the service provider to perform the contract;

the performance of service contracts through a third party, the law only recognizes the supplier's obligations from the supplier's perspective. Accordingly, the supplier is obliged to perform the work himself and can only let a third person do the work in the case of the user's consent. Current legal regulations are pretty rigid and not suitable for the service sector - a field that requires flexibility in the professional, professional and organized nature. Therefore, in the performance of a service contract, the performance should be recognized by a third party with specific conditions. It will create a legal basis for the supplier to perform its obligations flexibly.

4.2. Recommendations to complete the law on service contracts toward the goal of sustainable development

Based on analysis of current regulations, assessment of legal regulations, the improvement of the law on service contracts, recorded explicitly in the Vietnam Civil Code, needs to focus on the following contents:

Finalize the conditions for the object of the service contract. The object of a service contract is a job, but this work must satisfy the nature of the service: professionalism and specialization. A specific definition of the subject matter of the service contract should be noted to distinguish it from non-service work. When clearly defining the object of a service contract, it is also a basis for determining the scope of the contract subject to the provisions of the service contract.

Finalize service pricing. Service price in case no agreement, no instruction to calculate service price or no price for services of the same type at the time and place where the contract is concluded, the service price shall be determined according to the professional third party.

Perfect for paying services. It is necessary to supplement the principle and order of priority only after the principle of agreement of the parties, that is, the principle of choosing a form of payment under the conditions of the parties in the service contract. This principle is fundamental because the current service trend is borderless. The provision of services can ultimately be transnational, even transcontinental, so choosing the most suitable form of

-
- (b) The client to give directions regarding the performance of the service in so far as this is reasonably necessary to enable the service provider to perform the contract;
 - (c) The client, in so far as the client is to obtain permits or licenses, to obtain these at such time as is reasonably necessary to enable the service provider to perform the contract;
 - (d) The service provider to give the client a reasonable opportunity to determine whether the service provider is performing the obligations under the contract; and
 - (e) The parties to co – ordinate their respective efforts in so far as this is reasonably necessary to perform the contract.
- (2) If the client fails to perform the duties under subparagraph (1) (a) or (b), the service provider may either withhold performance under Article 9:201 PECL (right to withhold performance), or base performance upon the expectations, preferences to have, given the information and direction that have been gathered, provided that the client is warned in accordance with Article 1:110.
 - (3) If the client fails to perform the duties under paragraph (1) causing the service to become more expensive or to take more time than agreed upon in the contract, the service provider is entitled to:
 - (a) Damages for the loss the service provider sustained as a consequence of the non-performance; and
 - (b) An adjustment of the time of performance that is required for the service.

payment to minimize payment costs is very important. After this principle, the principle of payment at the place of service will be more appropriate.

Perfect on service discount. In order to solve the limitation related to a service fee reduction, legislators can ultimately develop the principle of service fee reduction as follows: Firstly, service fee reduction is determined by the service completion rate as follows: criteria mutually agreed upon by the parties. In case it is difficult to determine the service completion rate, the parties can entirely rely on the third party's opinion with appropriate expertise selected by the parties or a dispute settlement agency.

Perfect on the rights and obligations of service users. In order to improve the regulations on the rights and obligations of service users, it is necessary to focus on the following aspects: (i) Recognition of pre-contractual obligations of service users in providing information. The service user must provide information related to the service contract honestly agreed, negotiated and entered into by the parties. This information will help determine the exact scope of services, thereby determining the rights and obligations of the parties. In short, this information is decisive to the success of the future contract signing and performance between the parties; (ii) Service users are also obliged to immediately notify abnormal events that directly affect entering and performing service contracts. In the case of these facts, only the service user knows, but the service provider cannot grasp it by experience and knowledge. Clients do not have an obligation to notify the service provider so that the service provider has plans to perform the contract in the event of this unusual event; (iii) The clients must give specific instructions for the supplier to accurately identify the service object, develop plans for contract performance, determine the rights and obligations of each party, etc. This obligation is also essential and should be recognized in the law for service users; (iv) The client should be recognized for the right to request the provision of risk forecasts during the performance of the work, to request the provision of work performance plans so that the user has the right to choose whether the operation. Service provision is performing professional and organized work by the supplier, so the user must have a higher right to "demand" from its partner.

Improve the rights and obligations of service providers. Looking at the limitations in the regulations on the rights and obligations of the service provider shows that, in order for this subject to maximize its role in the economy, the obligations and rights of the service provider it is necessary to add the following provisions: Regarding the obligations of the service provider, it is necessary to add the obligation to warn of risks that may be encountered during the performance of the service; obligation to develop service implementation plans; the obligation to adjust the negotiated content in the event of a change in circumstances; obligation to gather information before performing work. Regarding the service provider's rights, it is necessary to add the following rights: The right to request the provision of a license that the State has granted the service user. The provision of this license directly serves the service provider's service performance. The service provider also has the right to request information about unusual events from the service user.

Completion of service contract performance. To further improve the provisions on the performance of service contracts, it is necessary to supplement the principle of cooperation and consider this a fundamental principle, the main principle for the performance of service contracts. This principle can entirely be recorded into an independent law or a clause in the law on the performance of service contracts. Next, the service provider should allow a third party to perform if the third person meets the requirements for the performance of the work unless the service user requests not to allow others to perform. For the service sector that requires flexibility and expertise, this principle can be applied entirely and promotes the development of this field./.

Abstract

In the context of implementing international commitments to cope with climate change in general, to mitigate GHG emissions in particular and especially to implement the Nationally Determined Contribution (NDC). The need to develop and complete the legislation on mitigation of greenhouse gas emissions fully and comprehensively at the present is really necessary. Therefore, on the basis of studying the general theoretical issues of the legislation to decrease GHG emission, the current situation of these regulations in Vietnam, the following article will give some directions to complete the law as well as specific suggestions for Vietnam to protect the environment based on the legal basis.

Keywords: *Legislation, environmental protection, air, climate change, mitigation of greenhouse gas emission*

1. Introduction

Climate change is happening more and more drastically around us while having an escalating influence on our world. The impact of climate change is not limited within a country's borders but takes place globally, which has become a mutual concern of not only developed countries but also developing ones, especially those in the underprivileged list. One of the inevitable tasks in the process of mitigating the effects of climate change that these countries must undertake is to establish a legal framework which could tackle this issue in general, GHG emission in particular. This is also a way of showing crucial steps in carrying out a series of international commitments on climate change: the United Nations Framework Convention on Climate Change (UNFCCC), the Paris Agreement, the Glasgow Climate Pact (2021) and so on. In that situation, Vietnam, which was the 6th country in the world in "The Climate Risk Index for 2017: the 10 most-affected countries", took the first ranking among ASEAN countries and has also advocated for promulgating particular

legislation on climate change. However, the reality indicates that Vietnam not only has to encounter certain common struggles like other developed countries such as the impact of economic development level, ensuring the implementation of international commitments, international experiences, etc... but also has significant difficulties of its own such as the accomplishment of the legal system for environmental protection, the coordination mechanism for implementation, the procedure for promulgating law, etc... Therefore, the following article will focus on studying the challenges that Vietnam has to cope with in the establishment of the legislation on mitigating GHG emission at present. Contemporaneously, this article will also suggest some recommendations for Vietnam to meet the demands of international environmental law and implementation conditions in Vietnam in the near future.

2. Literature Review

2.1. The definition and position of the legislation on mitigating GHG emission

The Law on GHG emission reduction is a relatively new legal field not only in the legal system of Vietnam but also many other developing states. Revolving around the protection of the air environment generally and responding to climate change by reducing GHG emissions, the regulations aim to adjust the relationship between the actors in the administrative mechanisms to protect a common interest of the safe air environment; Control the sources of GHG emissions and increase the absorption of greenhouse gasses; Ensure the right of relevant State agencies to implement activities of GHG mitigation; Prepare, fulfill plans, implement protection and enforcement mechanisms; Process and procedures for considering complaints.

Based on the groups of social relations within the scope of the legislation on mitigation of GHE emissions, this law can be defined:

“The legislation on mitigating greenhouse gas emissions is a legal field that includes a set of legal norms and legal principles governing social relations which arise between entities in the process of greenhouse gas emissions, on the basis of a combination of different adjustment methods in order to effectively implement actions to decrease greenhouse gas emissions.”

From the perspective of both international and national environmental law, the legislation on GHG emission reduction which acts as a part of the law to protect environmental components, coexist with many areas of law on other environmental components protection.

In the international environmental law, there is a system of regulations governing issues such as soil environmental protection (United Nations Convention to Combat Desertification 1994, Convention on Biological Diversity 1992,...) , air environmental protection (United Nations Framework Convention on Climate Change - UNFCCC 1992, The Vienna Convention for the Protection of the Ozone Layer 1985, Montreal Protocol 1987,..), water environment protection, biodiversity conservation, ... Through analysis, it is shown that the legislation on GHG emission reduction is a part of the law on climate change - within the scope of the law on air environmental protection in the overall international environmental law. Because GHG emissions are one of the main factors in climate change caused by air pollution, certain international treaties have separate provisions on GHG

emission mitigation, for example: Article 4 of UNFCCC 1992 mentioned the commitments of the contracting states around the issues related to GHG emissions¹⁷⁷; The Paris Agreement on climate change has set out specific commitments of developed countries (in Annex I) on GHG reduction (Article 2-4)¹⁷⁸,...

From the perspective of national environmental legislation, specifically the environmental protection law of Vietnam and many other countries in the world such as the Philippines and South Korea, the regulations of mitigating GHG emissions in the law of Vietnam has a similar status to the position of this regulation in international environmental law. Specifically, the law on climate change has integrated regulations on GHG emission reduction to implement the law on air pollution control and is included in the overall environmental law. Chapter VI of the Law On Environmental Protection 2020 regulates the issues of coping with climate change. In this chapter, Article 91 is devoted to providing legal provisions around GHG emission reduction and in order to detail this Article 91, sub-law documents (Decree 06/2022/ND-CP,...) have been issued.

2.2. Main contents of the law

Researching the practice of national environmental legislation on climate change, GHG emission reduction of countries such as China, Korea, the Philippines..., the role of the law and understanding the legal provisions of certain countries, the study shows a general pattern of the content of legislation on GHG emission reduction which includes:

- Measures to reduce GHG emissions: Here, solutions to limit GHG emissions into the environment are given. Currently, the implementation of GHG emission reduction with carbon credits, operating the carbon market is considered an economic tool that should be applied to the environment field to solve the problems of climate change. Therefore, the law on GHG emission reduction needs to specify the mechanism for exchanging and trading this type of credit.

- Measurement, reporting and appraisal of GHG mitigation: Establish a system and process for measuring, reporting and validating GHG emission reduction activities at the national level. The law should have regulations to guide the production facilities, businesses to carry out the GHG inventory and report on GHG mitigation at their own facilities.

- Community propaganda and education: Propose measures to enhance communication, education and community participation in the implementation of GHG emission reduction; improving the role of the communication system and bringing issues around GHG emission reduction into teaching, compiling teaching contents that are suitable for all grades.

- International cooperation: Developing legal regulations to promote international cooperation in GHG emission reduction issues such as actively participating in international negotiations; seeking support from outside resources; calling for research and innovation projects, technology development and transfer; building bilateral and multilateral cooperation mechanisms and forums;...

¹⁷⁷ United Nations Framework Convention on Climate Change - UNFCCC 1992

¹⁷⁸ Kyoto Protocol to The United Nations Framework Convention On Climate Change

- Budget allocation: Specifying financial sources and budgets for GHG emission reduction activities in a clear and transparent manner; sorted by the level of priority activities to be spent and to other activities related to GHG emission reduction.

- Obligations and responsibilities of actors in GHG emission reduction: In addition to relevant regulations on obligations and responsibilities of GHG emission facilities, organizations and individuals are encouraged to implement, at this section also mention to the roles and responsibilities of relevant authorities and state agencies in monitoring, management and law enforcement on GHG emission reduction.

- Liability: Provide sanctions for those who violate the law or perform insufficiently or improperly their obligations and responsibilities.

- Dispute settlement: In the environmental field, conflicts of interests may still exist between different groups of objects, which leads to the need for a mechanism to tackle these issues. Therefore, the law needs to mention the methods and procedures to resolve environmental cases and especially that related to the issue of GHG emissions.

3. Results

3.1. Status of law on GHG emission reduction in Vietnam

Until now, in the environmental protection law system, Vietnam hasn't enacted any specific laws on GHG emission reduction. The regulations on this issue is just integrated into Law on Environmental Protection 2020 (LEP) and other relevant laws including Law on Economical and Efficient Use of Energy 2011, Law on Water Resource 2012, Law amending and supplementing a number of articles of the Electricity Law 2012, Law on Forestry 2017. Especially, LEP regulates that GHG emission facilities, which are on the list of required GHG emission inventories, have responsibilities for carrying out some activities to reduce GHG emissions based on the amount of historical GHG emissions and quotas of GHG emission allocated by the government. Besides, the government has recently issued a by-law document: Decree No.06/12/2022/ND-CP dated 07/01/2022, regulation on GHG emission reduction and Ozone- layer protection has emphasized this is the utmost issue of concern and the determination of well accomplishing international commitments of which Viet Nam is a member. Below is some basic information about GHG reduction regulations.

3.1.1. System of environmental technical regulations on greenhouse gasses

According to Clause 10 Article 3 of Law No.72/2020/QH14 on Environmental Protection: *“Technical regulation on environment means a regulation requiring mandatory application of limits of parameters regarding environmental quality, concentration of pollutants in raw materials, fuels, materials, equipment, products, goods and waste, and technical and managerial requirements. The regulation is issued by a competent authority in accordance with regulations of law on standards and technical regulations.”*

Environmental technical regulation on GHG is a regulation that requires the application of limits of parameters on environmental quality and GHG content in raw materials, fuels, materials, equipment, products and goods., waste, technical and management requirements promulgated by competent state agencies in accordance with the law on standards and technical regulations. The system of environmental technical

regulations on greenhouse gases includes technical regulations on ambient air quality and environmental Technical Regulations on Emissions.

3.1.2. Regulations on prevention, remediation and improvement of greenhouse gas emissions

This is a system of legal regulations governing the activities of state agencies as well as organizations and individuals in order to limit GHG emissions that have adverse impacts on people and the environment. Activities to prevent, remedy and improve GHG emissions include:

EIA activities (Environmental impact assessment activities): According to the provisions of Clause 7 Article 3 of LEP “*Environmental impact assessment (hereinafter referred to as “EIA”)* means the process of analyzing, assessing, identifying and predicting environmental impacts of an investment project in order to take measures to reduce adverse impacts on the environment.”

From the competent State agencies on environmental management, EIA is the activity of verifying the scientific accuracy as well as the legality of the EIA report. In this activity, all positive and negative impacts on the air environment from economic activities will be carefully considered. Thus, in order to effectively protect the air environment in general and mitigate greenhouse gas emissions in particular, it is necessary to comprehensively and comprehensively evaluate these impacts in order to propose appropriate measures to help reduce greenhouse gas emissions. minimize the negative impact on the air.

From the perspective of GHG emission mitigation, management agencies need to evaluate the EIA report to determine the potential negative impact of any development on the air environment. The appraisal results of the EIA report are one of the important bases for relevant State agencies to grant project approval, decide whether the project is allowed to operate or not, or apply mandatory measures. compliance to handle environmental issues at the facilities that have been put into operation.

Developing targets, roadmap and methods to reduce greenhouse gas emission: In Article 91 of LEP organize the implementation of activities to reduce greenhouse gas emissions and absorb greenhouse gasses according to the roadmap. The method of mitigating greenhouse gas emissions in accordance with the country's conditions and international commitments is one of the important contents in mitigating greenhouse gas emissions. Accordingly, the GHG emission reduction target approved by the Prime Minister in the NDC, including the GHG emission reduction target for the energy, agriculture, land use and forestry sectors, waste management, industrial processes in accordance with the country's socio-economic development conditions and international treaties to which the Socialist Republic of Vietnam is a signatory. In addition, Vietnam also applies methods to prevent, remedy and improve GHG emissions, including the following four main contents: Firstly, focus on building a system of policies and management activities to control greenhouse gas emissions. Second, issue detailed plans to reduce greenhouse gas emissions at field and grassroots levels. Third, encourage projects to develop science-technology, production processes and services with low GHG emissions. Fourth, mechanisms and methods of cooperation on mitigation of greenhouse gas emissions are consistent with the provisions of laws and international treaties to which Vietnam is a signatory.

GHG inventory: GHG inventory is understood as “the activity of collecting information and data on sources of GHG emissions, calculating GHG emissions, and absorbing greenhouse gasses within a specified range. and for a particular year in accordance with the method and procedure established by the competent authority.” According to the UNFCCC, the Paris Agreement, Vietnam is obliged to develop and send to the Secretariat of the Climate Convention BURs, including content on the results of the GHG inventory according to general regulations. GHG inventory helps to determine the GHG emissions of each inventory sector, thereby, as a basis for proposing GHG emission reduction targets, checking the implementation of emission reduction targets. KNK has committed. Right from 2012, the Prime Minister issued Decision No. 1775/QĐ-TTg dated November 21, 2012 approving the project on management of GHG emissions causing greenhouse effect; manage carbon credit business activities to the world market. Then, Decision No. 2359/QĐ-TTg dated December 22, 2015 approving the National GHG inventory system, Decree 06/2022/ND-CP Regulations on mitigation of greenhouse gas emissions and protection. Ozone layer, Circular 01/2022/TT-BTNMT detailing the implementation of the Law on Environmental Protection in response to climate change and Decision No. 01/2022/QĐ-TTg promulgating a list of fields, GHG emitters must carry out a GHG inventory which is issued in turn to provide detailed regulations on the above issue.

Monitoring and monitoring compliance with regulations on GHG emission reduction: The Vietnamese legal system has issued many regulations to mitigate GHG emissions for establishments that have to carry out a GHG inventory. The compliance with legal regulations needs to be monitored and supervised by competent State agencies through the National System of Measurement, Reporting and Appraisal of GHG emission reductions. The Ministry of Natural Resources and Environment is the focal agency of the National System of Measurement, Reporting, Appraisal of GHG emission reduction, responsible for checking compliance with regulations on measurement, reporting, assessment of mitigation of greenhouse gas emissions at establishments; building and operating a national online database on measurement, reporting and appraisal. The acts of emitting greenhouse gasses will be administratively sanctioned corresponding to the amount of gas emitted into the environment; the fine level is specified in detail in Article 16 of Decree 179/2013/ND-CP. If they have been administratively sanctioned but continue to commit violations, they may be examined for penal liability according to the provisions of Articles 235 and 236 of The Code No. 100/2015/QH13 dated November 27, 2015 of the National Assembly on Criminal of causing air pollution.

3.1.3. Regulations on inspection of emission sources

The law on controlling GHG emissions in the world has been put into application and successful for many years, but in Vietnam, this definition has only been approached for more than 15 years. In Vietnamese legal documents, there is no exact definition of controlling GHG emissions.

When being domesticated, control of GHG emissions first appeared in the Law on Environmental Protection 2005 with regulations on management of GHG emissions causing greenhouse effect, destruction of the ozone layer and at the same time regulated expenses and more detailed in Decision No. 1775/QĐ-TTg dated December 21, 2011 of the Prime

Minister approving the Project on management of GHG emissions; manage carbon credit business activities to the world market.

Until the Law on Environmental Protection 2014, compared with the Law on Environmental Protection 2005, the Law on Environmental Protection 2014 has added Chapter IV on "Response to climate change", in which Article 41 has inherited the provisions of LEP. Decision No. 1775/QĐ-TTg dated December 21, 2011 of the Prime Minister on the content of controlling the source of greenhouse gas emissions. At the same time, adding an item on air environment protection, including regulations on ambient air quality management, air pollution control.

By the current LEP, the control of GHG emissions has been legislated in a clearer and more detailed way. Compared with the previous regulations, this law has specified 06 types of greenhouse gases. Article 91 of this Law also specifies the responsibilities of the Ministry of Natural Resources and Environment, the Ministries in charge of the fields that are required to carry out an inventory of greenhouse gases, and the People's Committees of provinces in controlling emission sources. GHG emissions, thereby avoiding overlapping when performing functions and tasks. LEP has a new point, that is, the Prime Minister has issued a list of fields and establishments that emit greenhouse gases that must carry out a greenhouse gas inventory. This list is detailed in Decree No. 01/2022/QĐ-TTg dated January 18, 2022 of the Prime Minister, which specifies the names of greenhouse gas-emitting facilities in one of six sectors. The following sectors will be required to carry out greenhouse gas inventories: Energy sector; Transportation; Construct; Industrial processes; Agriculture, LULUCF; Waste.

The responsibilities of GHG emitters on the list of required greenhouse gas inventories are also specified in Clause 7, Article 91 of the LEP. In Article 139 of the Law, the Law established for the first time the organization and development of a carbon market as a tool to promote the reduction of GHG emissions in the country, contributing to the implementation of the contribution to GHG emission reduction made by Vietnam. commitments when joining the Paris Agreement on climate change. In which, clearly stipulates who are allocated GHG emission quotas and have the right to exchange, buy and sell on the domestic carbon market; bases for determination of greenhouse gas emission quotas; responsibilities of management agencies and inter-organizations in allocating GHG emission quotas; the roadmap and time to deploy the domestic carbon market to suit the country's socio-economic conditions and international treaties to which the Socialist Republic of Vietnam is a signatory¹⁷⁹. In addition, Decree No. 06/2022/ND-CP dated January 7, 2022 of the Prime Minister has detailed regulations on Mitigation of GHG emissions, organization and development of the Carbon market. as well as measures to control GHG emissions.

3.1.4. Regulations on the system of agencies to control greenhouse gas emission

In order to fully and effectively implement the above-mentioned GHG emission control activities, it is necessary to build a system of GHG emission control agencies from central to local levels. This organ system includes:

¹⁷⁹ Vo Trung Tin (2021), *New points of the Law on Environmental Protection 2020*,

The general authorized agency

The Government: Pursuant to the Law on Organization of the Government 2015 and Article 165 of the Law on Environmental Protection 2020, the Government is responsible for organizing and unifying the State management of the implementation of measures to protect the environment in general and to protect the environment, air environment protection in particular. Directing all activities to protect and control air pollution in general and control GHG emissions in particular is one of the tasks of the Government.

The People's Committees at all levels, based on Article 168 of the Law on Environmental Protection 2020, are the agencies that control air pollution in their localities.

The professional authorized agency

The professional authorized agency will have the primary responsibility for addressing issues of general air pollution control and control of GHG emissions. in particular.

The Ministry of Natural Resources and Environment is the agency with the highest professional responsibility and directly before the Government in the field of GHG emission control and has the responsibilities provided The Law on Environmental Protection 2020.

Ministries, ministerial-level agencies and government-attached agencies, within the ambit of their respective functions, duties and powers, are also responsible for coordinating with the Ministry of Natural Resources and Environment in controlling GHG emissions.

These are other specialized management agencies, but the activities of those branches are related to the air environment. In order to complete the proposed contents on mitigation of GHG emissions, ministries and ministerial- level agencies should closely coordinate with the Ministry of Natural Resources and Environment. For example, The Ministry of Industry and Trade is responsible for coordinating with the Ministry of Natural Resources and Environment to allocate, adjust and supplement import and production quotas for controlled substances; give opinions on the list of goods banned from import and export, and goods imported and exported according to conditions within the scope of their management. The Ministry of Agriculture and Rural Development; The Ministry of Finance, The Ministry of Public Security, the Ministry of Industry and Trade, the Ministry of National Defense and relevant ministries and ministerial – level agencies shall assume the prime responsibility for, and coordinate with the Ministry of Natural Resources and Environment.¹⁸⁰

3.2. The trend of perfecting the legislation on mitigating GHG emissions

3.2.1. Towards a low carbon economy (LCE)

In the context of recent years, the effects of climate change and the degradation of the living environment have negatively impacted people's quality of life and seriously affected the sustainable development of nations, regions, and the world. To address issues related to GHG emission reduction and climate change, the United Nations and international organizations have held many climate change conferences to find effective and practical options. Accordingly, the direction taken by many countries today is to develop the economy according to the model of a low-carbon economy.

¹⁸⁰ Decree No. 06/2022/ND-CP dated 07/01/2022 of the Government regulating GHG emission mitigation and protection of the ozone layer, Article 29

LCE is an economy that aims to minimize GHG emissions while operating as a typical economy, based on low-carbon energy sources with a minimum output of GHG emissions into the biosphere. This model has become a long-term goal of many countries around the world to reduce GHG emissions and cope with climate change.¹⁸¹

Firstly, research and develop policies to regulate and encourage production and business establishments to apply low-emission production technologies to production and business activities to build a low-carbon economy.

Second, focus on developing and innovating science and technology for gas production and treatment in order to minimize the amount of GHG discharged into the environment. Limiting the use of GHG - producing energy sources and traditional waste treatment methods such as destructive incineration

Third, perfect the system of air environment regulations and standards in the direction of reviewing and supplementing Vietnam's system of regulations and standards on air quality in general and GHG emissions, in particular, to ensure health and safety, minimize the amount of GHG, and be in line with regional and international standards.

3.2.2. Consistency guarantee

The direction of completing the legislation on GHG emission reduction needs to ensure the systematicity of the environmental law in particular, and the legal system in general. When completed, it should aim to meet the following requirements:

Firstly, legislation on GHG emission reduction needs to ensure consistency in form. Regulations on GHG emission reduction need to show concentration and avoid spreading. Stemming from the situation, although Decree 06/2022/ND-CP on GHG emission reduction and ozone layer protection has been issued, the regulations on GHG emission reduction are still scattered in many documents. Environmental legislation, the development and completion of legislation on GHG emission reduction in a centralized and unified manner will create a scientific environmental legal system, making it easier for subjects to look up and learn.

Second, the legislation on GHG emission reduction needs to ensure consistency in content. Accordingly, regulations on GHG emission reduction need to avoid overlapping and conflicting content, especially the authority and obligations of entities. To perfect the legislation on GHG emission reduction, the content needs to be built based on the basic policy on GHG emission reduction. At the same time, in the process of completing the legislation on GHG emission reduction, it is necessary to refer to international experiences, especially with countries that are leading in GHG emission reduction and have similar legal models to Vietnam.

Third, legislation on GHG emission reduction should aim for adequacy. Accordingly, the legislation on GHG emission reduction should be clarified in terms of nature, principles, and content to avoid omissions. In addition, it is necessary to improve the forms of handling, and sanctions in relevant legal documents in the field of GHG emission reduction.

¹⁸¹ Busch Systems, what is Low Carbon Economy (LCE), <https://www.buschsystems.com/resource-center/knowledgeBase/glossary/what-is-a-low-carbon-economy-lce>,

3.2.3. In line with international commitments

Vietnam is currently a party to many international treaties related to GHG emission reduction, which stipulate the obligations that Vietnam must perform. Therefore, the improvement of the law should pay attention to compatibility with international commitments related to GHG emission reduction in particular and environmental protection in general.

The legislation on mitigation of GHG emissions must be consistent with international conventions on the environment such as UNFCCC, KP, and the 1985 Vienna Convention on the protection of the ozone layer; The 1978 Montreal Protocol on Ozone Depleting Substances; The Paris Agreement... The principle of conscientious implementation of international commitments appeared very early, existed in the form of international custom, and has been applied to international law for a long time, becoming a fundamental legal principle. in international relations, whereby member states must apply the treaty to the entire territory of that state unless otherwise agreed. Therefore, the improvement of the law still has to ensure compliance with the principles recognized in the system of international treaties that have been established in the past.

3.2.4. Increase private sector support

The role of the private sector, including organizations, residential communities, households and individuals, should be promoted in the implementation of legislation on GHG emission reduction in the following directions:

Firstly, reduce the proportion of state agencies directly participating in the treatment of GHG emissions. Legislation should be developed in the direction of encouraging and attracting investment in emission treatment projects with advanced and modern technology; simplifying procedures for investment preparation, construction, and operation of waste gas treatment facilities. At the same time, various kinds of voluntary commitments are encouraged from the producer and business establishments in the implementation of the legislation on GHG emission reduction. Implement incentives for small and medium-sized production facilities and businesses that do not have enough resources to invest in infrastructure to treat GHG emissions but can still participate in GHG emission reduction by hiring private organizations that specialize in providing this service.

Second, socialize activities to implement legislation on GHG emission reduction by increasing the participation of socio-political organizations, mass organizations and communities in participating in management and give suggestions to the production facilities and businesses that emit GHG on air pollution from production to waste treatment.

Third, participate in contributing and supporting the state budget for state agencies to serve the implementation of the law on GHG emission reduction. The private sector always plays a very important role in providing additional budget support to SOEs when needed.

Thus, the coordination between the state agency and the private sector will bring about high efficiency in law dissemination and practice. From there, GHG-emissions facilities and businesses will have easier access to and implementation of legislation on GHG emission reduction.

4. Discussion and Conclusion

Through surveying the trend of perfecting the legislation on GHG emission reduction along with the assessment of some remaining limitations in the Vietnamese law system, this research is providing some recommendations to improve the effectiveness of Vietnamese law on this issue.

Firstly, the promulgation of climate change law integrated with some regulations on GHG emission reduction in Vietnam is an essential demand to ensure a strict legal framework when implementing actions to achieve the stated goal.

Secondly, the law needs to focus more on putting measures to mitigate GHG emissions, specifically the construction, development, and introduction of the domestic carbon market into practice. Through research on developing countries such as China and South Korea, it is found that both countries consider this as a key policy tool in response to climate change and low-emission development. To establish a domestic carbon market, government agencies are responsible for allocating or selling a limited number of GHG emissions quotas (in tons of CO₂ equivalent) over a period of time. Enterprises wishing to exchange emission quotas do so on the carbon credit exchange.

Thirdly, Vietnam should apply the economic tool - carbon tax (or carbon emission tax) in protecting the environment in general and reducing GHG emissions in particular. With the desire to fulfill commitments and deeply participate in international integration, it seems that the need to use carbon tax in Vietnam has been existing¹⁸².

Fourthly, Vietnam needs to enact legal policies to encourage voluntary agreements from manufacturing and business facilities on reducing GHG emissions. This can create a positive effect on making them raise their own awareness and responsibility in environmental protection activities.

Fifthly, it is very necessary to build a specific sanction, which is capable of deterring every subject when performing improperly or inadequately his responsibilities and obligations as prescribed by law with the aim of prohibiting the act of violating the laws on GHG emission reduction.

In summary, by creating a legal framework for the targets of reducing GHG emissions in particular and responding to climate change in general, Vietnam has correctly identified the issues that need to be focused on in environmental protection at the present stage. This is a positive development trend in terms of legislation, showing the determination of the Communist Party and State in making efforts to achieve national goals and international commitments of which Vietnam is a member.

Abstract

The Mekong River Delta is a socio-economic region that contributes a high yield of rice, aquatic products and fruits to Vietnam; It is also one of the three deltas in the world that are heavily affected by climate change. Over the years, Vietnam has promulgated many policies for the sustainable development of the Mekong Delta. Despite many results in practice, the Mekong Delta is still facing many problems and challenges for development. Based on the theoretical framework of public policy, the article points out the economic, social and environmental problems of the Mekong Delta. The article also gives several recommendations to improve the policy system for sustainable development in the Mekong Delta in order to adapt itself to the climate change in the coming time: (1) Focusing on policy solutions to keeping people in addition to preserving land, conserving water and protecting the environment; (2) Concentrating on scientific research activities to forecast and develop regional development scenarios; (3) Placing great importance on educational development; (4) Identifying a sustainable economic development model and effectively exploiting resources and potentials; (5) Effective regional linkage.

Keywords: *The Mekong Delta, public policy, sustainable development, climate change.*

1. Introduction

The Mekong River Delta is a socio-economic region of Vietnam, including 13 provinces and cities, with a natural land area of 40,816.4 km² (12% of the country's area) and a population of 17,282,500 people (19% of the country's population) (General Statistics Organization, 2019). This is a socio-economic region with many potentials and advantages in Vietnam's development, contributing 50% of rice production, 95% of rice exports, 65% of aquaculture yield, and 60% of fish exports and 70% of Vietnamese fruits (Government Office, 2021). However, the Mekong Delta is also one of the three deltas of the world most affected by climate change along with the Ganges - Brahmaputra (Bangladesh) and the Nile (Egypt) (Nguyen Van Thang - Mai Van Khiem, 2017). In reality, severe weather and human destruction are gradually making it possible that the Mekong Delta will be wiped out within the next 100 years (Joep Janssen, 2019).

In the past years, Vietnam has paid special attention to determining orientations, building development viewpoints and planning policy systems for sustainable development of the Mekong Delta in the face of challenges of new development contexts and conditions. especially Resolution No. 120/NQ-CP dated 17 November, 2017 of the Government on sustainable development of the Mekong Delta in adaptation to climate change. On the basis of Resolution No. 120/NQ-CP, the Government has focused on directing the building, supplementing and perfecting mechanisms and policies for sustainable development of the Mekong Delta in four main areas: (1) Renewable energy and energy efficiency; (2) Infrastructure and environmental technology; (3) Agriculture and Aquaculture; (4) Food processing and related transportation (logistics) services (Anh Hung, 2021). This resolution is considered a breakthrough milestone, marking a shift from a passive defensive approach to climate change towards a model of “proactive adaptation to nature”. (Carolyn Turk, 2021), ensuring sustainable development in the “new normal” conditions – an adaptation to climate change in the Mekong Delta.

On the basis of orientations and policies by the Party and the State, the Mekong Delta has received the attention and investment from the Government. In the 2016 - 2020 period, the total state budget investment through localities in the Mekong Delta is over VND 220 trillion, equivalent to 16% of the whole country. Some industries and fields are on the list of investment such as: Traffic with 32,961 billion VND; Agriculture with 28,200 billion VND. The interlink within the Mekong Delta and between the Mekong Delta and other localities has also been improved, in which the economic link between the Mekong Delta and Ho Chi Minh City has reached VND 280 trillion. In addition, 863 residential clusters and lines and 119 existing residential embankments have been completed for 191,000 households and one million people in flooded areas. The average rate of urban population supplied with clean water in the Mekong Delta region is about 89.6% (increasing by 1.5% compared to that of 2017), the average rate of loss of clean water is 22.5% (4% higher than the national average) (Anh Hung, 2021).

2. Method

In completion of the article, the author relied on the theoretical framework of the State - a public organization with the mission of managing and developing all aspects of socio-economic life (Bui Ngoc Hien, 2021); on public policy - an important tool of the State in management and development of the socio-economy. Public policy is whatever the State chooses to do or not to do (Thomas Dye, 2008); it is a course of actions or inactions by the government in response to a public problems (Kraft - Furlong, 2013; p. 40); it refers to all activities of the State that directly or indirectly affect the lives of all citizens” (B. Guy Peters, 2013; p. 4). In general, public policy is a tool of the State, expressed in a series of managerial decisions, planned and implemented to solve public policy problems or to achieve defined goals, all of which influence the social community. To have a good public policy, the first important requirement is to correctly identify the public policy problems.

Besides, the author mainly employed the theoretical framework on public policy problems. According to Hoppe (2002), the problem is understood as the unacceptable gap between needs and reality in the present and in the future. The public policy issue is that

unrealized needs and values - or opportunities for improvement - can be realized through State activities (Dery, D., 1984); “a conflict arises from the reality of socio-economic life, or a need to change the current situation. This urges that the State promulgate public policies with a view to resolving the desired goals” (Trieu Van Cuong, 2016: p. 49); The public policy issue is also referred to as the condition or circumstance that results in a need, or dissatisfaction in the public which is mitigated or restored from Government action (NAPA, 2015; p. 127). On the basis of accurately identifying public policy problems, competent state agencies carry out public policy planning - performing the inalienable role of the State.

Besides, the author also relied on the theory of geo-politics in the research process when considering the geographical factors specific to the Mekong Delta region - the socio-economic region with many potentials and advantages, but facing many problems in development, especially the impacts of the climate change. This reality demands that the Vietnamese Government perfect the public policy system for sustainable development of the Mekong Delta in the new context and conditions.

To complete this article, the author also focused on researching policy documents on the development of the Mekong Delta region since 1998 (when Decision No. 01/1998/QĐ-TTg by the Prime Minister approving Master Plan for socio-economic development of the Mekong Delta region to 2010) to present; on implementation reports and research works on development policy for the Mekong Delta in the period 1999 - 2021).

Regarding reality-based research, the author used some research results in the process of conducting research on the implementation of educational development policy; educational development process in the Mekong Delta from April 2017 to August 2018. In this process, the author employed the survey method by using a questionnaire (900 questions distributed, 795 votes collected) and in-depth interviews with 12 experts to analyze and evaluate the development policy system for the Mekong Delta; tested the necessity and feasibility of orientations of and solutions to improving the development development policy system for the Mekong Delta.

In addition, in order to process the collected information, the author mainly used the following methods: analysis and synthesis methods; statistical methods combined with the use of data processing software.

3. Results

3.1. Problems of economic development

The share of GDP contribution by the Mekong Delta, although always ranked third after the southeast region of South Vietnam and the Red River Delta region (the Mekong Delta's area is three times as large as that of the Red River Delta), is decreasing, namely 31.5% in 1988, 27% in 1993, 27% , 18.3% in the period 1996 - 1998, and 17.2% in 2000 (Vo Hung Dung, 2011). In 2017, the Mekong Delta contributed approximately 18% of the national GDP and 17.7% in 2019 (Fulbright, 2021).

The income of the people in the Mekong Delta is lower and lower than the national average. In the period 1999 - 2002, the per capita income of the Mekong Delta region was higher than the national average; however, in 2004, 2008, 2010 and 2018, the income of the

people in the region fluctuated at 97.3%, 94.5% , 95%, 92.5% respectively (equivalent to 3,585/3,874 thousand VND) and in 2019 at 90.4% (equivalent to 3,886/4,298 of the national average). In some localities in the region, the per capita income per month in Group 1 (in 2019) is very low such as: 806,000 VND in Tra Vinh, 812 thousand VND in Ca Mau, 853 thousand VND in Bac Lieu (GSO, 2021). In addition, the people in the Mekong Delta are always facing increasingly serious impacts of the climate change. Environmental degradation threatens the lives and livelihoods of millions of people here (The World Bank, 2021).

Especially, in areas where ethnic minorities live, economic life is even more difficult. In 2019, there were about 1,310,007 ethnic minority people in the Mekong Delta, accounting for 9.27% of the whole country, living in 463 communes, including 17 border communes. The rate of poverty-stricken households among ethnic minorities in the Mekong Delta is 24.2% (Committee for Ethnic Minorities & General Statistics Office, 2020), accounting for 19.93% of the total poor households in the region (Nguyen Thanh Son & Hoang Hanh, 2021).

This situation has had several impacts upon the socio-economic development of the Mekong Delta. In particular, this situation greatly affects the investment in the education of children in the region. The level of investment of families is low, 32/43 (74.41%) of households asked said to have difficulty in funding their children's education. These rates In Tan Phu Dong district - Tien Giang province, in Vi Thuy district - Hau Giang province, in Duyen Hai district - Tra Vinh, in Hong Ngu - Dong Thap province, and in Cai Rang - Can Tho are 06/09 (66.66%), 08/10 (80%), 07/08 (87.5%), 07/09 (77.77%), and 04/07 (57.14%) respectively.

Besides, the economic restructuring has not been orientated clearly and lacks synchronicity in the region. The conventional drivers of the Mekong Delta in economic development have been exploited to their limit while the new ones have not been clearly defined (Fulbright, 2021).

3.2. Social problems

Although the State has particular policies for the Mekong Delta region, it is still the “educational sagging area” of Vietnam (Nhu Anh, 2021). Most of the education development indicators of the Mekong Delta region are lower than the national average. In 2019, the literacy rate of the population aged 15 and above in the Mekong Delta was 94.2%, compared to the national average of 95.8%. Some specific localities in the region have a low literacy rate of the population aged 15 and above, such as: Tra Vinh 89.5%, Soc Trang 89.3%, and An Giang 91.6%.

Table 1. The literacy rate in percentage of the population aged 15 and above in the Mekong Delta in 2019

Mekong Delta	An Giang	Bac Lieu	Ben Tre	Ca Mau	Can Tho	Dong Thap	Kien Giang	Hau Giang	Long An	Soc Trang	Tien Giang	Tra Vinh	Vinh Long
94,2	91,6	95,1	95,2	96,6	96,5	93,8	93,4	94,4	96,7	89,3	95,9	89,5	95,5

Source: compiled from GSO, 2021

In addition, economic conditions have also had a great impact on the educational development of the region. The survey results showed that 20/43 households (48.83%) when

asked said that the cause of the dropout was due to the family's economic difficulties, namely inability to understand the knowledge (08 households, 18.6%), lack of concern for their children's education (08 households, 18.6%), lack of concern from the school (02 households, 4.65%), and having no opinion (02 households, 4.65%). Survey results also showed that 36 out of 53 students interviewed (67.92%) said that the reason for dropping out was due to family economic difficulties.

The rate of trained workers in the Mekong Delta is 13.3% (the lowest in the country, compared to the national average 22.8%). The provinces with low rates of trained workers include Bac Lieu 8.8%, Hau Giang 10.8%, and Ben Tre 11.6%.

Table 2. The rate of employment of trained labourers aged 15 and above in the Mekong Delta region in 2019

Mekong Delta	An Giang	Bac Lieu	Ben Tre	Ca Mau	Can Tho	Dong Thap	Kien Giang	Hau Giang	Long An	Soc Trang	Tien Giang	Tra Vinh	Vinh Long
13,3	14,6	8,8	11,6	12,3	16,4	13,5	13,6	10,8	16,7	12,2	11,7	11,8	15,3

Source: Source: compiled from GSO, 2021

Regarding health facilities, in 2018, the Mekong Delta region had 24.8 hospital beds per 10,000 population (cf. 31.3 of the whole country). Some localities had a lower number of hospital beds than the region's average such as: Tien Giang (16.1), An Giang (19.9), Tra Vinh (20.5). The number of doctors per 10,000 population is 7.7 (cf. 9.0 of the whole country); some localities had a lower number of doctors than the region's average such as: Soc Trang (5.0), Tien Giang (5.3), Long An (6.3), Hau Giang (6.4) (Fulbright, 2021).

According to the Government's assessment, the educational plane and the rate of application of advanced science and technology in the Mekong Delta region are lower than the national average; the quality of education and health care is still low compared to the requirements... (Government, 2017).

In addition, in the period 2009 - 2019, the urban population of the Mekong Delta increased by 0.98% per year and the average population growth was 0.05% per year, which was very low compared with 2.62% and 1.14% of the national average growth. Migrations take place on a large scale, mainly among young people of working age. The number of people who migrated out of the Mekong Delta during this period was nearly 1.1 million people, larger than the population of some provinces in the region, and equivalent to the natural population growth of the region (Bui Quoc Dung, 2020). Besides, the Mekong Delta region has the fastest population aging rate in the country.

3.3. Environmental problems

The Mekong Delta region is increasingly facing many environmental problems such as saltwater intrusion, landslides, and sea-level rise due to increasingly serious impacts of the climate change. In 2020, the Mekong Delta will have more than 500 points of river and sea erosion with more than 800 km, 63 of which were seriously eroded, with a length of up to 104 km. Annually, landslides cause the loss of about 300 hectares of land and coastal

mangrove forests of the Mekong Delta. More than 19,000 households along the river side had to be relocated from dangerous areas (Quach Hang, 2020).

The pace of industrialization in the Mekong Delta in recent years has increased rapidly, resulting in environmental pollution in general and air pollution in particular. Waste from many industrial plants in the region has been causing serious air pollution, which endangers local people's health (Le Thai Ha & Le Viet Phu, 2020). The region's industry which has relatively low added value causes considerable soil and water pollution, including the generation of solid waste (Nguyen Ngoc Tran, 2021).

Together with that, with the characteristics of an agricultural economic region, the reduction of agricultural production area along with the process of urbanization and impacts from the climate change should increase the pressure of increasing productivity. This reality results in the abuse of pesticides and chemical fertilizers. According to a report by the World Bank, about 1,790 tons of active snailicides, 210 tons of herbicides, 1,224 tons of pesticides and 4,245 tons of fungicides are overused annually in rice production in the Mekong Delta (Mai Chi, 2019).

Environmental problems of the Mekong Delta are getting increasingly serious, threatening people's livelihoods; They have an growing impact on socio-economic development and is an indirect cause of increasing migration out of the Mekong Delta.

It can be said that, from a rich land, favored by nature, the Mekong Delta is gradually facing challenges of the times - serious impacts from the climate change and many problems concerning socio-economic development. This reality "requires a new vision, strategic orientation, comprehensive, radical and synchronous solutions, maximum mobilization of resources and the participation of all economic sectors for sustainable development of the Mekong Delta" (Government, 2017).

3.4. Perfecting the policy system for sustainable development of the Mekong Delta in the coming years

On the basis of the Party's viewpoints and orientations, in recent years, State agencies have issued many policy documents on the development of the Mekong Delta, including Resolution No. 120/NQ-CP. This resolution is considered to create a strategic vision, a "naturally harmonious" development philosophy to proactively solve challenges, to constructively create institutions and policies with a view to promoting sustainable development of the Mekong Delta in a unified whole (Mai Xuan Nghien, 2021). The process of implementing the policy system has brought positive results, which is the premise for the sustainable development process of the Mekong Delta region. However, to realize the sustainable development of the Mekong Delta, the Government as well as the authorities at all levels of the Mekong Delta need a perfection and synchronization in organizing the effective implementation of the policy system for sustainable development in the Mekong Delta. Firstly, the competent authorities need to pay attention to building and perfecting the policy system on the following aspects:

Firstly, attaching importance to policy solutions to keeping people in addition to preserving land, conserving water and protecting the environment of the Mekong Delta.

In perfecting the policy system for sustainable development of the Mekong Delta, in addition to paying attention to determining the long-term vision, goals and solutions to sustainable socio-economic development, the competent authorities need to pay attention to three policy groups: (1) policies of keeping people; (2) policies of preserving land and water; (3) policies of environmental protection. These policy groups need to be integrated to improve the efficiency of the implementation of specific policies. In particular, the policies of keeping "people" should be identified as the pivotal policy group, aiming at building generations of people born and raised in this land, equipped with sufficient knowledge and skills to live together and develop their homeland. They are the decisive factor in the effective implementation of the regional sustainable development policy system. In addition, it is necessary to synchronously build a system of structural and non-structural solutions to preserving land, conserving water and protecting the environment for this socio-economic region.

Secondly, conducting research, forecasting and building feasible schemes for sustainable development of the Mekong Delta

(1) Improving policies and mechanisms to encourage strong research groups at home and abroad to participate in comprehensive research to accurately forecast the problems in sustainable development of the Mekong Delta in coming decades. On that basis, developing feasible and effective schemes for the sustainable development of the Mekong Delta in each period.

(2) Perfecting policies to encourage scientific research activities with a view to capitalizing on the challenges and solving problems in socio-economic development, in the protection of natural resources (especially land and water) of the region, and in adapting to the increasingly diverse and severe negative impacts of the climate change.

(3) Perfecting the policies on promoting applied research activities in agricultural production and socio-economic activities of the region. Placing special priority to research and breeding activities of livestock and plants that are adapted to the conditions of the Mekong Delta in the face of the negative impacts of the climate change. Thereby, creating new and effective livelihoods to help residents in the region live and develop with the climate change.

Thirdly, paying attention to developing education

On the basis of the Party's view on education: "Socio-economic policies must be suitable to the characteristics of regions..."; "Rapidly developing and improving the quality of education in disadvantaged areas, mountainous areas and ethnic minority areas" (Communist Party of Vietnam, 2011). Education development takes "priority" in socio-economic development programs and plans" (Central Committee, 2013), in the author's view, for sustainable development of the Mekong Delta, the Government needs to pay attention to perfecting and improving the effectiveness of the implementation of education development policies for the Mekong Delta. In practice, since 1999, policy documents have been issued on education development of the Mekong Delta (Prime Minister, 1999), aiming to "reaching to the average index of the whole country by 2010" (Prime Minister, 2006) and "achieving the development indicators of academic levels high above the national average by 2020" (Prime Minister, 2012). Although education in the Mekong Delta has made many positive changes, there are many limitations, shortcomings and failures in achieving the set

goals. This is a big challenge for the Mekong Delta region in the process of comprehensive and sustainable development. That reality requires a comprehensive and scientific research and evaluation of education in the Mekong Delta so as to perfect and improve the effectiveness and efficiency of the implementation of the education development policy in the Mekong Delta in practice, making a decisive contribution to in the sustainable development of the Mekong Delta when performing the role of building the generations of people to construct and implement the development goals of the Mekong Delta.

Through the survey, there were 11/12 experts and 587/651 (90.16%) respondents who believe that education development is the top-priority solution to sustainable development of the Mekong Delta in the coming years.

Forthly, identifying the model of sustainable development and effective exploitation of resources and vantages for development

First things first, relevant agencies need to organize research and consultation activities to determine an effective and sustainable economic development model for the Mekong Delta in the coming decades. These activities need to be seriously implemented to accurately and comprehensively identify opportunities, potentials as well as risks and challenges of the region, and at the same time to create consensus among stakeholders in sustainable economic development of the Mekong Delta region. Should it be that the economic development model of the Mekong Delta in the coming time should be consistent towards creating a unified whole for the region to develop a modern and sustainable agricultural economy, linked to an professional and effective market. This model requires each locality to redefine its role in the unified whole of the region, and at the same time to adjust the local development strategies and plans accordingly. In addition, localities in the region need to pay attention to strong digital transformation to improve socio-economic efficiency and to advertise, connect and develop domestic and foreign markets.

In addition, in the new development process, the Mekong Delta needs to protect and increase the value of its traditional resources and strengths, especially in the agricultural sector with agricultural produce, fruits and fisheries. At the same time, it is necessary to take advantage of new resources for development such as the attention and investment of the State in the socio-economic development of the region; the international community's interest in the impacts of the climate change in the region; invisible resources from the Fourth Industrial Revolution, international integration.

Fifthly, establishing a coordinating machanism and effective regional linkage

Currently, the Prime Minister has established the Coordinating Council for the Mekong Delta region for the period of 2020 - 2025 (Prime Minister, 2020). The linkage of the Mekong Delta region should aim at promoting the coordinating role in the whole Mekong Delta region, thereby specifying the roles and tasks of each locality in the sustainable economic development model of the Mekong Delta. At the same time, it should work towards increasing regional linkages between the Mekong Delta region and Ho Chi Minh City, the southeast region of South Vietnam and the Asian region and worldwide.

4. Conclusion

The Mekong Delta is a socio-economic region with many potentials and advantages for development. However, this socio-economic region is most affected by the climate change in Vietnam. In the author's perspective, to develop the Mekong Delta sustainably in the new development context, the competent authorities need to correctly identify the challenges and problems of the region. At the same time, they are expected to promote research activities, forecast and develop schemes for sustainable development of the Mekong Delta; to establish a model of sustainable economic development and effectively promote resources and strengths for development; to pay special attention to policy solutions to "keeping people", developing education and creating an effective coordination and regional linkage mechanism.

REDUCING WITHDRAWAL OF LUMP - SUM SOCIAL INSURANCE ALLOWANCE IN VIET NAM: PROPOSED SOLUTIONS

PhD. Phan Anh Tuan

phananhtuan@neu.edu.vn

MSc. Dang Thi Minh Thuy

thuydm@neu.edu.vn

Faculty of Insurance, National Economics University, Ha Noi, VietNam

Abstract

In order to ensure employees' income and maintain their standard of living, especially when their earnings are postponed or they are out of labor force, insurance policy always encourages employees to receive annual/monthly pensions instead of receiving lump - sum allowance. However, the number of pensioners tends to increase each year. Thus, to achieve this goal and ensure social security, it is necessary to propose solutions which orientate employees remain in social insurance system.

Keywords: *Lump sum payment, pension, employees*

1. Introduction

In Law on Social Insurance (Law No. 58/2014/QH13), regulations on Lump-sum social insurance allowance at Article 60:

1. Employees defined in Clause 1, Article 2 of this Law are entitled to a lump-sum social insurance allowance upon their request when falling in one of the following cases:

a/ They have reached the retirement age specified in Clause 1, 2 or 4, Article 54 of this Law but have paid social insurance premiums for under full 20 years, or the age specified in Clause 3, Article 54 of this Law but have paid social insurance premiums for under full 15 years and do not continue paying voluntary social insurance premiums;

b/ They settle abroad;

c/ They get a fatal disease, such as cancer, poliomyelitis, dropsy cirrhosis, leprosy, serious tuberculosis, or HIV infection progressing into AIDS, or other diseases as prescribed by the Ministry of Health;

d/ Employees defined at Points d and e, Clause 1, Article 2 of this Law who are demobilized or cease working without being eligible for pension.

And at Article 77:

1. Employees defined in Clause 4, Article 2 of this Law are entitled to a lump-sum social insurance allowance upon request if they fall in one of the following cases:

a/ They satisfy the age requirement specified at Point a, Clause 1, Article 73 of this Law but have paid social insurance premiums for under 20 years and do not continue paying social insurance premiums;

b/ They settle abroad;

c/ They suffer a fatal disease, such as cancer, poliomyelitis, dropsy cirrhosis, leprosy, serious tuberculosis, HIV infection progressing into AIDS, or other diseases as prescribed by the Ministry of Health.

Thus, this law has tightened the conditions for withdrawing lump-sum payment by providing this for only employees who reach retirement age but are not eligible for pension or go abroad for legal residency. Simultaneously, the law has also added cases are eligible for receiving lump-sum allowance including employees who suffering from life-threatening diseases such as cancer, polio, cirrhosis of the liver ascites, leprosy, severe tuberculosis, HIV infection that has progressed to AIDS stage. and other diseases as prescribed by the Ministry of Health (including cases with full 20 years of paying social insurance contribution).

On June 22nd, 2015, the XIII National Assembly approved Resolution No. 93/2015/QH13 on the implementation of policy on lump-sum payment of social insurance benefits to employees. Accordingly, from January 1st, 2016, “One year after leaving their jobs, for employees participating in compulsory social insurance, or after stopping to make social insurance contributions, for persons participating in voluntary social insurance, employees participating in compulsory social insurance and persons participating in voluntary social insurance whose social insurance payment period is less than 20 years will be entitled to receive lump-sum social insurance benefits if they so request.”

The resolution affirms that employees are entitled to reserve their contribution time to be eligible for pension which helps to ensure their old – age life as prescribed by 2014 Law on Social Insurance. Also, it meets the needs of employees who, after one year of leave, have no job, no income, and still have difficulties in their life, and wish to be entitled to a lump-sum social insurance benefit.

In recent years, the number of employees receiving lump-sum allowance is increasing, which has put some pressure on social insurance policy, and will also bring disadvantages to the employees themselves.

2. Method

The study uses synthesis and statistical analysis methods. Data sources on the implementation of lump – sum social insurance payments for employees are taken from Vietnam Social Security, Department of Social Insurance and scientific reports to summarize, analyze and clarify the current status of lump – sum social insurance allowance in Vietnam.

3. Results

According to the statistics of Vietnam Social Insurance, data on payment of lump – sum social insurance benefits since the implementation of Law on Social Insurance in 2014 (from 2016) to the end of 2020 are described as follows:

Figure 1. The withdrawal of lump-sum social insurance allowance for the 2016-2020 period

Source: Vietnam Social Security

The above data indicates that, in the 2016-2020 period, there were 3,195,058 employees who applied for and received lump - sum benefits. This number for following years was always higher than the previous year with an average growth rate of about 11.3% per year. Specifically: there was 500,174 people in 2016; 560,137 people in 2017 (increased 12% compared to 2016); 666,482 people in 2018 (increased 19% compared to 2017); 707,184 people in 2019 (increased 6.1% compared to 2018). In 2020, there was 761,081 people (an increase of 7.62% compared to 2019 and 52.2% compared to 2016).

Furthermore, the benefit amount also increased in proportion to the number of beneficiaries. From 2016 to 2020, it experienced a gradual increase when comparing 2 consecutive years: 32.8%, 40.2%, 23.8%, 17.7 %.

Additionally, it is seen that the number of female beneficiaries is always higher than that of male in terms of gender.

The following chart also shows data about the recipients of lump – sum allowance by working sectors:

Unit: people

Figure 2. The number of lump – sum social insurance allowance recipients by working sectors

Source: Vietnam social security

In the 2016-2020 period, the number of lump – sum social insurance beneficiaries is mainly from private sectors with a total of 2,899,200 people (accounting for 90.74% of total number). While 257,002 beneficiaries work for state – owned sectors, the low figure is for those contributing voluntary system with 38,856 people. This can be explained by the reason that employees in private and foreign invested enterprises often work under pressure. This group usually have a "job switch" mindset, so when they quit their jobs, they want to enjoy a lump-sum social insurance benefit while looking for a new one

Figure 3. Distribution of Social Insurance Allowance Beneficiaries by age

Source: Vietnam social security

According to above data, Beneficiaries of Lump –sum allowance are mainly from 20 years old to 40 years old, accounting for 80.9% of the total number. The highest figure The age group from 20 to 30 years old has the highest figure (accounting for 42.7%), while the lowest is the group of under 20 years old (accounting for 0.25%). This early withdrawal is an expected trend, because young employees are more concerned with immediate needs than pensions when they get old. Additionally, financial pressures such as starting to be independent, continuing to invest in studying to improve vocational skills, getting married, raising children... also cause early applying for lump – sum social insurance benefit

Moreover, the average periods of social insurance premium payment of these age groups are relatively low, while legal age for participating in Vietnam social insurance system starts from 15 years old. This can be explained by late participation in social insurance system which leads to employees reach retirement age but cannot afford to pay voluntary social insurance premiums to be eligible for monthly pension, so they must receive lump-sum social insurance allowance.

Based on conditions for withdrawing lump -sum social insurance allowance according to 2014 Law on Social Insurance, we have the following table:

Table 1. Number of Social Insurance Allowance Beneficiaries by Cause

	2016 (people)	2017 (people)	2018 (people)	2019 (people)	2020 (people)	Total (people)	Rate (%)
Point a, Clause 1, Article 60 Law on Social Insurance	4,904	5,238	5,532	5,902	6,551	28,127	0.88
Point b, Clause 1, Article 60 Law on Social Insurance	1	453	3,263	3,741	1,650	9,108	0.29

Source: Vietnam social security

The above statistics imply that in the period 2016-2020, the majority of lump -sum social insurance allowance beneficiaries are employees who stop contributing social insurance after one year of participating (accounting for 98.72% of the total number). The number for beneficiaries who reach retirement age but not minimum contributing period accounts for very few, only 0.92%. This shows that maintaining the waiting period "after one year of leaving work or after one year of not continuing to pay voluntary social insurance contributions" to receive lump- sum social insurance allowance does not achieve the desired purpose of Resolution No. 93/2015/QH13. When considering the opportunity to get pension in old age, be financially dependent and benefit health insurance, many employees still decide to withdraw a lump-sum social insurance allowance to use for other purposes or to meet their financial needs.

4. Discussion and Conclusion

4.1. Causes

4.1.1. From Lump – sum social insurance allowance policy

The 2014 Law on Social Insurance contributes to limit the beneficiaries of lump-sum social insurance allowance when it stipulate that employees who "leaving job for one year without continuing to participate in social insurance" are unentitled to this benefit. However, when the Law had not yet taken effect, the Resolution No. 93/2015/QH13 allowed providing lump-sum social insurance benefit for employees leaving job after one year and having not full 20 years of paying social insurance premiums.

Conditions for withdrawing lump -sum social insurance benefit are quite easy, the level of enjoyment is more attractive more than the period of contributing social insurance from 2014 onwards. This also benefits employees (with the contribution of 8% of the monthly salary to pension and survivor regimes, the lump-sum allowance for pensioners shall be calculated based on their period of social insurance premium payment, in which for each year of payment of social insurance premiums prior to 2014, they are entitled to 1.5 months' current pension and for each year of payment of social insurance premiums since 2014, they are entitled to 2 months' current pension). Thus, this regulation encourages employees who quit their jobs want to enjoy lump-sum social insurance benefit.

In addition, the conditions on the minimum contribution period for getting pension are too long which discourage employees from continuing to contribute. According to the 2014 Law on Social Insurance, employees need to pay social insurance premiums for at least full 20 years are entitled to pension in order to be entitled to pension. Hence, employees who have only 3 to less than 10 years of contribution when they leave their jobs, will find it difficult to decide to wait and continue contributing to be eligible for pension.

Some changes in social insurance policy such as: From 2018 onwards, the time of payment of social insurance is gradually increased is paying full 35 years for men, 30 years for women to enjoy maximum retirement benefit (75%). From 2021 onwards, the retirement age will be increased according to the roadmap for retirement age (Decree coded 155/2020/ND-CP). The retirement age of male employees will be increased by three months

each year till 62 years of age reached in 2028. Meanwhile, the retirement age of female workers will be risen by four months each year till 60 years of age reached in 2035.

This also makes many employees choose to receive a lump-sum social insurance allowance or retire early because it can be more profitable and psychologically safety.

The policy of voluntary social insurance is still not attractive to employees in the informal sector as well as to employees in the formal sector after the termination of the labor contract.

The above legal provisions are the prologue which causes the implementation of lump –sum social insurance policy recently is considered to be quite open and uncomplicated. This is reflected by the continuously increasing number of beneficiaries which posing challenges in expanding social insurance coverage, ensuring income security for employees at the end of working age, and ensuring long-term social security.

4.1.2. From the organization and implementation of Law on social insurance

- Communicating activities have been promoted but inefficiently. Thus, many employees do not fully understand the benefits of enjoying pension as well as the disadvantages of receiving the lump-sum social insurance benefit.

- The reform of administrative procedures creates favorable conditions for employees to authorize others to request settlement and receive lump-sum social insurance allowance. This caused that some employers take advantage of these conditions to collect employees' social insurance books via the form of authorization contract (purchasing the social insurance books at a much lower price than the actual value of lump –sum social insurance allowance). Then these employers can perform the legal procedures to enjoy this benefits. However, even though pledging and purchasing social insurance books is illegal and unfavorable to both sellers and buyers, employees still accept purchasing this book instead of waiting to meet the conditions prescribed by the Law on Social Insurance to receive a lump-sum social insurance benefit.

- The **authorities** of the local public administrations have not paid much attention to instruct the organization and implementation of social insurance policies. The coordination of regional departments with the social insurance agency is not regular. In some regions, this is considered the sole responsibility of the social insurance agency.

4.1.3. From employers' side

- The production and business situation of enterprises has faced many difficulties, especially in recent years when the economy has been heavily affected by the Covid-19 epidemic. Many businesses, especially businesses such as tourism, hotels, transportation, apparel, etc., have stopped operating or downsize business. The rise in the number of unemployed workers and who do not have the opportunity to re-enter the labor market are the reasons for increasing the number of people receiving lump-sum social insurance allowance.

- Besides, some employers' legal compliance on social insurance and unemployment insurance is still not seriously. They are lack of concern for employees' rights such as participating in social insurance for employees at low wages, owed or late payment of social insurance premiums, dismissing elderly workers to avoid paying salaries and high social

insurance premiums, cost savings. This leads to that employees cannot enjoying timely and fully the benefits. Hence, it partly affects the psychology of not wanting to join with social insurance system for a long time and wanting to get their benefits early.

4.1.4. From employees' side

- There are many reasons why employees choose to enjoy lump –sum social insurance benefit. Most employees work in industrial zones who have low income choose to withdraw this allowance which might be financial resource to cover their living.

- The insecure psychology of employees is rising because they are afraid that the policy will change in an unfavorable direction, so there will be many risks, slippage, reduction of social insurance benefits. Thus, although being aware of the negative impact on long-term benefits, employees still choose the "immediate securely" option.

- The awareness of employees about the effect and meaning of enjoying pension is not sufficient. They do not form consciousness of participating in social insurance at a young age to enjoy pension in old age. The majority of employees do not concern long- term financial dependent.

4.2. Disadvantages of receiving lump-sum social insurance allowance

4.2.1. No reservation of period of social insurance premium payment

Article 61 of 2014 Law on Social Insurance stipulates: Employees who cease working without being eligible for pension specified in Article 54 or 55 of this Law or without receiving a lump-sum social insurance allowance provided in Article 60 of this Law are entitled to have their period of social insurance premium payment reserved. Thus, if employee quits his job and has not received a lump-sum social insurance benefit, the period of social insurance premiums payment will be preserved and added to the subsequent payment period. When having this benefit, employees might lose the opportunity to receive pension because they are not eligible for contribution period of social insurance.

4.2.2. Not entitled to funeral and survivor allowance upon death

Those who are participating in social insurance but cannot afford to further payment, can reserve the period of social insurance premium payment. During the reservation period, if they die unfortunately, their families and relatives are entitled to a funeral survivors allowance. However, if they have received a lump-sum social insurance allowance, they will not be entitled to that benefit again. Therefore, withdrawal of lump – sum social insurance allowance has a significant impact on funeral and survivor allowance of employees' relatives.

4.2.3. Out of pocket payment for medical examination and treatment expenses at old age

At retirement age, employees often face health problems and diseases related to old age. Therefore, the law stipulates that social insurance agency pay health insurance contributions for people who receive pensions, monthly allowances for loss of working capacity, etc.... (Clause 1, Article 2 of Decree No. 146/2018/ND-CP). Hence, employee who has received a lump-sum social insurance allowance must pay in pay health insurance contributions by himself.

4.2.4. Breaking social insurance system

If social insurance participants working in both private and public sectors claim the right to receive a lump-sum social insurance benefit before retirement age, it will lead to the breakdown of social insurance system. The negative consequence of this policy is that the number of employees applying for this allowance will increase. Then they are unable to accumulate pension benefits which might cause their financial insecurity at old age.

4.3. Solutions to reduce the withdrawal of lump –sum social insurance allowance

Although lump – sum social insurance benefit is an employee's right, they are enjoying this benefits incorrectly and unsustainably. Therefore, in order to ensure the financial needs of employees and stimulate them to stay in the system, a number of solutions need to be taken as follows:

- Reduce the period of social insurance contribution payment to enjoy the pension from 20 years to 15 years, then to 10 years with lower benefits. This will give employees more opportunities to enjoy retirement benefits and bring up their trust for the system. Hence, they will make efforts to pursue the process of contributing to ensure their social security.

- For those who need to receive lump - sum social insurance allowance, there should be a regulation that only allows the withdrawal based on the contribution of that individual; while the employer's contribution will be retained to ensure long-term balance of the fund. This separation of benefits both ensures the fairness of contributions, employees' benefits (they have the right to withdraw the part they have paid) and policy goals (the employer pays due to government's regulations, so their contributions are also retained). Furthermore, employees will also find that if they stay in social insurance system, they will receive higher benefits than withdrawing from the system.

- It is necessary to have policies which allow social insurance participants to borrow from their contributions to serve their needs of business investment, housing or long-term medical examination and treatment. As these needs are met, they earn a stable income then return to contribute and repay the system. This will create a reciprocal relationship between members and the system. Moreover, conditions for enjoying lump –sum social insurance benefit need to be specified in the direction of encouraging employees to stay in the system longer such as allowing a longer period of leave.

- The propaganda and popularization of law on social insurance should be promoted strongly in the process of formulating and accomplishing legal policies. Citizens need to be informed and effectively consulted about the meaning and purpose of legal policy and adjustments changes. This will create social consensus as policies and laws are designed and enacted, as well as help employees well prepare for the future if there are legal changes. Before settling lump – sum social insurance benefit, social insurance officers are responsible for propagating and clearly explaining to employees the benefits of continuing to participate to enjoy pension instead of receiving lump – sum social insurance benefit.

- A communication strategy on expanding social insurance coverage, including limiting the withdrawal of lump – sum social insurance allowance, should be coordinately

controlled by state and regional social insurance agencies. This strategy aims to raise awareness about the meaning and importance of cumulative contributions to retirement regime, thereby creating social consensus if there are legal adjustments and changes on social insurance including lump –sum social insurance benefits.

Abstract

Using clean energy is a new trend around the World recently. It is a good way to protect the environment and implement the Sustainable Development Goals of the United Nation. Following that trend, in recent years, Vietnam encourage everyone using of clean energy to develop economics. In this paper, the author will analyze the facts and problems of using clean energy in Vietnam, in comparison with other countries around the world. Then, the author will recommend some solutions to improve the problems related to using clean energy in Vietnam for the next period. To do this research, the author uses many kinds of methodologies such as analysis Vietnam legal policy and documents (law and regulations) related to energy activities, use the hypotheses developed in the study shows how to use law and regulation to govern energy activities in Vietnam, survey, etc.

Keywords: *clean energy; sustainable development; Vietnam*

1. Introduction

The 2030 Agenda for Sustainable Development, adopted by all United Nations Member States in 2015, provides a shared blueprint for peace and prosperity for people and the planet, now and into the future. At its heart are the 17 Sustainable Development Goals (SDGs), which are an urgent call for action by all countries - developed and developing - in a global partnership. They recognize that improve health and education, reduce inequality, and spur economic growth – all while tackling climate change and working to preserve our oceans and forests. The 7th Goal of the 17 Sustainable Development Goals is Ensure access to affordable, reliable, sustainable and modern energy for all.

Vietnam is in the process of industrialization and modernization. Therefore, ensuring the demand for energy for rapid and sustainable economic development, maintaining national defense, political security, social order, and safety, and constantly improving people's living particularly important role. Over the years, Vietnam has had many policies to invest in and support the energy industry in many aspects. The Politburo of Vietnam has issued Conclusion No. 26-KL/TW in 2003 on the Strategy and Planning for the Development of Vietnam's Electricity Industry; Resolution No. 18-NQ/TW in 2007 on the orientation of

Vietnam's national energy development strategy to 2020, vision to 2050. Thanks to the Party's policy, correct leadership, and the influence of the Party. In response to the participation of the political system, the business community, and society as a whole, in recent years, our country's energy industry in general and the electricity industry, in particular, have made rapid and relatively similar developments. Ministries in all sub-sectors and fields closely followed the orientation and achieved many specific goals set out. In response to the socio-economic development requirements of the 2021-2030 period. On the basis of this resolution, the National Assembly will study, amend and supplement the law to create favorable conditions for national energy development. Resolution 55 is highly appreciated by ministries, branches, localities, the business community, investors, domestic and international experts. The good implementation of this Resolution is expected to create breakthrough developments for Vietnam's energy industry in the next period.

2. Literature Review

2.1. Sustainable development Goals of United Nation

The Sustainable Development Goals (SDGs), also known as the Global Goals, were adopted by the United Nations in 2015 as a universal call to action to end poverty, protect the planet, and ensure that by 2030 all people enjoy peace and prosperity. The 17 SDGs are integrated—they recognize that action in one area will affect outcomes in others, and that development must balance social, economic and environmental sustainability. The creativity, knowhow, technology and financial resources from all of society is necessary to achieve the SDGs in every context.

Climate change is a real and undeniable threat to our entire civilization. The effects are already visible and will be catastrophic unless we act now. Through education, innovation and adherence to our climate commitments, we can make the necessary changes to protect the planet. These changes also provide huge opportunities to modernize our infrastructure which will create new jobs and promote greater prosperity across the globe.

Renewable energy solutions are becoming cheaper, more reliable and more efficient every day. Our current reliance on fossil fuels is unsustainable and harmful to the planet, which is why we have to change the way we produce and consume energy. Implementing these new energy solutions as fast as possible is essential to counter climate change, one of the biggest threats to our own survival. To ensure access to sustainable energy, we all have to take action. Get inspired here:

- i. Universal access to modern energy. By 2030, ensure universal access to affordable, reliable and modern energy services. Increase global percentage of renewable energy. By 2030, increase substantially the share of renewable energy in the global energy mix.
- ii. Double the improvement in energy efficiency. By 2030, double the global rate of improvement in energy efficiency.
- iii. Promote access to research, technology and investments in clean energy. By 2030, enhance international cooperation to facilitate access to clean energy research and technology, including renewable energy, energy efficiency and advanced and

cleaner fossil-fuel technology, and promote investment in energy infrastructure and clean energy technology.

- iv. Expand and upgrade energy services for developing countries. By 2030, expand infrastructure and upgrade technology for supplying modern and sustainable energy services for all in developing countries, in particular least developed countries, small island developing States and landlocked developing countries, in accordance with their respective programmes of support.

Together we can ensure affordable and clean energy for all. Here you can see what you can do to contribute. Find organizations to support, information to share and some useful tips for your everyday life that can really make a difference.

2.2. Paris Convention 2015 on Climate change

At COP 21 in Paris, on 12 December 2015, Parties to the UNFCCC reached a landmark agreement to combat climate change and to accelerate and intensify the actions and investments needed for a sustainable low carbon future. The Paris Agreement builds upon the Convention and – for the first time – brings all nations into a common cause to undertake ambitious efforts to combat climate change and adapt to its effects, with enhanced support to assist developing countries to do so. As such, it charts a new course in the global climate effort.

The Paris Agreement’s central aim is to strengthen the global response to the threat of climate change by keeping a global temperature rise this century well below 2 degrees Celsius above pre-industrial levels and to pursue efforts to limit the temperature increase even further to 1.5 degrees Celsius. Additionally, the agreement aims to increase the ability of countries to deal with the impacts of climate change, and at making finance flows consistent with a low GHG emissions and climate-resilient pathway. To reach these ambitious goals, appropriate mobilization and provision of financial resources, a new technology framework and enhanced capacity-building is to be put in place, thus supporting action by developing countries and the most vulnerable countries, in line with their own national objectives. The Agreement also provides for an enhanced transparency framework for action and support.

The Paris Agreement requires all Parties to put forward their best efforts through “nationally determined contributions” (NDCs) and to strengthen these efforts in the years ahead. This includes requirements that all Parties report regularly on their emissions and on their implementation efforts. There will also be a global stocktake every 5 years to assess the collective progress towards achieving the purpose of the agreement and to inform further individual actions by Parties.

The Paris Agreement opened for signature on 22 April 2016 – Earth Day – at UN Headquarters in New York. It entered into force on 4 November 2016, 30 days after the so-called “double threshold” (ratification by 55 countries that account for at least 55% of global emissions) had been met. Since then, more countries have ratified and continue to ratify the Agreement, reaching a total of 125 Parties in early 2017. The current number of ratifications can be found here.

In order to make the Paris Agreement fully operational, a work programme was launched in Paris to develop modalities, procedures and guidelines on a broad array of issues. Since 2016, Parties work together in the subsidiary bodies (APA, SBSTA and SBI) and various constituted bodies. The Conference of the Parties serving as the meeting of the Parties to the Paris Agreement (CMA) met for the first time in conjunction with COP 22 in Marrakesh (in November 2016) and adopted its first two decisions. The work programme is expected to be completed by 2018.

The Paris Agreement, adopted through Decision 1/CP.21, addresses crucial areas necessary to combat climate change. Some of the key aspects of the Agreement are set out below:

- i. Long-term temperature goal (Art. 2) – The Paris Agreement, in seeking to strengthen the global response to climate change, reaffirms the goal of limiting global temperature increase to well below 2 degrees Celsius, while pursuing efforts to limit the increase to 1.5 degrees.
- ii. Global peaking and 'climate neutrality' (Art. 4) – To achieve this temperature goal, Parties aim to reach global peaking of greenhouse gas emissions (GHGs) as soon as possible, recognizing peaking will take longer for developing country Parties, so as to achieve a balance between anthropogenic emissions by sources and removals by sinks of GHGs in the second half of the century.
- iii. Voluntary cooperation/Market- and non-market-based approaches (Art. 6) – The Paris Agreement recognizes the possibility of voluntary cooperation among Parties to allow for higher ambition and sets out principles – including environmental integrity, transparency and robust accounting – for any cooperation that involves internationally transferal of mitigation outcomes. It establishes a mechanism to contribute to the mitigation of GHG emissions and support sustainable development, and defines a framework for non-market approaches to sustainable development.
- iv. Adaptation (Art. 7) – The Paris Agreement establishes a global goal on adaptation – of enhancing adaptive capacity, strengthening resilience and reducing vulnerability to climate change in the context of the temperature goal of the Agreement. It aims to significantly strengthen national adaptation efforts, including through support and international cooperation. It recognizes that adaptation is a global challenge faced by all. All Parties should engage in adaptation, including by formulating and implementing National Adaptation Plans, and should submit and periodically update an adaptation communication describing their priorities, needs, plans and actions. The adaptation efforts of developing countries should be recognized
- v. Loss and damage (Art. 8) – The Paris Agreement recognizes the importance of averting, minimizing and addressing loss and damage associated with the adverse effects of climate change, including extreme weather events and slow onset events, and the role of sustainable development in reducing the risk of loss and damage. Parties are to enhance understanding, action and support, including through the Warsaw International Mechanism, on a cooperative and facilitative basis with respect to loss and damage associated with the adverse effects of climate change.

- vi. Finance, technology and capacity-building support (Art. 9, 10 and 11) – The Paris Agreement reaffirms the obligations of developed countries to support the efforts of developing country Parties to build clean, climate-resilient futures, while for the first time encouraging voluntary contributions by other Parties. Provision of resources should also aim to achieve a balance between adaptation and mitigation. In addition to reporting on finance already provided, developed country Parties commit to submit indicative information on future support every two years, including projected levels of public finance. Climate change education, training as well as public awareness, participation and access to information (Art 12) is also to be enhanced under the Agreement.
- vii. Global Stocktake (Art. 14) – A “global stocktake”, to take place in 2023 and every 5 years thereafter, will assess collective progress toward achieving the purpose of the Agreement in a comprehensive and facilitative manner. It will be based on the best available science and its long-term global goal. Its outcome will inform Parties in updating and enhancing their actions and support and enhancing international cooperation on climate action.
- viii. Decision 1/CP.21 also sets out a number of measures to enhance action prior to 2020, including strengthening the technical examination process, enhancement of provision of urgent finance, technology and support and measures to strengthen high-level engagement. For 2018 a facilitative dialogue is envisaged to take stock of collective progress towards the long-term emission reduction goal of Art 4. The decision also welcomes the efforts of all non-Party stakeholders to address and respond to climate change, including those of civil society, the private sector, financial institutions, cities and other subnational authorities. These stakeholders are invited to scale up their efforts and showcase them via the Non-State Actor Zone for Climate Action platform (<http://climateaction.unfccc.int>). Parties also recognized the need to strengthen the knowledge, technologies, practices and efforts of local communities and indigenous peoples, as well as the important role of providing incentives through tools such as domestic policies and carbon pricing.

2.3. Some research related to clean energy

Renewable energy is encouraged to exploit and maximize its capacity and reach its limit in the next few decades. Countries around the world have been using renewable energy as significant solutions for meeting energy needs economically, ensuring energy security and sustainable development. The capacity and use of renewable energy on a global scale has increased at a faster rate than expected, especially in the electricity generation sector. The trend of renewable energy development in recent years has created turning points in the development of the global energy system. The rapid growth of renewable energy demonstrates the commitment of Governments around the world. More than 170 countries have set renewable energy targets, and nearly 150 countries have issued preferential policies for renewable energy development. The private sector also plays an important role in the development of renewable energy on a global scale. This signals a growing consensus that renewable energy technologies will be the engine for sustained growth and economic development.

The cost of electricity generation from renewable energy has decreased significantly since 2010 with the decreasing trend of renewable energy equipment. Led by a trend of 81% decrease in the value of solar power equipment along with other cost reductions, the cost of residential electricity (LCOE) of solar power decreased by 73% between 2010-2017, to 10 USc/ kWh. In some countries, solar power has been able to compete directly with traditional power sources without financial support. Offshore wind power and concentrated solar power also saw a significant decrease during this period with LCOEs of 14 USc/kWh and 22 USc/kWh respectively. Bidding results for the two years 2016-2017 show a further reduction for these two types of renewable energy by 2020.

The main factors leading to the reduction in electricity costs of renewable energy include improved technology, competitive bidding, and accumulated experience at a large scale with international project developers. The results collected by IRENA for competitive bidding for renewable power project development through 2022 suggest that the reduction in LCOE will continue to be sustained. IRENA also predicts that by 2020, the cost of renewable electricity will be in the range of fossil fuel power sources. With an increasing amount of accumulated capacity in regions and countries, renewable electricity development costs will continue to maintain their current downward momentum. Building on this momentum, renewable energy is well-positioned to play a central role in the implementation of international agreements on climate change and sustainable development goals. IRENA estimates show that doubling the share of renewable energy to 36% by 2030 is technically and economically feasible.

Accelerating the implementation of energy turning points and developing renewable energy beyond electricity generation can have economic, social, and environmental benefits. Achieving the share of renewable energy by 2030 contributes to an increase in global economic output of 1.3 trillion USD compared to conventional projects. It also contributes to the creation of millions of jobs and significantly reduces the health hazards caused by air pollution. One of the biggest benefits is also creating opportunities for the 1 billion people who do not have access to electric power and the nearly 3 billion people who depend on traditional biomass for cooking. According to the report of IRENA 2018, to achieve the goal of reducing greenhouse gases under the plan to promote renewable energy, the world needs an investment of 16,000 billion USD by 2050. In which, renewable energy types. mainly onshore wind power 33%, solar power 43%. This is followed by an increased share of renewable electricity, increased investments in energy storage, power transmission, and distribution capacity, flexible power sources, and load regulation. The additional investments help the system to integrate 62% of the power load from wind and solar while ensuring an adequate, stable, and reliable power supply. In the period to 2050, solar power will increase from 233 GW to 7122 GW, wind power from 411 GW to 5445 GW, concentrated solar power from 5 GW to 633 GW, biomass power from 119 GW to 384 GW, geothermal power from 10GW to 227 GW, other forms of renewable energy (tidal, wave, etc.) from 0.3 GW to 881 GW. Thus, wind power and solar power will be the main forms of renewable energy to meet electricity demand in the future. At this rate of growth, electricity from renewable energy will contribute to 85% of total electricity production by 2050 compared to 24% in 2015.

3. Method

In this paper, the authors use many kinds of researching methodologies to analyze international and national legal policy and documents (law and regulations) related to using clean energy for sustainable development. Besides, the authors based on the hypotheses developed in the study show how to use law and regulation to laws when implementing activities of using clean energy. To examine these relationships, the authors developed some hypotheses and tested these hypotheses using some empirical models. The developed models confirm the assumptions and demonstrate a legal mechanism for using clean energy. Moreover, statistics and surveys are also used to finish this research. The authors used the poll to survey the Vietnamese citizens, enterprises, and associations in Vietnam. The authors also sent the questionnaires to ask them some questions related to the law and using clean energy. The authors combined all of the methodologies above to do this research. However, because of time and financial limitations, the working paper cannot cover inclusive aspects of issues related to the topic. Thus, the authors look forward to taking the comments and opinions of readers and reviewers to do better in future.

4. Results

4.1. Overview of using clean energy in the Worldwide

In the 21 century, the rapidly changing world energy development potential is reflected in fluctuations in energy supply. Gradually reduce the use of coal for electricity development, switch to gas-fired thermal power and renewable energy instead. The European Community is also making efforts to stop coal-fired power, countries such as the UK, Belgium, France, Italy, the Netherlands, Portugal, Austria, Ireland, Denmark, Sweden and Finland all set targets to phase out coal-fired power by 2030. The total coal-fired power capacity of these countries is currently at 42 GW. Germany alone is 50 GW, Poland 29 GW is the 4th and 9th ranked countries in the coal-fired countries of the European Union. The German government does not currently have a specific plan to phase out coal-fired power, but the goal of eliminating 50% of total capacity by 2030 is feasible. To meet the goals of the Paris Agreement, the European Union needs to close coal-fired power by 2030. A rising carbon price is seen as the driver of the shift from coal to natural gas in the coming years.

Other Asian countries such as Korea, Japan, Bangladesh, Pakistan and the Philippines or South Africa are actively tending to replace coal with renewable energy sources.

The United States demonstrates an effort to phase out old coal-fired power plants, which have already reduced 61 GW and are projected to 58 GW in the coming years. This effort will reduce coal-fired power capacity by about 220 GW, equivalent to two-thirds of the total capacity of 327 GW compared to 2000. Technological advances in shale gas extraction and cost reduction trends of renewable energy electricity, market conditions are currently favorable for the development of gas thermal power and renewable energy. Currently, the United States has no plans to develop coal-fired power. In 2018, the United States plans to phase out 18 GW of coal-fired thermal power. Thus, coal consumption in the United States in 2016 reached the lowest level since 1982. According to the US Energy Outlook Report showing all development strategies, US coal-fired power capacity will

decrease from 0.8-2.1% per year until 2050. It is expected that by 2050, the United States will only have about 144-150 GW of coal power.

Natural gas and shale gas are used to replace coal and kerosene for power generation purposes. Current combined cycle gas turbine technology has reached an efficiency level of 60%, the highest among power generation technologies. In recent decades, proven reserves of natural gas have increased significantly, thereby, strongly promoting the extraction and use of natural gas. This is a source of fossil fuel-based electricity generation that has less impact on the climate and environment than oil and coal. Shale gas has transformed the gas market in North America, as well as elsewhere. The emergence of shale gas as a potential energy source has had strategic implications for geopolitics and the energy industry.

The IEA forecasts that more than 1500 GW of gas thermal capacity will be added to the global network by 2040. The increase in capacity will mainly come from developing economies such as the BRICS group. Currently, gas-fired thermal power accounts for about 30% of the OECD group's source capacity structure, especially in the United States, Japan, and developed European countries in the Western region. The United States is a country with abundant natural gas reserves, ranking fourth in the world after Russia, Iran, and Qatar. Japan has quite limited gas reserves (only 1/30th of Vietnam's) and is currently one of the world's largest importers of liquefied natural gas. In 2017, petroleum-fired thermal power accounted for 44.7% of the source structure and approximately 50% of electricity output, partly due to the decline in nuclear power in recent years. However, according to the national energy plan, with the return of nuclear power and renewable energy, Japan's output from oil and gas thermal power by 2030 will be reduced to 30%. The gas exploration industry in Europe has been affected to some extent by the shale oil revolution and competition from other sources in the Middle East. However, electricity production from gas has increased, in the context of countries promoting clean energy, to replace coal. For example, compared to 2016, in major markets Spain saw a 28.8% increase in the demand for electricity; Turkey 26.3%; France 19.2%; Netherlands 12.6%; Poland 11.4%; UK 4.4%; Germany 0.4%; etc. In the context of the European Union's target to reduce greenhouse gas emissions by 80-95% by 2050 compared to 1990 levels, gas-fired power generation still has a place, especially when the technology is recovered. and carbon storage has not reduced costs. In the structure of electricity production of Russia, oil and gas account for more than 50% because Russia is a country with many energy resources. Russia's gas power plants are considered to be of the old generation, half of which will be replaced or renovated to achieve 60% efficiency. Russia's gas power plants are newly built to meet the demand for the increased load as well as to replace coal-fired power. In the structure of electricity production in China in 2017, oil and gas accounted for only 3.3%. However, the growth rate of this type of power generation in the past 10 years, accounting for 13%/year of total output. Currently, China is the largest gas importer in the world. It is expected that by 2040, China's coal and gas thermal power will only increase from 71 GW to 255 GW. In the ASEAN region, Thailand has an outstanding share of electricity from gas electricity reaching 68.6% in 2017. However, this raises two problems related to energy security: high imports of liquefied natural gas; power sources lack diversification. Therefore, after 2025, Thailand will add more gas power capacity.

According to Bloomberg, the general trend in the world by 2040 is to save, use energy efficiently and reduce CO₂ emissions by only 50% compared to today. Countries are making efforts to change national policies on energy, actively applying modern technologies to improve energy efficiency, giving priority to the development of renewable energy, especially wind and solar energy. Solar energy gradually replaced fossil energy, wind and solar energy increased to 40%, water energy and atomic energy remained stable. By 2050, the total fossil energy including coal, oil and natural gas will be only about 31%, of which the proportion is expected to be only about 2%, coal less than 14% and natural gas accounting for about 18%. However, renewable energy will account for 62% of total global energy production, of which wind energy accounts for 28%, solar energy accounts for 24%, and hydroelectricity accounts for 10%. The global economy needs to be more energy efficient. Oil consumption fell by up to 20%, natural gas increased modestly, nuclear power increased by more than 50% renewables more than doubled, and carbon capture and storage technologies deployed at scale in 2040.

4.2. Using clean energy in Vietnam

4.2.1. Sources of clean energy in Vietnam

Regarding solar energy, in the context of the world's progress in solar energy absorption technology, Vietnam's solar energy sector is considered to have many positive impacts. Solar energy is considered to have strong development potential in the future due to the favorable geographical position of Vietnam, located within the limit between the equator and the Tropic of Cancer, in the inner tropical region where the sun shines year-round. However, the exploitation and use of this energy source have been improved with many applications of advanced equipment technology, especially for power generation, hot water heating, and drying, etc. The use of this energy source compared to other energy sources is gradually developing and there is competition in the market. On the other hand, mechanisms and policies to encourage the use of solar energy and citizens' awareness have also been gradually improved. In the future, when the exploitation of other energy sources has reached the limit, Vietnam's solar energy source is great potential.

Biomass energy along with solar energy is a potential clean energy source of Vietnam. The source of biomass energy is waste from agricultural products or livestock waste, urban organic waste, and other organic wastes. According to preliminary calculations, Vietnam's solid biomass energy source is about 170 million tons and has an electrical output of 2000 MW. This is a great and potential energy source of Vietnam.

Wind energy is also a potential source of Vietnam due to its location in the tropical monsoon region, with a coastline of more than 3000km. Vietnam's wind power potential ranges from 1785MW to 8700MW. Wind power of Vietnam is not only in coastal areas but also in mountainous areas, especially in valleys along rivers and streams. Vietnam has started implementing a number of projects to exploit wind power sources in Ca Mau and Ninh Thuan.

In addition, Vietnam also has potential for marine energy such as tides, ocean currents, and burning ice on the seabed. This is an energy source that can meet the needs of economic development in the long-term energy extraction strategy.

4.2.2. Facts of using clean energy in Vietnam

In Vietnam, the energy industry has become a large-scale economic sector with dynamic development and deeper international integration. The strong development of the oil and gas industry, with the core being PVN, has led to the development of other industries such as power generation, chemical production, liquefied petroleum gas, etc. Oil industry services are also rich and diversified. In these fields, there are domestic and foreign-invested companies. Oil and gas exploitation has brought great benefits both directly and indirectly for socio-economic development. In about 10 years (2007-2017), the production value of the energy industry (coal and petroleum mining, electrical equipment production, electricity and gas production, and distribution) increased six times, contributing 20% value of the total output of the mining industry, the processing industry, the production and distribution of electricity and gas. The industry of manufacturing electrical equipment and manufacturing all kinds of equipment and services in the oil, gas, and coal industries has had some achievements and is increasingly developing. The dynamic development of the energy sector has made an important contribution to maintaining the high growth rate of the whole economy and is an important macro-regulating tool of the Government. The energy sector has actively promoted and effectively performed its role as the economic locomotive of the country. Energy enterprises are really the core in the formation of many concentrated industrial parks; play a huge role in socio-economic development, increasing budget income in many localities. In addition to the purpose of electricity development, hydropower plants also have the task of preventing floods downstream in the rainy season, and at the same time providing water for production and people's needs in the dry season.

Many policies on ensuring energy security have been implemented such as: reducing coal exports; promote the exploitation of domestic energy sources; encourage the development of renewable energy, promote electricity trading and exchange with neighboring countries. According to the system of international standards, Vietnam's national energy security has had a number of indicators that are moving in an unfavorable direction: the ratio of reserves and production of coal, crude oil and gas has been decreasing year by year, per capita energy consumption is still low; National petroleum reserves have not yet ensured stability in the event of an oil price crisis in the international market.

Priority solution is to establish an energy development fund to support investment in new and renewable energy projects and public utility projects that have not yet been implemented; has not prioritized allocating preferential credit capital from the development assistance fund, ODA capital and other bilateral loans for energy resource prospecting and exploration projects.

The quality of human resource training is still uneven, there is a shortage of high-quality human resources meeting international standards; additional training to take the lead in a number of weak fields, not really linked to task requirements, especially in new and renewable energy, bio-energy, refining and petrochemicals, nuclear power, etc.

The structure and operation of scientific and technological research institutions are still inadequate and lacking in depth; limited ability to absorb and improve foreign technology; research and development (R&D), innovation is low; have not created new technology creation.

According to the report of the Productivity Institute, in the period 2011-2017, the energy industry in the recent period increased capital rapidly, reaching 8.5%/year; The added value is largely based on inputs without a clear improvement in productivity, reaching only 1.05%. In the field of electricity, gas, labor productivity of some countries in the region is many times higher than that of Vietnam (Taiwan is 3.19 times; Japan is 7.2 times; South Korea is 14.5 times; Thailand is 2.1 times). For EVN, labor productivity in 2015 reached about 1.54 million kWh of commercial electricity/person, while Malaysia reached 2.9 million kWh/person, Tepco Group (Japan) reached 7.5 million kWh/person.

National environmental protection policies and objectives, and the slow issuance of strategic environmental assessments have caused difficulties in the implementation of energy sector projects. After 5-7 years since 2007 as Resolution No. 24-NQ/TW of the 11th Party Central Committee on proactively responding to climate change, strengthening natural resource management and environmental protection; Decision No. 1293/QĐ-TTĐ dated 25/9/05/9/2012 of the Government on the National Strategy on Green Growth 2011-2020 and Vision to 2050; Decision No. 1216/QĐ-TTĐ dated September 5, 2012, of the Government on the National Strategy for Environmental Protection to 2020 with a Vision to 2030; Resolution 11/NQ-CP dated February 18, 2013, of the Government on the Government's action plan to implement Resolution No. 62/2013/QH13 dated November 27, 2013, of the National Assembly on strengthening the management planning, investment, construction, operation and exploitation of hydroelectric projects; Decree 18/2015/ND-CP stipulating environmental protection planning, strategic environmental assessment, environmental impact assessment, and environmental protection plan. National standards and regulations on safety and protection the environmental and social impact assessment is still lacking, slow to be supplemented according to international regulations and standards. The control and management of energy exploitation technology equipment are not regular. Many old power plants have outdated equipment and lack equipment for treating smoke and wastewater according to advanced standards. Mechanisms and policies for the treatment of ash and slag discharged from coal-fired power plants are slow to be promulgated. Ensuring a good combination of energy exploitation and use with good environmental management has not been paid enough attention in some places. There have been some unfortunate incidents about the environment that cause concern when building new projects. New plants, especially coal-fired power plants, such as air pollution, deterioration of seawater and river water quality, changes in ecosystems, etc. The strong development of hydropower projects from 2006 to 2012 changed the flow mechanism of many natural rivers, reduced biodiversity, took away a large area of forest and agricultural land. Coal and oil products account for the largest proportion in the structure of primary energy supply (37.9% and 27.6% respectively in 2017). In the coming years, the demand for supply and use of these energy sources will continue to remain high in several industries and transportation leading to increased emissions, environmental pollution, especially in big cities. Energy is the industry with the highest level of greenhouse gas emissions, which directly affects Vietnam's implementation of international commitments on environmental protection.

In 2015, the Prime Minister issued Decision No. 2068/QĐ-TTĐ approving Vietnam's renewable energy development strategy to 2030 with a vision to 2050. The renewable energy development strategy has encouraged the mobilization of all social resources and people for the development of renewable energy to enhance access to modern, sustainable, reliable energy sources at reasonable prices for all people; to step up the development and use of renewable energy sources, increase domestic energy supply, gradually increase the proportion of renewable energy sources in national energy production and consumption to reduce dependence on renewable energy sources, fossil energy, contributing to ensuring energy security, mitigating climate change, environmental protection, and sustainable socio-economic development.

To attract businesses to invest in the renewable energy sector, Decision No. 2068/QĐ-TTĐ stipulates EVN's responsibilities in purchasing electricity and prioritizing capacity mobilization from renewable energy sources. Power producers from renewable energy sources are given priority to exploit the full capacity and develop electricity by the operating mode of the plant. This decision is aimed at protecting the interests of investors, ensuring that they will be able to mobilize maximum capacity and sell all electricity produced from renewable energy sources.

In addition, the electricity price support mechanism is also implemented in the direction that electricity produced from small hydropower sources, wind energy, and solid waste biomass energy is purchased at a higher price than the purchase price of electricity from power sources conventional energy (large hydroelectricity, fossil fuels, etc.). Small hydropower projects and grid-connected biomass power projects enjoy preferential electricity prices. Wind power, solar power, and electricity from grid-connected solid waste are entitled to electricity price incentives according to the feed-in tariff price mechanism (The FIT price for onshore and offshore wind power is equivalent to 8.5 cents/kWh and 9.8 Ascent/kWh; FIT price for solid waste electricity is equivalent to 10.05 Uscents/kWh). This FIT price is applied to the project for 20 years. The selling price is fixed in USD, payment is in VND at the time of payment. The purchase price of electricity from renewable energy projects is higher than the average retail price of electricity in Vietnam. The Ministry of Industry and Trade of Vietnam has also coordinated with the ASEAN Council to issue the "Technical Handbook on connecting wind power to the Vietnamese grid". The development of renewable energy has many shortcomings, the power transmission system is still not synchronized and meets the requirements. In the year 2017-2018, with incentives for the development of solar energy (Decision No. 11/2017/QĐ-TTĐ of the Prime Minister) and wind power (Decision No. 37/2011/QĐ-TTĐ and Decision No. 39/2018/QĐ-TTĐ of the Prime Minister), wind power and solar power have made great progress. By 2019, more than 100 solar power projects and 11 wind power projects have been put into operation with a total capacity of 44,479.5 MW from solar power and 377 MW from wind power, respectively. In addition, about 378 MW of rooftop solar power has been installed, of which the Hochiminh City area accounts for 18%, the southern region (excluding HCMC) accounts for 50% and the central region accounted for 26%. In 2019, the electricity output from rooftop solar power is expected to reach about 99 million kWh 2019. However, because the grid infrastructure has not been developed in sync with the development of renewable energy

sources, mainly solar power, while the private mechanism has not been opened to invest in the power transmission system. Thus, there have been several projects with reduced capacity. According to the report of EVN, this group has ensured the transmission capacity to mobilize the full power generation capacity of 81/100 renewable energy projects with a total capacity of about 4,400 MW (ie, ensuring the mobilization of 86% of the capacity of power sources of wind and sun have come into operation). Only 19 factories in the two provinces of Ninh Thuan and Binh Thuan with a total capacity of 670 MW had to partially limit the generating capacity at some point in time due to partial overload of the 110kV power grid because these 19 projects are all over the world connected on a single-circuit 110kV transmission line. Research by the German Development Cooperation Organization GIZ shows that in Ninh Thuan, about 10 solar and wind power projects have had their capacity cut by 38%-65% while in Binh Thuan, from mid-2019 to date, renewable energy projects have experienced an average reduction of 30% in generating capacity. It is worth noting that projects that have been in operation since 2 years ago are also affected by the sharing of generating capacity with new projects put into operation.

There is a paradox currently occurring, the number and capacity of wind and solar power projects proposed to supplement the planning are very large, many times higher than the planned structure, but the amount Actual output power is still very low. The main reason is that the investor's capacity is not guaranteed, the state of offering for sale and project transfer leads to the slow implementation of the project while many capable investors cannot deploy the project because it has not been added to the project. This causes a great waste of national resources. The hot development of renewable energy, especially solar energy, is creating great challenges in power system operation while there is a lack of mechanisms and policies to encourage the private sector to invest in national electricity transmission systems.

In general, mechanisms and policies to develop renewable energy, especially wind and solar power, have not kept pace with the market, creating many policy risks for investors. Typically, Decision No. 13/2020/QĐ-TTg was issued in 2020, nearly a year after Decision No. 11/2017/QĐ-TTg expired on June 30, 2019. While the validity of Decision 11 is valid for more than two years, Decision 13 is only valid until the end of 2020. Besides, the Decision's guidance on these documents is not yet available. Regarding wind power, Decision No. 39/2018/QĐ-TTg issued in 2018 is valid until 2021. The effectiveness of the FIT mechanism for wind power is relatively short compared to the construction characteristics of wind power. In addition, the bidding mechanism is expected to be put into effect from November 2021 but has not been clearly developed, it is necessary to consider extending the time to suit the actual situation.

The challenges of protecting the ecological environment and international commitments to respond to climate change also create great pressure when implementing the strategy to ensure energy security associated with sustainable development.

4.2.3. Impact of international trends of energy on Vietnam field for next period

Under the impact of climate change, the criteria of clean electricity production, difficult to exploit fossil energy, efficient use of energy, along with the explosive

development of digital technologies and energy markets. Rapidly growing renewables have all contributed to changing the world's energy landscape. The international context has a strong impact on Vietnam's energy development, especially in the context of increasing fuel and energy demand to 2030 and long-term to 2045. In which, positive impacts such as developing digital technology applications to improve user efficiency and save energy; convert from using fossil energy to other forms of energy, mainly using renewable energy; the world energy market appeared non-traditional objects such as low-carbon fuels, fuel cells, smart energy grids; etc. However, the main negative effects such as shortage crisis lead to frequent price fluctuations; emission standards to the environment are getting higher and higher; pressure to increase the rate of renewable energy; equipment, personal use of energy increased by a factor of two, increasing the demand for domestic energy consumption; rapid increase in foreign investment, it is difficult to control the rising energy demand; etc.

In the context of fierce international competition and the implementation of a green growth strategy in reducing greenhouse gas emissions, Vietnam needs to strongly promote its available market tools and potential to be able to meet the requirements of domestic energy demand so that in the future, Vietnam will not depend on imported energy sources that Vietnam has the potential to produce and develop.

5. Discussion and Conclusion

From the analysis above, we can see that clean energy plays an important role in the process of sustainable development. Moreover, we can take away some lesson-learned as following:

First, develop and complete the legal framework and implement policies to soon form a competitive electricity market. The policy focuses on encouraging domestic and foreign economic sectors to invest in the energy sector, especially the private sector based on attracting investment capital.

Secondly, create a mechanism to encourage the development of renewable energy. Accordingly, to effectively transition to market-based pricing, Vietnam needs to develop a comprehensive price reform plan; building a strong communication strategy; appropriately staged price increases; improve the efficiency of state-owned enterprises; encourage energy efficiency; minimize the impact of the state on energy pricing.

Thirdly, Vietnam needs to develop mechanisms and policies to encourage the use of renewable energy sources, first of all, using wind energy, solar energy, and bioenergy. The state needs to have a tax reduction policy to reduce the burden on investors exploiting renewable energy forms.

Fourthly, for wind power and solar power, priority should be given to development by the ability to ensure system safety with reasonable electricity prices. Encourage the development of rooftop and on-water solar power. Develop supportive policies and breakthrough mechanisms for offshore wind power development in association with the implementation of the Vietnam Marine Strategy.

Fifthly, restructure energy-consuming sectors and areas in parallel with implementing policies on clean, economical, and efficient use of energy. Develop sustainable energy infrastructure, connect the region, improve internal resources of manufacturing and service

industries for clean energy development. Restructure, innovate and improve the operational efficiency of state-owned enterprises in the energy sector; encourage the private economy to participate in the socialization of clean energy development.

THE IMPROVEMENT OF THE CAPACITY TO PERFORM PUBLIC TASKS OF THE CONTINGENT OF CADRES AND CIVIL SERVANTS OF THE DISTRICT-LEVEL PEOPLE'S COMMITTEE IN TAY NINH PROVINCE

MA. Tran Ba Hung

tranbahung@hcmussh.edu.vn

VNUHCM-University of Social Sciences and Humanities, Ho Chi Minh City, Vietnam

Le Thi Hong Tham

thphcohi@gmail.com

People's Committee of Trang Bang town, Tay Ninh Province, Tay Ninh, Vietnam

Abstract

The district government plays a particularly important role at the administrative levels in Vietnam. It is necessary to develop a contingent of capable cadres and civil servants in order for the district-level to extend their roles and positions. Each of the cadres and civil servants has made certain contributions to the operational efficiency of the district-level, in which the role of the contingent of cadres and civil servants of the district-level People's Committee (Chairman, Vice-Chairman of the People's Committee) is especially important. This is the force that leads and manages all activities of the district-level People's Committee. As a result, with such a vital role, they must be well-equipped with the necessary knowledge and skills. The article explores the current state of the capacity to perform public tasks of the contingent of cadres and civil servants of the district-level People's Committee in Tay Ninh Province, thereby proposing solutions for improvement.

Key words: *Cadres, Capacity to perform public tasks, The district-level People's Committee.*

1. Introduction

Tay Ninh is a province located in the Southeast region, with the peculiarity of being a border region, which has posed many socio-economic problems to be solved. This necessitates the development of the contingent of cadres and civil servants in the province in general, and cadres of the People's Committees of districts, towns, and cities in particular, who are capable and well-responsive to the issues. According to provisions of the 2008 Law on Cadres and Civil Servants, cadres of the district-level People's Committees include the Chairman and Vice-Chairman of the People's Committee. Because this contingent is the force leading and operating the activities of the district-level People's Committee and managing socio-economic life in the district, Tay Ninh Province needs to have solutions to boost its capacity. The research objective of the article is to analyze the current state of the capacity to perform public tasks of the contingent of cadres and civil servants of the district-level People's Committee in Tay Ninh Province, thereby proposing some solutions to improve the capacity to perform public tasks of the contingent of cadres and civil servants of the district-level People's Committee in Tay Ninh Province in the coming time.

The article is based on the theory of capacity and capacity to perform public tasks. Today, however, it is interpreted in a variety of ways. From a pedagogical perspective, capacity is understood as *“the general mobilization of knowledge, skills, and other personal attributes such as excitement, belief, will... to execute a piece of work in a certain context”* (The Ministry of Education and Training, 2015). According to the Organization for Economic Cooperation and Development (OECD), *“capacity is an individual's ability to meet complex requirements and successfully execute tasks in a specific context”* (2015). According to the Vietnamese Dictionary, capacity is *“the ability, subjective or natural condition to be able to perform a particular activity, or in other words, a virtue, psychological and physiological that allows people to complete a certain act of high quality”* (Institute of Linguistics, 1997). According to Administrative Sciences, capacity is *“a term that refers to the physical and intellectual abilities of an individual person or the ability of an organized group to establish and perform its own behaviour in social relations in order to achieve the goals and tasks set forth by themselves or the state or other subject defined with the best results”* (Institute of Administrative Research, 2009). Meanwhile, the capacity to perform public tasks of cadres and civil servants is interpreted as the *“actual ability of each civil servant in performing well the assigned functions and tasks. There are many factors constituting capacity, in which knowledge; skills; attitudes and behaviours are the core factors”* (Nguyen Hong Hoang, 2020). According to this approach, civil servants’ capacity to perform public tasks is based on three factors: knowledge, skills, and attitudes. This is also the popular approach of administrative science today.

District-level People’s Committee cadres are a constituent part of the contingent of cadres and civil servants, so their capacity to perform public tasks is also based on three factors. According to the trend of output results-based management today, capacity is not only assessed based on the three factors mentioned above but must be considered in the results of public task performance. Therefore, within the framework of this article, capacity is considered and evaluated on 4 factors, including knowledge, skills, attitudes, and results of public task performance.

2. Method

The article uses the method of secondary document research and questionnaire survey. For data (quantity, gender), knowledge, rating results of the district-level People’s Committee cadres, use data from reports and statistics of Organizing Committee of Tay Ninh Provincial Party Committee, Tay Ninh Department of Home Affairs. For data on skills and attitudes of district-level People’s Committee cadres, the research team conducted a survey using a questionnaire for research subjects, specifically as follows:

- Survey objects: Chairman, Vice-Chairman of People’s Committees of districts, towns, and cities in Tay Ninh Province (9/9 district-level administrative units). The number of survey votes: 28 votes, accounting for 100% of survey objects, including 9 Chairman of the People’s Committee and 19 Vice-Chairman of the People's Committee.

- Survey content: Survey on the capacity to perform public tasks of district-level People’s Committee cadres. On skills, conduct a survey on the proficiency of skills such as thinking skills; meeting organization and management skills; assignment and coordination

skills; change management skills; job analysis skills; communication skills, skills to welcome people and settle complaints and denunciations; decision-making skills; skills in organizing propaganda and mobilizing people; consulting skills; inspection and supervision skills; skills in using computers and applying information technology to leadership and management activities; conflict resolution skills. On attitudes, conduct a survey on some contents as the sense of discipline; responsibility at work; honesty; the spirit of learning to develop; positive attitude to cooperation at work; attitude to serve people; motivation, purpose to work; relationships with subordinates, superiors and peers. In which, Skills and attitudes are considered on 5 levels (1. Excellent, 2. Good, 3. Regular, 4. Bad, 5. Very bad).

3. Results

3.1. Overview of the contingent of cadres and civil servants of district-level People's Committees in Tay Ninh Province

Nowadays, Tay Ninh has 9 district-level administrative units, including Tay Ninh City, Trang Bang Town, Hoa Thanh Town, Ben Cau District, Chau Thanh District, Duong Minh Chau District, Go Dau District, Tan Bien District, Tan Chau District. In the past time, in order to ensure the organisation and operation of the People's Committee of districts, towns, and cities in the area, Tay Ninh Province has always focused on the arrangement of cadres of district-level People's Committees. This contingent is consolidated according to the provisions of the Law on Organization of Local Government 2015.

Table 1. Statistics on the situation of cadres of district-level People's Committee

Total	Gender		By Age		
	Male	Female	Younger than 40	From 40 - 50	Older than 50
28	19	9	02	18	8

Source: Department of Home Affairs of Tay Ninh Province, 2021

3.2. Overview of the capacity to perform public tasks of the cadres of the district-level People's Committee in Tay Ninh Province

3.2.1. Knowledge

During this time, Tay Ninh Province has always focused on standardizing the cadres of the district People's Committee. Tay Ninh Province has organised many training and refresher courses on knowledge for this contingent. In addition, they also participate in standardized classes according to titles and positions.

Table 2. Statistics on knowledge of cadres of district-level People's Committees

Knowledge	Contents	Quantity	Percentage (%)
Qualification	Bachelor	17	60.71
	Master	11	39.29
Political Theory	Middle ranking	0	0
	High-ranking	26	92.86
	Bachelor	2	7.14

Knowledge	Contents	Quantity	Percentage (%)
State management	Participating in training for specialists	3	10.71
	Participating in training for principal- specialists	20	71.43
	Participating in training for senior - specialist	5	17.86
Information technology	Certificate A	5	17.86
	Certificate B	21	75
	Intermediate	2	7.14
Foreign Language	Certificate A	4	14.29
	Certificate B	12	42.86
	Certificate C	4	14.29
	University	1	4.27
	No certificate	4	14.29

Source: Statistics of the Organizing Committee of Tay Ninh Provincial Party Committee, 2021

Compared with the regulations of the Party and State for the standards of the Chairman and Vice-Chairman of the district-level People's Committee in Tay Ninh Province, it can be seen that the professional qualifications, state management knowledge, political theory and information technology, the standard rate is 100%. Meanwhile, the rate of foreign languages just reaches 71,82% of the regulations.

3.2.2. Skills

The assessment of the knowledge level of the Chairman, Vice-Chairman of the District-level People's Committee is just about the theoretical aspect, mainly shown through degrees, which is not very practical. Therefore, it is necessary to consider the skill aspects to assess the capacity of this contingent. The research team surveyed the real situation of skills, the concrete results are as follows:

Table 3. Summary table of survey results on the level of skill use

Skills	The level of skill use				
	Excellent	Good	Regular	Bad	Very bad
1. Thinking skills	4	23	1	0	0
2. Meeting organization and management skills	9	17	2	0	0
3. Assignment and coordination skills	6	21	1	0	0
4. Change management skills	6	12	5	5	0
5. Job analysis skills	2	5	15	6	0
6. Communication skills, skills to welcome people and settle complaints and denunciations	7	10	8	3	0
7. Decision-making skills	6	20	2	0	0
8. Skills in organizing propaganda and mobilizing people	9	17	2	0	0
9. Consulting skills	7	19	2	0	0
10. Inspection and supervision skills	5	15	8	0	0
11. Skills in using computers and applying information technology to leadership and management activities	1	10	12	5	0
12. Conflict resolution skills	4	7	15	2	0

Source: Survey results of the research team

Most of the Chairmen and Vice-Chairmen of the district-level People’s Committees self-assessed their skills at a good and excellent. Specifically, there are some highly regarded skills, such as communication skills, skills in propaganda and mobilizing people, time management skills. On the contrary, there are also some skills that they find themselves being not proficient such as skills in using computers and applying information technology to leadership and management activities, change management skills, conflict resolution skills, and coordination skills. This is also a common fact for the contingent of cadres and civil servants in general, because most of these skills are relatively difficult and high-demanding.

3.2.3. Attitudes

In the process of performing public tasks, the cadres of the district-level People’s Committee are aware of their responsibility in performing their public tasks. The district leaders have always focused on raising awareness and sense of public task performance for the contingent of Chairman, Vice-Chairman of the district-level People’s Committee, so they all have a serious and standard attitude to the assigned work. Moreover, the Chairman and Vice-Chairman of the district-level People’s Committee always have a serious attitude and are aware of their responsibility to their work, so they always make great efforts in the process of performing public tasks.

Table 4. The level of responsiveness about the attitudes

Attitudes	The level of content responsiveness about attitude				
	Excellent	Good	Regular	Bad	Very Bad
1. Sense of organization and discipline	15	10	3	0	0
2. Responsibility in work	10	12	6	0	0
3. Honest	17	10	1	0	0
4. The spirit of learning to develop	5	13	10	0	0
5. Positive attitude to cooperation at work	9	18	1	0	0
6. Attitude to serve people	17	10	1	0	0
7. Motivation, purpose to work	10	17	1	0	0
8. Relationships with subordinates, superiors and peers	9	19	0	0	0

Source: Survey results of the research team

3.2.4. Results of public task performance

Currently, the assessment work of cadres and civil servants is mainly through the assessment of outputs to consider how effectively the knowledge, skills and attitudes of civil servants have been applied in the process of performing public tasks. Therefore, capacity should be considered on the results of public task performance of each cadre and civil servant. Each year, the People's Committees of districts, towns and cities evaluate the contingent of Chairman and Vice-Chairman of the district-level People’s Committees. The assessment from 2017 to 2019 was carried out according to the provisions of Decree No. 56/2015/ND-CP dated June 9, 2015, of the Government on assessment and classification of all civil servants. From 2020, the assessment and classification will be carried out according

to the Government's Decree No. 90/2020/ND-CP dated August 13, 2020, on the assessment and classification of the quality of all civil servants.

Table 5. Statistics on the results of the annual evaluation and ranking

Year	Results of evaluation and ranking			
	Excellent completion of the task	Good completion of the task	Completion of the task but limited capacity	Non-completion of the task
2016	4	23	0	0
2017	5	22	0	0
2018	3	24	0	0
2019	6	21	1	0
2020	6	22	0	0
2021	0	28	0	0

Source: Statistics of the Department of Home Affairs of Tay Ninh Province

Overall, the results of the annual cadre evaluation and classification are at a high level. In the years 2017, 2018, 2020, the proportion of ranking from the level of good completion of the task upwards reached 100%. Meanwhile, there was only 1 case that was ranked at the level of completing the task but limited capacity in 2019.

3.3. Assessment of the current state of capacity for public task performance of the cadres of the district-level People's Committee in Tay Ninh Province

3.3.1. Advantages

First, the knowledge level of the cadre of the district People's Committee of Tay Ninh Province has been improved year by year. The level of knowledge of this contingent has well met the requirements and tasks set out. Some district-level People's Committee cadres have exceeded the the criteria prescribed (11/28 cadres have master's degrees). Besides, many cadres have two or more professional degrees.

Second, most district-level People's Committee cadres are proficient in basic skills, have a harmonious combination of skills, and meet requirements in the process of performing public tasks. The contingent of district-level People's Committees is mostly from 40 to 50 years old, have length of service, and long time in charge of position. Therefore, their experience and administrative skills, executive management skills are quite good, which will facilitate effective guidance for subordinates, and solve problems quickly and effectively.

Third, District-level People's Committee cadres have a good attitude, strictly obey the Party's lines and undertakings, the State's legislation, the office's rules. In the process of performing their public tasks, they have had a spirit and sense of responsibility for their assigned tasks. Their behavior always secures the standards of the legal regulations on civil service ethics

Fourth, the contingent of district-level People's Committees has effectively applied knowledge, skills and attitudes in practice, so it has contributed to achieving high results

in the process of performing public tasks. The percentage of cadres who “good completion of the task” upwards has gradually increased over the years. They have made constant efforts to improve their capacity in performing public tasks, develop an effective and efficient administration.

3.3.2. Restrictions

First, Most of cadres only stop at the level of obtaining certificates in informatics and foreign languages, and their ability to apply knowledge in practice is still quite weak. Besides, there are still a number of cadres who do not meet the standards of foreign languages in accordance with the regulations of their titles.

Second, there are some skills that just stop at the level of knowing, but not understanding, even not being proficient. The performance of skills of the majority of Chairmen and Vice-Chairmen of the district-level People’s Committees is uneven and has many shortcomings, the application of skills in practice to solve problems is still confusing.

Third, people reception has not been conducted regularly and seriously. In fact, some people said that they are not satisfied with the way the Chairman and Vice-Chairman of the district-level People’s Committee is handling the work. In addition, the sense of responsibility, sense of discipline of a part of the Chairman and Vice-Chairman of the district-level People’s Committee is not yet high, the working style still applies the traditional method, slow to innovate.

Fourth, the number of Chairman and Vice-Chairman of district-level People’s Committees are ranked as “excellent completion of the task” over the years accounts for a low proportion. There are still cadres who are only rated at the level of “completion of tasks”. The results of administrative reform of districts, towns and cities have not been improved, this stems from limitations in direction and execution work in the process of performing public tasks. The actual settlement of works is sometimes slow and awkward, leading to loss of people’s time.

4. Discussion and Conclusion

In order to improve the capacity to perform public tasks of district-level People’s Committee cadres in Tay Ninh province, the research team proposes the following solutions:

First, it is necessary to complete the legal provisions related to the requirements on knowledge and skills of the contingent of the district-level People’s Committee cadres. Ministry of Home Affairs should advise the Government on the development of regulations on standards for the Chairman and Vice-Chairman titles of the district-level People’s Committees. In addition, it is necessary to identify specifically the standards of professional qualifications, political theory, state management, work experience. The Government, the Ministry of Home Affairs and Tay Ninh province need to speed up the salary reform roadmap, especially paying a salary based on the job position.

Second, in the coming time, Tay Ninh province needs to organize a survey on the training and fostering needs of the Chairman and Vice-Chairman of the district-level People’s Committee. In addition, it is necessary to base on the requirements of each job

position that they undertake to determine the necessary knowledge and skills. On the basis of the real situation of skills of district-level People's Committee cadres in recent years, the research team proposes that Tay Ninh province should focus on fostering the following skills: job analysis skills; forecasting skills; change management skills; skills to handle unexpected situations;...

Third, it is necessary to renovate the assessment work of cadres of the district-level People's Committee. Assessment criteria need to be specified and quantified in order to have a basis for evaluation. Besides, it is necessary to assess the cadres of the People's Committee in a multi-way through the participation of superiors, subordinates, and the people. Assessment results must be used for salary payment, training, fostering, planning and appointment.

Fourth, it is necessary to strengthen the inspection and examination work of the activities of district-level People's Committee cadres. Leaders of the Tay Ninh People's Committees and districts, towns and cities should inspect and supervise the public task performance activities of district-level People's Committee cadres periodically or irregularly. During the process of inspection and examination, if anyone is found to have made a mistake, it should be handled seriously and promptly. It is necessary to avoid both respect and fear of contradictions to ensure compliance with legal regulations during the process of handling.

Fifth, it is necessary to promote the initiative of each cadre of the district-level People's Committee. Besides, it is also necessary to propagate so that they could aware that socio-economic life is increasingly complicated which requires them to have the capacity to be commensurate with tasks in the coming time. Each cadre needs to clearly aware of requirements on their capacity to perform public tasks in the new period so as to actively improve their capacity. Tay Ninh province needs to regularly mobilize and persuade district-level People's Committee cadres to actively study and practice in order to improve their capacity for performing public tasks. Moreover, each individual needs to receive comments from superiors, subordinates and the people for themselves about limitations and inadequacies in order to make appropriate adjustments.

Cadres in general and district-level People's Committees in particular play an important role in the effectiveness and efficiency of the state apparatus. The quality of district-level People's Committee cadres is a decisive factor for state management as well as socio-economic development in the district. During the current administrative reform, the Party and State always care and develop this contingent. Therefore, it is very important to improve the capacity of cadres to perform public tasks of district-level People's Committees. In the coming time, it is required that the political system has some solutions to develop the capacity of district-level People's Committee cadres.

COMPLETING THE EXEMPTION POLICY FOR RESEARCH AND DEVELOPMENT AGREEMENTS

Tran Trung Vy

trantrungvy1971@gmail.com

Vice Principal, HaLong University, Quangninh, Vietnam

Tran Thi Nguyet

nguyettt@neu.edu.vn

Faculty of Law, National Economics University, Hanoi, Vietnam

Abstract

An exemption policy for anti-competition agreements is one of the major and important contents of the institution that controls anti-competition agreements. However, in the course of operation, when manufacturing and trading enterprises want to survive and develop, they must conduct research and development activities for new products (hereinafter referred to as research and development - R&D). However, the costs of research and development, especially creating breakthrough products, are often huge. On the other hand, investing in research and development often has a large probability of failure. High cost and high risk are one of the challenges of research and development activities. The paper focuses on analyzing the nature of research and development agreements, the purpose and meaning of exemption policies for research and development restrictions; Relevant aspects in the competition law of Vietnam on the basis of reference to the respective experience from the competition laws of the United States and the European Union, from which there are assessments and recommendations for institutional improvement this plan.

Keywords: *Research and development, exemption, competition restriction agreement, complete exemption policy.*

1. Introduction

Competition restriction agreement is an agreement between the parties in any form to influence or potentially cause anti-competitive effects (Clause 4, Article 3 of the Competition Law 2018). However, agreements between competitors do not always restrict competition and consumers' interests. In certain cases, these arrangements can provide value that drives competition in the marketplace. One of the positive aspects of competition promotion agreements are new product research and development (R&D) agreements. Within the scope of this scientific paper, the purpose and significance of the exemption policy for research and development restraining agreements are mentioned. The timing of application, the procedure, and the extent to which the enterprise will receive benefits upon waivers from research and development agreements have been analyzed. The provisions of the competition law in some countries, compared with Vietnam's competition law on the exemption of research and development agreements are also made for recommendations to improve this policy.

2. Method

The specific method used to study the topic "Completing the exemption policy for research and development agreements" is as follows:

- Interpretation method

This is the method applied to study the basic theoretical issues about the legal issues controlling anti-competition agreements in general and the exemption policy for research and development agreements in particular. .

- Methods of analysis and commentary

This method is used to present specific provisions of the international legal system as well as the Vietnamese legal system on anti-competition agreements and exemption policies for research agreements and development.

- Comparative jurisprudence

This method is also used to study the provisions of international law, the laws of other countries and compare with the provisions of Vietnamese law in order to assess the compatibility and suitability, thereby drawing experience and specific solutions in the laws of other countries, on that basis, proposing solutions to perfect Vietnamese laws in this matter.

- Methods of systematizing and synthesizing

This is a research method used to generalize and draw basic conclusions and proposals on the author's new contributions to the improvement of Vietnamese laws on controlling anti-competition agreements. and implement an exemption policy.

Research question

- Why is the exemption policy for anti-competitive agreements on research and development mentioned in the legislation that controls anti-competition agreements?
- What is the solution to completing the exemption policy for the anti-competitive agreements on research and development under current Vietnamese conditions?

3. Results

3.1. Identify research and development agreements

“Research and development” is a term commonly used to describe activities performed by companies and other entities such as business individuals to create or improve products and process [1]. Along with increasing competition, the need to conduct research and development for businesses also becomes greater. But on the other hand, the nature of research and development also involves risks for businesses doing this activity. Theoretically, there are two major risks: i) first, stemming from the nature of research and development as an activity that involves a high probability of failure; ii) Secondly, the possibility that the enterprise is at risk from being appropriated by other companies for research and development results from hostile mergers and acquisitions [2]. Therefore, enterprises face a dilemma that is the pressure to conduct research and development (to compete better in the relevant market) and the risks from research and development activities. To deal with this dilemma, the solution is to allocate risk through conducting this

activity with other businesses. To put it simply, a research and development agreement is an agreement between enterprises to contribute financially together, to take the necessary activities to improve and / or create products. or production process or operation. From the above analysis shows, research and development activities have two important characteristics as follows: the association is formed from agreements between enterprises; Risks will be allocated to businesses participating in research and development activities. On the other hand, the benefits from this process will also be distributed to the firms that conduct the agreement.

As an activity that involves a high probability of risk, logically, businesses will tend not to share research and development results with other firms, and this is also the time when competition law comes into play. The practice of many countries around the world shows that competition law considers research and development agreements as competition promotion agreements or will grant these agreements an exemption [3]. However, not all research and development agreements explicitly promote competition. In fact, refusal agreements with competitors to ensure research and development results are only allocated to firms that jointly invest their finances and efforts to conduct. The most controversial in the implementation process. Accordingly, there are still many different opinions regarding whether to consider the refusal agreements with parties not to the agreement as agreements that automatically violate the competition law or should apply logic rules when handling [4].

3.2. Purpose and implications of an exemption policy for research and development competition restriction agreements

As analyzed above, a competition restriction agreement is an agreement between the parties in any form that affects or has the ability to cause anti-competitive effects (Clause 4, Article 3 of the Competition Law 2018). However, agreements between competitors do not always cause harm to the competition and to consumers. In certain cases, these arrangements can provide value that drives competition in the marketplace. One of the positive aspects of competition promotion agreements are new product development and research agreements. Research and development costs, especially the creation of breakthrough products, are often enormous. High cost and high risk are one of the biggest challenges of research and development activities. Therefore, it is ineffective for each individual enterprise to operate this activity independently from an economic perspective. That is also the reason why businesses agree to jointly carry out research and development activities. In the practice of competition law, countries always consider product research and development agreements to promote competition or give such agreements an exemption [1]. In practice, not all agreements explicitly promote competition like research and development agreements. Denial deals with competitors are among the most controversial in the execution process. Accordingly, there are still many different opinions related to whether to consider refusal agreements with competitors to be default agreements, so the principle of reasonable argument should be applied when handling [2]. Scholar Herbert Hovenkamp has made compelling arguments regarding the control of no-transaction agreement behavior. It is assumed that there are three enterprises working together on a research and development

project, they initially invited a fourth firm to participate, but this firm disagrees. Therefore, the project includes only three businesses. After that, the successful research project began to create commercial value. At this point, when the fourth firm wanted to be involved in this process, all three firms above simultaneously refused to allow the fourth firm to participate [3]. The nature of research and development activities is risky investments in research. The key to this process is to face risks during the investment process to benefit from a new product that will be breakthrough or high profit margins in the future. Therefore, forcing firms to allow a fourth firm to participate in the production of a new product would be unfair for businesses that had already faced the risk from the start and allowed the fourth firm to take advantage from the risk of other businesses unjustly. In its 1998 international competition law enforcement policy guide, the US Department of Justice also emphasizes this aspect with respect to denial of transaction agreements. Accordingly, forcing the joint venture to open up opportunities for competitors to become members of the joint venture (or license research and development products of the joint venture to businesses that want to). license ownership) will reduce the motivation of research and development joint ventures. According to international practice, exemptions are built on the rule of reason, whereby the principle of evaluating the illegality of an anti-competitive agreement on the basis of balance between positive and negative effects, especially those that promote competition and restrictive effects, or between the effect of restraint of competition and the economic efficiency or benefits that the agreement acts bring. again. In essence, when the competition restriction agreement has constituted enough signs to conclude is a violation of competition law, however, if the benefits to the economy and consumers that the agreement can bring out is higher than the anti-competitive effect, the agreement may be granted performance. Currently, in Vietnam under the provisions of the Competition Law 2018, a prohibited anti-competition agreement will be exempted for a term if it is beneficial to consumers and meets one of the following four conditions: (1) The impact of promoting technical and technological progress, improving the quality of goods and services; (2) Strengthening the competitiveness of Vietnamese enterprises in the international market; (3) Promoting the uniform application of quality standards and technical norms of product categories; (4) Agree on terms of performance of the contract, delivery, payment, but not related to price and price elements. Thus, the aim when building an exemption mechanism for anti-competitive agreements is to promote competition in the market, in addition to bringing benefits to consumers. And agreements to restrain competition in research and development of new products among enterprises belonging to this target group (the impact of promoting technical and technological progress, improving the quality of goods and services).

3.3. The timing of application, procedure and extent of benefits received by the enterprise when exempt from research and development agreements

Exemption policy procedures are of the nature of administrative procedures and comply with the provisions of competition law. Therefore, agreements to restrain competition in research and development enjoying an exemption do not automatically apply when the conditions specified by the content law are met, but are required to receive the approval of the competition authority. Specifically, in order to enjoy the exemption policy,

members planning to participate in anti-competitive agreements in research and development must submit a request for exemption to the competent competition authority. permission. Based on the dossier of request for exemption, the Competition Administration Authority shall issue a decision on approval or disapproval for the parties enjoying the exemption. Accordingly, the parties to an anti-competition agreement in research and development that meets the conditions for exemption may only enter into an anti-competition agreement after the exemption decision is issued. This shows that the waiver started to establish before this anti-competition agreement was put into operation.

Regarding the scope of benefits that enterprises receive, enterprises that are entitled to an exemption from competition restriction agreements in research and development will be completely free from penalties (ie complete exemption). And the decision to grant an exemption is not permanent. They are always valid for a certain period of time (in the decision to grant an exemption, always have a period of validity) or are subject to review and may be annulled in accordance with the law.

3.4. Regulations of competition law in some countries, comparing with Vietnam's competition law on exemption from research and development agreements - current situation and recommendations

For the purpose of controlling anti-competitive agreements effectively, the European Union competition law in fact classifies exemption criteria into several different groups. Research and development agreements are considered by the European Union as value agreements that promote competition. Under the competition laws of the European Union [5], research and development agreements are automatically exempted [6]. Exemptions are automatically applied which means that when an enterprise implements agreements, but under competition laws it is defined as the default competition-promoting value agreements. The competition authority does not need to consider the beneficial or anticompetitive aspects of an agreement. Accordingly, pursuant to Article 81 (3) of the Agreement, the provisions of these Regulations, declare that Article 81 (1) shall not apply to agreements between two or more parties (hereinafter referred to as parties) regarding the conditions pursued by them:(a) joint research and development of products or processes, and jointly explore the results of such research and development; (b) jointly explore research and development results of products or processes that they have previously researched and developed together; or (c) joint research and development of products or processes jointly, but excluding the joint exploitation of the results. This waiver shall apply in the event that such agreements (hereinafter "research and development agreements") contain competition restrictions that are covered by Article 81 (1).

In its 1998 international competition law enforcement policy guide, the US Department of Justice also emphasizes this aspect with respect to denial of transaction agreements. Accordingly, forcing the joint venture to open up opportunities for competitors to become members of the joint venture (or license research and development products of the joint venture to businesses that want to). license ownership) will reduce the motivation of research and development joint ventures. The consequence of implementing a policy that does not allow joint ventures to choose members can have the worst consequences of encouraging

firms to avoid risk (without having to start first) but they There are grounds to hope to be able to share the results from previously ventured businesses through competition litigation [8].

The provisions of the competition law of Vietnam, under the provisions of the Competition Law 2018, if the competition restriction agreements in Article 11 are beneficial to consumers and satisfy one of the conditions specified in Clause 1 Article 14 is subject to an exemption. These conditions are: the impact of promoting technical and technological progress, improving the quality of goods and services; enhancing the competitiveness of Vietnamese enterprises in international markets; promote the uniform application of quality standards and technical norms of product categories; agree on contract performance, delivery, and payment terms, but not related to price and price factors. Thus, according to the provisions of the competition law of Vietnam, there are no separate provisions for research and development agreements. The criteria specified in Clause 1, Article 14 of the Competition Law may be a consequence of research and development agreements, but it is not necessarily agreement. In other words, such criteria as the impact of promoting technical and technological progress, improving the quality of goods and services, promoting the uniform application of quality standards and technical norms of product categories. product... may be a result of a research and development agreement or another.

Under Clauses 3 and 4, Article 12 of the Competition Law 2018, the subject of a non-transaction agreement with non-parties may be between enterprises on the same relevant market or enterprises. doing business at different stages in the same production, distribution and supply chain for a certain kind of goods or service. In terms of the nature of this boycott agreement will be controlled in the direction of reasonable argument. That is, an agreement will be dealt with when it exerts a significant anti-competitive effect or affect in the market [9]. On the basis of the above study and comparison, the author would like to give comments and recommendations as follows:

Although they mentioned the same boycott, the Vietnamese competition laws and the US and EU competition laws differ in their approach. In particular, the EU competition law is quite open when it comes to assigning research and development agreements to the automatic exemption. Vietnam's approach differs from that of EU law when it does not recognize research and development agreements. Specifically, according to the provisions of the US law and EU law, if the enterprises agree on joint research and product development and one of the contents of this agreement is that the parties will not trade. for parties that were not originally involved in the research and development agreement, the agreement will still enjoy an exemption. It should be noted that the exemption here is an exemption to the research and development agreement and the boycott is only part or part of the agreement. Meanwhile, the Competition Law 2018 considers this as a non-transaction agreement with non-parties specified in Clause 9, Article 11. Accordingly, this agreement will be dealt with or may be waived if it meets the conditions in Article 14 of the Competition Law (for example, the agreement has the effect of promoting technical, technological, advanced quality of goods and services). In other words, under Vietnam's competition law, the issue of exemption here is an exemption from a non-transaction agreement with non-contracting

parties rather than an exemption to a research and development agreement. development. The author argues that, with the competition law of Vietnam not recognizing types of research and development agreements is unreasonable for the following reasons:

Firstly, the current Vietnamese economic practice, with the explosion of digital economy and e-commerce, research and development agreements are increasing. To meet that need, it is imperative that research and development activities be encouraged.

Second, from the perspective of the line, development of science and technology has been identified as one of the priorities to ensure the development of Vietnam. Resolution No. 52-NQ / TW dated September 27, 2019 of the Politburo on a number of guidelines and policies to actively participate in the Fourth Industrial Revolution, requiring "perfecting the law, first of all the Law on enterprises, creative start-ups, intellectual property, commerce, investment, and business to facilitate national digital transformation and the development of products, services, and business models. New economy is based on digital technology" [10]. There are agreements between businesses that clearly damage competition. But on the other hand, there are also competitive and favorable agreements. In the context of the current development of science and technology in Vietnam, research and development agreements among enterprises, even if they contain factors that limit competition, should be considered and encouraged. In order to promote joint research and development activities, Vietnamese competition law needs to change its approach to this type of agreement in the direction of recognizing this type of agreement in the law and giving it its entitlement. automatic immunity. Control over the nominal use of research and development agreements to enter into other types of anti-competitive agreements by assessing anti-competitive factors. If, in the case of a research and development agreement, but contains the potential to significantly limit competition, then the possibility of settlement should be taken into account. To assess the potential for competition restriction in this case, it can be considered based on two criteria: i) the market share of the firms participating in the research and development agreement and ii) the position of the business. industry in the relevant market or in the production, distribution or supply chain of a certain kind of goods or service.

4. Discussion and Conclusion

For the purposes of controlling competition restriction agreements, in fact, competition law has classified research and development agreements as automatic waivers. When businesses make value agreements that automatically promote competition, they are automatically exempt. The competition authority does not need to consider the beneficial or anticompetitive aspects of an agreement.

Research also shows that research and development agreements are one of the types of anti-competitive agreements that promote technical and technological progress, improve the quality of goods and services, and benefit people. consumption, beneficial for the market and for the economy. High cost and high risk are one of the challenges of research and development activities. The practice of many countries around the world shows that competition law considers research and development agreements as competition promotion agreements or will give them an exemption. Seeing the respective experience from the

competition laws of the United States and the European Union, with the study of Vietnamese competition law, it is found that Vietnam does not recognize various types of research and development agreements as inappropriate. The author and the author boldly made recommendations to improve the legal provisions on the exemption of all types of anti-competitive agreements in general and competition restriction agreements in research and development in particular. The author is looking forward to receiving research comments and contributions from scholars and entrepreneurs!

ENHANCING THE STRATEGIC THINKING OF EDUCATION MANAGERS FOR ETHNIC MINORITY, MOUNTAINOUS AND DISADVANTAGED AREAS IN THE CONTEXT OF EDUCATION 4.0

MA. PhD. Candidate. Tran Thien Tu

tttqtvn@gmail.com

Le Duan School of Politics, Quang Tri, Vietnam

Abstract

Strategic thinking is simply an intentional and rational thought process that focuses on the analysis of critical factors and variables that will influence the long-term success of a team or an individual. Strategic thinking requires research, analytical thinking, innovation, problem-solving skills, communication and leadership skills, and decisiveness. The competitive landscape can change quickly for any organization. New trends may emerge quickly and require you to take advantage of them or fall behind. By incorporating everyday strategic thinking into work and life routines, we will become more skilled at anticipating, forecasting, and capitalizing on opportunities. Based on the statistical synthesis and meta-analysis methods; The article analyzes the need to develop strategic thinking of educational administrators and proposes requirements to improve strategic thinking of educational administrators in ethnic minority mountainous and disadvantaged areas in the context of education 4.0.

Keywords: *Strategic thinking, educational managers, ethnic minorities, mountainous areas, education 4.0.*

1. Introduction

The fourth industrial revolution (Industry 4.0) began to appear in the first decade of the 21st century. It is a revolution based on breakthrough achievements in various technology fields with the foundation of breakthroughs in digital technology. The emergence of the industrial revolution 4.0 has impacted and changed all areas of social life, including education. Education should change to meet the development needs of society in the era of Industry 4.0. To accomplish that task, the educational manager has an important role. Education managers should improve strategic thinking, which is an issue for educational institutions to constantly adapt to new conditions, improve capacity and operational efficiency.

2. Method

Research methods: To carry out the stated research purposes and tasks, the authors consistently and systematically use popular scientific research methods: historical and logical methods. This method is used in the article to analyze, interpret and clarify the concept of strategic thinking of educational administrators in ethnic minority mountainous and disadvantaged areas in the context of education 4.0); Methods of analysis and synthesis (to deploy, synthesize, and generalizing research contents); Statistical methods (to collect and evaluate the research situation), etc.

Sources of research materials: The secondary sources used, synthesized, and analyzed in the article are mainly documents published in books, newspapers, magazines, studies of authors in Vietnam and abroad.

3. Results

3.1. Strategic thinking, Strategic thinking of educational administrators

** Strategic thinking*

Thinking (or Thought) encompasses a flow of ideas and associations that can lead to logical conclusions [5]. Although thinking is an activity of an existential value for humans, there is still no consensus as to how it is adequately defined or understood.

Thinking is a reflection of a high-level cognitive process in a general, positive, indirect, and creative way about the worldview. The characteristic of thinking is generalization and abstraction to form concepts, theories, and creative cognitive activities. In thinking, abstraction and generalization go hand in hand. Generalization appears in thinking when it has been abstracted. Based on forming knowledge about the world and society indirectly.

Thinking is a reflection of a high-level cognitive process in a general, positive, indirect, and creative way about the worldview. The characteristic of thinking is generalization and abstraction to form concepts, theories, and creative cognitive activities. In thinking, abstraction and generalization go hand in hand. Generalization appears in thinking when it has been abstracted. Based on forming knowledge about the world and society indirectly.

Thoughts can be divided into different categories. If divided according to the level of perception, thinking includes experiential and theoretical thinking; if divided by thinking method, thinking is divided into dialectical and metaphysical thinking; considered according to a scientific level, divided into non-scientific and scientific thinking; considered according to the "vision" of the task, the goal that people are aiming for, thinking divided into strategic and tactic thinking, etc.

** Strategy*

Strategy (from Greek στρατηγία *stratēgia*, "art of troop leader; office of general, command, generalship" [8]. is a general plan to achieve one or more long-term or overall goals under conditions of uncertainty.

Henry Mintzberg from McGill University defined strategy as a pattern in a stream of decisions to contrast with a view of strategy as planning [1], while Henrik von Scheel defines the essence of strategy as the activities to deliver a unique mix of value – choosing to perform activities differently or to perform different activities than rivals [2]. While Max McKeown (2011) argues that "strategy is about shaping the future" and is the human attempt to get to "desirable ends with available means". Dr. Vladimir Kvint defines strategy as "a system of finding, formulating, and developing a doctrine that will ensure long-term success if followed faithfully" [11]. Complexity theorists define strategy as the unfolding of the internal and external aspects of the organization that results in actions in a socio-economic context [10].

In the article, the author approaches the concept of "Strategy" as follows: Strategy is a set of decisions about long-term goals and measures, ways, and ways to reach those goals.

** Strategic thinking*

Strategic thinking is reflecting the nature, laws, and movement trends of objective reality and gives the right orientation to human cognitive and practical activities, helping people achieve their goals.

** Strategic thinking of educational administrators*

Education administrators set educational standards and goals and establish the policies and procedures required to achieve them. They also supervise managers, support staff, teachers, counselors, librarians, coaches, and other employees. They develop academic programs, monitor students' educational progress, train and motivate teachers and other staff, manage career counseling and other student services, administer recordkeeping, prepare budgets, and perform many other duties. They also handle relations with parents, prospective and current students, employers, and the community. In a smaller organization such as a small daycare center, one administrator may handle all these functions. In universities or large school systems, responsibilities are divided among many administrators, each with a specific function.

Thus, managers are the management subject, the person holding the position in the organization, appointing the job positions; has the role of leading, influencing, ordering, and controlling in order to achieve the objectives of the unit. Education administrators in Vietnam currently account for about 10% of the total education officials and employees. Preschool education accounts for 18.85%; general education is 55%, colleges and universities are 15.3%; education management agencies at all levels accounted for 10.75% [7]. The strategic thinking of educational administrators: The strategic thinking of educational administrators includes the following aspects:

Professional competence to direct educational activities; capacity to advise, guide, and assist officials and teachers in professional education; have political, economic, medical, cultural, and social knowledge related to education; be able to apply specific education methods in schools; have the capacity to organize teaching and learning activities of the school; has the capacity to advise, guide and assist officials and teachers in pedagogy.

Ability to organize and implement educational programs know about educational programs; capable of implementing educational programs suitable to the target audience and the actual conditions of the school and the locality; have the capacity to guide and assist officials, teachers, and staff in implementing educational programs and plans.

Having knowledge of the management profession, completing the training program for educational administrators as prescribed; Apply knowledge in leadership and management. Formulate and organize the implementation of school development plans, forecast the school's development; develop and organize the implementation of the school year plan.

Implementing democracy in school activities, building democratic regulations in schools according to regulations; organize the implementation of grassroots democracy

regulations, create favorable conditions for mass organizations and social organizations in the school to work to improve the quality of education.

Coordinating between the school and the locality, consulting with the Party committees and local authorities to develop education; mobilize resources of the community, economic, socio-political organizations, and individuals to build a developing school; organize for staff, teachers, and students to participate in social activities in the community [4].

3.2. Education 4.0 and improving strategic thinking for education administrators in ethnic minority, mountainous and disadvantaged areas

Industry 4.0 refers to the fourth industrial revolution. It calls for a dynamic transformation of how all aspects of business and production are done. A new wave of global technology will change global production. Internationalization, in all aspects of business and industry, will be the norm. Countries can no longer remain confined within their borders but must become citizens of the world. Leaders in this new era will need to be critical thinkers, problem solvers, and be able to interact across the globe. In short, they need to be liberally educated.

But how should this impact on education? Future workers will need to be highly trained in the emerging technologies but also, as importantly, in the values associated with using those technologies. In the future, we must not only possess the ability to develop the technology but also to know whether, when, and where to use that technology. That kind of thinking is both reflective and interdisciplinary. Schools must reinvent themselves quickly. They need to adapt to the demands of the RI4 and have the obligation to come out of its shell, its hermetic spaces and try to give as many opportunities as possible by creating the adequate contexts for students to be prepared for the future jobs. The problem in the future could not be the lack of employment, but the shortage of skills that the new jobs will demand.

Students need to understand how they can correlate and use and apply different knowledge in diversified contexts, what they really mean and how they can create synergies among different subjects to develop/create “something” that connects to the real world. This takes us to another very important point: students need to work in a framework of projects and from there they need to collaborate with their colleagues, with their teachers and with the outside world. They need to develop new ways of communicating; they need to be put in front of complex situations to develop critical thinking and complex problem solving and to learn how to be imaginative, creative, adaptable, flexible and to develop brain plasticity.

In other words, Industry 4.0 will require the world to produce a new kind of worker—a knowledge worker! Tomorrow’s industry leaders and managers must possess new skill sets to adapt, to manage, and to take advantage of Industry 4.0. They must be critical thinkers, problem solvers, innovators, communicators, and provide value driven leadership. They must be able to see beyond the technology at play to the implications for society for the use of that technology. These traits define the knowledge worker. They must know the technology but be able to meet and solve all aspects of the challenges engendered by this technology. This kind of leader requires a new approach to education.

As Alex Gray (2016) states “Change won’t wait for us: business leaders, educators and governments all need to be proactive in up-skilling and retraining people so everyone can benefit from the Fourth Industrial Revolution” [3]. So, we have the obligation to create the models and contexts to allow it to happen, otherwise we will have a generation with no skills shortage for the new demands of the labor market and that will become a big problem to society.

To meet the requirements and requirements of modern education in industrial revolution 4.0, the strategic thinking of an education manager must have the following basic requirements:

Firstly, education administrators must have political courage and comply with the guidelines, guidelines, and policies of the Party and State.

Second, there must be a vision to develop education strategies and policies. Education managers need to be equipped with knowledge, skills, and attitudes to determine the position, role, and mission of the education and the educational institution, thereby building strategies, educational development policy, and educational institutions.

Third, must have the capacity to manage human resources. Education administrators need to renew their thinking about the role and content of human resource management and development policies. Education administrators should apply the theory and legal basis to implement the contents of human resource management, work arrangement, assignment of tasks, assessment, reward and discipline, and remuneration policies.

Fourth, educational administrators must have professional competence. It is the ability to analyze and solve work, detect challenges and opportunities, propose solutions; Ability to properly identify the development trend of the system or organization. Education administrators must have the capacity to innovate thinking; adaptability and integration; cooperation capacity; the ability to test and evaluate; know education law and legislation; have analytical and synthesis skills; kindness, honesty, and humility; to apply foreign languages and informatics in management.

Fifth, educational administrators must have good leadership capacity, apply effective management methods to meet the roles and responsibilities of the leader.

Sixth, education managers must be capable in educational development at schools, taking learners as the center, creating conditions for learners to always strive for high results in learning; have a broad vision so that the school's educational innovation programs must closely follow the national educational goals, from which there are reasonable educational development orientations.

Eighth, must have different skills in operating and solving work such as: Arrange work scientifically, rationally, get along with people, cooperate and encourage people to work, promote the creativity of individuals; examine, evaluate and properly use the capacity of each person; Detect general and detailed problems, identify motivational factors.

3.3. Solutions to improve strategic thinking of education administrators in ethnic minority, mountainous and disadvantaged areas in the context of education 4.0.

To meet the requirements of education and training innovation, building "Smart schools, approaching the 4th Industrial Revolution", it is advisable to carry out synchronous

solutions to improve the quality of education and training. Among the solutions, it is necessary to improve the strategic thinking capacity of educational administrators. Solutions to improve the strategic thinking of education administrators in ethnic minority, mountainous and disadvantaged areas in the context of education 4.0 include:

Firstly, regularly grasp the resolutions and directives of the Party, the State and the Ministry of Education and Training on the contents of education and training; Directly are: Resolution of the XIII Congress of the Party, Project "Improving the capacity of teachers and managers of higher education institutions, meeting the requirements of a comprehensive reform of education and training in the period. period 2019 - 2020" according to Decision No. 89/QĐ-TTg, dated January 18, 2019, of the Prime Minister, and orientations, goals, tasks, solutions for the development of education and training up to 2030 and the following years, etc. Therefore, education administrators in schools need to raise awareness, consider this as a political and decisive task to the quality of education and training; from there, leaders and directions set out effective guidelines, measures, plans, and training programs. At the same time, strengthen inspection, supervision, review, and draw experience in fostering to improve the qualifications and quality of education management staff.

Secondly, the training of education administrators must be comprehensive in terms of content, focused, and focused, select appropriate training content for each audience. In addition to professional and professional training according to functions and tasks, it is advisable to focus on fostering Marxist-Leninist theory, Ho Chi Minh's thought, resolutions of the Party committee, laws and regulations, rules, and regulations on education and training of the school. Along with that, fostering health, soft skills, knowledge, and understanding about life and society; leadership and management experience; foreign language skills and information technology.

Third, flexibly apply forms of training, the theory associated with the practice. The fostering of education managers should be based on the requirements of reality, based on the requirements of education and training innovation; characteristics and requirements of professions, qualifications of the staff, so that each school determines the appropriate form of training.

Fourth, strengthen the fostering and training of revolutionary ethics for educational management.

Fifth, have a good remuneration policy, improve the material and spiritual life of the educational management.

In order to create motivation for education administrators, it is advisable to continue to innovate, supplement and perfect mechanisms, regimes, and remuneration policies for education administrators, especially salary policy; take care to ensure good material and spiritual life and working conditions; attract qualified and experienced cadres to add to the contingent of educational administrators. To perform well the emulation and commendation work, with specific forms of commendation and honoring; encourage and motivate excellent individuals, models, effective ways of doing things, and typical individuals in educational management.

Implementation of the above solutions will improve the quality of education management staff, thereby developing education in ethnic minority, mountainous and disadvantaged areas today.

4. Conclusion

Vietnamese education is entering a new stage of development, successful integration with the region and the world is becoming a requirement. We must make efforts to improve the quality of training and educational development. To fulfill that role well, each education manager needs to improve strategic thinking, which is an important factor for educational institutions to adapt to new conditions, improve operational efficiency to meet new development requirements of education. Well-implemented solutions to improve strategic thinking for education administrators will help education in ethnic minority, mountainous and disadvantaged areas develop on the path of international integration.

FOREIGN MARKET ENTRY STRATEGY OF MULTINATIONAL ENTERPRISES FROM INSTITUTIONAL PERSPECTIVE

Tran Thi Tuan Anh

anhtht@ptit.edu.vn

Business Administration Department, Posts and Telecommunications Institute of Technology, Ha Noi, Viet Nam

Abstract

Foreign market entry strategy has an undoubtedly powerful impact on multinational enterprises' (MNEs) performance outcomes, and this subject has received much attention from the academic community and managers of MNEs for the past decades. However, only few studies from institutional perspective has been conducted. Thus, the aim of this paper is twofold. Firstly, this article summerizes the understanding of market entry strategy and institutional theory. It then identifies and describes entry timing, entry modes and entry market involved in institutional perspective. It is hoped that the research not only increases academic knowledge but also helps practitioners in selecting accurate entry strategies to penetrate foreign markets and implementing these strategies effectively.

Keywords: *Entry strategy; market entry strategy; foreign market; institutional perspective; institutional theory ; institutions*

1. Introduction

Market entry decision which is important to the survival, growth and market evolution of multinational enterprises (MNEs) has been the subject of inquiry for decades (Zachary et al., 2015). The choice of entry mode abroad is critical to the success and longevity of a foreign market operation (Root, 1994; Terpstra and Sarathy, 2000) and considered as one of the most significant strategic decisions affecting both internationalization speed and performance of MNEs (Zhao and Luo, 2002; Douma et al., 2006). The general concern of research agenda in market entry strategy has evolved into three fields, namely, factors deciding market entry, entry modes used to enter and outcomes as results of market entry (Zachary et al., 2015).

Foreign market entry subject has also been driven by research showing that institutional context in which firms operate has a direct effect on market entry strategies and outcomes (K. E. Meyer & Nguyen, 2005). This is an important issue to address because institutional theory has been viewed as the most popular source to explain firm strategies and local contexts (Meyer and Peng 2005). Foreign markets have varying characteristics based on infrastructural, institutional, and factor development to clarify the modes of entry for MNEs (Hoskisson et al., 2013). The institution strongly affects transaction and production costs and therefore the profitability of firms engaged in economic activities (North, 1990) and is also equally important for selecting an appropriate mode of entry (Brouthers, 2002).

Existing research on market entry choice has mostly focused on the resource-based and transaction cost while institution-based location lacks attention. Thus, understanding of locational factors, particularly insitutional subject on entry mode choice by MNEs, has been insufficient (Dunning, 1998). To date, only few research has addressed the questions of which entry strategies selected and when to penetrate the foreign markets based on institutional theory. Consequently, the principal purpose of this paper is to provide comprehensive knowledge regarding entry strategies as pertains to institutional perspective. To achieve this objective, research of market entry mode literature was conducted from wide ranges of well-known journals. This study should be crucial because its may help to facilitate a deeper understanding, from a perspective of institutional theory, the market entry strategies of MNEs. Additionally, the result is also useful for business managers in considering entry strategy to enter foreign markets.

2. Literature Review

Institutional theory has been viewed as the most relevant theoretical perspective in explaining firm strategies for penetrating foreign markets, especially emerging economies, compared with other theories (Peng, Wang, & Jiang, 2008). Institutional theory is a nonefficiency perspective that considers institutional environment and the differences between host and home instututions as the key drivers of MNEs location choices (Xu and Shenkar 2002).

In other word, institutional theory highlights the relationship between firms and the environment, including political, cognitive, and sociological factors (Handelman & Arnold, 1999). There are two categories of institutions: formal and informal forces (North, 1990). Formal institutions are organizations such as regulatory bodies, law enforcement agencies and economic reform committees (Yiu and Makino, 2002; Arregle et al., 2016) while informal institutions pertain to the social norms (Lahiri et al., 2014). The main concept of institutional theory is isomorphism (Di Maggio & Powell, 1983), a constraining process expected to force one unit in a population to resemble other units that experience similar environmental conditions (Hawley, 1986), as is the case with firms competing in the same industry and foreign markets (Schellenberg, Harker & Jafari, 2018).

In recent years, more studies examine the impacts of institutional changes and continuity on market entry strategy of MNEs. Institutional continuity and changes affect investment strategies of foreign firms. In a dynamic, complex and volatile global economy, the role of both firm- and location-specific institutions in reducing transaction costs of cross-border value-added and exchange activities are becoming more important (Dunning and Lundan, 2008). Benefits of location-based institution influence the geographical scope and organizational effectiveness of MNEs. In contrast, disadvantages of that may increase the trend of entrants in the economies with immature market-based institutions to reduce transaction costs through joint venture (Meyer, 2001; Kawai & Jonas, 2007). Institutions are more effective and evident in emerging markets than in mature markets (Meyer, Wright, et al., 2009).

3. Results

Market entry is defined as planned movements into a new or adjacent market for the creation and/or delivery of offerings, where 'markets' refers to service or product categories,

technology or resource spaces, or in terms of industry, sector and/or geography (Markman D. et al., 2019). An international market entry strategy is the planning and implementation of delivering goods or services to a new target international market (Kar, 2011).

Choice of the entry strategies plays important role not only for the firm's survival in the foreign market but also for their success (Brouthers, 2002; Rasheed, 2005). In order to penetrate foreign markets, MNEs need to decide strategies of when, how and where to enter. In this regard, general concern of research has evolved into three main subjects, entry timing, entry mode, and entry markets, respectively.

3.1. Entry Timing

The question of when firms should enter and operate abroad has been a consistent topic in international business research for past decades. The early entrants have the chance of obtaining substantial advantage as first movers, but at the same time they also experience some potential threats, compared to late entrants. Early market entry refers to the process that a firm establishes its operation in a certain host country before other foreign firms. Some scholars argued that early market entry of companies may affect positively on its performances (Kunkel, 1991; Patterson, 1993), and first entrants might have more advantages than late movers (Lieberman and Montgomery, 1988) such as reputation, switching costs, relationship with local government (Frynas et al., 2006; Gomez and Maicas, 2011). However, early movers also face with disadvantages in some cases (Shamsie et al., 2004), such as higher costs for infrastructure, or differences between the products of MNEs and the need of local consumers. Table 1 identifies key elements that might lead to risks or awards from early versus late entry.

Table 1. Common risks and rewards faced by early versus late entrants

Early entry	Late entry
Rewards	Rewards
Create barriers to followers	Learn from early entrants
Preempt scarce assets	Free ride on early entrants' investments
Create buyer and supplier switching costs	Wait until uncertainties are resolved
Enjoy less competition	More flexibility to adapt to changes in market
Create brand recognition & loyalty	Ability to react to early entrants' strategies
Risks	Risks
Lack of needed infrastructure	Established incumbents
Less flexibility to react to changes in the market	Locked-in buyers or suppliers
Lack of market knowledge	Greater competition
Lack of local familiarity with product	Early entrants have moved down learning curve
Late entrants might free ride	Scarce resources already locked up

Sources: C.E. Stevens and B.J. Dykes, 2013

According to the perspective of institutional theory, home-country culture may moderate the effect of MNE's early market entry. Institutional theory suggests that institutional factors, including cognitive and cultural elements has effects on the interpretation of problems or actions as they arise and exist (Scott, 2001). MNEs with similar

institutions may express their internal and external environment similarly, so they are more likely to set and execute similar strategies than firms with large cultural differences. Along with this, firms with similar cultures also have similar entry decision. Additionally, early market entry may also indirectly impact on the performance of market followers through deviation from the industry norms. In other words, the action of imitating early entry firm's strategy by many imitators may lead to the result that the imitation has been institutionalized (Li., Cai., et al., 2014).

3.2. Entry modes

Which entry mode is chosen and enacted may determine whether market entry strategies succeed or not (Agndal & Chetty, 2007; Ragland, Widmier, & Brouthers, 2015). Under an institutional context defined by specific rules, norms and values, how enterprises penetrate and operate abroad is investigated (Davis, Desai, & Francis, 2000; Meyer & Nguyen, 2005). Market entry mode based on the institutional theory is classified into following types, namely, activity mode, ownership mode, and establishment mode (Slangen & Hennart, 2008)

Activity mode

Activity mode is related to the question of whether a firm should enter new market through export or foreign production. Generally, export needs to pay higher cost than foreign production due to higher transportation costs and possible tariffs. Over past time, exporting is one of the most crucial and frequently strategy used by firms to internationalize (He, Brouthers, & Filatotchev, 2013). The exporting mode is a low level of investment and as a result it experiences low risk. In contrast, foreign production might incur a higher operating cost operation (Buckley and Casson, 1981). MNEs investing abroad by following foreign production mode have two options. Some might replicate their production process in foreign country to avoid trade costs, while others choose to offshore their production (or part of their production) with the aim of exploiting cost advantages in host countries. In the first case, MNEs' local partners should have the market access motives (Dardati & Saygili, 2020).

Studies on the effects of the institutional context on activity mode have recently attracted attention. Institutional differences could be viewed as a source of comparative advantages, some regions which are more attractive than others may obtain more investments. The quality of home institutions is considered as an important factor that strongly influences export performance both directly and indirectly (Yi et al., 2013). Additionally, it also impacts on export decisions of MNEs (Krammer et al., 2018) by shaping resource decisions and affecting resource allocations during internationalization process (Estrin et al., 2016). Otherwise, good institutions could also have a positive effect on foreign production outflows as they provide good conditions for MNEs to emerge, and thus to invest abroad.

Ownership mode

One of most important decisions when expanding into new market is the choice by MNEs between joint venture and wholly-owned subsidiary, the so-called the ownership mode. This choice represents the level of ownership and consequently the level of control that MNEs have on their abroad operation obtained through the investment. Joint venture is

defined as an entry strategy where two or more legally separate bodies (one a foreign entity) form a separate jointly owned entity in which they invest and engage in various decision-making activities (Geringer & Hebert, 1989). Following joint venture strategy, firms are allowed to share the risks and resources needed to enter international markets (Pan & Tse, 1996). Most joint ventures cooperate with a local company that deeply understands the local country's competitive conditions, legal and social norms, and cultural features, which help the companies to strongly compete in the new market (Hitt et al., 2001). However, it may lead to the potential that partners only focus on their benefits instead of joint venture's (Beamish, 1985). On the other hand, wholly-owned may protect proprietary technologies and core competencies of MNEs (Buckley and Casson, 1976). A wholly owned subsidiary allows the parent company to easily manage diversify, manage, and reduce the risk of business. Firms entering a foreign market through wholly owned subsidiaries might take advantage of managerial autonomy and full control over local operations.

Institutional theory in recent years has emerged as an alternative approach to explain entry strategies based on foreign ownership of the host market, more studies focus on the choice between joint venture, wholly-owned subsidiaries using institutional theory (Meyer, 2001; Brouthers, 2002). Instead of concentrating on the technical environment of individual transactions as transaction cost theory mentions, institutional theory deeply investigates different institutional contexts across economies and their effects on the MNEs' ownership strategies (Meyer, 2001). Higher levels of ownership may affect positively on the survival rates of foreign subsidiaries, depending on the institutional differences between home and host countries and foreign parents' operating experience in host countries (Gaur & Lu, 2015).

Establishment mode

Greenfield and acquisition are considered as two alternative establishment modes. A greenfield investment refers to the creation of new venture while an acquisition is the purchase of stock in an already existing firm in an amount sufficient to acquire control (Kogut & Singh, 1988). Acquisition is faster than greenfield in terms of entering new markets and viewed as the quickest mode and the largest initial international expansion of the alternatives. Additionally, it may help to eliminate potential conflicts with partners (Geringer & Herbert, 1989). However, firms following this mode may pay higher costs for gaining appropriate information to negotiate an agreement or multiple risks (Hitt et al., 2001).

From institutional theory, greenfield is the process of setting up new company, searching for and educating new employees, and gradually develop the business based on the understanding of local institutions. Greenfield investors own the technologies, knowledge, capital themselves while in acquisition's entry, these properties may belong to the local enterprises. Institutional theory claims that subsidiaries of MNEs experience conformity pressures from both their home-country (internal) and host-country(external) environments (Kostova and Zaheer, 1999). Scholars investigating the choices of establishment mode based on selection of international strategies, suggests that MNEs subsidiaries using a global strategy usually face the high pressures for internal conformity, while those of MNEs pursuing a multidomestic strategy are subject to external conformity.

Additionally, internal conformity is often through greenfield because it encourages an MNE's resources to be deployed from the outset, while external conformity is easier to obtain through acquisitions because they are local firms already deeply understand the host-country environment. Consequently, MNEs using a global strategy might choose greenfield, and those using a multidomestic may select acquisition (Harzing 2002).

3.3. Entry market

'Where to enter' is a crucial issue of MNEs when exploring new foreign markets. 'Where' refers to the area to focus, including technology corridors, product spaces, markets, industries, sectors, or geographies (Markman D. et al., 2019). Market orientation is an ideology that focusing on creation and maintenance of superior customer value at the highest level and encourages employees of MNEs to develop and exploit market information (Narver and Slater, 1990). New entrants might choose to directly compete with established firms, and less likely to create products and services that are complementary to incumbent offerings (Plummer & Acs, 2014; Rothaermel & Boeker, 2008). During the process of expanding into new market, enterprises could identify and select new market opportunities, and then develop strategies to capture these opportunities by offering existing products to new markets, or offer new products to new markets (Mohr, Sengupta & Slater, 2010). Institutional theorists emphasize that there is positive relationship between diverse regional knowledge pools and new venture creation. The sociocultural context can influence new company entry, but do not delve into business opportunities (Vedula et al., 2019). Firms need to choose accurate the foreign markets in which they operate, conform to local environments and, finally manipulate the environment in a way that allows firm to operate.

4. Conclusion

The aim of this article is to provide the deeper knowledge of foreign market entry strategies under institutional perspective. In particular, entry timing, entry modes and entry market of MNEs when entering new markets are analysed by using institutional theory. It is concluded that the entry choices of MNCs depend on various aspects of institutional environments, and MNCs need to adhere to the prevailing rules, standards, and procedures of the market in which they operate in order to survive and develop. This study hopes to contribute to the literature on market entry strategies in some ways and becomes useful for MNEs managers who are in need of selecting appropriate entry strategies to invest abroad.

Abstract

Plastic has become one of the most widely utilized materials in numerous industries due to its adaptable features and low price. This has caused an alarming global concern due to the detrimental effects of plastic pollution on humanity. Several developed nations have regulations to restrict the consumption of plastic products. However, plastic waste management remains a challenge in some developing countries, especially Vietnam, and has not been investigated. This paper aims to review Vietnam's current plastic waste management policies and compare them to parallel policies in other jurisdictions.

Keywords: *Plastics, plastic waste management, policies, regulations.*

1. Introduction

Plastic waste is one of the biggest challenges for countries around the world. Vietnam is no exception. In 2017, Vietnam has officially ratified the Ministerial Conference on Marine Litter and Plastic Pollution and had the 5th meeting of the UN Environment Assembly in February 2021 ('Ministerial Conference on Marine Litter and Plastic Pollution', 2021). Consequently, in 2019, the Prime Minister launched a nationwide "Plastic Waste Prevention" campaign to reflect the previous commitment. Besides, Vietnam has to obey various strict environmental regulations in various modern Free Trade Agreements, including the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP) and Europe – Vietnam Free Trade Agreement (EVFTA).

In a research article by Cell Press, Vietnam was reported to be in the top 24 countries globally that had daily COVID-19 facemasks and global plastic waste, which is continually increasing (Benson et al., 2021). Vietnam is also a country with a long coastline, which could act as one of the main factors driving plastic waste pollution to deteriorate. If Vietnam arrives at the most acceptable solution for this challenge, Vietnam will not only develop significantly in all aspects but also gain greater prestige and respect in the world.

This paper examines Vietnam's policies on plastic waste to discuss the Government's efforts and the various challenges that lie ahead. This study has three main parts to answer the following questions: (i) Why governments must regulate plastic waste?; (ii) How Vietnamese Government regulate plastic waste?; (iii) What are the differences between these approaches in Vietnam and in other nations?

2. Method

This paper uses the logical and comparative methods to examine the policies governing plastic waste in Vietnam and other countries.

3. Results

3.1. Why governments must regulate plastic waste?

The presence and widespread usage of plastic offers a range of benefits to daily life. Yet at the same time, the ubiquitous appearance and uncontrolled disposal of plastic waste also has a plethora of unintended environmental implications (Li et al., 2021). Living species, particularly humans, are confronted with environmental challenges. Hence, the public's perception of this contentious issue is increasing day by day, and the concern around it is expanding tremendously, necessitating the Government's unwavering efforts to maintain a country's sustainable development.

The negative environmental consequences of plastic waste have been discussed continuously and extensively in recent years, with a particular emphasis on promising solutions for ongoing development of the field ('The environmental impacts of plastics and micro-plastics use, waste and pollution: EU and national measures | Think Tank | European Parliament', 2020). It is shown that there are two primary concerns: the impacts on human and the impacts on environment, including land, marine, and climate impact. All of these will be briefly explained in the following paragraphs.

Many scientific investigations have shown that plastic is hazardous to human health in significant ways and at different levels. The majority of health impacts are caused by chemical additives in plastics. Heavy metals and associated toxic mechanisms are the most common culprits. Direct toxicity from plastics includes lead, cadmium, and mercury ('Adverse Health Effects of Plastics | Ecology Center', 2021). Apart from that, carcinogens and other persistently poisonous elements contained in plastics can increase the risk of cancer, birth defects, and developmental issues in children mercury ('Adverse Health Effects of Plastics | Ecology Center', 2021). Consequently, as people's health and living standards deteriorate, labour productivity declines and health-care costs rise. These are all ever-increasing pressures on the government.

Plastic bags, disposable single-use plastics, and microbeads are all important sources of plastic pollution ('Legal Limits on Single-Use Plastics and Microplastics: A Global Review of National Laws and Regulations', 2018). Yet plastics and the environment have a positive relationship. It can be inferred that as consumption increases, so does the impact on the environment (Afzal et al., 2012). As a result, with plastic bags being the number one consumer item in the world today (Anderson, 2016), the environmental consequences are becoming more intense than ever.

Plastics and fossil fuel industries are inextricably linked. Plastic is produced out of chemicals sourced from fossil fuels in more than 99 percent of the total (Hamilton and Feit, 2019). The process of producing plastic accounts for 4–8% of oil and gas consumption worldwide (OECD Environment Policy Papers, 2018). Nevertheless, a global total of 15% of plastic waste is collected for recycling, and 25% is incinerated (Governments need to act to encourage plastic recycling markets - OECD, 2022). More notably, the rest will be accumulated in large landfills before being burned outside. Burning plastic in the open air creates a deadly poisonous chemical known as black carbon, which has a global warming potential 5,000 times that of carbon dioxide (Reyna-Bensusan et al., 2019). In addition, the plastic production lifecycle from extraction, production, consumption to destruction emits pollutants and greenhouse gases like carbon dioxide. According to a report released by the Center for International Environmental Law (CIEL) in 2019, greenhouse gases, which are emitted during the production of plastics, have adverse impacts on climate change (Hamilton and Feit, 2019). Rising sea levels, global warming, creating storms, floods, droughts, and erosion, among other things are the possible consequences of climate change (Grabowski, 2018) that every year the government has to spend billions, even trillions of dollars to deal with the repercussions they bring.

The above findings confirmed the need for governments to step in and manage plastic waste.

3.2. Existing policies on plastic waste management in Vietnam

Vietnam has become more and more proactive in engaging in environmental governance. In 2017, the country ratified the United Nations Environment Program (UNEP)'s resolution on plastic waste and ocean microplastics (Resolution adopted by the United Nations Environment, 2019). At the G7 Summit in Canada in 2018, the Prime Minister Nguyen Xuan Phuc promised to act as well as call for global cooperation to address the problem of marine plastic waste. Numerous agencies, organizations, towns, enterprises, and people have done many practical, meaningful, and successful efforts to minimize plastic trash since the Prime Minister began a countrywide crusade against it in 2019.

The Vietnamese state has promulgated numerous guidelines and policies in fighting against plastic pollution, including: (i) Resolution No. 24-NQ/TW dated June 3, 2013 on proactively responding to climate change, strengthening natural resource management, and environmental protection; (ii) Resolution 36-NQ/TW dated October 22, 2018 on the Strategy for sustainable development of Vietnam's marine economy to 2030, with a vision to 2045; (iii) Resolution No. 26/NQ-CP dated March 5, 2020 on proactively responding to climate change, strengthening natural resource management, and environmental protection; (iv) Resolution No. 36-NQ/TW dated October 22, 2018 Promulgating the Government's master plan and 5-year plan to execute Resolution No. 36-NQ/TW of the Party's Eighth Conference on the Strategy for Sustainable Development of Vietnam's Marine Economy to 2030, with a Vision to 2045, dated October 22, 2018. The aforementioned resolutions are mostly connected to take all appropriate measures to protect the ocean from marine plastic debris and minimizing damages to the marine ecosystem.

Furthermore, the government has published a series of documents relating to plastic waste management in particular, including:

• **The Prime Minister Decision No. 1216** on September 5, 2012, authorizing the National Strategy for Environmental Protection to 2030, with a vision to 2030 and an overall aim of managing and minimizing environmental degradation. The decision aims at reducing the production and use of non-biodegradable bags and packages, by (a) propaganda and advocacy to raise household awareness; (b) improving the responsibility of plastic manufacturers and importers; (c) research on easily degradable bags and packages to replace bags and packages that are non-biodegradable; (d) strengthen the responsibility of manufacturers and importers for the recall and handling of packaging, machinery, equipment, and tools after use.

• **The Prime Minister's Decision 582/QD-TTg** dated April 11, 2013, approving the project on improving the environmental pollution control for the use of non-biodegradable plastic bags by 2020. The project said that the shared aim is to gradually reduce the use of non-degradable plastic bags in daily life, to increase non-degradable plastic bag waste collection and recycling. By 2015, reduce the number of non-biodegradable plastic bags used in supermarkets and shopping malls by 65 percent compared to 2010; Reduce the usage of non-biodegradable plastic bags in residential markets by half compared to 2010; Collect and reuse half of the non-biodegradable plastic bag waste created in daily life. The project outlines tasks and solutions in the areas of policy reform, finance and human resources, research and technology, and international collaboration in order to achieve this goal.

• **The Prime Minister's Decision 622/QD-TTg** dated May 10, 2017, on the National Action Plan to Implement the 2030 Agenda for Sustainable Development. This decision establishes goals and tasks for sustainable development, including waste management. The decision specifies to prevent, considerably reduce, and regulate certain forms of waste by 2030. Marine pollution, particularly that caused by land-based activities, with a focus on solid waste, wastewater, and organic matter contamination. The Government has delegated this task mainly to the Ministry of Natural Resources and Environment.

• **The Prime Minister's Decision 491/QD-TTg** dated May 7, 2018, approving the adjusted national strategy on integrated management of solid wastes up to 2025, with a vision toward 2050. By 2025, there will be defined objectives for each form of trash: hazardous solid waste, urban household solid waste, rural domestic solid waste, conventional industrial solid waste, and other specialized solid waste. To accomplish this mission, the decision sets out the basic activities that correspond to the objectives for the waste types listed above. The answer to these duties includes improving systems and policies, expanding research and technology, assessing waste management, developing human resources, creating awareness, and allocating financial resources.

• On December 4, 2019, the Prime Minister signed **Decision No. 1746/QD/TTg**, promulgating the national action plan on marine plastic debris management through 2030. This plan specifically addresses ocean waste, with particular goals of reducing 50% of plastic waste in seas and oceans by 2025 and 75% by 2030. To that end, the plan provides five sets of duties and solutions for authorities: (1) To disseminate, raise awareness and change behaviors about plastic products and marine plastic debris; (2) To collect, classify, transport

and treat wastes and plastic debris in coastal areas and at sea; (3) To carry out at-source control of plastic debris; (4) To carry out international cooperation, scientific research, and technology application, development and transfer serving marine plastic debris treatment; (5) To investigate, survey, review, study and formulate a comprehensive, consistent, effective and efficient mechanism of marine plastic debris management.

• On August 20, 2020, the Prime Minister issued **Directive 33/CT-TTg**, urging key ministries and agencies, as well as the People's Committee of cities, province in order to harmonize policies and duties and boost the efficiency of waste management operations. The Ministry of Natural Resources and Environment is the primary agency in charge of implementing government policies, collaborating with other ministries such as the Ministry of Finance, the Ministry of Industry and Trade, the Ministry of Agriculture and Rural Development, and others to carry out the state's policies, regulations, and objectives.

• Recently, the Prime Minister issued **Decision 1316/QĐ-TTg**, approving the scheme for strengthening management of plastic wastes in Vietnam on July 20, 2021. The project's aims divided into three categories: (1) To improve mechanisms, policies and laws on management of plastic wastes; production and consumption of non-biodegradable domestic plastic bags; single-use domestic plastic products (including single-use tumblers, cups, bowls, plates, spoons, forks, straws, plastic packaging or food containers, plastic wrap and single-use plastic tableware, etc.); (2) To strive to the target by 2025: 100% of environmentally friendly plastic bags and packaging will be used at shopping centers and supermarkets for domestic purposes as replacement for non-biodegradable plastic bags; 85% of generated plastic wastes will be collected, reused, recycled and disposed of; 50% of marine plastic wastes will be reduced; 100% of tourist attractions, tourist accommodation establishments and hotels will not use non-biodegradable plastic bags and single-use plastic products; the production and use of non-biodegradable plastic bags and single-use plastic products will be gradually reduced in daily life; (3) To raise the awareness of agencies, organizations, enterprises, communities and people in the production, consumption and treatment of plastic wastes, non-biodegradable plastic bags and single-use plastic products in daily life.

In general, Vietnamese policies have increasingly focused on improving mechanisms, policies, and laws on the management of plastic wastes; production and consumption of non-biodegradable domestic plastic bags; single-use domestic plastic products (**Decision No. 1316/QĐ-TTg** on July 22, 2021). In many recent policies, the ambitions of the Vietnamese government have been demonstrated to be greater and more intensive through specific figures in the specific objectives section. As proof, **Decision No. 1746/QĐ-TTg** on December 4, 2019 specified one objective that was "By 2025, 80% of tourist attractions and sites, and establishments providing tourist accommodation services and other coastal tourism services will refrain from using disposable plastic products or non-biodegradable plastic bags". That figure of 80% rose to 100% in **Decision No. 1316/QĐ-TTg** on July 22, 2021.

In order to implement national strategies and plans, competent state agencies have issued law and regulations. The most prominent of which are the following documents:

• **Law On Environmental Protection 2020** has introduced provisions aimed at limiting and controlling the amount of plastic waste in the environment (especially the marine environment), encouraging and promoting activities of collecting, recycling and reusing plastic products (Articles 54, 55, 73).

• The tax rates applied to plastic bags, goods and products packaging have been specified in documents such as **Law on Environmental Protection Tax 2010; Resolution No. 579/2018/UBTVQH14** dated September 26, 2018, of the Standing Committee Of The National Assembly on Environmental Taxes; and **Decree No. 69/2012/ND-CP** amending and supplementing Clause 3 Article 2 Of The Government's Decree **No. 67/2011/ND-CP** dated August 08, 2011, detailing and guiding the implementation of the law on environment protection tax.

• **The Decree On The Management Of Wastes And Scraps No. 38/2015/ND-CP** outlines the general regulations on plastic waste and also explains the responsibilities and working principles of provincial and central agencies and departments in the process of handling, controlling and recycling all kinds of plastic waste. At the same time, it also sets out requirements for environmental protection in the process of importing scrap. These import requirements were later amended and supplemented in **Decree No. 40/2019/ND-CP**, which stipulates the import volume and the corresponding deposit more fully.

• Some other regulations on plastics imported are in the following documents: **The Consolidated document No. 09/2015/VBHN-BTNMT, Decision No 36/2016/QD-TTg**, etc. The main regulations of these documents are on the tax rate applied to imported goods and define the types of plastic bags and packaging.

• **Circular No. 07/2012/TT-BTNMT** provides criteria, order and procedures for recognizing environmentally friendly plastic bags.

• Regarding the recall and treatment of discarded products, **Decision No. 16/2015/QD-TTg** and **Circular No. 34/2017/TT-BTNMT** explain the list, quantity, implementation process of the recall, also treatment method and technical requirements for collection and recycling discarded products and the responsibilities of producers, consumers, and state management agencies in this process chain.

• **Directive No. 10/CT-BGTVT** stipulates methods of collecting, recycling and reusing plastic waste on board. In terms of treatment methods, it is similar to solid waste, with the treatment cycle specified in the **Circular No 41/2017/TT-BGTVT**, which clearly states the regulations on implementation, promotion of international cooperation and research and application of science and technology into the process of managing and treating plastic waste.

• **Directive No 08/CT-BYT** requires medical facilities to limit single-use plastics in daily life, medical examination and treatment activities, and at the same time conduct classification of non-biodegradable plastic waste.

• **Decision No. 2395/QD- BTNMT** was issued to implement **Directive No. 33** with specific requirements and tasks of central and provincial agencies and accompanying the implementation time.

According to the above list, waste is now more specifically separated based on many standards such as type, weight, materials. It could be demonstrated in Decree No. 38/2015/ND-CP dated April 24, 2015 on the management of wastes and scraps, Circular No. 34/2017/TT-BTNMT dated October 04, 2017 of the Ministry of Natural Resources on recall and treatment of discarded products. Especially, the National Assembly has already set out a particular article 73 in Law on Environmental Protection 2020 to regulate plastic waste issues. It is a remarkable change in Vietnamese Law on Environmental Protection 2020 compared to that of 2014. Nevertheless, similar to policies, the government now has not yet introduced guiding implementation documents, which might postpone the law implementation in practice.

Overall, the Vietnamese government is gradually paying more attention to the plastic waste issue, especially in the development of guidelines, policies, and laws. Regulations are becoming more and more comprehensive, with higher compulsion. The strengthening of cooperation between individuals, organizations, and state agencies is also emphasized. However, the regulations are still general and primitive. Despite being more mandatory than previous documents, regulations are still encouraging, based on people's awareness and self-discipline. The fact that the guiding documents have not been enacted drives the regulations unenforceable, or the practical implementation confronting many difficulties and shortcomings.

3.3. Compare and contrast the Vietnamese policies with those in foreign countries

3.3.1. Bans and restriction

Vietnam does not have many restriction orders: currently including regulations on tariffs related to products with microplastics, such as the tax rate corresponding to a certain amount of microplastics in the product (which stated in the Law on Environmental Protection Tax 2010, Decree No.40/2019/ND-CP dated April 24, 2019, etc.). In addition, there are national goals and policies to implement plans related to the control and limitation of plastic waste in the marine environment, health sector, daily life, import and export, etc. (e.g., Resolution No. 26/NQ-CP dated March 5, 2020; Decision 1281/QD-UBND of Hanoi People's Committee, etc.) but no specific laws.

In terms of bans, many countries have very stringent penalties, including hefty fines (e.g. in Germany, supermarkets and retailers that provide plastic bags to clients face a punishment of up to 100,000 euros; in Kenya, the fine is 38,000 USD; and in China, the goods are confiscated) or even imprisonment if recidivism occurs (up to 4 years in Kenya, 5 years in India, 10 years in South Africa, etc.). Especially, in China, the government also strictly monitors the people by setting up a system to track and detect cases of single-use plastic consumption (Giacovelli, 2018). Vietnam also has legislation limiting the use of a variety of single-use plastics (for example: banning the use of paper, cups, and discs in company meetings and parties in Directive No. 10/CT- Traffic Department dated October 7, 2020, etc.). But, when compared to other nations, it is obvious that Vietnam's scope of the ban is considered moderate and the measures to handle violations are not harsh, which leads to a lot of circumvention.

However, most recently, the Government issued Decree 08/2022/ND-CP, requesting to stop the production of single-use plastic products after December 31, 2030, along with improving regulations on manufacture, import and recycle plastic bags and non-degradable plastic packaging. This is a step forward in the state's efforts to strictly regulate the discharge of plastic products into the environment.

3.3.2. Economic instrument

To manage plastic waste, the Vietnamese government has employed economic methods. Plastic bags, in particular, are one of the subjects taxed in Vietnam, as defined in the Law on Environmental Protection Tax 2011. The general tax rate for taxable plastic bags is approximately at 50,000 VND (approximately €2), which is the responsibility of importers and producers (National Assembly, 2010). In general, Vietnam has employed taxation to manage plastic waste. However, this measure is not adequately regulated. While a low tax rate can alleviate businesses' financial burdens, it cannot affect how customers and producers perceive the issue of plastic waste management. In addition, Vietnam has only one tax on plastic bags, whereas many legislations in the world have many tax rates corresponding to different types of plastic bags (Tackling Plastic Pollution: Legislative Guide for the Regulation of Single-Use Plastic Products, 2020). Calculating tax rates is a critical step after establishing which categories of plastic bags should be charged (Tackling Plastic Pollution: Legislative Guide for the Regulation of Single-Use Plastic Products, 2020). Since the purpose of environmental taxes on plastic bags is to raise consumers' and producers' awareness and to shape their behavior, different levels of taxation could be considered to accomplish this objective. For example, The Latvian natural resource tax on plastic packaging is material-specific (Schweitzer, Gionfra, Watkins, Pantzar & Kettunen, 2018). Polystyrene source materials are charged at €1.56 per kilogram, the majority of plastic is charged at €1.22/kg, single-use plastic bags weighing more than 0.3 g are charged at €1.14 per kilogram (lighter bags are charged at €3.70 per kilogram), and oxo degradable plastic is charged at €0.70 per kilogram (Schweitzer, Gionfra, Watkins, Pantzar & Kettunen, 2018). Comparing to those tax rates above, the one tax rate applied for all types of plastic products in Vietnam could not reach the aim of increasing public awareness about the different impacts of each type of plastic bags on the environment.

3.3.3. Standards, certification and labelling

In terms of standards, certification, and labelling approach, the Vietnam Ministry of Resources and the Environment has issued Circular No. 07/2012/TT-BTNMT providing on criterion of, order of, procedures for recognition of environmentally friendly - nylon bags, which contains regulations on the criteria, order, and methods for recognizing eco-friendly plastic bags. It can be shown that, when compared to other nations, Vietnam's on standards, certification, and labelling are restricted, with few restrictions on standard systems, labelling, and certifications for plastic-related items. This criterion is used in a large number of developed countries (USA, Europe, Japan, etc.) (Tackling Plastic Pollution: Legislative Guide for the Regulation of Single-Use Plastic Products, 2020). Manufactures and suppliers can obtain a certificate through a due diligence procedure or through a third party (for

example, the Biodegradable Products Institute in the United States compliance with ASTM standards, the Japan Environment Association compliance with ISO standards) (Tackling Plastic Pollution: Legislative Guide for the Regulation of Single-Use Plastic Products, 2020).

Apart from certification, labeling is a frequently utilized approach. How2Recycle is a label based in North America that promotes recycling bottles with the cap on. A survey in the field of Food Technology in June 2019 by PhD from Packaging Technology and Research showed that 57% of total consumers in the market would be more inclined to buy products with the How2Recycle label over products without the label (Sand, Claire, 2019). The Vietnamese government is also beginning to recognize the need of establishing a comprehensive standard system to improve the legal policy on plastic waste management. This task is stipulated in the Prime Minister's Decision 1316/QD-TTg, approving the scheme for strengthening management of plastic wastes in Vietnam on July 20, 2021.

3.3.4. Post-consumer use and product end of life

Waste management legislation

Firstly, about prevention and minimization of plastic waste, Law on Environmental Protection 2020 just regulates the minimization, reuse and recycling of plastic wastes in culture, sports and tourism activities and Decision No. 1746/QD-TTg Promulgating the national action plan on marine plastic debris management through 2030 applies at-source control of plastic debris. In Directive 33/CT-TTg on strengthening management, reuse, recycling, treatment and reduction of plastic waste, Ministry of Agriculture and Rural Development is directed to limit the use of Styrofoam in the seafood industry. In medical services, Directive 08/CT-BYT on reducing plastic waste in the medical industry, the use of plastic straws and other disposable or non-degradable objects for eating and drinking by patients and their family members is restricted, as is their use at unit conferences, seminars, training sessions, and workshops.

Secondly, regarding collection, separation and recovery of plastic waste as well as payments and fees, Directive 33/CT-TTg on strengthening management, reuse, recycling, treatment and reduction of plastic waste dated August 20, 2020 imposes that plastic waste and other recyclable waste must not be mixed with organic waste. The process of separation is mainly manually carried out with a very limited interpretation of technological sorters. Environment Protection Law 2020 issues incentives for this and separation and collection for household waste and industrial waste. In case households or individuals fail to sort wastes or sort wastes not according to this Law, they shall pay waste collection, transportation and treatment service charges which are calculated based on quantity or volume of sorted wastes instead of per capita in the 2014 version.

Even though the Vietnamese law has been updated to international standards in terms of regulations on waste classification, collection, treatment, and minimization, Vietnam still has shortcomings in some areas, such as a lack of legislation on incentives to enhance manufacturing processes and persuade consumers to demand more environmentally friendly products, or no regulations for materials used for packaging in e-commerce activities, as France does in Law No. 2020-105 of 2020 on Combating Waste (LAW No. 2020-105 of February 10, 2020).

Thirdly, in order to control the cross-border transportation of hazardous wastes and their disposal, Vietnam must adhere to the international standard, such as the Basel Convention and ratified the Basel Convention on Control of the Transboundary Movement of Hazardous Wastes and Their Disposal. However, Vietnam has not yet ratified the Basel Convention Amendments to Annexes II, VIII, and IX (Basel Convention Amendments to Annexes II, VIII, and IX).

Extended producer responsibilities (EPR)

EPR approaches including reuse and recycle of products are proposed with concrete measurements in Appendix XXII of Decree 08/2022/NĐ-CP Detailing a number of articles of the Law on Environmental Protection. Directive 33/CT-TTg on strengthening management, reuse, recycling, treatment and reduction of plastic waste dated August 20, 2020, has also directed "regulations on recall and treatment of discarded products in the direction of increasing the responsibility of manufacturers, importers, brand owners, distributors and modern and traditional retailers in waste recovery and recycling". In order for individuals and organizations to understand and properly implement EPR, and to support and advise state agencies, Vietnam has issued regulations on the National EPR Portal and the National EPR Council in Decree No. 08/2022/ND-CP detailing a number of articles of the Law on Environmental Protection 2020 dated January 10, 2022.

Regarding EPR upstream, Vietnamese Law on Environmental Protection 2020 and Decree 08/2022/NĐ-CP has specifically identified products that are the subjects of EPR. Manufacturers and importers specified in Articles 77 and 83 of Decree 08/2022/NĐ-CP are responsible for disclosing information about the products and packages they manufacture or import, including the following: ingredients, fuel, and materials; guidelines for classification, collection, reuse, recycling, and treatment; and warnings about risks associated with recycling, reuse, and treatment.

According to Article 77 of this Decree, organizations and individuals manufacturing and importing the products and packages listed in Column 3 of Appendix XXII issued in conjunction with this Decree include disposable batteries of all types; disposable diapers, diapers, sanitary napkins, and wet wipes. There are, however, exceptions for manufacturers and importers of items and packages for export or temporary import, re-export or production, and import for the purpose of research, study, or testing. They are manufacturers of packaging with a combined revenue from sales and service provision of less than VND 30 billion in the preceding year; or importers of packaging with a combined revenue from sales and service provision of less than VND 20 billion in the preceding year.

This demonstrates that Vietnam has designated particular manufacturers or items as being subject to EPR and others as being exempt. However, Vietnam's policies are not considered comprehensive. They do not include regulations on eco-design standards, such as those in the 1991 Rigid Plastic Packaging Container Program of the US state of California (Reuters Westlaw, 2016), or economic instruments such as fees and taxes as part of a focus on eco-design in order to reduce plastic packaging and encourage the design of lighter products in Europe (EU, 2019).

Regarding EPR downstream, Vietnamese law has devoted Chapter VI of Decree No. 08/2022/ND-CP detailing a number of articles of the Law on Environmental Protection 2020 to stipulate in more detail the subjects and exemptions in article 77 mentioned above and their responsibilities of recycling, product handling and packaging of producers or importers. In particular, the Decree has specific regulations on the objects, implementation schedule, rate and procedure of recycling. The mandatory recycling rate for each type of product and packaging is specified in Column 4 of Appendix XXII issued with the Decree 08 for the first three years, for example, 22% for rigid PET packaging and 10% for rigid EPS packaging; and is adjusted every three years, gradually increasing to meet the national recycling target and environmental protection requirements.

Besides, mandatory recycling specifications define recycling systems that meet strict minimum requirements for material and fuel recovery from products and packaging. Column 5 of Appendix XXII produced with this Decree contains mandatory specifications for each product and package. For example, for rigid PET, HDPE, LDPE, PP, and PS packaging, three methods of recycling are available: (i) making recycled plastic pellets for use as raw materials in other sectors, (ii) manufacturing other products (including PE fibers), and (iii) chemical production (including oil). There are two forms of responsibility implementation, namely organizing recycling or making financial contributions in two ways: directly or authorised, which is submitted to the Vietnam Environment Protection Fund. The level of financial contribution and the level of support funding for recycling is determined by the type, volume, or unit of product and packaging as prescribed by law, to illustrate, for bottles, plastic boxes, it is 50 VND/piece (less than 500 ml) and 100 VND/piece (more than 500 ml). It can be seen that, in the stage of EPR downstream, Vietnam issues relatively as sufficient regulations as in other foreign developed countries like Germany or Australia.

3.3.5. Consumer education

Policies in Vietnam on the prevention of plastic waste (especially plastic pollution in the ocean and single-use plastic waste) mention a lot of propaganda and education issues, but they have not been effectively applied in practice (Nguyen T. T., 2021). Authorities in the major urban cities have been orienting towards organizing environmental movements (such as the "Green Consumption 2019" campaign taking place in Ho Chi Minh City), while small localities have essentially no precise policy to enact (Nguyen T. T., 2021). As can be seen, while many countries around the world put the prevention of plastic waste into the educational programs or organize a lot of extra-curricular sessions, summer camps and research seminars on plastic waste, etc., in Vietnam, such activities are quite rare (usually only at bilingual or international schools) and are often small in scale, media activities cannot reach many people (environmental movements have steadily become stronger since around 2016 – 2017 with the regular organization of summer camps and scientific conferences, but by 2020, they had ceased due to the epidemic) (Uyen, Linh & Hien, 2021).

4. Discussion and Conclusion

4.1. Discussion

The law on plastic waste in Vietnam is still in its infancy, with regulations that are tolerating rather than legal enforcing (Law on Environmental Protection 2020, 2020). This is demonstrated by the lack of specificity of the notions described. For example, there is no clear classification and definition of plastic trash and few quality standards in the importation, use, and management of plastic products (Law on Environmental Protection 2020, 2020); also no formula for estimating the rate and recycling procedure for plastic products.

Additionally, when compared to other types of waste, plastic waste is exceedingly difficult to decompose; also, some standard treatment procedures cannot be used to manage plastic waste (such as incineration since burning plastic will produce toxic substances that cause gas poisoning). As a result, the fact that rules on plastic products are coupled with other types of waste causes many inadequacies: the amount of plastic discharged into the environment is excessive, the treatment technique and degree of recycling are unsuitable, leading white pollution to worsen, and so on.

Because the law is still vague and lacking in practicality, each approach has not been clearly stated, thus affecting the depth of development of other approaches. For instance, waste classification is lacking, and people's awareness of environmental protection is low, in a context where the number of education instruments is limited, along with regulations rely heavily on individual awareness; the work of collecting, treating, and recycling waste plastic would therefore have many shortcomings.

At the same time, the development of safe and appropriate processes for recycling and reusing plastics in accordance with the common ground's economic and technical viability are heavily dependent on the detail of quality standards and criteria for evaluating and classifying plastic products. When the import of materials and recycling processes are not tightened, it severely hampered the Government's ability to control the amount of plastic production, consumption and discharge from companies and businesses.

4.2. Conclusion

Despite their low cost and simplicity of use, plastic products have the potential to cause harm to human health and the environment. Toxic elements in plastic items can affect human health. This can reduce quality of life, deplete labor resources, and raise health-care costs over time. Furthermore, plastic pollution has serious consequences for living organisms and climate change, which can lead to rising sea levels, global warming, and storms, floods, droughts, and erosion. Government must step in and regulate plastic waste since plastic pollution can have significant economic and social effects.

There have been numerous approaches adopted widely and effectively in many countries in the world. The most commonly applied measures nowadays are Bans and restrictions; Economic instruments including taxes and subsidies; Standards, Certification and Labelling; Post-consumer use and product end of life; and Information and Education instruments. In spite of many challenges in practical implementation, these approaches have been proved to be successful with many drastically positive results in the countries.

Vietnam's involvement in environmental governance has become increasingly proactive. The Vietnamese government has enacted various programs and legislation to tackle plastic pollution. The Vietnamese Government's objectives have been proved to be increasingly concentrated, as well as its regulations are becoming more detailed, comprehensive, and forced.

Yet, the legal system and the level of awareness of the Vietnamese people are both weaker when compared to the legal systems of other developed countries in the world. Generally speaking, the law in Vietnam is more vague; many regulations require to be elaborated in more detail to effectively regulate the consumption, treatment, and management of plastic waste in a sustainable manner. While this is going on, the propaganda and information-dissemination activities aimed at preventing plastic waste and white pollution haven't been particularly exciting. In order to create a greener, cleaner, and more beautiful environment, the Vietnamese government still has a long way to go in perfecting the environmental legal system which fights against plastic pollution.

CORPORATE CRIMINAL LIABILITY: A COMPARISON OF VIETNAM AND FRANCE

LLM. Luu Hai Yen

luuhaiyenhlu@gmail.com

Criminal Law Faculty, Hanoi Law University, Vietnam

Abstract

Since the January 1 of 2018, corporate can be the subject of criminal liability in Vietnam. However, the type of corporate and the scope of crimes corporate will be prosecuted as a controversial issue in Vietnam that requires further research. Currently, only the commercial juridical person shall be liable for criminal penalties for certain crimes include economic crimes, terrorism financing, money laundering and environmental crimes under the Penal Code of Vietnam 2015 (amended in 2017). It is crucially important to understand current global trends and the attitudes towards corporate criminal liability in different jurisdictions because it is key to preventing crimes committed by corporate. This paper will study both legal theories and practices of corporate criminal liability in Vietnam in comparison with France to identify the key lessons learnt for Vietnam to reform the provisions on corporate criminal liability.

Keywords: *corporate criminal liability, commercial juridical person, criminal law, Vietnam, France.*

1. Introduction

Corporate criminal liability has been stipulated in the criminal law of many countries in the world. In Vietnam before 2015, the concept of corporate criminal liability is still quite new, causing a lot of controversies in research and law-making. Some researchers thought that it is necessary to stipulate the criminal liability of legal person or corporation in accordance with the socio-economic conditions of Vietnam and the goal of international integration. However, some others disagreed because so far in Vietnam, the offences of legal person is still governed by administrative law.

In fact, the legislators believed that corporate criminal liability should be regulated and completely consistent with the crime prevention and control of Vietnam because of some reasons. Firstly, the number of crimes committed by corporate in some fields is increasing recently, especially in environmental and economic areas, causing serious damage to the economy and people's lives. The current Penal Code lacks regulations on corporate criminal liability, causing many difficulties in law application. For example, when the corporate commits a crime, only the corporate representatives have criminal responsibility under the criminal law while the administrative sanctions are imposed on the corporate. The administrative sanctions are not severe enough to deter the crimes committed by corporate in future. Secondly, Vietnam needs to reform the criminal law to fulfil our obligations when becoming members of some international conventions, including establishing corporate

criminal liability. For example, the United Nations Convention against Transnational Organized Crime (UNTOC) requires member states to “establish the liability of legal persons for participation in serious crimes involving organized criminal group and for the offences established following articles 5, 6, 8 and 23 of this Convention”,¹⁸³ which are money laundering, obstruction of justice. As a member of this convention, Vietnam needs to regulated corporate criminal liability in the criminal law to fulfil our obligation. Besides, Vietnam is a member of the Asia/Pacific Group on Money laundering (APG- an autonomous regional anti-money laundering body established in 1997 in Bangkok, Thailand), so Vietnam needs to implement the Recommendation of the Financial Action Task Force on Money Laundering (FATF) regarding the regulation of corporate criminal liability. Thirdly, regulating corporate criminal liability will create equity in criminal law application between a natural person and a legal person. Furthermore, this is a common trend in many countries in the world.

Corporate criminal liability is pretty complicated new issue in Vietnam. Therefore the legislations had learned experiences of many countries which have long governed corporate criminal liability. In 2015, the Penal Code of Vietnam was promulgated formally stipulating the criminal liability of commercial legal entities. This Code was amended in 2017 and took effect on January 1, 2018. Since the January 1 of 2018, corporate can be the subject of criminal liability in Vietnam. Currently, under the Penal Code of Vietnam 2015, only a commercial juridical person shall be liable for criminal penalties for certain crimes, including economic crimes, terrorism financing, money laundering and environmental crimes. The type of corporation that can be imposed a penalty in Vietnam and many provisions of corporate criminal liability are also different from some other countries in the world. Some issues such as the types of corporate, the scope of crime which corporate shall be held criminally liable, or the conditions of prosecuting corporate are still controversial in Vietnam that requires further research, especially comparative law research. This study focuses on comparing the provisions on corporate criminal liability in Vietnam and France. Base on pointing out the similarities and differences between Vietnam and France, the developed country that have regulated corporate criminal liability for a long time, this research will suggest some recommendations to complete the regulations of corporate criminal liability in Vietnam.

The objective of the research is corporate criminal liability under the criminal law of Vietnam and France.

The primary purpose of the research is to suggest recommendations in reforming the regulations of corporate criminal liability in the Penal Code of Vietnam by comparing the provisions on corporate criminal liability in Vietnam and France.

Research questions include:

- (1) What are the provisions of corporate criminal liability in the Penal Code of Vietnam?
- (2) What are the main similarities and differences of corporate criminal liability between Vietnam and France?
- (3) What are lessons learnt for Vietnam to reform the provisions on corporate criminal liability?

¹⁸³ Article 10, United Nations Convention against Transnational Organized Crime (TOC)

2. Method

In order to suggest some valuable recommendations, this article will use the research methodologies: desk reviews, analysis, problem-solving and comparative study for achieving the research purpose.

3. Results

3.1. *The regulation of corporate criminal liability in Vietnam*

3.1.1. *Types of corporate*

The general provisions of corporate criminal liability of Vietnam are regulated in 16 articles from Article 74 to Article 89 in chapter XI of the Penal Code. Besides, some principle articles govern this issue, such as Articles 2, 3, 6, 8, 30, 33. According to the basis of criminal liability in Article 2, “commercial legal entity commits crimes which regulated in Article 76 shall bear criminal liability”. Under these articles, in Vietnam, the corporate type can be subject to criminal liability and shall be liable for criminal penalties for certain crimes is only a commercial legal entity. It means that the corporate shall be imposed penalty must be a juridical person who has the primary purpose is seeking profits and its profits shall be distributed to its members.¹⁸⁴ Currently, the State agencies, political and socio-political organizations, armed forces, the non-commercial legal entity (a juridical person whose primary purpose is not seeking profits and its possible profits may not be distributed to its members)¹⁸⁵ and organizations without legal personality are still not the subject of criminal liability and can not be imposed penalties.

“Article 5. Effect of the Criminal Code on criminal offences committed within the territory of the Socialist Republic of Vietnam

1. The Criminal Code applies to every criminal offence committed within the territory of the Socialist Republic of Vietnam.

It also applies to criminal offences committed on sea-going vessels and aeroplanes having Vietnamese nationality or operating in Vietnam's exclusive economic zones or continental shelves, or consequences thereof”

“Article 6. Effect of the Criminal Code on criminal offences committed outside the territory of the Socialist Republic of Vietnam

1. Any Vietnamese citizen or Vietnamese corporate legal entity that commits an act outside the territory of the Socialist Republic of Vietnam, which is defined as a criminal offence by this Code, shall face criminal prosecution in Vietnam as prescribed by this Code. This clause also applies to stateless residents of Vietnam.

2. Any foreigner or foreign corporate legal entity that commit a criminal offence outside the territory of the Socialist Republic of Vietnam shall face criminal prosecution as prescribed by this Code if such offence infringes the lawful rights and interests of Vietnamese citizens or the interest of the Socialist Republic of Vietnam or under an international agreement to which Vietnam is a signatory.”

¹⁸⁴ See Article 75 The Civil Code of Vietnam 2015

¹⁸⁵ See Article 76 The Civil Code of Vietnam 2015

Article 5 and Article 6 define that foreign corporates could be held criminally liable under the Penal Code of Vietnam if they commit an offence within or outside the territory of the Socialist Republic of Vietnam. In case the offence is committed outside the territory of Vietnam, the foreign corporation shall bear criminal liability if it infringes the lawful rights and interests of Vietnamese citizens or the interest of the Socialist Republic of Vietnam or under an international agreement to which Vietnam is a signatory.

3.1.2. The Conditions for liability

Under Article 75, a corporate shall only bear criminal liability if all of the following conditions are satisfied: (1) The criminal act is committed on behalf of the corporate; (2) The criminal act is committed in the interests of the corporate legal entity; (3) The criminal act is under instructions or approval of the corporate; (4) Still has time for criminal prosecution. That means corporate shall not bear criminal liability for actions of every member of corporate but certain peoples who are considered representative. When the representative commits a crime on behalf of the corporate, in the interests of and under the instructions or approval of the corporate, both corporate and the individual has criminal responsibility (Clause 2 Article 75). The corporate can be imposed criminal liability when the representative commits a crime on behalf of and in the interest of the corporation under the corporate's permissions or instructions. The Penal Code of Vietnam requires to prove four conditions when imposing criminal liability on corporate. However, proving all the conditions in practice has some difficulties. The first condition requires the crime committed by limited persons, only representatives of corporations such as director, president, chairman of the Board, or the legal representative recognized in the company's charter. The second condition determines representatives commit crimes on behalf of and in the interest of the corporate. That means the purpose of committing crimes is for the benefit of the corporate, not for the representative's benefit. The third condition asserts the action of the representative must be under the permission or approval of the corporate.

3.1.3. The scope of crimes for corporate

Corporate shall be imposed criminal liability when all the conditions for liability are satisfied. The Penal Code of Vietnam stipulates corporate criminal liability with the conditions for limits the scope of crimes which corporate can be prosecuted. Currently, according to Article 76, corporate can be held criminal liability for 33 crimes that corporate usually commit include economic crimes, terrorism financing, money laundering and environmental crimes.

The economic crimes which corporate can be imposed criminal liability are 22 crimes, for instance, Smuggling (Article 188); Illegal trafficking of goods or money across the border (Article 189); Manufacture or trading of banned commodities (Article 190); Storage or transport of banned commodities (Article 191); Manufacture or trading of counterfeit foods, foodstuff, or food additives (Article 192); Tax evasion (Article 200).

Chapter XIX of the 2015 Penal Code regulates environmental crimes with 12 articles (from Article 235 to Article 246), of which 09 articles have supplemented the corporate criminal liability. For example, Causing environmental pollution (Article 235); Violations

against regulations on environmental emergency prevention, response, and relief (Article 237); Violations against regulations on the protection of irrigation works, embankments, and works for protection against natural disasters; Violations against regulations on the protection of river banks (Article 238); Import of wastes into Vietnam's territory (Article 239).

When promulgated in 2015, the Penal Code of Vietnam only stipulated 31 crimes for which corporates must bear criminal liability. However, in 2017, Law No12/2017/QH14 on the amendment to the Criminal Code No100/2015/QH13 added two more crimes to the scopes of crimes which corporate can be held criminally liable. These are terrorism financing (Article 300) and money laundering (Article 324).

3.2. Corporate criminal liability in France in comparison with Vietnam

3.2.1. Types of corporate

“Corporate” usually refers to a company, but the definition of this concept in law is broader and has some differences in each country. In this research, corporate means legal person that is the subject of criminal liability. However, the types of corporate shall be held criminally liable are not the same in every country.

In France before 1994, corporate criminal liability was not recognized because of the principle of “*societas delinquere non potest*” (a legal person can not be held criminally liable). However, regulating corporate criminal liability in France was necessary for some reasons. Firstly, both the European Financial Action Task Force (FATF) and The United Nations Commission on Crime Prevention and Criminal Justice have urged the establishment of corporate criminal liability to combat money laundering. In 1988, the Council of Europe asked those member states whose criminal law had not yet provided for corporate criminal liability to reconsider the matter.¹⁸⁶ Besides, France had to implement the requirement of Recommendation No. R (88) 18, adopted by the Committee of Ministers of the Council of Europe on October 20 1988, on the Criminal Liability of Corporate Bodies, set up under the authority of the European Committee on Crime Problems.

Appendix to Recommendation No. R (88) 18:

“The following recommendations are designed to promote measures for rendering enterprises liable for offences committed in the exercise of their activities, beyond existing regimes of civil liability of enterprises to which these recommendations do not apply.

They apply to enterprises, whether private or public, provided they have legal personality and to the extent that they pursue economic activities.

...

3. To render enterprises liable, consideration should be given in particular to:

a. applying criminal liability and sanctions to enterprises, where the nature of the offence, the degree of fault on the part of the enterprise, the consequences for society and the need to prevent further offences so require.”

¹⁸⁶ Orland, Leonard, and Charles Cachera, Fall 1995, *Corporate Crime and Punishment in France: Criminal Responsibility of Legal Entities (Personnes Morales) under the New French Criminal Code (Nouveau Code Penal)*, Connecticut Journal of International Law, vol. 11, no.1, pp.121.

Secondly, the corporation's potential caused more and more significant harm to society therefore, the Government needed to find the solution for controlling and preventing this circumstance. Furthermore, many European countries under the Common law system had recognized the corporate criminal liability to deal with crimes committed by corporations. In 1994, the Penal Code of France was adopted to officially regulate corporate criminal liability for the first time. Under Article 121-2 of the French Criminal Code, a corporation may be held criminally liable for offences committed on their behalf by their organs or representatives:

“Legal persons, with the exception of the State, are criminally liable for the offences committed on their account by their organs or representatives, according to the distinctions set out in articles 121-4 and 121-7.

However, local public authorities and their associations incur criminal liability only for offences committed in the course of their activities which may be exercised through public service delegation conventions.”

According to this Article, all types of corporations can be criminally liable, include all corporations, non-profit organizations, even some (but not all) governmental or State-controlled organizations except the State. However, in some cases, local public authorities and their associations incur criminal liability. They can be imposed a penalty under the Penal Code for offences committed in the course of their activities which may be exercised through public service delegation conventions. Moreover, foreign corporations with establishments in France may be criminally responsible according to Article 113-2 of The Penal Code, and the French jurisdiction will extend for crimes committed outside France in some cases.

Unlike France, the criminal law of Vietnam defines only commercial legal entity can be the subject of criminal liability. Under Vietnamese law, the scope of corporates shall bear criminally liable is limited; therefore, the State agencies, political and socio-political organizations, armed forces, the non-commercial legal entity (a juridical person whose primary purpose is not seeking profits and its possible profits may not distribute to its members)¹⁸⁷ and organizations without legal personality can not be prosecuted and applied criminal sanctions. This difference can be explained on some main points: (1) Regulating corporate criminal liability for the first time, Vietnam needs to take careful steps by limitation the type of corporate can be prosecuted; (2) The goal of applying criminal liability to corporates is to punish and prevent them from committing crimes for profit, therefore applying this provision to commercial juridical person is reasonable; (3) Corporate shall only be held criminally liable for some types of crimes include economic crimes, terrorism financing, money laundering and environmental crimes which commercial juridical person usually commits.

The Conditions for liability

It seems to be obvious that corporate can not think and act as natural person; therefore, determining the conditions for corporate criminal liability is quite complicated.

¹⁸⁷ See Article 76 The Civil Code of Vietnam 2015

There are some ways to prosecute a corporate base on some theories of corporate criminal liability. This article only mentions three of them include: Vicarious Liability, Identification Theory, The Corporate Culture Model.

Vicarious Liability “puts more emphasis on accountability by corporate administrators as an 'agent' of the corporation's actions, based on the employment principle and the delegation principle”.¹⁸⁸ This doctrine defines in some cases, even though a criminal offence might not specifically be made for companies, the law considers it appropriate for a corporate to be held vicariously liable for criminal acts done by its employees or agents. A court might consider that it is appropriate for employers to take criminal responsibility for offences committed by their employees.¹⁸⁹ However, vicarious liability was only used for a small number of offences and later replaced with the identification theory.

Identification Theory is the doctrine that defines the crime committed by certain people in some circumstance as the corporate's action. It means that corporate shall bear criminally liable for the crime committed by the person who controls and manage the corporation. According to this theory, “those who control or manage the affairs of a company are regarded as embodying the company itself”.¹⁹⁰ Therefore, the action and mistake of senior managers are identified as the action and mistake of the corporation.

The Corporate Culture Model is the later doctrine that determines that corporate shall be held criminal liability if the crime is committed because of the corporate culture. “Corporate culture” means “an attitude, policy, rule, course of conduct or practise existing within the body corporate generally or in the part of the body corporate in which the relevant activities take place”.¹⁹¹ Corporate will be prosecuted if the corporate culture which directed, encouraged, tolerated or led to a non-compliance with the relevant provision or that the corporation failed to create and maintain such a corporate culture. In addition, it is sufficient to establish that the Board of directors intentionally, knowingly or recklessly carried out the relevant conduct, or expressly, tacitly or impliedly authorized or permitted the commission of the offence or that a high managerial agent, knowingly or recklessly engaged in relevant conduct, or expressly, tacitly or impliedly authorized or permitted the commission of the offence.¹⁹²

In France, criminal liability can be imputed to corporate when: (1) the criminal offence committed by an organ or representative; (2) the criminal offence must be undertaken on behalf of or in furtherance of the goals and objectives of corporate. In some limited circumstances, corporate criminal liability can occur even without the conduct of an organ or representative.¹⁹³ Generally, the conditions for corporate criminal liability in France base on the content of Identification Theory.

¹⁹² Markus Wagner, 1999, *Corporate Criminal liability: National and International Responses*, 25 Commonwealth Law Bulletin 600, pp. 604.

¹⁹³ Circular, *supra* note 53, 148-49.

The crime committed by an organ or individual legal representatives can rise to corporate criminal liability. The organ means the body of law consisting of one or more individuals to whom the law or the statutes provide a specific function by loading the "administration or management," including the decision-making and representation organs¹⁹⁴ such as the Board of directors or the supervisory Board. The individual representatives who are mentioned before can be directors, managers, general managers and presidents, who are vested, by the law or the bylaws, with the power to administrate, manage and control the corporation. The representatives can also be de facto directors or managers, or persons, vested with the delegation of powers (including employees) or acting within a specific mission for the corporation (such as liquidators). As regards the liability arising out of acts of employees, and given that the delegation of powers does not need to be made in writing, certain Supreme Court cases refer to the status or quality of the employee to determine whether they are acting as "representatives" of the legal person.¹⁹⁵

Moreover, the illegal act must have been committed on behalf of or in furtherance of the goals and objectives of the corporate. However, in fact, even when the corporate did not get benefit from the illegal act, the courts can still impute criminally liable to the corporate if the offense simply occurred in the conduct of its activity, for instance, offenses arising out of failure to act in accordance with regulations relating to safety or supervision. Moreover, in case the offense was not committed for personal interest, the corporate's interest can be considered to exist.

The conditions for prosecuting corporate in the criminal law of Vietnam have some similarities with the corresponding regulations of France. In the Penal Code of Vietnam, the Court can impose criminal liability on corporate if all the following conditions are satisfied: (1) The criminal act is committed on behalf of the corporate; (2) The criminal act is committed in the interests of the corporate legal entity; (3) The criminal act is under instructions or approval of the corporate; (4) Still has time for criminal prosecution. Vietnam has more conditions for corporate prosecution than in France. The corporate can be imposed criminal liability when the representative commits crimes on behalf of and in the interest of the corporation under the corporate's permissions or instructions. The Penal Code of Vietnam requires to prove four conditions when imposing criminal liability on corporate. The first condition requires the crime committed by limited persons, only representatives of corporations such as director, president, chairman of the Board, or the legal representative recognized in the company's charter. The second condition determines representatives commit crimes on behalf of and in the interest of the corporate. That means the purpose of committing crimes is for the benefit of the corporate, not for the representative's benefit. The third condition asserts the action of the representative must be under the permission of the approval of corporate.

¹⁹⁴ Claudia Ghica-Lemarchand, 2012, *The criminal liability of legal persons*, The International Conference Education and Creativity for a Knowledge Based Society – LAW, Titu Maiorescu University, pp.11

¹⁹⁵ Eric Lasry, *Corporate liability in France*, <https://www.globalcompliancenews.com/white-collar-crime/corporate-liability-in-france/>

The conditions for criminal liability of corporate in Vietnam are based on a combination of doctrines of corporate criminal liability. Therefore, these conditions for criminal liability of corporate have both similarities and differences compared to the corresponding regulations in France. The first and second conditions specified in Clause 1, Article 75 of the Penal Code of Vietnam are quite similar to the conditions for corporate criminal liability in France. This similarity is explained by two main points. First, identification theory and vicarious liability are the fundamental doctrines for regulating the conditions for corporate criminal liability in Vietnam. Second, Vietnam regulates the corporate criminal liability later; therefore, it was the opportunity for Vietnam to learn from the experiences of other countries, especially France. However, the third condition mentioned in Clause 1, Article 75, was established close to the content of The Corporate Culture Model doctrine. This condition is quite different from the corresponding in France.

When prosecuting a corporate, the Court has to prove all of the conditions in Clause 1, Article 75. Nevertheless, in practice, proving all the conditions of corporate criminal liability according to the Penal Code of Vietnam has some difficulties. For example, proving the criminal offence committed by the representative under the approval or direction of the corporate in some cases is quite complicated. Usually, this consent or direction is oral, so it is difficult to collect evidence.

3.2.2. The scope of crimes for corporate

When recognizing corporate criminal liability, each country has to establish the conditions and the scope of crimes for which the corporate can be held criminally responsible. The scope of crimes for corporate is different from country to country, depending on its criminal policy and law application.

For the first time stipulating corporate criminal liability, The Penal Code of France limited the scope of crimes in which corporations can be held criminal liability. Section 121-2 of the French Criminal Code is restricted by the requirement that a corporate can be punished for a specific crime, the application of corporate criminal liability is confined to a limited number of crimes which is provided by law or the regulations. However, there was inequality between corporations and individuals. Since December 31 2005 (**Law No 2004-204** of March 9 2004), the words "as provided by law or the regulations" in Article 121-2 were deleted. Thus, the new general principle of corporate criminal liability, which is corporations are criminally liable for all crimes, was made. The main corporate criminal offenses include fraud, bribery, misuse of corporate assets, money laundering, and ^[1]market manipulation offenses.¹⁹⁶

The number of crimes in which corporations can be prosecuted under the Penal Code of Vietnam is less than the crimes for corporate in France. This is quite similar to the previous Penal Code of France (The Code Penal of 1992, which took effect on March 1, 1994) and is different from French criminal law currently. According to Article 76 of the Penal Code of Vietnam, the corporate can only be held criminal liability for 33 crimes that corporate usually

¹⁹⁶ Jones Day, 2020, *2020 Cross-border corporate criminal liability survey*, One Firm Worldwide, pp.57.

commit include economic crimes, terrorism financing, money laundering and environmental crimes. Moreover, unlike France, Vietnamese criminal law have not yet recognized corporate criminal liability for crimes of fraud, bribery and corruption. In addition, only natural person can be imposed criminal liability for such crimes. This is the first time Vietnam has recognized corporate criminal responsibility, so limiting the scope of crimes for which corporates are criminally responsible is appropriate and prudent. France had the same step in the past, like Vietnam, before stipulating that corporate must be criminally responsible for all crimes.

4. Discussion and Conclusion

Although Vietnamese criminal law has officially recognized corporate criminal liability, these regulations are still limited to a certain extent on the type of corporate, the scope of crimes corporate will be prosecuted, and the conditions of corporate criminal liability. These issues are still controversial and sometimes cause difficulties in law application. For example, the scope of crimes which corporate will be prosecuted for only 33 crimes, but there are no crimes of fraud, bribery or corruption. Many researchers believe that expanding the crimes for which corporations can be prosecuted, including bribery or corruption, is appropriate because these crimes are often committed by corporates and can cause serious damage. Besides, as mentioned at the end of section 3.2.2, applying the conditions of corporate criminal liability in practice is quite complicated and difficult. On the basis of the above-mentioned comparative studies between Vietnam and France, some lessons learned for Vietnam are as follows:

Firstly, France consider determining criminal liability for both non-legal entities or non-profits organizations because these organizations can also cause damage in their operation.

Secondly, France regulates corporate criminal liability for certain crimes such as bribery, corruption, fraud or other crimes. These crimes are usually committed by corporate and cause serious damage.

Thirdly, whether they are stipulated in the written or unwritten law, the conditions for prosecuting corporate for criminal liability in France must also be based on certain principles from the fundamental doctrines of corporate criminal liability. Moreover, these conditions will be specifically considered in law-making or law application. Basically, it is not necessary that all the conditions must be satisfied at the same time and for each case, only certain conditions need to be considered and proved to convict a corporate. Sometimes the law may provide for the non-applicability of the general principles in some special cases.

Learning from experiences in law-making and law application of experienced countries as France is very useful for reforming the provisions of The Penal Code of Vietnam on corporate criminal liability. Some recommendations for Vietnam to reform the regulations of corporate liability include:

First, expanding the types of the corporate can be held criminal liability such as non-commercial legal entity, non-profits organization in some cases. Theoretically, all types of the corporate can be imposed criminal liability for the crimes committed by their representatives or members if they were committed on behalf of or for the benefit of the corporate, or under the construction or approval of corporate. In fact, it will be unfair in case

a member of corporate (even if the corporate is non-commercial juridical person or non-profits organization) commits a crime for the benefit or on behalf of the corporate, causing damage, only the individual who commits crimes shall be held criminal liability, but the corporate is not. In addition, it is also inequitable that only commercial legal entities should be held criminally responsible while non-commercial legal entity should not for committing crimes.

Second, expanding the scope of criminal offences for which corporate shall be criminally liable, such as fraud, bribery, or corruption. These crimes are often committed by corporates and can cause very serious damage, but currently, according to Vietnamese criminal law, only individuals to be held criminally responsible even they commit these crimes on behalf of or for the benefit of the corporate, or under the construction or approval of corporate. Prosecuting corporate for the offences mentioned above is completely reasonable and also consistent with international conventions that Vietnam has signed.

Third, applying the conditions of corporate criminal liability need to be flexible; thus, it is necessary to change the way it is prescribed in the current criminal law. In Article 75 of The Penal Code, instead of stipulating that “all of the following conditions are satisfied”, it should be “one of the following conditions is satisfied” or “prove one of the following conditions”. Reforming this article will make criminal prosecution for corporate easier and more effective in practice.

Corporate criminal liability is still a controversial issue in Vietnam with many opinions. The establishment and the promulgation of legal provisions on corporate criminal liability still have many problems. Furthermore, applying the law in practice to prosecute the criminal liability of corporate still faces many difficulties. Reforming the provisions of The Penal Code of Vietnam on corporate criminal liability will help to solve the problems mentioned above. Studying the provisions of corporate criminal liability from the perspective of comparison in Vietnam with the developed country like France will identify the key lessons learnt for Vietnam in law-making and law application. Recommendations from these useful lessons will be able to assist Vietnamese law-makers in reforming the provisions of corporate criminal liability and support the law-applicators in imposing criminally liable on corporate.

PREVENTION OF VIOLATIONS OF LAW ON ENVIRONMENTAL PROTECTION IN INDUSTRIAL ZONES IN THE SOUTH KEY ECONOMIC AREA BY FUNCTIONS OF ENVIRONMENTAL POLICE

Dr. Dinh Anh Tuan

dinhanhtuanbca@gmail.com

People's Police University, Hanoi, Vietnam

Abstract

Many years after the war, Vietnam has implemented the innovation policy and achieved many great milestones and is aiming to become a modern industrialized country with the formation of 04 key national economic zones which is assigned the task of leading, the locomotive for the development process of the whole country. In particular, the Southern Key Economic Zone (SKEZ), chose Ho Chi Minh City as the center of attraction for the development of the whole region, has been and is the area with the largest contribution to the budget compared to other regions. However, the rapid development of industrial zone (IZ) here, has left negative environmental impacts such as: pollution of water, soil, air, noise is increasingly complicated and difficult to control; the number of cases of violations of the law (VOL) on the environment in IZ, in spite of being under control, has increased at times, seriously affecting people's health. Faced with that situation, the Environmental Police force (EPF) with its functions and duties, needs to study and evaluate the status and causes of VOL on environmental protection (EP) in IZ and propose appropriate solutions in the prevention of violations of the law (VOL), contributing to sustainable development of the country.

Keywords: *Southern key economic Region, environmental law violations, industrial zones, Environmental police.*

1. Introduction

SKEZ, Vietnam includes 08 provinces and cities: Ho Chi Minh City and Dong Nai, Ba Ria - Vung Tau, Binh Duong, Tay Ninh, Binh Phuoc, Long An, Tien Giang Province - Region has the fastest growth rate and the most IZ in the country. As of 2019, SKEZ is also the largest foreign investment attraction center in the country with more than 15,000 effective FDI projects; there are 140 IZs in operation. A large system of seaports and international airports supported this economic region to become a center of tourism, to develop all kinds of information technology, telecommunications, logistics services... the largest in the country¹⁹⁷... The development of IZs in the region has been changing the economic landscape of localities, making an important contribution to the economic development of the country. However, along with the development of many IZs without paying due attention to EP, the situation of crimes and VOL on EP is very complicated,

¹⁹⁷ Encouraging the development of Southern Key Economic Zone: <https://www.nhandan.com.vn/tphcm/item/41895702-thuc-day-phat-trien-vung-kinh-te-trong-diem-phia-nam.html>. Access on 19/4/2022.

widespread in most fields, seriously affecting the environment, people's health and sustainable economic and social development.

Faced with the above situation, the author has taken measures in scientific research and assessment of the development of IZs; guidelines, policies and laws of the State of Vietnam in economic and social development in IZs creating the driving force for socio-economic development of localities here. The article also researches and analyzes data to evaluate the basic characteristics of IZs in the SKEZ; statistics on VOL situation on EP in IZs. Thence, the author has evaluated the achieved results, limitations, shortcomings and their causes in the prevention and control of VOL on EP in IZs and proposed solutions to contribute to improving operational efficiency. Preventive action against VOL on EP in IZs in the SKEZ in the coming time according to the function of the EPF.

2. Method

The author uses specific research methods as follows:

- Document research method: By this method, the author researches and acquires knowledge from document sources promulgated by the Vietnamese Communist Party, State, relevant ministries and a number of related scientific works.... thence to draw theoretical problems, then analyze and synthesize documents and data related to the research content. The author also uses the method of analysis and synthesis to record and interpret documents and data that have been processed in the entire research process, thereby synthesizing and evaluating.

- Statistical, comparative and practical methods: With this method, the author makes statistics of the existing works and compares them with the research matters to propose the contents that need to be further researched; statistics of legal documents, guidelines, related to the research matters. Most of the research materials were provided by the EPF and other state management agencies of Ho Chi Minh City, Dong Nai, Binh Duong, Long An and Tien Giang province. The purpose of viewing is in areas where many IZs are concentrated with fewer areas; localities have many VOL on EP with less happening in localities.

3. Results

3.1. Basic awareness of industrial parks in key economic zones

3.1.1. The concept of key economic zones

Currently, in research works, articles, policies of the Vietnamese Communist Party and State referring to regions in general and economic zones in particular was widely used. However, when mentioning to this issue, depending on the research purpose and different approach, then there are corresponding way seeing and evaluating the region. In particular, geography considers "region" to be a geographical unit of the earth's surface. On the other hand, economics understands that "region" is a relatively complete economic unit in terms of economics. Politics for "region" is the administrative unit that performs administrative management. Sociologists consider "region" to be a settlement with similar social characteristics of a community of people (language, religion, ethnicity, culture). In some cases, the terms "region", "locality", "area", "domain", "range" have not been clearly distinguished¹⁹⁸.

¹⁹⁸ Nguyen Xuan Thu – Nguyen Van Phu (co-editor) (2006), *Regional economic development in the process of industrialization and modernization, Monograph, Publisher National Politics, Hanoi 2006.*

In Vietnam, IZs are defined as a part of the national territory of a collection of provinces and cities that have many similarities but cannot develop the same economic and social development between them. Equally, it is necessary for localities to develop ahead of them to form a key economic area, to act as the locomotive for the entire economic zone to develop accordingly, that has formed the KEZ.

Up to now, there are many concepts of the KEZ, but most of them agree that it is the place that fully converges development conditions, has the ability to create competitive advantages, and act as the locomotive of rapid growth to accelerate the development process for themselves and play a decisive role in the national economy, so it can be understood that: *A key economic zone is a part of the national territory including provinces and cities according to the regulations of the Government of Vietnam, converging favorable development conditions and factors, has great economic potential, plays the role of driving force for the overall development of the country.*

3.1.2. Features of key economic zones

After a period of formation, construction and development of key economic zones and the current reality and future development directions, it can be generalized that the KEZ has the following characteristics: the KEZ accounts for a large proportion of the country's total GDP, is the driving force, the locomotive of economic development for the whole country; The KEZ converges favorable conditions such as infrastructure, technical labor, national and regional training and scientific research centers, which have an attractive position for domestic and foreign investors... it has the ability to attract IZs, new industries and key service industries. Thence, its effect is to spread the industrial distribution to the surrounding regions with the function of being the center of a large territory. In addition, another outstanding feature of KEZ is that IZs are mainly concentrated here, so besides the socio-economic achievements, the environmental pollution in IZs matters in KEZ is developing complicatedly, increasingly difficult to control, this is both an immediate and long-term threat and in the KEZs and in each specific location.

3.1.3. Concept and characteristics of industrial zones in key economic zones

3.1.3.1. Concept

In Vietnam, the establishment of IZs has created a great impetus for industrial development, attracting foreign investment capital, strongly promoting economic restructuring in localities, creating jobs for employess, forming new urban areas as well as developing supporting industries and services, tourism. On April 24, 1997, the Government issued Resolution No.36/ND-CP on promulgating regulations on industrial zones, export processing zones and high-tech zones. Thence there comes the concept of IZ: "an IZ is an area where enterprises specialize in manufacturing industrial goods and providing services for industrial production, having definite geographical boundaries, and having no inhabitants; established under the Government or the Prime Minister's decision, there may be an export processing enterprise in an IZ¹⁹⁹. Accordingly, *an Industrial Zone is an area*

¹⁹⁹ Government (2008), Decree No.29 Regulations on industrial zones, export processing zones, economic zones, Hanoi.

specializing in the production of industrial goods and provision of services for industrial production, with defined geographical boundaries, and established according to the conditions, order and procedures prescribed by the Government. This is a concept that is approached from the perspective of State management to serve the management of competent State management agencies with the goal of economic development, ensuring social security... Facts in countries around the world and in Vietnam show that IZs are often invested, built and developed in KEZs because there are converging favorable factors in terms of natural conditions, traffic, human resources and other factors such as policies and regimes of the State for investment and development. This is one of the characteristics to distinguish IZ in KEZ from those built in other regions.

From the perspective of security science, research to serve the prevention of VOL on EP according to the function of the EPF, the IZ of the KEZ can be conceptualized as:

An IZ in a KEZ is an area where many domestic and foreign enterprises invest in the construction and provide services for industrial production, established and operating in accordance with Vietnamese law where environmental law violations often occur, requiring the Environment Police Force to actively grasp the situation, take measures according to their functions and tasks, to serve the prevention of law violations. environmental law, contributing to environmental protection, maintaining social order and safety.

Thus, the IZ of the KEZ approaches from the perspective of security science, prevention of VOL of EP of the EPF, first of all, it is an area where many domestic and foreign enterprises are engaged in processing, assembling and manufacturing activities industrial products for export or domestic consumption. In addition, the IZ is also the place where a lot of waste (wastewater, exhaust gas, industrial waste) is generated in large quantities, potentially causing environmental pollution of land, water, and air, seriously affecting the people's health and life so it is the key areas of the VOL on EP that the EPF needs to focus on preventing and combating.

3.1.3.2. Characteristics of industrial zones in key economic zones

The actual operation of the IZ in the KEZ shows a number of outstanding features related to the prevention of VOL on EP according to the functions of the following EPF:

- IZ in KEZ is area with a defined scope but not an administrative unit. There are clear boundaries around the IZ (with a protective barrier). However, VOLs on EP occur in IZs not only within the IZ but often affect a large area of the population outside the IZ.

- The IZ in KEZ is the place where many factories, enterprises, domestic and foreign companies are engaged in production and business activities with interwoven diverse types. There are a lot of Vietnamese and foreigners here, so they are related to foreign policy, investment, and jobs. The main purpose of businesses is to make a profit. Because there are many domestic and foreign enterprises, investment forms are diverse and complex. These matters have greatly affected the EP nwork because there are specific requirements unlike any other area or location. Therefore, the prevention of VOL on EP must be in harmony with other economic-political requirements in IZs.

- The process of formation and operation of IZs in the KEZ is related to many policies and laws of the State, such as the Law on Investment, the Law on Enterprises, the Commercial Law, the Law on Customs, the Law on Environmental Protection... Ministries, branches and Local authorities also promulgate regulations to manage and guide the implementation. The subject of State management of IZs is the Government, ministries, branches and provincial-level People's Committees operating under the specific "one-stop door, on-site" mechanism. Currently, many localities that want to attract investment have issued preferential policies, including issues related to the environment. It is the involvement of many management subjects, coordination relations, international cooperation, diplomatic issues, etc., which has influenced and influenced the direction and conduct of prevention of legal violations on environmental protection in IZs.

- During the operation of enterprises, there are still many old, broken and outdated equipment and machines for operation and production, which, when used, will cause environmental pollution. This feature also easily raise to factors that can be the causes and conditions of VOLs on EP that the EPF has to carry out effective prevention and control.

- VOLs on EP are mainly caused by enterprises, the harmful consequences are often very serious, especially serious, environmental pollution not only occurs in the IZ but also affects a large area around which is hard to fix. This greatly affects the prevention of VOLs on EP in IZs.

From the above characteristics of the IZ of the Key Economic Zones above, the environmental protection force needs to be aware that: the IZ of the key economic zones are both a key area and area for economic development as well as a complex and frequently occurring area. legal acts on environmental protection. Dealing with the above issues poses a requirement for the environmental police force to implement preventive measures against legal violations on EP in the IZs of the KEZ in particular, in accordance with those characteristics.

3.2. Situation of violations of environmental laws in industrial zones in the southern key economic zone

3.2.1. Characteristics of the southern key economic zone

The SKEZ was established according to Decision No. 44/1998/QĐ-TTg, February 23, 1998 of the Prime Minister, including Ho Chi Minh City and the provinces of Dong Nai, Binh Duong and Ba Ria-Vung Tau. During the Conference of the SKEZ Provinces on June 20-21, 2003, the Prime Minister decided to expand the boundary of the SKEZ, then the Government Office issued the Notice No. 99/TB-VPCP 2/7/2003 on the conclusion of the Prime Minister, including the decision to add 3 more provinces to the SKEZ: Tay Ninh, Binh Phuoc, and Long An. On August 13, 2004, the Prime Minister issued Decision No. 148/2004/QĐ-TTg on "main directions and tasks of the key economic zones up to 2010 and a vision to 2020", the SKEZ includes 7 provinces and cities. By 2009, after adding Tien Giang province, the SKEZ included 8 provinces and cities: Ho Chi Minh City, Ba Ria - Vung Tau, Binh Duong, Binh Phuoc, Dong Nai, Tay Ninh, and Long An. Tien Giang has an square area of approximately 30585.8 km² with a population of approximately 17.2 million people, the population density is roughly 563 people/km², the urbanization rate of the region is 49.6% compared to the whole country, the

region has only 8% of the area and 17% of the population, but for many years now, the region's production has reached more than 40% of the gross domestic product (GDP), the export value accounts for about 40 %, average economic growth is more than 1.5 times, budget revenue accounts for more than 43% of the total budget revenue of the country, attracting 56% of projects and 45% of foreign investment capital into Vietnam²⁰⁰.

The outstandingly relevant feature of the SKEZ is that Ho Chi Minh City is the most dynamic economic and development center in the country, which is considered as the "leading" economic, driving force and leading the whole southern economy; the SKEZ has a large area, large population scale, rapid urbanization rate, and convenient transportation system for economic development; is the place with the fastest concentration of IZs in the country, with high operational efficiency and the largest contribution to national income compared to other KEZs. However, the development of IZs in the whole zone is not in the proper range. Development is more quantitative in breadth than in depth; the development of IZs still lacks planning and synchronization in the whole zone; The development of IZs entails a series of complex, outstanding and urgent problems in environmental protection.

3.2.2. Basic characteristics and developments, structure of violations of the law on environmental protection in industrial zones of the Southern key economic zone

- Basic characteristics of industrial zones:

According to statistics from the EPF of the SKEZ by 2020, the whole zone will have 132 operating IZs (Ho Chi Minh City has 16 IZs; Long An province has 34 IZs; Dong Nai province has 31 IZs; Binh Duong has 27 IZs; Ba Ria-Vung Tau has 9 IZs; Binh Phuoc has 8 IZs; Tien Giang has 4 and Tay Ninh has 3 IZs in operation and more than 50 IZs under construction and expected constructed project). In which, 23 IZs have an area of over 500ha; 27 IZs with an area from 300ha to 500ha; 62 IZs with an area from 100ha to 300ha and 25 IZs with an area of less than 100ha with 5,853 domestic and foreign enterprises investing. Investment in the development of IZ in the SKEZ has changed the economic landscape of many localities, making an important contribution to the overall economic development of the country. However, the development of IZs over the years has revealed many negative sides, unsustainable development, not coupled with environmental protection, has adversely affected the environment, people, ecosystems, air pollution, etc. waste water, solid waste, hazardous waste, environmental incidents have happened such as: Vedan company directly discharge untreated wastewater into Thi Vai river; the case of Sonadezi Long Thanh Company discharging unqualified wastewater into Ba Cheo canal; Hao Duong Tannery Joint Stock Company repeatedly discharged wastes causing environmental pollution in Dong Dien canal as well as many other IZs in the area which are directly or indirectly polluting the environment.

With the number of IZs as above, there are always over one million, six hundred thousand workers, experts, technicians... working and living in the IZs have been discharging a huge amount of household waste into the environment. In addition, the concentration of many people with local characteristics in one place and in a certain period of time has often

²⁰⁰ Phung Ngoc Bao (2021), Accomplishing the coordination mechanism to improve the operation quality of the southern key economic zone, Communist Journal, Hanoi.

caused frequent traffic congestion, noise pollution, and emissions from vehicles... affects the lives and health of workers and people living in the vicinity. Besides, the distribution of IZs is not equal among localities, the number of IZs is concentrated mainly in Ho Chi Minh City, Dong Nai, Binh Duong, and Long An because there are favorable regional connections and favorable conditions. Infrastructure is relatively invested. The provinces with fewer IZs are Binh Phuoc, Tay Ninh, Ba Ria - Vung Tau and Tien Giang. However, these localities are also implementing many preferential policies, so the number of IZs is increasing gradually and attracting about 6,000 businesses to attract investment.

- *Developments and tricks of violating environmental laws in the SKEZ::*

+ *Developments:*

The number of cases of VOL on EP occurring in IZs of the SKEZ detected by the EPF from 2011 to 2020 is 3,526 cases out of a total of 12,772 cases of VOL on EP in the whole SKEZ, accounting for 14.5 %. The analysis shows that the IVOL on EP in the entire SKEZ are common: Violating regulations on wastewater, emissions, noise and causing environmental pollution; violation of regulations on management and treatment of hazardous wastes; violation of regulations on food safety and hygiene; violations of EP work documentation procedures; Violations against regulations on hazardous waste management and treatment...

The number of VOL on EP occurring in IZs tends to increase gradually over time from 2011 to 2017. Starting from 2018, the number of VOL on EP occurring in IZs tends to decrease gradually. However, the structure of legal regulations on EP in IZ still accounts for a high proportion of the total number of legal documents on environmental protection in the whole zone. From 2019, especially in the recent 2020s, due to the serious impact of the COVID-19 pandemic, the production and business processes of enterprises in IZs have stalled, the EPF is also limited. As a result, the number of violations has decreased compared to previous years, but there are still many potential risks and complications about EP in these areas.

However, all cases of VOL on EP were found to be handled only administratively, none were prosecuted criminally although many violations left great consequences for the environment, causing a lot of damage to the people's life. The failure to criminally handle many cases of environmental law violations IZs of the SKEZ is due to the shortcomings of the provisions of the Criminal Law and a number of other legal documents, such as: environmental crimes in the Criminal Law over the period often stipulates the consequences that make it difficult to determine the damage, the consequences often do not happen immediately but have to go through a long time.

+ *Methods and tricks of the VOL on EP occurring in IZs:* are very diverse and complex, but focus on a few methods and tricks as follows: Taking advantage of loopholes in management, inspection and examination of authorities to violate such as: Most of the enterprises have not complied with the requirements in the decision approving the EIA (Environmental Impact Assessment) report or the confirmation of the registration of meeting environmental standards and commitments on environmental protection when prepare an EIA report or a registration of environmental standards of the project showing the following

contents: When treating wastewater, especially without waste treatment equipment, toxic (SO, CO₂, NO₂, HCl...) by absorption method to minimize pollution before discharging into the environment; failing to invest in industrial wastewater treatment systems according to regulations; Waste water treatment does not meet environmental standards...

3.3. Some causes of legal violation on environment protection in industrial zones in the Southern Key Economic Zone

Over the years, although all levels and sectors have implemented a lot of solutions to implement environmental protection in general and in IZs in particular, there have been many results achieved that are recognized by society. However, due to many objective and subjective reasons, the status of VOL on EP in IZs is still complicated. Specifically:

- Most of the production facilities and economic organizations in profit-driven IZs do not strictly comply with the provisions of the law on EP during operation, do not treat or treat waste by different methods to cut costs; production technology in craft villages is very outdated, small-scale production is usually individual households, not enough financial and technical capacity to invest in waste treatment technology; due to limited knowledge and awareness of environmental protection, left by historical practices;

- The current legal system on handling 1 VOL on EP still has many shortcomings, limitations, and lacks, creating loopholes for subjects to take advantage of and commit illegal acts on environmental protection or difficult to handle crimes. Example: Crime of causing environmental pollution is prescribed in a timely manner but still applies only to the act of emitting gas and dust, but not yet for about vibration, noise, smell. Moreover, according to current regulations, the act of discharge must reach a certain amount to be prosecuted for criminal liability, this regulation causes certain difficulties in practice by determining this load with the air environment is relatively complex, possibly beyond the capacity of the prosecuting agency. By adding the provisions of criminal liability of commercial legal entities to the Criminal law so the Criminal Procedure Code 2015 also added a separate chapter to regulate the proceedings for prosecution of the criminal liability of legal entities. However, the regulation is still in principle, and has not been criminally prosecuted for commercial legal entities in the IZs of the SKEZ... Or Decree No. 155/2016/ND-CP (amended and supplemented by Decree No. 55/ 2021/ND-CP) regulations on sanctioning administrative violations in the field of environmental protection show that it is very difficult for environmental protection officers to carry out penalties for violations specified in Article 8; Points b, c, Clause 1, Article 9 and points a, b, c, d, Clause 1, Article 10 of Decree No.155/2016/ND-CP; Although these groups of violations are often found in the production and business activities of enterprises in IZs, because they do not have the authority to impose penalties according to regulations.

- Caused by difficulties and obstacles in the prevention of 1 VOL on EP of local authorities in general and the EPF of provinces and cities in the SKEZ in particular, such as:

- + The situation of many localities rolling out the red carpet to attract investment and focus on economic development while neglecting EP is quite common. The environmental inspection and examination by the authorities for businesses is still a formality, the

phenomenon of "penalty to survive" is still common. The appraisal and assessment of environmental impacts for investment projects are still inadequate and have not been given due consideration, there will still be a situation where many places only carry out a formality, roughly for all procedures.

+ The legal power of the EPF is not really strong enough (the EPF has not been specified as a specialized investigation agency in the People's Police) which will also limit the effectiveness of detection, prevention, fight and handling VOLs on the environment in IZ; The outstanding contingent of officers and soldiers of the EPF of the provinces and cities of the SKEZ were trained from many different sources, so the level of awareness and professionalism is not uniform and inconsistent; The number of staff with skills and knowledge in science and technology, especially in the field of environment, is still limited. On the other hand, the arrangement of cadres in some sections and of the environment police force is not really rational, sometimes it is not suitable with the training expertise and not with the capacity and forte; equipment, technical means, professional services for the inspection, detection and handling of VOL on EP in the coming time have not yet met the requirements of practice. Therefore, in many cases, the EPF cannot detect the sophisticated tricks of enterprises discharging pollutants into the environment, as well as it is difficult to determine the basis for handling environmental violations of the business organizations and individuals in violation in IZs.

- The development and increase of IZ in the SKEZ affects the work of environmental protection: in the coming time, there will be an increase of IZs, accompanied by the massive development of the transportation system, the means of transport, the number of workers will be millions of people, along with the amount of water used for daily life, as well as wastewater, emissions... will be complicated, potentially pose many risks to environmental security; some enterprises have taken advantage of loopholes in management to put into IZ old and outdated technologies and machines when they operated, have consumed a lot of electricity and polluted the water and air environment, noise ... until it can't operate, it wastes a lot of money to repair, destroy or can't handle it, causing environmental pollution.

- The effectiveness of environmental communication and urging the implementation of environmental protection regulations in the IZs of the SKEZ has not brought about the expected high efficiency. The awareness of many business owners to comply with the law on environmental protection is still low. For profit, many business owners have designed and constructed very sophisticated sewers and pipes deep underground to stealthily discharge illegally waste into the environment. They include State-owned enterprises.

- Human resources directly conducting EP inspection and examination are lacking, with limited capacity; funding for the operation has not met the requirements; post-inspection work has not been paid due attention; the assignment and decentralization of EP management in the IZs between the Management Board of IZs and the Department of Natural Resources and Environment is still overlapping and has many shortcomings...

- Thus, it can be seen the situation the regulations on environmental protection in the IZs the SKEZ in the coming time will still be complicated, the operation tricks of the subjects

are more and more sophisticated in order to conceal violations and deputy law enforcement agencies. VOLs on EP in SKEZ are still mainly in the field of waste discharge (wastewater, exhaust gas, smoke, dust, hazardous solid waste) into the environment without treatment.

4. Discussion and Conclusion

4.1. Discussion

Some solutions to improve the effectiveness of prevention of violations of the law on environmental protection in industrial zones in the Southern Key Economic Zone according to the function of the number of Environmental Police Force

Firstly, the police force needs to positively and actively advise the Directors of the Public Security of the provinces and cities as a basis to propose to the Party committees and local authorities in the SKEZ in need of review, adjusting the planning of IZs, planning and land use plan; it is necessary to re-examine the interrelationship between the planning for development IZs and the planning of other socio-economic branches in the zone; IZ development planning should be suitable to natural resource conditions, socio-economic characteristics and market prospects. The planning process must immediately take into account the factors causing environmental pollution and propose solutions to reduce and protect the environment. The establishment and development of IZs must ensure compliance with the approved planning²⁰¹.

Second, the State management agencies, the management of IZs, the EPF need to positively, proactively and regularly coordinate in propagating and mobilizing the masses, officials, employees of the agencies, socio-political organizations, economic units, especially business owners in IZs actively protect the environment. In order to achieve this requirement, first of all, the Communist Party of Vietnam needs to rely on Party committees at all levels and mass organizations to actively disseminate and propagate the law as well as the Party's and State's policies on public affairs. prevention of 1 VOL on EP. Dissemination of information can be carried out in many different forms, such as organizing forums on environmental legislation and environmental pollution in the mass media, communicating to each household, each enterprise, and each institution. production and business establishments, combined with propaganda sessions on occupational safety, health, insurance, salary...

Thirdly, the EPF should recommend to investors that build and trade in technical infrastructure of IZs to accept only projects with modern, high-tech production technology or less polluting; projects applying cleaner production technology, environmentally friendly technology. Based on environmental standards, the investor in business construction and IZ infrastructure develops specific rules on wastewater, emissions, and solid waste to be applied to customers in the IZ. At the sewer lines that collect wastewater from investors, it is necessary to have wells to allow access and sampling, monitoring the flow and quality of wastewater from factories in the industrial park. IZ infrastructure investors need to clearly

²⁰¹Le Thanh Quan, Situation and solutions to protect the industrial environment - A couple of things to discuss: <http://www.khucongnghepchulai.vn/index.php/tin-tuc-su-kien/53-thc-trng-va-gii-phap-bo-v-moi-trng-kcn-oi-iu-cn-ban>. Access: on 11 May, 2022.

agree with contractors on the quality of input water to the wastewater treatment plant, inspection and troubleshooting measures. Enterprises periodically report results of monitoring and control of wastewater quality, emissions, solid waste and hazardous waste management to local environmental management agencies and send reports to management units. industrial park infrastructure. Conduct periodic inspections twice a year for the entire drainage and wastewater treatment system of enterprises to obtain information and provide practical treatment solutions.

Fourth, strengthen coordination in state management of EP for enterprises in IZs: environmental protection forces need to consult with state management agencies on construction investment, licensing, and management activities of IZs must have synchronous coordination among sectors and levels in the field of EP; projects that are licensed for construction must fully comply with EP procedures before being built and put into operation; strengthen inspection, remind and apply strict sanctions against organizations and individuals who frequently repeat offenders such as suspension for a definite time to improve or complete waste treatment works.

Fifth, to renew and improve the professional work efficiency of the EPF; use modern equipment and technology to support timely detection of all VOLs on EP of enterprises; mobilize the masses, workers with the spirit and responsibility of EP working in IZs and adjacent areas to actively detect and notify the EPF of the VOLs on EP of enterprises in the IZs; strengthen inspection and post-inspection for enterprises and production facilities that have many legal complaints on environmental protection and propose strict handling according to law.

Sixth, to build and form a close coordination mechanism between the school's EPF and other forces in preventing VOLs on EP occurring in IZs. Specifically:

- In relation to the professional forces of the Public Security: to closely coordinate with the Traffic Police to arrest the transportation of hazardous wastes; close relationship with the Economic Police force in the use of basic investigation documents in IZs opened by the Economic Police; establish a close relationship between the EPF of the Department and the Department, the relationship with the Police at the IZ Police Stations in exchanging information and coordinating with each other to solve specific problems.

- In relation to state management agencies on environment: PC49 leaders of local police need to direct and command units to directly build close relationships with leaders of related units. When there is a request for coordination, the commanding leader must raise issues directly with the partner unit, promote the effectiveness of the organization, and direct the implementation of the coordination contents.

- Promote international cooperation in crime prevention and environmental law enforcement in IZs. In fact, in the IZs in the SKEZ, there are many foreign enterprises investing, especially the 4 EPZs all have foreign elements, so the problem is international cooperation. In the content of international cooperation, it is necessary to effectively implement international treaties on EP to which Vietnam is a member. In addition, it is necessary to cooperate with countries with advanced science, environmental protection work is respected and experienced

in handling environmental incidents to train staff, transfer technology, sponsor facilities, equipment in detecting and handling acts of environmental pollution.

4.2. Conclusion

Investment and construction of IZs in the SKEZ is one of the objective and important requirements to promote economic and social development of the whole region. Reality has proven that the chapters and policies of the Party and State in investment and construction of IZs in the SKEZ are very correct. The development of IZs has been and is an important factor promoting industrial growth; increase the ability to attract domestic and foreign investment capital in industrial development; receiving new technology transfer, boosting production to increase the source of export goods; create jobs and income for workers.

However, most of the IZs in the SKEZ have multi-industry and multi-field production, so they emit many different types of waste. Due to different reasons, but mainly due to not paying enough attention to EP of enterprises along with shortcomings and limitations in the state management of functional agencies, including the responsibility of the local government. quantity of EPF. In order to take effective measures in environmental protection work in IZs, it is required that state management agencies from the central to local levels in the SKEZ need to base themselves on the general development orientation of the Government. to the specific factors of each locality to develop and issue appropriate guidelines and policies to develop stable and sustainable IZs.

In the face of the above remaining problems, from all levels of government, state management agencies from central to local levels as well as there have been many researches and evaluations on the status of legal documents on EP in IZs of SKEZs from different angles and with different results. However, from the perspective of security science, specifically, the responsibility of the EPF in the prevention of VOLs on EP occurring in IZs in the SKEZ is still lacking and there are no scientific works on security, Police in-depth research in this area. In addition, EPF with assigned functions and roles also need to be proactive, strengthen coordination and advise with local authorities at all levels to issue legal documents to regulate legal acts on EP in IZs in the SKEZ. On the other hand, EP officers need to be proactive and positive in implementing their professional measures to grasp information, documents and developments of enterprises with sign of VOLs on EP in IZs in the SKEZ, contributing to the sustainable development of Vietnam's economy, society and environment. THE COMMUNIST PARTY OF VIETNAM LEADS THE STATE IN THE MANAGEMENT, CONSERVATION AND PROMOTION OF ETHNIC MINORITY CULTURAL VALUES IN VIETNAM TODAY

MSc. Tran Toan Trung

trungtt@napa.vn

National Academy of Public Administration (NAPA), Hanoi, Vietnam

Abstract

Vietnam is a multi-ethnic country with 54 ethnic minorities living together, including 53 ethnic minorities with 14.1 million people (accounting for 14.7% of the total population of the country). Ethnic minorities in Vietnam alternately reside in a large area, occupying a particularly important position in politics, economy, security and national defense. Over thousands of years of labor and production, ethnic minorities have formed and developed their own unique cultural identities, contribute to building a rich and diverse Vietnamese culture imbued with national identity. The Communist Party of Vietnam is the leading force of the state and society, leading in all fields of social life, in which culture and preserving national cultural identity are one of the leadership tasks of the Party's concern. The Party always pays attention to the State leadership in managing, preserving and promoting the cultural values of ethnic minorities, creating endogenous strength to contribute to socio-economic development. The article focuses on studying the leadership process of the Communist Party of Vietnam through the State for the management, conservation and promotion of cultural values of ethnic minorities in Vietnam.

Keywords: *Communist Party of Vietnam, leadership, state, preservation and promotion, ethnic minority culture.*

1. Introduction

The cultural values of people are a measure of the level of development and show the unique characteristics of each nation. Vietnamese culture is the cultural collection of 54 ethnic minorities. Along with the Kinh culture, all 53 ethnic minorities [22] have their own cultural identity. President Ho Chi Minh used to say “For survival as well as the purpose of life, humans have invented language, writing, morality, law, science, religion, and literature, art, tools for daily living in terms of clothing, food, accommodation and methods of use. That whole creation and invention is culture” [13, vol.3, p.458]. He also admonished: “The Kinh or the Tho, the Muong or the Man, the Giarai or the Ede, the Xedang or the Bana, and other ethnic minorities are all descendants of Vietnam and are all siblings” [12, vol. 4, p.217]. The country of Vietnam, in the historical process, is the gathering place of many ethnic minorities, all of which have contributed with the Vietnamese people in the process of building and defending the country. Along with the sustainable community, stemming from their geographical and historical conditions, the ethnic minorities in Vietnam have built unique cultural values.

The cultural identity of a nation is the material and spiritual values that are permanent with that nation. It is distilled and handed down from generation to generation, reflecting and crystallizing the cultural and spiritual life of people. Those are the material and spiritual values that have been accumulated and preserved in the entire history of the nation's development. Ethnic minority cultural values manifest in all areas of social life, from ideas, feelings, conceptions, symbols, ethics, aesthetics, lifestyle to spiritual values created by people such as art, architecture, painting, music... bring to a diverse and colorful cultural picture.

Ethnic minority culture expresses the richness, diversity and uniqueness of Vietnamese culture. This is the merit and creative result of 54 ethnic minorities, a spiritual product born from the sentiments and souls of many communities residing in different geographical and natural circumstances. About the cultural identity of ethnic minorities in Vietnam, it is the richness and diversity in unity: "If the ethnic minorities in Truong Son - Central Highlands have a tradition of making famous tomb statues, has a very rich and unique set of gongs and epic epics... the Cham people in the central coast have temples, stone sculptures, and inscriptions on stone. If the Khmer people in the South have a rather large treasure of Buddhist literature, Buddhist sculpture and architecture, pagodas are cultural centers and many unique festivals, the Tay and Thai people live in the highlands in the North have beautiful stilt houses, a treasure of diverse folklore, rich in genres... But between them, there is a common feature of Vietnamese culture. All belong to a Southeast Asian cultural base. The Vietnamese are the subject ethnic minorities and have many influences on other ethnic minorities. Vietnamese culture is the core, nucleus, and cultural attraction of other ethnic minorities" [10, p.30].

The beauties in the traditional culture of Vietnam's ethnic minorities have ensured the existence and development of those ethnic minorities in history. Those beauties further clarify the unity in the diversity of the culture of the ethnic communities in Vietnam. Vietnam has 54 ethnic minorities, which are 54 colorful flowers in the cultural flower forest imbued with Vietnamese national identity. It is also an invaluable endogenous resource for Vietnam's strength in the process of national renewal, industrialization and modernization of the country, and realizing the goal of rich people, a strong country, a democratic society, and a democratic society.

2. Method

To carry out this research, theoretically, the author bases on the point of view of Marxism - Leninism, Ho Chi Minh's thought, the point of view of the Communist Party of Vietnam on the issue of ethnicity and ethnic minority culture. Regarding the scientific research method, the author uses the method of scientific inheritance from the authors who have studied before; methods of specialized research in history and methods of summarizing and analyzing information and data to give an objective view of the Party's leadership over the State in the performance of conservation management and promotion. Ethnic minority cultural value - one of the ways to ensure cultural rights of ethnic minorities in Vietnam - an important basis for realizing equality among ethnic minorities.

3. Results

3.1. The view of the Communist Party of Vietnam on preserving and promoting the cultural values of ethnic minorities in Vietnam

The Communist Party of Vietnam since its establishment (from 1930 to present), having spent more than 90 years leading the revolution and leading the country, the Party has always been aware that ethnic minority culture and culture is an important factor, an indispensable front in the cause of revolution, construction and development of Vietnam. The preservation and promotion of ethnic minority cultural values has been paid special attention by the Communist Party of Vietnam throughout the process of leading the Vietnamese revolution from its inception to the present.

The Vietnamese cultural outline was born in 1943, marking an important event in the field of culture in general and ethnic minority culture in particular. Right from that moment, the Party's position on the cultural issue was very clear with three major issues: The Cultural Front was one of the three fronts (economy, politics, culture) in which communists had to work; not only political revolution but also cultural revolution; Only when the cultural movement can be led, the Party can influence public opinion, and the Party's propaganda will be effective. There are times when the Party insists that the cultural revolution is very important, even ahead of other revolutions to bring about a comprehensive victory for the Vietnamese revolution.

Immediately after independence, before the chaos of work in consolidating and building the fledgling government, at the Conference of cadres of the Party Central Committee (from April 3 to April 6, 1947) the Resolution was issued, which affirms: "Respecting customs, promoting the capacity of national minorities" [4, vol.8, p.196].

The report of the 4th Central Committee Conference (Second session) stated: "It is necessary to support the cultural and intellectual elements in ethnic minorities so that they can carry out the task of propagandizing in their own nation, and must know how to promote the local dances and songs to entertain and educate the people, making the culture of the nations develop" [5, vol.14, p.117].

The document of the 3rd National Congress of the Communist Party of Vietnam clearly stated: "It is necessary to have a comprehensive and long-term plan for economic and cultural development in mountainous areas... In terms of culture, it is necessary to continue eradicating illiteracy and building ethnic letters in necessary places, etc. to develop national culture" [6, vol.21, p.609-610].

The Resolution of the 4th National Congress of the Communist Party of Vietnam affirmed: "Preserve and promote the good and progressive customs, traditions and cultural traditions of ethnic minorities; to lead and guide ethnic minorities to build a new way of life" [7, vol.37, p.1036].

At the document of the 5th National Congress of the Communist Party of Vietnam, our Party clearly stated: "The new culture harmoniously combines the quintessence with its own style of the ethnic brothers in the great Vietnamese national family" [2, vol.1, p.94].

At the 6th National Congress of the Communist Party of Vietnam, the Party made the point of view: "The State together with the people build the necessary material and technical

foundations for culture and art, preserve and embellish the relics of the history and culture. Completing the collection of cultural and artistic capital of the nations...” [15].

The document of the 7th National Congress of the Communist Party of Vietnam continues to affirm: “Unity, equality and mutual assistance among nations, jointly building a prosperous and happy life, while preserving and promoting the fine identity of each nation is the consistent policy of our Party and State” [9, vol.51, p.104].

At the 8th National Congress of the Communist Party of Vietnam, the Party emphasized: “Culture is the spiritual foundation of society, both a goal and a driving force for socio-economic development... conditions of the market economy and expansion of international exchanges, special attention must be paid to preserving and enhancing the national cultural identity” [16].

The Resolution of the 5th Central Committee (Session VIII) in 1998 marked the great development of culture not only in theoretical thinking but also in its practical value. The Resolution affirmed: “Vietnamese culture is the sum of material and spiritual values created by the Vietnamese ethnic community in the process of nation building and defense” [3, p.20] and “Appreciate and preserve and promote the traditional values of building and developing new cultural, literary and artistic values of ethnic minorities” [3, p.45].

In the document of the 9th National Congress of the Communist Party of Vietnam, the Party continued to affirm: “Implement well the policy of ethnicities’ equality, solidarity, mutual assistance and mutual development;... preserve, enrich and promote the cultural identity and fine traditions of the nations; implement social justice among ethnic minorities, between mountainous and lowland areas” [5, p.127-128].

In the document of the 10th National Congress of the Communist Party of Vietnam, our Party emphasized: “Develop the economy, take care of the material and spiritual life, eliminate hunger and reduce poverty, raise the people's intellectual level, preserve and promote the cultural identity, language, writing and fine traditions of the nations” [8, p.122].

The document of the 11th National Congress of the Communist Party of Vietnam clearly stated: “Continue to build an advanced Vietnamese culture imbued with national identity, preserve and promote the good cultural values of the nation, at the same time absorbing the quintessence of human culture” [17].

At the 12th National Congress of the Communist Party of Vietnam, our Party emphasized: “Improve the quality and efficiency of cultural activities. Mobilize the strength of the whole society to preserve and promote traditional cultural values of the nation;... Build a mechanism to reasonably and harmoniously deal with the conservation and promotion of cultural heritage with socio-economic development” [18].

At the recent 13th National National Congress of the Communist Party of Vietnam, the Party continued to affirm: “Focus on improving the quality and effectiveness of various cultural and artistic forms. There are plans, mechanisms and solutions to properly handle the relationship between preserving and promoting traditional cultural and historical values in human construction and socio-economic development... Paying attention to and creating conditions for the development of culture and arts of ethnic minorities” [19].

For nearly a century, in the process of leading the construction and development of the country, the Communist Party of Vietnam has always paid special attention to and focused on leading the development of the cultural field in general as well as the preservation and promotion of the cultural values of ethnic minorities in particular because this is an invaluable resource of the nation.

3.2. The Communist Party of Vietnam leads the State of the Socialist Republic of Vietnam in managing, preserving and promoting ethnic minority cultural values.

A prominent feature of Vietnamese practice over the past century has been the leading role of the Communist Party of Vietnam in the political arena, as well as in all areas of social life. This is not the will of anyone, the “impression” of a certain group of people, but an objective necessity of history and of the entire Vietnamese nation for the merits and roles of the Party in practice during the past time. As the leading force in the state and society, the Party demonstrates its leadership role through many different methods.

In this article, the author would like to present the leadership method of the Communist Party of Vietnam in preserving and promoting ethnic minority cultural values through the state because a fairly clear feature of contemporary Vietnamese society is the prominent role of the state in all fields as a force leading, regulating and performing tasks of national stature. In the field of culture in general and the preservation and promotion of ethnic minority cultural values in particular, the state has an irreplaceable role in managing national cultural issues in order to ensure advanced cultural development, imbued with national identity and sustainable according to the common goal of the United Nations. Specifically, the Party's leadership method through the state in cultural management and preservation and promotion of ethnic minority cultural values is demonstrated through a number of specific works:

Firstly, the state plays the role of establishing and orienting the development of the nation's traditional cultural values. This role is confirmed when the state distinguishes between what needs to be preserved and promoted and what is backward, outdated and counter-evolutionary in the separate traditional cultural heritage of each ethnic minority which has been specifically prescribed in the legal documents of the Law on Cultural Heritage of Vietnam.

Secondly, with a huge financial resource in hand, the state has conditions to actively invest in cultural development and preserve and promote ethnic minority cultural values. UNESCO's recommendations have stated that: Governments of countries need to invest in culture not less than 2% of total national income [11, p.28]. This is a very high requirement that not all countries can fulfill. In Vietnam, the Tenth Conference of the Central Committee of the Party (IX term) pointed out the need to gradually raise the investment rate for culture from the state budget to at least 1.8%.

Thirly, the state plays an irreplaceable role in solving cultural exchange issues and international cooperation in preserving and promoting ethnic minority cultural values. In this area, the state participates in international discussions to reach consensus on rules, standards and practices at the national and international levels in international exchanges and cooperation. In the context of international economic integration, the state adheres to the

principle of protection for the products of its cultural industry. Because a cultural product is not an ordinary good, it is first and foremost a product carrying the characteristic spiritual value of each group of people and each ethnic minority.

Forth, the state plays the role of guiding the cultural cause and preserving and promoting ethnic minority cultural values to truly become the cause of the entire people, of all ethnic minorities, of all population groups, of everyone. The people really become the creative subject and at the same time the object of enjoyment of cultural achievements and the preservation and promotion of ethnic minority cultural values.

Some results have been achieved in preserving and promoting ethnic minority cultural values in Vietnam

Firstly, the work of collecting, preserving, embellishing, restoring and promoting the value of the nation's cultural heritage has achieved many achievements, meeting the people's demand for diverse cultural enjoyment and creation. Thanks to the right guidelines and policies, 62,283 intangible cultural heritages of 63 provinces and cities have been inventoried, and 288 intangible cultural heritages have been included in the list of national intangible cultural heritages. family (including 145/288 heritages of ethnic minorities – accounting for more than 50% of the total heritage); 05 heritages in the form of spoken and written form... In the period from 2016 to 2020, there have been 3 special national relics, 8 historical - cultural relics, and scenic spots related to the ethnic minorities. ethnic minorities are ranked as national monuments; there are 126 intangible cultural heritages, 276 elite artisans are ethnic minorities [20]... tangible and intangible cultural heritages are recognized at the national, international, and international levels into common heritages of human culture; at the same time become a unique resource of Vietnam tourism..

Secondly, Equal rights among ethnic minorities have been recognized in the Constitution and reflected in the resolutions and policies of the Party and the State. The Party and State's interest in ethnic minority areas is shown in detail. The solidarity between the peoples continued to be consolidated.

Thirdly, Traditional culture, culture of ethnic minorities is focused, invested in development, making a worthy contribution to the cause of conservation, affirming the values and identity of Vietnamese culture. Many cultural movements and campaigns have achieved positive results, contributing to creating a cultural environment, protecting and promoting the fine traditional values of the nation. Culture has made an important contribution to raising people's intellectual level, democratizing social life, enhancing creative dynamism, self-control and social activeness of people.

Fourthly, international cultural exchange and cooperation activities with the region and the world have been expanded, gradually developed in depth, are stable and sustainable, contributing to the introduction, promotion and honor of culture. Vietnam, absorbing the cultural quintessence of humanity. Cultural international integration has many achievements. Many new cultural values and cultural creations of humanity have been received, contributing to enriching and improving the people's spiritual and cultural life. Many cultural events are held to honor and affirm the cultural identity of the nation.

It can be seen that, along with economic resources, natural resources, national defense - security... cultural resources and the preservation and promotion of ethnic cultural values are playing an increasingly important role, govern, influence and directly affect the development of the country.

Some limitations in preserving and promoting ethnic minority cultural values in Vietnam

In addition to the achieved results, in the past time, in leading the preservation and promotion of ethnic minority cultural values, the Party has some limitations as follows:

Firstly, cultural identities of some ethnic minorities are in danger of being deformed and lost due to the pressure of the process of industrialization and modernization; Some backward and superstitious practices tend to develop. Socio-economic changes are taking place very quickly in some areas; a part of young people who are unfamiliar with ethnic cultural traditions, pursuing ideas that are new, but in fact hybrid are a challenge for the process of preserving ethnic minority cultures. The trend of “Kính lize” is a prominent trend in the culture of ethnic minorities today.

Secondly, policies in this field are both lacking, not synchronous, following socio-economic changes, investment projects have both insufficient financial potential and lack of implementation ability when human resources are lack and weak in expertise.

Thirdly, the level of cultural enjoyment is still low and there is quite a distance compared to the plains and developed economic zones, which is a prominent issue in culture and information in mountainous provinces and ethnic minority areas. Many communes do not yet have some basic cultural and information institutions such as commune cultural post offices, commune reading rooms, commune radio stations, places for community cultural activities, limiting the ability to attract people to participate in cultural activities. Meanwhile, cultural activities from the central, provincial and district levels have been brought down to a low level due to lack of funding and ability to organize the implementation.

Fourthly, the socialization of cultural and information activities has been implemented very limitedly in the provinces with ethnic minorities and mountainous areas, still heavily subsidized in the context of the state budget for culture and preserving and promoting ethnic minority cultural values must be spread evenly for all activities.

Fifthly, the staff working on culture and preserving and promoting ethnic minority cultural values is still lacking and weak, has not met the requirements in terms of quantity and quality, there is a shortage of ethnic minority cadres in the management and professional activities.

Sixthly, some party committees have not really paid attention to identifying tasks and solutions to preserve and promote ethnic minority cultural values and tasks; The proposed solution is not suitable with local reality, lacks tasks and breakthrough solutions.

Seventhly, State leadership activities institutionalize the Party's guidelines and policies, showing that the system of policies and laws promulgated by the State is large, but in general, there is a lack of synchronization and overlap.

3.3. Strengthening the leadership of the Communist Party of Vietnam in preserving and promoting ethnic minority cultural values in the context of international integration

Firstly, raising awareness and responsibility of Party committees, key cadres, the state and local authorities and responsibilities of officials and party members from the

Central Committee to grassroots levels for the preservation and promotion of cultural values. Ethnic Minority Culture and Strengthening Party Leadership for the Preservation and Promotion of Ethnic Minority Cultural Values in Vietnam.

Secondly, renewing and improving the quality of activities of Party agencies, cadres and party members from central to grassroots levels to meet leadership requirements for the preservation and promotion of ethnic minority cultural values.

Performing synchronously, creating a clear change, correcting the way and innovating the working method; modernize offices and apply information technology to serve the activities of Party committees, ministries and branches in preserving and promoting ethnic minority cultural values; specific decentralization of responsibilities in preserving and promoting ethnic minority cultural values for localities. Promulgating professional standards and regulations of the ranks of civil servants and public employees of agencies in preserving and promoting ethnic minority cultural values.

Thirdly, formulating, supplementing and perfecting a system of policies and laws for the preservation and promotion of ethnic minority cultural values.

Completing the system of legal documents and mechanisms and policies in preserving and promoting ethnic minority cultural values in a comprehensive and synchronous manner in all areas of cultural life in line with the national guidelines, policies of the Party, State and laws of Vietnam; adjust and supplement issued policies to suit the country's development practice and international commitments to which Vietnam participates; eliminate mechanisms and policies that are no longer appropriate and hinder development.

Fourthly, building a contingent of staff engaged in cultural management, conservation and promotion of ethnic minority cultural values who are capable, qualified, and on par with their duties.

Developing standards and mechanisms for selecting and assigning leaders, managers, and consultants in the field of cultural management, conservation, and promotion of ethnic minority cultural values with sufficient capacity, qualifications and skills. quality of the job. Prioritizing the training of cultural intellectuals for ethnic minorities, ensuring preferential regimes so that they can return to work in the locality. Focus on training knowledge on management and organization of cultural activities for grassroots officials; overcome the shortage of cultural activities cadres in the localities.

Fifthly, strengthening the socialization of conservation and promotion of ethnic minority cultural values

Strengthening the Party's leadership and the State's management of culture and preserving and promoting ethnic minority cultural values, following the principle that the Party leads, the State plays a pivotal role. at the same time, mobilize the potentials and resources of all forces and sectors of society to participate in the creation, provision and dissemination of culture, and to preserve and promote ethnic minority cultural values, create favorable conditions for for these activities to develop strongly, widely, diversify actors, democratize but not commercialize the conservation and promotion of ethnic minority cultural values..

4. Conclusion

Over 92 years of construction (1930 - 2022), the Communist Party of Vietnam has always performed well its leadership role and historical mission to the Vietnamese people, especially through the specific method of state leadership materializing the guidelines and lines of the Party by policies, laws and state management activities. Since the Party led the renovation until now, the socio-economic life of the people of the country in general and of the ethnic minorities in particular has undergone significant changes. The achievements made in the past time have helped the Vietnamese people believe in the leadership of the Party more and more. People's economic life is constantly improving, which is a great influence on changes in the cultural activities of individuals as well as the community, and the trend of international integration is becoming more and more significant impact on preserving and promoting national cultural identity in general and ethnic minority culture in particular. In order to preserve and promote the cultural values of ethnic minorities, contributing to building an advanced Vietnamese culture imbued with national identity, it is necessary to synchronously implement the five solutions mentioned above in order to further improve the leadership of the Party, contribute to the construction of a developed country, a prosperous society, and firmly defend the socialist Vietnamese Fatherland./.

MATERNITY REGIME IN VIETNAM'S SOCIAL INSURANCE AND INTERNATIONAL EXPERIENCE

Lu Thi Mai Oanh

oanhltm@vnu.edu.vn

VNU - University of Education, Hanoi, Vietnam

Abstract

Maternity insurance regime is one of the social insurance's regimes implemented to insure female employees' health and income while performing motherhood including pregnancy, childbirth, and newborn rearing, taking contraceptive measures. Hitherto, Vietnam has had a progressive system of laws and policies on gender equality, ensuring the rights of female workers to access the maternity benefits. However, most women face higher barriers to entering the workforce (such as those doing unpaid work after pregnancy, childbirth, and childcare period), making it difficult for women to be entitled to social security benefits. Therefore, Vietnam needs a specific, multi-dimensional strategy and international experience to improve the status and living quality of female workers today.

Keywords: *Maternity regime, social insurance, international experience.*

1. Introduction

Social insurance plays an important role as one of the main contents of social security, contributing to improving people's living quality, compensating for lost or reduced income during the working process. In the social insurance system, maternity accounts for an important part in terms of scale of implementation, specialised content and workers' needs of participation in society. However, to date, very few studies have examined the impact of maternity policy on women's health and have focused on childbirth (Dagher et al, 2014) in order to complete the maternity regime for female workers. Maternity policies can have a long-lasting effect on a mother's long-term health by preventing or alleviating the stress, difficulty, and pressure of childbirth. Several studies have highlighted that woman who have just given birth to newborns face a high risk of psychiatric disorders including depression, post-traumatic stress disorder, and postpartum anxiety (Brockington, 2004). Research by Wisner et al (2002) highlights that between 10% and 15% of mothers experience depression in the postpartum period and this may increase the risk of subsequent major depressive episodes and other psychotic disorders as they age (Hammen, 2003). Therefore, many countries around the world have conducted long-term studies to evaluate and perfect the appropriate, humane, and effective maternity regime for workers in general and female workers in particular.

In Vietnam, the maternity regime has a fairly progressive system of laws and policies on gender equality. It is very necessary for employees in general and female employees in particular to participate in social insurance in order to ensure their rights when facing risks and determine the employer's legal responsibilities, as well as when facing difficulties through mandatory financial obligation contributions. In 2007, the first year of implementation of the Law on Social Insurance, there were about 2 million turns of people

enjoying sickness benefits, 300,000 turns of maternity benefits, 750 turns of convalescence and rehabilitation benefits (CRB) (Statistical data of the Ministry of Labour, Invalids and Social Affairs). By 2018, there were more than 9.75 million people enjoying the sickness and maternity benefits, the CRB increased more than 4 times compared to 2007. It can be seen that the sickness and maternity regime has great significance for employees and ensuring its appropriateness and transparency are very important. Therefore, the payment of Social Insurance is an alternative guarantee to compensate a part of the income for employees when their income is lost or decreased due to illness, maternity, occupational accident and disease, disability, unemployment, old age, death, on the basis of a financial fund contributed by the parties participating in social insurance, under the protection of the State in accordance with the law, in order to ensure life safety for employees and their families, and at the same time contribute to ensuring social safety (Law on Social Insurance No. 58/2014/QH13).

Maternity insurance is one of the main schemes of compulsory social insurance programs along with sickness, occupational accident, and retirement insurance. This is an important policy that contributes to improving health care for employees, ensuring children's right to care and promoting a sustainable quality of life. However, besides the positive aspects that Vietnam's maternity regime has achieved, there are still some limitations when it comes to the common support framework, compared to some regional and international countries. Therefore, learning from international experience in order to complete the maternity regime will make an important contribution to creating favourable conditions for female workers so that they can feel secure while performing their maternal functions as well as to improving living quality and comprehensive post-natal support for women. Therefore, the article "Maternity regime in Vietnam's social insurance and international experience" will contribute a basis for perfecting the maternity regime, ensuring the wellbeing of female workers during pregnancy and childbirth and childcare; as well as they're not being left behind on re-entering the workplace.

2. Method

In order to provide a comprehensive picture of maternity benefits in social insurance and international experience, the main method of this paper is to review and analyse the literature. The author group uses research from some main sites such as Google scholar, libgen.rs, etc. with some key phrases: "*social insurance, maternity benefits, international experience on maternity regime*". The purpose of the literature review is to find theoretical as well as practical instructions for the author to detect and analyse the research problem. At the same time, the overview analysis of documents helps the author to synthesise the necessary information and data in order to point out the gaps in documentation, theoretical tools, and methods in order to identify new research tools and methods.

3. Results

3.1. Maternity benefits in Vietnam's social insurance

Hitherto, Vietnam has had a fairly progressive system of laws and policies on social insurance in general and maternity insurance in particular in terms of gender equality. The Law on Gender Equality was passed by the National Assembly of Vietnam in 2005, ratifying

most international conventions related to gender equality and women's rights, the most important of which is the Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW). This is partly reflected through the legal system, the Constitution, and other normative documents to create opportunities for women to participate in and enjoy socio-economic development achievements. Social Insurance has been gradually expanded, thereby enhancing physical care and rehabilitation among females, and improving the life quality of female employees, especially through maternity regime, death, occupational accident and disease, unemployment, risks, or other issues.

According to the provisions of the Labor Code, male and female employees are entitled to participate and pay for social insurance equally. Participants in compulsory social insurance are those working under labor contracts of indefinite term, definite term, seasonal or specific working contract with term from 3 months to less than 12 months, including labor contracts signed between the employer and the legal representative of the person under the age of 15; labor contract from 1 month to less than 3 months and other subjects as prescribed in Article 2, Law on Social Insurance 2014. Considering maternity benefits, the Law on Social Insurance stipulates conditions for enjoying maternity benefits for both male and female employees in the following cases - pregnant female employees; female workers giving birth; female workers as surrogates and mothers asking for surrogacy; employees adopting children under 6 months old; female employees using IUDs, employees taking sterilisation measures; male employees who are paying social insurance having wives being giving birth to children. Under the sickness regime, the Law on Social Insurance stipulates that both parents are entitled to work leave to take care of their sick child if the child is under seven years old. The revised Labor Code in 2012 introduced many advanced regulations to protect the health of mothers and children according to CEDAW principles to protect the reproductive health of women, mothers and children, and at the same time create opportunities for babies of breastfeeding in the first 6 months.

In particular, the Labor Code was approved by the 14th National Assembly of the Socialist Republic of Vietnam, 8th session, on November 20, 2019, and the President signed the proclamation Order No. 08/2019/L-CTN December 3, 2019; Effective from January 1, 2021, replacing Labor Code No. 10/2012/QH13. Accordingly, Chapter X of the Labor Code with 8 articles From Articles 135 to 142 presents separate regulations for female employees and ensures gender equality. The content of the articles focuses on the State's policies, the responsibilities of the employer, the rights and interests of the pregnant and child-rearing employee, etc. Accordingly, regulations for pregnant and child-rearing female employees in the 2019 Code inherits a number of provisions of the 2012 Labor Law, emphasizing the views and policies of the Party and State on women and gender equality. When developing the maternity leave regime, Vietnam has shown the importance of legal policies and laws on Gender Equality when approaching most of the Convention on Prenatal Protection, 2000 (No. 183) along with the Recommendation on Prenatal Protection, 2000 (191). Convention 183 extends coverage to all women, regardless of job and type of business including dependent work and increases maternity leave to 14 months. Convention 183 is an important document aimed at protecting the health and well-being of a large number of female workers

and their children around the world. Although Vietnam has not ratified Convention 183, its domestic law has met most of the Convention's requirements.

When it comes to benefits of prenatal and postnatal care, health protection of female employees, Maternity Insurance also emphasizes that it is not allowed to handle labor discipline for pregnant female employees, employees taking maternity leave, female employees raising children under 12 years old. Clause 3, Article 37 of the Labor Code 2019 stipulates that an employer is not allowed to exercise the right to unilaterally terminate a labor contract with a pregnant female employee, an employee who is on maternity leave or raising a child under 12 months age. In order to ensure employment and health for female employees after giving birth, Article 140 emphasizes that, after the employee takes maternity leave, he/she can secure his/her current job without any reduction in salary, rights and benefits compared to these before maternity leave. In case the previous job is no longer available, the employer must arrange another job with a salary at least equivalent to the previous job. However, Article 142 also stipulates occupations and jobs that adversely affect reproductive function and child rearing. According to the 2019 Labor Code, the Minister of Labour, Invalids and Social Affairs promulgates a list of occupations and jobs that adversely affect reproductive function and child rearing for both men and women. Employers offering jobs on this list are obliged to provide full information on the dangerous nature, hazards, requirements of the work and to ensure the occupational safety and health conditions according to the regulations. These regulations show an improvement in gender equality in Vietnam, contributing to upgrading the quality of life, children care and women's health.

3.2. The international situation of applying maternity insurance

At its 35th Session, the General Conference of the ILO was convened by the Governing Body of the International Labour Office in Geneva on June 4, 1952, after deciding to accept a number of proposals on minimum legal norms on social security, on June 28, 1952, the ILO adopted Convention No. 102 - Convention on Social Security (Minimum Standards), marking an important turning point in social insurance in the world. Accordingly, Convention No. 102 on social insurance includes 9 regimes related to social insurance, including medical care; sickness allowance; unemployment benefits; old age allowance; occupational accident or occupational disease allowance; family allowance; maternity allowance; disability allowance; survivor's allowance. In particular, ILO Convention 183 has shown comprehensiveness when it comes to maternity insurance policies and has been participated and studied by many countries around the world. Each country participating in the Convention, depending on socio-economic conditions in each specific historical period, when implementing social insurance in general and maternity insurance in particular, has the right to implement recommendations to different degrees.

Up to now, many countries around the world have also developed maternity regimes based on different studies and criteria. Many studies look at how maternity benefits affect mental health. The results of studies of changes of enactment of maternity leave legislation with time in European countries (Gornick and Meyers, 2003), across a variety of different approaches, have provided evidence of an impact of paid maternity leave time around the

birth of the first child on end-of-life depression. End-of-life depression is a growing public concern. The Global Burden of Disease Report ranks major depressive disorders as the second leading cause of disability (Ferrari et al., 2013). In the United States alone, depression costs \$83.1 billion in economic costs (Greenberg et al, 2003). The prevalence of end-of-life depressive symptoms in European women ranges from 18% to 37% (Castro-Costa et al, 2007). Depression leads to impaired social functioning, decreased quality of life, and an increased risk of health problems (McCall and Kintziger, 2013).

Many countries around the world have made progress in changing eligibility criteria for social insurance programs, including informal workers. For example, Latin America has made notable progress in providing informal workers (primarily domestic workers but some other informal groups) with maternity protection. In Brazil, rural workers and domestic workers were granted maternity leave in 1991. Chile and Costa Rica also granted maternity leave to temporary workers. In Salvador, the government launched a national campaign in 2011 to extend maternity protection benefits to uninsured domestic workers, with the goal of covering 27,000 domestic workers in five years (25%) (ILO 2014b). The program includes the provision of a maternity cash benefit with 100% wages covered for 12 weeks, plus access to outpatient health care services for workers and children under 12 years of age. The program is organized based on monthly voluntary contributions by both callers and employers who are provided with income tax breaks in order to promote adoption rates (ibid.). In the case of health insurance, national governments have expanded social insurance coverage by retreating from voluntary programs, which have proven difficult to get participation.

In general, female workers in the formal and private sectors are better off than those in the informal sector because they often have access to statutory social security schemes, such as health care or retirement benefits. Even so, multifaceted gender inequalities are also prevalent in such systems, with women primarily suffering the negative consequences. Female participation rate in the workforce in ASEAN is much lower than male counterparts. According to the ILO, 81.8% of the male working population participates in the labor market in Southeast Asia compared with 58.8% of women. In addition, women are often paid lower wages, face more barriers to enter the workforce, and are more prone to layoffs after having children and taking maternity leave, retiring earlier, or working at home with no salary. These factors are crucial to women's right to social insurance, especially when benefits are based on contributions accumulated during work (e.g., pension). In addition, benefits may not meet the needs of target groups, especially given the limited number of maternity benefits, mothers are made to return to work earlier than recommended.

3.3. International experience on designing maternity regime in social insurance

The majority of women of working age in Southeast Asia are shorter than men and often receive lower wages. In addition, women face higher barriers when entering the workforce, such as after spending time with pregnancy, childbirth and childcare, doing no-paid housework. This makes it difficult for women to participate in social security benefits. Therefore, Southeast Asian countries have been pursuing complementary strategies to increase social protection for female workers, ensuring female workers have access to social insurance programs in general and maternity insurance in particular.

It can be seen that in the process of completing the maternity regime, countries in the ASEAN region have also shown their efforts in accessing benefits based on the CEDAW convention. Under the maternity regime in Brunei, the 2011 Maternity Leave regulation emphasizes measures to coordinate the needs of mothers pre and after birth, and to take care of mothers' health; at the same time emphasizes an increase in maternity leave from 56 days to 105 days. Regulations on maternity leave will also be extended to the private sector. In Malaysia, it is emphasized that female employees are entitled to a maximum of 300 days of maternity leave during the working period, in which the employee has the right to be flexible in determining the period of maternity leave from 60 days to 90 days to prepare for giving birth. Female employees are also entitled to unpaid leave of up to 1,825 days (5 years) during their employment under the Public Service Circular on Child Care Leave which was effective on September 3, 2007. According to government directives, some private companies such as domestic and foreign banks, through a collective agreement with the National Association of Bankers (NUBE) have extended the period of Paid Maternity Leave from 60 days to 90 days, effective August 10, 2010. Maternity regime in Singapore found that women who quit their jobs because of postnatal care responsibilities may have difficulty returning to the workforce. The Government has partnered with a labor movement to introduce a program called "Back 2 Work With U" to: (i) Support women to enter or re-enter the workforce through recruitment events such as job fairs; (ii) Enhance women's employability by providing training opportunities; and (iii) Help women continue to participate in the workforce by promoting integration between work and life. Maternity regime in Thailand ratified ILO Declaration of Fundamental Principles and Rights at Work, stipulating maximum working hours, revising non-conforming work categories to allow women to work jobs that are not harmful to health. Under the national health coverage program, all people have access to free medical services, including antenatal care. Establishing a women-friendly environment at the micro level or at the workplace such as promoting the establishment of workplace and industrial childcare centres to share responsibility for childcare supports women's participation in the market.

In some developed countries like the US, maternity leave is 3 months and unpaid. IOM's milestone 2001 report, named *Overcoming the Quality Pit*, called for a fundamental redesign of the US healthcare system. The report provides a sound framework for improvement across six aspects of care: An ideal maternity care system that protects, promotes, and supports physiological childbirth and experiences optimal for women giving birth based on shared decision-making and respect for informed choices; provide coordinated, evidence-based care and follow ongoing performance measurement and quality claims; and promote a satisfying work environment for his or her caregivers. In Germany, since the mid-1950s, working mothers are entitled to a paid leave of six weeks before and eight weeks after childbirth, during which they are not allowed to work. During this so-called 'mother protection period', women are guaranteed not to be fired and, when they return to work, they have the right to be placed in a job equivalent to their previous job. The benefits during this period correspond to a 100% replacement rate and are equivalent to the average income of women in the three months before childbirth. This pre-reform setting is, to some

extent, comparable to the current maximum of 12-week unpaid and job protected leave in the US (under FMLA), and a minimum of 14 week of paid leave with job protection in the EU. Specifically, female employees are entitled to a total of 14 weeks of maternity leave, 6 weeks before giving birth and 8 weeks after giving birth. Maternity leave is divided into maternity leave of the mother and parental leave of both parents, the longest period of leave lasts until the child turns 3 years old, including 1 year of paid leave.

The Swedish maternity system emphasizes maternity leave that lasts several years and is divided between both parents. Female employees are entitled to a 7-week leave before the due time, and both parents are allowed to stay at home to take care of their children until the child is 1 and a half years old. When the child turns 8 years old or finishes primary school, parents can get a $\frac{1}{4}$ reduction of the working time, both parents can receive 480 days of allowance, whose amount is equivalent to 80% of the actual income before taking leave. In addition, a number of other developed countries have also shown interest in gender equality in improving the quality of maternity insurance for female workers. In the UK, a pregnant woman can take 26 weeks off, 11 weeks before her due date and her husband can take 2 weeks, the first week receiving basic salary and the second week receiving government allowance. In case the wife does not take full maternity leave and has returned to work, the husband can continue to take the wife's leave. In Denmark, each couple is entitled to a total leave of 1 year when giving birth. Accordingly, the mother's leave is 18 weeks and the father's are 2 weeks; The remaining 32 weeks are divided equally between the couple. In Canada, women giving birth are entitled to 17 weeks of leave and the leave will be extended to 35 weeks divided by both parents. The government also provides a monthly allowance to help families raise children under the age of 18. Similarly, in France, postpartum women are entitled to 16 weeks of leave and receive 100% of their salary; The husband is also entitled to 11 consecutive days of leave after his wife's childbirth. The mother is also allowed to take leave and reserve her job and income for up to 3 years to stay at home for the sake of childcare and receive childcare allowance and other allowances. Agencies and enterprises will not be allowed to fire female employees after their giving birth...

4. Discussion and Conclusion

Maternity benefits are a great source of income, as family costs increase dramatically when babies are born. Therefore, maternity insurance is an essential support for a mother's physical and psychological health. From a broader societal perspective, the economic costs of childbearing should not be disproportionately borne by women and families, but should be shared among families, employers, and society in general. Compared with many countries in the world, Vietnam has a fairly progressive system of laws and policies on gender equality, ensuring the rights of female workers to access the maternity regime. Accordingly, the Law on Social Insurance has many advanced regulations related to gender equality, considering the care and protection of the rights of men and women. It can be seen that the maternity regime in social insurance has introduced many advanced regulations to protect the health of mothers and children according to CEDAW principles. However, to build a more complete maternity regime, Vietnam also needs to refer to the experience of international countries.

Maternity insurance in social insurance has an important meaning to increase the participation of female workers in the labor market and protect women's rights and interests during working time and after maternity leave. International experience in building maternity regimes of countries in the ASEAN region and outside ASEAN shows that the distribution of maternity benefits is uneven across countries. In some developed countries such as the US, the maternity regime for female workers has not been presented equally and comprehensively. However, in some other developed countries such as Sweden, Denmark, UK, Germany... and countries in ASEAN such as Singapore, Thailand, maternity regime is implemented based on international criteria and has recorded many achievements. Maternity insurance will encourage employers to employ women, as a result, promoting the role of women in the labor market. However, unequal care and responsibilities within the family have great impacts on access to and benefit from social insurance programs in terms of women's ability to contribute financially to programs when they do not participate in the labor market, as well as other issues such as the time involved in the application and insurance claims processes. Therefore, while it is important to recognize and value the reproductive role of women, it is also important to support paternity or paternity leave (UN Women, 2015). This requires comprehensiveness in the introduction of measures to promote gender equality more broadly (UN Women, 2015). Several insurance plans, including microinsurance services, have attempted to address women's time constraints by providing geographically close service and investing in distribution mechanisms, such as using agricultural extension agents and field staff, to support women in the application and insurance claim process... Therefore, with an aim of building a comprehensive maternity regime, ensuring gender equality and especially protecting female workers during pregnancy, childbirth and child-rearing, Vietnam needs a specific strategy, multi-dimensional approach, and international experience to improve the status and life quality of today's female workers.

Abstract

In building a socialist-oriented market economy, the State plays a particularly important role. The State must perform economic management functions both to ensure that the economy operates according to the market mechanism in a correct and effective manner, but at the same time always maintain the socialist orientation in the country development and economic growth. Researching and clarifying the functions of state management of the economy in the socialist-oriented market economy; Achievements and limitations in the process of performing these functions are extremely necessary and meaningful because this is the basis for the Party and State to develop solutions to improve and better implement these tasks this function, thereby improving the capacity and effectiveness of state management of the economy in our country today.

Keywords: *Socialist state, function, market economy*

1. Introduction

The state's function in managing the market economy is the most general activities that the state must perform to achieve the set goals, answering the question: What must the state do? The specific content of the state's functions in the management of the market economy is not fixed but has been mobilized and developed to suit the objectives and requirements of the periods. Under specific conditions, due to changes in goals and socio-economic conditions, the roles and priority order of functions may have certain changes little change. The 12th Party Congress also affirmed: "The State plays the role of orienting, building and perfecting economic institutions, creating an equal, transparent and healthy competitive environment; use tools, policies and resources of the State to orient and improve the economy, promote production and business and protect the environment; implement social progress and justice in each step and development policy". The 13th Party Congress affirmed: "The socialist-oriented market economy is the general economic model of our country during the transition to socialism. It is a modern economy with international

integration, fully and synchronously operating according to the rules of the market economy, under the management of the socialist rule of law state, led by the Communist Party of Vietnam leadership, ensuring the socialist orientation for the goal of rich people, strong country, democracy, justice and civilization"²⁰².

2. Method

The article uses document collection methods, document reading and data analysis, synthesis, comparison, generalization, take into consideration

3. Results

3.1. The role of the state in managing the market economy

The function of state management of the economy in our country today according to the requirements of serving political and socio-economic tasks of each period, the prioritization and the specific content of the functions subject to change, specifically:

Firstly, the function of creating the environment and conditions for business activities

Creating a business environment and creating favorable conditions for business activities is one of the basic conditions for promoting the strong development of the market economy. The business environment is the necessary conditions for individuals, organizations and businesses to feel secure, trust and willing to invest capital in business. Historically, according to J.B. Say (1766-1832) upholding the role of the state in creating a favorable environment for wealth, he said that the state only stopped at the level of ensuring social welfare (constructing public works) public works or preserving security and sovereignty). Therefore, such conditions can only be made and guaranteed by the State. Through the law and policy system, the State creates a safe legal corridor, encouraging all individuals and organizations to freely do business in all fields not banned by the State. The Resolution of the 13th Party Congress sets out three strategic breakthroughs suitable for the new period, in which the first strategic breakthrough is: "To perfect synchronously the development institution, first of all the development institution socialist-oriented market economy Renovating national governance towards modernity and effective competition Focusing on prioritizing perfecting synchronously, having quality and well organized implementation of the legal system, mechanisms and policies, creating a favorable, healthy and fair investment and business environment for all economic sectors, promoting innovation and creativity; effectively mobilizing, managing and using all resources for development, especially land, finance, public-private cooperation; promote decentralization and decentralization in a reasonable and effective manner, and at the same time strengthen inspection, supervision and control of power through the legal system the law"²⁰³.

With the supreme and unifying power given to society by society, only the State is able to build and ensure a favorable and equal environment for production and business

²⁰² Communist Party of Vietnam (2021), Documents of the 13th National Congress of Deputies, Volume 1, National Political Publishing House Truth, pp.128

²⁰³ Communist Party of Vietnam: Document of the 13th National Congress of Deputies, Volume II, National Program Publishing House ST, H., 2021. pp. 337-338.

activities, while also ensuring the environment. the right environment for the new mechanism that is forming, developing and bringing into play. This function of the State is performed specifically as follows:

- Building a stable political environment, really promoting the resources and creativity of the people and businesses.

- Building a stable legal system, creating a favorable legal environment, suitable for the development of the market economy and international integration.

- Build and perfect infrastructure for the economy to move and develop smoothly, including traffic systems, roads, railways, airways, electricity and water, cultural and communal infrastructure associations, information infrastructure...

- Building and perfecting the information environment. The State must be the center that provides the most reliable information for businesses on a regular, timely and accurate basis...

- Building a cultural and social environment suitable for the market economy.

- Ensuring the security of property and life for the production and business world by effective means and forces of the State.

Second, the function of guiding the development of the entire economy

This can be seen as the most important function of the State in managing the economy. In fact, most of the instability of countries in the current context, especially for developing countries, comes from the weakness and limitations of the state in orienting the economy. The State determines the direction and direction for the development of the economy on the basis of perception and application of objective laws and also on the basis of the socio-economic development goals set by the country. .

For the process of developing the market economy in our country today, the guiding function of the State is especially important because this is a prerequisite for the economic development process not to deviate from the socialist direction. That also means determining the ultimate goal of economic growth and development is to improve and enhance the material life of the people towards the realization of the common goal of socialism as the people rich, strong, democratic, fair and civilized country. Thus, in this function, the main responsibility of the State is through tools such as strategies, planning, policies, plans, information and resources of the State to guide business people economic organizations operating in line with the common goals of the country.

Third, the organizational function of managing the economy

With this function, the State must carry out specific and direct activities for the economy in order to create a regular and synchronous management framework, create and maintain a reasonable economic structure, ensuring the stable development of the macro-economy. Specifically, the State needs to perform the following tasks:

- To rearrange and re-organize economic units, of which the most important and urgent is to rearrange and strengthen state-owned enterprises, to organize economic zones, industrial parks, and export processing zones to create a reasonable economic structure;

- Reorganize the management system, rearrange the state management agencies in charge of the economy from the central to the grassroots level, renovate institutions and administrative procedures, train and re-train, re-arrange the staff the ministry of civil servants in state management and enterprise management;

- Ensuring major balances of the market economy such as total supply - aggregate demand, export - import balance, budget revenue - expenditure balance, etc., ensuring macroeconomic stability of the economy market;

- Establishing economic relationships with countries and international organizations....

Fourth, the function of regulating the economy

While operating the socialist-oriented market economy, the State must both comply with and apply the objective laws of the market economy in order to promote the positive aspects of the market mechanism, at the same time must use the tools of their power to regulate the activities of the national economy according to the orientation of the State, ensuring the stable, fair and efficient development of the economy. To regulate the economy, the State must use a series of measures including:

- Developing and implementing a policy system with policy impact tools: financial, monetary, income and trade policies;

- Supplementing goods and services to the economy in necessary cases: the private sector cannot or does not want to do it (especially in the field of providing public services);

- Support people to set up economic business: Build preferential investment banks, develop and implement the production and business insurance regime...

Fifth function check, control

In fact, the State's inspection and control function in a market economic order is especially important, especially for a newly developed, primitive market economy with many phenomena negative, disorderly and spontaneous development in many areas as in our country today. The State performs this function in order to establish order and discipline in economic activities, detect and prevent phenomena of law violation and policy violation, and protect national property and interests of the State people, contributing to economic growth and gradually realizing social justice. In order to ensure compliance with the law, protect public assets, overcome defects of the market economy and create a healthy competitive environment for state business and production activities, it is necessary to strengthen inspection work, control. The main content of this function focuses on the following tasks:

- Inspect, control and handle violations in the activities of market participants in the implementation of the State's guidelines, policies and laws on the economy;

- Inspect, control and handle violations in the activities of the State's economic management agencies and officials and civil servants.

At present, the State's functions must demonstrate and ensure that it is truly a constructive State, that the State serves businesses and the people. The State must encourage, support, protect and protect the economic entities, for the people to do business in accordance with the law.

3.2. The actual situation of performing the function of state management of the economy in the socialist-oriented market economy in our country over the past time

**** Achievement***

In recent years, the implementation of state management functions on the economy in the development of a socialist-oriented market economy has achieved many remarkable achievements. Specifically:

Firstly, the State's management and administration of the market economy is more and more realistic and effective. Basically, the State has established a legal framework to ensure the management of the economy based on law in all fields. As a result, it has partly created a stable, equal and safe business environment, contributing to encouraging all individuals and organizations in all economic sectors to confidently participate in investment, production and business, promoting strong economic growth. In addition, the State has also implemented a series of specific policies to effectively support production and business activities.

The economic orientation function of the State has always been maintained and implemented more and more effectively. As a result, the goal of socialist orientation for the entire economy at each specific period is always maintained; businesses and entrepreneurs in the economy get a complete overview of the overall national economy, the country's general economic development strategy, the movement trend of the economy, of the market... so that they can actively plan their own activities, avoid losses, failures, breakdowns, and general damage to the economy.

The State's economic organization and management function has also achieved many great achievements: The government structure is becoming more and more compact; The functions, tasks and organizational structure of State agencies from central to local levels are adjusted and arranged appropriately, ensuring better and better state management of the economy in the new conditions. Administrative procedures and operations of state administrative agencies are renewed; the contingent of cadres and civil servants in the state management of the economy has been increasingly strengthened. The rearrangement and reorganization of important sectors, fields and economic zones, including state-owned corporations, corporations, state-owned enterprises, industrial parks and export processing zones, has many steps. Thanks to that, the economic structure is changing in a more and more reasonable direction. The process of international economic integration is accelerating we are increasingly expanding and establishing economic relations with many countries and territories around the world as well as signing more and more bilateral agreements multilateral and multilateral in the economic field...

The use of economic management tools (mainly fiscal policy, monetary policy) to regulate the market economy instead of administrative interventions has made much progress relatively stable economic development. Basically, we have maintained our strategic goals in developing the national economy, maintaining macroeconomic balances, stabilizing and developing the economy, and partly responding to and reducing minimize the negative effects of the economic cycle...

Second, the State's function of checking and controlling the economy is also being performed better. As a result, in many cases, the State has timely: detected and prevented mistakes of market participants; ensure the strictness of the law in economic development; protect the national property and resources and the people's interests; maintain the confidence of the government and foreign investors in the purity and fairness of the domestic economy...

The fact that economic achievements have been achieved after more than 30 years of conducting the renew process is the clearest proof that the State has been performing well its economic management functions to a certain extent. As a result: The economic growth rate, in general, is constantly being improved; The size and potential of the economy continues to increase; The structure of economic sectors continued to shift towards promoting the potentials of all economic sectors: State-owned enterprises were rearranged, renewed and reorganized, contributing 38.4% of GDP, dominating many industries key economic sectors and focus more on key sectors of the economy. Private enterprises develop quite quickly, operate effectively in many fields, contribute 45.7% of GDP make an important contribution to socio-economic development, especially in job creation and improvement improve people's lives; The structure of industries and fields has changed markedly in the direction of industrialization and modernization, the proportion of industries and services has continuously increased; The economic structure of the region has been adjusted in the direction of bringing into play the advantages of each region, key economic zones, industrial zones, economic zones and specialized production areas for crops and livestock are developing quite well rapidly, making an important contribution to the growth of the economy; Total social investment as well as the ratio of social investment capital to GDP increased continuously and remained at a high level; Economic growth is always associated with progress and social justice in every step of development, people's average living standards are raised, social security is increasingly expanded: the proportion of investment from the bank State budget for social security accounts for about 28%/year. Resources mobilized from the community, individuals, businesses, economic organizations, social organizations and international cooperation for social security account for about 30%; International economic integration is deepening: in terms of bilateral cooperation, Vietnam has established diplomatic relations with 170 countries around the world, expanded trade relations, exported goods to over 230 countries and territories, signed over 90 bilateral trade agreements, nearly 60 investment promotion and protection agreements...; Regarding multilateral and regional cooperation, Vietnam has a positive relationship with financial and monetary institutions such as the Asian Development Bank, the World Monetary Fund, the World Bank, etc²⁰⁴

²⁰⁴ See Dinh The Huynh, Phung Huu Phu, Le Huu Nghia... (Co-editor): 30 years of innovation and development in Vietnam, National Political Publishing House, Hanoi 2015, p. 102-112.

* Limit

In addition to the achievements, the process of performing state management functions on the economy also has many limitations and shortcomings. Specifically:

The State has not really created a business environment to ensure fair and healthy competition among enterprises of all economic sectors. There is still a ask-for-give mechanism and "favours" for state-owned corporations and enterprises, which should create a virtual environment for these businesses. The legal system, infrastructure system, information environment, socio-cultural environment... suitable and serving the development of a socialist-oriented market economy still have many shortcomings really make new entrepreneurs feel secure to invest capital and develop business smoothly and stably.

The state's function of guiding and directing the economy has not really taken effect: The investment is too large for the state economic sector with the expectation that this economic sector will become the core of the economy, leading the remaining economic sectors to follow the socialist orientation did not bring the expected results. Strategies, master plans and plans for economic development by industry, region, and product have many unreasonable points. Policies to support and encourage industries and fields that are beneficial to the strategic goals of the economy as well as to limit unprofitable sectors and fields are slowly promulgated...

The organization of the state management apparatus is still heavy, the relationship of assignment and cooperation is not clear and there are still many obstacles; corruption, wastefulness, bureaucracy, and fragmentation are still serious; State cadres and civil servants still have many limitations in terms of qualifications, capacity and quality, not commensurate with the requirements of their tasks.

The use of macroeconomic management tools to regulate the economy is still formal, legal and imposed. The decentralization and decentralization of management authority in the system still have many shortcomings and problems. Regulation of budget revenue and expenditure, regulation of money circulation, regulation of savings - investment, regulation of export - import balance is still limited...

State inspection and control in economic development is not comprehensive, unified, and lacks publicity and transparency; There are still many loopholes in the supervision mechanism of economic groups, creating abuses of power by corporations; the strictness of the law at many times and places has not been guaranteed; detecting and handling violations in the operation of agencies and officials and civil servants in economic management of the State is still limited...

In general, the effectiveness and efficiency of state management of the economy has not met the requirements of developing a socialist-oriented market economy, has not brought into full play its positive aspects, and has limited spontaneity negative, defects of the market economy. Because of that, in recent years, our country's economy has faced many difficulties and challenges. The macro-economy is stable but not yet firm; economic growth is fast but not sustainable; the economic structure's transformation is

still slow; human resources and infrastructure for economic development have not been synchronized; laws, mechanisms and policies for economic development are few but overlapping and contradictory in many places; the distribution mechanism is still unreasonable; resource allocation is still spread; International economic cooperation has only grown in breadth, not really in depth....²⁰⁵

Thus, it can be affirmed that the 13th Party Congress, on the basis of summarizing 35 years of national renewal, especially from the 9th Congress (2001) up to now; 10 years (2011 - 2020) of implementing the socio-economic development strategy and more than three years of implementing Resolution No. 11 - NQ/TW dated June 3, 2017 of the 5th Plenum of the 12th Central Committee, added, raise the level of guidelines, viewpoints, tasks and solutions to complete and improve the quality of institutions to develop the socialist-oriented market economy fully, synchronously, modernly, and integrate... These views, tasks and solutions come to life, on the basis of a deep grasp of the contents, a unified perception and action of the entire Party, people, army and political system with high and decisive political determination, the National Assembly's Party Committee directed the development and completion of the legal system and supervised the implementation. The Government Party Committee shall direct the formulation and organize the successful implementation of action plans, strategies, master plans and plans, ensuring the promotion of advantages and effective use of all resources for the country rapid and sustainable development.

In order to do well the set goals, first of all, re-perceive the roles and functions of state management of the economy, and perform well the assignment and decentralization in the performance of functions. Continuing to be aware of the role and function of state management of the economy in the socialist-oriented market economy, clearly distinguishing it and placing it in relation to the functions of the market, the function of enterprise; Secondly, well handle the relationship between the leadership of the Party and the State management of the economy, between the management of the State and the business administration of enterprises. It is necessary to be aware of and clearly distinguish between the leadership function of the Party and the function of state management of the economy; Third, well implement the principle of democratic centralism in the state management of the economy; Fourth, concentrate all resources to well implement three strategic breakthroughs: perfecting the socialist-oriented market economy institution; building infrastructure systems and improving the quality of human resources. Fifth, improve the quality and efficiency of international integration, promote the application of the results of the fourth industrial revolution; Sixth strengthen inspection and handle

²⁰⁵ See Dinh The Huynh, Phung Huu Phu, Le Huu Nghia...(Co-editor): 30 years of innovation and development in Vietnam, phone number, p. 122-123.

violations. Strengthen inspection, supervision, preliminary and final review; promptly detect and properly deal with major, important and complex socio-economic problems of the country. Strengthen coordination and control of power between the legislative, executive and judicial branches; Saturday reforming state governance, building a constructivist State. Renovating the mode of state governance; properly and fully perform the State's functions in the market economy. Managing the economy not only ensures short-term goals, but also aims to realize medium and long-term goals. Improve analytical and forecasting capacity, especially strategic forecasting. To fundamentally and comprehensively renovate the formulation and implementation of socio-economic development master plans and plans, public investment and public finance really according to the market mechanism, to overcome the situation of "please - give", subjective, will-only.

4. Discussion and Conclusion

During the renovation period, our country changed from a centrally planned and subsidized economic model to developing a socialist oriented market economy. This is a completely correct policy of the Party to create the impetus to bring our country out of the serious socio-economic crisis in the 80s of the twentieth century. This transformation of economic model also means that it is necessary to fundamentally renew the function of state management of the economy.

The economic management functions of the State in the process of developing the socialist-oriented market economy in our country today are specifically expressed in such points as: The State orients the economic development - society by means of economic development, strategic forecasting, planning and planning. The state establishes order for the economy by means of a legal system and sub-law documents. The State creates conditions and environment for production and business; First of all, maintaining a stable political environment, creating trust as well as ensuring the safety of businesses' operations. The State regulates through policies and macroeconomic instruments such as stabilizing the currency, controlling inflation, balancing the balance of payments domestically and internationally ensuring sustainable and stable economic growth. The State builds infrastructures such as transportation and communication systems and invests in training human resources for economic development. In the past time, besides the achievements, the process of performing the state management function on the economy still has many limitations and shortcomings. This is one of the basic reasons why our country's economy has not achieved the goals set by the Party and State. On the basis of studying the actual state of performing the function of state management of the economy in the socialist-oriented market economy with all its achievements and limitations, the Party and State should continue to build a system of solutions to improve and better perform these functions. This is also a prerequisite for our country's economy to grow rapidly, stably and sustainably, and to keep the socialist orientation in the process of development.

Abstract

Innovative work behavior, which is an essential part of supporting individuals in finding and coming up with new and unique ideas for the organization, is the key to improving work productivity and creating a competitive advantage. Each employee with a distinct personality trait, however, shows different levels of efficiency. Therefore, this research aims to study and point out the difference of demographic variables on employees' innovative work behavior in Vietnamese organizations. To draw an accurate conclusion, the authors conducted a survey among 397 employees working in many types of organizations in Vietnam. The research has determined that gender, age, and income are three variables that make differences in the implementation of innovative work behavior of employees in Vietnam. Based on the results, recommendations are made to assist organizations in developing appropriate recruitment, selection, and training plans.

Keywords: *Innovative work behavior, demographic, Vietnam*

1. Introduction

The world is increasingly developing thanks to the guidance of Industry 4.0, and the strong impact of the Covid-19 pandemic on the global social economy requires organizations to adapt fast. The need for change is also climbing due to the rapidly increasing competition. The more severe the competition is, the more unique the organization has to be to overcome the rivals. And to have that uniqueness, organizations must carry out the process of continuous innovation, improving old ideas and developing new ones.

Innovation is considered the most fundamental element to the success and survival of every enterprise (Abbing, 2010). Apart from gaining competitive advantages, innovation

helps boost their work efficiency. This allows them to easily reach more customers and build market dominance. To public organizations, innovation helps strengthen and complete the mechanism, and it helps them work more effectively. Innovation also aids organizations to utilize their strengths and improves their weaknesses.

Various researchers found that innovative work behavior of employees is one of the main factors in contributing to the organization's modernization and work efficiency enhancement (Janssen, 2000; Mumford, Scott, Gaddis, & Strange, 2002). Individuals with innovative work behavior tend to be more creative and they dare to propose to apply it in practice (Janssen, 2000).

However, each individual has their own traits, so do their innovative mindset and creativity. (Tuominen & Toivonen, 2011) showed that each employee has a different skill level regarding innovative work behavior. (Ng & Feldman, 2013), for example, reported about the impact of age and seniority on innovative work behavior. They realized that to a certain extent, age and seniority do have a positive effect on the learning process and the acquiring of suitable skills for the job. This shows that different characteristics among individuals can influence Innovative work behavior considerably.

Personal traits play an important role in the employees' innovative work behavior. Yet, they have not been studied deeply enough, especially in Vietnam. For that reason, this research observed the difference in implementation such as gender, religion, age, organizations, income, education levels, on innovative work behavior of employees in Vietnam.

2. Literature Review

The term innovative work behavior has been concentrated on by scholars since the nineties of the last century. When the research of West and Farr (1989) was published, they defined that innovative work behavior is the deliberate launch and implementation, in a function, group, or organization, of ideas, processes, products or procedures, new to the relevant unit of approval, designed to crucially advantages the individual, the group, organization or the larger society. After this definition, a series of other definitions and research works of multiple scholars have been developed, including the study of Scott and Bruce (1994). They argued that innovative work behavior is a behavioral complex consisting of three behavioral components: idea generation, idea marketing, and idea execution, along with this, they also built a one-way scale with 6 items.

Janssen (2000) followed the point of Scott and Bruce (1994) and clarified that innovative work behavior is defined here as the deliberate creation, launch and implementation of new ideas in a work function group or organization, in order to advantages role performance, the group, or the organization. Furthermore, Janssen is the first researcher who tried to develop a multi-dimensional scale (nine items) using both his own and others' ratings of innovative work behavior.

The research work of Jassen was quickly reviewed and widely accepted by later scholars, such as De Jong and Den Hartog (2007) with their definition of innovative work behavior, which consists of individual behaviors, such as exploring, generating, championing, and implementing creative ideas. Tuominen and Toivonen (2011) interpreted

innovative work behavior as innovation and activities that create change. In other words, innovative work behavior is all activities that aim at contributing to the creation and utilization of beneficial novelties in an organization.

Thus, innovative work behavior is often described as a type of extra-role behavior at work that is necessary for organizations to survive (Tuominen & Toivonen, 2011), with innovative work behavior, employees would contribute to the innovation and development of the organization. However, each person belongs to a different demographic, which then impacts their ability to innovate (Amabile, 1988; George & Zhou, 2001).

Rogers Everett (1995) analyzed demographic impact on innovativeness and concluded that the early adopters group is usually younger, better education, higher income, low dogmatism. Recently, Soni and Bakhru (2019) studied the impact of demographic factors on innovative work behavior and found that age and education levels both have an impact on innovative work behavior. While, Korkmaz (2020) demonstrated that there are differences in innovative work behavior implementation among different groups of people in terms of experience in different fields, age and education levels.

Although there are many previous studies that realized the connection between demographic factors and innovative work behavior, in the context of Vietnam, it is really limited and no research has shown specific results. Therefore, we are proposing hypotheses on the differences in the implementation of employees' innovative work behavior among different demographic groups:

H1: There is a difference in implementation of innovative work behavior among gender groups.

H2: There is a difference in implementation of innovative work behavior among groups in different regions.

H3: There is a difference in implementation of innovative work behavior among age groups.

H4: There is a difference in implementation of innovative work behavior among organizational groups.

H5: There is a difference in implementation of innovative work behavior among income groups.

H6: There is a difference in implementation of innovative work behavior among groups of education levels.

3. Method

Data collection

The authors implemented a qualitative research method to evaluate and adjust the questionnaire, and at the same time we collected opinions from various demographic groups (gender, working region, age, organization, income, education qualification). Then, we determined if there were any differences in the innovative work behavior of employees from those groups. We conducted in-depth interviews with 15 people in Vietnam. The content of the interview revolved around the following issues: demographic information of respondents, how and how often employees created and developed their new ideas in the

workplace. We recorded by phone, took notes with pen and paper to gather and summarize the information, then the information was analyzed, encrypted, and stored in the computer.

From the results of in-depth interviews, the authors built a complete research model. To evaluate and adjust the questionnaire most completely before conducting the official survey, we conducted quantitative research with employees in different organizations in the North, Central, and South of Vietnam. Table 1 below showed the demographic profile of respondents.

Table 1. Demographic characteristics of respondents

Characteristics	Category	Sample	
		Number of respondents	Percentages (%)
Gender	Male	177	44.6
	Female	216	54.4
	Other genders	4	1.0
Working region	North	241	60.7
	Central	106	26.7
	South	50	12.6
Age	From 18 to 22	115	29.0
	From 23 to 30	124	31.2
	From 31 to 40	73	18.4
	From 41 to 50	67	16.9
	Over 50	18	4.5
Organization	Private enterprise	159	40.1
	Foreign Direct Investment enterprise	57	14.4
	State-owned enterprise	19	4.8
	State agencies	160	40.3
	Other organization	2	0.5
Income	Under 8 million	157	39.5
	From 8 to less than 15 million	179	45.1
	From 15 to less than 25 million	40	10.1
	From 25 to less than 40 million	13	3.3
	Over 40 million	8	2.0
Education qualification	High School	148	37.3
	Vocational School	10	2.5
	College	28	7.1
	University	173	43.6
	Postgraduate	38	9.6

The authors conducted the survey by directly sending participants photocopies and via the Internet (social networks and email) through the Google Forms tool. Within 45 days (from October 10, 2021, to November 23, 2021), completed surveys were received from 529 respondents. After the exclusion of 132 invalid questionnaires with missing information or the respondents answered one choice for the total questions, we have officially gathered 397 valid feedbacks in a quantitative study that gave sample results about employees in organizations in Vietnam. The data shows that the number of women and men filling out the survey does not deviate much from the 50% mark (females with 54.4% and males with 44.6%). Observing the distribution in 3 regions, it is evident that participants mainly reside in the North, accounting for more than half of the total number of observations, at 60.7%, followed by the Central at 26.7% and the South at 12.6%. One hundred and twenty-four respondents are from age 23 to 30 (accounting for 31.2%) and respondents from 18-22 of age equate to 29.0%. Of the data gathered, there is not much difference in the number of employees between state agencies (40.3%) and private enterprises (40.1%), with 179 people (45.1%) earning from 8 to less than 15 million every month. In addition, in terms of the education qualification, 43.6% of the surveyed people graduated from university and about 37.3% of them had high school diplomas.

Measures

After synthesizing documents and carrying out in-depth interviews, the authors drew scales with observations and similar models taken from previous studies. Then, we selected, composed, and translated them from English into Vietnamese in the most appropriate way. All items were measured using a five-point Likert-type scale (1 = strongly disagree, 2 = disagree, 3 = neutral, 4 = agree, 5 = strongly agree).

The theoretical construct in the model's measurement approach was described briefly below. The study used six items built by Scott and Bruce (1994), to measure innovative work behavior with evidence detailing how and how often employees created and developed their new ideas in the workplace.

4. Results

The scale of "innovative work behavior" was tested for reliability with Cronbach's Alpha coefficient and exploratory factor analysis EFA. The analysis results show that Cronbach's Alpha coefficient is 0,878 and among the 6 observed items, the lowest total variable correlation coefficient is 0,602. The exploratory factor analysis EFA showed that Eigenvalues reaches $3,736 > 1$, the total variance extracted is $62,268\% > 50\%$. KMO coefficient = 0.896 and Bartlett's Test has sig equals $0,000 < 0,05$. All conditions are satisfied, therefore the scale is completely reliable and accepted. This study examines the evaluated difference in implementation of innovative work behavior among demographic groups in Vietnam.

Gender

Table 2. Test for gender differences

Gender	N	Mean	Sig of Levene Statistic	Sig of ANOVA
Male	177	3,8230	,480	,032
Female	216	3,6667		
Other	4	3,9167		

The first variable explored was gender. The male group reached 177 participants, the female group reached 216 participants, while the other gender groups had only 4 participants. Because the number of participants belonging to other gender group is too small and not representative enough, this group will be ignored. The test results show that there is a difference in innovation work behavior between different gender groups. Males tend to perform innovative work behavior better than the female group (Table 2).

Regions

Table 3. Test for working region differences

Working region	N	Mean	Sig of Levene Statistic	Sig of ANOVA
North	241	3,7040	,082	,284
Central	106	3,8160		
South	50	3,7433		

Research conducted in all three regions - the North, Central, and South of VietNam shows that the level of implementation of innovative work behavior in all three regions is at an average level, in the range of 3,7 – 3,8. However, because the Sig value of Levene Statistic is 0,082 > 0,05 and the Sig value in the ANOVA test is 0,284. Therefore, there is not enough evidence to conclude that there is a difference in the innovation work behavior of the three domains (Table 3).

Age range

Table 4. Test for age differences

Age	N	Mean	Sig of Levene Statistic	Sig of ANOVA
From 18 to 22	115	3,7043	,385	,040
From 23 to 30	124	3,6680		
From 31 to 40	73	3,7352		
From 41 to 50	67	3,9453		
Over 50	18	3,6944		

ANOVA test was used for the analysis because the Sig value of Levene Statistic is 0,385 more than 0,05 and obtained a Sig value of ANOVA test is 0,040, which is less than 0,05. Therefore, there is a statistically significant difference in innovation work behavior between different age groups. At a certain age, the ability to do innovative work is also different, employees aged from 23-30 years old scored at the lowest level of more than 3,6, while the age group from 41 to 50 rated for the highest level of 3,9 (Table 4).

Types of organizations

Table 5. Test for types of organizations differences

Types of organizations	N	Mean	Sig of Levene Statistic	Sig of ANOVA
Private enterprise	159	3,6593	,913	,147
FDI enterprise	57	3,7281		
State-owned enterprises	19	3,8596		
State agencies	160	3,8125		
Other organization	2	3,3333		

For types of organizations, the study conducted surveys on many different types of organizations and obtained the following results: the state sector, including state-owned enterprises and state agencies, selected the score level. The highest innovative work behavior reached 3,8596 and 3,8125 respectively. The ANOVA method continued to be used because the Sig value of Levene Statistic reached $0,913 > 0,05$. However, the Sig value of ANOVA has a value of $0,147 > 0,05$, which is not enough evidence to conclude that there is a difference in the innovative work behavior of employees in different types of organizations (Table 5).

Income

Table 6. Test for income differences

Income	N	Mean	Sig of Levene Statistic	Sig of Robust Tests
Under 8 million VND	157	3,6624	0,026	0,014
From 8 to less than 15 million	179	3,7402		
From 15 to less than 25 million	40	3,8583		
From 25 to less than 40 million	13	4,0641		
Over 40 million	8	4,0833		

The Sig value of Levene Statistic is only $0,026 < 0,05$, so the Welch test in the Robust table is used instead of the ANOVA test. The Sig value of Welch's test results in $0,014 < 0,05$, so there is a difference in innovative work behavior at different income levels. Table 5 shows that as the income increases, so does innovative work behavior. At the income level of less than 8 million, employees rated the level of innovative work behavior as the lowest - reaching 3,6624, steadily increasing to 4,0833 which is the highest of the income group over 40 million (Table 6).

Education qualification

Table 7. Test for education qualification differences

Education qualification	N	Mean	Sig of Levene Statistic	Sig of ANOVA
High school	148	3,6565	,401	,065
Vocational school	10	3,6833		
College	28	3,7262		
University	173	3,7630		
Postgraduate	38	3,9737		

Starting from the high school level group assessed at 3,6565, to the college graduate group at 3,7389. In particular, there is a clear difference between the graduated group and the rest of the groups. Although Table 6 clearly shows the positive change of education levels with innovative work behavior, it is not possible to confirm that there is a difference in the implementation of innovative work behavior of groups with innovative work. The levels are different because the Sig value of Levene Statistic = $0,401 > 0,05$ and the Sig value of the ANOVA test is $0,065 > 0,05$ (Table 7).

5. Discussion and Conclusion

This study analyzes the differences of demographic groups in the implementation of innovative work behavior in various types of organizations in Vietnam. Simultaneously, based on the obtained results, the research team will provide recommendations and useful solutions in recruiting, selecting, and training employees in an organization.

Research has shown certain differences in demographic variables to the innovative work behavior of employees. With a small difference in study results, the male gender tends to perform innovative work behavior better than the female gender, thus supporting hypothesis H1. Besides, the level of implementation of innovative work behavior of all three regions of Vietnam is at medium level, but there is not enough evidence to support hypothesis H2. Hypothesis H3 is supported when the results have a clear difference in the innovative work behavior of employees with gradual increasing performance reported from the 23 - 30 age group to the 41 - 50 age group. With the obtained results, hypothesis H4 has no basis to conclude that there are differences in employees' innovative work behavior different types of organizations. Particularly, the research results show that there is a positive relationship between income and education levels with innovative work behavior. But while hypothesis H5 is strongly supported with a significantly shorter interval of implementation of innovative work behavior in this group than in other groups, hypothesis H6 is not supported because it has not been able to confirm the distinctiveness.

From the aforementioned results, the authors recommend that organizations that want to promote innovative work behavior among employees need reasonable policies for human resources. In the recruiting process, when it is necessary to select employees for positions and departments that require creativity, the organization can also prioritize selecting male employees, especially between the ages of 31 - 50 years old, and should also consider paying higher wages to attract people with high innovative work behavior. In addition, in the process of training and building organizations, it is also necessary to have different policies for each group of people to stimulate creativity and encourage them to participate in the innovation process.

Apart from some significant contributions, this study still has limitations that can be overcome in the next topics. Due to financial constraints along with having to conduct research in the context of the Covid-19 outbreak in Vietnam, data collection faced many difficulties. This had a great impact on the research results where the research sample has not covered the entire territory of Vietnam but still focused mainly on the North and Central regions. Along with that, because of the unequal distribution in the data on the variables of organization types and education levels, the research results have not recognized the difference in these 3 variables to the innovative work behavior of the employees.

The research team suggests that future studies should expand the sample size further to include all regions in the country or collect more uniform data samples on specific demographic variables in terms of regions, organizations, and education levels. Along with that, it is possible to study more varieties of demographic variables, contributing to the theory as well as practical implications to help Vietnamese organizations raise innovative work behavior of their employees.

Abstract

The main objective of this study is to explore the relationship between working from home and job performance through studying the impact of physical and spiritual conditions with the moderating variable: work environment towards job performance. The research was conducted by two methods: qualitative research and quantitative research. First of all, the research team conducted a qualitative survey by asking and collecting expert opinions. After that, the results of the answers were compared with relevant theories that the team had used in the research, thereby considering the relevance between theory and reality, the context of Vietnam. Next, the research team conducted a quantitative study by conducting a survey to survey data from 312 full-time and part-time home workers across Vietnam. The authors use the model of intermediate variables and the software SPSS 22 to process the data. Research results show that working from home has both positive and negative impacts on job performance. Based on the research results, the authors make some recommendations to evaluate the job performance of Vietnamese workers.

Keywords: *Work-from-home, Job performance, Work environment*

1. Introduction

Work-from-home (WFH) is a new worldwide trend that many firms are actively pursuing. In fact, this is a long-established way of working, popular in European and American countries, and used by a few firms in specific fields. In Vietnam, this form of working is still relatively new and has not been favored by business managers.

Working from home has been adopted as a solution to the unfavorable situation in Vietnam due to the harmful influence of the COVID-19 epidemic on all aspects of life such

as economics and society at the time when guidelines on restricting contact and seclusion at home are routinely issued. In a forced circumstance, employees working from home must progressively develop flexibility in working style and self-balancing among their work, family and themselves as well as self-studying and the development of new abilities in the use of technology gadgets that facilitate remote connection.

Currently, the number of studies on the effect of working from home on job performance is very substantial; however, this remains a controversial issue (Allen et al., 2015). The researchers propose that people can work from home and interact by using online technological platforms. Working from home also enables employees to have more flexible work schedules as saving time and money on transportation. According to Allen & Associates (2015), working from home is acceptable when the nature of the task is one or it can be done online. In contrast to this view, several researches done by measuring and assessing employee views indicate the following results: “Workers are not at all comfortable or flexible as a result of their jobs. Working from home limits their ability to completely focus on work, and their promotion opportunities are restricted, thus they progressively lose motivation to work.”

On the other hand, these studies are typically undertaken and assessed in industrialized countries and countries with advanced infrastructure and technology. As a consequence, these study findings are inappropriate for the context of developing countries as Vietnam, which makes it difficult for our country's administrators to implement these ideas and solutions to enterprises and organizations in their position. The result of research focuses on investigating the effect of work-from-home on job performance: Empirical in Vietnam through physical and spiritual conditions with the moderating variable: work environment.

Work-from-home

The concept of working was first mentioned by Niles (1988) under the name "telecommuting" and redefined in various terms over the past four decades. Working from home is defined by Margrethe H. Olson (1989), Gibson et al. (2002), and Bello (2018) as a type of working remotely (or at a location other than the organizational office) with the support of technology-supporting devices and necessary telecommunications services rather than have to move, travel between different locations, or work directly at a specific location. According to Lamond, Standen, and Daniels (1998), the concept of working from home should be approached from multiple perspectives, particularly *physical conditions* aspect including: (1) telecommunications and IT equipment and services; (2) flexibility in working from home; (3) the degree of social interaction with colleagues; (4) frequency of working, communicating, and meeting with customers and partners; and (5) knowledge and skills. Baker et al. (2007) also said that four variables relating *spiritual conditions* of working from home affect employees: (1) organizational environment factors, (2) job characteristics, (3) social connection with colleagues and customers, and (4) personal working style. Therefore, the concept of working from home is a multidimensional concept that needs considering in two main aspects: physical conditions and spiritual conditions.

Job performance

According to Dingel and Neiman's (2020) analysis, 37 % of employment in the United States might be accomplished at home during the COVID-19 pandemic, such as financial administration, corporate management, and educational services. Meanwhile, many occupations, such as healthcare, agriculture, and hospitality, cannot be performed from home. Similarly, research conducted by Jean-Victor Alipour et al (2020) in Germany reveals that 56% of employment is believed to be appropriate for working from home, with the majority of them being in industries with a high degree of digitization. Baker et al. (2007) conducted a study based on data collected from employees working in more than 20 organizations in Australia, which demonstrates that working from home is influenced by many factors such as organization, job, family, satisfaction, and self-assessment of the individual's job performance rather than personal style and family life. As a result, Timsal and Awais (2016) and James (2016) suggest that it may not be appropriate for all employees. Furthermore, Jizba and Kleiner (1990) consider that it limits prospects for personal growth and destroys individuals' job motivation and advancement capacity.

According to Campbell et al. (1993), Borman and Motowidlo (1993), Sonnentag and Frese (2002), job performance encompasses the observable behaviors that a person exhibits when performing his or her job in order to achieve the organization's goal-defined goals. Different from the above views, Motowidlo (2003) defines job performance as the value that a company expects from certain employee actions. Similarly, Befort and Hattrup (2003) contend that job performance is inextricably linked to job requirements, corporate goals, and mission.

Huong and Lien (2017) conducted research on establishing a model to address mental problems impacting the job performance of 224 employees in the customer service industry in the financial - banking sector. Factors have all been studied: work motivation, leadership, organizational structure, organizational culture, training, and technology - telecommunications. Research results show that *spiritual conditions* have both positive and negative effects on job performance. Syamsu Alam (2020) conducted a research with the involvement of the work environment as the moderating variable and examined data gathered from 60 government workers in Makassar. According to studies, there is a positive relationship between *physical conditions* and job performance.

Work environment

Kohun (1992) defines work environment as the overall workforce, actions and other factors that have an impact on the relationship between working progress and job performance. In other words, the work environment is the sum of the interactions between workers and the environment in which they work. Besides, work environment is a multidimensional of three categories of environment: technical environment relating to *physical conditions*, the human environment and organizational environment relating to *spiritual conditions* (Opperman, 2002). Therefore, the authors suggest work environment as a moderating variable in this study with the two aspects of work environment including physical and spiritual conditions.

The impact of work-from-home on work performance

Bloom et al (2015) investigated the effect of working from home on job performance using a randomized experiment on agents at a Chinese travel agency. Research results show that working from home leads to a 13% increase in job performance and after the test, more than half of the employees have switched to working from home. Similarly, the research by Allen, Golden, and Shockley (2015), Donny Susilo (2020), Jamel Choukir et al (2022), and several statistical reports by MSPB (2011) and GWA (2017) all show the same conclusion discussing a positive relationship between working from home and job performance. However, according to the studies of Bailey (2002), Barton (2017), working from home does not always bring positive results. Working from home is said to produce better outcomes in the short term, but in the long run, it cannot bring good performance, only downsides and a reduction in job performance. However, these studies are not real and highly credible because the individuals and study area are so limited.

2. Method

Research model and research hypothesis

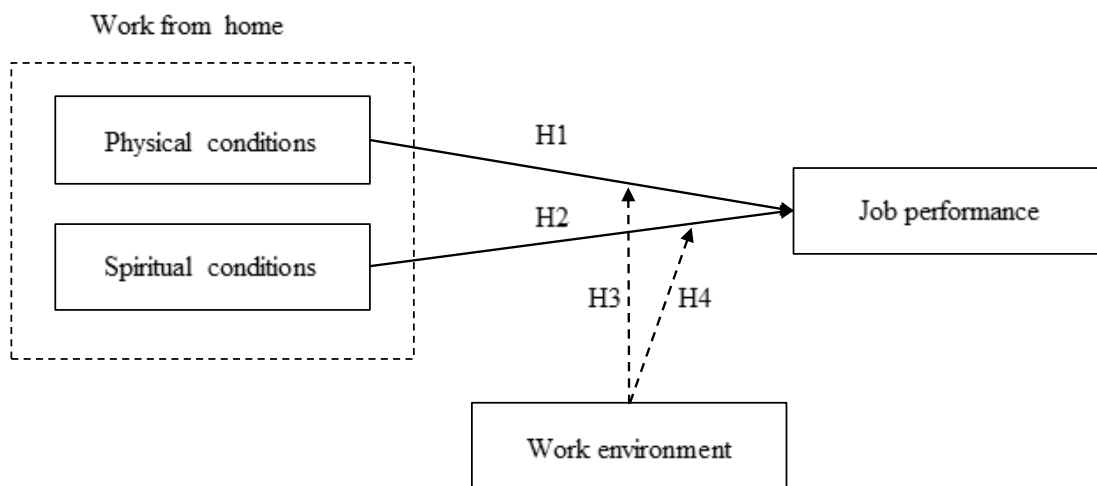

Figure 1. Proposed Research Model

The following research hypotheses are proposed:

Hypothesis 1 (H1): Physical conditions have a positive impact on job performance”.

Hypothesis 2 (H2): Spiritual conditions have a positive impact on job performance”.

Hypothesis 3 (H3): Work environment has a positive impact on the relationship between physical conditions and job performance.

Hypothesis 4 (H4): Work environment has a positive impact on the relationship between spiritual conditions and job performance.

Data source and samplekm

The study surveyed people who worked or are working from home in Vietnam. Regarding sample size, according to Tabachnick & Fidell (1996), the minimum sample size

needed to achieve the best results for linear regression analysis, where m is the number of observed variables and n is the size minimum sample. The research model presented in the topic includes 2 independent variables measured by 7 observed variables, 1 moderator variable with 4 observed variables, 1 dependent variable measured by 4 observed variables. Thus, there are all 15 observed variables and the research needs to use at least 170 questionnaires to be able to analyze the EFA discovery factor well. On that basis, the research team proposed 300 questionnaires to ensure the reliability of the research paper.

After the collection process, the author group obtained 312 valid questionnaires.

Data analysis method

Data after being returned is checked, cleaned, encrypted and entered. To analyze the model, the research team used the software SPSS 22 (Statistical Package for the Social Sciences) to analyze the data and test the hypothesis. Specifically: descriptive statistics analysis, reliability testing of the scale (Cronbach's Alpha), exploratory factor analysis (EFA), testing of the explanatory level and the model's fit, testing the system number of regressions, Levene and Anova tests.

3. Results

Reliability analysis results Cronbach's Alpha

Based on the research results, variable has a Cronbach's Alpha coefficient of $0.692 > 0.6$, and the total variable correlation coefficients are > 0.3 indicating that the scale is eligible. Alpha coefficient of $0.773 > 0.7$ and the correlation coefficients of all variables are > 0.3 , showing that the scale is well used. The variable "Work environment" has Cronbach's Alpha coefficient of $0.752 > 0.7$ and the total correlation coefficients are > 0.3 , showing that the scale is well used.

Table 1. Assessment of reliability Cronbach's Alpha

Factor	Cronbach's Alpha	Number of observed variables
Physical conditions (PC)	0.692	4
Spiritual conditions (SC)	0.773	3
Work environment (WM)	0.752	4
Job performance (JP)	0.795	4

Source: Results of the research team

The variable "Job performance" has Cronbach's Alpha coefficient of $0.795 > 0.7$ and the correlation coefficients of all variables are > 0.3 , showing that the scale is well used. . All variables are qualified for reliability to be used for the next step, which is exploratory factor analysis (EFA).

After analyzing EFA, it shows that the independent variable is divided into 2 groups: “Physical conditions” and “Spiritual conditions”, turning the moderator "Work environment" into a group, turning the dependent "Job performance" into a group. All load multipliers of 15 observed variables are > 0.5 satisfactory.

The results of running independent variables give $KMO = 0.784$, Bartlett's test has Sig coefficient is $0.00 < 0.05$, demonstrating the agreement of the EFA analysis with the actual data.

The results of running the moderator show KMO = 0.743, Bartlett's test has Sig coefficient is $0.00 < 0.05$, demonstrating the agreement of the EFA analysis with the actual data.

The results of running the dependent variable give KMO = 0.782, Bartlett's test has Sig coefficient is $0.00 < 0.05$, demonstrating the agreement of the EFA analysis with the actual data.

*Symbols *, ** and *** represent significance at 10%, 5% and 1% respectively.*

Based on the table of results Regression, it can be seen that the two factors “Physical conditions” and “Spiritual conditions” have a positive effect on “Job performance“ with the significance level of 1%, this shows that hypothesis H1 and H2 is supported. Regarding the impact of the moderator variable, "Work environment" does not have a moderating role in the relationship between “Physical conditions” and “Job performance”, but has a moderating role in the relationship between “Spiritual conditions” and “Job performance” at 5% significance level. However, “Work environment” has a negative effect that weakens the relationship between “Spiritual conditions” and “Job performance”. This shows that hypothesis H3 and H4 are not supported.

4. Discussion and Conclusion

Research results confirm that the physical and spiritual conditions of working from home have a positive impact on job performance. Physical conditions have a positive impact on job performance with Beta coefficient of 0.172, which means that when working from home, the more improved physical conditions are, the better the job performance is. Similarly, spiritual conditions have a positive impact on job performance with Beta

coefficient 0.322, which implies that employees' comfortable feeling to master their jobs and clear promotion path increases their job performance when working from home. On the basis of previous studies, the authors propose 2 main factors and regulatory factors affecting job performance in Vietnam with the research method. It is a quantitative study through survey questionnaires, the authors have assessed the factors and found that the organization's work environment factors have a positive impact on the relationship of spiritual conditions and job performance. It means that when there is a regulation of the organization's work environment, spiritual conditions have a positive impact on job performance. It also implies that the more concerns relating to physical and spiritual conditions when working from home there are, the better the job performance will also increase dramatically. Therefore, the authors propose groups of solutions to evaluate job performance in the context of working from home.

Recommendations on physical conditions

Firstly, the issues related to the information technology infrastructure at home should be improved as well as the employee's ability to apply information technology to be improved through the short training course.

Secondly, the administrator should distribute the workload evenly in the administrative time, creating conditions for employees to balance work and family life so that the job performance meets the expectations.

Thirdly, managers need to have a direction to evaluate job performance based on many aspects through responsibilities and work attitudes to replace the evaluation method based on working time criteria.

Recommendations on spiritual conditions

Firstly, for the welfare factor when working from home, the organization should improve the welfare policy to ensure the work of employees, specifically, ensuring income for employees on leave, birth time and flexible work schedules.

Secondly, the organization needs to complete a salary and bonus policy that ensures the following principles: "Employees are entitled to bonuses and allowances in addition to salary according to a system of public and reasonable performance evaluation criteria.

Thirdly, managers need to focus on assigning work, the assigned work must be clear, right with the position they are taking as well as with their authority as well as assigning challenging tasks with authority so that they can take responsibility for their work.

FACTORS DETERMINING THE FAMILY CAREGIVER BURDEN IN VIETNAM

Tran Thi Mai Phuong

phuongtm@neu.edu.vn

*Faculty of Human Resource Economics and Management,
National Economics University, Hanoi, Vietnam*

Abstract

Vietnam is experiencing a period of rapid aging, the increasing proportion of elderly people (NCT) will put increasing pressure on the social security system, especially in regard to elderly care at family. Therefore, studying the factors affecting the caregiving burden will make practical contributions to solutions to reduce the caregiver burden at home. Quantitative research conducted in Hanoi and Thai Binh shows the relationship between age, education level, caregiver's income, length of care, the relationship between caregivers and the elderly with the level of caregiver burden. In addition, the health status of the older people is also a significant factor affecting the family caregiver burden in Vietnam. The results of research will assist policy makers to identify the caregivers who need the most support from the policies of the State in general and of non-governmental organizations in particular, thereby contributing to the improvement of the social security system in Vietnam.

Key words: *caregiver burden, family caregiving, older people*

1. Introduction

Vietnam's population is aging rapidly with the proportion of elderly people in Vietnam (those over 60 years old) increasing at a remarkable rate. Furthermore, the proportion of chronic diseases in total deaths increased from 41.6% in 1986 to 61.6% in 2006 and witnesses a substantial increase especially among the older people (Mwangi et al., 2015). This will become a huge burden on families, communities as well as the social security system. Therefore, the study of factors affecting the elderly caregiving burden will help policy makers better support family members. Family members are demonstrated to play an important role in elderly care in Vietnam as well as in some aging countries nowadays.

From a theoretical perspective, the factors affecting the caregiving burden for the elderly have been demonstrated in a number of studies. However, there are few studies in Vietnam focusing on the influence of caregiver characteristics and caregiving context on the burden of elderly care. The stress process theory of Pearlin et al. (1989) has shown the role that background factors related to caregivers and recipients will affect caregiving outcome which is considered as an stressful life event. Therefore, this study will clarify the theoretical gap, especially the factors affecting the level of caregiver burden in Vietnam. Specifically, the study focuses on clarifying the relationship of factors including stressors (related to the health status of caregivers), the caregiving context, and the

caregiver burden. Based on the assessment of the influencing factors, the research will provide proper solutions to support the family caregiver - the primary source of support for older adults with chronic illness and disability.

2. Literature Review

Older people

Older people is defined differently depending on the average life expectancy as well as the level of socio-economic development of each country. For international organizations, the United Nations or World Health Organization defines older people as people over 60 years old. According to the classification of World Health Organization, the ages 60-74 are classified as old, 75-89 as elderly, and 90 and over as senility (Tran Ngoc Tu, 2009). In Vietnam, Law on the Elderly defines elderly as Vietnam citizens over the age of 60 years. Therefore, in this study, elderly people are also considered as people over 60 years old.

Family caregiver

Informal family caregivers are people who often provide care without payment or without specialized training. Meanwhile, professional (formal) caregivers include nurses, home health aides, and other professional care workers. Informal carers are usually spouses or adult children, or sometimes other relatives or friends (UNFPA). In this study, the author will focus on the carers who are family members (including spouse, or children, other relatives) of the older people.

Caregiving Outcomes

Caregiving outcomes are studied from two perspectives: positive outcomes and negative outcomes of caregiving. Among these, a positive outcome for carers is the notion that caregiving can be a positive and beneficial experience for carers (Sherrell et al., 2001). Specifically, many theories have indicated some positive experiences towards caregivers such as the satisfaction and pride, the ability to control any situation and deliver good results, understanding the meaning of life, positive mental health, personal growth, and improved social relationships (Smale & Dupuis, 2004). The negative outcomes of caregiving are mainly related to mental and physical health, burnout and caregiving burden (Conde-Sala et al., 2010; Kim et al., 2012). This study focuses on the family caregiver burden when taking care of the older people at home in Vietnam.

Caregiver Burden

George and Gwyther (1986, p. 253) defined caregiver burden as “the physical, psychological or emotional, social, and financial problems that can be experienced by family members caring for impaired older adults.”. Caregiving burden will affect the quality of life of caregivers as mentioned by the study of Wijngaart et al (2007). In this study, caregiving burden is considered as a caregiving outcome that reflects the negative emotional or physical feeling of carers when they confront with both physical and mental difficulties in taking care of an elder person.

The relationship between caregiving context and caregiving outcome

According to the stress process theory of Pearlin et al. (1990), caregiving context are related to the factors such as caregiver demographics, caregiving history, availability of

caring programs. Caregiving history mentioned two aspects: the relationship care-recipients and caregivers and duration of caregiving. These factors have both a direct and indirect impact on caregiving outcomes.

In terms of social and economic characteristics of caregivers, most research studied some characteristics of caregivers such as age, gender, marital status along with educational, occupational, and economic attainments. However, the researches related to demographic characteristics of caregivers illustrated the inconsistent results of the relationship between caregivers' characteristics and caregiving outcomes. For example, the existence of a relationship between age and caregiver burden is still controversial (Sherwood et al., 2005).

In the study of Seeher et al. (2013), the authors suggested that caregiver's age is related to caregiving burden. Andrén & Elmståhl (2007) was proposed that young and old caregivers would be experiencing different level of burden when taking care of family members. Some studies have shown that young caregivers experienced a greater level of caregiving burden than older adults did, while others have shown adverse results. Both situations could be explained that older caregivers are often physically and psychologically unstable, while young caregivers often have little experience in caring or have limited social knowledge.

Another possible explanation for these controversial results in terms of caregiver age may not be linearly related to caregiver burden. Research results of Andrén & Elmståhl (2007) indicated different patterns throughout the caring process. For example, caregivers of children may have little experience in providing care and it will influence the caregiving burden. During the caring process, they can adjust to the situation and learn more caregiving skills. At this point, they may experience less of caregiving burden. However, as carers' age increase, carers will face more responsibilities and fulfill cumulative care requirements. As a result, caregivers may experience a growing sense of burden.

The following studies all come to the same conclusion that the number of women involved in caring responsibilities is more than men. Research by Pöysti et al (2012) has provided an explanation for the above conclusion that women often have more responsibility for maintaining happiness in the family, from giving birth to taking care of older family members. Women tend to solve difficulties emotionally. Cultural aspects are also considered as one of the factors affecting caring process. Women are expected to be more selfless, responsible, and self-sacrificing, so they are more suitable than men in caring. Sherwood et al. (2005) further found that there is no relationship between gender and caring pressure. In contrast, Kim et al. (2009) came to the adverse conclusion that caregiver's gender has a relationship with caregiving burden.

In terms of education level, many studies show that education level is inversely related to caregiver burden regardless of caregivers' age. In the study of Papastavrou et al. (2007), the authors found that caregivers with high or low educational attainment experience different level of caregiving burden. Educational attainment has a positive effect on the caregiver's burden because the caregivers will be able to attain knowledge and skills actively in caring activities to help relieve stress and anxiety as well as improve the carers' health status.

Marital status and caregiver burden have a two-way relationship: those who are married experience less burden than their counterparts who are single, divorce or widow because they possibly have more financial support from their spouses and more social support.

Bauer & Sousa-Poza (2015) also pointed out the relationship between employment status of carers and caregiving burden. Firstly, caring activities take a long time, so carers often have difficulty in balancing their caring responsibility and their jobs; They must reduce their working hours or even quit their jobs in order to adequately care for the recipient. Secondly, because people who are unemployed or working part-time have more time, they are more likely to become carers. In Zhan's (2006) study, caregiver's employment status was related to their stress level and especially unemployed people are reported to have higher stress levels.

The relationship between stressors and caregiving outcome

Stressors in the researches of caregiving outcomes were mainly the cognitive and behavior status of care-recipients or the dependencies on activities of daily living and instrumental activities of daily living. Research by Johns et al. (2011) showed adverse effects between care-recipient's health status and negative caregiving outcomes such as caregiver burden and stress level. Besides, according to the research by Kim et al (2012), factors related to the caregiver's medical condition are essential factors explaining the burden on caregiving tasks. The study was based on US national data on care at retirement age with any selection of 302 people from the database. Research results showed that disease status related to ensuring daily activities has a positive relationship with caregiver burden. Another study by Morley et al. (2012) also showed that the impact of factors related to the degree of disease status, cognitive intelligence of the patient also affects the quality of life of caregivers.

Thus, researches on elderly care in Vietnam are not currently based on proper theoretical framework. Moreover, the factors related to the caring context and the older people's health status have been mentioned in a number of international studies and were demonstrated to have a direct impact on caregiver burden but hardly mentioned in the studies in Vietnam. Therefore, studying the factors affecting the caregiving burden of older people in the context of rapid aging in Vietnam with the theoretical background of the stress process model will bring great theoretical contributions.

Theoretical Framework and Hypotheses

The study focused on testing the impact of two factors: the caring context and the health status of care recipients on the caregiver burden when taking care of the older people at home. The specific research model is shown in Figure 1. The following hypotheses are put forward:

Hypothesis 1: There are differences in caregiver burden by age, sex, educational attainment, income, marital status, living arrangement, relationship between caregiver and care recipient

Hypothesis 2: Duration of caregiving and caregiver burden have a positive relationship

Hypothesis 3: The greater the dependency level on activities of daily living and instrumental activities, the greater the caregiver burden.

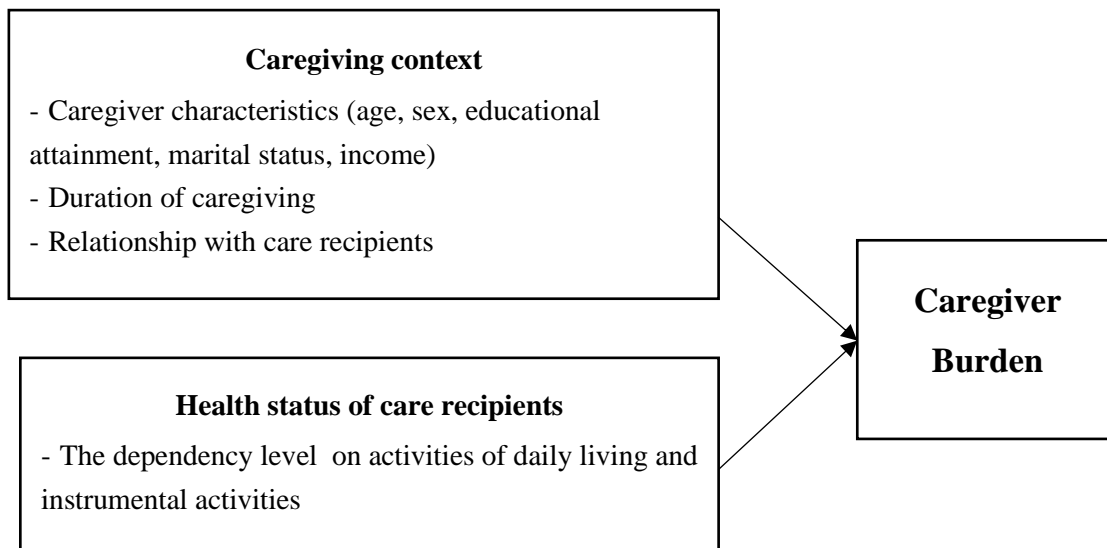

Figure 1. Theoretical framework addressing the factors affecting the burden of elderly family caregivers

3. Method

The study uses SPSS software to process data collected from 180 caregivers aged 30-60, currently caring for the older people at home in two provinces: Hanoi and Thai Binh - those with a high proportion of older people in Vietnam.

The data source is provided by the Elderly Association of wards and communes in Hanoi and Thai Binh. The Elderly Association is the main organization which obtain the information related to the health status, the caring situation for the older people at home. Therefore, using this data source will bring high reliability for the research. The survey will be conducted in three forms: handing out questionnaires, phone surveys, and online surveys. Out of 180 survey questionnaires collected, all 168 answers were valid and used to analyze the research model. Linear regression model, T-test and One-way Anova were used to evaluate the impact of independent variables on the dependent variable – caregiver burden. The health status of the older people are measured by the scale of Katz (1963) - the activities of daily living dependence (ADL) and instrumental activities dependence (IADL). However, the scale is adjusted to suit the research objectives. Daily living and instrumental activities are divided into 4 main groups: personal care, housework, transportation, medication management, and financial management.

For the Caregiver Burden variable, previous studies used a variety of scales, such as the Perceived Stress Scale (S. Cohen, Kamarck, & Mermelstein, 1983; 10 studies; 10 studies). Research), the Screen for Caregiver Burden (the Screen for Caregiver Burden) (Vitaliano, Russo, Young, Becker, & Maiuro, 1991; 8 studies). However, the level of caregiver burden is most measured by the Zarit burden scale (Gratão et al., 2019) with 58 different studies. Therefore, this study also uses the Zarit burden scale to assess the level of self-perceived burden from the caregiver's perspective. This scale is calculated on a total score from 0-48.

4. Results

Descriptive statistics of caregiver characteristics and the duration of caregiving

Indicators	Classifications	Number	Percentage (%)
Gender	Male	34	20,2%
	Female	134	79,8%

✚ Results of testing the level of caregiving burden related to caregiving context

In terms of the relationship with care recipients, including 3 groups: Spouses, Son - Daughter, Daughter-in-law - Son-in-law, Relatives, the results of One-way Anova test showed that there was a difference on the level of caregiving burden. Specifically, the level of caregiver burden towards spouses is higher than that of offspring.

By duration of caregiving including 3 groups: Less than 6 months; From 6 to 12 months and over 1 year, the results of One-way Anova analysis showed that there was a statistically significant difference in the level of caregiving burden. The caregiver who take care for the older person from 6-12 months experiences higher burden than those taking that responsibility over 1 year.

According to education level, including 4 groups: High school, College, Undergraduate, Post-graduate, One-way Anova test showed that there was a statistically significant difference report on the level of caregiving burden. Caregivers with a high school education or less have a higher perceived burden than the group with a higher education level.

According to caregiver's income, the results show that there is a statistically significant difference in the level of caregiving burden. Caregivers with the average income of less than 5 million perceived higher burden than those in higher income groups.

By age group, the test results showed that the mean value of burden level of the caregivers aged from 30 to under 40 compared to the other two groups of caregivers is positive, showing that the caregiving burden level of the caregiver group under 40 years old is higher than those of the groups over 40 years old. .

According to living arrangement, marital status and sex, the test results showed that there was no difference in the level of caregiving burden between these groups.

✚ Linear regression results

The study performed linear regression with the variable caregiver burden as the dependent variable. The regression results show the fit of the model, specifically, the independent variables in the model play an important role in explaining the variation of the caregiving burden with R2 reaching 39.5%. In the regression results, the author focuses on assessing the impact of quantitative variables that are the health status of the recipients. Regression results show that at the 5% significance level, health status of the recipients has a positive impact on the caregiver burden with a beta coefficient of $0.385 > 0$. Specifically,

the greater dependency on the daily and instrumental activities, the greater the burden that the caregivers perceived. The specific results are shown in Table 1 below.

Table 1. Linear regression results - Impact of factors on the caregiver burden for the older people

Model	Unstandardized Regression Coefficients		Dstandardized Regression Coefficients	t	Level of significance	Multicollinear Statistics	
	B	Standard error	B			Tolerance	VIF

5. Discussion and Conclusion

In terms of caregiver characteristics, the research results show that characteristics such as age, education, and income are related to the caregiving burden for the older people at home. Specifically, young carers felt a greater degree of caregiving burden than older caregivers. This can be explained that young caregivers often have little experience in caring or have limited social knowledge. In addition, the age group 30-40 is the age group that focuses on career development so the exposure to caregiving stresses may be higher for this age group than for older age groups. This result is similar to the results of the study indicated Andren and Elmstahl (2017).

In terms of education level, the author's research results show that the higher the level of education, the lower the caregiving burden for the older people at home. It can be explained that the higher the level of education, the better the knowledge and skills the caregivers obtain. Those knowledge and skills will help them to relieve stress and anxiety as well as improve their health status. This fact has also been demonstrated in the study of Papastavrou et al (2007). In addition, average income of the caregiver is also a factor that positively affects the caregiving burden. Research results show that the higher the income, the lower the level of burden. Income will help carers reduce financial pressure, and access many good caregiving services, thereby reduce both physical and mental burdens for them.

In terms of the caregiving context including the caregiving duration and the relationship with the care recipients, both of these factors show a relationship with the caregiver burden. The study results showed that the shorter the caregiving duration, the higher the perceived burden, which is in contrast with the results of Bialon & Coke (2012) and Chang (2010). The adverse effect between the caregiving duration and caregiver burden can be explained that when taking care of the older people more than one year, the caregivers have accumulated more experience, knowledge and are gradually getting used to dealing with them so the caregiving burden is also less than those taking that responsibility for the short-term. In addition, the relationship with the recipients is also one of the factors affecting the caregiving burden. Research results show that when the caregiver is the spouse, the level of caregiving burden is higher than that of a caregiver who is a offspring or relative. This result has not been supported by many studies, but it may be explained that the frequency of facing the stress of caregiving activities by the husband and wife of the care recipients will lead to an increasing level of burden. Carers who are offspring not only spend time on caregiving work, but they also have time for other social relationships (such as working in office), thus their perceived burden is lower.

In terms of the older people's health status, the research results show that the higher the level of dependency on daily and instrumental activities, the greater the burden the caregivers perceived. Previous studies in other countries had also shown a link between the health status of care recipients and overall caregiving outcomes, such as the studies of Johns et al (2011), Kim et al (2012), Morley et al (2012). These studies all showed that the health status of care recipients are the factor in explaining the caregiving burden, and the more severe the illness is, the more likely negative caregiving outcomes the caregivers experience.

Thus, based on the research results, the author proposes some policies to reduce the caregiver burden at home as follows:

Supporting policies should focus on young caregivers who are at the stage of career development (under 40 years old) as the study has shown. In addition, social security policies also need to pay attention to the groups of low-income and less educated caregivers. Especially for low-income groups, it is necessary to have specific support from the State or Non-Government Organizations to reduce the financial burden when caring for the older people at home. Moreover, in terms of the households in which the main caregivers are husband and wife, more attention should be paid to family caregiving policies.

In addition, other solutions for taking care of the older people at home should also be considered in current social security policies. For instance, the current older people caring system is mainly conducted by volunteers of NGOs or some groups such as the Elderly Association located in provinces with a high proportion of elderly people. However, in order to ensure the caregiving quality as well as to cope with the increasing speed of urbanization, it is necessary to develop a team of paid care workers at home. Payroll costs can be contributed by households, NGOs and the State to reduce the caregiving burden. The caregiving workforce can vary from people around them such as friends, neighbors, and even professional care teams. Diversification of care workers will help households make choices that are appropriate to the family's circumstances as well as the health status of the elderly. If care work can be considered as a profession, it can become an additional income for not only professional caregivers but also close family members around the older people. This policy will contribute to the improvement of social security system and the development of home community-based care.

Abstract

Social networking sites are becoming more popular and have a great influence on the user segment, which leads to the concept of learning on social networks. In recent years, due to the effects of the COVID-19 pandemic, foreign language practice on social networking sites is becoming a trend. This study explores the relationships of factors that influence the intention and behavior of using social networking sites for generation Z language learning (from 11-year-old to 22-year-old). The survey is conducted with 249 participants on popular social networking platforms. From the results of the analysis, we have used the UTAUT model to understand the factors that influence generation Z's intention and behavior to use social media in Vietnam. The results show that effort expectancy is the most important factor affecting the student's intention to learn foreign languages on social networking platforms.

Keywords: *behavior, behavioral intention, learning foreign languages, social networking sites*

1. Introduction

Foreign languages are a very important bridge in multinational communication in the world. One of the most effective ways to learn a foreign language is by using it every day. In addition to being used as a means of communication, the use of a foreign language also helps learners create their own knowledge (Vygotsky, 1978).

Many studies have mentioned the use of social networking sites in learning foreign languages, and learners' opinions on them show that the results are mostly favorable. According to a study in major cities, 99% of students in Vietnam now use social media and spend an average of 3-5 hours (Nguyen Thai Ba, 2019). Social media has certain influences on the learning and working performance of users at the age of pupils due to the long length of use. There are studies that show Facebook's advantage in improving learners' language proficiency (Lockyer & Patterson, 2008; Nakatsukasa, 2009). Wang & Associates (2016)

found that, with the help of Facebook as a common learning tool, students perform better and show more engagement and satisfaction with their learning. Our team implemented the topic "Factors influencing generation Z's language learning intentions and behaviors when using social networking sites" to develop a set of recommendations for both social network providers and students. However, while attempting to deploy a mobile learning system, numerous factors should be considered, such as the quality of the wireless connection or the development of social media application software.

2. Literature Review

2.1. Unified Theory of Acceptance and Use of Technology (UTAUT Model)

Venkatesh et al. (2003) conducted in-depth research to develop a tool that explains the birth of new technology and uses new systems. They looked at 8 technology adoption models (with 32 research variables attached). 8 models included: the theory of reasoned action (TRA) from Davis et al. (1992), the technology acceptance model (TAM) from Davis (1989) and Davis et al. (1992), the motivational model (MM) from Davis et al. (1989), the theory of planned behavior (TPB) from Taylor and Todd (1995a, 1995b), a model combining the technology acceptance model and the theory of planned behavior (C-TAM-TPB) from Taylor and Todd (1995a, 1995b), the model of PC utilization (MPCU) from Thompson et al. (1991), the innovation diffusion theory (IDT) from Moore and Benbasat (1991), and the social cognitive theory (SCT) from Compeau et al. (1999). They found that each model had advantages and that each model had theoretical base strengths in different fields. Their analysis ends with a proposal for an integrated model, namely Unified Theory of Acceptance and Use of Technology (UTAUT Model) - figure 1.

2.2. Research model

According to the results of previous studies and theoretical models, we show two main relationships: the effort expectancy, the performance expectancy, the social influence that is directly related to the behavioral intention to use technology; The second is the behavioral intention to use technology and facilitating conditions have a positive impact on the behavior of using technology. Therefore, the basic theoretical model of the topic is expressed as follows:

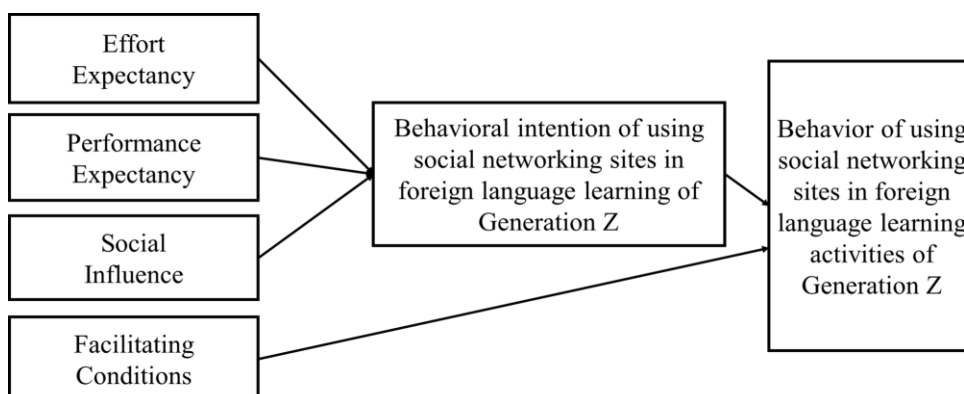

Figure 1. Research model

Source: Proposed research model of the authors (Based on Venkatesh & et al.'s original UTAUT model, 2003)

Effort expectancy (EE)

The effort expectancy is understood as the user's expectation of how easy it is to use a new technology (Venkatesh et al., 2003). Effort expectancy has proven to be an important factor that has a certain effect on the application of technology. The reason comes from the realization that the less effort there is, the higher the likelihood of accepting the use of the system (Ho & associates, 2010; Park & Ohm, 2014). This is also evident in the experimental work in Ismail's study (2010) which surveyed 24 international students to examine the application of social media. Ismail's research (2010) indicates that effort expectancy has a significant impact on the use of social media to support learning activities. Hence, it is expected that the effort expectancy will have an impact on the user's intention to use social media.

Performance expectancy (PE)

In previous studies, users' intentions to use the technology would be higher when they noticed that the system would improve their work performance (Venkatesh et al., 2003). Performance expectancy can be explained as "An individual is aware that the use of the system will enhance their productivity and lead to increased performance" (Brown et al., 2013). Previous scholars of mobile technology have demonstrated relationships between performance expectancy and behavioral intention. Since then users can join special groups chats created by administrators to enrich their existing learning experience from mobile advertising (Wong et al., 2015), e-wallet (Yu, 2012), and mobile learning (Yang, 2013). In addition, the application of social media in real life also offers the opportunity to share information with other users (Osatuyi, 2013). When interactions can lead to positive results (Lewis, 2010), more users are likely to use social media for the purpose of establishing more connections.

Social influence (SI)

According to Venkatesh et al. (2003), social influence is the extent to which an individual perceives external influences to have a certain impact on them. Acquaintances such as family and friends believe that the individual will use a new technology due to being influenced by external factors (Bhattacharjee, 2000; Sim & Associates, 2012). Social influence has also been shown to influence the user's technological behavior intent factor in various studies of mobile service adoption (Foley et al., 2007; Thorbjørnsen et al., 2007; Sim & Associates, 2014) and the facilitation of decision-making of the use of technology (Venkatesh et al., 2012). Social media is considered a highly communal platform, where students from many different regions connect and help each other to achieve a goal in learning (Nguyen Thi Bac, 2018). Therefore, the influence of society can create a positive motivation for students to use social media more to support their foreign language learning.

Facilitating conditions (FC)

Facilitating conditions are defined as the degree to which an individual believes an organization or technical infrastructure supports the use of the system (Venkatesh et al., 2003). Geddes (2004, 1) defined conditional mobile learning as "the acquisition of any knowledge and skills through the use of mobile technology, anytime, anywhere leading to behavioral changes. With the rapid development of mobile networks, this is also a favorable

condition for the use of social media in all circumstances. Because of its convenience and portability, technology has the potential to expand learning into a mobile environment, resulting in a positive impact in the use of social media to learn a foreign language (Ho & Associates, 2010).

Behavioral intention (BI) and Behavior (B)

Behavioral intention is defined by (Fishbein & Ajzen, 1975; Davis & Cosenza, 1993) as the extent to which the user intends to accept and use the system and this is the ultimate aspiration and goal. Besides, according to the theory of rational action (TRA), a person's behavioral intentions are determined by the person's attitudes about subjective behavior and norms. In addition, Venkatesh et al. (2003) assumed that behavioral intent would have a positive connotation that influenced behavior using technology. In this study, the behavioral intention was used as a predictive tool of an individual's perception of whether the indicated behavior was performed (Ajzen & Fishbein, 1980; Tan & associates, 2015). The application of the chosen intention to determine user beliefs and assessments in the use of social media to facilitate learning with the acceptance rate remains at the first stage level.

3. Method

3.1. Data collection method

The research paper was carried out with the goal of merging qualitative and quantitative research approaches. After collecting study data, our team designed the factor survey based on existing ideas linked to the topic. The poll employed a five-level Likert scale to capture the survey participants' responses, ranging from level 1 - absolutely disagree to level 5 - completely agreed. The targeted participants in the survey were generation Z students the age of 11-22 years old who used or did not use social media to learn foreign languages. Due to COVID-19 obstacles, the sample selection procedure is simple to use, and the survey is transmitted to surveyors through the internet. There are 249 valid responses in the findings.

3.2. Data analysis method

Our group used the descriptive statistical method to gather and objectively analyze the responses from the survey participants based on the preliminary data collected. The data is then loaded into SPSS software to ensure the scale's reliability before undertaking a value assessment of rotational factors and metrics to find the elements that influence the intent and behavior of utilizing social media in language learning. After all of the prerequisites have been met, the correlation test will proceed to conduct correlation testing and assess the two regression methods in order to determine the level of interpretation between the independent and dependent variables. The findings of the study will be used to guide the discussion and development of the appropriate solutions listed below.

4. Results

4.1. Survey sample characteristics

The total number of valid response tables of those surveyed was 249 responses with the characteristics shown below:

Table 1. Demographic structure of data

Character		Quantity (people)	Proportion (%)
Gender	Male	84	44,58%
	Female	165	55,42%
Age	11 - 15 years old	49	19,67%
	16 - 18 years old	56	22,49%
	19 - 22 years old	144	57,84%
Education level	Pupil	111	41,65%
	Student	138	58,35%
The use of social media in learning foreign languages	Use	222	89,16%
	Unused	27	10,84%
Social media is used to learn a foreign language	YouTube	137	61,7%
	Facebook	53	23,9%
	Tiktok	22	9,9%
	Twitter	3	1,4%
	Other	7	3,2%

Source: The team's investigation

According to the survey results, the proportion of social media users accounted for most of the observation variables with 89.16% (222 people) and the number of non-users was 10.84% (27 people). According to the results of the study, the number of people surveyed using Youtube accounted for 61.7% (137 people) and Facebook accounted for 23.9% (53 people) is the largest showing that the features of these two social media platforms are suitable for learning foreign languages for students.

Table 2. Time students use social media to learn foreign languages

Time to use social media (Experience)	Quantity	Proportion
Less than 6 months	31	12,44%
From 6 months to 1 year	54	21,68%
From 1 to 2 years	83	33,33%
From 2 to 3 years	31	12,44%
Over 3 years	50	20,11%

Source: The team's investigation

In terms of the time users adopt social media for language learning activities, users under 6 months accounted for 12.44% (31 people), equal to the user data from 2 to 3 years. Next, users over 3 years accounted for 20.11% (50 people) and users from 6 months to 1 year accounted for 21.68% (54 people). Most statistics fall into the group of users from 1 to 2 years accounting for 33.33% (83 people).

4.2. Results of examination of scales of impact factors

a. Reliability

Cronbach's Alpha coefficient is used in this study to determine the degree of correlation between factors in the questionnaire and to estimate the change in each variable as well as the correlation between variables (E. Hays, 1983). In each group, according to Jum Nunnally (1978), when Corrected Item - Total Correlation ≥ 0.3 , the measurement variable would be qualified and an Alpha coefficient greater than 0.6 would be accepted and included in next processing analysis steps.

Table 3. Reliability analysis of the scale

Reliability analysis of the independent variables	
Criteria	Cronbach's Alpha
Effort Expectancy (EE)	0.771
Performance Expectancy (PE)	0.738
Social Influence (SI)	0.783
Facilitating Conditions (FC)	0.733
Reliability analysis of the dependent variables	
Behavioral intention to use social media in learning a foreign language (BI)	0.785

Source: The team's investigation

The reliability of all constructs was greater than 0.6 and is reliable enough to conduct EFA factor analysis.

b. EFA - Exploratory Factor Analysis

EFA discovery factor analysis will maintain observational variables with a load factor larger than 0.5 and arrange them into key groups that impact the user's intention to utilize social networks for foreign language acquisition.

Table 4. Total variance extracted

Factor	Initial Eigenvalue coefficient			Index after extraction			Indicator after rotation		
	Total	Percentage of variances	Percentage of cumulative variances	Total	Percentage of variances	Percentage of cumulative variances	Total	Percentage of variances	Percentage of cumulative variances

Extraction method: Analysis of the main component. Rotation method: Varimax with Kaiser Normalization.				
a. The rotation converges in 7 repetitions.				

Source: The team's investigation

Data processing results show that there are 4 groups of factors classified as Facilitating Conditions, Social Influence, Effort Expectancy, Performance Expectancy. In addition, the total variance table indicates that these 4 groups of factors explain 60.839% of the user's intention to use social media to learn a foreign language.

c. Analysis of factors influencing the behavioral intention and behavior of using social networking sites for generation Z's foreign language learning

Factors influencing generation Z's intention to use social networking sites for language learning

Based on the study overview and the research model already mentioned in the above sections, the team came up with the following model:

$$BI_i = \beta_0 + \beta_1 * EE_i + \beta_2 * PE_i + \beta_3 * SI_i + \varepsilon$$

BI: Behavioral Intention

SI: Social Influence

EE: Effort Expectancy

PE: Performance Expectancy

The *i* index corresponds to the first student

ε is the surplus.

The regression method used is the Enter method with a Sig. <0.05. From there, the regression results are as follows:

Table 6. Summary of the regression model

Model	R	R Square	AdjustedR Square	Std. Error of the Estimate	Durbin-Watson
1	0,521a	0,272	0,263	0,67450	2,015
Predictors: (Constant), PE, SI, EE					
Dependent variable: BI					

Source: The team's investigation

The corrected R Squared value indicates the suitability of the model. Based on the above table, the model has an Adjusted R Square of 0.263, which be 26.3% of the variation of the variable "Behavioral intention to use social media" explained by the three observation variables "Social Influence", "Effort Expectancy" and "Performance Expectancy", the other is due to the impact from factors other than the model. The correlation of the errors is measured by the Durbin-Watson quantity that value of 2.015, so the model has no similar phenomenon.

Table 7. Results of regression weightings

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	1,201	,301		3,996	,000		
	SI	,142	,068	,126	2,106	,036	,831	1,204
	EE	,325	,076	,289	4,280	,000	,654	1,530
	PE	,270	,078	,229	3,468	,001	,680	1,470
<i>a. Dependent variable: BI</i>								

Source: The team's investigation

From the table above, the Sig. values of the SI, EE, and PE variables are all less than 0.05, so all three independent variables make sense in the regression model. The variance inflation factor (VIF) is less than 10, even less than 2, so there is no violation of the multilinear assumption between independent variables.

The results of the study show that the Effort Expectancy has the greatest influence on the intention to use social platforms in foreign language learning (B = 0.289), if Generation Z believes they can easily use social networks for language learning, they will intend to use social networking platforms to learn a foreign language. The second most powerful impact variable is the Performance Expectancy with B = 0.229, which implies that

if Generation Z expects learning a foreign language on social networking platforms to bring well results, they will increase their intention to use. The third factor influencing Generation Z's intention to learn a foreign language through social networking platforms is the influence of friends, relatives or teachers with $B = 0.126$, which shows that Generation Z also has observation and learning from relatives, however, they also have their own opinion in their intention to use social networks to learn foreign languages.

From intent to the behavior of using social platforms in generation Z's foreign language learning

In order to assess the effect on the behavior of using social media, our group implemented a binary regression method. The dependent variable is "Generation Z's use of social media for language learning" with two answers- use and unused answers encoded into two values 0 and 1. If a respondent has used a social networking site, use = 1, whereas never having used a social networking site, use = 0

Table 8. Regression Results

		B	Std. Error	Wald	df	Sig.	Exp(B)
Step ^{1a}	BI	3,097	,567	29,858	1	,000	22,131
	FC	1,043	,357	7,787	1	,005	2,839
	Constant	-12,113	2,310	27,504	1	,000	,000

Source: The team's investigation

From table 8, 2 independent variables in the regression model are correlated with dependent variables and the level of statistical significance has reliability, measuring the Sig has a value of < 0.05 . The mark of the regression coefficients is in line with expectations.

Table 9. Probability calculation results

No.	Var	B	Exp(B)	Probability	Speed increase (reduced)	Influence position
				Original Po = 10%		
1	BI	3,097	22,131	71,1%	61,1%	1
2	FC	1,043	2,839	24,0%	14,0%	2

Source: The team's investigation

The results of the study showed that the Behavioral intention to use social media had the greatest influence on the behavior of using social media in learning foreign languages ($B = 3,097$), if Generation Z had the belief and intended to use social media in learning foreign languages, they would increase the behavior of using social media platforms to learn a foreign language. The second impact factor is facilitating conditions with $B = 1,043$, which implies that if Generation Z had a full range of equipment to support learning on social media platforms, they will tend to use social media more in learning foreign languages.

Based on the above results, the team draws out the regression equation as follows:

$$\text{Ln (Odds)} = -12,113 + 3,097*BI + 1,043*FC$$

5. Discussion and Conclusion

5.1. Discussion

As a result, the model after the actual regression retains the same independent variables as the original model. The effect of social factors on the intention to use social networks in foreign language learning activities is unclear, according to the study. Because each country and region has its own cultural background, the fact that Social Influence has yet to impact user intention due to worries about information hazards. The results also revealed that the largest influence was exerted by the Effort Expectancy. When students expect to be able to acquire foreign languages quickly through social media, their desire to use it for non-language learning increases. Additionally, on social media sites, the Performance Expectancy influences the ambition to study a foreign language. Furthermore, the Behavior Intention as well as Social Influence are two essential aspects that have a direct impact on students' use of social media to learn foreign languages.

The following research implications for social media developers can be derived from the results. Firstly, with the social influence on intention, social media providers' marketing agencies should develop promotion strategies to boost foreign language study on social media to students. Secondly, advertising campaigns advertise many of the benefits derived through the usage of social media in foreign language learning with the Performance Expectancy. Finally, the authors discovered that the Effort Expectancy influenced the intention to utilize social media in foreign language learning activities significantly. As a result, social media app developers must dig deeper into the features that young people are interested in learning. In summary, social media providers must have solutions to improve the efficiency of usage features in order to clearly demonstrate the superiority in rapid learning and easy information discovery for generation Z engaged in learning. Finally, the team encourages social media providers to understand and well implement relevant legislation in order to protect the privacy of social media content.

5.2. Conclusion

The UTAUT model was utilized to better understand the dynamics impacting Generation Z's social media use in Vietnam, and to provide administrative implications to social media providers to better satisfy their demands. Reliability is ensured by the magnitude of both independent and dependent variables. According to factor analysis, the scales all have a factor load factor of relatively high variables, and they all attain the distinguishing value and convergence value. The study's findings revealed that the effort expectancy element had the greatest impact on students' intentions to learn a foreign language through social media platforms, followed by performance expectancy and social influence. The criteria listed above account for 26.3 percent of generation Z's decision to use social media to learn a foreign language. The researchers expect that the findings will provide precise information and serve as a foundation for future research in this area.

Abstract

The main purpose of this study is to explore how engagement, value co-creation and self-brand connection factors affect university brand identification. This study proposes a structural model of the relationships among engagement in social media sites, value co-creation and university brand identification. Randomly selected respondents from the students from universities in Hanoi were selected to participate in the questionnaire study. Initially, an exploratory factor analysis (EFA) was performed to test the validity of the constructs, and the confirmatory factor analysis (CFA), using AMOS, was used to test the significance of the proposed hypothesis model. Results about the relationships among engagement, value co-creation and university brand identification were revealed.

Keywords: *Social media activities, University brand identification, Value co-creation, Engagement*

1. Introduction

In globalization trends, fundamental movements have seen increased challenges in higher education such as declining government funding support, financial autonomy, quality of methodology, prestige, and so on (Stephenson & Yerger, 2014) (Abdelmaaboud, Peña, & Mahrous, 2021). Consequently, this competition pressure has driven universities to adopt marketing activities, including branding strategies. A successful brand is proved by generating competence advantage effectively in the business domain, and brand management is a main organizational competence that organizations need to make sense (Harman, Hayden, & Pham, 2009). Thus, to maintain their competitiveness, a number of universities have chosen to innovate their management system in terms of both teaching quality and brand promotion which can help to identify them from others in the current dramatically challenging marketplace (Tran et al., 2016).

Kuenzel (2008) provided supportive empirical findings to explain why marketers might wish to strive hard to strengthen brand identification by enhancing the level of prestige associated with their brand and focusing on building customer engagement. Nevertheless, existing literature seems to be rather silent on what can strengthen brand identification, especially university identification in the educational context. Thus, this study answers one overarching research question of what can promote university identification. First, it investigates new antecedents of university identification, including students' engagement in university's social media sites, students' value co-creation activities on university's social media sites and students' self-brand connection. Second, by examining student-to-student value co-creation activities taking place in the university's social media sites among students (also known as consumers experiencing the university's educational services), this study aims at filling a gap in extant literature, which has always emphasized the effects of value co-creation activities between brands and consumers, thereby overlooking the importance of value co-creation activities developed among consumers themselves (Nicholls, 2010; Rihova et al., 2013). Therefore, this research extends the current knowledge on value co-creation activities by highlighting the key role of customers (students) in driving the value co-creation process and how they influence the brand (university) identification. Although data collected to test these relationships were related to social media activities of several universities in Hanoi, research results could be applied to many other educational institutions in similar contexts.

2. Literature review and Hypothesis development

2.1. Brand identification

According to marketing researchers, brand identification specifically refers to the “psychological state of perceiving, feeling, or valuing consumer's belongingness with a brand” and experiencing the brand's successes and failures as their own (Lam et al., 2010; Badrinarayanan and Laverie, 2011; Hughes and Ahearne, 2010). Consumers' identification occurs with a brand from two perspectives. Firstly, on a personal level, brands can help emphasize their personality as well as expressing their values and beliefs (Bhattacharya and Sen, 2003). Secondly, from a social perspective, brands can act as a means of communicating consumer aspirations and self-status (Tuškej et al., 2013). On social networks, consumers are identified by their profile and tend to present their actual self (Habibi et al., 2014).

2.2. University identification

Universities need identification with which students can be associated. University identification is a specific form of social identification characterized by students' attachment or belongingness with the university (Mael & Ashforth, 1992; Wilkins & Huisman, 2013). Drawn from social identity theory (Tajfel, 1978), university identification allows students to enhance their self-concept or self-image by representing and supporting their university. Students with strong university identification may act on behalf of the university, and the university supports their activities with recognition (Mael & Ashforth, 1992). Therefore, university identification engages the students in developing a long-lasting relationship with the university (Balaji, 2016).

In recent years, due to new policies employed by the government to control university activities, the widened influence on higher education work from “university autonomy” policy and various third parties, e.g. in the form of evaluations, Vietnamese universities need to reorganize and change their management strategies (Minh, 2018). These studies hinted that academic studies should focus more on brand identification in the concept of higher education in order to build a theoretical background for promoting university identification.

2.3. Consumer engagement and value co-creation activities in social media

Technological development and the advancement of social media supported a new conceptualisations of customer engagement with brands on social media (Li & Bernoff, 2011). To emphasize customers’ contributions, Sashi (2012) define the concept of customer engagement as a “process of value creation” that consists of personalised experiences with “informed, networked, empowered and active customers increasingly co-creating value with the organisation”. In social media, CE can be expressed by liking, sharing and commenting in brand/organization-related interactions, posting content or messages.

Engagement between brand/organisation and existing or potential consumers – and among consumers themselves – enables consumers to co-create value by “generating content, providing feedback, disseminating information and becoming advocates for the organisation among their peers” (Shawky et al., 2018). Co-creation as a phenomenon included in the social connection can then be studied by interpreting shared social structures and their interaction and reproduction by individuals (Edvardsson et al., 2011). Therefore, considering just the customer–brand interaction will not be enough. Hence, customer-to-customer (C2C) interactive experiences should be considered in the whole process of value co-creation. Urich (2014) classified the five practices involved in the C2C co-creation process as associating and dissociating, engaging and sharing, competing, intensifying and exchanging. In the concept of higher education, the existence of value co-creation activities enables students to interact with each other to improve their experience and performance (Dollinger, Lodge, & Coates, 2018).

2.4. Hypothesis development

Social media are motivating the process of business change fundamentally, where customers and firms are able to communicate with each other by means of two-way interaction. According to Boyd and Ellison (2007), customers who engage with a firm by actively participating in the firm’s social media sites share a level of connection with the firm. When customers are drawn to engage with a brand by liking, commenting, and/or sharing company or personal posts with other site members, they begin to identify with the collective group. Moreover, Balaji (2016) indicates that university identification is related to students’ advocacy behaviors which includes positively sharing about their university to external publics or their friends, for example on social media. In the same perspective, Fujita and associates (2017) also clarify students’ brand engagement via social media as part of their higher education’s acculturation and social identification. Therefore, we hypothesize that:

H1: *Engagement in university’s social media enhances university identification.*

At university, by allowing students and institutions to connect and collaborate, value co-creation bridges formerly isolated users' and producers' asymmetric knowledge and information (Von Hippel, 2009). Value co-creation helps build relationships between students and faculty members, it may also be able to benefit the institution through numerous factors including student loyalty, university image as perceived by students, and student-university identification (Schlesinger et al., 2015). In this study, value co-creation activities are not limited to the interaction between the university and students but also include interactions or behaviors toward co-creating value with other students on the university's social media sites. Researchers who explore C2C interactions in such contexts mostly adopt a subjectivist, experiential perspective in that they focus predominantly on the perceived positive, negative or neutral value outcomes of social atmospherics (Uhrich and Benkenstein, 2012), or the influence of other customers on service experiences (Huang and Hsu, 2010). While these studies highlight the fact that customers co-create value with each other, other customers are viewed merely to comprise a social element of the servicescape that may impinge on individuals' service experiences. Based on the above discussion, the following hypothesis is proposed:

H2: *Value co-creation on social media is positively related to university identification.*

Figure 1. Theoretical framework of the research

3. Method

3.1. Research design

The study was conducted through a quantitative survey method in the context of higher education in Vietnam. Measurements scales were adapted from previous studies. All items in the measurement scale were measured with a 5-point Likert scale. The proposed conceptual framework consisted of three constructs, namely university identification, engagement in university's social media sites, and value co-creation activities on university's social media sites. The questionnaire contains a total of 18 items (presented in Table 2) with 6 items to measure value co-creation activities, 6 items for engagement activities and 6 items for university identification.

3.2. Sample and data collection

Data were collected among students at several universities in Hanoi, Vietnam in November 2021. Both undergraduate students, alumni and overseas students were invited to participate in the survey with convenient sampling and their participation was based on a voluntary basis. Questionnaires were circulated online to 330 and out of which 323 were returned, indicating a 98-per-cent rate of response.

4. Results

SPSS 22.0 and AMOS software were utilized to analyze the collected data. The measures were evaluated for reliability and validity before the hypotheses were tested. First of all, Cronbach's alphas are above the standard threshold of 0.70 for all variables at 0.857 (engagement in university's social media sites), 0.926 (value co-creation activities on social media sites), 0.887 (university identification). VCASM3 (item 3 for *value co-creation activities on social media*) and UI3 (item 3 for *university identification*) were eliminated because Cronbach's Alpha if Item Deleted is higher than Cronbach's Alpha.

Exploratory factor analysis (EFA) was then conducted using principal component analysis (PCA) extraction with varimax rotation to investigate the validity of measures. The resulting factors were as expected with acceptable loadings of items on their relevant factors, indicating convergent validities of the measures. After that, confirmatory factor analysis (CFA) was applied for further test of the measure validity. The results of CFA indicate acceptable fit: Chi-square = 3.969 ($p < 0.001$); GFI = 0.854; TLI = 0.896, CFI = 0.913 RMSEA = 0.096. The results exhibited that factor loadings of all items are higher than 0.5, while the average variances extracted (AVE) of all constructs are higher than 0.5 (See Table 2). Therefore, the measures can be considered to have adequate convergent validities (Hair et al., 2018).

Table 1. Reliability and convergent validity of measurement scale

Constructs	Items	EFA	CFA	AVE	CR
EUSM	I read posts on my university's social media sites.	0.771	0.794	0.512	0.861
	I am a member of my university's social media sites.	0.592	0.571		
	I often watch pictures/graphics on my university's social media sites.	0.799	0.818		
	I follow my university's social media sites.	0.752	0.744		
	I read users' comments on my university's social media sites.	0.647	0.678		
	I read users' reviews on my university's social media sites	0.630	0.658		
VCASM	I usually comment on videos/pictures/posts on my university's social media sites	0.745	0.739	0.715	0.925
	I usually share posts on my university's social media sites	0.707	0.710		
	I usually post on my university's social media sites.	0.922	0.931		
	I usually post videos/pictures on my university's social media sites.	0.919	0.933		
	I usually write reviews on my university's social media sites.	0.877	0.887		

Constructs	Items	EFA	CFA	AVE	CR
UI	When someone praises my university it feels like a personal compliment	0.844	0.834	0.621	0.891
	The university reflects my individual characteristics	0.669	0.674		
	I am very interested in what others think about my university.	0.782	0.774		
	I feel good when I see a positive report on social media about my university	0.865	0.864		
	I find it easy to identify with my university on social media	0.762	0.781		
Note: EUSM: Engagement in university's social media sites, VCASM: Value co-creation activities on social media site, UI: University identification					

Table 3 below shows that the AVEs are greater than the correlation squared between variables as estimated in the measurement model. Thus, the discriminant validity of the measures are adequate (Fornell & Larcker, 1981).

Table 2. Discriminant validity of measurement scale

Constructs	1	2	3	4
1. University Identification	0.621	0.40	0.04	0.58
2. Engagement in University's social media sites		0.512	0.11	0.46
3. Value co-creation activities on social media sites			0.715	0.14
Note(s): Numbers in the diagonal are the average variances extracted (AVEs). Other numbers are correlation squared between variables.				

To test the hypotheses in our research model, first the item scores for each factor were averaged to form the variable representing that factor. To test moderation effects, multiplication variables were created by multiplying the moderator and the independent variables. However, to remove the nonessential correlations between the multiplication variables and the independent variables that create them, we mean-centered the independent variable and the moderator variables before taking the multiplication (Cohen et al., 2014). Ordinary least squares (OLS) regressions were used to test the models.

Table 3. Regression results with university identification as dependent variable

Variable	Model 1					Model 2				
	B	Std. Error	β	t-value	p-value	B	Std. Error	β	t-value	p-value
(Constant)	3.700	0.172		21.523	0.000	1.226	0.222		5.694	0.000
Gender	0.341	0.102	0.184	3.346	0.001	1.186	0.081	0.100	2.281	0.023
Age	-0.110	0.136	-0.044	-0.809	0.419	0.068	0.107	0.027	0.632	0.528
EUSM						0.643	0.048	0.623	13.395	0.000
VCASM						-0.004	0.038	-0.005	-0.110	0.912
R ²	0.036					0.409				
Adjusted R ²	0.030					0.402				
Note: EUSM: Engagement in university's social media sites, VCASM: Value co-creation activities on social media site, UI: University identification										

Table 4 presents the regression results. R^2 for the full model M2 at 40.9% is greater than R^2 of M1 (3.6%) with only control variables. The highest variance inflation factor (VIF) is 1.964, indicating that multicollinearity would not be a problem (Cohen et al., 2014). The analysis result shows that engagement is positively related to university's social media (with $\beta = 0.623$, p value < 0.001). Therefore, H1 is supported. However, the negative beta ($\beta = -0.005$) indicates that this is a negative relationship, which is contrasting to what was proposed in H2.

5. Discussion and Conclusion

In conclusion, our analysis results have confirmed that students' engagement in their university's social media sites has a great impact on university identification. Drawing from the social identity theory (Tajfel, 1978), our research corroborates findings of previous studies by affirming that students' interaction with or engagement in their university's social media sites enables them to identify themselves with the values and prestige of the university they belong to (Fujita et al., 2017; Balaji, 2016). However, our research findings reveal that the activities of co-creating values among students and students on university's social media sites may not promote university identification as proposed. In contrast, it was found out that value co-creation activities between students and students on the university's social media sites are significantly negatively associated with university identification. This finding is opposite to the positive impacts of value co-creation on brand identification as found in most research in existing literature (Halbesleben & Wheeler, 2009); Schlesinger et al., 2015). This can be explained as followed. Sometimes, students may be exposed to negative word-of-mouth can be spread by other students in the university's social media sites. Interaction to these types of contents posted by other students in the university's social media sites may lead to negative emotions or remind students of bad experiences they may have with the university. However, as each individual student's identification of the university tends to be their individual self-concept, this kind of co-created value is likely to be ignored or sometimes protested against by others. Therefore, it can be argued that university identification in that sense can be negatively influenced by value co-creation activities between students and students on social media sites of the university.

Theoretically, this study has contributed to the literature of university identification. The proposed research model integrated the influence of students' engagement in the university's social media sites on university identification. However, it rejects the assumption that value co-creation between students and students on the university's social media sites can promote university identification. This is one of the very few studies exploring the role of value co-creation activities between customers and customers in consumer behavior research, proposing that value co-creation does not always positively influence brand identification as typically concluded in previous literature.

Practically, findings from the study will first help university leaders establish a clearer insight into how students' engagement in the university's social media sites can positively influence university identification, which will ultimately lead to many other favorable outcomes in terms of engaging in pro-brand activities, such as supporting the

university's goals, protecting its reputation and becoming loyal. Furthermore, universities should also set some restrictions to particular behaviors that students can interact with each other while performing value co-creation interactions in the university's social media sites in such a manner that will not negatively influence other students' university identification.

Limitations and Recommendations

This research is not without limitations. First of all, data were collected for this research in the convenience sampling method, which will mean that findings can be different between groups of students who usually engage with the university's social media sites and groups of students who do not do so frequently. It would be advisable that future research would compare the proposed relationships in the theoretical framework in different groups. Second, respondents who participated in the research survey were from different universities in different fields. Therefore, the generalization of the research findings may be restricted as students studying different fields may have different attitudes or behaviors towards engagement in social media sites or self-brand connection with their universities. Therefore, further research may focus on one type of universities or even compare findings from universities in different fields.

Abstract

Vietnam's Southern key economic zone is also known as the leading economic region in our country, which contributed to 42% GRDP and more than 43% of the country's total budget revenue in 2019. It not only is a big influential foundation force but also a locomotive in the promotion and economic development of the whole country. During the Covid 19 outbreak, workers massively moved from the industrial zone of the southern key economic region to the West and even to the North, away from their workplace and from the unstable life after losing jobs. The number of people moving from Ho Chi Minh City and the southern provinces to their hometown accounts for 60% in the total 1.3 million people moving of 63 provinces. The fact that thousands of workers went back to their hometowns will have a strong impact on the labor market. This research identifies the factors affecting laborers' movement during Covid 19 pandemic based on theory models, quantitative scales, statistical and control processing research data on hypothesis, thereby making necessary recommendations for regulators and businesses firm in Viet Nam.

Keywords: *labor polivy, labor movement, Covid-19 pandemic, key economic zone.*

1. Introduction

The Covid-19 pandemic has caused a lot of damage in all aspects to the economy of our country, most evident in the southern key economic region - which has the most vibrant economy in the country (includes 8 provinces and cities: Ho Chi Minh City, Dong Nai, Binh Duong, Ba Ria - Vung Tau, Binh Phuoc, Tay Ninh, Long An and Tien Giang). The areas that are particularly seriously affected are labor and employment.

In this study, we will focus on analyzing the factors affecting labor mobility in industrial zones in the southern key economic region and finding solutions to help restore the new normal state for workers and businesses.

The majority of workers in industrial zones in the southern key economic region are unskilled workers and are one of the places that attract the most labor in the country. Workers in the zone come from many different provinces in the world, including those from the provinces in the region, the provinces of the Mekong River Delta and the provinces in other regions such as the north, the central region, ... with provinces such as Thanh Hoa, Nghe An, Nam Dinh, Hai Phong, etc. When the pandemic took place, a large number of unskilled workers left the city, industrial zones, and export processing zones, leading to a shortage of labor resources in these areas. The impact of the epidemic along with the impact of the 4th Industrial Revolution requires a total solution to restore the labor market and improve the capacity of workers.

On the side of businesses, they not only face difficulties due to lack of workers but also financial difficulties due to long-term closure. Laborers who stay in the city also have difficulty in securing stable jobs due to the changing demand for jobs. As a result, they have to endure financial difficulties such as salary cuts and high prices of consumer goods. For example, some working families face difficulties in investing in learning equipment for their children such as laptops or phones. Many people are forced to withdraw their social insurance to get a few million dong - the last resort reflects the great difficulty that the workers are facing. Schools have not yet returned to operation, making it difficult for workers to both take care of their children and go to work.

For workers who move to their hometown, it is difficult to decide whether to return to the city or continue in the countryside - where they do not have a stable job but because of the risk of a re-epidemic outbreak due to disease transmission in the country. The locality also makes it impossible for workers to return to their old workplace.

Low-skilled workers are gradually being eliminated. In fact, the labor market in Vietnam is suffering from a double impact, which is a wave of workers moving to their hometown due to the impact of the epidemic and a part of manual workers who were simply eliminated during the Revolution. The 4th industrial network Certificates from elementary level and above account for only 24.6%.

2. Method

Research methods are based on available data analysis: through articles, magazines, reports on socio-economic situation, year-end economic summary reports of reputable source sites such as VTV, economic and development magazines. development, economic - labor and employment reports for quarters and year-ends of HCMC.

In-depth interview method: for business owners in industrial zones in the southern key economic region, experts in the field of labor management in the region.

Methods of survey questionnaires: building questionnaires and surveying employees, analyzing collected data using SPSS software to analyze Cronbach's Alpha reliability coefficient and exploratory factor analysis EFA to We can see the relationship of factors affecting labor mobility, from which we can see the causes of labor mobility and give necessary solutions and recommendations.

3. Results

Figure 1. Sample structure chart by hometown

Source: Summary results of the research team, 2022

Regarding the structure by hometown of employees:

The majority of workers come from the North Central and Central Coast regions with the rate of 27%. The following regions are the Mekong River Delta with 21%, the Red River Delta with 18%, the Southeast with 15%, the Northern Midlands and Mountains with 17% and a small part accounting for 2% to from the Central Highlands. It can be seen that workers in the southern key industrial zone come from all over the country. Therefore, with the current situation, the homeland of the surveyed workers is tending to develop strong industrial zones, which has created a competitive attraction with the southern key economic region.

Comparing working status before and during the pandemic:

Figure 2. Sample structure chart by working status

Source: Summary of the results of the research team, 2022

According to the survey results, with a research sample of 150 observations, the post-pandemic unemployment rate skyrocketed compared to before the pandemic (from 29 people, accounting for 19.33% to 89 people, or 59.33%). However, in fact, the increased demand for labor here shows the inconsistency between workers and businesses in terms of wages and remuneration policies during the pandemic. Both of these subjects are affected by the negative effects of covid, businesses are stagnant or even have to stop completely due to covid while they still have to bear the fixed costs during the shutdown. a great burden on the finances of businesses, while workers face difficulties such as salary cuts, living costs and high prices of necessities and medical equipment.

Descriptive analysis of factors affecting the employees' decision to continue working in the industrial park

3.1. Employee's assessment of the Income Factor

Table 1. Descriptive Statistics Income Factor

Elements	Observed variables	Content	The average value	Std. deviation
Income	THUNHAP	Income		
	THUNHAP1	The pandemic has significantly lowered my income	3,67	0,746
	THUNHAP2	The level of income during the pandemic has greatly affected my daily life	3,72	0,743
	THUNHAP3	If my income increases to 1-2 million/month, I will continue to do my current job.	3,74	0,746
	THUNHAP4	Assuming my income decreases, I will move my hometown or to order regions to find a new job	3,73	0,757

Source: Survey data, 2022

According to the statistics table of the factor Income level, we see that in the 5 scales of the variable, the scale 'If the income level increases to 1-2 million/month, I will continue to do my current job' is agreed the most, with an average of 3.74/5. In addition, we can also see that the other questions are smaller in terms of agreement, but the difference between them is not much. In general, all 5 scales give results above the agreed level.

3.2. Employee's assessment of the Cost of Living Factor

Table 2. Descriptive Statistics Cost Factor

Elements	Observed variables	Content	The average value	Std. Deviation
Cost of living	CHIPHI	Rising cost of living		
	CHIPHI1	I had to spend more during the pandemic.	3,23	0,798
	CHIPHI2	I accept to pay more medical-related living expenses to ensure health.	3,23	0,752

Elements	Observed variables	Content	The average value	Std. Deviation
	CHIPHI3	The rising cost of living makes my life more difficult than before	3,12	0,759
	CHIPHI4	The high cost of living is the reason why I have to move to my hometown or to other places where the epidemic situation is more stable.	3,25	0,804

Source: Survey data, 2022

According to the statistical table describing the Cost Factors, in the five-variable scale, we can see that the variable CHIPHI4 - The high cost of living is the reason why I have to move to my hometown or to other places where the situation is different. More stable disease is the most agreed opinion, with the average value reaching 3.25/5, but the difference between the mean values of the variables is not high, especially there are 2 variables CHIPHI1. and CHIPHI2 have the same mean. CHIPHI4 is also the variable with the highest standard deviation, up to 0.804, however, like the mean, the standard deviation of all 5 variables also has a small difference and all five scales give the above results are agreed.

3.3. Workers' assessment of the Pandemic Fear Factor

Table 3. Descriptive Statistics the Fear Factor

Elements	Observed variables	Content	The average value	Std. Deviation
Fear of the pandemic	SUSOHAI	Fear of the pandemic		
	SUSOHAI1	I myself or a loved one have an underlying medical condition and my health will be affected if I get Covid-19	3,66	0,731
	SUSOHAI2	The number of deaths where I live is so high that worries me.	3,60	0,803
	SUSOHAI3	My current accrual and related benefits are not enough to cover my living if I become ill.	3,61	0,776
	SUSOHAI4	Fear of the pandemic was the main reason why I had to relocate for work.	3,71	0,789

Source: Survey data, 2022

For the descriptive statistics table Attraction factor, with the five-variable scale being conducted, it can be seen from the obtained results that the SUCHUT4 factor is the factor that achieves the greatest agreement, and similar to the other tables. Statistics describe the factors above, the difference between the mean and the standard deviation is different, but the difference is not too much. It can be seen that the opinion is similar, the factor has had a profound impact on the majority of survey participants and has shown that this is a factor that has a profound impact on employees.

3.4. Employee's assessment of the Allowance Factor

Table 4. Descriptive Statistics Subsidy Factor

Elements	Observed variables	Content	The average value	Std. deviation
Subsidize	TROCAP	Subsidize		
	TROCAP1	I will decide to stay at the place of work if I receive a salary subsidy, food, etc...	3,73	0,783
	TROCAP2	I feel satisfied because I have Covid test support, cost support for F0.	3,64	0,771
	TROCAP3	I look forward to receiving more attention and subsidies from the company.	3,55	0,824
	TROCAP4	I look forward to receiving more attention and subsidies from the locality.	3,62	0,808

Source: Survey data, 2022

According to the descriptive statistics table of Subsidies, similar to the above tables, statistics are conducted on a five-variable scale. It can be seen that the variable TROCAP1 - I will decide to stay at work if I receive salary, food, etc... is the opinion that has the most agreement with the average value of 3.73/5, however, the standard deviation from the rest of the variables is not too high, at 0.783. For the remaining variables, the agreement level is smaller, but the difference with TROCAP1 is not too much and the standard deviation of the variables does not have mutational differences. It shows that these factors are having a great impact on employees - who give opinions for the survey.

3.5. Employee's assessment of the Employment Attraction Factor in other regions

Table 5. Descriptive Statistics Attraction Factor

Elements	Observed variables	Content	The average value	Std. Deviation
Attraction, job opportunities in other areas:	SUCHUT	Attraction, job, opportunities in other areas:		
	SUCHUT1	Higher level of income	3,71	0,717
	SUCHUT2	Lower cost of living	3,65	0,794
	SUCHUT3	More suitable job	3,75	0,753
	SUCHUT4	Convenient for commuting because close to home, close to family	3,85	0,739

Source: Survey data, 2022

For the descriptive statistics table Attraction factor, with the five-variable scale being conducted, it can be seen from the obtained results that the SUCHUT4 factor is the factor that achieves the greatest agreement, and similar to the other tables. Statistics describe the factors above, the difference between the mean and the standard deviation is different, but

the difference is not too much. It can be seen that the opinion is similar, the factor has had a profound impact on the majority of survey participants and has shown that this is a factor that has a profound impact on employees.

3.6. Employee ratings of Trend Factor

Table 6. Descriptive Statistics Trend Factor

Elemen	Observed variables	Content	The average value	Std. Deviation
Trend	XUHUONG	Moving trend		
	XUHUONG1	I wouldn't move if a similar pandemic broke out because I've experienced and reduced anxiety.	3,49	0,775
	XUHUONG2	I will not move because I am very satisfied with my current job.	3,41	0,844
	XUHUONG3	I won't move when I'm firmly attached to the job.	3,40	0,760

Source: Survey data, 2022

From the results of the statistical table on the influence of the 'Trend' factor, we see that the scales have a consensus level ranging from 3.40 to 3.49. The lowest level of agreement belongs to the scale of “I will not move when I am firmly attached to the job.” (reaching 3.40/5). The highest level of agreement was with the observed variable “I would not move if there was a similar pandemic outbreak because I experienced and reduced anxiety.” (reaching 3.49/5). In addition, the standard deviation of the scales in the Trend is also relatively high, ranging from 0.775 to 0.884. This shows that the surveyed people have different thoughts about the trend of displacement in the context of the epidemic outbreak. This difference in action will be discussed more closely by the group in the following sections.

Table 7. Detailed table of statements in groups of factors

Identify	Variable	Load factor
Higher level of income	SUCHUT1	0,812
Lower cost of living	SUCHUT2	0,801
More suitable job	SUCHUT3	0,786
Convenient for commuting because close to home, close to family	SUCHUT4	0,785
The level of income during the pandemic has greatly affected my daily life	THUNHAP2	0,844
Assuming my income decreases, I will move to my hometown or to other regions to find a new job	THUNHAP4	0,843

Identify	Variable	Load factor
If my income increases to 1-2 million/month, I will continue to do my current job	THUNHAP3	0,816
The pandemic has significantly lowered my income	THUNHAP1	0,691
My current accumulation and related benefits are not enough to cover my life if I get sick	SUSOHAI3	0,795
Fear of the pandemic is the main reason why I have to relocate for work	SUSOHAI4	0,754
I myself or a loved one have an underlying medical condition and my health will be affected if I contract Covid-19	SUSOHAI1	0,751
The number of deaths where I live is so high that I worry	SUSOHAI2	0,695
The rising cost of living makes my life more difficult than before	CHIPHI3	0,816
The high cost of living is the reason why I have to move back to my hometown or to other places where the epidemic situation is more stable	CHIPHI4	0,792
I accept to pay more medical-related living expenses to ensure health.	CHIPHI2	0,763
I had to spend more during the pandemic.	CHIPHI1	0,642
I look forward to receiving more attention and subsidies from the company	TROCAP3	0,789
I look forward to receiving more attention and subsidies from the local community	TROCAP4	0,760
I feel satisfied because I have Covid test support, cost support for F0	TROCAP2	0,595
I will decide to stay at the place of work if I receive a salary subsidy, food, etc...	TROCAP1	0,543

In fact, workers have the highest intention to move when they are attracted to jobs in areas other than industrial zones in the southern key economic region. The main reasons for this attraction include attractive income and reasonable costs. The two factors THUNHAP and CHIPHI are reflected in the SUCHUT factor, so workers tend to move their jobs when there are attractive new job opportunities in other localities.

The TROCAP factor has the least impact on the intention to move workers. While the cost of living has increased, wages have been significantly cut, and subsidies from the Government or local authorities are still very limited, unable to compensate for the loss from the epidemic. So even if they receive a subsidy, workers will have little reaction to the decision to move or not.

Table 8. Regression coefficients of independent factors to Trend

Model	Unnormalized coefficients		Normalization coefficient	T	Sig,
	B	Standard error	Beta		
(CONSTANT)	-0,856	0,344		-2,492	0,014
THUNHAP	0,179	0,073	0,162	2,458	0,015
CHIPHI	0,142	0,071	0,123	2,005	0,047
SUSOHAI	0,326	0,075	0,293	4,319	0,000
TROCAP	0,171	0,079	0,146	2,172	0,031
SUCHUT	0,363	0,072	0,326	5,032	0,000

Source: Research team, 2022

Sig value, in the table is used to determine the significance level of the regression coefficients of the independent variables. The statistical hypothesis tests all apply significance level of 5% or Sig, must be less than 0.05 to be considered significant. Therefore, the independent variables Income, Cost, Pandemic Fear, Allowance, Attraction (sig < 0.05) are all significant in the proposed model.

Comment on the level of impact:

$$XUHUONG = -0,856 + 0,162*THUNHAP + 0,123*CHIPHI + 0,293* SUSOHAI + 0,146*TROCAP + 0,326*SUCHUT$$

The sign of the above regression function has shown the meaning:

Variables: Income, Cost, Pandemic fear, Allowance, Attraction all have a positive impact on the mobility trend of workers. All variables (Income, Cost, Pandemic Fear, Allowance, Attraction when changing one unit), the trend is in the same direction as: 0.162; 0.123; 0.293; 0.146, 0.326, respectively.

4. Discussion and Conclusion

In summary, it has systematized the main causes which affect the mobility of workers. In addition, this report has analyzed the data collected from the General Statistics Office of Vietnam, through independent surveys conducted with businesses and employees. From the factors proposed as well as some solutions that businesses, employees and we propose ourselves, which can be useful ideas and can be the basis for not only Vietnam but many other countries to consult when the events with great impact suddenly occur, like the Covid-19 pandemic that has impacted Vietnam. Here are some of the research's recommendations:

Firstly, improving the quality of labor and information on labor supply and demand needs to be more complete. The times after the crisis, the recovery period is always the period when the job demand is active again. However, in countries with developing economies such as Vietnam, the connection between employers and employees does not have a strong and durable connection. The information about labor is not common and the recruitment information is mostly aimed at local workers and is less likely to attract labor elsewhere (especially in the provinces and cities that are not the center of the country such as economic, financial or production), is the lower level. Along with that, another very important reason is the quality of

labor, for Vietnam, although the quality of labor is improving, in general it is still low and needs to be further improved in the future. Low-skilled workers during the recent Covid-19 pandemic, they are the ones most affected by the pandemic. Therefore, improving the skills of workers is also contributing to minimizing the consequences, impacts and risks of future crises.

Second, State policies need to be flexible and be expressed more quickly.

According to our research, allowance is one of the main factors for employees to decide to work in a certain locality, but it is also the main reason for employees to have to go to another area or leave their hometown when they can't wait for the subsidy packages. Meeting the procedures to receive subsidies from the government and businesses which takes too much time and has some disadvantages. In my opinion, this is a difficult problem. However, from the lessons learned by the recent Covid-19 pandemic, businesses and the state should make timely corrections and amendments so that employees can feel more secure at work and work.

Third, develop the economy more sustainably and evenly across regions. According to the information and data we have collected. It can be seen that the developed economic regions are the places where the most labor is concentrated. And in general, that has caused. The difference in labor, also as the labor shortage of many other localities. Therefore, it is necessary to develop a sustainable and multi-centre economy, Narrow the development gap between regions and provinces, so that workers can work in the locality Help thrive than the local economy About reducing the load. Labor demand Shortage in rural areas and surplus labor in large urban areas./.

Abstract

The COVID-19 pandemic has impacted all aspects of social life, including education. From the traditional form of learning, higher education institutions have to switch to online teaching. Not only that, the COVID-19 pandemic also shows the dependence between countries around the world in the race for a vaccine to prevent the spread of coronavirus. This study aims to examine the factors affecting students' global citizenship capacity in the context of globalization. The study uses Morais and Ogden's model to assess students' global citizenship capacity to provide an overview and direction to educate students in the context of globalization.

Keywords: *COVID-19, educational institution, global citizenship, global competence, globalization, higher education.*

1. Introduction

In recent years, the context of globalization has taken place strongly as well as had many obvious impacts on all aspects around the world. Thanks to the process of globalization, the distance between countries has decreased, giving the chance of accessing to information, human knowledge, and building good relationships among countries more easily. In addition, the outbreak of COVID-19 caused the dependence between countries and individuals around the world is even more evident when witnessing the race to change policies regulations and vaccines to prevent the spread of COVID-19. The issue of globalization has really affected all areas to control the epidemic in countries, it is both an opportunity and a challenge that countries face.

Similar to other countries, the COVID-19 pandemic requires Vietnam to both develop socio-economic and improve its ability to adapt to the change of new context. In

fact, the “new normal” is opening up many directions if there is a timely transformation, higher education can completely assert its position and rise to strong development. However, the concept of global citizenship is still quite new and university’s responsibility for global citizenship education has hardly been researched.

Along with that, the role of global citizenship education is of great significance to the influence of a citizen's culture and society on the country and the world. In the era of technology development, distance is no longer a barrier preventing students from comprehensive development and integration into the modern world. Global citizenship education towards tapping into human potential with lifelong learning capabilities, self-worth awareness, career orientation awareness, and a deep awareness of what one’s culture is the most important important when applying intercultural values that aspire to solve global problems. Global citizenship education has also become a target educational trend of countries when facing the global vision of the United Nations' 2030 SDGs Sustainable Development Goals. Accordingly, when referring to goal 4.7 on global citizenship, it is mentioned that “By 2030, ensure that all learners have the knowledge and skills necessary to promote sustainable development, including, through education for sustainable development and sustainable lifestyles, human rights, gender equality, promotion of a culture of peace and non-violence, global citizenship and appreciation of cultural diversity and of culture’s contribution to sustainable development”. It can be seen that global citizenship education is an inevitable trend that requires the education system to build learners' values, soft skills, and attitudes in the face of the constant fluctuations of globalization.

2. Literature Review

2.1. Overview of research projects on Global citizenship

The concept of "global citizenship" is getting more attention worldwide in general and in Vietnam in particular. This concept was mentioned about thousands of years ago, from the time of ancient Greece related to the right to govern the subjects of the King in the cities of Rome, Greece,... In the context of deep and wide international integration with the international community in Vietnam, the concept of "Global Citizen" is increasingly focused and becomes more urgent.

According to Richardson (1997), a "global citizen" is someone who is aware of how the world works, and stands up against injustice. In addition, they must be willing and able to face global challenges as well as provide solutions to global problems.

Ikeda (2010) introduced the concept of global citizenship, he said that wisdom, courage, and compassion always interact and support each other and that is what nourishes and directs people to become global citizens. Social responsibility (awareness of social inequality, concern for others and the environment, and recognition of local and global interconnectedness) corresponds to compassion and wisdom as Ikeda (2010) defines. In 2015, UNESCO introduced the concept of global citizenship. Accordingly, Global Citizen is the awareness of a large community and common features of humanity, thereby showing the connection and mutual bond among the political system, the economy, humanity, and cultural traditions around the world.

Of all the studies on "Global Citizen", most of the studies have confirmed the essential points that make up a global citizen: respect for human values; say no to behaviors related to discrimination on the basis of race, age, sex, religion and political opinions; aware of its responsibilities in providing approaches to solving global problems; consciously protecting and valuing nature and the life of all things; resolutely oppose acts that manifest injustice or inequality in society in any form.

2.2. Overview of research projects on Global competence

An international education initiative, called global competence, was first recognized in 1988, in a report published by the Council for International Educational Exchange. Lambert (1996), considered by many to be the father of the Global competence initiative, defined a globally competent citizen as someone with knowledge (of current events), able to empathize with others. , show approval (remain positive), have a low level of foreign language ability and the ability to perform tasks is not up to standard.

Global citizenship competency is understood as an open mind, actively understanding the cultural norms and expectations of others and utilizing this knowledge to interact, communicate and work effectively with the external environment. (American Board of Education, 2008; Deardorff, 2006; Hunter et al., 2006; Peterson et al., 2007; Westheimer & Kahne, 2004). Globally competent students recognize their limitations and abilities in participating in cultural exchanges and demonstrate a range of cross-cultural communication skills.

The Organization for Economic Cooperation and Development (OECD) (2016) also introduced the concept of global citizenship competency through the PISA international student assessment program. Accordingly, global competence is the ability to think and analyze local, global and intercultural issues in order to understand and appreciate the perspectives and worldviews of others. From there, core criterias are developed in four areas: skills, knowledge and understanding, attitudes, and values.

(1) Analytical and critical thinking skills, the ability to interact respectfully, rationally and effectively

(2) Knowledge and understanding of global and intercultural issues

(3) An open attitude towards people from different cultures, respecting cultural differences, and aiming for global responsibility.

(4) Appreciate human dignity and cultural diversity.

3. Method

In line with the scope of research based on theory and practice to assess "global citizenship" in students in Vietnam, the research team has chosen the scale of Morais and Ogden (2011). edited as a theoretical framework. Because this is a relatively modified and perfected scale from many previous studies, it is used mostly in research papers when assessing global citizenship capacity in students. The research team will use the dependent variable which is the global citizenship capacity with the independent variables drawn from the research model: Self-Awareness, Intercultural Communication and Global Knowledge. In addition, the newly added independent variable is: Appreciate cultural values.

In order to better control the impact of variables in the model, the research team decided to use the following variables: gender, school year, major, career orientation, level of participation in activities at university, the level of interest in global issues, the degree of connection of students' relationships.

Figure 1. Research Model

Self-awareness is the ability to self-recognize, including thoughts, experiences, and abilities. From there, you have understanding and acceptance of inherent qualities to promote your strengths, limit your weaknesses in order to organize your life well and improve your relationships with people. In summary, self-awareness is an important skill in modern society.

Intercultural Communication capacity is the contact and exchange of information and emotions between people from many cultures and different cultural expressions in a particular region or the world in general. Through it, people can exchange information, emotions, perceptions, and interactions between cultures and cultural communities around the world.

Global Knowledge is essential for adapting to an international environment that includes social issues of global concern. This ability enables students to apply their global experience to work anywhere in the world, solving emerging problems locally and connecting with the world such as epidemic, environmental pollution, schools, terrorism, global trade...

Appreciate cultural values is a key competency for success in the context of globalization. It requires learners to have the ability to access information, research and evaluate social issues based on their own perspectives. Therefore, receiving a person's cultural values can build a cultural value system and a standard value system in morality, personality, creative capacity and civic duty in international integration.

4. Results

4.1. Respondent profile

The survey received 503 valid responses, including 191 votes (38%) from males, 312 votes (62%) from females. With 150 (29.8%), third-year students received the most votes, followed by sophomores with 148 (29.4%), freshmen with 145 (28.8%), fourth-year students with 60 (11.9%). It is acceptable to conclude that third-year students are more concerned about this topic. Furthermore, the survey respondents' educational backgrounds are at the university level, which has resulted in a strong personal opinion and life perspective that they need to conduct this survey.

Table 1 illustrates the number and percentage of students participating in the survey from the Northern schools in Vietnam, mainly the Hanoi University of Science and

Technology, National Economics University, VNU University of Social Sciences and Humanities, Academy of Journalism and Communication.

Table 1. Respondent of students from universities in Vietnam

Name of the university	Number of respondents	Percentage
National Economics University	111	21.1%
ThuongMai University	47	9.3%
Hanoi University of Science and Technology	131	26%
Posts and Telecommunications Institute of Technology	50	9.9%
VNU University of Social Sciences and Humanities	65	12.9%
Academy of Journalism and Communication	64	12.7%
Other universities	35	7%

Source: Author's survey results

Table 2 demonstrates the number of students in the different majors and the percentages in each category. As presented in the chart, the number of students in the economic sector accounted for the largest number, with 176 students (equivalent to 35%), followed by engineering students with 121 (24.1%), Journalism and Social students with 112 students (22.3%). Finally, there are students from other majors with 18.7%, equivalent to 94 people.

Table 2. Respondent of students from different majors in Vietnam universities

Name of the major	Number of respondents	Percentage
Economic	176	35%
Engineering	121	24.1%
Journalism and Social	112	22.3%
Other majors	94	18.7%

Source: Author's survey results

4.2. Descriptive statistics analysis

Figure 2. The necessity of becoming Global Citizen

Source: Author's survey results

With a very high level of awareness about the need of Global Competence, equivalent to 93.8%, we recognize that the needs and desires of students to become global citizens make up the very important role of Global Citizenship in the context of globalization. Most students themselves realize that the increasingly flat world is an opportunity as well as a challenge for the young generations in Vietnam-Southeast Asia in particular and the world in general in promoting their ability to become a global citizen.

Figure 3. List of motivates to become a global citizen

Source: Author's survey results

The role of Global Competence appears in many aspects of student life as well as learning. Firstly, Global Competence plays a role in Personal Development, which is expressed in the aspect of “Wishing the opportunity to interact with many different cultures to cultivate global citizenship” which takes the highest rank with 304 votes out of 503, equivalent to 60.4%. Besides, other factors within the scope of self-development are "Acquiring a lot of knowledge about globalization" and " Intercultural communication and cooperation are important aspects of personal competence” also received high votes, 54.1% and 48.3% respectively.

The development and acquisition of knowledge is also an essential factor of a person receiving a higher education like the majority of respondents in this survey. This proves that the relationship of global competence and self-development capacity is complementary to each other, the development of intelligence is always accompanied by the global issues in social topics as well as learning platforms and tools. A person who wants to develop knowledge will be actively or passively led to the knowledge resources around the world and from there they will be partly influenced by ideologies and opinions beyond their geographic space from it. Therefore, global competence becomes an important key for students to expand their understanding as well as be more open in the process of accepting different cultures.

Global competence is also extremely important in developing students' careers in this era of globalization, expressed in the fact that the factor “Important to career development ranks 4th out of a total of 503 votes, accounting for 45.5%. Firstly, in order to have all the elements constituting a global competency, students themselves will have to learn and hone their knowledge and skills related to their field of study and at the same time develop themselves comprehensively at the university. Thereby, they gradually create the necessary knowledge for themselves in the development of their future careers. Secondly, when global competence has been formed in students themselves, they will have all the elements and skills to participate in the domestic and international labor market without encountering any (or less) language and cultural barriers, from which they can easily seize opportunities for development and promotion.

Figure 4. The level of interest in global issues (hours/day) through books, television, mobile devices

Source: Author's survey results

In a world where information technology has developed rapidly, it is not surprising that students' interest in global issues is quite high, with a total of 39.6% of students interested in 1-3 hours of studying global issues, and a total of 65% of students are interested in these issues more than 1 hour/day. The interest in global issues is a testament to the fact that students are closely connected to the development and operation of events which take place in different cultures and countries. They concern and set a special space in their mind to develop the ability to perceive this problem, and thereby transform that knowledge into their own perception. This demonstrates the role of global citizenship in building habits and further building students' inner consciousness in receiving and evaluating global issues.

5. Conclusions

This study proposes a methodology to assess students' global citizenship capacity in the context of globalization. In addition, the study also shows an overview of students' capabilities when the COVID-19 epidemic becomes widespread in Vietnam and Vietnam's gap with other countries in the world. The research model that the study propose can be expected as a basis for assessing student capacity at higher education institutions in Vietnam.

Abstract

People with disabilities are one of the most vulnerable groups in society, they face various difficulties and barriers, especially in finding opportunities to participate in the labor market. This study explored factors affecting the employment of disabled people in Vietnam, thereby determining the correlation between the employment status of people with disabilities and the main independent variables including Family Support and Social Support. The results showed the differences in employment rates among different groups of people with disabilities. Especially, Family Support and Social Support had a positive impact on the employment status of the disabled. The authors also suggest some changes in policies to increase employment opportunities for people with disabilities in Vietnam.

Keywords: *disabled labor, employment, people with disabilities, policy.*

1. Introduction

In order to reduce poverty and achieve its sustainable development goals, Vietnam faces a multitude of challenges. To overcome those challenges and get the goals, the country needs to mobilize all human resources, including the vulnerable. People with disabilities are one of the typical vulnerable groups in society. In Vietnam, the estimated number of people with disabilities is 6.1 million, accounting for about 7.8% of the population. However, the unemployment rate for people with disabilities is 28%, and the more severe the disability, the higher the unemployment rate (74.7%). The unemployment rate in the urban areas is 13.9% - a relatively large number (United Nations Population Fund, 2009). In the coming time, the number of people with disabilities in Vietnam is expected to increase continuously because the country is still affected by agent orange dioxin during the war with the US and the impact of environmental pollution, traffic accidents, and the heavy impact from natural disasters. Therefore, finding the factors affecting employment thereby creating conditions for people with disabilities to integrate into the community is extremely necessary.

2. Literature review and research model

2.1. Literature review

Persons with disabilities include those who have long-term physical, mental, intellectual, or sensory impairments which in interaction with various barriers may hinder their full and effective participation in society on an equal basis with others (United Nations, 2006). According to Chapter I, Law on Persons with Disabilities, persons with disabilities means a person who is impaired in one or more body parts or suffers functional decline manifested in the form of disability that causes difficulties with his/her work, daily life and study. National Assembly divides the classification of disability and the levels of disability including 6 main types of disability: physical disability; deaf and dumb disability; visual disability; mental and psychiatric disability; intellectual disability; other disabilities and 3 levels of disability are particularly exceptionally serious disabilities; serious disability; mild disabilities (National Assembly, 2010).

Studies in Vietnam show that people with disabilities face mental and physical barriers (Ngoc, 2016; Dai, 2017). Chi (2017) pointed out that a factor influencing strongly the employment of people with disabilities is the facilities and access conditions. People with disabilities tend to have a 50/50 mentality with their educational choice because of their incomplete and inaccurate view of the rights and benefits of an apprenticeship. In addition, the impact of family factors also greatly affects vocational training to encourage people with disabilities to participate in the labor market (Duong, 2019).

The World Health Organization (2001) issued the International Classification of Function, Disability, and Health (ICF) synthesized by the deficit model and social model. The model pointed to factors that directly affect people with disabilities in question such as products and technologies; connections and support from family, friends, authorities; age; gender; education; lifestyle, etc. In addition, a series of studies simultaneously point to factors that have a significant effect on the employment status of people with disabilities are the levels of disability, gender, age, and educational attainment (Grow, 2004; Shaw et al., 2007; Boman et al., 2015; Narahariseti & Castro, 2016). In addition, the living area is also a variable of interest in the studies of Shaw et al (2007), Narahariseti & Castro (2016), and Boman et al (2015). The type of disability is a factor given in the studies of Narahariseti & Castro (2016), Marigu (2012), Boman et al (2015) to assess the impact on employment of people with disabilities. Opoku et al (2016) pointed to family support and social support as factors that significantly influence the ability of people with disabilities to be employed, these factors along with the marital status of people with disabilities are also considered (Lee & Park, 2008).

Some research in Vietnam covered the issue of people with disabilities and jobs for people with disabilities and propose measures to support them. These include the study "Employment for people with disabilities under current Vietnamese law" (Ngoc, 2016), the study "Social work in supporting livelihoods for people with disabilities in Bac Ninh city" (Chi, 2017), "Expanding employment opportunities for people with disabilities in Vietnam" (UNDP, 2020), etc. However, most studies used qualitative methods to approach. This study is based on the theory of studies in the world to understand the factors affecting the

employment of people with disabilities in Vietnam by using quantitative data to take a complete and more comprehensive approach to the factors affecting the participation in the labor market of people with disabilities in Vietnam.

2.2. Research model

The research model is built on 3 characteristics: Sociodemographic characteristics including the variables "Age", "Gender", "Education level", "Marital status"; Disability-related characteristics including the variables "Types of Disability", "Level of disability" and social environment characteristics with the variables "Living area", "Family Support", "Social Support".

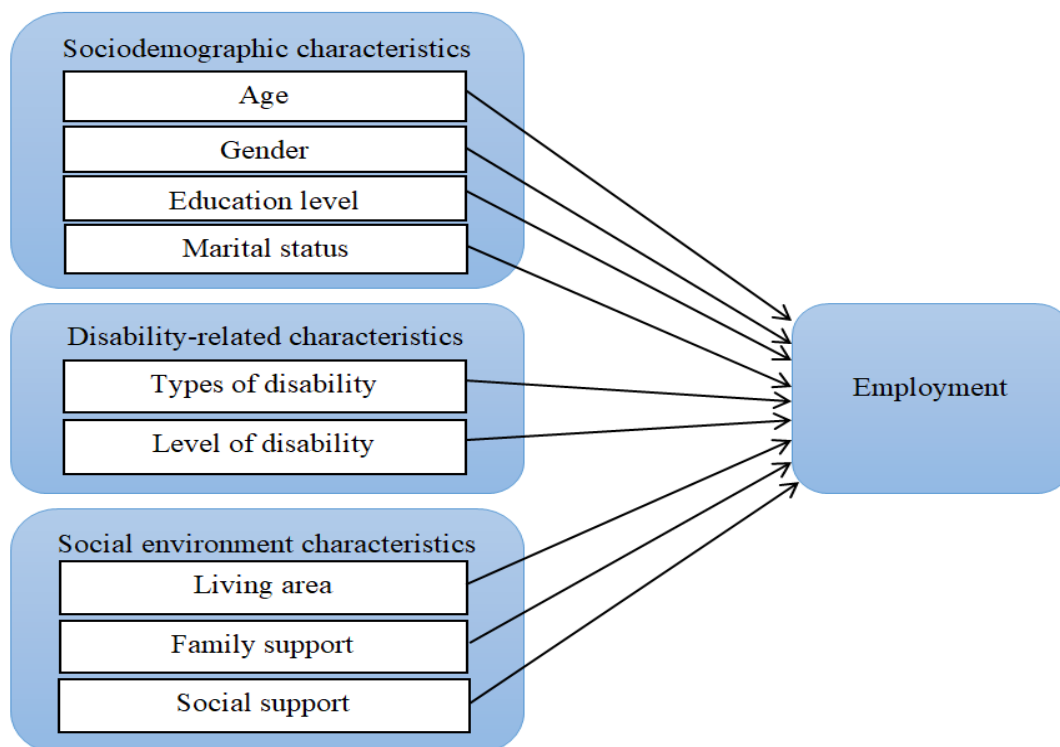

Figure 1. Research model

Employment (E)

In study of Naraharisetti & Castro (2016) the dependent variable is the employment variable and whereby respondents are categorized in two forms employed or unemployed. This study inherits the approach of Naraharisetti & Castro (2016).

Gender (G)

Gender is considered as a factor that has a significant effect on the employment status of people with disabilities when male disabled workers have more job opportunities than female disabled workers (Grow, 2004; Shaw et al., 2007; Lee & Park, 2008; Marigu, 2012; Boman et al., 2015).

Age (A)

Results on employment status by age are different in studies, with young age groups having higher employment rates (Grow, 2004; Marigu, 2012), in contrast to the study of

Shaw et al (2007), found that people in the old age group were more employed. However, Lee & Park (2008) found no significant association between age and employment.

Education level (EL)

Studies show that education levels have a major impact on their ability to participate in the job market, while the higher the education, the higher the employment rate (Shaw et al., 2007; Lee & Park, 2008; Opoku et al., 2016). This result differs from the study of Grow (2004), people with visual disabilities with an education at the middle school level had a higher employment rate than those with a college degree, and much higher than those without an education.

Marital Status (MS)

Lee & Park (2008) indicate that the employment prospects of people currently living with their partners are about 2.7 times higher than that of those who are single.

Types of disability (TOD)

Workers with physical disabilities are supposed to have higher job opportunities than other types of disability (Marigu, 2012), while Naraharisetti & Castro (2016) points out that people with physical disabilities or visual disabilities are all potentially highly employed. According to Boman et al (2015), the group of people with disabilities with mental and psychiatric disabilities is the least likely group to be employed.

Level of disability (LOD)

The level of mild disability is thought to give people with disabilities a higher chance of participating in the labor market (Grow, 2004; Shaw et al., 2007; Lee & Park, 2008).

Living area (LA)

According to Lee & Park (2008), people living in metropolitan areas are more likely to work than those living in small cities or rural areas. Naraharisetti & Castro (2016) points out that people with types of mental disabilities are less likely to be employed in rural areas.

Family support (FS)

Opoku et al (2016) believes that being abandoned, lack of care and teaching from their families not only affects people with disabilities mentally, but they also lack the skills to help them be hired or have any support so that they can run their own business.

Social support (SS)

Lee & Park (2008) believes that the higher the practical support from family and community members is, the lower the employment rate of people with disabilities is. These results are in contrast to the study of Opoku et al (2016), people with disabilities are discriminated against by those around them, and it is the prejudices of society that affect their ability to be employed.

3. Method

The authors proceeded to collect preliminary information using the survey method through questionnaires. The questionnaire was tested in a pilot with 5 people with disabilities, after ensuring the consistency, clarity, and understandability for the newly surveyed respondents sent to the respondents in the form of printed tables for a direct

response from 27/11/2021 to 15/12/2021. The result was 214 responses, of which 186 were valid. The data is processed on SPSS software version 26 to test the reliability of the quantitative independent variable scale before conducting a rotating factor and matrix analysis to identify groups of factors affecting the employment of people with disabilities. The groups of factors are included in binary regression analysis to determine the explanatory levels of independent variables to dependent variables.

4. Results

The results of the study showed that the employment rate among male (64.2%) was about 1.6 times higher than the percentage of employment in female (39.6%). In terms of the age of people with disabilities, the age group that participates in the labor market the most is the age group 25-39 years old, and the most unemployed age group is from 50 to 54 years old. This result is the same as the model of Shaw et al (2007) and Lee & Park (2008) on the effect of education level on employment of people with disabilities, most people with disabilities in intermediate or college, or university degrees or higher are significantly more likely to engage in the labor market than those with disabilities with low levels of education. In terms of the marital status of the survey participants, most of the married people answered that they had a job. In addition, the number of people with employment rate is also higher for people with physical disabilities (67.4%) or visual disabilities (76.2%), while the number of people with disabilities with mental and psychiatric disabilities (16.7%) has very few opportunities to participate in the labor market. It is not too surprising to look at employment outcomes at significantly higher levels of mild disabilities than those with particularly exceptionally serious disabilities, serious disabilities. Finally, people with disabilities living in cities were more likely to be employed than people with disabilities living in rural areas.

For quantitatively independent variables, the team chose to use a 4-point Multi-Dimensional Support (MDSS) scale. The surveyor was asked to respond by selecting the most appropriate level on a scale of 1 to 4 as follows: (1) Never; (2) Sometimes; (3) Often; (4) Always (Winefield et al., 1992). Table 1 shows specific results.

Table 1. Descriptive statistics of quantitative independent variables

Factor	Observable variable	Mean	Standard deviation
Family support	FS1	2.70	1.000
	FS2	2.82	0.967
	FS3	2.95	1.007
	FS4	2.85	1.016
	FS5	2.88	1.012
	FS6	2.61	0.937
Social support	SS1	2.66	1.013
	SS2	2.74	1.014
	SS3	2.63	1.012
	SS4	2.85	0.995
	SS5	2.68	1.035

The result of testing the reliability of the variables in each group are based on Corrected Item Total Correlation greater than 0.3 and Cronbach's Alpha greater than 0.6 before processing the next analytical steps and is shown in table 2.

Table 2. Results of reliability statistics

Criteria	Corrected item - total Correlation	Cronbach's Alpha if Item Deleted
<i>Family support (FS)</i>	<i>Cronbach's Alpha = 0.905</i>	
<i>FS1</i>	<i>0.763</i>	<i>0.885</i>
<i>FS2</i>	<i>0.814</i>	<i>0.878</i>
<i>FS3</i>	<i>0.786</i>	<i>0.881</i>
<i>FS4</i>	<i>0.651</i>	<i>0.902</i>
<i>FS5</i>	<i>0.764</i>	<i>0.885</i>
<i>FS6</i>	<i>0.661</i>	<i>0.899</i>
<i>Social support (SS)</i>	<i>Cronbach's Alpha = 0.879</i>	
<i>SS1</i>	<i>0.781</i>	<i>0.836</i>
<i>SS2</i>	<i>0.766</i>	<i>0.840</i>
<i>SS3</i>	<i>0.528</i>	<i>0.895</i>
<i>SS4</i>	<i>0.735</i>	<i>0.848</i>
<i>SS5</i>	<i>0.756</i>	<i>0.842</i>

The results indicated that the "Family support (FS)", "Social support (SS)" having Cronbach's Alpha coefficient > 0.6 indicated a good scale and all of the variables in the group had a Corrected Item-Total Correlation greater than 0.3 ensuring conditions (Trong & Ngoc, 2008). Therefore, the observed variables are accepted and retained.

The "Social Support (SS)" group has a Cronbach's alpha coefficient = $0.879 > 0.6$ showing that the scale uses good measurement. Although the SS3 variable has a coefficient of Cronbach's Alpha if Item Deleted is greater than Cronbach's Alpha, the difference is not much due to Corrected Item-Total Correlation of the SS3 variable = $0.528 > 0.3$, so the team retained and considered the convergence of the variable at the exploratory factor analysis step to evaluate the quality of the variable and then make a decision whether to remove the variable or retain it.

Factor analysis will consider the possibility of reducing a set of interdependent measures into a smaller set of variables (called a factor) but still including the information of the original set of observable variables. To reflect specifically the impact of independent variables on the specific variables (Trong & Ngoc, 2008). The research team tested once more time whether the rating coefficients of the observable variables in each factor really achieved reliability and cohesion as shown in the Cronbach's Alpha coefficient test or not.

The scale of factors affecting the employment of people with disabilities has 10 components including 9 independent variables (age, gender, education level, marital status, level of disability, types of disability, living area, family support, social support) and 1 dependent

variable- employment. In the 10 variables of the model, there are 2 quantitative variables measured by 11 observable variables that will be analyzed EFA discovery factors as follows:

Table 3. KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0.893
Bartlett's Test of Sphericity	Approx. Chi-Square	1345.225
	Df	55
	Sig.	0.000

KMO test results reaching 0.893 greater than 0.5 and Sig. of Bartlett's test reaching 0.000 is less than 0.05 indicating that these observable variables are correlated with each other and are fully consistent with factor analysis.

Table 4. Total Variance Explained

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	6.086	55.324	55.324	6.086	55.324	55.324	4.008	36.438	36.438
2	1.428	12.981	68.306	1.428	12.981	68.306	3.505	31.867	68.306

The data processing results show that there are two groups of factors cited based on the Eigenvalue criterion greater than 1, so these two groups summarize the information of the 11 observable variables in the best way for inclusion in EFA. The total variance cited by these two groups of factors was 68.306% >50%, which represents two factors that explain 68.306% of the data variability of the 11 observable variables involved in the EFA.

Table. Rotated Component Matrix

	Component	
	1	2
FS2	0.841	
FS3	0.805	
FS1	0.796	
FS5	0.796	
FS4	0.745	
FS6	0.671	
SS1		0.862
SS2		0.848
SS4		0.779
SS5		0.771
SS3		0.606
Extraction Method: Principal Component Analysis.		
Rotation Method: Varimax with Kaiser Normalization. ^a		
a. Rotation converged in 3 iterations.		

The above data table shows that 11 observable variables are divided into two groups of factors: Family Support and Social Support. All of the observable variables have a factor loading greater than 0.5 and no bad variables.

After testing reliability and analyzing exploratory factors for quantitative independent variables that achieve the standard of test coefficients, the team put all the variables into the model to run Binary Logistic. In order to include the properties of qualitative variables in the quantitative regression model, the team carries out quantification of the properties using dummy variables. The model is as follows:

$$\text{Log}_e \left[\frac{P_i}{1-P_i} \right] = B_0 + B_1A_1 + B_2A_2 + B_3A_3 + B_4A_4 + B_5A_5 + B_6A_6 + B_7A_7 + B_8A_8 + B_9A_9 + B_{10}G + B_{11}MS + B_{12}EL_1 + B_{13}EL_2 + B_{14}EL_3 + B_{15}EL_4 + B_{16}EL_5 + B_{17}TOD_1 + B_{18}TOD_2 + B_{19}TOD_3 + B_{20}TOD_4 + B_{21}TOD_5 + B_{22}LOD_1 + B_{23}LOD_2 + B_{23}LA + B_{24}FS + B_{25}SS$$

P_i : Probability of have a job

$1 - P_i$: Probability of no job

$A_1; A_2; A_3; A_4; A_5; A_6; A_7; A_8; A_9$: Dummy variables of age variables

G: Gender

MS: Marital status

$EL_1; EL_2; EL_3; EL_4; EL_5$: Dummy variables of education level

$TOD_1; TOD_2; TOD_3; TOD_4; TOD_5$: Dummy variables of types of disability

$LOD_1; LOD_2$: Dummy variables of the level of disability

LA: Living area

FS: Family support

SS: Social support

B_0 : Regression coefficient

$B_1; B_2; B_3; \dots; B_{23}; B_{24}; B_{25}$: Regression coefficients corresponding to variables

The Enter method is the regression method used by the team, selected through the criteria of selecting factors with a meaningful level of Sig. < 0.05. Regression results:

Table 6. Omnibus Test of Model Coefficients

		Chi-square	df	Sig.
Step 1	Step	175.603	26	0.000
	Block	175.603	26	0.000
	Model	175.603	26	0.000

The result shows that the Sig. tested Chi-squared value corresponding to the Model row of $0.000 < 0.05$ shows that the regression model is perfectly appropriate.

Table 7. Model Summary

Step	-2 Log likelihood	Cox & Snell R Square	Nagelkerke R Square
1	81.904 ^a	0.611	0.815

a. Estimation terminated at iteration number 9 because parameter estimates changed by less than .001.

Table 7 shows the model's relevance results. The value of -2 Log likelihood with the blank model is 257.507, while -2 Log likelihood in the last proposed model is 81.904, indicating that when introducing independent variables into the model has significantly reduced -2 Log likelihood in the blank model, demonstrating the suitability of the regression model.

The Nagelkerke R square value showed the model fit. The model has a Nagelkerke R square value of 0.815 which is relatively high. In other words, 81.5% of the variation of the "Employment" variable is explained by the nine independent variables of the proposed model, the rest is due to the influence of factors that are not in the model. Thus, the regression model achieves high relevance.

Table 8. Classification table

Observed			Predicted		
			Employment		Percentage Correct
			Unemployed	Employed	
Step 1	Employment	Unemployed	79	10	88.8
		Employed	9	88	90.7
	Overall Percentage				89.8

a. The cut value is .500

Table 8 shows the results of classification of practical and predictive cases.

In 88 cases of observed practically not having jobs, the predicted 79 cases of joblessness were predicted, the correct prediction rate was $\frac{79}{88} \cdot 100\% = 88,8\%$.

In 98 cases of actual observations having jobs, the predicted 88 cases of employment were predicted, the correct prediction rate was $\frac{88}{98} \cdot 100\% = 90,7\%$.

Thus, the average correct project rate of the whole model is 89.8%.

Constant	-10.918	23.175	0.222	1	0.638	0.000

Table 9 shows that all 9 dummy variables of the Age variable have a Sig. value greater than 0.05, thus the Age variable does not impact on the Employment variable at a meaningful 5%.

Gender variable, Marital Status variable, Area of Living variable, Family Support variable, and Social Support variable all have Sig. of a Wald test less than 0.05, proving that these variables all make sense in the regression model.

For each Education Level variable, Types of Disability variable, and Level of Disability variable, there is at least one dummy variable with a Sig. value of less than 0.05. It can be concluded that these variables all have an impact on the Employment dependent variable.

5. Discussion and Conclusion

Thus, compared to the 9 independent variables in the originally proposed model, there is only 8 independent variables in the model after regression analysis. Although statistics describing the "Age" variable show that people with disabilities in the 25-39 years old group had significantly higher employment rates than other age groups, when participating in this variable regression model was excluded from the model due to the Sig. value. of Wald test. Similar to the results of the study of Lee & Park (2008), the effect of the age factor on the employment of people with disabilities is unclear.

The results indicated that the proportion of men who are involved in the job market is significantly higher than that of female disabled workers. The cause of this difference may

be due to psychological barriers, perceptions, gender biased views in employment, and learning from people with disabilities themselves and their families. Meanwhile, organizations, businesses, and employers do not really have a clear awareness of the working capacity of female disabilities when always assuming that the productivity and labor efficiency of female disabilities are always lower than those of male disabilities.

The unemployment rate for married people is much lower than for those who do not have a partner (Lee & Park, 2008). It can be indicated that, when having a partner, people with disabilities will be motivated to try harder for the future for their own families. Therefore, they will always be looking forward to finding a stable job.

The results also showed that people with disabilities in urban areas had a higher employment rate than those in rural areas. It can be easily understood that when the conditions of facilities in training and vocational training places in rural areas are not as adequate as in the rural areas and most of the work is more distributed in urban areas, the disabled in rural areas have less opportunities to access to advanced science and technology.

Like the results of the study by Shaw et al (2007); Grow (2004); Lee & Park (2008), the higher the level of education is, the greater the employment rate is, especially when people with disabilities have intermediate degrees or universities or higher because when they have expertise and education, they will easily access to the labor market and be employed.

The types of disability also indicated the impact of this variable on employment when people with physical disabilities or visual disabilities have more chance to engage in the labor market than those with others and mental and psychiatric disabilities. This result is in line with study of Narahariseti & Castro (2016); Boman et al (2015) and only a little different from research of Marigu (2012).

People with mild disabilities are more likely to get a job because their level of disability does not affect their ability to participate in daily life activities.

Both family support and social support have a positive impact on the employment of people with disabilities. When they are supported mentally, physically or with the necessary information, their guilt will be less so that they can be motivated to try to get on well with the community. This result is similar to the study of Opoku et al (2016), but in contrast to the study of Lee & Park (2008).

From the above results, the authors have some of the following proposals to increase employment opportunities for people with disabilities in Vietnam:

It is necessary to eliminate employment between different genders with propaganda and dissemination measures to raise gender awareness, pay more attention to the problems of people with disabilities.

Supporting people with disabilities to seek happiness and move towards marriage through organizing reality shows about pairing for people with disabilities, along with building communities for them so that they could socialize, learn and get out of their own shells.

Building more vocational training institutions in the locality, regularly organize propaganda programs on employment for the disabled to improve their understanding.

Improving the educational attainment of persons with disabilities by considering adjusting, expanding, and developing flexibly other types of education such as distance education, informal education or community education classes that facilitate different types and levels of disability.

For social support, organizations, ward management boards, union agencies manage loans, legally facilitate administrative procedures for people with disabilities to easily access capital sources, develop open production facilities in the locality.

Families support people with disabilities by taking care of their needs, regularly encouraging and raising awareness of them so that they understand the importance of employment, help the disabled in practical ways.

However, there is also a limitation of this study. The researchers surveyed only 4 centers for people with disabilities in the North, while different habitats and regions can also affect the perception as well as employment of people with disabilities. Therefore, expanding the scope and scale of research for people with disabilities across the country to examine the research model is a potential future research direction.

Abstract

Young human resources, such as interns are always considered as one of the important resources of the organization. With the aim of improving the quality of interns in particular and human resources in general, the goal of this study is to evaluate the factors influencing the recruitment decision of interns specialization in economics of enterprises in the Northern region of Vietnam. Some recommendations are also given to improve the employability of young human resources. In this study, SPSS software are used to conduct statistics and analyze data obtained from a survey. The analysis results shows that the groups of factors that positively affect the recruitment decisions of enterprises include: Students' equipped knowledge, Soft skills and Demographic factors. In addition, the process and the ability to handle the situation also have a low influence on the recruitment decision of enterprises.

Keywords: *Businesses, Decisions, Specialization in Economics, Interns, Recruitment.*

1. Introduction

The objective of the study is to provide theoretical and practical knowledge based on the factors affecting the selection of economic internship students of small and medium enterprises in the northern region of Vietnam. Solutions to improve the quality and efficiency of recruitment of small and medium-sized enterprises for students intern in the economic sector are proposed.

1.1. Internships of Economics Students

As Rothman (2007) explains that “Internships are an essential part of recruitment success for many companies where a particular department often manages internships with educational institutions”. According to Calloway & Beckstead (1995) “Practice is about exposing students

to practical skills, improving their social relationships, motivating their future learning, and enhancing their social character. ". Through the definition given by the author above, it can be said that an internship is a period of time that employers provide students / new graduates to familiarize themselves with the office environment and learn new skills. work skill.

In short, the research group that "Economy Intern" is people trained in social sciences, specializing in research on production, distribution, consumption of goods and activities. service from the overall point of view.

1.2. Recruitment Process

According to Edwin B. Flippo (1984), recruitment is "the process of finding potential candidates and encouraging them to apply for jobs in an organization". According to the Human Resource Management textbook (Vu Thi Thuy Duong, Hoang Van Hai, 2005), the human resource selection process is defined as: " is the process of evaluating candidates in many different aspects based on the following criteria. requirements of the job, to find 9 people who match the requirements set out among those attracted in the recruitment process. The basis of selection is the requirements of the job that have been set out according to the job description and the requirements for the person performing the work.

From the above definitions, the research team believes that: each organization, each manager has different recruitment standards, but in general, recruitment is the process of gathering potential candidates and from there. Employers will bring out their full potential to help the organization operate effectively.

1.3. Enterprise Business

According to Colin Gray (1998), "enterprise from its original origins was a French word as a noun to describe commercial undertakings between people, it has since expanded to become a synonym for a business or company". In general, according to author Mai Thanh Loan (2015), "an enterprise is an organization operating with a strategy and plan for the purpose of producing, trading, and distributing products, services, or whole products. products and services to customers and/or consumers." According to the encyclopedia, "Enterprise is a business unit established for the principal purpose of carrying out the business activities of the owners (public, collective, private) of one or more many industries". This definition is accepted by the majority of society, which holds that an enterprise is a certain unit and is owned by certain objects. In Vietnam, according to the 2005 Enterprise Law: "An enterprise is an economic organization with its own name, assets, stable transaction office, and business registration in accordance with the law for the purpose of conducting business. business activities".

Thus, the research team understands that the definition of "enterprise" is developed from time to time and is increasingly perfected. In general, an enterprise is a business unit established to carry out business activities.

1.4. Decision Making Theory

Decision making theory was developed by Herbert A.Simon in 1977. This theory is classified by Simon into two types, including (i) programmed decisions and (ii) secondary

decisions. two non-programmable. Pre-programmed decisions are repetitive decisions. These decisions are usually handled according to a predetermined and routine process. A pre-programmed decision is like a computer program that has been designed, built and operated according to a pre-existing scenario. Non-programmable decisions are novel, unstructured, often unexpected and have a direct impact on the performance of organizations. For example, a business enterprise's decision to diversify its business and diversify products into a new market.

In summary, the study of decision-making in business can be grouped around a wide variety of issues. In it, the first problem to be faced is that the decision-making activity is choice or principles.

1.5. Theory of Choice

Choice theory emphasizes the control of individuals over their own emotions and actions and teaches the concept that all behaviors are subject to choice, created by Dr. William Glasser. The theory that all human behavior is driven by a desire to satisfy five basic human needs: the need to be loved and accepted, the need for power, the need to be free. , the need to have fun and the need to exist. Another branch of choice theory, Rational Choice Theory states that people make decisions based on analyzing the pros and cons of a situation. This means that people weigh the costs and benefits of potential options before deciding to act. Originally conceived as an economic theory, it is a way to understand how people make decisions to maximize their money. Under this assumption, all human behavior can be seen as a way to satisfy individual needs.

The decision-making to recruit interns is said to be based on LTheory of Rational Selection through the analysis of the student's characteristics, thereby assessing the suitability with the company recruiting the intern.

1.6. Theory of planned behavior

The theory of planned behavior or the theory of planned behavior was initiated by Icek Ajzen in 1991. *The theory of planned behavior* is a theory that demonstrates the relationship between a person's beliefs and behavior beliefs are divided into three categories: behavioral beliefs, normative beliefs, and self-control beliefs. This theory proved to be a powerful approach to explaining human behavior. According to *the Theory of Reasoned Action*, if a person has a positive attitude towards the behavior and their significant others also expect them to perform the behavior, the result is that they have a higher level of behavioral intention. and are more likely to act (implement intent). Theory of Planned Behavior expands on Theory of Rational Action with the addition of a new section called Perceived Control. The addition of new components not only overcomes the limitations of the previous theory, but also proves the value and effectiveness of a series of research papers on psychology related to human behavior.

Regarding the enterprise's decision to recruit interns, if the candidate has a behavior that meets the employer's expectations, the result is that the employer intends to make the decision to recruit that employee and is likely to take action.

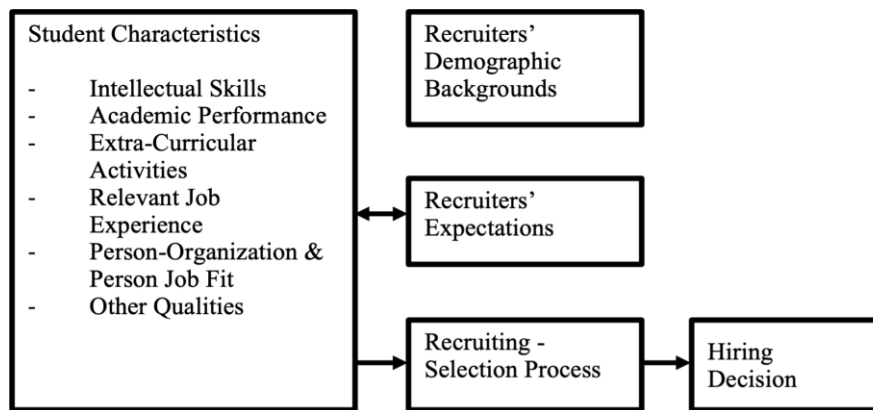

Figure 1. Research proposal model

Based on the research paper on 'Factors affecting the recruitment process of the hotel industry' by Work et al, the team proposes a research model 'Factors affecting the decision to recruiting students to practice economics in enterprises in the Northern region

1.7. Student Characteristic

According to Theo Bradberry (2007), student characteristics distinguish this individual from other individuals and have a great influence on his thinking behavior, thereby affecting the blood pressure and social relationships. That same personality trait is related to the ability to work in groups is proved by Costa & McCrae (1992). Group members who score high on the Conscientious, Agreeable, and Extroverted scales are effective at working. In leadership selection, those with high scores on the Extravert, Open, and Responsive measures were also more likely to be selected.

The recruitment process of final year hotel management graduates in the study of Kwok, L., Adams (2011) considers many factors including: Student characteristics. These characteristics include students' intellectual skills, academic performance, extracurricular activities, students' experience with relevant jobs, and people-to-organization and people-to-people fit. Work. Other factors are also taken into account in the model as it is possible that the researchers may not be able to identify all the qualities that hospitality employers look for in fresh graduates.

Based on the theory of student characteristics, the research team builds questions related to 2 main topics: students' equipped knowledge (work-related experience, job suitability, career readiness, interview behavior) and soft skills (professional level, extracurricular activities, language ability, leadership ability)

1.8. Demographic factors

An employer's demographic background can also play an important role in the hiring decision process. Several studies have shown that interviewers rate employees more favorably if they have the same schedule, regime, and personality as the interviewer (Anderson & Shackleton, 1990). Anderson (1992) also identified four different numbers that influence employer decisions during a retrospective meta-assessment of Development Research from 1910 to 1990. These variables include (a) experience and training interviewers on the job, (b) tasks from the interviewer's physical behavior, (c) the interviewer's cognitive behavior and (d) microprocessor panament interviewer manager.

Because of these, the demographic background of the employer can be very important in helping the researchers interpret the Study results.

Based on the above theory, the research team built questions related to demographic factors as follows: gender, age, influence from candidate's physical capacity, cognitive behavior

Recruitment expectations

There have been many studies on the basic requirements of employers for university graduates, but often these are single studies such as: research on some soft skills of students (Andrews & Higson, 2008; Graham et al., 2010; Lievens & Sackett, 2012; Nickson et al., 2012); on problem-solving skills (Wellman, 2010; Reid & Anderson, 2012); on professional knowledge (Huang & Lin, 2011; Laker & Powell, 2011); and on the reputation of the university students attend (Chevalier & Conlon, 2003; Pampaloni, 2010). Until the study of Finch et al (2012, 2013), conducted research simultaneously on the basic requirements that are interested by employers when recruiting new university graduates, that is: soft skills, problem-solving skills, professional knowledge, prior experience and university reputation. According to Hurley- Hanson & Giannantonio (2006), students who meet the minimum requirements set forth by employers for the field of interest will create their basic expectations that lead to a hiring decision. If a candidate does not meet the organization's expectations, the employer may judge them unsuitable for the position.

Based on the theory of recruiters' expectations, the survey's questions are based on the main ideas: interoperability (work motivation, communication and teamwork skills), computer skills, and problem-solving abilities. (carefulness, problem-solving ability, organizational ability, analytical ability)

Employers use these activities to interact with students, get to know candidates, and gauge their potential for success in the organization. These activities have proven effective in attracting student candidates in a number of studies (Powell & Goulet, 1996; Rynes, Bretz, & Gerhart, 1991; Turban, 2001). Ryan and Ployhart (2000), who reviewed the literature from 1985 to 1999, found that candidates' responses to employers during the selection-recruitment process were important predictors. on recruitment results. Chapman et al. (2005) confirmed in their meta-analytical review of recruitment that the selection-recruitment process is a variable that affects recruitment outcomes. They concluded that researchers had previously questioned the recruitment process from potential clients of candidates, testing their perceptions of how they received interpersonal treatment. . relevant and timely information, as well as whether the selection instruments are valid and fair, and more research is needed on the entire selection process.

Overall, the FIHRHD Model developed by researchers outlines the possible qualities employers look for in final year graduates. Employers select qualified graduates through a selection process. This conceptual model guided the qualitative investigation of this study

Based on the above theory, the research team built questions related to Recruitment Process Employers as follows: feedback provided by students, questions related to the interview

Hiring decisions

The most important step in the hiring process is making the decision to hire or remove candidates. Once the necessary information has been collected about the candidate through

the steps in the recruitment process and it is deemed that they have fully met the organization's selection requirements, the selection committee will make a selection decision. This is supposed to be one of the closing steps of the interview process. Thereby, the organization was able to identify and select a carefully selected list consisting of a small number of candidates who meet the requirements of the enterprise in many aspects (such as the ability of the enterprise to meet the needs of candidate's career goals as well as the development of business trends...)

According to Pham Ba Thang (2017), “After going through the probationary period, the enterprise will make the final recruitment decision to select the most suitable candidates for the job, and at the same time eliminate the candidates who are not suitable for the job. suitable for the job. does not meet the requirements of the job”.

Based on the above theory, the research team built the following questions related to hiring decisions: introduction, personal profile, performance in the interview

2. Method

Quantitative research method requires the researcher to make a survey (questionnaire) based on the research variable scale for each factor that has been mentioned in the model. Collected data will be through the use of digital software for scientific research. The team used SPSS 26.0 software for the purpose of excluding observed variables whose total correlation index was less than 0.3. The reliability test of the scale is verified from the results of Cronbach's Alpha analysis. A scale with a Cronbach's Alpha coefficient between 0.8 and 1.0 is considered a good scale, greater than 0.6 and up to 0.8 is a scale that may be useful. Scales with Cronbach's Alpha analysis results less than 0.6 are considered unusable.

For the purpose of conducting quantitative research, the research team conducted the following steps in turn:

- Step 1: Based on an overview of previous national and international studies on *Factors affecting actual recruitment decisions.interns* give theoretical concepts of variables
- Step 2: Build the Vietnamese version of the questionnaire from the original English version of the research variable scales that have been studied before.
- Step 3: Re-check the transparency, clarity and accuracy of the Vietnamese version, discuss in groups, then edit it accordingly and add observed variables.

The research team based on information gathered from documents including documents, policies, laws, projects, research reports related to the recruitment process of interns in the period from from 2009 to 2021. The collected data will be processed in a way that categorizes, synthesizes and selects appropriate information to form a theoretical basis, and make assessments and comments on the current situation. of Vietnam, thereby proposing appropriate solutions.

Primary data was collected by survey method by online questionnaire. The questions included in the survey are based on the following main factors: students' equipped knowledge, soft skills, demographic factors, interoperability, IT skills, ability to handle situations, interview process, student profile and performance in the interview. From the main observed variables, the authors themselves synthesize questions and form a questionnaire to send to businesses

The questionnaire is designed with clear, easy-to-understand questions so that participants can answer according to their thoughts and ensure acceptable reliability and will be sent online via Google Form to large, medium and small enterprises from November 15, 2020 to December 31, 2020. The research team conducted a preliminary quantitative study with 102 survey samples to test the model and standardize the questionnaires. asked, the number of valid votes obtained was 97/102. Collected data will be processed by SPSS software with high accuracy.

3. Results

Evaluation of independent variables affecting the business intern recruitment decision in the Northern region.

To determine the factors affecting the decision to recruit economic interns of enterprises in the Northern region, the authors in turn evaluate the independent variables with the criteria of quality of the observed variables. , reliability of the scale, convergence and discriminant through the estimation model.

Quality of observed variables: As a result of assessing the quality of observed variables, the authors obtained observed variables and the degree of association between observed variables and variables of the general scale in the Table.

Scale reliability: The results of the scale reliability assessment show that the Cronbach's Alpha coefficient of the variables is greater than 0.8 and the composite reliability coefficient (CR) is greater than 0.8.

Convergence of the indexes: The average extracted variance (AVE) indexes are all greater than 0.6, so the scales are all convergent. The results of the convergence of all variables meet the standard, showing that the average latent parent variable will explain at least 60% of the variation of each sub-surveyed variable.

Discrimination; Discriminant value shows the difference of a structure when compared with other structures in the model. Discrimination is guaranteed because all values below the diagonal are less than values above the diagonal from KN to HS.

	XL	KN	QT	KT	NK	HS
XL2	0.924					
XL7	0.873					
XL5	0.858					
XL4	0.852					
XL3	0.833					
XL6	0.801					
XL1	0.702					
KN5		0.866				
KN4		0.835				
KN9		0.806				
KN6		0.706				
QT5			0.787			
QT4			0.776			
QT3			0.579			
KT5				0.890		
KT6				0.776		
NK3					0.852	
NK2					0.631	
HS2						0.884
HS3						0.849
HS1						0.702

The research results show that the independent variables affecting the decision to recruit economic interns of enterprises in the Northern region correspond to the observed variables as Table.

After evaluating the observed variables that all meet the standards, the authors continue to evaluate the influence of the independent variables on the dependent variable through the model. SmartPLS - SEM linear structure as shown in Figure 2.

Evaluation of the impact of factors on the recruitment decision: According to Figure 2, KN (Ability of students), NK (Demographic factors), XL (students' problem-solving ability) and QT (Recruitment process) have a direct impact on the decision (Recruitment decision) on students' ability (KN) and demographic factors (NK).) because $P - \text{value} < 0.05$, the recruitment process (QT) and students' ability to handle situations (XL) have $P - \text{value} = 0.065 > 0.05$, so there is no statistical significance.

Research results show that the ability of students has the strongest impact and demographic factors have the weakest impact on the recruitment decisions of enterprises in the North.

4. Discussion and Conclusion

In the context of regionalization, globalization, and inclusive and sustainable development, countries are increasingly paying attention to personnel issues, especially interns, in order to improve the quality of human resources. labor volume. The research team has synthesized the opinions affecting the recruitment decision of companies in the economic sector and concluded that: The factors *Ability* or *equipped knowledge of students* have a positive impact. to the selection of interns of enterprises. In addition, *knowledge* or *soft skills* and *demographic factors* also have a positive impact on the selection of interns of enterprises. However, based on the results of the research team, there are two factors that are Interview process and the ability to handle situations that are said to have no positive impact on the intern recruitment process of enterprises.

The research model proposes 5 factors affecting the decision to choose an intern in the economic sector of enterprises in the northern region, including: Student characteristics, demographic factors, and employer expectations. recruitment, recruitment process and hiring decisions of enterprises with all 52 observed variables. However, there are 3 factors affecting the decision to recruit interns in the North region, including KHANANG, KIENTHUC, NHANKHAU and have a decreasing influence as follows: KHANANG (standardized Beta coefficient is 0.434), KIENTHUC (Normalized Beta coefficient is 0.339), NHANKHAU (normalized Beta coefficient is 0.174). This result is also considered to be consistent with current reality in the Northern region.

The objective of the study is to find out the factors affecting the decision to recruit economic interns of enterprises in the North, how those factors affect them and why they are important. . Research results have practical application for both students and businesses in the economic sector. To improve the quality of recruitment and selection, businesses can consider the following suggestions: Given challenging questions during the interview process, these challenging questions must be highly applicable, making students staff clearly reveal their personality and ability, Consider the relationship between students' soft skills and GPA at school; using assessment tools such as presentations, case studies, attitude during interviews, Cooperation with universities and educational institutions to facilitate students' easy access to recruitment information, Encourage students to participate in academic competitions related to economics; Providing advice and guidance for students to have a better overview of the career they are pursuing, the Enterprise informs candidates of their expectations about the position.

This study adds valuable empirical findings to current views on enterprises' recruitment of economic interns. Current research provides students who have been and are in the process of preparing for an internship, helping interns to be more proactive in approaching the probationary process and bringing the most benefit to both. both themselves and the employer because businesses will be more cautious with recruitment decisions and the probationary process will be more thorough. Using the foundation laid out in our research, future studies can further extend the theoretical understanding and research scope to all professions trained.

Abstract

The Covid-19 pandemic has hit all aspects of life, especially the field of education. Although it is now considered as a temporary measure to address the problem of social distancing on lecturers, Work from home (WFH) is believed to become the norm for lecturers in the future. This paper aims to investigate the impact of Work from home on Work performance of lecturers in the context of Covid-19 pandemic. Survey data collected from a sample of 320 lecturers working for public universities in Vietnam are analyzed by Structural equation modeling method (SEM). Results show that Work from home indirectly impacts Work performance, with the mediating role of Work motivation, Work stress, and Work-life balance. At the same time, another significant finding is explored, revealing that while Work stress is negatively related to Work performance, other factors including Work motivation, Work-life balance, and Work from home are all positively related to Work performance. On this basis, the paper suggests a set of recommendations related to improving work performance of lecturers.

Keywords: *Covid-19, Work from home, Work performance, Work-life balance, Work stress, Work motivation*

1. Introduction

In 2019, the outbreak and global spreading of COVID-19 caused a severe medical crisis. In this situation, Work from home was considered one of the alternatives allowing socio-economic activities to take place despite the lockdown announcement of governments

all over the world. According to Owl labs' reports, in COVID-19 pandemic, approximately 70% workers worked full time at home. Besides, many conducted surveys showed that the majority of employees would prefer to Work from home in the future.

Many concerns have arisen from this, one of which is that how Work from home affects different aspects of employees' work and life results. However, the previous research focusing on the effect of Work from home on employees still produced mixed results (Allen, Golden & Shockley, 2015). In Vietnam, due to the movement restrictions, many university lecturers are required to Work from home, and the classroom is changed to online platforms. This made a great impact as teaching productivity plays a very important role in society, especially in a developing country like Vietnam, where education is the top national policy, as well as the key to future advancements and developments.

In this paper, we choose the topic "The Impact of Work from home on Work performance of Lecturers in Vietnam " to explore the effects of Work from home on Work performance of lecturers in Vietnam, and the mediating role of Work stress, Work-life balance and Work motivation. Based on the research results, we produce a set of recommendations on improving Work from home productivity of lecturers, along with developing related policies in case Work from home becomes one of the main work models in the future.

Work from home theoretical framework

The authors base the research on the Work from home analytical framework by Vyas & Butakhieo (2020). In this framework, Vyas & Butakhieo suggested that two factors - organizational and individual-family - were linked to Work from home. Besides, their proposed framework puts work outcome domain and family outcome in consideration.

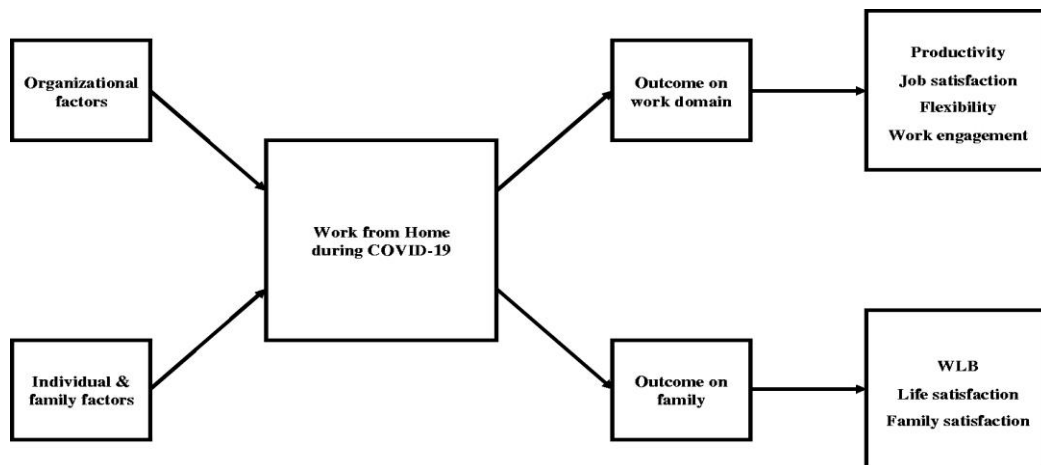

Figure 1. Analytic framework of Work from home

Source: Vyas and Butakhieo (2020)

“Organizational factors” include employees' benefits, trusts from managers, training in the use of technology, as well as organizational communication. On the other hand, individual factors are concerned with self-discipline, self-motivation, ability to work independently, tenacity, self-organization, self-confidence, time management skills, computer literacy knowledge. Regarding family factors, household characteristics such as

size of the living area, number of family members sharing the same accommodation and the number and age of children in the household are considered as family factors influencing Work from home.

Vyas & Butakhieo (2020) also stated that Work from home resulted positively in Work performance and work satisfaction. Besides, Work from home allowed employees to work flexibly, therefore, promoting organizational commitments. However, Work from home might lower the motivation of the work (Purwanto et al., 2020). Turning to life factors, empirical studies produced mixed results. Work from home has a negative relationship with Work-life balance (Grant et al., 2019) but Work from home is positively related to work-life satisfaction (Eddleston và Mulki 2017; Virick, DaSilva and Arrington 2010).

The relationship between Work from home and Work performance

WFH increases the level of flexibility (Cascio, 1989), therefore, employees can optimize their working time, as well as improve their level of concentration. Hence, WFH significantly enhances workers' productivity. (Mark et al, 1993). Besides, proper working environment that makes employees feel comfortable while WFH will also positively affect their moods and improve both their work quantity and quality (Susilo, 2020).

Hypothesis 1: Work from home (WFH) is positively related to lecturers' work performance (WP)

The relationship between Work from home and Work-life balance

Performing assigned tasks at home offers workers more sense of control, which is, in this case, time and place (Sardeshmukh et al., 2012). Thanks to this, employers can now balance their work and life activities. For instance, they can equally distribute their physical and mental side to both life and work aspects. This positive relationship between WFH and WLB is supported by many previous researchers, such as Fisher et al. (2009), Ellis and Webster (1998), Fedáková and Ištoňová (2017). The proposed hypothesis is:

Hypothesis 2: Work from home (WFH) is positively related to lecturers' Work-life balance (WLB)

The relationship between Work-life balance and Work performance

According to Jackson and Fransman (2018), Work-life balance positively affects Work performance. Byrne (2005) affirms that employers can take advantage of this attribute as it boosts workers' motivation and productivity, and reduces stress level.

Hypothesis 3: Work-life balance (WLB) is positively related to lecturers' work performance (WP)

The relationship between Work from home and Work motivation

Compared with traditional working modes, WFH is considered to result in positive motivation, making employees more eager for work (Sok và Blomme, 2014). Timsal and Awais (2016) claims that WFH is associated with advanced technology, which gives workers the right to manage their workflow and make them feel more motivated.

Hypothesis 4: Work from home (WFH) is positively related to lecturers' Work motivation (WK)

The relationship between Work motivation and Work performance

Motivation is one of the core attributes that every organization needs to boost workers' outcomes (Bessell et al., 2002). Being internally motivated by positive feelings, workers can handle their work more efficiently and produce better output (Camilleri and Falzon, 2021).

Hypothesis 5: Work motivation (WM) is positively related to lecturers' work performance (WP)

The relationship between Work from home and Work stress

While workers may feel anxious being accustomed to a new working environment, the closeness from family members can help reduce their anxiety. (Hilbrecht et al., 2008; Irwanto et al., 2021). Besides, WFH allows employees more autonomy, which helps them feel less stressful and depressed when working (Gajendran and Harrison, 2007; Baruch, 2000; Sardeshmukh et al., 2012). Work flexibility while WFH results in employees' well-managed time and energy, reduced work-life conflict and less anxiety (Kim et al., 2020).

Hypothesis 6: Work from home (WFH) is positively related to lecturers' Work stress (WS)

The relationship between Work stress and Work performance

Work stress has a negative relationship with workers' productivity (Ganster and Schaubroeck, 1991). This claim is also supported by Jex (1998), who finds out that factors that contribute to Work stress can indirectly affect Work performance.

Hypothesis 7: Work stress (WS) is positively related to lecturers' work performance (WP)

Based on aforementioned hypothesis, we propose the model as can be seen in Figure 2:

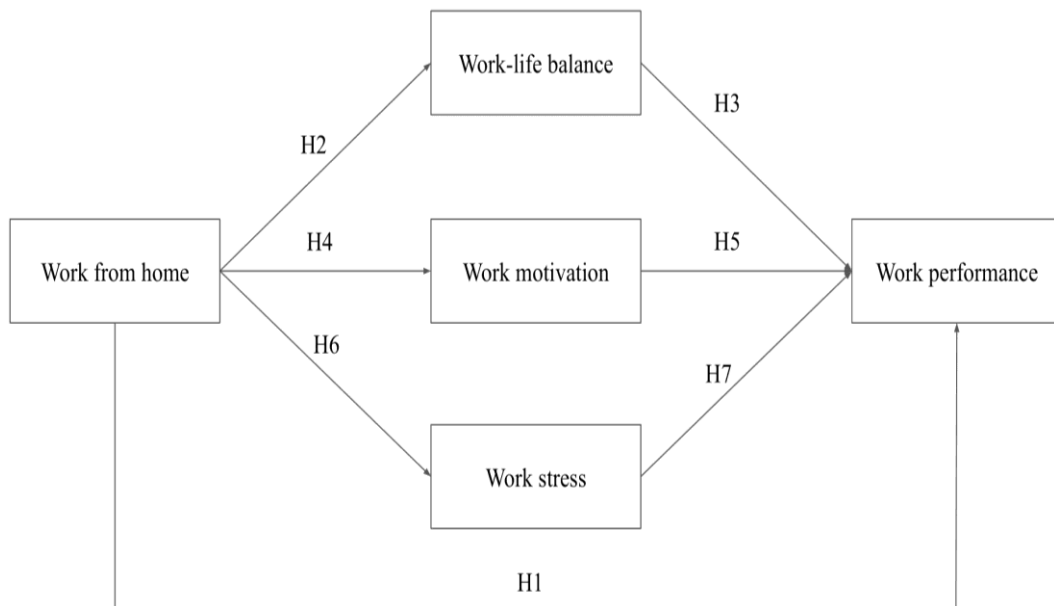

Figure 2. Hypothesized model

Source: Authors' Hypothesized model

2. Method

Data collection

The research is based on both primary and secondary data. Secondary data is gathered from other researches, dissertations, theses and reliable articles domestically and internationally. From this source, we propose a model including 5 latent variables (Work from home_WFH; Work Performance_WP, Work Life Balance_WLB, Work Motivation_WM, Work Stress_WS) and 27 observed variables (Table 1).

Table 1. Measurement scales

Construct	Code	Measurement items	Source
Work from home (WFH)	WFH1	I perform most of my office work at home.	<i>Susilo (2020), Amanda Putri, Ali Amran (2020)</i>
	WFH2	The duration I work at home is the same as the duration I work in the office	
	WFH3	I use information and communication technology in doing my work at home	
	WFH4	I do not meet my colleagues and students in person while working at home	
	WFH5	I can easily discuss work/lectures with my colleagues/students while working from home.	
	WFH6	The company can monitor the results of my work easily when I work from home	
Work Performance (WP)	WP1	When working from home, I adequately complete my assigned tasks	<i>Staples, Hulland & Higgin (1999); Bouckennooghe et al.(2013)</i>
	WP2	When working from home, I fulfill my job responsibilities	
	WP3	When working from home, I perform my duties beyond expectations from my superiors	
	WP4	When working from home, I am content with my work quality	
	WP5	When working from home, my colleagues always consider me as an effective lecturer	
Work Life Balance (WLB)	WLB1	I have a good balance between my work and life aspects	<i>Amanda Putri, (2021); Bui Nhat Vuong (2021)</i>
	WLB2	My involvement in family activities and work activities is done in a balanced way	
	WLB3	My colleagues and family members say that I meet their expectations	

Construct	Code	Measurement items	Source
	WLB4	I feel satisfied with a balanced life between work activities and activities outside of work	
Work Motivation (WM)	WM1	I feel stimulated by my teaching duties when I work from home	<i>Amanda Putri, (2021); Bui Nhat Vuong (2021)</i>
	WM2	I often feel a strong will to work from home	
	WM3	I would spend more time working from home if possible	
	WM4	My university allows me to work independently without supervision	
	WM5	My university gives me the opportunity to be promoted while staying safe from COVID-19	
	WM6	My job gives me the chance to develop myself so that I am not bored during the COVID-19 crisis	
Work Stress (WS)	WS1	I find it boring to perform my teaching tasks	<i>Lait and Wallace (2002)</i>
	WS2	I feel many things are beyond my control and ability while working from home	
	WS3	I feel overwhelmed by completing work during working from home	
	WS4	I feel more pressured when working from home	
	WS5	I feel like giving up on my job	
	WS6	I feel frustrated with my work from home job	

Source: Summarized by Authors

Primary data are collected from 350 lecturers working in public universities in Hanoi and Ho Chi Minh City. After eliminating 30 unvalid data sets, the final data compose of 320 datasets, which is used for descriptive statistics and regression analysis.

Data processing

The authors use SPSS 20.0 and AMOS 24.0 to analyze primary data as followed: (1) Cronbach's alpha test to measure scale reliability, (2) Exploratory factor analysis test to measure convergent validity and discriminant validity, (3) Confirmatory factors analysis to test the model structure, (4) Structural equation modeling (SEM) to test structural relationship among variables, (5) Bootstrap test in case of larger size sample. Besides, Independent Samples T-Test and Anova are used to explore gender, education, experience and income differences in lecturers' Work performance.

3. Results

Descriptive statistics result

Table 2. Descriptive statistics result

Characteristics		Sample	
		Number (of lecturers)	Percentage (%)
Gender	Female	185	57,8
	Male	135	42,2
Age	Under 25	14	4,4
	From 26 to 35	89	27,8
	From 36 to 45	138	43,1
	Over 45	79	24,7
Region	South	168	52,5
	North	152	47,5
Experience	Less than 5 years	88	27,5
	From 5 to 10 years	101	31,6
	More than 10 years	131	40,9

Source: Authors' calculation from survey data

It can be seen that the research is equally surveyed between female and male lecturers, with 57,8% and 42,2% respectively. In regards to age, the group of lecturers from 36 to 45 years old accounts for the largest portion (43,1%), secondly comes the group of 26-to-35-year-olds (27,8%), thirdly ranked is the group of over-45-year-old lectures (24,7%), and the smallest fraction belongs to the under-25 group (4,4%). The sample is distributed evenly between the Southern and Northern part of Vietnam, with 47,5% và 52,5% respectively. The majority of lecturers surveyed had been teaching for more than 10 years (40,9%), 5-to-10-working-year group holds a slightly smaller part of 31,6%, and lastly ranked is the group of less-than-5-working-year lecturers (27,5%).

Cronbach's alpha, Exploratory factor analysis, Confirmatory factor analysis, and Structural equation modeling results

After Cronbach's alpha test is performed, $KMO = 0,917 > 0,5$ indicates Exploratory factor analysis is suitable. Bartlett's test result is statistically significant ($sig = 0,000 < 0,05$), which means that observed variables have a correlation with each other in the population.

The Eigenvalue (Initial Eigenvalues) of the first 5 factors in the table are greater than 1, which shows that 5 factors remain in the analysis model. Extraction Sums of Squared Loadings for the first 5 factors is 61,190% $> 50\%$, which reveals that the EFA results are valid and 61,190% data are divided into 5 groups of variables as our initial proposed model.

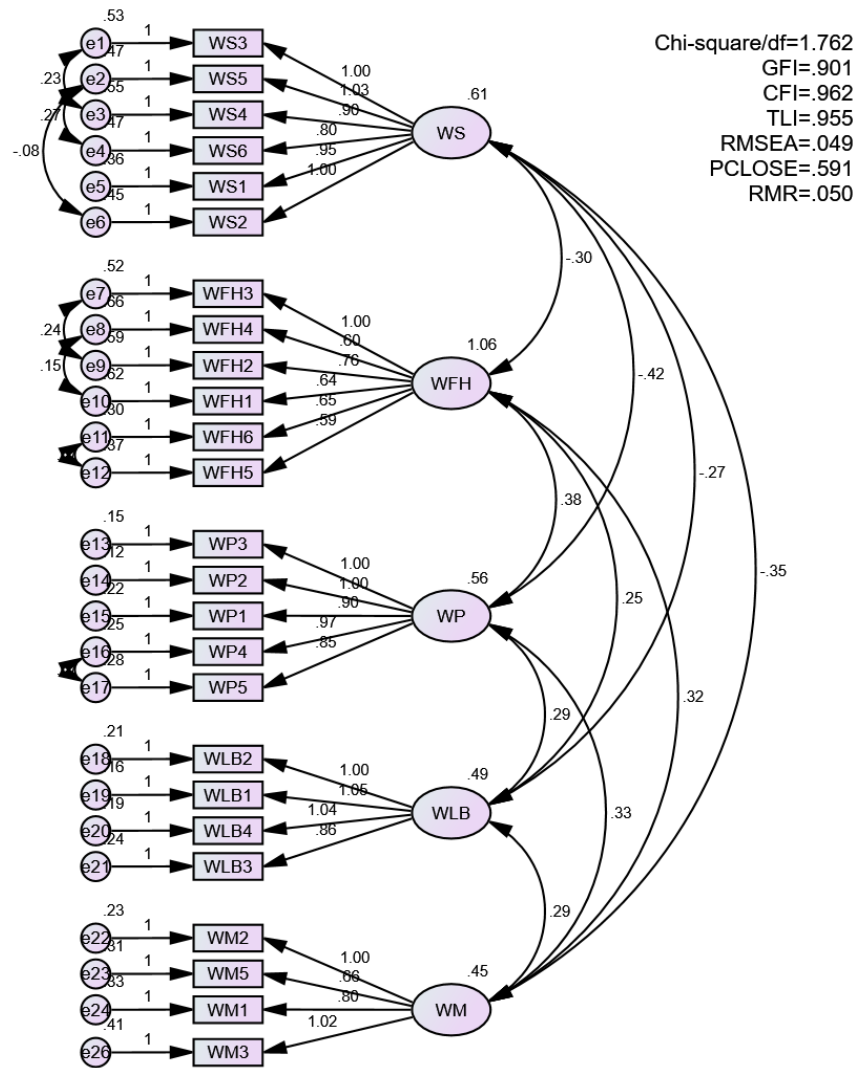

Figure 3. Confirmatory factor analysis result

Source: Authors' result from SEM

The CFA result shows that all model fit values are satisfied. To be specify, CMIN/df = 1,762 < 3, CFI = 0,962 > 0,95, SRMR = 0,05 < 0,08, coefficient RMSEA = 0,049 < 0,08, Pclose = 0,591 > 0,05, (Hu và Bantler, 1999).

The P-value of all observed variables are noted as *** (which equals to 0,000), therefore, all variables are confirmed to be well represented in the CFA model.

Table 3. Reliability, discriminant validity and convergent validity test

Variable	Code	CR	AVE	MSV	MaxR(H)
Work from home	WFH	0,861	0,510	0,244	0,873
Work motivation	WM	0,808	0,514	0,447	0,822
Work-life balance	WLB	0,903	0,700	0,393	0,908
Work stress	WS	0,874	0,537	0,505	0,877
Work performance	WP	0,925	0,713	0,505	0,933

Composite Reliability: CR values of all factors are greater than 0,8, which indicates that all observer variables are internally consistent and represent one particular latent variable.

Convergent Validity: After eliminating 1 observed variable (WM6), AVE values are all greater than 0,5. This index fluctuates around 0,510 to 0,713, which means 50% of the latent variables are explained by the observed variables. All observed variables are highly convergent.

Discriminant Validity: regarding 5 factors above, MSV value is less than AVE value, which shows that all observed variables are discriminant. (See figure 4)

Figure 4: Structural equation modeling result

Source: Authors' result from SEM

After the reliabilities and validities of the measures used were assessed, we conducted a structural equation modeling to test the proposed research hypotheses. The overall fit measures of the structural model indicate the adequate fit (Chi-square/DF = 2,365 ≤ 3; CFI = 0,930 > 0,9; 0,065 < 0,08) (Hu and Bantler, 1999).

The P-value of all five hypotheses are less than 0,05 (Confidence interval 95%), which means all the hypotheses are supported. In other words, five variables including WFH, WS, WM, WLB, WP are statistically significant, which means that there is cause-effect relationship among dependent variables (WS, WM, WLB, WP) or 7 hypotheses are accepted (H1, H2, H3, H4 H5, H6, H7).

Table 4. Structural equation modeling result

Relationship			Hypothesis	S.E.	C.R.	P	Standardized Estimate	Decision
WP	□	WFH	H1	0,056	2,584	0,010	0,191	supported
WLB	□	WFH	H2	0,048	7,033	***	0,453	supported
WP	□	WLB	H3	0,052	3,059	0,002	0,157	supported
WM	□	WFH	H4	0,049	8321	***	0,571	supported
WP	□	WM	H5	0,065	3,645	***	0,224	supported
WS	□	WFH	H6	0,057	-6,955	***	- 0,483	supported
WP	□	WS	H7	0,056	-7,400	***	-0,451	supported

Source: Authors' compilation

Based on the standardized regression weights, the impacts of independent variable Work from home (WFH) on mediating variables are in descending order as follows: WM, WLB, WS ($0,571 > 0,453 > -0,483$). The coefficients of WM and WLB are positive, so we can conclude that Work from home (WFH) has a positive effect on Work motivation (WM) and Work-life balance (WLB). Meanwhile, the coefficient of Work stress is negative, which means that Work from home (WFH) inversely impacts Work stress (WS).

Similarly, the statistical impacts on Work performance (WP) are noted in descending sequence as follows: WM, WFH, WLB, WS ($0,224 > 0,191 > 0,157 > -0,451$). The coefficients of WM, WFH, WLB are positive, indicating that these factors are positively correlated with Work performance (WP). On the other hand, the negative coefficient of Work stress (WS) shows that it is inversely correlated with Work performance (WP).

In addition, it can be seen that Work from home not only directly affects Work performance, but it also indirectly affects Work performance with the mediating role of Work motivation, Work stress, and Work-life balance.

Table 5. Statistical difference test

	Control variable	Levene test	T-Test/ ANOVA/Welch test	MEAN
Work performance	Gender	0,628	0,001	
	Female			4,06
	Male			3,79
	Experience	0,857	0,000	
	Less than 5 years			3,67
	From 5 to 10 years			3,87
	More than 10 years			4,23
	Income	0,049	0,029	

	Control variable	Levene test	T-Test/ ANOVA/Welch test	MEAN
Work motivation	Less than 5 million (VND)			3,68
	From 5 to 10 million (VND)			3,66
	From 10 to 15 million (VND)			3,70
	More than 15 million (VND)			3,65
Work stress	Experience	0,684	0,000	
	Less than 5 years			3,69
	From 5 to 10 years			2,54
	More than 10 years			2,17
Work-life balance	Age	0,458	0,004	
	Under 25			2,82
	From 26 to 35			2,45
	From 36 to 45			3,62
	Over 45			3,78
	Experience	0,922	0,000	
	Less than 5 years			2,66
	From 5 to 10 years			3,43
	More than 10 years			2,17

Source: Authors' Independent T-Test and One-way ANOVA result

After Independent T-Test and One-way ANOVA are conducted, the results reveal the differences in habits and behaviors of lecturers while WFH.

Regarding Work Performance, female lectures (MEAN = 4,06) have a higher level of Work Performance compared with male counterparts (3,79). Besides, differences in experience are shown to result in the difference in Work Performance. To be specific, the groups of less-than-5-working-year and from-5-to-10-working-year lecturers are both indicated as having lower Work Performance than fellows who have expertise level of more than 10 years.

Also, differences in Work motivation, Work stress and Work-life balance are explored. Concerning Work motivation, the group of lecturers who earn less than 5 million VND a month is shown to have the lowest level of Work motivation. Similar results are noted in regards to experience, with the lowest level Work stress coming down to lecturers who have been working for more than 10 years. Different age groups and experience also result in different Work-life balance. Specifically, lecturers aged under 36 or working less than 10 years encounter more difficulties in balancing between work and life.

4. Discussion and Conclusion

Assuming from the results of this research, we have drawn out these discussions:

Hypothesis H1 is accepted, showing that in Covid-19 pandemic, Work from home is positively related to Work Performance, which is also supported by other contemporary researches. Therefore, policymakers in universities should consider measures to improve lecturers' abilities, focusing on research and development of applying advanced technology into teaching methods, maintaining the flexible and sustainable university – research – corporation ecology. Subsequently, universities should establish short-term courses to provide lecturers with the knowledge of innovative assistant softwares such as "virtual teacher", Internet of Things (IoT), Learning machine, Deep learning, et cetera. Additionally, colleges and universities should digitalize and simplify complicated administrative formalities, and offer internet-access assistance.

Hypotheses H2 and H3 are accepted, indicating that Work from home positively affects Work-life balance, and Work-life balance positively results in Work Performance. This is also claimed by previous researches and the results are suitable in the context of Covid-19 pandemic. This research conveys an important message, saying that universities should pay attention to the balance between work and life aspects of lectures to improve the quality of human resources. For example, meetings should not be set to close to family-gathering time, and class timetables should be better modified for those who have children under 6 years old.

Hypotheses H4 and H5 are accepted, revealing that Work from home is positively related to Work motivation, and Work motivation is positively related to Work Performance, which is also claimed by Susilo (2020). Work from home is associated with novel and updated technology, which helps lecturers perform tasks more straightforward, therefore increasing the level of eagerness for work. Taking Covid-19 pandemic into consideration, institutions and universities should implement policies regarding lecturers' health, job security so that they will feel cared for and develop stronger motivation. Besides, policy makers in universities should pay attention to the needs of lecturers, making sure that they deserve a suitable salary and benefits for their duties, expertise, education and position. That will lengthen their engagement with the organization.

Hypotheses H6 and H7 are accepted, Work from home is negatively correlated with Work stress, and Work stress is negatively correlated with Work Performance. To improve Performance of lecturers, universities should implement actions such as supervising online classes and collecting feedback from online learners. To reduce stress level, universities should: define a particular size for each class, notify lecturers about the class schedule in advance, and reduce to a minimum number of unexpected meetings or class schedules. An allowance should be given to all the lecturers participating in online teaching, so that they can have a well-equipped, not just "temporary", working space at home.

Statistical difference test results show that senior lecturers achieve a higher level of work Performance. Experienced lecturers are able to be accustomed to new working conditions; therefore, they can work productively under any circumstances. Thus,

universities should encourage lecturers to participate in activities related to their major fields. In addition, talk shows and forums about innovative teaching methods should be held in order that lecturers could sharpen their knowledge and enhance their pedagogical skills. Besides, universities could make use of incentives such as raising salary or awarding bonuses to lecturers who have earned accomplishments, which indirectly inspires those who do not have much achievement.

In summary, a concise policy framework, which regards Work from home rights and duties of lecturers, and most importantly, a specific measure to evaluate teaching outcomes, is a must for the purpose of increasing work Performance of lecturers. This is the key point that policymakers in the field of education management should pay attention to when planning a policy concerning improved teaching quality in the context of Covid-19 pandemic.

This paper has made contributions to previous researches by exploring typical mediating factors that affect the relationship between Work from home and Work Performance of university lecturers. They are the elements that are often be underestimated while evaluating teaching outcomes of WFH lecturers. Among these 4 factors that influence Work Performance, Work motivation exerts the most significant impact. This makes Work motivation is the key to higher work Performance and organizational commitment. In other words, if universities want to effectively establish the online learning platform, even in normal conditions without pandemics, they should give more thoughts to Work motivation, Work-life balance, and Work stress while designing an optimized work-from-home infrastructure.

This paper still contains these limits: (1) not conducting mediating factor analysis in different levels of education (undergraduate and postgraduate), (2) not taking the differences between public and private universities into consideration. On the basis of this paper, future research could extend to further contexts such as: war, disaster... and more online teaching modes: e-learning, cross-border study...

Abstract

This paper investigated the relationship between personal factors and perceived environmental conditions on students' intention to return to their hometown to work using the theory of planned behavior (TPB). The study was conducted by a cross-sectional survey and included 479 final-year students at 7 universities in the north of Vietnam. A structured questionnaire was used to collect the data. The results confirm that family supports, job, hometown attachment, social relations, and perceived hometown living conditions, are significantly related to entrepreneurial intention, the attitude towards becoming an entrepreneur and perceived behavioral control. TPB is a valuable model for understanding the relationship between students' intention to return hometown for working and exogenous factors in Vietnam – a developing country context. This study contributes to the body of knowledge and recommend several solutions for policy makers in the provinces to attract more high-quality human resources for economic development

Keywords: *Return hometown intention, graduate student (s), quality of living conditions, return migration*

1. Introduction

Researchers have focused on various aspects of the migration process, including areas from migration decision, settlement and return back to origin communities. While migration from rural to urban areas or international migrations are received widely interests, return migration has received less attention although return migration has important implications for communities (Bjarnasona & Thorlindssonb, 2006). Several scholars criticized that the theoretical and empirical literature on return migration is too narrow and limited (Constant & Massey, 2002; Dustmann, 2003). Theories on return migration, research on the impacts and determinants of return migration mainly focuses on international return

migrants who go abroad and then when return home, they bring back knowledge, money and skills to their home countries and set up new venture. Less attention is paid to internal return migrants although recent studies suggested that internal return migrants may have even stronger positive impacts on their home regions development (Yue et al., 2010). The important reason for this neglect is that internal return migrants comprise a relatively small number of people in the total domestic migration in developed areas (Lee, 1966).

In addition, a special research area of internal return migration – education-based migration is also limited. Young adults who want to get higher education is temporary migrate from their birthplace to the university city since higher education institutions are located mostly in urban places. These young graduate decision in the transition from universities, colleges to the labor market, the geographies patterns of graduates' moves have been considered in a wide range of contexts. The fact that graduates tend to not return to small city and rural regions, have been demonstrated in all the research results (Constant and Massey, 2002; Huang and Zhang, 2013). However, almost studies of return migration are interested in economic perspective, which explained the return decision by income differences in regions (Rérat, 2014). Recently, research has paid more attention to the significance of non-economic factors motivating return migration such as environment (Dustmann - 2003), family (Nguyen, 2015), social issues (Jorgensen & Stedman, 2001; Janta et al., 2019).

The objective of this research is to identify and test a theoretical model and hypothesis of determinants of students' intention to return to their hometown applying the platform of the theory of reason behavior (Ajzen, 1991). This research will help policy makers and enterprises in Vietnam to better understand and develop appropriate solutions to attract a quality labor force for the economic development of the provinces.

2. Literature review and hypotheses

Return migration is “a concept capturing a widely witnessed phenomenon of migrant flows from intended destinations back to places of origin” (Janta et al., 2019). Students after graduating from universities may come back to their hometown for work and with a devotion to the development of the place where they were born (Huynh and La, 2010).

Lee's “A Theory of Migration” (1966) categorizes reasons for migration into 2 group of factors which are associated with the area of origin and those associated with the area of destination. These factors can either be push factor or attracting - pull factor for a certain individual. Push factors include the state of unemployment, poverty as well as concerns about high crime rates, perceived deficiencies of service, safety and security issues in a city. These factors might depend on personal perception as well as an individual previous experiences of a city or even a country or even a personal situation in a city. If a person suffers from these factors, they migrate from that place. Pull factors like conditions one hopes or thinks to find in the area of destination, the attractiveness of the place, vary from potential for employment and high service provision to low crime rates. Pull factors also include a higher quality of life, place attachment, place facilities such as increasing number of free online facilities to keep in touch with family and friends... could facilitate the decision to migrate. These factors can be influenced by local authorities by different means

and therefore if a city want to attract more labors, policy makers should take care in order to increase its attractiveness. The importance of each of the factors mentioned above is probably depending on the given location and circumstances.

Based on a literature review, the push and pull factors, the theoretical model and hypothesis for students' hometown return intention is developed for this research:

The theory of planned behavior (TPB)

According to the TPB, entrepreneurial intentions can be predicted from the attitude towards the behavior, perceived behavioral control and social norm (Ajzen, 1991). The attitude towards the behavior refers to how positively or negatively an individual evaluates a particular behavior. Perceived behavioral control is an individual's perceived sense of self-efficacy or ability to perform a particular behavior. The direct effects of the attitude towards the behavior and perceived behavioral control on entrepreneurial intention were supported in most studies (Janta et al., 2019; Jorgensen & Stedman, 2001). Since results for the effect of subjective norms on entrepreneurial intention appeared to be mixed (Soon, 2010), we do not include the subjective norms variable in the current study

Hypothesis 1: Attitude is positively related to students' intention to work in their hometown

Hypothesis 2: Perceived behavioral control is positively related to students' intention to work in their hometown

Family support

Family support is a students' perception of family members' attitudes, encouragement toward their return intention and also the family's preparation of facilities for students to settle in their hometown if they come back home to work (Yue et al., 2010). The family is considered a central place in socialist society of Vietnam (Nguyen, 2015), any Vietnamese individuals can be able to require some form of family supports but at the same time be subject to moral obligations towards his family. Rérat (2014) has mentioned in his research the role of family and extended family members' support relating to the return migration. Morathop et. al. (2010) have indicated that greater family encouragement to students to settle in big city results in a greater tendency to indicate non return intentions.

Hypothesis 3: Family support is positively related to students' intention to work in their hometown

Job availability

Previous research of Huang and Zang (2013), Soon (2006), and Rérat (2004) pointed out that students who have good perceptions of the working environment at home are more likely to return. The returnees do not have obligation to return home but choose to do so since they see increasing opportunities for them in their home communities or feel that they can faster move up with the career development in their home communities. Good perceptions of job finding opportunities in hometown, also have large and significant impact on a student return intention (Huynh and La, 2011; Soon, 2010; Ezmale, 2012; Rérat, 2004).

Hypothesis 4: Job availability is positively related to students' intention to work in their hometown

Quality of living environment

The living environment of a place refers to the set of characteristics that define a place, making it attractive and livable. A set of desirable amenities include parks, bike trails, cultural amenities, such as museums and art galleries, a rich variety of cafe and restaurants, a vibrant nightlife, and a diverse and tolerant population (Gungo and Tansel, 2006)

The quality of a living environment, the “livability” of a region, is commonly expressed as an index that includes such factors as the standard and variety of amenities, education and community facilities, climate, environmental quality, housing affordability, crime level, and transportation access (D'agostini & Luiz, 2008).

The “quality of living environment” may assume a very different meaning for each individual. Traditionally, research has shown that factors related to the living environment dominate in the relocation of households between central areas and suburbs. The importance of quality of life and residential amenities in migration has been highlighted in the case of some rural areas by research on amenity-led or lifestyle migration (Ezmaie, 2012). The quality of a living environment is increasingly reflected in the location intention of workers and firms (Soon, 2010). Students who have good perceptions of the living environment at home are more likely to return (Bjarnasona and Thorlindssonb, 2006).

Hypothesis 5: Quality of living environment is positively related to students' intention to work in their hometown

Hometown attachment

Place attachment is “a positive affective bond or association between individuals and their residential environment” (Bollman et al., 2001). Place attachment can be expressed by personal sentiments express by having deep affection for and being proud of the place of origin, by their desire to contribute and devote for a place. (Ezmaie, 2012).

Philip Kotler (1993) mentioned in his research that provinces can take advantages over big cities in attracting labor by the proud, the love of their citizens on the city. Our physical surrounding play important role in our lives. Individuals usually develop very strong sentimental and emotional attachments to the places in which they live, that create feelings of comfort and security (Williams & Vaske, 2003). Lalli (1992) has noted that it is important to take the strong emotional attachments between people and place into account when attempting to understand variety of human experiences. Place attachment makes people become dependent upon regions or on a certain kind of environment. An individual with a strong hometown attachment can be only satisfied with another different location as long as those places have the similar right characteristics. Feeling of place attachment makes people homesick in involuntary relocation (as in case of going to city for higher education) and grows the desire to restore the past experiences of being at home or return to the original place (Bollman et al, 2001),

Hypothesis 6: Hometown attachment is positively related to students' intention to work in their hometown

Social relations

Researchers indicate that people access more resources and support for living from their close ties (Junge et al., 2015). Individuals' beliefs that they can rely on their social ties

for resources and support when starting a new life in big city (Yue et al., 2010). Based on the foregoing discussion, it can therefore be argued that individuals who have social ties at big city have a negative effect on the formation of return migration intentions

Hypothesis 7: Social capital is positively related to students' intention to work in their hometown

Role model

Role model includes family members, friends, or neighbor, who returned hometown and successfully setting up their professional career and lives, would affect individuals' perceptions of returning. Role models provide an observational learning experience for the individuals. Literature noted that individuals may subconsciously develop their mentality, imitate the role model (Perrone & Kristin, 2002) and strive to become the role model. Role models have a profound impact on individual's career choices.

Hypothesis 8: Role model is positively related to students' intention to work in their hometown

Mediating Effects

In the TPB model (Ajzen, 1991), attitudes to behavior, and perceived behavioral control are substantive determinants of intention, while other exogenous factors indirectly impact entrepreneurial intention through these components.

Hypothesis 9a. Attitudes toward behavior mediate the relations between exogenous factors and students' intention to work in their hometown

Hypothesis 9b. Perceived behavioral control mediate the relations between exogenous factors and students' intention to work in their hometown

3. Method

To examine the hypotheses, data was gathered from a self-administered questionnaire conducted among university students in Hanoi, Vietnam. The participation in this study was final year students studying business and economics at 7 public and private universities. Questionnaires were randomly distributed by sending soft electronic copies of the survey questionnaire online via Google docs to target respondents with control of sex, major and universities.

The research questionnaire was designed by using measures from the previous research of with adaptation for the Vietnamese context. Five-point Likert scale questions are used ranging from 1 "Strongly disagree" to 5 "Strongly agree". Measurements are coded as: intention to work in hometown - YD, family support - GD, hometown attachment - GB, job availability - VL, quality of living environment - CL. Control variables are coded with dummy variables (0 and 1).

After collecting the questionnaires, we checked the data to ensure that the sample consisted of the research designed subjects. Responses were eliminated due to the fact they had been answered by second or third year students - inappropriate survey subjects, or they were missing essential information, or they had inconsistent or biased answers. The final sample size of 479 responses. The author analyzed data via SPSS software version 20 to examine the validity and reliability of measures, and AMOS 23 to test the research model and hypotheses.

4. Results

4.1. Sample statistics description.

Total responses consisted of 479 questionnaires. In which, 41,5% are men, 58,5% are women. 8.1% of sample respondents were born in Hanoi, 39% are from other cities in Vietnam and 52,8% from rural areas.

4.2. Measures assessment

All the measures in this research have been assessed for validity and reliability by using Cronbach's Alpha analysis and EFA analysis.

EFA analysis was used at the same time for 9 variables with 42 items, and promax rotation loaded in 9 factors with an Eigenvalue > 1; KMO and Berlett test is 0.936. All items are loaded in their original factors with the lowest factor loading being 0.540 and the highest 0.889

Cronbach's Alpha analysis for this research independent and dependent variables shows that all variables' Cronbach's Alpha are bigger than 0.7 (Table 1). All the research variables having "Cronbach's Alpha if item deleted" are lower than its Cronbach's Alpha; and all the values of "Corrected item total correlation" are bigger than 0.3. Therefore, all research variables' measurements are reliable.

Table 1. Measures

No	Variable name	Items	Cronbach's Alpha	Sources
1	Quality of living environment	9	0.853	Ezmale, 2012)
2	Social capital	3	0.771	Epstein & Gang (2006)
3	Job availability	4	0.851	Mushtaq et.al. (2014), Soon (2010)
4	Hometown attachment	8	0.902	Jorgensen & Stedman (2001) Scannell and Gifford (2010)
5	Family supports	5	0.859	Güngör & Tansel (2006).
6	Role model	3	0.823	Linan and chen (2009)
7	Attitude	4	0.861	Scannell and Gifford (2010)
8	Perceived behavioural control	3	0.796	Linan and Chen (2009)
9	Intention to work in hometown	3	0.758	Güngör & Tansel (2006)

Source: Author survey.

Confirmatory factor analysis was used to find the relationship between items and latent variables. In the measurement model, an adequate model fit was found, with the following indices: $\chi^2 = 1496.324$, $\chi^2/df = 1.911$, TLI = .920, GFI = .862, IFI = 0.920, CFI = 0.927, RMSEA = 0.044. The construct reliability was assessed using composite reliability (CR) above 0.7 and was considered to be adequate. AVE values were well above the cut-off of 0.5, and discriminant validity $MSV < AVE$ ensured the convergent validity of all the scales (Hu and Bentler, 1999) (Table 2).

Table 2. Scales' reliability and validity

	CR	AVE	MSV	MaxR(H)	GB	CL	GD	VL	TD	RM	QH	KS	YD

4.3. Hypotheses testing

To test our hypotheses, we applied SEM and then with a bootstrapping method following Preacher and Hayes (2004) to assess the mediation effect. Figure 1 shows the SEM results with an adequate model fit index.

Figure 1. SEM model

The results of the study indicate that family support also strongly and positively affect the graduate decision of returning to their hometown to work. This result is consistent with the migration theory of Lee (1996). In general, a person has supports from his parents, relatives, society, and the area where he or she used to live. If the graduate family support is strong, it is possible that returning to their hometown to work will be strong as well, which is consistent with the finding of Mixon (1992), Nguyen (2015). The results seem consistent with those found by Soon (2010) where they conclude that return intention is strongly related to family and lifestyle factors, rather than to the income factor. The research result also confirmed the fact that in Vietnamese social context, students' choice of future career is strongly influenced by their family. Family support, not surprisingly, has considerable weight in the mobility decisions of the survey participants, indicating that choosing a place to work is not simply a matter of earning a higher salary or enjoying better work conditions. Good perceptions of lifestyle and family ties at home also have a large and significant impact on a student's return intention. Greater family support for returning results in greater probability of having return intentions.

Job availability offered in one' hometown positively affect the returning intention and is the second-best factor influencing return migration decision. This is consistent with Rérat (2004) and Mushtaq et.al. (2014) research. Graduates are also more attracted to places offering higher living conditions like better public services, good educational facilities, shopping services and better quality of infrastructure. Job availability is the most important factor to pull graduates to come back hometown to work.

Table 3. Hypotheses testing

YD <--- TD	.094	.047	1.977	.048	Support

Residential living conditions is important for choosing workplace. This confirms the arguments that amenities are relevant when some other factors (job, partner's aspirations) are fulfilled (Niedomysl and Hansen, 2011). The impact of family support is important but not dominant. They influence graduates' migration decisions in combination.

The results of this study indicate that role model also and positively affect the returning intention to work in one's hometown as the other research indicated (D'agostini & Luiz R, 2008).

The finding is inconsistent with studies of Nguyen (2015), Junge et.al (2015), who insisted that place attachment can stimulate inter-provincial migrants in- migration and

discourage out-migration decision. Hometown attachment does not significantly relate to intention to return hometown for working.

Social relations in urban and big city is negatively but not significantly affect the returning intention to work in one's hometown as the other researches indicated (Yue, 2010).

Hypothesis H1, H2, H3, H4, H5, H8 are supported by the research data. H6, H7 is not supported by the research data (table 3).

The relationship between five exogenous factors and entrepreneurial intention in the TBP model are confirmed to be mediated by the attitude toward behavior and behavioral control. The perceived behavioral control, attitude fully mediate the impact of social relation on intention, and partly mediate the impact of four other exogenous factors on intention. Thus, hypotheses H9a, H9b are supported by the research data.

5. Discussion and Conclusion

This research provides empirical evidence about the impact of family support, perceived city environmental conditions, role model, job and hometown attachment to student' intention to work in their hometown after graduation.

From the research findings, some recommendations have been suggested for policy makers in order to attract high quality labor resources for the economic development of cities and rural areas.

First, cities and rural areas should strengthen the relationship between students with their hometown to preserve and warm up their hometown sentiments. Provincial Governments should pay more attention to introducing lessons learnt by successful students who have come back and settled in their hometowns.

Secondly, efforts to improve city quality of life and environmental conditions should be made by provincial governments. City and rural governments should invest more in social services and facilities such as education for children, the healthcare system, entertainment infrastructure, and trading centers to improve city living standards to attract high quality workers.

Thirdly, since the perception of skill use opportunities and job opportunities is one of the factors having a positive impact on return intention, home governments should ensure enough opportunities for returning students to apply their newly acquired skills. There should be creation of jobs commensurate with the tertiary-level qualification of returning students. Governments should provide favorable policies for highly qualified labor resources to return to their hometowns. The government and others concerned should help to provide career opportunities for them. If these young emigrants could gain satisfaction in jobs in their areas of origin, they would not abandon their hometown.

Finally, provinces should encourage their city residents to support and pull their family members back to settle in the region. Provincial governments can promote and market new and favorable city policies and environmental conditions for their residents in order to change their perception of the goodness of hometown life, so that they can help to pull their family "sons" or "daughters" to return back to their hometown to work.

This study had some limitations. It relied on the self-reported intentions of final-year students at National Economics University. The email survey method resulting in a limited number of responses may lead to an unrepresentative sample. In addition, the cross-sectional study design was limited to determining causal associations between the study factors, intention and decision to return to work. A further longitudinal study is needed to ensure the factors affecting intention actually affect the practice and the duration for which graduates were willing to work in hometown. More variables should be included in the study, such as motivation, which will influence the decision of graduates to return.

THE USES OF YOUTUBEVIDEOS IN ENGLISH LANGUAGE LEARNING: A LITERATURE REVIEW

Le Thi Thu Hien

hienlth@ueh.edu.vn

MITC, University of Economics Ho Chi Minh City- Campus in Vinh Long, Vietnam

Abstract

YouTube.com (or other online streaming video websites) is a free online video repository where nearly any digital video file can be stored and displayed. YouTube's diverse content and organic community interaction make it an invaluable resource for a wide range of educational endeavors. YouTube videos can be a valuable tool for teaching multiple languages. Furthermore, they can be used to make students aware of the various dialects of English spoken around the world, as well as to provide them with authentic materials for developing their English language skills. This paper seeks to give a list of considerations for teachers while integrating YouTube videos inside and outside of the classroom to fully capitalize on the strengths of YouTube videos in English language learning and teaching.

First, a brief review of various research methods used to investigate the use of YouTube videos in English classrooms through studies to improve learners' English language competencies has been presented, followed by a summary of the main findings of the uses of YouTube in teaching and learning English has been discovered. One of the remarkable findings that have been highlighted when applying YouTube in teaching English is that teachers must consider choosing videos that are appropriate to the objectives and other requirements of courses and to the level of learners, as well as keep track of the proportion of the class design to get the optimal learning outcome.

Keywords: *YouTubeVideos, Use, English Language Learning*

1. Introduction

Language acquisition is the cornerstone of human existence. Learning a new language can help us communicate our thoughts, feelings, hopes, and even dreams more effectively (Tavil, 2009). We all believe that English will be the international language most people learn as a second language. Therefore, it is the most widely spoken language in the world. One in five people can use or understand English. Nowadays, people spend more and more time learning English as a second language. Furthermore, English is a required subject in most schools, and children are learning English at an ever-younger age. English is the language of commerce, science, and technology. Learning English, in addition, will improve our chances of getting a job, participating in discussions, and networking. English allows us to broaden our educational options. Similarly, English is the language of technology, particularly in high-tech fields such as computer science, genetics, and medicine. If we read documents in those fields, we will have to read them in English. In other words, English is a necessary tool for broadening and illuminating our worldview. Moreover, once you have

mastered English, you will have more opportunities to learn about other cultures through literature, as most popular foreign books are written in English rather than in other languages. The majority of information on the Internet is also in English. Diana-Petruța Mahu (2012) claims that learning English allows us to widen our understanding. We can discover entertainment and help develop life skills thanks to English. When we emigrate or study abroad in countries that officially use English, we have more opportunities to communicate and integrate with the local community. Geoffrey Broughton, et al. (1978) stated that English is by far the most commonly spoken of the 4,000-5,000 living languages. There are 300 million native English speakers on every continent and over 250 million people who speak English as a second language. Finally, we cover one-sixth of the world's population if we include those locations where life and welfare decisions are decided and proclaimed in English.

YouTube Website is among the websites that consider a great resource for English language learners. It contains resources of data for learning, allowing teachers and students to share information, increasing their time for independent tasks, and solving problems on their own if teaching and learning seem difficult to them. Founded in 2005 by PayPal and owned by Google since late 2006, YouTube (<http://en.wikipedia.org/wiki/YouTube>) is a video-sharing, uploading, and viewing platform. Users on YouTube can make their videos, tag a video's content, write a title and description for those videos, leave their comments or comment on other users' videos, search for videos that interest them, etc. According to Jones and Cuthrell (2011), YouTube is a Web 2.0 site where users can collect information, share their work, and participate in peer feedback through asynchronous interaction with other users. Having approximately 7 billion videos (according to Brand Vietnam statistics in February 2019), YouTube is the world's most popular video-sharing website. Numerous YouTube videos are employed to learn English thanks to their outstanding features such as the "Closed Caption" button, Open transcript, and Playback speed, which allow learners to watch their favorite English videos on YouTube but struggle with English. According to Shell et al. (2010), incorporating YouTube videos can transform our classroom into a more participatory learning environment and create a place where students will want to be. It reaches more students by incorporating different learning styles and allowing students to design their self-paced study plans. Besides, students "use YouTube videos as supplementary resources for textbook materials in language learning." Students create and distribute their videos" (p. 468). Furthermore, Raniah Kabooha et al. (2015) discovered both students and teachers believe that YouTube technology is an effective tool for helping students better understand and comprehend the English language or, in this case, the target English vocabulary. The majority of students found YouTube to be beneficial in improving their understanding of English vocabulary. Meanwhile, Mohammad Jalaluddin (2016) acknowledged using YouTube videos to educate students about the various dialects of English spoken and provide them with authentic materials to improve their speaking skills. Even Jon Watkins et al. (2011) claimed that using YouTube inside and outside the classroom can improve conversation, listening, and pronunciation skills. In light of these findings, the author wishes to learn more about the *methodology that the prior researchers have used to*

study the uses of YouTube videos in learning English to improve the English proficiency of learners. This study aims to identify potential caveats that researchers have encountered and then suggestions for how to overcome them.

Research Question

*How have YouTube videos been used in English language learning both inside and outside of the classroom to enhance the **English competencies of learners** and which common warnings have raised in their studies?*

Research Objective

To make recommendations to overcome the cautions that researchers have mentioned earlier in their studies while employing YouTube videos as learning tool to develop foreign language ability for learners in general and English language skills in particular.

2. Method

This paper is based on library research. Official websites, conference proceedings, conference papers, thesis, and journal articles were used to collect relevant information and data. The researchers' methodology and core findings on the use of YouTube videos in English language teaching and learning were then compiled. Following that, the outstanding warnings would be thoroughly identified, and solutions would be proposed.

3. Results

Many previous researchers conducted studies on YouTube as an educational tool to improve students' language skills. Ahmad NurSyafiq et al., (2021) conducted action research at Universitas Muhammadiyah Kudus in the academic year of 2019-2020, including 205 first grade students of a non-English program during online learning in the pandemic of COVID-19. Eighty-five students were the total samples only due to the researchers' access to teaching those samples. The study started with discussing the barriers to learning English speaking during COVID-19, then offered YouTube videos as one of the alternative solutions in English class, which obtained the result on the students' speaking skills in terms of fluency, vocabulary, pronunciation, grammar, and content were significantly improved. Observing how YouTube videos are combined while the teaching and learning English speaking occurred. On the other hand, comparative methods and descriptive statistics were instruments to collect data.

Nguyen Minh Trang (2022) carried out qualitative research to determine whether or not YouTube videos can help university students develop their learning autonomy when used as a medium for writing activities. The researcher employed questionnaires, semi-structured interviews, and diaries of teachers and students as survey tools to identify the students' perceptions of the uses of YouTube videos in the classroom. They were required to perform two basic writing activities: (1) writing about the content of videos and (2) commenting on it. Every video was around 15-20 minutes long to ensure that students were keen on watching it. The researcher asserted that YouTube videos could be a tool that students can use to learn English at their own pace, and teachers can exploit them as educational resources to help them in their teaching careers. However, the researcher has stressed that short, authentic, and captivating YouTube videos are the best choices for writing activities.

Meanwhile, Qomariyah et al., (2021) conducted a quasi-experimental with non-equivalent control group design including two groups; experimental and control. Both had pre-test and post-test designs. The experimental group was exposed to YouTube videos, whereas the control group was exposed to audio recordings. A listening test with 35 multiple-choice questions was designed to collect data for the study. The collected data was then analyzed using SPSS 19 and the t-test to compute the data derived from two samples. The researchers compared the results of the t-test with the t-table to determine whether or not using YouTube videos had a significant effect on students' listening comprehension performance. The study's findings were also similar to those of Ayu's (2016) study, "YouTube Videos in Teaching Listening." The researchers also cautioned watching relevant videos on YouTube has become one of the alternatives sources for learning to improve English learners' listening comprehension performance.

Similar to Qomariyah et al., (2021)'s study, Chia-chi Chien et al.,(2020), used YouTube as supplementary material with EFL college students at Chung Shan Medical University in Taiwan to see if there was any improvement in the students' listening comprehension after the 5-week treatments. The subjects are 38 Taiwanese students in the same class, aged 18 to 20, who were required to take the pre-test and post-test. A questionnaire was distributed to ascertain the students' perceptions and reflections while incorporating YouTube into the course. The paired T-Test was used to examine what happened before and after the treatments. The result found that students' listening skills improved significantly when combined with computer-assisted learning technology—YouTube—and traditional pedagogy. They did emphasize, however, that teachers must continue to keep an eye on video selection and control the proportion of class design to ensure the best learning outcome.

Raniah Kabooaha et al., (2018) also published a study on The Effects of YouTube in Multimedia Instruction for Vocabulary Learning, which used a research method quite similar to that of Chia-chi Chien et al. (2020)'s research. Pre-tests and post-tests with two questionnaires were used to answer the research questions. Integrate videos in reading classes to examine the improvement and the retention of students' English vocabulary at King Abdul Aziz University. Students were divided into two groups; an experimental group who watched YouTube during the reading activities and a control group who was not shown the videos. The findings showed that the current lesson plan in students was able to recognize and comprehend the target vocabulary. Teachers should be encouraged to use YouTube in their classrooms. However, to achieve maximum effectiveness of YouTube, the teachers must pay close attention to the videos they are attempting to choose (Fisher & Frey, 2011). Natalia Anggrarini et al., (2021) performed qualitative research with a case study design to explore the students' perception of using YouTube in English class. Questionnaires and interviews were the instruments and implemented in six undergraduate students of the 3rd semester who voluntarily participated in the research. The result highlighted that YouTube videos make learning English enjoyable; it helps them comprehend the material presented in the YouTube video that could improve their listening, writing, reading, speaking skills, pronunciation, and vocabulary enrichment. The researchers also discovered the

strengths and weaknesses of YouTube; YouTube keeps the students from feeling bored; they can study anytime and anywhere; and also re-watch the video at will. However, if the videos are unreliable and lengthy, they can be a complete failure in the learning medium. Without Wi-Fi access, YouTube is considered expensive. Signal interference is the final possibility. Students will struggle if they do not have Wi-Fi, have limited educational funds, or live in areas with limited internet access.

Another study led by Md. Mahadhi Hasan et al. (2018) discovered that students considered YouTube a motivating and engaging learning tool. The students' English language such as speech delivery, pronunciation, intonation, grammatical skills, and listening skills has been improved. The study employed qualitative research, with 30 tertiary students from eight universities in Bangladesh divided into six focus group discussions. They all agreed to participate fully in the information-gathering interview. For analysis, the data were coded, and the emerging broad themes were presented under key headings. However, the study found that language learning videos on YouTube sometimes contain material that is not culturally appropriate. The speaker's attire and demeanor may cause cultural shock among the students. The researchers recommended that learners and teachers choose culturally appropriate language learning videos for active and fruitful learning.

Inda Nofrika (2019) found three categories of YouTube videos often watched by students such as art and humanities, vlogs, and social sciences. Art and humanities videos consist of music videos or lyric videos, films, talks, sitcoms, and talk shows. Vlogs include food vlogs, review videos, beauty vlogs, haul vlogs, and DIY videos. Social sciences contain simulations and educational videos. Inda Nofrika applied a descriptive qualitative research design and interview that were the gathering method to collect the data. Four seniors of an English Language Education Department in a private Islamic university in Yogyakarta were employed to conduct the study. The result of the research was that students watched YouTube based on their preferences. English skills of the students in speaking, listening, pronunciation, vocabulary list, and grammar improved significantly after watching YouTube videos.

4. Discussion and Conclusion

4.1. Discussion

To answer the research question I stated earlier, the latest research papers from various authors were selected for review what they had investigated the application of YouTube videos in learning and teaching English. Quantitative and qualitative approaches (questionnaires and interviews) have been employed in most studies. In addition, a rather coincidental result of the investigation also shows that the researchers admit YouTube videos are an effective learning channel for both teachers and learners who can exploit real-life resources through millions of English videos uploaded to Youtube.com every minute. This finding is consistent with the study conducted by Watkins and Wilkins (2011), who claim that using YouTube in and out of the classroom can help students improve their conversation, listening, and pronunciation skills. YouTube videos can also be used as realia in cultural lessons to increase exposure to world Englishes and promote authentic vocabulary development. Reading and writing assignments can also be based on YouTube videos. It is

also in line with the findings of Abdul Khaliq R. Nasution's (2019) study, which emphasized that YouTube videos can be great mediums for teaching language, such as motivating learners, referring to learning something new, and many other things. It was such an intriguing discovery when six out of eight studies, which I already presented above, shared a common point. It means that six out of eight researchers confirmed that if YouTube is intended to be used as an alternative material or primary source to improve learners' English language skills, it will be a powerful and excellent tool for English language learners. However, relevant videos must be chosen, and teachers also need to control the proportion of the class design to ensure the best learning outcome. This caution is in line with a study conducted by Moghavvemi et al. (2018). According to their findings, if the videos are relevant to the subject at hand, they can be an effective tool for enhancing the learning experience. It is similar to what has been studied by Abdul Khaliq R. Nasution (2019) entitled "YouTube as a Media in English Language Teaching (ELT) Context: Teaching Procedure Text". He emphasized that some videos may contain images or themes which considered controversial or indecent in some cultures, so teachers should be careful when searching for videos on YouTube to use as appropriate teaching materials.

Based on the studies of Tira Nur Fitria (2019) and Francesco Pierini (2014), the writer wanted to make a list of considerations for teachers while incorporating YouTube videos into and out of the English classroom to achieve the research objective and take full advantage of YouTube videos in teaching and learning English as well.

✚ Identify who your students/learners are:

They can be (busy) adults, students at universities, pupils at high schools, pupils at primary schools, or children. Once you have determined who your learners are, you will pay close attention to the length and content of the videos you choose.

✚ Recognize the objectives of the lesson and then the objectives of the course.

Teachers must have a thorough understanding of both the lesson's and the course's objectives. The objectives of the various courses are not the same. Francesco Pierini's (2014) study researched that "General English" is used to refer to the English language with ordinary content. The course objectives would be to help learners use the English language in all ways and contexts and then be able to communicate in everyday life and situations, from very simple contexts to very complex ones. Meanwhile, Tira Nur Fitria (2019) reminded us that "the goal of any Business English course is to allow its users to communicate effectively with others in a business environment, whether the communication is through correspondence, face-to-face meetings, or other methods. Therefore, a business English language may include topics like business English reading, letters and resumes, business phrases, terms of sale, advertising, and marketing. As well if your students are learning English to get an IELTS certificate, the objectives of every lesson delivered will be different in specific skills, including listening, academic reading, academic writing, and speaking.

✚ Ascertain a clear understanding of why they are learning English.

Teachers have to dig out what their students' purposes for learning English are. From that, they keep an eye on choosing appropriate learning materials to help them achieve their goals. Your students studying English would be there for a variety of reasons. Some want to learn English to work in an international environment where English is required, others want to learn English to relocate permanently to a country where English is spoken officially. Others learn English simply because it is one of the compulsory subjects at school, while others need to study English for international certificates, as I listed above, and for various other purposes, such as finding a job in foreign companies, getting promoted, and so on.

✚ Find out what your students/ learners want to achieve.

The English level of the students must be assessed, and what the students hope to achieve after the lessons (courses) must be clearly understood by the teachers or educational administrators. Teachers need to concentrate on the goals and needs of their learners. For example, the students may wish to;

- Improve Listening skills, like practicing telephoning more effectively, etc.
- Enhance Speaking skills/ Communicating Skills; chairing meetings, debating, negotiating, discussing, giving opinions, etc.
- Sharpen Writing abilities, such as writing more coherent emails and letters, writing more logical and organized essays, etc.
- Strengthen Reading skills; reading for general information and detailed information, etc.
- Expand vocabulary list; business English vocabulary, general English vocabulary, English for specific purposes vocabulary, etc.
- Boost pronunciation: British English pronunciation, American English pronunciation, Canadian American English pronunciation, etc.
- Achieve a high level of proficiency in English and so on.

✚ Choose your materials wisely

When teachers fully comprehend and carry out the steps outlined above, they will select materials for their lectures in an appropriate, easy, and wise manner in order to obtain the objectives of the lesson and then the objectives of the course in the most convincing way and make the learning and teaching process meaningful and fruitful.

4.2. Conclusion

In the age of the internet, applying information technology to practical life is an unavoidable trend. It is even more critical to pay close attention to the use of information technology in education. As a result, an increasing number of websites are being created to assist users in learning and working. Most researchers consider YouTube.com to be one of the most valuable tools that people all over the world use to learn and exchange information with others. It is an undeniable fact that most foreign language teachers and students must accept that YouTube videos are used to aid in the achievement of the goal of teaching and

learning. To summarize, we must realize our objectives and requirements. Furthermore, we must understand the goals and needs of those involved in general, and our students in particular, and the use of the websites that we are employing will always help us (users) find ways to overcome their weaknesses and know how to dig out their strengths to bring us results that exceed our expectations. Like the proverb said, “He who sees through life and death will meet most success”.

Faculty of Foreign Languages, National Economics University, Hanoi, Vietnam

Abstract

This study investigates the factors influencing the teaching of English as the second language for non-English major students at economic universities in Hanoi. The key findings indicate that all the factors which affect the quality of teaching English at economic universities in Hanoi include teaching methods, lectures skills and qualifications, teaching materials, assessment, facility, and English learning attitudes. Specifically, English teaching methods have the strongest impact on the quality of teaching English. Through the results, the researchers propose practical recommendations for administrators, lecturers, and students to improve the quality of teaching English as the second language for non-English major students at economics universities in Hanoi.

Keywords: *factors, quality of teaching English, non-English major students, economic universities.*

1. Introduction

With the increasing global economic integration, it is obvious that foreign languages, especially English, have tremendous effect upon all the aspects of human life. Therefore, there is a constant demand to learn and grasp the English language which has nowadays become a universal language, used both for business and pleasure. Teaching English at schools and universities is an important bearer of such a process. It is supposed to be based on effective study strategies and established on the basis of sustainable development, with a high-quality result as a final outcome. There is no doubt that scientific and effective teaching assessment is the important means by which teachers and learners can check whether the aim is well realized.

Universities worldwide all share a commitment to assuring high quality teaching and learning and emphasize the maintenance and constant development of quality. No matter what a language course a teacher may use while teaching, to maintain quality, teaching and learning must meet learners' needs. That it, the process must be creative, with inevitable usage of up-

to-date information technologies, employing different resources to support good practice, and as a final step, the process must end up with evaluation of teaching and learning outcomes.

In Vietnam, the majority of universities understand the importance of English and they have focused on developing the quality of English teaching and learning to meet the speed of industrialization and modernization of the country as well as globalization. In order to be better employed after graduation, students need to acquire English language proficiency. The requirement of an English outcome standard for non-English major students at many Vietnamese universities with IELTS 5.5 or equivalent certificates before graduation has become more challenging to students, lecturers, and university administrators.

It can be seen clearly that numerous international and domestic studies were conducted to identify factors that affect the quality of teaching English to give an in-depth understanding. In particular, Betts et al. (2003) conclude that the teacher qualifications most significantly related to better student success are subject-area certification. Similarly, Cavalluzzo (2004) indicates that lecture qualifications and student achievement have strong correlations. In addition, educational facilities are also necessary for the teaching and learning process to take place (Sopiatin, 2010). Urbina (2016) discovers that lecturers were aware of the teaching process by using the grammar-translation method most of the time, which was combined with the direct method and audio-lingual methods such as repetition and presentation. Julia and her colleagues (2020) also analyze five terms including pedagogy-related factors. The findings show that lecturers were aware of how important pedagogy-related factors were. Such teaching methods, implementation of lesson plans, and classroom management could either aid or impede a lecture in ELT. Kausar, Shoukat, and Zafar (2020) conduct research to identify factors affecting the quality of education of secondary school students in Tehsil Faisalabad. Four elements (Teacher related factors, Examination related factors, Psychological related factors, Socio-economic related factors) are used to evaluate the quality of teaching in the study.

As indicated by Tran (2013), English was poorly taught at Vietnamese universities. The data showed that most students were not taught according to the English curriculum. Additionally, the study results indicate de-motivating factors of English teaching at HUTECH in particular and in Vietnamese universities in general. Nguyen (2014) & Pham, (2021) investigates factors affecting the quality of teaching English at NEU. The findings reveal that teaching method has the strongest impact on teaching quality, followed by teaching materials, teaching attitudes, assessment, and facilities.

To conclude, a great deal of research has been carried out to investigate the factors affecting the quality of teaching English; however, little research was concerned with the non-English major students at economic universities in Hanoi. Considering these factors is crucial to improve students' English proficiency since students are required to achieve English outcome standard before graduation. In order to fill the research gaps, it is of great importance to conduct research on factors influencing the quality of teaching English as a second language for non-English major to analyze the influencing factors as well as evaluate the level of influence of these factors, and propose implications for institutions, lecturers, and students to enhance the quality of teaching English.

On the basis of previous international and domestic studies, the researchers selected six factors affecting the quality of teaching English as the second language of non-English major students at economics universities in Hanoi. These factors include (i) English teaching methods, (ii) Lecturers' skills and qualifications, (iii) English teaching materials, (iv) Facilities, (v) Assessment, and (vi) English learning attitudes.

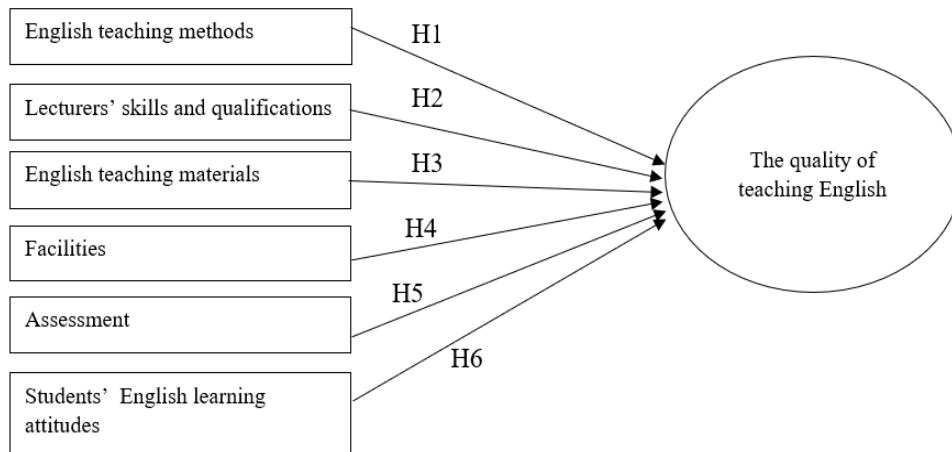

Figure 1. Proposed research model

2. Method

The researcher follows these steps to conduct the study:

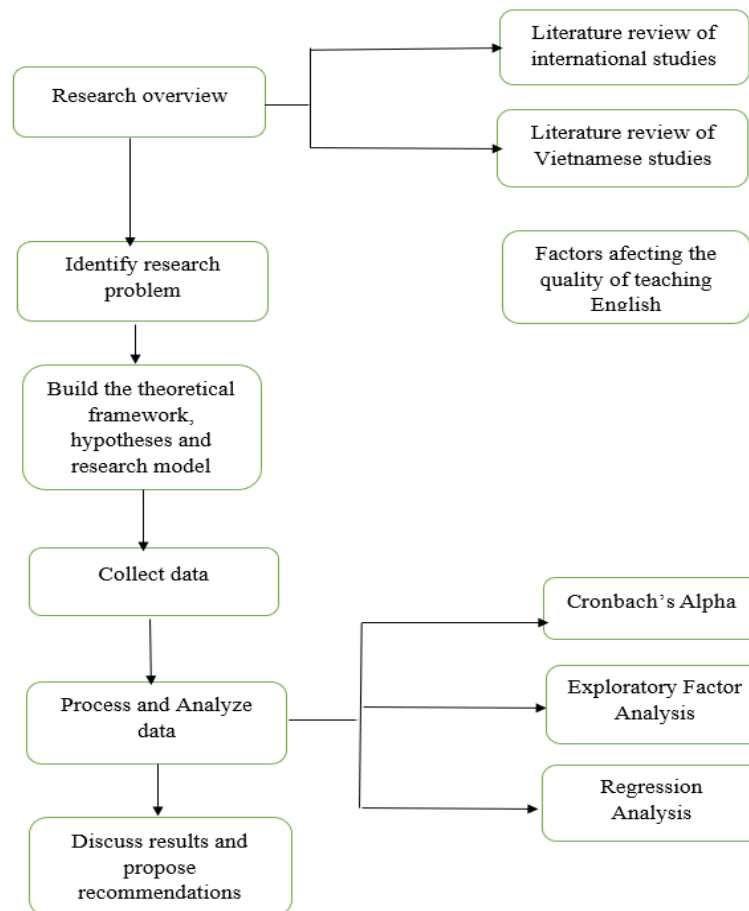

Figure 2. Research process

2.1. Qualitative methods

In-depth interview method: The researchers conducted in-depth interviews with 10 students from economic universities to analyze, supplement necessary factors and adjust the scales. Due to the Covid-19 pandemic, the interviews were carried out via telephone calls and Google meetings.

Expert-opinion method: After interviewing 10 non-English major students of the National Economics University, Foreign Trade University, and Banking Academy in Hanoi to adjust the questionnaires, lecturers of the Faculty of foreign languages from the three economics universities were invited to provide their opinions, comments, evaluations to help the researchers finalize the questionnaire before distributing it to the respondents.

2.2. Quantitative methods

Data collection

Due to Covid-19, the questionnaires were uploaded to Google Forms and distributed to economics students via Facebook, student platforms, and student email systems. The results were then compiled and put into SPSS for analysis.

Data Analysis

The reliability and validity of the scales is evaluated thanks to SPSS. The reliability of the scale is tested through Cronbach's alpha coefficient. The validity of the scale was tested through exploratory factor analysis (EFA). Finally, the impact of factors on the quality of teaching English was estimated using a regression model.

Evaluating of Scale Reliability by Cronbach's Alpha

Cronbach's Alpha coefficient is used to analyze the consistency of a scale consisting of many observed variables. Through this coefficient analysis allows the researchers to remove the garbage variables (do not guarantee the consistency when reflecting on the same concept). Specifically, variables having Corrected Item-Total Correlation less than 0.3 will be excluded from the set of observed variables of the scale. Criteria for a good scale is that the scale has Cronbach's Alpha greater than 0.6 and no any Corrected Item-Total Correlations below 0.3 (Nunnally & Burnstein, 1994).

Exploratory Factor Analysis

To analyze the validity of the scales, the researchers use EFA technique. This tool is able to evaluate the homogeneity of component elements that are expected to be significantly correlated with each other in the same component. During analysis, observed variables with a loading factor of less than 0.5 continue to be excluded from the set of observed variables because the scale's convergence is not guaranteed. The method of extracting is the Principal components method with Varimax rotation and the stopping point when extracting factors with Eigenvalues being equal to 1. According to Hair et al. (1998), the scale is accepted when more than 50% of the total variance is extracted and not less than 0.5 of loadings factor.

Regression Analysis

Regression analysis is a reliable method of identifying which variables have impact on a topic of interest. The process of performing a regression allows researchers to confidently determine which factors matter most, which factors can be ignored, and how these factors influence each other. There are two main components to be essentially comprehended: dependent variable and independent variables. Dependent Variable is the main factor to be understood or predicted while Independent Variables are the hypothesized factors having an impact on the dependent variable.

3. Results

3.1. Qualitative Results

425 questionnaire forms that were delivered online via Facebook, student platforms, and student email systems. However, after the initial visual examination 25 invalid or unreliable responses were removed due to acquiescing responses (i.e., providing same values for all items) or missing values in the key variables of interest. A total of 400 cases of analyzable samples were used in the study.

The respondents of this study are undergraduate and graduate students from three economic universities in Hanoi including National Economics University (35.5%), Banking Academy (33.25%) and Foreign Trade University (31.25%).

3.2. Quantitative Results

Evaluating of scale reliability by Cronbach's Alpha

The analysis results of evaluating of scale reliability by Cronbach's Alpha reveals that the corrected Item-total correlation is greater than 0.3; Cronbach's alpha of six scales is greater than 0.6. Therefore, it ensures sufficient reliability to be included in the exploratory factor analysis.

Table 1. Summary of the results of the scale reliability analysis

Factors	Cronbach's alpha
ETM	0.886
LSQ	0.880
TM	0.881
F	0.920
AS	0.911
LA	0.888

Source: Researchers's summary from the results

Analysis of the scale validity

After analyzing the reliability of the scales, the researchers analyzed the validity of the scales to ensure that these scales reflect completely the aspect that they need to measure. Analyzing indicators such as KMO, P value of Bartlett's test, Total Variance Explained which showed that the overall quality of teaching English scale is valid allowed the

researchers to compute the overall quality of teaching English for non-English major students at economics universities in Hanoi.

Total Variance Explained							
Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total
1	6.520	16.300	16.300	6.520	16.300	16.300	4.667
2	4.403	11.006	27.306	4.403	11.006	27.306	4.324
3	4.213	10.533	37.840	4.213	10.533	37.840	4.235
4	4.094	10.236	48.076	4.094	10.236	48.076	4.195
5	3.750	9.376	57.451	3.750	9.376	57.451	4.150
6	2.405	6.013	63.464	2.405	6.013	63.464	3.814

KMO and Bartlett's test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.764
Bartlett's Test of Sphericity	Approx. Chi-Square	901.127
	Df	3
	Sig.	.000

KMO is $0.764 > 0.5$; P value of Bartlett's test is 0.000, very small (< 0.05); therefore, the EFA method is suitable.

Total Variance Explained

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	2.601	86.686	86.686	2.601	86.686	86.686
2	.210	7.015	93.701			
3	.189	6.299	100.000			

The table indicates that the observed variables of the overall quality of teaching English scale converge on 1 main component with the total variance explained as 86.686%. It shows that this main component explains 86.686% of the variation of the set of observed variables for the scale of overall quality of teaching English.

As a result of this finding, the researchers may infer that the overall quality of teaching English scale is valid (i.e. it can measure exactly the concept it is supposed to measure). The researchers can make use of this scale to calculate the overall quality of teaching English for non-English major students in economics universities in Hanoi.

Assessment of quality of teaching English in economics universities in Hanoi and factors affecting the quality of teaching English in economics universities in Hanoi

Students' assessment about factors affecting the quality of teaching English

Moreover, the findings indicate that generally the students have positive assessment of factors affecting the quality of teaching English in economics universities in Hanoi. Specifically, the students are most satisfied with Facilities, English teaching methods, Teaching materials, and Lecturers' skills and qualifications (with the average satisfaction score from 3.7 to 3.9).

Students' assessment about the overall quality of teaching English

Items	N	Minimum	Maximum	Mean	Std. Deviation	Items
QTE1	400	1	5	3.87	.480	QTE1
QTE2	400	1	5	3.87	.489	
QTE3	400	1	5	3.87	.469	

Source: Researchers' data processing

With the average assessment score of about 3.8 points, it can be supposed that the majority of students evaluated the quality of teaching English with optimistic effects.

Analyzing the impact of factors on the quality of teaching English in economics universities in Hanoi.

The researchers figured out 6 major factors that can affect quality of teaching English, including: (i) English teaching method, (ii) lecturer's skills and qualifications; (iii) English teaching materials; (iv) Facilities; (v) Assessments; and (vi) students' learning attitude.

To determine the effect of each of these components on the quality of teaching English, the researchers performs a regression with an analytical model written in the following form:

$$QTE = B_0 + B_1*ETM + B_2*LSQ + B_3* TM + B_4*F + B_5*AS + B_6*LA + U_i (1)$$

The researchers used summary of model indicators and analysis of variance.

Results of estimate

Variables	Estimate	Std. Error	Beta	T - stat	P_value
(Constant)	.288	.180	-	1.601	.000
ETM	.133	.026	.204	5.185	.000
LSQ	.083	.021	.141	4.048	.000
TM	.238	.019	.438	12.577	.000
F	.147	.019	.265	7.629	.000
AS	.133	..023	.227	5.793	.000
LA	.196	.020	.336	9.671	.000

4. Discussion & Conclusion

Conclusion

From the above results, there are six factors responsible for the quality of the teaching of English as a second language at economics universities in Hanoi, namely (1) English teaching methods, (2) lecture skills and qualifications, (3) English teaching materials, (4) facilities, (5) assessment, and (6) English learning attitudes. Additionally, the six factors above have a positive impact on the quality of teaching English as the second language for non-English major students in economics universities in Hanoi. The most dominant factor was English teaching methods, followed by lecture skills and qualifications, teaching materials, facility, assessment, and English learning attitudes.

Discussion

To start with, the results indicated that the role of English language teachers in achieving significantly the quality of education in economics universities cannot be denied. In language acquisition, skilled and capable pedagogues are recognized to make a positive impact on students' motivation and help in innovatively implementing pedagogical approaches. Thus, English language lecturers act as quality facilitators who influence educational quality.

Teaching skills are capabilities that enable lecturers to contribute to students' success. These skills are essential at every step of the way, from creating lesson plans and instructing learners to collaborating with parents and school administrators. Therefore, it is obvious from the findings that teaching skills have great influence on the quality of teaching English at tertiary education.

Teaching materials form an important part of most English teaching programmes. From textbooks, videotapes and pictures to the Internet, teachers rely heavily on a diverse range of materials to support their teaching and their students' learning.

According to the research results, assessment is also a crucial factor that positively affects student satisfaction and the teaching English quality. It is a pedagogical context designed to encourage and promote student engagement in studying. In addition, the assessment system should be improved to ensure more fairness, transparency and equality in assessing student learning outcomes, which is clearly shown in each assessment item.

It can be seen from the data analysis that the next crucial affecting factor was related to facilities which can be defined as the necessary resources in an EFL classroom. Facilities referred to libraries, multimedia equipment such as English labs, the use of projectors, computers, as well as the number of students in the classroom as areas of infrastructure.

The research results also indicate that students' learning attitude is also an integral factor that has a detrimental impact on the quality of teaching English and the student's satisfaction. Students are the major subject in the training process and their attitude contributes an extremely important part to the quality of teaching and learning.

Recommendations

On the basis of findings, the researchers propose some viable recommendations to improve and enhance the quality of teaching English for non-English major students.

In terms of English teaching methods, the new ones are put forward to help lecturers of English to improve the existing methods: (i) layered teaching methods, which aims at different English levels and different learning abilities of students; (ii) life-related teaching methods, that is, integrating English into life, learning English in life, and mastering the basic skills of English in practice; (iii) group-divided and cooperative teaching methods, which means dividing students into groups according to students' interests, the English levels and autonomous learning.

In terms of lecturer skills and qualifications, it is crucial to follow these steps to improve the English teaching quality: (i) identify strengths and areas for improvement - find out what they are good at and use it as a springboard to work on their weaker areas, (ii) implement improvement strategies, including public speaking practice, reading inspirational books and listening to motivational speakers, attending workshops and conferences, etc.

In terms of English teaching materials, they should be authentic and contextualized. Moreover, they need to offer opportunities for integrated language use. Lastly, English teaching materials should be attractive in terms of physical appearance, user-friendliness, durability and ability to be reproduced.

In terms of facilities, in order to bring the best learning conditions and create a modernized and friendly atmosphere in classes, universities should take into consideration several attributes. Firstly, the classrooms need to be organized in an appropriate way. Secondly, the building in the university has to be equipped with whiteboards, multimedia equipment such as speakers and computers, and even projectors. Finally, libraries should be provided with full and diverse sources of learning materials such as books and reference ones or even pre-recorded lectures.

In terms of assessment, due to its significance to students, lecturers and parents, it is necessary for lecturers to consider the following: (i) Supporting student learning through formative assessment, (ii) Using assessment data to improve learning, (iii) Providing feedback on student work, (iv) Recording and tracking progress and achievement, (v) Standardizing teacher assessments within subjects, (vi) Using assessment data for school evaluation and target setting.

In terms of English learning attitudes, it is obvious that students' attitude towards the foreign language is very often influenced by teacher-student relationships, the general classroom atmosphere, and the use of authentic teaching materials and activities; therefore, it is highly recommended for lecturers to take into consideration some suggestions. Firstly, they should foster a positive psychological classroom atmosphere in which students feel free to communicate using a foreign language by the following techniques: (i) Avoiding excessive, "on the spot" correction in speaking activities; (ii) Adopting a correction code in writing tasks; (iii) Establish a set of classroom rules and enforce them fairly and consistently with all students and Incorporate collaborative work in your English classroom. Secondly,

they should create an attractive physical classroom environment. Some practical advice includes: (i) Paying attention to seating arrangement; (ii) Making effective use of bulletin boards and display areas; (iii) Using posters, maps, newspaper clippings to provide a stimulus for classroom discussion; (iv) Establishing classroom procedures and rules; (iv) Bringing to the classroom a number of English books. Lastly, they should supplement the teaching material with authentic texts and tasks. Authentic material and tasks should be selected based on the students' interests, knowledge and everyday experiences. Additionally, they should foster students' autonomy by providing activities and tasks that require students to use English for authentic communicative purposes.

Limitations & Suggestions for Further Studies

The researcher made a significant effort to investigate the relationship between factors mentioned above and the quality of teaching English in Hanoi economics universities but limitations on the study are inescapable. First of all, the research investigates on only three economics universities in Hanoi due to the Covid-19 pandemic and the shortage of time. 400 responses were collected, but this number is not able to make a sweeping statement of the results to a larger group of students effectively. Secondly, the researchers intended proposed to interview lecturers and administrators in economics universities in advance, but due to the Covid-19 pandemic, the researchers could not interview administrators; therefore, the evaluation of factors affecting the quality of teaching English would not be all inclusive. Last but not least, the study only focuses on evaluating six major dimensions of the quality of teaching English in university while it may cover other aspects. The aforesaid issues could be solved and be a basic foundation for further research. Firstly, future researchers can extend the scope of the study with more data from more universities in other cities in Vietnam. Instead of just focusing on economics universities, the research should be conducted at other universities with different fields such as medicine, art, culture or technology. Expanding domains of university would make the findings even more beneficial. Secondly, further studies should consider the impact of other factors, including the university reputation/ image, gender on the quality of teaching English as the second language.

Abstract

The study aimed to evaluate the students' satisfaction and identify the factors affecting the training quality for adult students in Vietnam. By desk study and in-depth interviews, the theories of students' satisfaction evaluation and the legal documents relating to training quality were analyzed and symbolized with a conceptual theory frame. The research was then based on the quantitative method to analyze the students' satisfaction on training quality. Primary data was collected from 200 students of two training institutions in management of agriculture and rural development. A set of criteria, including five factor groups with 31 observed variables was developed. The Exploratory Factor Analysis (EFA) method and the multivariate linear regression model were used to identify the groups of factors that affect the level of students' satisfaction with the training quality at the two institutions. Accordingly, there were three groups of factors that most strongly influence the students' satisfaction, including trainers, training curriculum, infrastructure facilities. Basing on the analysis, recommendations to improve the training quality were also provided.

Key words: *Adult student, training quality, satisfaction level.*

1. Introduction

In the context of knowledge-based market economy, the short-term training for civil servants and public employees in Vietnam has been changing to meet the students' needs in the new period (Thuy et al., 2018). Accordingly, assessment of the training quality is an inseparable part of the training cycle. Through the assessment and evaluation, training managers can make reasonable adjustments to meet the learning needs and to improve the quality of teaching and learning.

In adult training, the students must be the ones who decide the goals of their learning contents what could support for their careers or awareness ability (National Research Council, 2000). However, in fact, at the education and training institutions, especially short-

term training for public employees in Vietnam, assessment of the training quality is only considered as a channel to provide information about learning results rather than being seen as a tool to improve training quality. Therefore, the assessment of factors affecting the quality of training is extremely important for training institutions to identify key factors that need to be focused on improvement in a limited resource. However, current studies have mainly focused on assessing the students' satisfaction at higher-education organizations while the research for students' at the training institutions for civil servants have not been cared much (Thuy et al., 2018). Thus, this study was conducted as a case study at two training institutions in Vietnam where provide the training programs to the public employees to evaluate how the adult students expressed their satisfaction on the training quality. The research results were expected to provide significant scientific evidences for adult training, especially for public employees. Furthermore, the relevant recommendations were expected to contribute to improve the profession, qualifications and public service skills for training of employees to meet the requirements of innovation and international integration.

2. Literature review and Conceptual framework

Customer satisfaction is considered the basis in the marketing concept of satisfying customer needs and desires (Spreng et al., 1996). In education, Nadiri et al. (2009) suggests that educational managers need to apply market principles and strategies used by manufacturing enterprises. Accordingly, schools must learn their students' expectations and thoughts about the factors that affect educational service quality in order to meet their demand in learning.

In the UK, a toolkit for assessing students' satisfaction on their universities was developed by scholars (Harvey et al., 1997). The toolkit consists of 3 criteria, including: student learning support, infrastructure (learning resources) and support services for students' lives. In the United States, the American scholars developed a toolkit for students' satisfaction survey that has been popularly applied in the US and Canada since 1994. The toolkit includes 70 questions relating to the satisfaction (Ruffalo Noel Levitz, 2020). Those are divided into small groups, such as: effectiveness of academic counseling, academic support services (library, computer room, etc.), school environment, and school-based support programs, level of individualized interest, effectiveness of teaching, safety and confidentiality. Accordingly, a study by Wiers-Jenssen et al. (2002) reveals three main groups of factors that affect the students' satisfaction at Norwegian universities, including: the quality of education related to the curriculum and lecturers; the social environment; facilities and resources of the university. Meanwhile, a study by Butt & Rehman (2010) shows that four factors that affect the satisfaction of university students in Pakistan as followed: lecturers' expertise, provided courses, learning environment and facilities. In Vietnam, a study by Chau & Chau (2013) discovers the factors that affect the level of students' satisfaction on the quality of training services in the Faculty of Economics and Business Administration at Can Tho university. They are the element of internship conditions, social knowledge, lecturer interaction and improvement of foreign language skills. By contrast, Lien (2016) shows that factors affecting student satisfaction at University of Economics and Business-Vietnam National University, Hanoi are ranked in the descending orders as following: training programs; supportive ability of the staff; the

infrastructure and facilities. Furthermore, Nhung et al. (2019) points out the students' satisfaction with IFRS accounting training at the Banking Academy is influenced by the quality of the lecturers, IFRS curriculum and students' foreign language ability.

According to Parasuraman et al. (1985), satisfaction can be measured at 5 to 7 level. The Likert scale is often applied in survey students' satisfaction. The scale can be divided into 7 levels to access student satisfaction in the UK (Harvey et al., 1997) and to profile the students' satisfaction at Noel Levitz in the US and Canada (Ruffalo Noel Levitz, 2020), or a 5-level scale as shown in a survey in Norway (Wiers-Jensen et al., 2002) and in Vietnam (Lien, 2016). The use of a 3-level, 5-level, or 7-level scale depends on the evaluation goal. In Vietnam, the Ministry of Home Affairs issued a Circular No.10/2017/TT-BVN on evaluating the quality of training for cadres, civil servants and public employees (Government of Vietnam, 2010). Accordingly, the evaluation objects include 6 criteria: training curriculum, leaners, trainers, infrastructure and facilities, training course, post-training effectiveness with 28 indicators and 78 evaluation sub-indicators. The 10-point scale is used for evaluation according to the provisions of the Circular. Through the desk review, 31 factors (observed variables) that affect the level of students' satisfaction were identified. Accordingly, these 31 factors are divided into 5 groups, including: (1) training curriculum; (2) trainers; (3) assessment and evaluation; (4) infrastructure and facilities; (5) training course delivery. A 10-point scale is used to evaluate the students' satisfaction.

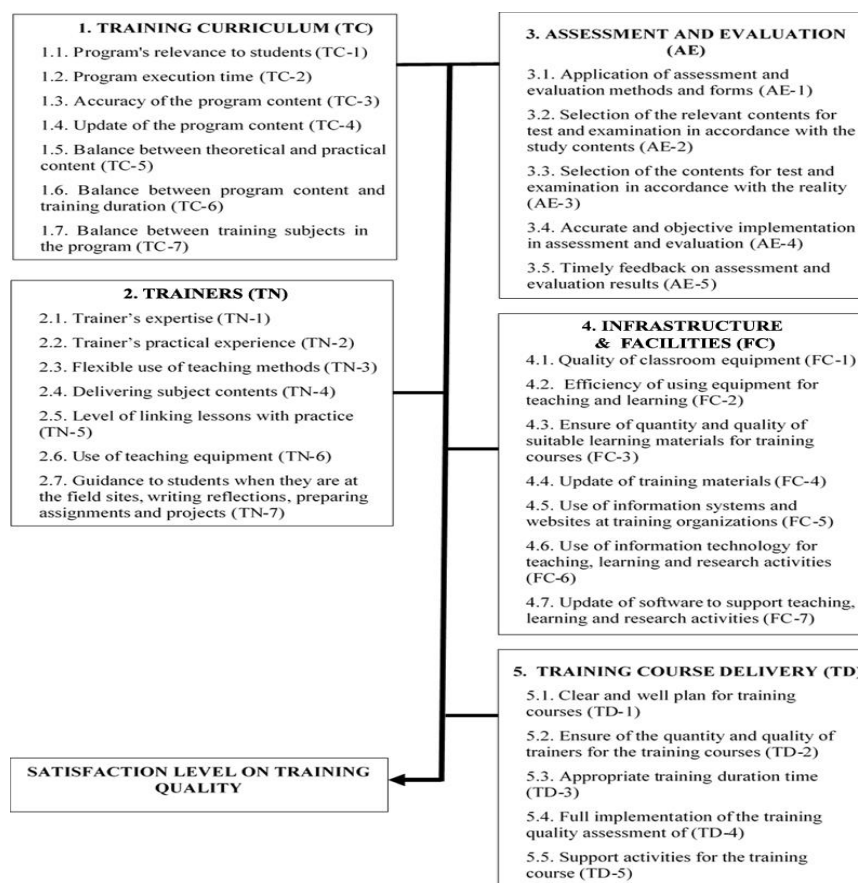

Figure 1. The research conceptual framework

3. Method

3.1. Data collection

The quantitative and qualitative research methods were applied. Both secondary and primary data was used in the study. Secondary data was collected at the institute in terms of training management and teaching activities. Primary data was collected by some in-depth interviews with trainers and students and a survey based on the prepared questionnaires to collect students' assessments of training quality including the factors of (1) training curriculum; (2) trainers; (3) assessment and evaluation; (4) infrastructure and facilities; (5) conduction of training.

The questionnaire was designed with a 2 main part structure: Part A (General information about interviewees) and Part B (Assessment of 05 groups of factors with 31 sub-indicators and satisfaction level on training quality). The questionnaire could be answered within 15 minutes. Additionally, the introduction and closing parts were both put in the sheet to make sure information, questions and survey results achieve in the most effective manner.

Before conducting the survey, the questionnaires were pilot within a small group of volunteers for testing the questions and information and revising. They were then revised and finalized basing on the pilot result and experts' recommendations.

3.2. Sample selection

The sample size was determined by Smith (2013):

$$n(\text{total} > 50,000) = \frac{Z^2 p(1-p)}{c^2}$$
$$n(\text{indented total} < 50,000) = \frac{n(\text{total} > 50,000)}{1 + \left(\frac{n(\text{total} > 50,000) - 1}{\text{Pop}}\right)}$$

Where, Z is a parameter interval, with $Z^2 = 1.96$ (the equivalent of the confidence interval is set at 95%); P is the probability of making a choice, assumed to be 0.5; c is the marginal of error, chosen at 0.07; Pop is the identified total. Accordingly, when $N = 9,671$ students (average of 3 years), the number of minimum survey samples should be 193. However, to increase the accuracy, 200 students were surveyed by questionnaires.

3.3. Data analysis and processing

Both qualitative and quantitative methods were utilized to analyse students' satisfaction on the training quality in this study. The quantitative method was implemented through 04 steps:

Step 1: The reliability of the scale was tested by Cronbach's Alpha coefficient and the correlation coefficient of the total variable (Corrected Item Total Correlation). The Cronbach's Alpha coefficient allows to assess if it is appropriate to include certain observed variables belonging to a research variable (potential variables, factors). Accordingly, when Cronbach's Alpha is from 0.8-1, the measurement scale is good; if from 0.7-0.8 is usable; if

from 0.6-0.7 is usable when the measurement concept is new or it is a new concept to respondents in the context of the study; if it is less than 0.6, it cannot be usable (maybe in the research interviewees do not have their feeling about that factor). However, if the Cronbach's Alpha coefficient is over 0.95, the observed variables should be considered because there may be a "coincidence" phenomenon (Hair et al., 2006; Nunnally, 1994).

Step 2: Using the Exploratory Factor Analysis (EFA) to test the influencing factors and to identify the factors that are considered suitable for analyzing the level of students' satisfaction. However, some certain conditions that need to be ensured for factor analysis results as followed:

(1) The Factor Loading coefficient of an observed variable between the factors must be ≥ 0.5 to ensure the distinction between the factors to ensure simple correlation between variables and factors. Factor Loading >0.3 is considered to be a minimum, Factor Loading > 0.4 is considered important, Factor loading >0.5 is considered to be of practical significance (Hair et al., 2006). If Factor Loading ≥ 0.3 the sample size should be at least 350, if the sample size is about 100 then Factor Loading should be >0.55 , if the sample size is about 50, then Factor Loading should be >0.75 . Therefore, in a rotation deviation, an observed variable uploads in both factors that the difference value of loading factor coefficient is below 0.3, that variable is disqualified (Jabnoun & Hassan Al-Tamimi Hussein, 2003).

(2) KMO index (Kaiser Meyer-Olkin) ranges from 0.5 to 1 and the Sig coefficient of Bartlett's test <0.05 . These two values help to consider the suitability of factor analysis. If this value is less than 0.5, factor analysis is likely to be inconsistent with the data (Hair et al., 2006).

(3) Percentage of variance (% Cumulative) indicates the percentage of variance explained by factors, which must be greater than 50% (Gerbing & Anderson, 1988).

Step 3: From the results of exploratory factor analysis, statistical analysis was utilized (mean, median, standard deviation) to analyze the data.

Step 4: Using a multi-dimensional linear regression model to identify the factors and the influence of each factor on students' satisfaction to the quality of the institution's training services. A model to identify the factors effecting the satisfaction level on training quality (Y) was established. The independent variables in the model included 5 factors (Xi) which resulted by the exploratory factor analysis (EFA), including: training curriculum (X1); trainers (X2); assessment and evaluation (X3); infrastructure and facilities (X4); training course delivery (X5). The parameters in the model were estimated by the Least Squares Regression on SPSS software. The model was presented as followed: $Y = f(X_i)$

4. Results

4.1. Sample characteristics

The study was conducted at training organizations for adult students in the sectors of agriculture and rural development. These institutions deal with training and improving the quality of human resources for agriculture and rural development management. The study

focused on training programs for professional expertise and management from 2016 to 2020. This study focused on surveying the alumni who participated in the training courses of leadership and management, profession standards for public employees those held at the training institution. 200 selected alumni were invited to join the survey. Their information is presented in Table 1 below:

Table 1. Information of survey respondents

Characteristics	Mean	Median	Standard deviation	Minimum	Maximum
Age	39.08	38.00	6.983	24	60
Sex (Male=1; Female=0)	0.69	1.00	0.464	0	1
Years of experience (year)	13.30	13.00	6.922	1	36
Number of courses participated (course)	1.14	1.00	0.471	1	4

The Table 2 shows that the average age of the survey respondents is at 39.08. In terms of gender, 69% of male and 31% of female students participated in the survey. The statistical index of the experience years shows that those who have attended the training courses have many working experience years (average of 13.03 years). The average number of courses they attended is 1.14.

4.2. EFA results

Table 2 below shows that the 5 scales with Cronbach's Alpha coefficients are all greater than 0.6. Thus, the scales are at the high reliability. In addition, all observed variables in the factor scale reach a total correlation coefficient greater than 0.3, therefore, they should be included in EFA.

Moreover, the analysis results show that the KMO coefficient (Table 1) reaches 0.875 >0.5. Bartlett test result with statistical significance sig =0 <0.05. Thus, the Ho hypothesis: the correlation between zero observed variables in the population is rejected, i.e., the observed variables are correlated with each other in the population. These results show that EFA is appropriate.

Bartlett's test of correlation of observed variables (sig. =0.000 <0.05) proves that the variables are closely related; The total variance extracted =62.001% (>50%) is satisfactory and shows that 5 groups of factors explain about 61.001% of the variance of the data. This shows that the EFA analysis results are perfectly consistent.

Table 2. EFA results

Observed variables	Code	TC	TN	AE	FC	TD
Training curriculum (Cronbach's Alpha =0,884)	TC					
Program's relevance to students	TC-1	0.744				
Program execution time	TC -2	0.806				
Accuracy of the program content	TC -3	0.791				
Update of the program content	TC -4	0.663				
Balance between theoretical and practical content	TC -5	0.622				
Balance between program content and training duration	TC -6	0.622				
Balance between training subjects in the program	TC -7	0.649				
Trainers (Cronbach's Alpha = 0,903)	TN					
Trainer's expertise	TN-1		0.736			
Trainer's practical experience	TN-2		0.772			
Flexible use of teaching methods	TN-3		0.696			
Delivering subject contents	TN-4		0.778			
Level of linking lessons with practice	TN-5		0.691			
Use of teaching equipment	TN-6		0.795			
Guidance to students when they are at the field sites, writing reflections, preparing assignments and projects	TN-7		0.748			
Assessment and evaluation (Cronbach's Alpha = 0,797)	AE					
Application of assessment and evaluation methods and forms	AE-1			0.597		
Selection of the relevant contents for test and examination in accordance with the study contents	AE-2			0.674		
Selection of the contents for test and examination in accordance with the reality	AE-3			0.801		
Accurate and objective implementation in assessment and evaluation	AE-4			0.692		
Timely feedback on assessment and evaluation results	AE-5			0.688		

Observed variables	Code	TC	TN	AE	FC	TD
Infrastructure and facilities (Cronbach's Alpha = 0,886)	FC					
Quality of classroom equipment	FC-1				0.712	
Efficiency of using equipment for teaching and learning	FC-2				0.762	
Ensure of quantity and quality of suitable learning materials for training courses	FC-3				0.719	
Update of training materials	FC-4				0.753	
Use of information systems and websites at training organizations	FC-5				0.770	
Use of information technology for teaching, learning and research activities	FC-6				0.786	
Update of software to support teaching, learning and research activities	FC-7				0.762	
Training course delivery (Cronbach's Alpha = 0,871)	TD					
Clear and well plan for training courses	TD-1					0.741
Ensure of the quantity and quality of trainers for the training courses	TD-2					0.530
Appropriate training duration time	TD-3					0.767
Full implementation of the training quality assessment	TD-4					0.822
Support activities for the training course	TD-5					0.664

Accordingly, 5 groups of factors have no change in observed variables. Thus, the observed variables are representative of the measurement scale. Some statistical values of 5 groups of factors are presented in Table 3.

Table 3. Statistical values of 5 groups of factors after EFA

	Mean	Median	Std. Deviation	Minimum	Maximum
TC	9.05	9.00	1.014	6	10
TN	9.16	9.00	0.853	5	10
AE	9.22	9.00	0.807	7	10
FC	9.11	9.00	0.979	5	10
TD	8.87	9.00	1.009	6	10

The analysis results show that the average value of the training curriculum, trainers, assessment and evaluation, facilities, and training delivery is 9.05 (standard deviation 1.01), respectively; 9.16 (standard deviation 0.85); 9.22 (standard deviation 0.81); 9.11 (standard deviation 0.98); 8.87 (standard deviation 1.01). The classification of assessment results follows Vietnam's Circular 10/2017/BNV on assessing the quality of training for cadres, civil servants and public employees (Table 4).

Table 4. Classification of training quality evaluation results

General evaluation indicator	Evaluation level
$0 \leq \text{indicator} < 2.0$	poor
$2.0 \leq \text{indicator} < 4.0$	weak
$4.0 \leq \text{indicator} < 6.0$	average
$6.0 \leq \text{indicator} < 8.0$	moderate
$8.0 \leq \text{indicator} \leq 10.0$	Good

Source: Government of Vietnam (2010)

Accordingly, all 5 factors (training curriculum, trainers, assessment and evaluation, infrastructure and facilities, training course delivery) have achieved "good" rating. The following is students' evaluation:

Training curriculum: The training curriculums defined clear and specific objectives, reasonable structures. They were systematically designed in accordance with the framework program. In addition, the curriculums were also reviewed and self-assessed for quality improvement to meet “the social needs and learners' needs”. They were basically relevant and responsive to the students' learning needs.

Trainers: Most of the trainers were professional in their expertise and good at teaching skills. The trainers all achieved the basic foreign language and computer skills to meet the requirements of the innovation in teaching, research, consulting and international cooperation. In addition, the team of training managers and support staff were qualified enough to serve the training services. In particular, visiting trainers and experts with excellent profession from management agencies and training institutions to participate in teaching.

Infrastructure and facilities: According to students' assessment, the training facilities, equipment and textbooks were generally sufficient for teaching, learning and other activities. Additionally, management software and intelligent software were gradually utilized in teaching and training management.

Training course delivery: The training courses were well organized. Timeframe and duration of the training courses were adequately suitable. Trainers were enthusiastic and responsible with their work.

4.3. Linear regression model

In order to determine the influence of factors on the students' satisfaction level, 01 model to determine the influence level of 5 factors is set up based on the factor analysis of the satisfaction level on training quality and the results of linear regression analysis on the

relationship between the factors affecting the satisfaction of training quality. The model with 5 independent variables is presented in Table 5 below.

Table 5. Standardized regression model

Variables	β	Standard deviation	P-value	VIF
CT	0.276	5.267	0.000*	1.700
GV	0.547	10.594	0.000*	1.646
DG	0.092	1.865	0.064	1.493
VC	0.119	2.709	0.007*	1.194
TC	0.029	0.567	0.571	1.587
Adjusted R-square = 0.678				
Durbin-Watson coefficient = 1.731				
Sig. = 0.000				

Note: * it is statistically significant at 5%

Results of linear regression analysis shows that Sig coefficient. = 0.000 <0.05, proving that the model is statistically significant, Durbin-Watson coefficient =1.731, proving that the model has no autocorrelation phenomenon. The VIF is also much smaller than 10, so the variables in the model have negligible multi-collinear phenomena. The adjusted R² coefficient =0.678 proves that the independent variable explained 67.8% of the value of the dependent variable.

Accordingly, 3 variables (among 5 independent variables) are statistically significant. Specifically, the factor that most strongly influences the student satisfaction is “trainers” (β =0.547; p-value =0.000), followed by “training curriculum” (β =0.276; p-value =0.000) and “infrastructure and facilities” (β =0.111; p-value =0.007). These variables have positive β values, proving that all factors are positively correlated with the student satisfaction to training quality.

5. Discussion and Conclusion

According to the results of in-depth interviews and primary report, most of trainers at the two training institutions have suitable qualifications and teaching skills. At present, the institutions have also focused on selecting and inviting qualified visiting trainers and experts who come from relevant management agencies and training institutions to participate in training. However, a part of the faculty (especially young trainers) is weak in practical experience, professional competence and teaching methods. In addition, many trainers have mainly applied traditional teaching methods and monologues which are less interesting for students and not fit with civil servants who not only expect to learn knowledge, skills but also would like to share working experience with their classmates and experts (Thuy et al., 2018).

In terms of training curriculums, the goals are all clear and specific. Additionally, they are systematically designed in accordance with the framework. At present, many practical subjects have been included in the trainings, but they only refer the general issues and avoid

the sensitive situations. Additionally, some curriculums are not relevant to students' learning needs, resulting in the less effectiveness in learning outcomes than expectations. Specifically, the existing training curriculums do not meet the increasing students' needs of intensive and separate learning. Moreover, the training contents have not been regularly updated and supplemented with new knowledge. They have been also not close to job requirements in the new context.

Additionally, besides human resource building, the institutions also care of their training facility development. Basing on available resources, the organizations have reserved certain budgets for infrastructure renovation and new construction, buying equipment and materials for teaching and learning. However, their training materials have been focused much in theory. Furthermore, classrooms and training equipment have not been synchronized and modernized to meet the students' learning objectives yet.

5.1. Recommendations

To improve training quality, it is necessary to promote active learning. This is a measure to improve the quality of training in the orientation to change students' awareness and attitudes on learning. For those who have less time for study, trainers should focus on specific and practical assignments. Furthermore, the trainers should gradually reduce the one-way presentations but change to introduce learning materials and instruct students to learn and solve problems themselves. In the classroom, trainers should apply positive teaching methods and have sessions to summarize and answer students' questions at the end of each topic.

With regards of training curriculum, the institutions should develop a standard training package for specific training subject and target audience. Moreover, the training contents should be updated with regulations, guidelines and policies regularly. The training contents should be designed basing on society's requirements and students' needs because that will be a motivation for students in their learning process and performance. Additionally, there should be more time for self-study, discussion and case study. Furthermore, to equip students with the necessary knowledge and skills for their work, the institutions should emphasize on more flexible modules and offer more elective subjects in the curriculum, or supplement "elective on demand" subjects. At the same time, it is possible to consider eliminating unnecessary subjects within the permitting authority or provide recommendations to reduce inappropriate subjects. Another suggestion is reserved for opportunities of exchanging working experience, difficulties and obstacles between students and trainers. Re-evaluation of the training needs is also a solution for timely adjustment to meet the students' demand.

Furthermore, the institutions should develop a plan to improve trainers' profession and skills with focus on young trainers, including (i) Organizing internal seminars and training workshops on expertise and teaching skills for trainers. The teaching techniques should be integrated into the training such as: designing lesson plan (scripts), writing and developing instruction questions and case study for teaching, designing assessment criteria, preparing presentations; (ii) Sending trainers to study at training courses related to specific profession and teaching methods which are conducted by reliable domestic and international

organizations. These training will provide their teaching staff opportunities to access to new professional knowledge and active teaching methods that should be appropriate to the training subjects for civil servants or public employees; (iii) Providing opportunities for young trainers to participate in practical research and field study in order to improve their professional capacity associated and active teaching methods.

Finally, the institutions should improve their infrastructure system including to invest in modernizing their information technology equipment to provide students and trainers favorable using conditions for their teaching and learning. In addition, the organizations should also develop their electronic materials and install advanced teaching software those may help trainers and students take the most effective use of the Learning Management System (LMS).

5.2. Conclusion

Improving the quality of training, especially training for civil servants is an urgent task and requirement for Vietnam to implement successfully the objectives of the National Socio-Economic Development Strategy, including public employees in agriculture and rural development. The research results have shown that, under limited resources, to improve the training quality at the training institutions in management of agriculture and rural development, the organizations should focus on improving the quality of trainers; improving the training curriculums as well as the system of infrastructure and facilities for teaching and learning. Specifically, it is necessary to develop a plan to improve professional qualifications and skills with a focus on integrating occupational skills for young trainers. In addition, it is necessary to develop the curriculums associated with students' specific and intensive learning needs. The training contents need to be regularly developed, updated and supplemented in accordance with the students' specific and specialized work requirements in the new context. Furthermore, a priority should be given to increasing investment in modernizing information technology equipment at training institutions which will be provide favorable conditions to trainers and students in their study and usage.

IMPROVING WORK MOTIVATION OF OFFICE EMPLOYEES AT TECHNOLOGY COMPANIES IN THE DIGITAL AGE

MA. Hoang Yen Phuong

yenphuongbsneu@gmail.com

National Economics University, Hanoi, Vietnam

Abstract

Motivation plays an incredibly important role in guaranteeing the level of job performance and the development of the company as well. In other words, in the current competitive market, no corporation or company could be successful without employee motivation. Recently, tech firms have tried a lot to inspire workers. However, recently, the turnover rate is becoming a considerable majority of the board of directors. Therefore, the author decided to conduct a study regarding the topic “Improving work motivation of office employees at technology companies in the digital age”.

The objectives of this study consist of:

- To review theories of employee motivation to identify the theoretical framework for analyzing employee motivation at technology firms.*
- To analyze and evaluate the current situation of motivating employees at technology companies in the information age.*
- To suggest solutions to improve employee motivation at technology companies.*

The author used both secondary data and primary data with the scope of 100 employees working in various departments at technology companies. In addition, the factors mentioned had no strong impact on worker motivation as the mean of the factors was at the average score with the notable exception of working environment and co-worker relations.

To sum up, the author suggested some recommendation to enhance employee motivation including: diversifying the nature of work, improving working environment, harmonizing the benefits of the company and compensation of employees, raising recognition and appreciation for employees’ performance, giving more effective training courses and development, creating more job opportunities and promotions, creating effective administrative policy and strengthen relationship between colleagues and others.

Keywords: *Digital age; Office employees; Technology companies; Work Motivation*

1. Introduction

It is conspicuous that Human Resource plays an integral part in guaranteeing the success of an organization. Many managers have been successful because they had the knack for hiring the right people for the right job and motivating, appraising, and developing them. Over the years, many studies have illustrated that motivation is seen as one of the most essential factors in issues linked with human resources management (HRM) and

organizational behavior management (Latham, 2007). As such, inspired employees are crucial to the quality of job performance in every organization as they are generally more productive at the workplace.

According to Abzari and Sadri (2006), if employees work harder, the workplace will become more joyful, absenteeism will be reduced, satisfaction will be enhanced, workplace rules and regulations will be observed, and employees will do their best to actualize the organization's goals and strategies. Therefore, studying motivation is extremely imperative and it should be at the top of any organization's agenda. However, each enterprise needs to find appropriate ways to achieve high results.

The rapid development of technology-based enterprises has led to some problems. One of the major issues in tech firms is employee motivation. This factor is indeed important for the health of the company. Only when employees are motivated sufficiently can they contribute their best. Over the years, tech firms had many policies to balance the benefits of the company with the compensation of workers. It not only improves the company's profits but also improves the performance of employees and gives them more motivation to work. However, with the speedy development of the companies, the pressure from the market and the competition of competing companies, the firms need more solutions to improve the motivation for workers. It will be an important factor in building a successful long-term business and limit "brain drain" within the company itself.

After an interval of time thoroughly learning, surveying and researching about previous studies, the author finds out that there is a lot of research about employee motivation. On the other hand, these studies are more about the theory, not to mention the specific circumstances and difficulties of a technology company in today's economy. Therefore, the author decided to conduct a study regarding the topic "Improving work motivation of office employees at technology companies in the digital age" in order to help relatives parties have a comprehensive view over this situation. Then they can enhance employee motivation and contribute to the development of the organization as well.

2. Literature Review

Definition of employee motivation

In the early 20th century, money was regarded as the most important input into the production of goods and services (Kreitner, 1995). However, after a series of researches, one known to be the "Hawthorne Studies", conducted by Elton Mayo from 1924-1932 at the Hawthorne Works of the American Western Electric Company in Chicago, it was observed that employees were not motivated solely by money but that employee behavior was linked to their attitudes (Dickson, 1973, in Lindner, 1998). The Hawthorne studies began the human relations approach to management, whereby the needs and motivation of employees become the primary focus of managers (Bedeian, 1993). This paved the way for other theories and definitions on motivation and performance at the workplace.

The most celebrated idea is from Herzberg (1958). He illustrated that working motivation was personnel's prevalence and expectation to achieve organization's objectives.

Furthermore, Herzberg et al. (1959) proposed that an employee's motivation to work was best understood when the respective attitude of that employee is understood. That is, the internal concept of attitude which originates from a state of mind, when probed, should reveal the most pragmatic information for managers with regard to the motivation of workers.

According to Vroom (1964), motivation was a formative state where workers expect that they will receive the desired results if they attempt to do the job.

Additionally, motivation at the first stage was "an internal state or condition (sometimes described as need, desire, or want) that serves to activate or energize behavior and give it direction" (Kleinginna and Kleinginna, 1981). After a long time researching for improvements, Franken had ascertained his own definition of motivation by adding components to this concept that "motivation also included arousal, direction, and persistence of behavior".

Mitchell (1982) illustrated that motivation was the level which an individual wanted to reach and choose to engage his or her behavior.

Robbins (1993) found out that motivation is the willingness to exert efforts to achieve the highest goal of the organization, provided that the organization must be able to satisfy some personal needs.

Locke (2000) described motivation as made up of four key concepts: needs, values, goals and intentions and emotions.

Crossman & Abou Zaki (2003) pointed out that work motivation was the action encouraging workers such as nature of work, salary, promotion, supervision, and relationships with peers that may affect attitudes, behavior and determine the level of passion, commitment, participation and concentration.

Lin P Y (2007) indicated that motivation has the impact that makes people choose a specific job, stay and do it hard.

Shah and Shah (2010) defined motivation as encouraging people to do a job; independently or teamwork to produce best performance.

There are two types of motivation at work including internal and external motivation. Internal motivation is a satisfying activity for individuals who want to work in order to understand their abilities and self-determination in their job, and challenge their work as well (Deci 1975, Warr, Cook, & Wall in 1979; Amabile in 1993). In the meantime, external motivation is fueled by all exterior sources to stimulate efficiency of personal work. External factors may include reward, feedback, recognition, rewarding perk, monitoring, wage and promotion (Kluger & DeNisi 1996, Whang & Hancock, 1994).

Through these studies, there are many different definitions and studies related to the motivation of workers. Based on these valid references, along with the adjustments, the author will consider, analyze these data to complete the specific target and scope of the study in a suitable and accurate way.

Theories on employee motivation

As a multidimensional psychological concept, employee motivation should be viewed from an academic perspective in order to have a firm technical background. The

second half of the twentieth century saw a development in the motivation concepts, leading to the classification into two major theoretical streams: the content (or need) theories of motivation and the process (or cognitive) theories of motivation. Maslow's hierarchy of needs and Herzberg's two-factor theories are considered to be major content theories of motivation, which focus on internal drives as an explanation for motivated behaviors. Process theories of motivation, based on the assumption that behavior is the result of rational decision-making processes, illustrate the other school that traces motivation back to conscious human decision processes. Expectancy theory is categorized as one of the typical process theories of motivation. The author would carefully examine the three main theories: Maslow's hierarchy of needs, Herzberg's two-factor theory and expectancy theory.

3. Method

Research process

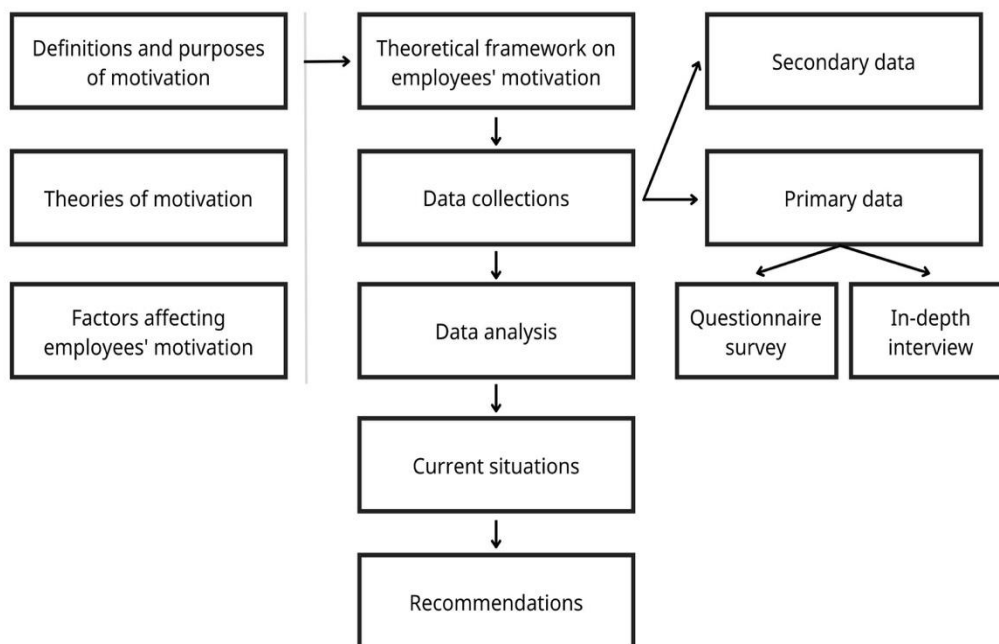

Figure 1. Research process

Source: The author

Data collection

To achieve the research objectives as well as providing reliable information for the study, the author has adopted both primary data and secondary data. Further details of each method will be discussed below.

Secondary data

The secondary data is essential in this study. These data were collected through both internal and external sources.

The companies' official website, Facebook fanpage, periodic and extraordinary reports, HR monthly and annual reports, the annual survey, etc., which provide me with useful knowledge about companies overview and the current situation of technology

companies' employees. Moreover, the information through textbooks, documents and research also broadens my own knowledge about the theoretical background on employee motivation.

Primary data

Primary data is indispensable in answering the research question and plays an important role to obtain the research objectives. In this study, the primary data is collected from questionnaire surveys and in-depth interviews to obtain multidimensional and reliable information.

- *Objectives:* The surveys are conducted with the aim to analyze and evaluate the current situation of working motivation at tech firms.
- *Respondents:* People that are working at tech companies.
- *Sample size:* The population of the study includes a group of employees currently working at tech firms from many departments.
- *Sampling method:* The research was conducted by using convenience sampling which is not only convenient, accurate but also timely to collect information.
- The author conducted surveys by handing out questionnaires to staff working at tech based companies. The response rate was 100% as all workers joined in and completed the questionnaire.

Data processing

- *Qualitative research:* the research uses methods of collecting information, describing and analyzing secondary data. Thereby, the author builds a design research model.
- *Quantitative research:* the author examines primary data, calculates mean score via Microsoft, adjusts the research model in line with the motivational factors in the enterprise.
- Finally, the author presents the results of the research model and suggests solutions to improve motivation for working in the enterprise.

Proposed research model

It is undoubted that employee motivation plays an unmatched vital role in the success of every organization. So far, many studies have shown that only when employees are motivated sufficiently can they give their best. In contrast, without a motivated workplace, companies could be placed in a very risky position.

After consulting with many researches related to the topic, the author realized that Herzberg's two factor theory was one of the most widespread theories used in studies towards employee motivation. Following Baaren and Galloway (2014), the reason is that Herzberg's achievement tends to provide a higher level of reliability and consistency. Hence, the author decided to build a proposed research model based on Herzberg's two factor theory and many studies above.

The figure below indicates factors that impact on employee motivation proposed by the author.

Figure 2. Proposed research model

Source: The author

For detail, the proposed research model contains 9 factors namely Working environment, Nature of work, Compensation and Benefits, Administrative Policies, Career Advancement, Managers, Training and Development, Recognition, Co-worker relations.

4. Results

Detailed assessment

- ***Working environment:*** It is visible that clean working area reached the highest point. Moreover, the importance of secured workplace should be considered when it ranked the second place, followed by fully equipped facilities and appropriate schedule.

- ***Nature of work:*** Suited competence reached a peak of the average score. The figure for variety of skills, reasonable workload and balanced life were slower.

- ***Compensation and benefits:*** Rewarding perk reached the highest score. Furthermore, the 3 following elements namely commensurate salary, wage meets basic human needs and fair wage were smaller respectively.

- ***Administrative policies:*** The figure for Organizational culture makes employees proud of their job took the highest score. Additionally, the average score of policies are able to motivate employees, employees can develop administrative policies and the company cares about employees' targets and values were lower.

- ***Career Advancement:*** While trained sufficient skills for occupation reached a peak while equal promotion opportunities dropped to the lowest point. Additionally, the average score of the variety of opportunities and manager promotes and helps employees to get promotions were similar

- **Managers:** Supervisor allows employees to join in the decision- making got the highest mark almost the time surveyed. The figure for easily conversasion with manager, manager meteculously give specific instructions to employee’s work, enthusiastic supervisor were lower respectively.

- **Training and Development:** While the courses broaden employees’ own knowledge and help them master vital skills reached a peak, the positive infulences on employee’s working performance was the lowest point. Additionally, the figure for sufficient training course and suitable evaluation after training courses ranked the third and fourth place.

- **Recognition:** While the score of gained appreciation as my expectation was higher than 3 remaining categories, the figure for equal appraisal system was the lowest. Futhermore, the figure for everyone is grateful for what employee contribute and clear & consistent terms and conditions of performance were similar.

- **Co-worker relations:** Enthusiastic parents reached the highest score almost the time surveyed. In contrast, the figure for partners respect employee, valuable experience from the colleges and efficient cooperation between parents and employees were lower respectively.

Overall assessment

Figure 3. Overall assessment

Source: Research data

The bar chart illustrates the figure for the mean of 9 motivating elements which employees believed that tech companies had gained.

Overall, working environment and co-worker relations both had the highest mean score, which accounted for 4.15. In contrast, compensation and benefit was the factor that got the lowest mean score, at 3.35.

The mean score of managers was 3.91, compared to 3.83 of career advancement, 3.79 of both training & development and administrative policies. The figures for recognition, nature of work were lower, at 3.61 and 3.6 respectively.

As a result, it is true that technology based firms have tried to satisfy employees. However, according to the data above, the factors mentioned in the chart had no strong impact on worker motivation as the mean of the factors was at the average score with the notable exception of working environment and co-worker relations.

Recommendation to improve employee motivation at tech companies

According to previous sections, research models and factors in this study are given after consulting many previous analyses on motivation of work. This study has shown that the 9 factors including: Working environment, Nature of work, Compensation and benefits, Administrative policies, Career advancement, Managers, Training and development, Recognition and Co-worker relations affect the inspiration of workers. Hence, the author proposes some suggestions to increase the motivation for the employees at technology-based enterprises.

Matching work nature and staff competency

The nature of work is one of the most influential factors in motivating workers at office. It demonstrates relevance between employees' performances and the content of work. Almost all departments in tech firms require workers with highly specialized skills and progressive spirit. However, the nature of work, following the mean score in chapter 2, was the second least favorite among factors influencing employee motivation. As a result, the study proposes some solutions to match work nature and staff competency.

First of all, providing specific job descriptions and selecting suitable candidates at the beginning of the recruitment process are extremely crucial. The organization should arrange the tasks in accordance with the ability of each person, help them broaden their own knowledge and understand the significance of the job. Moreover, based on the capabilities and qualifications of the employees, the firm needs to spend time introducing and training their staffs to enhance essential skills for the job. Furthermore, the companies can give employees opportunities to join in the decision-making within their capacity and permission. It aims to enhance efficiency and avoid micromanagement as well.

Additionally, the firm can make the job become more productive and meaningful via:

- Make employees feel responsible for their work and their important role in the organization.
- Ensure that employees can see their significant contribution to the overall results of the companies.
- Provide timely and accurate feedback on the completion of tasks.
- Increase job requirements such as increasing the level of difficulty of the job and the responsibility of the employee.
- Enhance the diversity of tasks or challenging jobs so that employees can see their importance in the companies.
- Provide feedback on employee's performance and vice versa, employees should also report performance on a regular basis to the supervisor.

Improving working environment

Almost all of the respondents in the survey were extremely pleased with the working environment. However, some people disagree with the recent working schedule as sometimes they had to work overtime too much which related to the deadline of projects. It can lead to the situation of overburdened with work and then reacting against working. As a result, the companies should improve the schedule in a more timely and flexible way. It means that the companies can lighten the workload or create a free and fair working schedule within the allowed limit such as: let workers do their jobs according to their own schedule, time limits. This improvement will ensure the health and the balance between personal life and work of employees, simultaneously, motivate the staff to devote themselves to the firms.

Harmonizing the benefits of the companies and compensation of employees

According to many respondents in the survey, compensation and benefit is the most vital factor to inspire employees at work. Recently, the salary and rewarding perk has been implemented well by tech companies, but it still has some problems affecting the motivation of employees. Hence, in the coming time, the companies should improve policies to adjust the salary, bonus and welfare system. For detail:

- Current salaries have not yet had positive effects in motivating workers. They can only guarantee the basic necessities of life for employees. Therefore, the firms need to adjust its compensation system to the employees' work efforts and ensure the payment for their lives. If employees have higher income which is consistent with the current inflation situation and enough to ensure the life of their family, the staff will do their best. So the work efficiency will increase dramatically.

- Wages should be calculated and paid fairly between employees by using appropriate timekeeping forms, closely monitoring the production process and calculating monthly wages according to real workdays. The companies will award bonuses and penalties based on the number of working days and the working process of employees. It will create confidence and satisfaction for the staff at work.

- The companies should intensify rewarding perks as well. This bonus will encourage them to try hard and enhance the level of job performance significantly.

- The companies need to publicly announce wage regimes in their employment contracts, in meetings with employees or departments, to avoid conflicting opinions on how to calculate wages.

- The companies must pay full wages on time and enhance fringe benefits such as team-building activities, vacation, health insurance as well.

Raising recognition and appreciation for employees' performance

Performance appraisal is a formal system to review and evaluate the periodically finished work of an individual on the basis of comparison with the standards, which has been developed and discussed with the employee. It aims to improve employee performance and helps business leaders make the right human resource decisions such as: training and development, remuneration, promotions, etc.

Recognition has a great impact on employee benefits so this is one of the motivating factors for them. To make performance evaluation as motivation for employees, the companies should use clear evaluation criteria with reasonable evaluation methods. Evaluators must have sufficient knowledge and professional ethics as well. Furthermore, the firms should provide a fair assessment and this will be a basis for HR activities such as: promotion and reward.

In addition to evaluating the capacity of employees, the promotion of their potential is also important in motivating employees. To promote the potential of employees, the companies should follow the solutions below:

- Modelling typical people: they must be exemplary, progressive and serious in their work. They are progressing and materializing the qualities that the employees in the companies want to look forward to. Hence, workers can access a world of new knowledge and draw inspiration.

- Set clear objectives and tasks: Setting goals for employees is a necessary element in motivating employees to work. This is an important part of the evaluation and reward program because without goals, the results are not easily measurable to help employees see the purposes to reach.

Giving more effective training courses and development

Currently, tech firms organize many training courses about specialized skills for all freshers, juniors and seniors in different departments such as: tester, DEV, BA, etc and foreign languages including Japanese and English. These courses are extremely effective and related to job requirements of employees. Hence, employees can apply this sort of knowledge for the next task. The companies encourage employees to attend courses by paying the full tuition fee if they pass the final exam. If not, they only pay 50% of the course fee. This policy not only encourages workers to enhance their knowledge, gain some valuable skills, but also directly relates to their performance in the future. It proves the effective long-term strategic vision of the company.

Through training, the companies can maximize the available resources and improve the efficiency of the organizations. At the same time, it helps employees have a clear understanding of the companies' goals and culture and learn more about the job requirements, occupations. And then they can perform their tasks in a self-conscious way to improve future adaptability and meet the goal of the companies as well. Furthermore, the training process has the effect of motivating. For detail, when an employee is trained, they develop a sense of belonging or get recognition, which is one of the motivating factors. Therefore, based on the needs of work and the ability of employees, the companies should organize training courses in order to broaden their specialized skills and master vital soft skills. To do that, the firm needs to focus on onsite training, content training which is close to the work that employees are taking and improve the efficiency after training as well. During the training period, employees do not have to undertake 100% of the workload.

Creating more job opportunities and promotions

To inspire employees, the work of promotion is one of the important factors that stimulates employees eager to work with the hope of being considered promoting to a better position with higher salaries and more attractive job opportunities. The promotion should be based on the capacity, personality and practical performance of employees at work. For individuals in need of promotion, the companies need to give them opportunities to gradually accrue the standards. Additionally, for employees who are working in the company but have the need to move or leave their job, the company leaders need to meet, exchange frankly, ask for their opinions and reasons and then have suitable solutions.

Motivating employees by promotion is one of the essential solutions for employees to see that their contributions and endeavors at work are highly appreciated. Since then, employees will have more motivation to work effectively, dedicate and have long-term attachment to the companies.

Creating effective administrative policies

It is clear that policies are the major concern of both workers and organizations. According to these, they create organization culture and help employees understand basic rules of the office as well. Currently, there are a lot of established policies related to general rules and benefits of workers, which is clearly disclosed via employee handbooks, portals and so on. However, the companies still need to improve their policies system so that employees can concentrate on fulfilling the assigned tasks. For detail:

- Leaders should support workers to join in the development of the performance evaluation system. It aims for the employees to express their own opinions, aspirations and ensure the fairness, accuracy of the policy system. From there, leaders can understand the desire and expectations of employees to develop the most effective and appropriate policy system.

- The policy system needs to improve timely and efficiently, giving benefits to both employees and the organization.

- The companies should enhance fringe benefits such as team-building activities, vacation to inspire workers to do their best.

Strengthen relationship between colleagues and others

a. Narrowing the gap between managers/leaders and employees

According to the result mentioned above, a manager/leader is also an element affecting the motivation of employees at work. When the superiors listen to the views and thoughts of the workers as well as appreciate the talents and contributions of each person, they create a great motivation. Therefore, the company leaders need to pay attention to these factors in order to bring positive inspiration from the workers to improve the efficiency of work. In order to have a positive impact on the employees, managers and leaders of the company need to change the working style into an open and gentle way to create a friendly, dynamic and creative environment which closed to the employees.

- Leaders must always be at the forefront of implementing policy advocates such as company movements. In terms of expertise, the manager must demonstrate a thorough

understanding of and ability to make sound professional decisions. To achieve this, leaders must always work hard to learn to improve their knowledge, listen, analyze and synthesize the situation.

- Leaders demonstrate trust with employees by: reducing control, empowering employees within allowed limitations. It will make the employee feel confident, comfortable and then motivating them to contribute more for the company.

- For each employee's achievement, leaders need timely rewarding perks.

There are many ways to motivate workers which are not only praise but sometimes just a pat on the shoulder to record a good performance that also has a great impact on the working spirit of the workers. Additionally, the leader can choose the meaningful reward for workers such as:

- Weekly, monthly record for employees with outstanding performance on the board of the companies.

- Sending greeting cards to high-performing workers.

- Praising and rewarding excellent employees in sum-up meetings.

b. Strengthen relationship among co-workers and others

Following the respondents in the survey, the relation of co-worker with others plays an integral part in motivating employees. Therefore, if this factor changes positively, it will have the greatest impact on the motivation of every worker. Through the process of carrying out their responsibilities, members of the company cooperate directly with each other and build a strong relationship. It allows employees to learn how to manage conflicts, obtain a lot of real experience and sometimes draw inspiration. Therefore, the first thing that the management board of tech firms should do is to improve the working environment, narrow the generation gap between young workers and older ones and create a close relationship between colleagues to increase motivation at work.

- Need to create coordination and efficiency at work between co-workers.

- Create a creative, harmonious and cheerful atmosphere of collective work.

- Create conditions for employees to exchange experience, knowledge and learn from each other.

- Build the spirit of solidarity in every worker by helping each other both in work and life.

There are some suggestions to improve the motivation for employees at technology based enterprises as they illustrate any work performance and contributions are recognized and highly evaluated. Therefore, workers will try their best for the development of the company.

5. Discussion and Conclusion

The first decades of the 21st century have witnessed many important changes all over the world, especially the impact of technological development on employee's motivation and the labour market as well.

According to the results of the survey and tests above, the author found out that employee motivation plays an integral part in not only guaranteeing the level of job

performance but also having a strong impact on the development of the whole company and each worker as well. The more satisfied the employees are, the better results they gain.

After consulting with many researches related to the topic, the author realized that Herzberg's two factor theory was one of the most widespread theories used in studies towards employee motivation. However, during the information age, particularly after the outbreak of Coronavirus, the world witnesses various complex and unpredictable changes, which have far-reaching effects on employee motivation.

In addition, technology companies are growing rapidly and becoming an indispensable part of economic development. They bring a variety of job opportunities for many people. However, currently, the companies still have some limitations which lead to the dissatisfaction of employees and reduce their quality of performance. Therefore, they should have timely and suitable solutions to solve all problems and improve the motivation of workers.

In this research, the author illustrated 9 dimensions which have huge influence on the motivation of workers at tech firms including: Working environment, nature of work, compensation and benefit, administrative policies, career advancement, managers, recognition and co-worker relations. Furthermore, the study also gives some recommendations to help the company enhance the satisfaction of workers including matching work nature and staff competency, improving working environment, harmonizing the benefits of the company and compensation of employees, raising recognition and appreciation for employees' performance, giving more effective training courses and development, creating more job opportunities and promotion, creating effective administrative policies, strengthen relationship between colleagues and others. However, the research still has some disadvantages as the scope is limited within some tech firms, not the whole companies on the market.

In short, the author hopes the data in this research will be useful and practical, contributing to the development of the companies in the future.

Abstract

The Internet has become a virtual platform for a great number and large diversity of social relations thanks to the proliferation of social media, which have undergone exponential growth. Being aware of this, many advertising companies consider using this platform to promote their products. However, this leads to a lot of advertisement avoidance when students are constantly affected by those. Although previous studies have investigated advertising avoidance in traditional media and on the Internet, there has been little investigation of advertising on social networking sites. The study is carried out to investigate influencing factors that affect students' advertisement avoidance on social media in Hanoi. Questionnaires were sent to students to investigate their avoidance behavior. The study investigates crucial factors influencing students' advertisement avoidance, including (i) prior negative experiences, (ii) skepticism towards advertisement, (iii) perceived privacy concerns, (iv) perceived personalization(v) perceived advertisement clutter and (vi) skepticism toward advertising mediums. It is worth noting that prior negative experiences are the key factor affecting students' advertisement avoidance behavior on social media in Hanoi.

Keywords: *factors, advertisement avoidance, social media*

1. Introduction

Electronic and print media have changed the world of advertisement and innovations in electronic media have made new ways to advertise products or brands. Advertisement is considered a million- or billion-dollars game as multinational companies have a healthy budget for advertisement and companies spend millions or billions of dollars for advertisement. Innovations in modern technologies and electronic media explore new ways

for advertisers. No doubt the basic purpose of advertisement is to create awareness in customers about brands. It is stated that personalized advertisements give opportunities to both marketers and customers. With the help of personalized advertisements, it makes customers easily search for their needed products or services and personalized advertisements give opportunities to marketers to develop relationships with customers by making advertisements according to their interests.

With innovations in hand-held devices, personalized advertisements allow marketers to grant increased exposure to their brands. No suspicion that personalized advertisements provide a new dimension to markets and advertisers but not all of them are appreciated because of the irritation people can get when they want to determine the number of advertisements by different companies (Rezola et al., 2016). Ovalized advertisements give new dimension to markets and advertisers but not all personalized advertisements are welcomed because people may get irritated to see the number of advertisements by different companies (Rezola et al., 2016). Advertisement avoidance is a major problem for advertisers and marketers. Advertisement avoidance is also a big question for academicians and practitioners and is an action in which users reduce exposure to advertisements in unusual ways (Speck & Elliott, 1997). The advertisement avoidance leads to the user's intent to skip the advertisement, and it is considered one of the biggest obstacles of advertisement. Users may have separate ways to avoid advertisement, depending on personal characteristics and other frameworks such as demographics, target disruptions, and related issues (Speck & Elliott, 1997).

Although avoidance of advertising is a well-researched topic, it has only recently been studied in the online environment (Cho & Cheon 2004; Grant, 2005) and never specifically in online social media. Thus, the study is conducted to explore the factors that affect students' avoidance of advertisement on social media in Hanoi because this range of subjects has not been studied before. To accomplish the research aims and objectives, the study is to explore the answers to three following research questions:

- What are the factors that affect students' advertisement avoidance in Hanoi?
- How do the factors affect students' advertisement avoidance in Hanoi?

2. Literature Review

Advertisement avoidance is a big question for academicians and practitioners and is an action in which users reduce exposure to advertisements in unusual ways (Speck & Elliott, 1997). Advertisement avoidance leads to the user's intention to skip the advertisement, and it is considered one of the biggest obstacles of advertisement. Users may have separate ways to avoid advertisement, depending on personal characteristics and other frameworks such as demographics, target disruptions, and related issues (Speck & Elliott, 1997). According to (Cho & Cheon, 2004; Grant, 2005), due to a well-researched topic, avoidance of advertisement recently has only been examining within the online environment, particularly never in online social media. Thus, our purpose is to explore the factors that affect students' avoidance advertisement on social media in Hanoi because this range of subjects has not been studied before.

There are many reasons for advertisement avoidance in general and online advertisement, which is one of the biggest obstacles for businesses. Research on advertisement avoidance is exploited under various aspects. It is suggested by Bettman & Park (1980) that theoretical justification stems from the impacts of prior knowledge and experience on the decision processes of consumers. Several researchers reach a conclusion that consumers' avoidance is caused by the proliferation of advertisements (Zanot, 1984). Cho & Cheon (2004) examine three variables of Internet advertisement avoidance: Perceived goal impediment, perceived ad clutter, and prior negative experiences. The research of Chatterjee (2008) discovers that consumers felt that they are interrupted their goals when advertisements appeared. Perceived goal impediment was measured by items as makes more difficult, interrupts the movement of texting, disrupts or hinders people from utilizing other devices or content, disrupts receiving wanted incoming content, infringes on control, interfering with the search for desired information (Speck & Elliott, 1997; Edwards, Li & Lee, 2002; Cho & Cheon, 2004; Shin & Lin, 2016). Due to these activities, they cause discomfort for users, which in turn leads to avoiding advertisement (Nettelhorst & Brannon, 2012). Li & Huang (2016) in the research "Influence Factors of Online Behavioral Advertisements Avoidance" delved in the idea of Online behavioral advertisements, or the idea of gathering information to tailor a personalized advertisement list to each person. In the study "The impact of advertisement value to Awareness and behavior of advertisement avoidance" (Ho, 2018) proposes to expand on the correlation between advertisement avoidance behavior and awareness of the advertised product brand. Research results show that advertisement avoidance is negatively and strongly affected by valuable content in advertisement including informational value and entertainment value, incentive value.

In the research "Behavior of avoiding personalized advertising of social network users" (Pham & Huynh, 2021), the authors conduct the study to identify factors affecting advertisement avoidance of Youtube users, which focuses on people using smart phones, personal laptops, television installed social media. Research results find out that user's advertisement avoidance behaviors are affected by four factors: (1) negative experience, (2) perceived privacy concerns, (3) perceived personalization, (4) skepticism towards advertisement. In addition, research shows that the premise of avoiding personalized advertisement is: when there are more and more advertising means thanks to the development of science and technology, the ability to reach users is easier, this leads to advertisement avoidance behaviors.

In this study, "The impact of advertisement value to awareness and behavior of advertisement avoidance" (Ho, 2018) proposes to expand on the correlation between advertisement avoidance behavior and awareness of the advertised product brand. Research results show that advertisement avoidance is negatively and strongly affected by valuable content in advertisement including informational value and entertainment value, incentive value. This result is similar and re-rendering the discovery of Edwards, Li & Lee (2002). Besides, the impact from the customer's past negative experiences also affects avoidance

behavior, which is again in agreement with Cho & Cheon (2004). Research results have found that harmfulness does not affect advertisement avoidance, this result is contrary to the findings of Edwards, Li & Lee (2002) on adjudication. This is the difference in this study, businesses can consider when implementing advertisement activities.

It can be clearly seen that there have been few researches on factors affecting students' advertisement avoidance on social media related to user perception. Secondly, the research focuses on students who spend a lot of time using social media and explores students' advertisement avoidance on social media in Hanoi. The previous study mentioned above are considered as references for the researchers to conduct a new study.

3. Method

Research process

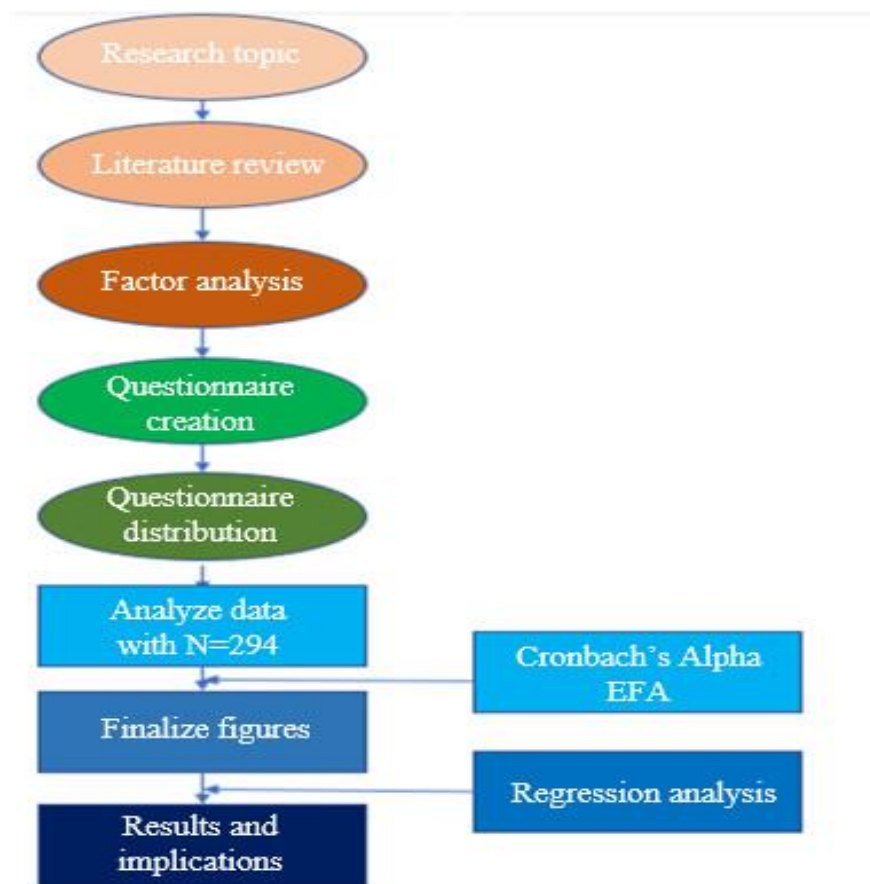

Figure 1. The research processes

Research model

The researchers conducted a preliminary study before conducting an official study to identify clearly factors affecting students' advertising avoidance on social media. Firstly, the researchers collected all the factors that might affect students' advertising avoidance on social media from a review of literature. The result of the preliminary study was the basis to build up the research model and hypothesis of the research.

Basing on the research models of Ho (2018) and Cho & Cheon (2004), the researchers propose the research model for the study.

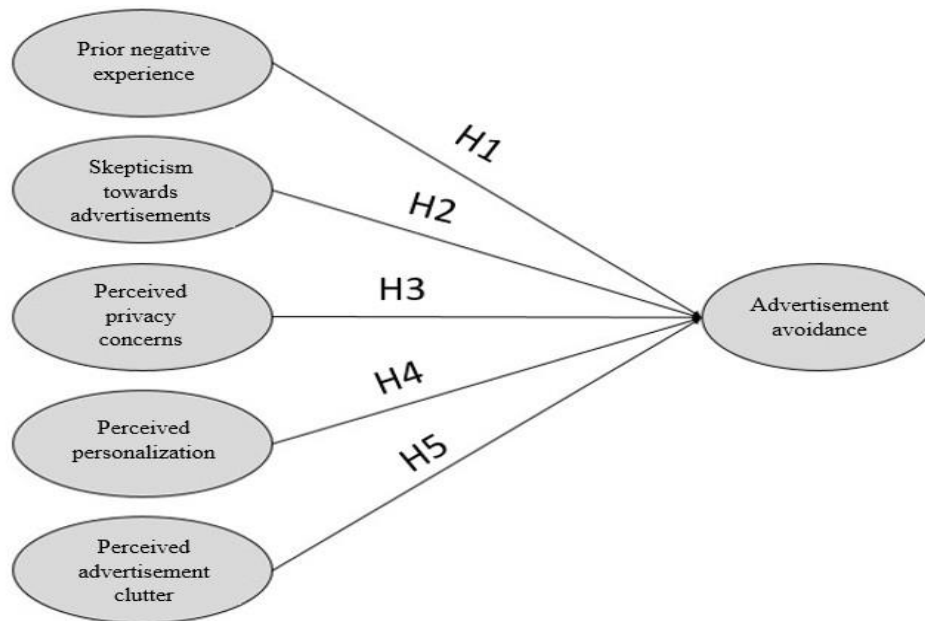

Figure 2. Recommended research model

Hypothesis

Table 1. Main research hypothesis

Hypothesis	Content
H1	Prior negative experiences are positively related to advertisement avoidance.
H2	Skepticism towards advertisement is positively related to advertisement avoidance.
H3	Perceived privacy concerns are positively related to advertisement avoidance
H4	Perceived personalization is positively related to advertisement avoidance.
H5	Perceived advertisement clutter is positively related to advertisement avoidance.

Research instruments

The study is conducted through quantitative method which were distributed to university students in Hanoi. The data collected from the questionnaires was then synthesized in the excel forms and illustrated by SPSS software according to each research question. The data was analyzed and interpreted qualitatively to identify factors impacting students' advertisement avoidance on social media.

4. Results

Cronbach's Alpha method was used to eliminate inappropriate variables, limits scattered variables in the research process and evaluates the reliability of the scale by coefficients through the Cronbach alpha coefficient. After evaluating the reliability of the scale by Cronbach's alpha coefficient and removing the variables that do not ensure reliability, factor analysis was carried out.

Table 2. Summary of the results of the scale reliability analysis

Factors	Denotation	Observed Variables	Corrected Item-Total Correlation	Cronbach's Alpha
Prior negative experiences	H1.1	It is unreliable to click advertisements on social medias	.625	.764
	H1.2	I do not dare to click on advertisements for fear of being attacked by a virus	.476	
	H1.3	Clicking advertisements on social medias does not bring benefits to me	.520	
	H1.4	There is no stimulation that makes me loyal and continue to use the service after clicking advertisements on social medias	.562	
	H1.5	Having bad experiences with advertisements before leading to negative perceptions about advertisements.	.376	
	H1.6	I feel advertisements on social medias are not as reliable as old-fashioned platforms	.494	
Skepticism toward advertisement	H2.1	I feel skeptical towards advertisements because friends and family are skeptical towards it, too.	.454	.737
	H2.2	I prefer advertisements that give emotion over advertisements that give information.	.405	
	H2.3	I am skeptical towards advertisement by new or non-familiar brand	.577	
	H2.4	I think there are numerous advertisements that are only instructive and extraneous	.555	
	H2.5	I am skeptical when there is an orientation of high price in advertisements.	.403	
	H2.6	I assume that companies only show positive side of products or brands and aggravate by publicizing	.459	

Factors	Denotation	Observed Variables	Corrected Item-Total Correlation	Cronbach's Alpha
Perceived privacy concerns	H3.1	I feel uncomfortable when information is shared without permission	.741	.875
	H3.2	It is important for me to know how my personal information is used	.689	
	H3.3	I feel that my privacy is invaded if I cannot control my personal information	.773	
	H3.4	I am worried that my record of network activity will be abused	.715	
	H3.5	I am worried that advertisements will lead me to a phishing website	.614	
Perceived advertisement personalization	H4.1	Advertisement is not according to consumers' demographic or characteristics; contents of advertisement are not according to the culture or society and perception of consumers towards advertisement	.543	.746
	H4.2	I do not receive any positive message or essential information tailored to my requirements and preferences through advertisements on social medias	.651	
	H4.3	These advertisements do not enable me to order products I need easily.	.379	
	H4.4	These advertisements do not make purchase recommendations match my needs.	.598	
Perceived advertisement clutter	H5.1	There are excessive advertisements on social medias	.689	.767
	H5.2	Advertising content exceeds the level of acceptance of consumers in specific social medias	.429	
	H5.3	I think advertisement on social media should be limited by sites.	.590	
	H5.4	Too many advertisements cannot meet the customer's needs	.578	

Overall, the study uses six conceptual scales, of which 05 are for factors affecting students' advertisement avoidance behavior and 01 are for students' advertisement avoidance on social media. A total of 27 observed variables are retained after analyzing the reliability of the scale, of which there are 6 observed variables measuring for components of students' advertisement avoidance and 21 observed variables measuring for factors affecting students' advertisement avoidance.

After evaluating the reliability of the scale by Cronbach's alpha coefficient and removing the variables that do not ensure reliability, factor analysis was carried out. EFA discovery factor analysis for independent variables is performed four times. On the first time, second and third time, 25 observed variables were included in the analysis and 04 observed variables which did not meet the conditions was removed for re-analysis. In the forth (final) analysis, 21 turned the observation converged and distinguished into six components.

Table 3. Six new factors

Part	Detonation	Factors
1	A1	Prior negative experiences
2	A2	Skepticism towards advertisement
3	A3	Perceived privacy concerns
4	A4	Perceived advertisement personalization
5	A5	Perceived ad clutter
6	A6	Skepticism toward advertising mediums

Multiple regression was used to predict the intensity of the impact of factors on students' avoidance of advertisement on social media in Hanoi.

The multiple linear regression has the form:

$$HPT = \beta_0 + \beta_1 * A1 + \beta_2 * A2 + \beta_3 * A3 + \beta_4 * A4 + \beta_5 * A5 + \beta_6 * A6 + \alpha$$

Table 4: Model Summary^b

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.726 ^a	.527	.517	.46606	1.945

The results of multiple linear regression analysis show that the model has R = 0.527 and adjusted R² = 0.517. The findings reveal that the adjusted R² is smaller than R, so it is safer to use it to evaluate the fit of the model because it does not inflate the fit of the model (Hoang & Chu, 2008). Adjusted R² = 0.517 indicates the appropriateness of the model is 51.7% or in other words is 51.7% variation of the variable "Students' advertisement avoidance behavior on social media" is explained in analyzing 6 independent variables. Thus, the given multiple linear regression model is suitable for the data and can be used.

The results of verification of research hypothesis are summarized as follows:

Table 5. (Using Enter method) Regression coefficient

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	95.0% Confidence Interval for B		
	B	Std. Error	Beta			Lower Bound	Upper Bound	
1	(Constant)	.562	.212		2.655	.008	.145	.979
	A1	.259	.046	.298	5.644	.000	.169	.350
	A2	.273	.047	.291	5.835	.000	.181	.365
	A3	-.082	.051	-.081	-1.594	.112	-.183	.019
	A4	.153	.051	.143	2.987	.003	.052	.254
	A5	.227	.049	.238	4.636	.000	.131	.324
	A6	.044	.039	.055	1.122	.263	-.033	.120

Regression results for independent variables A1, A2, A4 & A5 with significance level 0.00 to 0.003 (< 0.05) are variables that affect the overall decision and have a positive impact because the regression coefficients are all positive. The variable A3 and A6 are excluded due to the sig value. is 0.112 and 0.263 (> 0.05).

Table 6. Summary of results of research hypothesis verification

Hypothesis	Standardized Coefficients Beta	Content	Result
A1	.298	Prior negative experiences	Accepted
A2	.291	Skepticism toward advertising	Accepted
A3	-.081	Perceived privacy concerns	Rejected
A4	.143	Perceived advertisement personalization	Accepted
A5	.238	Perceived ad clutter	Accepted
A6	.055	Skepticism toward advertising mediums	Rejected

From the above results, the authors get the following regression equation:

$$\text{HPT} = \beta_0 + 0.298 * A1 + 0.291 * A2 + 0.143 * A4 + 0.238 * A5 + \alpha$$

According to the regression equation on the weights of the factors affecting "students' advertisement avoidance behavior on social media of students in Hanoi" are presented as follows:

Prior negative experiences: 0.298

Skepticism towards advertisement: 0.291

Perceived advertisement clutter: 0.238

Perceived advertisement personalization: 0.143

To determine the importance of each variable for the dependent variable in the comparative relationship between the independent variables, the authors use the normalized regression coefficient (Beta). According to beta coefficient results, Prior negative experiences place the greatest vital role in students' advertisement avoidance (0.298) while 0.291 is the beta coefficient value of Skepticism towards advertisement which presents the second most important factor, followed by the Perceived advertisement clutter factor (0.238). The least important one is the Perceived advertisement personalization (0.143).

5. Discussion and Conclusion

To summarize, the research reveals four major factors that influence students' advertisement avoidance on social media in Hanoi. It is worth noting that prior negative experiences are considered the most influential of all, followed by skepticism towards advertisement, perceived advertisement clutter, perceived personalization.

Firstly, the findings show that prior negative experience is the most factor influencing advertisement avoidance on social media. Prior negative experience is revealed to be a factor in social media advertisement avoidance in this study. The findings imply that negative prior experiences induce students to avoid the source of the negative experience, specifically advertisement avoidance, as evidenced by overall unhappiness and a perceived lack of value and incentive. The perceived motivation and usefulness of clicking advertising on social media, as well as student contentment with advertisement services, are all key elements in building customer retention intentions for clicking advertisements.

Secondly, the result shows that skepticism towards advertisements is the second most dominant factor contributing to advertisement avoidance. Consumers will be overwhelmed by something altogether new, the majority of individuals believe advertisements only show the good aspects of products, sometimes aggravated by publicizing while the bad side remains hidden. Students, on the other hand, prefer emotional commercials to factual advertisements, possibly because they do not trust the facts presented.

Thirdly, the findings of the study reveal the significant effect of perceived advertisement clutter. Users tend to avoid commercials that appear frequently in a congested media environment, and advertisements gain less attention from users for the following reasons. People are irritated by advertisement, and as a result, they ignore them entirely. Due to limited memory capacity, users are unable to remember all of the advertisements shown at the same time.

Finally, according to the research results, perceived personalization is also a factor that affects students' advertisement avoidance on social media. Personalization has a crucial impact on customers, who find individualized advertisements to be beneficial. However, in spite of the benefits of personalization, highly tailored ads in mobile device ad settings, web ads, and social media ads pose issues about user privacy. Users believe that companies grab personal information and utilize it for marketing purposes, which has heightened their concern about privacy.

There are limitations to the generalizability and reliability of these findings. Many of the findings may not be generalizable to all online social media users or to teenaged online social networking users internationally. Therefore, further research is needed to define social media as an advertising medium and address their relevance and credibility to their target market. Further research could widen the frame of reference by drawing on larger samples nationally and internationally and addressing users of different ages and demographic profiles. Researchers could also consider the issue that students raised regarding the lack of advertising regulation on online social network sites. Finally, this research presents a new model for advertising avoidance in the online social media environment. Further investigation into this model could clarify and confirm its importance in developing advertising in the online social networking environment.

National Economics University, Hanoi, Vietnam*

Abstract

This study was carried out with the aim of exploring the factors affecting high school students' intention to choose gap year in Ha Noi. This research used the combination of qualitative and quantitative methods. The result indicated 7 factors related to research object in total, namely internal motivation, media, financial capability, influence of people around and society, attitude, personality and risk perception. From there, the research pointed out the potential for development and proposed solutions to promote the popularity of gap year in Viet Nam.

Key words: *intention to choose, gap year, high school students, Ha Noi.*

1. Introduction

Gap year has long become a popular choice of American students and Western countries like Britain, Canada, Australia. Well-known universities such as Harvard, Yale have encouraged students to postpone one year before studying to attend extracurricular activities for self-development. According to American Gap Association research, 98% of students informed that gap year allowed them to have chances to improve themselves, became more mature, 84% have more job experiences and 77% could define clear goals in life instead of being under pressure because of exams and mark results. In Southeast Asia, Malaysia has integrated gap year programme as part of the university curriculums. Idris Jusoh, minister of university education, announced that students in 8 selected public schools will take a one-year break from their studies starting from 2017.

In Viet Nam gap year is not really popular because of barriers of social prejudice, students do not have enough financial capability, lack of family support and do not have many options to have an effective gap year. However, due to global integration, parents have gradually realized that practical experience is immensely useful for their children development, and students have also ready to step out of their comfort zone to find new opportunities for self-development.

These are the reasons to conduct this research, which determine the factors affecting the intention to choose gap year of high school students in Hanoi.

2. Method

2.1. Theoretical basis

SWOT analysis model strengths and weaknesses. The theory of SWOT model was studied by Stanford research institute (1960 - 1970) to understand the planning and decision making process of enterprises. However, the SWOT analysis can also be applied to an individual in the process of giving the next direction. Through SWOT analysis, individuals clearly identify their goals along with internal and external factors that can positively or negatively affect the goals they have set. SWOT is a collection of letters that stand for English words: Strengths, Weaknesses, Opportunities, Threats.

The learning zone model (Senninger, T., 2000) shows the typical process when a person starting to learn something new. The model also proves that learners need to get out of their comfort zone, but not to the point of causing them to panic or stressed, the result of this situation is normally failure. The model has 3 zones in total, namely comfort zone, learning zone and panic zone.

Theory of planned behaviour TPB (Ajzen, 1991) predicts an individual's intention to perform a behaviour at a given period of time. An individual's behaviour is influenced by three basic factors, including their own attitude to action, subjective norms, perceived behavioural control. An individual's behavior is influenced by his or her attitude about action, subjective norms, and ways of controlling perceived behavior.

In addition, the authors also found several theoretical models related to gap year. The decision-making process model for choosing gap year activities (Jones, 2004) is divided into two basic classes: the first layer (UK or overseas, structured, or unstructured activities), the second layer includes 6 types of activities (paid job, voluntary work, study, organized and independent travel, leisure activities).

The model of factors affecting the intention to choose gap year (Wu et al., 2014) includes push factors (derived from psychological such as rest, learning social and soft skills, broaden the perspectives, getting to know yourself better, earning money, etc.) and pull factors (derived from environmental factors namely Appreciate foreign culture, family related destination and domestic landscapes). The four linked factors to stimulate behaviour are education, peer influence, family influence and information.

The pre-college gap year hierarchy model (Kaoru Ta, 2012) classifies gap year activities based on low to high levels of freedom, planning, and environment. Gap year

participants can choose from one of four programs: travel exploration, volunteering, participating in planning and presenting them to universities and organizations, programs run by university of administration and management.

2.2. Suggested model

On the basis of theoretical models and studies related to research object, the authors propose a research model with "Decision to choose gap year" as dependent variables and 7 independent variables H1, H2, H3, H4, H5, H6 and H7.

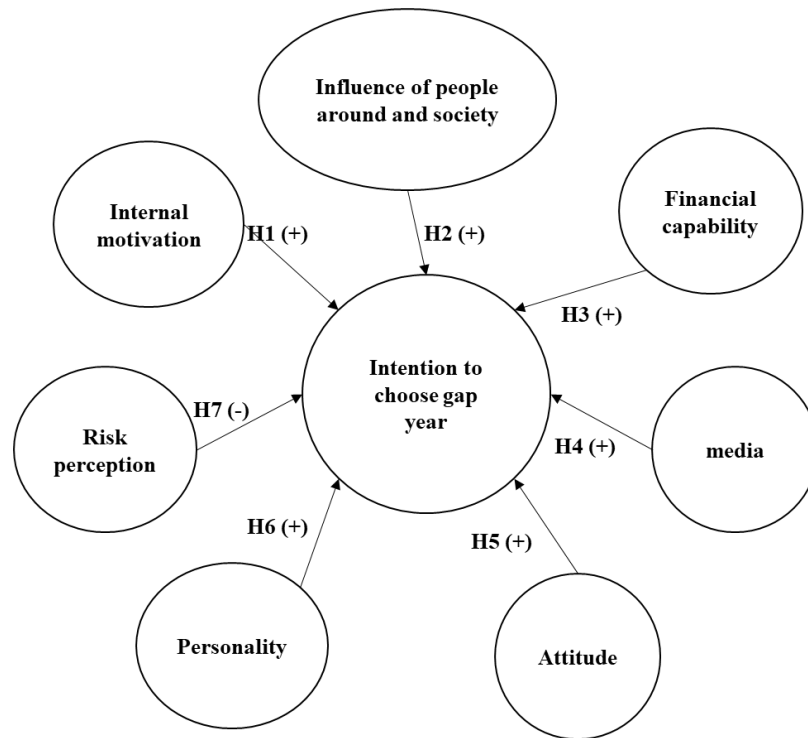

Figure 1. Theoretical model of factors affecting the high school students' intention to choose gap year

Source: The research team

Internal motivation: the desire for self-development, knowledge, improve soft skills has prompted students to choose gap year.

The influence of people around and society: Student consideration is often affected by close relationship (family members, friends, society, v.v.)

Financial capability: financial issues consist of financial conditions is suitable for gap year; the cost is worth it for the outcome of gap year. Besides, reasonable cost can result in the increasing rate of gap year demand. In conclusion, financial capability is also considered as one factor influences the decision to choose gap year.

Media: The process of exchanging information between people to acquire knowledge, which is the driving force of society development. The information sources from mass media strongly influences students' intention to choose gap year. This also helps students, families and society have better understanding the concept of gap year, experiential activities and the advantages after taking gap year.

Attitude: the reactions toward an object or a situation, positive or negative. Three components of attitude are: perception, emotion, and behavioural tendencies.

Personality: Personal nature that regulates the actions and reacts to the surroundings. Each person has their own personality and different reactions. The research group refer to this factor in order to point out how the personality differences affect the intention to choose gap year of high school student.

Risk perception: The student's concern when taking gap year such as not achieving goals, fall behind peers, wasting time and money. There may be some other unfortunate risks like scam, robbery. Therefore, the final decision is the comparison between benefits and risks.

- Hypotheses:

H1: Internal motivation is positively correlated with intention to choose gap year.

H2: The influence of people around and society is positively correlated with intention to choose a gap year.

H3: Financial capability is positively related to intention to choose gap year.

H4: Media factor has a positive correlation with intention to choose gap year.

H5: Attitude is positively correlated with intention to choose a gap year.

H6: Personality is positively correlated with intention to choose a gap year.

H7: Risk perception is negatively correlated with intention to choose a gap year.

The study uses qualitative and quantitative method and divided into two processes:

+ Stage 1: Qualitative research: interviewing, collecting expert opinions, high school students to form preliminary scale.

+ Stage 2: Quantitative research: information collected from questionnaires, analysing, data processing and model testing.

3. Results

3.1. Descriptive statistics

Gender: The difference is quite high, there are 256 female students, account for 83.1% while the number of male students is 52, only 16.9%.

Age: 18 years old students tend to take gap year more than others, account for 73.4%, around 226 students, the number of 17 years old student makes up 17.8%, which is 55 people and students at the age of 16 have the lowest record.

Family income: Mostly from 15 to 30 million dong, about 38.7% in total equal to 119 students. There are 115 students' family have under 15 million doing income per month, account for 37.3%. The family group that has income more than 45 million dong has the lowest record, only about 10.4%, which is 32 students, the rest have 30 to 45 million dong per month.

The way students approach gap year: Mostly from media (news, social networking sites, youtube, v.v.) with 83.1%, following is from family, friends with 11.1%. The number of students know about gap year from extracurricular activities and educational organization is 3.2% and 2.0% respectively, only 0.6% of other sources.

3.2. Cronbach's Alpha reliability test and Exploratory factor analysis EFA (EFA)

3.2.1. Cronbach's Alpha reliability test

After conducting Cronbach's Alpha analysis, the result shows that all 7 independent variables of a model have Alpha coefficient which is greater than 0.7, this justifies that the scale of all variables ensures about the coefficient. Of those, a scale of risk awareness factor has the greatest Cronbach's Alpha value (0.842) and media factor has the lowest value (0.757). With each of the scales, the research group realizes that none of the values of Corrected Item - Total Correlation less than 0.3. Therefore, all 26 observed variables on a table of the notions such as the influence of the people around and society, internal motivation, financial capability, media, attitude, personality and risk perception reach a requirement and continue to be used for analyzing Exploratory factor analysis EFA.

3.2.2. Exploratory factor analysis EFA

EFA result for the first time:

Table 1. KMO Coefficient and Bartlett test first time

KMO Measure of Sampling Adequacy		.784
Bartlett's Test of Sphericity	Approx. Chi-Square	4329.130
	Df	325
	Sig.	.000

Source: The research team

According to table 1, KMO is equal to 0.784 (satisfying $0.5 \leq \text{KMO} \leq 1$) which shows the results of analyzing factors that are suitable with the research data. Bartlett's Test of Sphericity has Sig as equal to 0.000 less than 0.05 which illustrates observed variables have a correlation with each other in the whole. Cumulative of variance reaches 68.261%, satisfyingly higher than 50% that justifies the EFA model is appropriate. In addition, the Eigenvalues value of seven factors is 1.138, higher than 1 so all factors are detained.

The result of research demonstrates RR3, DC3, AH4 variables have Factor Loading greater than 0.5 on two factors and the difference of Factor Loading is lower than 0.3, so this does not ensure discriminant value. Thus, the research group conducts to eliminate three observed variables (RR3, DC3, AH4) and continues to bring 23 remaining variables to do the second of Exploratory factor analysis EFA.

EFA result for the second time:

Table 2. KMO coefficient and Bartlett's test second time

KMO Measure of Sampling Adequacy		
Bartlett's Test of Sphericity	Approx. Chi-Square	2458.577
	Df	253
	Sig.	.000

Source: the research team

Table 2 shows that KMO is equal to 0.878 (satisfying $0.5 \leq KMO \leq 1$) and the results of analyzing factors are suitable with the research data. Bartlett's Test of Sphericity has Sig as equal to 0.000 less than 0.05 which illustrates observed variables have a correlation with each other in the whole. Cumulative of variance reaches 66.356%, satisfyingly greater than 50% that justifies the EFA model is appropriate. Besides that, the Eigenvalues value of seven factors is 1.065, higher than 1 so all factors are retained.

3.3. Pearson Correlation analysis

In short, all seven independent variables have a correlation with dependent variables.

Table 3. Correlation between variables

		AH	ĐC	KT	TT	TĐ	TC	RR
QĐ	Pearson	0.545**	0.593**	0.516**	0.519**	0.526**	0.516**	-0.489**
	Sig (2-tailed)	0.000	0.000	0.000	0.000	0.000	0.000	0.000

***. Correlation is significant at the 0.01 level (2-tailed)*

Source: the research team

The result illustrates that all variables such as the influence of people around and society, financial capability, media, attitude, personality, and risk perception are used for Linear Regression analysis.

3.4. Regression analysis

3.4.1. F-statistic

According to the analysis results, "Adjusted R square" reached 0.628, meaning that the independent variables explain 62.8% the variation of the dependent variable. 37.2% of the variation of dependent variable are affected by variables outside the model and statistical errors. This result indicates a suitable regression model.

Table 4. Model Summary

Model	R	R square	Adjusted R square	Std. Error of the estimate	Durbin-Watson
1	0.798	0.637	0.628	0.54724	1.962

e. Estimate variables: Constant, RR, TĐ, TT, TC, KT, AH, ĐC
f. Independent variables: QĐ

Source: The research team

The F value equal 75.077 with Sig. By $0.000 < 0.05$, this shows that linear regression model fits the data and can be used.

Table 5. Result of ANOVA analysis of general linear regression

Model	Sum of Squares	Df	Mean Squares	F	Sig.
Regression	157,382	7	22.483	75.077	.000
Residual	89,840	300	0.299		
Total	247,222	308			

e. Estimate variables: Constant, RR, TĐ, TT, TC, KT, AH, ĐC
f. Independent variables: QĐ

Source: The research team

3.4.2. Testing the hypothesis and evaluate the significance of the variable

Table 6. Coefficients

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
Constant	-0.115	0.334		-0.345	0.730		
ĐC	0.296	0.049	0.252	6.029	0.000	0.694	1.442
AH	0.204	0.042	0.199	4.818	0.000	0.710	1.408
KT	0.151	0.039	0.160	3.896	0.000	0.714	1.400
TT	0.185	0.040	0.185	4.593	0.000	0.750	1.333
TĐ	0.172	0.048	0.148	3.572	0.000	0.706	1.416
TC	0.127	0.044	0.121	2.881	0.004	0.686	1.457

Source: The research team

The values in the Sig column are all less than 5%, so all 7 independent variables are statistically significant to the dependent variable. In other words, 7 hypotheses H1, H2, H3, H4, H5, H6, H7 are accepted.

From the result, our research group suggest regression model below:

$$\mathbf{QD} = \mathbf{0.296*ĐC} + \mathbf{0.204*AH} + \mathbf{0.151*KT} + \mathbf{0.185*TT} + \mathbf{0.172*TĐ} + \mathbf{0.127*TC} - \mathbf{0.137*RR}$$

Including:

ĐC: Internal motivation

AH: Influence of people around and society

KT: Financial capability

TT: Media

TĐ: Attitude

TC: Personality

RR: Risk perception

3.4.3. Standardized Distribution Residual of Sphericity

To a Histogram chart, if Mean value is approximately equal to 0, standard deviation is close to 1, bell-shaped distribution curves can confirm that the distribution is approximately normal, assuming the normal distribution of the residuals is not violated. The survey indicates the residual has Mean value is -2.48E-15 (approximately equal to 0) and standard deviation is 0.989 (close to 1). Therefore, distribution of residuals is approximately normal, the assumption of normal distribution of residuals is not violated.

With a Normal P-P Plot chart, if quantiles in the distribution of the residual are centered on a diagonal, that is, the residuals are normally distributed. The data show that the percentiles are concentrated on a diagonal, so the residuals are normally distributed.

4. Discussion and Conclusion

4.1. Solution

4.1.1. Students

First, students should focus on opportunities in high school such as engaging in community services, research programme, participate in domestic and foreign projects or part-time job to acquire practical knowledge and have clearer view of the professions so that students can make accurate decisions.

Second, students should evaluate the advantages and disadvantages to form a detailed plan, prioritize necessary activities for time management and effective experiences.

4.1.2. Family

First, parents should hear more from their children to fully understand about gap year information and carry out navigation. Moreover, children need to be equipped with knowledge, necessary skills to handle problems themselves. Parents will have chance to connect more with their children through communicating.

Second, Parents should share with children about financial capability to avoid gap year time become financial burden for the family.

4.1.3. School

First, schools, especially high school level, should invite experts to give advice to students related to gap year, benefits, and drawbacks, how to have effective gap year time, or organize competitions related to gap year, encourage students to express their point of view.

Second, schools should support students intend to take gap year with scholarships. In addition, the school can refer to the gap year support programme of foreign universities such as Harvard, Yale. Besides, the school can open a counselling support room to help students orient their careers appropriately.

4.1.4. Society

Firstly, stimulate media activities effectively through conveying the messages with meaningful and appropriate content. Therefore, students can easily find a lot of highly reliable activities, for example volunteering activities of WWOOF, Working Holiday, Picking Jobs, etc when they take a gap year.

Secondly, diversify the way of conveying the messages to not only students but also society. In the era of increasingly advanced technology, people can access sources of information in several ways such as watching a video summary of gap year strategy on social networks or consulting a large number of volunteering, traveling and exploratory activities via groups on Facebook.

4.2. Conclusion

Gap year brings a range of benefits to not only education but also national development goals. It is necessary to conduct a survey and research the factors affecting the

intention of taking gap year of high school students in Hanoi, which provides parents, school managers as well as organizations with a clear view of gap year in order that they can propose appropriate solutions. In addition, media campaigns and extracurricular activities with purpose of promoting gap year should be stimulated to meet the growing students' demands of self-discovery.

Abstract

This study employs structural equation modelling (SEM) to identify and evaluate determinants of online learning student participation. Data was collected from 543 students from 29 universities in Hanoi. The results indicated that individual factors (Goal Clarity, Process Clarity, Expertise, Perceived Control) have a magnitude of impact on student participation in online learning.

Keywords: *online learning, student/customer participation, teaching styles.*

1. Introduction

Due to the Covid-19 pandemic, universities had to close or switch to online teaching and blended learning methods. Online learning has been used for a long time, playing an essential role in keeping Vietnamese universities running and students engaging in their learning.

Although the growth rate of e-Learning globally is about 35.6%, the implementation of e-learning has also encountered failures in some countries. Before that, there have been many studies on the critical success factors of the online learning system from learners' perspectives. From the service standpoint, user participation influences their decisions about using the system, and this process is repeated throughout the user's experience with that system. On the other hand, from the practical perspective of the application system, although the factors affecting user participation have been identified in many different studies, the direct integration of these factors in the specific implementation of the system seems to be missing.

This study has three objectives, namely:

Summarizing and identifying factors of students that affect student participation in online learning classes in universities.

Determining the influence of those factors on online class participation thus leads to student satisfaction in online classes.

Proposing specific models and solutions to improve learner participation in online learning in universities.

This study aims to answer three main questions: (1) How do students tend to take university online classes today?; (2) What factors influence student participation in university online classes?; (3) To what extent do factors influence university online class participation, thus leading to student satisfaction?

The research consists of four sections: the theoretical foundation and recommended conceptual model for the investigation; the study approach is then provided, followed by the research findings and related comments. Finally, results are offered, as well as suggestions for further research.

2. Literature Review

Student participation: Although customer participation has been developed from many perspectives, with many different terms, the number of definitions of student participation in learning is relatively small. While most concepts of student participation still consider student investment in learning activities as the main component, the concepts have recently been expanded to include related and closely tied together components, which are cognitive and emotional engagement.

While not directly developing a scale of student participation behaviour, the concept of customer participation behaviour in the scale of Yi and Gong (2013) includes four dimensions: information seeking, information sharing, feedback, and personal interactions are impressive for comprehensive exploiting the dimensions of participation. To confirm the diverse essence, spanning different stages of the service process, and to consider this concept and the scales for student participation summarized above, the authors decided to develop the scale of Yi and Gong (2013) for the research model.

Table 1. Comparing related concepts

	Definitions/Related research	Author
Co-creation	Students can co-create curriculum in real-time to support peer-informed learning	Aaron McDonald et al. (2021)
Student engagement	Student engagement includes three interrelated dimensions: behavioral, emotional, and cognitive	Bond et al. (2020)
Student involvement	The extent of a student's involvement in academic work, for instance, can be measured quantitatively and qualitatively	Alexander W. Astin (1984)

Components of student participation:

Table 2. An overview of definitions affecting the theory of student participation

	Dimensions of the research concept (dimensionality)	Author
Dimensions of customer participation behavior	<ol style="list-style-type: none"> 1. Information seeking 2. Information sharing 3. Responsible behavior 4. Personal interaction 	Yi & Gong (2013)
Criteria for assessment of class participation	<ol style="list-style-type: none"> 1. Preparation 2. Contribution to discussion 3. Group skills 4. Communication skills 5. Attendance 	Dancer & Kamvounias, (2005)
Six levels of student participation	<ol style="list-style-type: none"> 1. Students attend class and stay awake/ pay attention 2. Students attend class, take notes and complete assignments. 3. Students write papers that are thoughtful and reflective. 4. Students ask questions in class, make comments and provide inputs for class discussions. 5. Students do additional research or come to class with additional questions. 6. Students deliver oral presentations (i.e. they become teachers themselves) 	Fristchner (2000)

Factors affecting student participation:

Source Credibility: Source credibility has received considerable scholarly attention in the educational context (Myers & Martin, 2006; Teven, 2007). Source credibility concluded with three dimensions: Trustworthiness, Expertise, and Attractiveness (Roobina Ohanian, 2013).

Trustworthiness: The trust paradigm in communication is the listener's degree of confidence in and acceptance of the speaker and the message (Roobina Ohanian, 2013). As a source of trustworthiness in the classroom, teacher credibility is a student's attitude towards a teacher related to the perceived degree of trustworthiness of the instructor's abilities (McCroskey & Teven, 1999; McCroskey & Young, 1981).

Expertise: skills, knowledge and related competencies that an individual or organization possesses. Expertise is the second dimension of source credibility, as defined by Hovland, Janis, and Kelley (1953). Perceived instructor credibility has been related to

several instructional communicative behaviours. Instructors who are perceived as being credible have students who report greater levels of state motivation and affective learning (Frymier & Thompson, 1992; Teven & McCroskey, 1997). Additionally, instructors who are perceived as credible are rated as more immediate by their students (Johnson & Miller, 2002) [b] and have higher ratings of student satisfaction (Teven & Herring, 2005). Research investigating source expertise in persuasive communication generally indicates that the source's perceived expertise has a positive impact on attitude change (Horai, Naccari, and Fatoullah 1974; Maddux and Rogers 1980; Mills and Harvey 1972; Ross 1973)

Attractiveness: A considerable body of research in advertising and communication suggests that physical attractiveness is an essential cue in an individual's initial judgment of another person (Baker và Churchill 1977; Chaiken 1979; Joseph 1982; Kahle và Homer 1985; Mills và Aronson 1965; Widgery và Ruch 1981). Except for a few studies (Mills and Aronson 1965; Maddux and Rogers 1980), Joseph's findings are consistent with others that report that increasing the communicator's attractiveness enhances positive attitude change (Simon, Berkowitz, and Moyer 1970; Kahle and Homer 1985).

Teaching styles: Student participation may easily be moulded through pedagogy, and it can be expressed through teacher teaching, which is what teachers do to encourage students to participate in classes. their educational institution (Fredericks and partners, 2004, 2019; Kahu, 2013; Lawson & Lawson, 2013)

Each teacher has a different teaching method. In this study, 4 teaching style clusters which are developed by Anthony F. Grasha & Natalia Yangarber-Hicks (2000), consist: (1) Teachers present information through televisions or online classes., students will become more passive and act as receivers of information. (2) Students coach, guide, and model how to do things are strongly represented in this cluster (architecture or graphics design course). The coaching and role modelling can occur in a classroom or clinic, or even in a virtual environment. (3) Teachers use strategies for collaborative participation, include case studies, research projects, problem-based learning assignments, small-group discussions, role-playing and simulations, and activities in which students learn information and then teach their peers. (4) Teachers adopt the roles of consultants and resource people to students working alone or in small groups. They are available to comment on and to help clarify issues that were particularly troublesome.

Role clarity: Students understanding service training means that they know what they need to do and how to get the best out of the subject. The specific roles, contributions, boundaries and avenues for customer participation should be clear, familiar and consistent (Lengnick-Hall, 1996). This study chose the definition of (Beard, 1996) to do empirical research and find a positive relationship between the two components of role clarity (goal clarity and process clarity) with the effectiveness of marketing service providers (agency) as well as customer satisfaction.

Goal clarity: consistent with Kahn et al. (1964) scope of responsibility and considered to be "the extent to which the outcome goals and objectives of the job are clearly stated and well defined" (Sawyer, 1992).

Process clarity: parallel to the terminal knowledge dimension of Kahn et al. and is defined as "the extent to which the individual is certain about how to perform his or her job" (Sawyer, 1992).

Ability: Effective participation also requires customers who are capable of making useful and timely contributions during service delivery (Lengnick-Hall et al., 2000). Rodie and Kleine (2000) provide a very broad definition of ability, which includes "... all pertinent resources such as knowledge, skill, experience, energy, effort, money, or time". Customer ability refers to resources owned by the customer, including the customer's knowledge, skills, creativity, and network assets.

Motivation: Student motivation refers to the willingness to exert effort to work on a learning task (Kim & Bennekin, 2013). Participation makes student self-learn intentionally because participation is associated with learning results and motivation could enhance participation (Martin, 2012).

Therefore, theorists have been able to identify several specific types of motivation:

(1) Intrinsic Motivation defined as the doing of an activity for its inherent satisfactions rather than for some separable consequence

(2) Extrinsic Motivation defined as the doing of an activity for its external purposes or as a means to an end.

(3) Motivation defined as a driving force to do something (Ryan & Deci, 2000a; Vallerand, 1992).

Perceived control: Perceived control is the psychological perception of a customer's level of control over the environment and behaviour, affecting service production and service outcomes (Dabholkar, 1990, cited in the study of Yang and He, 2018). Perceived control is the emotional cognition of the individual's control level of the environment and his behaviour, and it is the perception of the customer's impact on the production and results of service (Koufaris, M., 2002; Wu, G.M., 2000; Peng, Y.J., 2009).

Student satisfaction: According to Oliver (1997), satisfaction is the consumer's response to the satisfaction of their wants. Kotler (1997) defines satisfaction as "a person's feeling of pleasure or disappointment resulting from comparing a product's perceived performance (or outcome) concerning his or her expectations".

Table 3. An overview of the previous research model on student participation

Framework

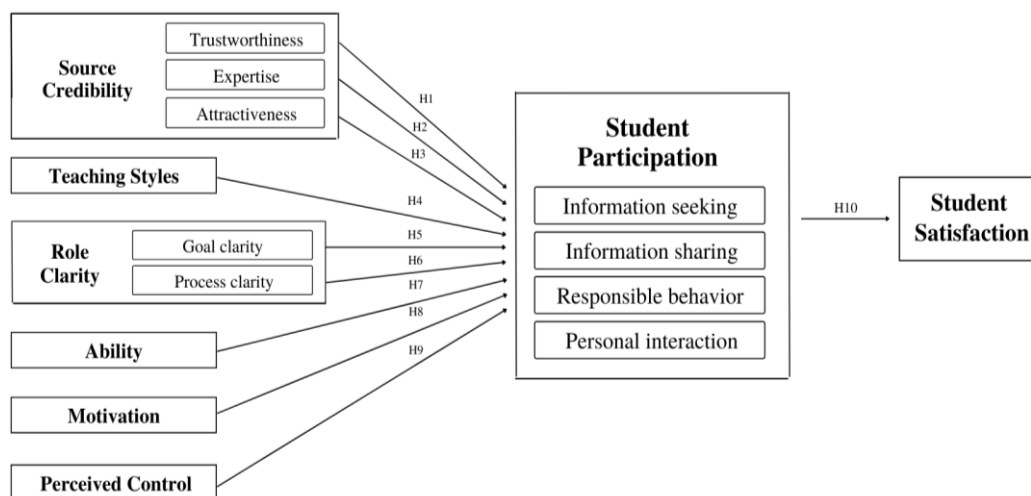

Figure 1. Proposed research model

H1: Teacher's trustworthiness is positively related to students' participation in online classes.

H2: Teacher's expertise is positively associated with students' participation in online classes.

H3: Teacher's attractiveness is positively associated with students' participation in online classes.

H4: Teaching styles are positively associated with students' participation in online classes.

H5: Students' goal clarity is positively associated with their participation in online classes.

H6: Students' process clarity is positively associated with their participation in online classes.

H7: Students' ability is positively associated with their participation in online classes.

H8: Students' motivation is positively associated with their participation in online classes.

H9: Students' perceived control is positively associated with their participation in online classes.

H10: Student participation in university online classes is positively associated with their satisfaction.

3. Method

3.1. Selection of research variables

By researching previous studies on student participation in online classes and based on observations of student characteristics, the authors discussed and decided to choose the following eight variables as the basis for the study—the basis for determining the factors affecting the participation in classes of students of universities in Hanoi city. Independent variables include Teacher credibility, Teaching styles, Role clarity, Ability, Motivation, and Perceived control. Mediating variables include Student participation. The dependent variable contains Student satisfaction.

3.2. Design quantitative questionnaire

In the quantitative questionnaire, the authors have selected the appropriate scale for the variables in the research figure. At the same time, the authors edited the content and

wording so that the survey respondents could fully understand and answer the questions in the questionnaire, avoiding misunderstandings or omitting questions.

3.3. Pilot study

The number of respondents in the preliminary quantitative study was 75 responses. 16% are first-year students, 14.67% are sophomores, 61.33% are juniors, and 8% are seniors. After delivering the questionnaire, the results are helpful and more comprehensive than initially intended by the group authors. From the data collected from the preliminary quantitative research results and the experts' advice, the authors have made some changes to adjust the questionnaire before the formal quantitative study.

3.4. Data collection

After completing the official questionnaire, the authors delivered more than 600 questionnaires on a large scale indirectly (online surveys, posted on social networks such as Facebook, ...) and collected 543 valid responses in official analysis.

3.5. Data analysis

This study implemented a structural equation modeling (SEM) approach, using SPSS 26.0 và AMOS 24.0 for data entry, analysis and processing:

1. Analyzing descriptive statistics to get an overview of the research object.
2. Using Cronbach's Alpha to assess construct reliability to reflect the close correlation between the observed variables of the same factor and remove the observed variables that are considered garbage.
3. Exploratory factor analysis (EFA) to remove the factors that do not fit the model.
4. Conducting confirmatory factor analysis (CFA) from Pattern Matrix to empirically test the measurement model, quality of observed variables, reliability, convergence, discriminant of variable structures.
5. Designing a general figure for the study and analyzing the SEM model to evaluate the hypothesis, the level of impact of the independent variables on the dependent variables.
6. Checking Model Fit in CFA.

4. Results

The analysis sample includes data collected from 543 students from 29 universities in Hanoi city. In the survey sample, females accounted for 71.8%, and males accounted for 27.8%. Most of them are first-year students with a rate of 45.5%, followed by the group of sophomore, junior, senior, and five-year students, respectively, with the rate: 22.8%; 23.2%; 7.0% and 1.5%.

4.1. Analyze the reliability of the scales (Cronbach's Alpha)

Firstly, the reliability of the criteria is evaluated through Cronbach's Alpha coefficient.

The minimum condition for testing the reliability of the scale using Cronbach's Alpha coefficient is that each factor in the research model must have at least 2 observed variables. All 8 variables in the research model of the authors meet this requirement.

The results show that all 62/63 variables give Cronbach's Alpha coefficient > 0.6 . At the same time, the observed variables of each scale have a total correlation coefficient > 0.3 , showing that the observed variables meet the standards (Nunnally, J., 1978).

There is only 1 variable on the scale (DC7) with Cronbach's Alpha coefficient below 0.6 - the scale, including 62 variables, is qualified and well used (Hoang Trong, Chu Nguyen Mong Ngoc, 2008).

After confirming the reliability of the variables and discarding the observed variables are considered garbage. Next, the authors turned to EFA exploratory factor analysis to remove the factors that do not fit the model.

Table 4. Cronbach's Alpha coefficient of each variable after correction

	Number of observed variables	Cronbach's Alpha coefficient
Teachers' credibility	15	0,945
Teaching styles	4	0,875
Role clarity	9	0,954
Ability	4	0,780
Motivation	6	0,808
Perceived control	4	0,780
Student participation	16	0,929
Students' satisfaction	4	0,931

4.2. Exploratory factor analysis (EFA)

According to (Kaiser, H. F., 1974), to meet the requirement that EFA can be performed, the $KMO > 0.5$. KMO value, in this case, reached $0.953 > 0.5$, this is for consistent data seen for factor analysis; and Sig. of Bartlett's Test = $0.000 < 0.05$, saying that the variables are compatible with each other in the population. Therefore, the group author can perform EFA.

According to (Hair, 1998), Factor loading ≥ 0.5 ensures the practicality of EFA. The author group found that 46/62 observed variables all satisfy this condition. There are 46 variables to ensure convergence and discriminant validity when analyzing EFA. In addition, the PP2 variable is confused with the Participation factor group, which means that the question of one factor is confused with the question of the other factor. The authors obtained the extracted variance = 67.230% and the Eigenvalues = 1.084 index, ensuring that the results of factor analysis are only accepted when the extracted variance is $> 50\%$ and Eigenvalues > 1 . Thus, the independent variables include 46 observed variables belonging to 7 factors that explain 67.230% of observed variables.

After analyzing EFA factors, the authors decided to remove 16 variables which are not compatible: TN9, TG2, TG3, TG10, TG11, KS2, KN3, KN2, KN1, KN4, KS1, TN14, TN11, DC2, DC1, PP1 and continued to test CFA.

4.3. Confirmatory factor analysis (CFA)

The authors encode and start the confirmatory factor analysis by software AMOS 24.0. The authors check the convergent and discriminant values of the research concepts (factors) before analyzing them through structural equation modelling (SEM).

Figure 2. A model of analyzing positive factors in Chartered Financial Analyst (CFA)

The author separates the factors TN15, TN12, TN13 into the group "Teacher's style" with coding "tinnhiem2". After confirmatory factor analysis, the authors removed variables not belonging to the confirmed hypothesis group including PP2, DC3, DC4, DC5, DC6.

All concepts achieve composite reliability (CR) greater than 0.7 and extracted variance (AVE) greater than 0.5 (Hu and Bentler, 1999).

The results show that Information Searching of Student Participation's scale is inappropriate. Information Sharing and Responsible Behavior are considered separate from Individual Interaction because of the author's way of questioning. Information Sharing and Responsible Behavior is represented by a specific sequence of actions, while Personal Interaction refers to students' attitudes towards teachers then, the respondents might have separated aspects into two distinct groups. Since then, TG14, TG15, TG16 were divided into "Personal interaction" with the encoding "thamgia2".

Goal Clarity and Process Clarity were also grouped into the "Role Clarity" after CFA because of the author's way of asking questions and personal responses. Accordingly, factors VT1, VT2, VT3, VT4, VT5, VT6, VT7, VT8, VT9 belong "Role Clarity" with coding "vaitro".

H1a: Teacher's trustworthiness is positively related to students' information sharing and responsible behavior in online classes.

H1b: Teacher's trustworthiness is positively related to students' individual interaction in online classes.

H1c: Teacher's attractiveness is positively related to students' information sharing and responsible in online classes.

H1d: Teacher's attractiveness is positively related to students' individual interaction in online classes.

H2a: Teaching styles are positively related to students' information sharing and responsible in online classes.

H2b: Teaching styles are positively related to students' individual interaction in online classes.

H3a: Students' goal clarity is positively related to students' information sharing and responsible in online classes.

H3b: Students' goal clarity is positively related to students' individual interaction in online classes.

H4a: Students' ability is positively related to students' information sharing and responsible in online classes.

H4b: Students' ability is positively related to students' individual interaction in online classes.

H5a: Students' motivation is positively related to students' information sharing and responsible in online classes.

H5b: Students' motivation is positively related to students' individual interaction in online classes.

H6a: Students' perceived control is positively related to students' information sharing and responsible in online classes.

H6b: Students' perceived control is positively related to students' individual interaction in online classes.

H7a: Student' information sharing and responsible in university online classes is positively related to their satisfaction

H7b: Students' individual interaction in university online classes is positively related to their satisfaction

Figure 3. Structural equation modelling

The linear structural model achieves better indexes than the confirmatory factor analysis model. According to Hu & Bentler (1999), the model's goodness of fit indexes include CMIN/DF; CFI; RMSEA is at an acceptable level, TLI is close to good, and GFI is near a good level.

4.4. Test the research hypotheses

All hypotheses related to Students' perceived control (the first dimension of participation) were rejected because this concept did not meet the threshold for testing the scale's reliability. Some hypotheses related to the concept of student's motivation and ability were also rejected because this concept also failed to test the reliability of the scale.

Table 5. Accepted variances in the research model

The ordinal number of the factor (From EFA)	Research variances	Coding for positive factors	Component observable variances
1	Source credibility	tinnhiem	TN1, TN2, TN3, TN4, TN5, TN6, TN7, TN8, TN10
2	Attractiveness	tinnhiem2	TN15, TN12, TN13
3	Teaching styles	phuongphap	PP3,PP4
4	Role Clarity	vaitro	VT1, VT2, VT3, VT4, VT5, VT6, VT7, VT8, VT9
5	Perceived control	kiemsoat	KS3, KS4
6	Information sharing and responsible	thamgia1	TG4, TG7, TG9, TG5, TG6, TG8
7	Individual interaction	thamgia2	TG15, TG14, TG16
8	Student satisfaction	hailong	HL1, HL2, HL3, HL4

Table 5. Accepted hypotheses in the research model

Relationship			Weight	Standard deviation	Significance	Hypothesis
thamgia1	<---	tinnhiem	.151	.028	***	1a
thamgia1	<---	vaitro	.052	.011	***	3a
thamgia1	<---	kiemsoat	.665	.268	.013	6a
thamgia1	<---	phuongphap	.536	.097	***	2a
thamgia2	<---	tinnhiem	.501	.041	***	1b
thamgia2	<---	vaitro	.079	.020	***	3b
thamgia2	<---	kiemsoat	-1.230	.492	.012	6b
thamgia2	<---	tinnhiem2	-.196	.038	***	1d
thamgia2	<---	phuongphap	1.431	.141	***	2b
hailong	<---	thamgia1	4.981	.836	***	7a
hailong	<---	thamgia2	-1.245	.180	***	7b

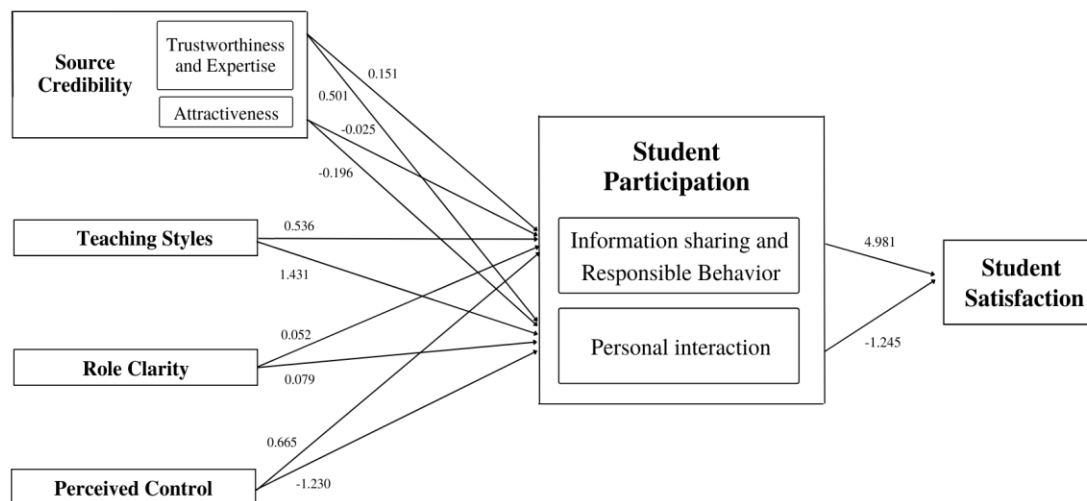

Figure 3. Accepted research model

In summary, from the initial 40 hypotheses of the proposed research model developed from the framework of previous researchers, through testing with actual data, the author group obtained an accepted model with 14 hypotheses. The theory meets the requirements of the linear structural model (with a non-zero impact level). Although the number of accepted hypotheses is not much, the model's indicators are relatively good and have many new points compared to previous studies.

5. Discussion and Conclusion

The research results have clarified the research issues and answered the research questions related to the factors affecting the students' participation in online learning through the proposed research model and tested the correlation between factors with learners' participation.

Research results show that changing the scale different from the initially proposed model is correct with the results of data analysis of the CFA model, supporting the running

of the model and creating an accurate analysis direction, reflecting the characteristics of the model. of the University's online learning environment. After analyzing the model, the number of hypotheses and the way to divide the hypothetical groups has changed to be more suitable to the standard model, specifically, the participation of students from 4 groups: Find information, Information sharing, Responsible behaviour and Interaction behaviour are divided into 2 main groups: Information sharing and responsible behaviour, and Personal interaction. Second, lecturers' trust from 3 groups Credibility, Expertise, Attractiveness is separated into 2 groups including Credibility and Attractiveness.

There is a standard correlation between 8 observed variables, including 6 independent variables: Role Clarity, Source Credibility, Teaching Styles, Motivation, Ability, Perceived control; 1 dependent variable is satisfaction, and one intermediate variable is participation.

The four major groups include Source Credibility, Teaching Styles, Role Clarity, and Perceived Control. The strongest influence is Teaching Styles on Personal Interaction (Weight = 1.431, $p < 0.05$).

Within the scope of the research, the authors have examined the relationship of the main components in the theoretical framework of factors affecting students' participation in the online learning process in university classes. The study is one of the first attempts to concretize the conceptual framework of student participation management by empirical research with multi-dimensional concepts. This governance model is of great significance for lecturers and administrators of higher education institutions in online classes in particular and in educational services in general when they want to promote student participation through the following factors: Factors affecting student participation (Source credibility (including trustworthiness and expertise, and attractiveness), Teaching styles, Role Clarity, Perceived control)

Certain limitations remain in the study. The following research direction should have more expansion in terms of scale; analysis with a deeper focus on a specific factor; design of simpler questions; research more about Analyzing Student Participation as a higher-order concept.

Development direction from the authors' research: distilling the relationship between Student Participation and outcomes such as Students' Grade, perceived values to conclude the influence of participation on outcomes; expanding participation with more relevant and diverse representations; clarifying the different components of the critical element (Teaching Styles); find out the hindering factors (negative/reverse effect on Student Participation).

Abstract

The study was conducted in a rather special context: 2 years after the Covid-19 pandemic took place and affected the economy and labor market of Vietnam. This research on factors affecting intention to receive the lump-sum social insurance benefit in Vietnam reveals that there are seven groups of influencing factors including Media, Income, Social security aspect of the Social insurance policies, Labor market context, Attitude towards behavior, Social insurance policies and Social influence. The research is based on theories combined with relevant studies and analytical results from data collected from 378 employees in the research area. From the analysis and practical assessment of the influence of these factors, the authors offer solutions and recommendations to reduce the demand for the lump-sum social insurance benefit, moving toward the goal set by the Party and State, which is to ensure social security for everyone. The research results are the basis for policymakers to publish policies to develop social insurance in Vietnam.

Keywords: *Social insurance, Lump-sum social insurance, Intention to receive*

1. Introduction

Social insurance policies have always been considered very important and adjusted to suit socio-economic conditions as well as the development of the country by the Party and the State, moving towards the goal of social security for all. However, opposite to the Government's efforts to increase the coverage of social insurance, an increasing number of employees are choosing to receive lump-sum social insurance, leaving the social insurance system, especially in the complicated situation of the Covid-19 pandemic.

According to statistics from Vietnam Social Insurance, from 2014 to 2019, over 3.7 million people received the lump-sum social insurance policy; nearly 750,000 people leave the system every year, accounting for over 5% of the total number of participants. This means with every two new people joining the social insurance system, one person is leaving.

This trend is getting worse and shows no sign of stopping either. In 2021, 963,272 cases of claiming lump-sum social insurance benefits were recorded. This is a worrying fact, a danger to the social insurance system. Employees who leave the social insurance system are deprived of their right to receive other social insurance benefits, especially long-term benefits such as pension and survivorship. Workers will face disadvantages in both the short term and long term.

With the present situation, it is urgent to identify the underlying causes of the increasing demand for lump-sum social insurance benefit, so regulators can find effective solutions to tackle this problem. Therefore, the analysis of factors affecting the intention to receive lump-sum social insurance benefits of Vietnamese workers is very necessary during this time.

2. Method

2.1. Data collection methods

2.1.1. Secondary data collection

Primary data is collected from social insurance reports at Viet Nam Social Security; Ministry of Labour, Invalids and Social Affairs (Vietnam); Vietnam General Confederation of Labour; in addition to scientific journals, relevant national and international prior science research.

2.1.2. Primary data collection

The authors use the convenience sampling method by direct investigation of employees in 3 provinces (Thai Binh, Quang Ninh, Thai Nguyen) and an online survey.

2.2. Data analysis methods

2.2.1. Descriptive Statistics

Descriptive statistics are used to describe the basic features of the data collected from a survey. The authors chose these demographic features: ages, genders, working and areas, educational levels. Through IBM SPSS Statistics 23.0, we could process and analyze data. In addition, for ease of inputting, analyzing and presenting data, the researched variable will be encrypted.

2.2.2. Cronbach's Alpha Reliability Analysis

This is used to eliminate ineligible scales. Cronbach's Alpha coefficient indicates relative uniformity in measurement according to variables that have close content and form a group of factors. According to authors Hoang Trong and Chu Nguyen Mong Ngoc (2008), a Cronbach's Alpha ranging from 0.8 to 1 indicates a good scale, and from 0.7 to 0.8 indicates that the scale is usable.

2.2.3. Exploratory Factor Analysis (EFA)

EFA will examine the relationship between the observed variables in all the different independent variables in order to detect whether the observed variables are loaded with multiple factors or with differential variance initially. Specifically, from a set of many original observed variables, after factor exploratory analysis, they will become more meaningful groups of factors. KMO coefficient is an index used to consider the suitability of performing factor analysis. If the KMO value is within the required range, then EFA factor analysis is appropriate. Necessary conditions to perform factor analysis are $0.5 \leq KMO \leq 1$.

2.2.4. Pearson correlation

Pearson correlation analysis aims to test the strong linear correlation between the dependent variables. When analyzing Pearson correlation, it is necessary to pay attention to the sig value. If $\text{sig} < 0.05$, there is a linear correlation between the dependent variable and the independent variables, and if $\text{sig} > 0.05$, there is no correlation. If there is a correlation, the Pearson correlation index will have a value ranging from -1 to 1. If the index is closer to 1 or -1, the stronger the linear correlation, the closer it is, corresponding with a positive or negative correlation. If the index is closer to 0, the linear correlation is weaker, if it equals 0, there is no relationship between the two variables.

2.2.5. Linear regression analysis

This method specifically determines the weight of each independent factor affecting the dependent factor, then gives a regression equation. The coefficient R Square indicates the percentage (%) of the variation of the dependent variable by the independent variables. If this value is above 30%, the study is considered significant. The F test in the ANOVA table is used to assess the fit of the model. Sig(P-value) of the F test $< 5\%$, the model fits the population. The Sig value in the Coefficients table indicates whether the regression parameters are significant or not (with 95% confidence, $\text{Sig} < 5\%$ is significant).

3. Results

3.1. Characteristics of surveyed subjects through Descriptive Statistics

By direct and indirect survey, we collected 378 eligible answers.

3.1.1. Age and gender of survey subjects.

The subjects are divided into 4 age groups ranging from 15 years old to 55 years old, which increases the reliability and objectivity of the research. The 35-year-old to 54-year-old age group took the highest percentage with 43.9%. Besides, there were 156 replies by men (41.3%) and 222 replies by women (58.7%).

3.1.2. Working and living areas

The private area made up 45.2% with 171 answers, whereas the public sector took 54.8%. In addition, employees working in the North of Vietnam showed the highest proportion at 60.1%, the figures for the Middle and South of Vietnam were 21.4% and 18.5%, respectively.

3.1.3. Education levels

There were 213 people with College/University education (56.3%), 61 people with intermediate education (16.1%), 56 people with high school education (14.8%) and 48 people with postgraduate education (12.7%). The group of people with college/university degrees accounted for the highest percentage, while the group of people with university degrees accounted for the lowest percentage in the study. Most of the research subjects are at the college/university level, reflecting the increasing intellectual level of the Vietnamese people today.

3.1.4. The time of participating in social insurance

The highest percentage is the group of people participating in social insurance from 10 years to less than 20 years with 38.4% and the second place is the group of employees

participating in social insurance. 20 years or more with 23%. Meanwhile, the group of workers who have not yet joined and who have just joined in the first year accounted for a small proportion, 2.9% and 2.6% respectively.

3.1.5. Status of receiving lump-sum social insurance allowance

The number of employees who have never received accounts for 80.2%, nearly 4 times higher than the number of employees who have received (19.8%). This difference can be explained based on the number of years of participation in the popular social insurance of the respondents above (from 10 years or more).

i) Reasons for having received lump-sum social insurance allowance

In 75 survey samples that were received, up to 52% were due to the needs of employees who needed an urgent amount of money to cover their lives. This reason is completely consistent with the goal of the lump-sum social insurance allowance policy: a large amount of money that is immediately beneficial to employees when they are in financial difficulty. In addition, there are many other reasons why employees do so such as feeling they will not live until they receive their pension, seeing that their colleagues consider them entitled to benefits.

ii) Reasons for not having received lump-sum social insurance allowance

The reason why the majority of respondents answered that there was no demand, with 43.23% of the total number of employees who had never received the lump-sum social insurance allowance. This figure is relatively consistent with the characteristics of the state employment sector, which has a relatively stable and less volatile nature of work. At the same time, there is a link with the characteristics of the number of years participating in social insurance of the surveyed subjects. It is more remarkable that up to 27.72%, equivalent to 84 people, do not know or understand the lump-sum social insurance allowance policy.

3.2. Testing the reliability of the scale

Cronbach's Alpha coefficient of all groups of observed variables has results greater than 0.6. Simultaneously, the results of the correlation coefficients of the total variables of the component measures all reached values greater than 0.3. The corresponding observed variables all meet the reliability condition.

Table 1. Reliability statistics

No.	Variables	Label	Cronbach's Alpha	N of items
1	Social insurance policy	CS	0.934	6
2	Communication	TT	0.884	6
3	Attitude towards behavior	TD	0.938	4
4	Social influence	AH	0.949	3
5	Income	TN	0.806	3
6	Social-security characteristic of social insurance	AS	0.827	4
7	Labor market context	BC	0.900	3
8	Intention to receive lump-sum social insurance	YD	0.965	3

Source: compiled from analysis result of authors

3.3. Exploratory factor analysis EFA

Results of factor analysis showed that there are 7 groups of independent factors and 1 group of dependent factors:

The first factor includes 6 observed variables CS1, CS2, CS3, CS4, CS5, CS6 . These variables constitute the factor of the Social insurance policy.

The second factor: Includes 6 observed variables TT1, TT2, TT3, TT4, TT5, TT6. These variables constitute the Communication factor.

The third factor: Includes 4 observed variables TD1, TD2, TD3, TD4. These variables constitute the Attitude towards behavior factor.

The fourth factor: Includes 3 observed variables AH1, AH2, AH3. These variables constitute the factor of Social influence (subjective norms).

Fifth factor: Includes 3 observed variables TN1, TN2, TN3. These variables constitute the Income factor.

The sixth factor: Includes 4 observed variables AS1, AS2, AS3, AS4. These variables constitute the factor Social-security characteristic of social insurance.

The seventh factor: Includes 3 observed variables BC1, BC2, BC3. These variables constitute a factor: Labor market context.

Dependent factor: Includes 3 observed variables YD1, YD2, YD3. These variables constitute the factor of Intention to receive lump-sum social insurance.

3.4. Pearson's Correlation Analysis

According to the results, the independent variables TN, AS, TD, CS, and AH have a linear correlation with the dependent variable YD because they have a sig. correlation values with dependent variable YD are less than 0.5. Among the above variables, CS has the highest Pearson correlation coefficient (0.389) and TN has the lowest Pearson correlation coefficient (0.199).

Between the independent variables, there are two pairs of variables with the sig. correlation values greater than 0.5 are TD, TT (0.758), and BC, TN (0.743), which means they have no linear correlation with each other. Every other pair of variables have sig. correlation values smaller than 0.5, which means they are linearly correlated with each other.

3.5. Linear Regression Analysis

The analysis results of the linear regression model:

$$YD = \beta_0 + \beta_1 \times TT + \beta_2 \times TN + \beta_3 \times AS + \beta_4 \times BC + \beta_5 \times TD + \beta_6 \times CS + \beta_7 \times AH$$

In which:

+ YD is the dependent variable (the employee's intention to receive lump-sum social insurance).

+ TT, TN, AS, BC, TD, CS, and AH are independent variables, showing the factors affecting the intention of employees to receive lump-sum social insurance in Vietnam. (TT: Communication, TN: Income, AS: Social security, BC: Labor market context, TD: Attitude towards behavior, CS: Social insurance policy, AH: Social influence) .

Regression Result of Determinants Influencing Intention is summarized as follows:

Table 3. Regression Result of Determinants Influencing Intention

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error			
TT: Media	-0.165	0.073	-0.114	-2.263	0.024
TN: Income	0.161	0.073	0.099	2.194	0.029
AS: Social security	-0.383	0.079	-0.223	-4.869	0.000
BC: Labor market context	0.150	0.067	0.122	2.240	0.026
TD: Attitude towards behavior	0.133	0.057	0.104	2.313	0.021
CS: Social insurance policy	0.629	0.076	0.435	8.300	0.000
AH: Social influence	0.261	0.052	0.247	4.998	0.000
R ²	0.308				
Sig. F Change	0.000				

Source: compiled from analysis result of authors

The coefficient of determination R^2 is 0.308, which means that the built linear regression model fits the data set to the level of 30.8%. This also shows the relationship between the dependent variable and the independent variables. The relationship is quite close, all 07 variables above contribute to explaining 30.8% of employees' intention to receive lump-sum social insurance in Vietnam.

The F-test used in the analysis of variance is still a hypothesis test of the fit of the overall linear regression model. We see that the F-test has a value of Sig = 0.000 showing that the multiple linear regression model is suitable for the data set and can be used.

Regression coefficient test: The regression results show the coefficients of β of the variables TT, TN, AS, BC, TD, CS, and AH are all different from 0 and $p(\text{sig}) < 0.01$, proving that all of the above factors affect the intention to receive lump-sum social insurance benefits of employees in Vietnam.

4. Discussion and Conclusion

4.1. Limitations and challenges regarding lump-sum social insurance benefits in Vietnam

Regarding social insurance policies, according to the author's survey, regulations pertaining to the minimum number of eligible years for pensions is unsuitable as the time required exceeds the economy's ability to generate and maintain jobs. Current regulations mandate a minimum of 20 years payment scheme for employed citizens to be eligible for pensions. Therefore, the sentiments of those with under 10 years of payment towards pension funds are often that of impatient and discouragement. In addition, Vietnam's unemployment benefit policies are still only focused on passively dealing with the consequences of unemployment to the workforce while measures to actively prevent and reduce unemployment are currently lacking. Contemporary social insurance policies are, in certain aspects, not as tempting as other forms of capital investment on the market.

In terms of media and PR, despite many attempts to disseminate information relating to social insurance policies, many find such information hard to approach and comprehend. One downside to the unprecedented development of the digital age is the abundance of misinformation from untrustworthy sources that comes with it. As a result, many people feel uneasy and are misled into withdrawing all their retirement funds.

Regarding the workforce's understanding of policies, it is certainly lacking in that aspect due to the media's ineffectiveness. A considerable number of working citizens do not consider funding social insurance schemes as a form of savings guaranteed by the government to maintain minimum living standards when they retire, so as not to burden their children.

Regarding income, according to research conducted by the Vietnam General Confederation of Labour, only 15% of the workforce have savings from their basic salaries while the rest have to work extra hours and live stringently to maintain a minimum living standard for their families. Many feel that a few hundred VND per month for social insurance funds is a considerable sum of money compared to their monthly income.

Regarding the viability of social insurance, people's confidence in the social insurance system is low. Recently, along with many adjustments to the law, the social insurance agency has had many events and information relating to the bureau which leads to an even further reduction of faith in social insurance.

Regarding the labor market context, the Covid-19 pandemic has had heavy impacts on the entire labor market in Vietnam. The official sector's labor market tends to shrink, the freelance labor force has had a reduction in the number of jobs and many had to temporarily stop working, accounting for a large proportion; employed workers decreased in number while unemployment and underemployment rate increased. In 2021, the pandemic is longer and more complicated compared to 2020, causing millions of people to lose their jobs, and the number of jobs in industries will continue to decrease, especially in the service sector. Therefore, in the face of difficulties in finding new jobs, many employees choose to withdraw their social insurance fund in order to get some capital for self-employment.

In terms of social influence, the persistent issue of lump-sum withdrawal of social benefits is creating a mob mentality among the workers in the social insurance system. When employees' awareness of social insurance is limited, they are more easily influenced and shaken by social factors such as family, friends, and colleagues. Especially from those who have been and are considering receiving lump-sum social insurance benefits.

4.2. Some solutions and recommendations

4.2.1. Improve the legal policies on social insurance as a comprehensive unity

Improve the legal policies on social insurance in the direction of "flexibility, diversity, multi-layer, modernity, international integration". It is necessary to improve sanctions for the punishment of violating social insurance law, especially for acts of payment invasion, late payment, and social insurance profiteering.

Implement the new terms of reducing the payment time into the social insurance system from 20 years to 15 years in order to boost motivation for employees, avoid discouragement when waiting too long to receive the pension.

Tighter regulations on receiving lump-sum social insurance allowance without creating more complex administrative procedures. In addition, it is essential to improve the unemployment insurance policies to maximize the function and role of a labor market management tool: creating more job opportunities, preventing and minimizing layoffs.

Add short-term benefits to the voluntary social insurance policies so that they could become more diversified and flexible. Consider increasing contributions from the National Budget and mobilizing from other social resources.

4.2.2. Strengthening communication, propaganda and people's awareness-raising about social insurance policies.

It is necessary to have a unified communication strategy in terms of content, format and methods of propaganda to suit the traits and specific characteristics of each different target group, local area. The communication work should be to develop the beneficiaries of social insurance and attract the groups that are difficult to compromise such as workers in the informal sector.

4.2.3. Providing a more favorable investment environment for businesses and improving the living and working environment for employees, investing in improving social insurance services.

Support small and medium enterprises in investment activities, expand the business scale to concrete financial potential and minimize layoffs. Thus, improving the material and spiritual life, working conditions for employees. Encourage enterprises to continue employing elderly workers and disadvantaged people in society. Enterprises need to accommodate welfare regimes with relative labor productivity of employees, pay attention to employees' aspirations so as to motivate employees to work hard, and give them confidence in the development of the business as well as peace of mind to stick with the business for a long time.

In the VssID - Digital Social Insurance application, there is now a 24/7 consulting support function via ChatBot. Vietnam Social Security may consider adding a new function to compare the number of money employees will receive when receiving lump-sum social insurance allowance with the monthly pension amount that employees will receive if they continue to pay social insurance until they reach retirement age so that employees can see for themselves the benefits of social insurance and limitations when receiving lump-sum social insurance allowance.

National Economics University, Hanoi, Vietnam*

Abstract

The main content of the article is to analyze the factors affecting sexual harassment behavior towards university students in Hanoi, Vietnam. Research results show that there are 5 influencing factors including: Law and institution; Student education; Student management; Culture - Society and Student Factors. In addition, the study also shows many surprising numbers about the status of students suffering from sexual harassment such as 25% of surveyed students saying that they have been victims of this behavior. From studying the current situation and influencing factors, the research team found the cause of the problem and proposed recommendations and solutions for each group of stakeholders.

Keywords: *Behavior, Students, Sexual harassment*

1. Introduction

Under the US Federal Civil Rights Act of 1964, sexual harassment is one of the forms of gender discrimination. "Sexual harassment is the conduct of acts such as using sexual advances, asking for sex against the will of others, using gestures or words that suggest sex with a submissive or reflexive attitude. against an individual that is suggested to be related to that individual's interests, job, and working environment."

Sexual harassment can be expressed through: actions and words that sometimes people have little suspicion. Many people often hear jokes, comments about their own gender and body from the opposite sex. But they did not expect that this is a manifestation of sexual harassment.

Types of sexual harassment

- Physical form of harassment
- Forms of sexual harassment in language or speech
- Non-verbal forms of sexual harassment

2. Literature Review

In the study “Sexual Harassment among University Students within University of Eldoret, Uasin Gishu County, Kenya” by R. K. A. Sang, J. K. Kemboi and R. O. Omenge and the study “Study on Students Sexual Attitudes and Views on Sexual Harassment” are of the same opinion that most Most sexual harassment cases are carried out by men against women. However, there are also cases of women harassing men and same-sex sexual harassment occurring by either sex. Sexual behavior often involves an aggressor who has power over the victim, including men against women, seniors against high school students, and in teacher-student relationships. born. Furthermore, such STD students may become targets of retaliation if they report the incident, by both colleagues and school personnel.

Research on "Group social work with sexual harassment prevention for female students in Bac Hong Secondary School" by Do Thi Hue shows that many people have experienced sexual harassment to different degrees, but most of them only know the negatives. silently suffer because of psychological guilt, shame, fear of market disobedience.

Factors affecting sexual behavior for students

Assumption PL: Institutional and legal factors

In Vietnam, codes on sexual harassment have been promulgated such as Decree 167/2013/ND-CP, Labor Code (2019), New Labor Code (2021), Decree No. 145/2020/ND-CP, Penal Code 2015, ... This is the basis for implementing sanctions for sexual harassment acts, and at the same time, it is also a deterrent to the subjects, helping them to re-aware of their behavior. , avoiding the occurrence of behaviors related to sexual harassment.

Assumption VH: Socio-cultural factors

According to Vietnamese culture or thinking, we seem to think that acts of touching and teasing our genitals towards children are normal, to show affection and affection for them. child. In fact, these acts are all classified as sexual abuse. These behaviors contribute to the "normalization" of sexual abuse while their consequences for children are huge.

Assumption QL: Student management factor

Universities have also introduced dress codes that can be applied to students in accordance with each gender. Not only stopping at the external requirements, universities also offer a lot of disciplinary rules to maintain order, moral education and limit social problems occurring in the school. Most schools comply with Circular No. 10/2016/TT-BGDĐT. Disciplinary actions of students with a warning or higher must be recorded in the student management file and communicated to the student's family. In case a student is disciplined at the level of suspension or expulsion from school, the higher education institution must send a notice to the locality and the student's family for coordination in management and education.

Assumption GD: The factor of student educational work

The common point is that schools in all fields have outstanding movements and activities to propagate and prevent sexual harassment. Activities, propaganda movements, workshops, talkshows, etc. on the topic of prevention and restriction of sexual harassment are held regularly, which have contributed to reducing the incidence of sexual harassment cases in universities in Ha Noi city. Interior. Although the activities offer solutions and ways to act when experiencing sexual harassment, because this is a sensitive topic, as well as psychological fear, most victims of sexual harassment are afraid to share it with others and tend to self-directed problem solving.

Assumption SV: Factor belongs to students

- *Gender issues*

Sexual harassment is the use of sexual acts or words to damage the honor and dignity of both men or women. Although the victims of sexual harassment cases we often hear on the radio, most of them are female. But in reality, both men and women are likely to be harassed.

- *Personality of the person being sexually harassed*

- Extroverts

An extroverted personality will be characterized by being friendly, active, tending to seek excitement and fun at large gatherings such as parties, community activities or crowded places. That's why, extroverts are often easily approached by sexual predators anywhere, anytime.

- Introverts

Introverts are mainly self-loving, focusing on their personal spiritual life. They prefer solitary activities, prefer quiet. This is partly to create a perfect cover for yourself; avoid "unnecessary" meetings, "friendly acquaintances" or avoid depraved harassers in the society.

- *Characteristics of the student's place of residence*

- Dormitory: the dormitory is very secure. All dormitories have security guards. Most have regulations on entry and exit hours; Some are stricter when the rule is that only students in the school can enter the dormitory, so it is very reassuring.

- Stay outside: With the same owner, you will be guaranteed on time, avoiding social dangers in the late period; ensure the security and order of the accommodation

- Stay with family: With this form, students will have their own private spaces, and have a warm and happy time with their families; avoid temptations or social evils.

Assumption TP: The factor belongs to the person who committed the act of sexual harassment

Usually, the perpetrators of sexual harassment are men. However, there are exceptions when the harasser is a woman. Portraits of people who perform sexual harassment are very diverse but will share some common characteristics.

First, there is a deviation in sexual perception and behavior.

Second, often people who have high sexual needs but cannot release and control them should redirect sexual orientation behaviors to other objects in an unusual way.

Third, the "harassers" or have a "safe cover". It can be a position, position, tangible or intangible authority in relationships

3. Method

3.1. Methods of primary data collection

In order to assess the factors affecting sexual behavior towards students in Hanoi, during the group study, we conducted an investigation and survey of the opinions of students in different groups of schools. university in Hanoi city.

This is an information method that uses a set of questions that are prepared according to specific content. At the same time, the group collected data through in-depth interviews using a prepared questionnaire for students in the study area.

The effectiveness of this method of information collection depends greatly on the design of a standard questionnaire capable of giving the collectors complete and accurate information about the subject. On the other hand, a well-designed questionnaire will make the collection, statistics and processing of the collected information easy and convenient.

3.2. Methods of processing survey data

In order for the data entry into the SPSS 22.0 statistical software to be effective, the research team will process the collected data so that the data entry is effective and best serves the data analysis process later. Here are some sketches that the team studied, absorbed and applied in this study:

- Firstly, the information about the address of the young people put into the SPSS 22.0 software is short and easy to understand. Due to this criterion, the research team was not able to update all the exact addresses of schools in Hanoi. The schools are arranged by the research team in the order of groups of disciplines: economics-business, technology-engineering, medicine-pharmaceutical, pedagogy, culture-art

- Second, information on the age of youth representatives will be divided into 4 levels compatible with five groups: first year, second year, third year, fourth year.

- Third, the validity of the young people's answer sheets in the survey. Because the biggest goal of the "questionnaire" is to survey opinions and assess the factors affecting sexual behavior in Hanoi students, the determination of what is a valid answer sheet and which one is not. invalid and must be discarded when analyzing data.

After completing the data entry, the team conducts analysis of the obtained data:

- The team conducted Cronbach's Alpha analysis to test the reliability of 3 variables (HV1- HV3) of the Behavior factor – (HV); 5 variables (PL1 – PL5) belong to the Law - Institution factor – (PL); reliability of 5 variables (VH1 - VH5) belonging to socio-cultural factors (VH); reliability of 4 variables (QL1- QL4) of the factor “Student management”- (QL); the reliability of 3 variables (GD1 - GD3) of the factor “Student education”- (GD); reliability of 5 variables (SV1 – SV5) belonging to “Factors belonging to students themselves”- (SV); reliability of 3 variables (TP1- TP3) belonging to the group of factors “Harassment”- (TP).

- The group performed two times of EFA exploratory factor analysis for the independent variables and one time of EFA exploratory factor analysis for the dependent variable.

- The group tested the correlation between variables through Pearson correlation analysis, multivariate regression. From there, the equations of unnormalized regression coefficient and normalized regression coefficient are given.

- Finally, the group tested the regression hypothesis through the residual normal distribution test and the linear relationship between the dependent variable and the independent variable.

4. Results

4.1. Exploratory factor analysis

Through Cronbach' alpha test, the group removed a number of variables that were not reliable enough and left 15 variables of 6 factors for further analysis. The results of testing the reliability of the scale are shown in Table 1.

Table 1. Results of testing of the factor scale

Factor symbol	Factor	Number of observed variables	Cronbach's Alpha coefficient	Research hypothesis
PL	Law – institutions	2	0.751	-
VH	Sociocultural	2	0.616	-
QL	Student Management	2	0.607	-
GD	Student Education	3	0.652	+
SV	Students themselves	3	0.600	-
TP	Harassment	3	0.683	-
HV	Sexual behavior	3	0.685	Dependent variable

Source: Compiled from analysis of survey data.

After performing EFA for the final exploratory factor analysis, the observed variables that could explain less than 0.5 variance of the factor were removed. Bartlett's test has sig. = 0.000 shows that the necessary condition to apply factor analysis is satisfactory. KMO index = 0.814 > 0.5 shows that sufficient conditions for factor analysis are appropriate. The total variance extracted is 63.443 % (greater than 50 %) and the Eigenvalues of the 6 groups of variables are all greater than 1. At the same time, the loading coefficients showing that observed variables in the same group have a good correlation. Therefore, the research team concludes that the group's model is suitable, 6 factors are kept. For the Behavior variable, the test results show that the parameters all meet EFA standards. In which, KMO coefficient is 0.556 (greater than 0.5), Bartlett test has Sig. = 0.000 (less than 0.05), the total variance extracted is 61.574% (greater than 50%) and the Eigenvalue is 1,847. The results of factor analysis (EFA) for the scale of sexual behavior behavior are shown in Table 2. Thus, after removing 3 observed variables including VH4, SV2 and TP1, the remaining 12 observed variables ensure the compatibility. condenser and discriminant.

Table 2. EFA results on sexual behavior scale

Variable	1	2	3	HV
PL2	- 0.816			
QL4	0.806			
PL4	-0.790			
TP3	0.769			
Highway 1	0.664			
GD3		0.853		
SV3		-0,700		
GD2		0.675		
GD1		0.626		
TP2			0.706	
VH3			0.672	
SV4			0.587	
HV2				0.886
HV1				0.768
HV3				0.687
Eigenvalue	3,881	2,648	1.084	1.847
Extracted Variance (%)	32,341	22,069	9,033	61,574

4.2. Multivariate regression analysis

The initial regression model has the form:

In which: HV is the dependent variable; variables: PL, VH, QL, GD, SV, TP are independent variables (explanatory).

Regression results are shown in Table 4. Specifically, the independent variable in the model explained 62.6% of the variation of the dependent variable (R squared adjusted by 0.632). Sig value. in ANOVA equal to 0.000 is less than 0.05, showing that the linear regression model is suitable for the data set. With the regression coefficient estimates, the Sig. in t-test of 6 variables (PL, VH, QL, GD, SV, TP) all < 0.05. In which, the regression coefficient of the factor GD > 0, shows that this independent variable has a covariance with the dependent variable (HV), and the 5 variables remaining has the regression coefficient < 0 shows that this independent variables has contra – variant effect on the depend variable (HV in a statistically significant way. Particularly for the harasser variable (TP), the value of VIF = 2,315 > 2 shows that this factor has multicollinearity, so the research team removed this variable from the model.

Table 3. Coefficients^a – MH1

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	REMOVE	Std. Error	Beta			Tolerance	VIF
(Constant)	5.598	0.309		18.103	0.000		
PL	-0.272	0.056	-0.214	-4.879	0.000	0.534	1,872
VH	-0.222	0.037	-0.236	-5.953	0.000	0.653	1.531
QL	-0.192	0.050	-0.172	-3.851	0.000	0.514	1,945
GD	0.496	0.042	-0.466	11,682	0.000	0.643	1.555
SV	-0.296	0.050	-0,260	-5,978	0.000	0.542	1.845
TP	-0.127	0.046	-0.135	-2.764	0.006	0.432	2.315

After removing the variable TP, the research team ran the model again and got the regression results shown in Table 4.

The normalized regression model reflecting the relationship between the dependent variable is sexual harassment behavior and the independent variables are as follows:

Table 4. Coefficients^a – MH2

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	REMOVE	Std. Error	Beta			Tolerance	VIF
(Constant)	5.698	0.310		18,380	0.000		
PL	-0.211	0.052	-0.166	-4,083	0.000	0.634	1,578
VH	-0.238	0.037	-0.253	-6.403	0.000	0.669	1.494
QL	-0.236	0.048	-0.212	-4,960	0.000	0.573	1,744
GD	0.445	0.039	0.418	11,544	0.000	0.797	1.255
SV	-0.322	0.049	-0.282	-6.548	0.000	0.562	1,781

Based on the results of regression analysis, it can be seen that, among the factors affecting sexual behavior, the factor student education is the most important factor, with an impact rate of 30.65%, next factors belonging to students themselves (22.18%), socio-cultural factors (16.39%), student management factors (16.25%) and finally legal factors – institutions (14.53%).

5. Discussion and Conclusion

5.1. Students themselves

Students need to equip themselves with sufficient knowledge and measures to prevent sexual harassment in life. In particular, students living in an advanced technological society like today need to be careful when making acquaintances, contacts and relationships with acquaintances through social networks; stay away from pervasive debauchery. Besides, each

student needs to have a suitable style of dress, a healthy lifestyle, and need to be aware of the constant threat around us so that it does not become a serious social problem. Each person, specifically students who are sexually harassed, need to have the courage to speak up, erase their own indifference, and remove the psychological barrier of the person being harassed.

5.2. School

The school needs to regularly organize seminars and talk shows on identification and prevention of sexual harassment at the school to help students expose themselves to information about sexual harassment, remove fear when being harassed. Boldly respond and denounce these acts. In addition, the school needs to perfect its regulations and rules on sexual harassment, so it should provide specific rules on words and gestures of lecturers and students; and apply appropriate penalties when such acts occur. In addition, each school needs to set out rules and regulations on sexual harassment for all staff, lecturers and students in the school to master. In addition, the school needs to build and establish a safe learning and living environment for students. In addition to building rules, installing security cameras at potential locations of potential harassment such as stair areas, corridors...; establish student groups to strengthen patrols, ensure security and order, and support students if they are harassed. Set up departments and assign personnel in charge of dealing with sexual harassment issues arising in the school. Equip staff working directly with students with the skills to handle sexual assault cases, develop online reporting tools, work closely with local authorities to provide measures to support students when they are sexually harassed.

5.3. Culture - society

Each person in today's modern society needs to join hands and work together to contribute to building an advanced culture, a civilized and better society. In order to do this, it is essential to fully equip every family with sexual harassment. Therefore, each family member, especially parents, must first understand their own roles and responsibilities; equip themselves and educate and guide their children with knowledge and skills in identifying, preventing and combating sexual harassment acts. Each family should accompany the school and local authorities to have a full awareness of sexual harassment, to transmit and provide knowledge to their children in a complete and timely manner, as well as to right actions with your children. Family members, especially parents, need to regularly care for and ask questions of their children, and share life's problems together to create a comfortable and secure mentality, so that their children can have peace of mind. Open your heart to seek help.

5.4. Laws and authorities

In order to reduce the current problem of sexual harassment, the whole society and state authorities at all levels need to clearly and specifically define concepts related to sexual harassment. A closer look and a more detailed and understandable regulation is needed so that everyone has the ability to fully understand sexual harassment. In addition, a more appropriate level of punishment should be considered for perpetrators of sexual harassment. Appropriate fines will significantly reduce the current state of sexual harassment. Competent state agencies should also develop a mechanism to deal with complaints and denunciations quickly, promptly and appropriately for cases of sexual harassment that occur. A good,

appropriate resolution mechanism will create trust for victims and be a way to support them to overcome difficult situations.

5.5. Conclusion

Through the process of conducting "Study on sexual harassment of university students in Hanoi", the group has provided the influencing factors which are also pointed out clearly, specifically, and easy to understand for readers and experts. viewers. From there, it helps readers have an overview and in-depth knowledge about this sexual harassment problem. Through the research process both at home and abroad, the group has pointed out the alarming situation of sexual harassment happening all over Vietnam in general and Hanoi in particular with students. Thereby, it can be seen that sexual harassment is happening anywhere, anytime and is a burning problem of the whole society.

ENHANCING THE QUALITY OF VIETNAM'S HUMAN RESOURCES IN THE FOURTH INDUSTRIAL REVOLUTION

Dr. Bui Thi Phuong Thuy

thuybuivientriet@gmail.com

Institute of Philosophy, Ho Chi Minh National Academy of Politics, Hanoi, Vietnam

Abstract

The world is entering the Fourth Industrial Revolution, a new manufacturing revolution associated with unprecedented technological breakthroughs related to the Internet of Things, cloud computing, 3D printing, sensor technology, virtual reality, etc. It is strongly affecting every country in the world, including Vietnam. This revolution is a great opportunity to promote industrialization and modernization. However, the shortage of a first-rate workforce is challenging for Vietnam to catch this opportunity. This paper will focus on the three main contents. The first is about the impact of Industry 4.0 on Vietnam's manpower. The second is about the current situation of the labor force. Finally, the author offers some solutions to improve the quality of Vietnam's human resources.

Keywords: *Human resources, Fourth Industrial Revolution, Vietnam.*

1. Introduction

It can be said that the three fundamental factors, namely, application of science and technology, development of infrastructure, and human resource development (HRD), contribute to the rapid and sustainable development of an economy. In which human resources play a vital role. The level of HRD is considered a measure of the development of each country. Therefore, this issue is a concern and valued by many nations worldwide. Inheriting and promoting ancestors' tradition in respecting talents and considering "they the core part of making the country's survival and development," the Party and the State of Vietnam constantly affirm that the "human is the center factor contributing to the development." Currently, in the context of accelerating industrialization, modernization, and international integration, especially the intense impacts of the Fourth Industrial Revolution (Industry 4.0), the problem of human capital is considered a breakthrough. HRD becomes the foundation for sustainable development and increases the national competitive advantage. Due to being in the golden population period, Vietnam's human resources have both the benefits and significant challenges in Industry 4.0. Based on the researched documents and the current situation of the labor force in Vietnam, the study will analyze the opportunities and challenges for the Vietnamese workforce under the impacts of Industry 4.0. Finally, the author proposes essential solutions to raise the quality of human capital in Vietnam.

2. Method

The study used basic methods such as secondary data research, primary and secondary data collection, and analytical methods.

3. Results

3.1. Impacts of Industry 4.0 on human resources in Vietnam

Up to now, the world has experienced 3 industrial revolutions. The first was Industrial Revolution 1.0 through the mechanization of production (taking place between 1760 and 1840 with the invention of the steam engine.) The second was the Industrial Revolution 2.0 with early factory electrification and the production line (from the late 19th century to the first half of the 20th century). The third was the Industrial Revolution 3.0, or Digital Revolution, characterized by the spread of automation and digitization through the use of electronics and computers, the invention of the Internet (taking place from about the 1960s to the first decade of the 21st century). Currently, we are in the first stage of Industry 4.0. Its feature is to integrate all the achievements of the previous 3 revolutions but raise it to a new level of qualitative development, associated with artificial intelligence, intelligent robots that can autonomously learn, the Internet of Things, cloud computing, and big data processing.

The four main features of the Fourth Industrial Revolution can be generalized as follows. The first is to combine new sensor technology, big data analytics, cloud computing, and the internet of things to promote the development of automated machinery and Intelligent Manufacturing Systems (IMS). The second is to use 3D printing to manufacture products completely thanks to the unification of production lines and not through the assembly of auxiliary equipment. This technology also allows users to print new products using modern methods, eliminate intermediaries, and reduce production costs as much as possible. The third is nanotechnology and new materials, creating new material structures widely applied in most sectors. The last is artificial intelligence and control, allowing people to control remotely, not be limited in space and time, and interact faster and more accurately.

Unlike previous revolutions, Industry 4.0 has a massive difference in speed, scope, and impact. It has grown and spread much faster than previous revolutions. The range of Industry 4.0 is comprehensive and covers all fields. It is forecasted to change the entire production, management, and administration system worldwide, strongly impacting life, economy, politics, society, government, businesses, organizations, individuals, etc. Therefore, to maintain a competitive advantage and catch up with advanced countries, many nations, including Vietnam, are focusing on developing and applying the technological achievements of Industry 4.0. Whether Vietnam makes good use of opportunities and overcomes challenges in the Fourth Industrial Revolution depends on many factors, especially the outstanding workforce. In this process, the staffing needs to have enough knowledge and high-level skills to master modern technology and meet the transformation of application of Industry 4.0 technologies.

Before the rapid development and impact of Industry 4.0, Vietnam's human resources have advantages and challenges.

In terms of opportunities, Industry 4.0 brings many benefits to employees by increasing labor productivity, leading to increased income. Many new products and services have been launched, improving the quality of life. In particular, opening the labor market will create many new jobs.

Besides opportunities, Vietnam also faces many new difficulties in human resource development:

Firstly, Industry 4.0 has drastically changed the labor structure and the labor market. The traditional occupations using many labors gradually disappear and be replaced by new ones. Industry 4.0 has produced automation systems and intelligent robots. These systems will replace manual labor. Thus, there will be a shift from labor-intensive production to knowledge- and technology-intensive production. According to the United Nations, about 75% of the world's workers will lose their jobs in the next few decades. Another study by the International Labor Organization (ILO) said that about 56% of workers in five Southeast Asian countries were at risk of losing their jobs because of the appearance of robots²⁰⁶. Vietnam is one of the countries most affected by Industry 4.0. Vietnam's labor force is relatively abundant but mainly low-skilled workers, so they are easily replaced by machines. In the future, modern machines will gradually replace the simple and repetitive tasks they are in charge of.

According to the forecast of the Ministry of Science and Technology, some professions in Vietnam will disappear in the future, which puts significant pressure on the labor market.²⁰⁷ According to the International Labor Organization, up to 86% of Vietnamese workers in the textile and footwear industries will be at risk of losing their jobs in the next 15 years. For the traditional agricultural sector in Vietnam, manual labor and highly repetitive jobs are likely to be replaced by automated machines and equipment. Some high-risk occupations are farming, breeding, horticulture, fishing, and aquaculture. However, Industry 4.0 will create many new industries and jobs that robots cannot fulfill, so it requires workers to have high skills and qualifications to meet the needs of society.

Secondly, many economic researchers argued that this revolution could bring about greater inequality, particularly the potential to disrupt the labor market. The labor market could be strongly differentiated. Besides, cheap labor will no longer be a competitive advantage for many countries globally. Moreover, many traditional occupations will be lost, and the international labor market will sharply distinguish between low-skilled and high-skilled groups. In addition, artificial intelligence (intelligent robots) reduces the need for a low-skilled workforce. In particular, Industry 4.0 also affects middle-skilled workers if they are not equipped with new skills, namely creative skills. With the rapid development of technology, the demand for highly qualified and skilled labor will be higher and higher in the future.

Thirdly, under the impacts of Industry 4.0, the requirement for high-quality human resources is increasingly urgent. In fact, Vietnam's economy still relies on industries that use cheap labor and exploit natural resources, and workers' qualifications are still weak. Industry 4.0 is significantly changing the production and business methods of enterprises globally. The number of jobs requiring exceptional labor is lifting. Therefore, if workers

²⁰⁶ <http://tapchitaichinh.vn/nghien-cuu-trao-doi/nhieu-thu-thach-cho-nguoi-lao-dong-thoi-40-140389.html>.

²⁰⁷ <https://www.most.gov.vn/vn/tin-tuc/14092/nguon-nhan-luc-chat-luong-cao--san-sang-truoc-cach-mang-cong-nghiep-4-0.aspx>.

have enough knowledge and skills (including hard skills in digital, technology, programming, human-robot interaction, and soft skills such as thinking ability, personal skills, social skills, etc.), they can meet the job requirements. Besides, the process of international integration will form and promote the vigorous development of regional and global labor markets. First-rate personnel must meet not only domestic requirements and standards but also those of foreign markets. It is one of the biggest challenges when Vietnam enters Industry 4.0. Therefore, it is indispensable to actively train human resources and implement vocational education to match market demand.

Besides the requirement for high-quality human capital, there is fierce competition for human resources. Firstly, competition will appear in some areas where technology is being widely applied, creating pressure to recruit and develop employees. In Vietnam, workers in artificial intelligence, the Internet of things, self-driving cars, robotics, etc., are being actively sought and paid handsomely. The most important thing is that wage expenses for this group can increase by 50 to 100% per year in a few years. An abundant human resource is no longer a competitive advantage. Thanks to technology, it's easy for companies to coordinate and execute tasks previously only done by large companies and focus on applying technology to new business models to create a distinct competitive ability.

To take advantage of opportunities and overcome challenges from the Fourth Industrial Revolution, Vietnam shall solve the problem of exploiting the workforce, especially in building and developing high-quality staff.

3.2. The current situation of human resources in Vietnam

In the face of the trend of international integration, globalization, and the impact of Industry 4.0, the requirement for a proficient labor force has become urgent for all countries. Due to being aware of the critical role of human resources, especially high-quality workers, the Party set forth a policy to implement the strategy on human resource development at the 11th National Congress of the Communist Party of Vietnam. In recent years, training and cultivating human capital to meet the development requirements of the country as well as the development trend of the world have been paid more attention by the Party and State. The Prime Minister issued a Directive on strengthening capacity to approach Industry 4.0 in 2017. Up to now, Vietnam has published many documents related to this topic. Training activities are changing to meet the labor needs of Industry 4.0 by developing training programs under output standards with knowledge, skills, and technology standards of Industry 4.0. As a result, Vietnam's human resources have positive changes, making a significant contribution to socio-economic development. The size of the workforce continues to grow. According to the report on labor and employment in 2020 of the General Statistics Office of Vietnam, the labor force aged from 15 was estimated at 54.84 million people, accounting for about 56% of the total population.²⁰⁸ This source of labor is relatively abundant. They are intelligent, hardworking, adapt quickly to modern technology, and are an important resource in the period of accelerating industrialization, modernization, and

²⁰⁸ https://www.gso.gov.vn/wp-content/uploads/2021/08/sach_laodong_2020.pdf.

integration. This factor is one of the favorable conditions for Vietnam in the Fourth Industrial Revolution. The education and professional and political qualifications of workers are increasingly improved. The number of workers with knowledge and mastery of advanced science and technology has increased. In industrial parks, enterprises in the non-state sector, and foreign investment capital, employees are exposed to advanced machinery and equipment and work with foreign experts. Therefore, they can improve their qualification and skills and be trained in the working style and advanced methods. The young workforce with education and culture trained under professional standards from the beginning stage in the modern production process will be the central workforce and positively impact industrial production and the value of industrial products, helping to increase the competitiveness of the economy in the future. High-quality human resources have also increased significantly. The most important thing is that some industries such as healthcare, mechanical engineering, technology, and construction have reached regional and international levels.

In addition to the advantages, there are many limitations in terms of human resources. Although Vietnam is in the period known as the golden population structure, we still lack employees, especially excellent ones. Besides, this workforce is limited in quality and has structural inadequacies. The report of the World Economic Forum in 2018 assessed that Vietnam's human resources were not ready for the 4IR and ranked 70 out of 100 countries. Due to low skills and the nature of labor, they are vulnerable to technological breakthroughs, lose their jobs, and are replaced by automation, robots, and artificial intelligence. We also ranked 90 out of 100 countries regarding technology and innovation. Highly qualified staff is also in the last group, ranking 81 out of 100 countries (view table). In particular, labor productivity was very low, equal to 7% of Singapore's labor productivity.²⁰⁹ According to the Ministry of Planning and Investment, with the current rate, it will not be until 2038 that our labor productivity can catch up with the Philippines' labor productivity. We will catch up with Thailand in 2069. Therefore, if we do not focus on improving the quality of workers and making training plans, we will have a severe shortage of labor if big projects are invested in Vietnam.

Table 1. Ranking of factors “Dynamics of production” of Vietnam and Asean countries

	Singapore	Malaysia	Thailand	Philippines	Vietnam	Indonesia	Cambodia
Technology and bright	6	23	41	59	90	61	83
Human resources	2	21	53	66	70	55	86
Highly skilled labor	1	45	78	50	81	83	87

²⁰⁹ <https://vietnamnet.vn/loi-giai-bai-toan-nguon-nhan-luc-nhan-taitrong-thoi-dai-40-713560.html>.

Human resource training in general and vocational training, in particular, has changed markedly in recent years, but it has not achieved outcomes and has not met the requirements of the economy. The number of trained and qualified workers from vocational training courses accounts for only about 24% of labor.²¹⁰ It is a low rate, adversely affecting the acquisition of science and technology, labor productivity, and product quality. Moreover, this 24% of the trained workforce has many weaknesses. Vocational training quality ranks 80 out of 100 countries, just above Cambodia (ranking 92 out of 100 countries.)

Source: WEF Readiness for Future of Production Report 2018

In the future, when we implement new-generation FTAs, and barriers in terms of economic space, goods, services, capital, science, technology, and the labor market will be removed, competition between countries will become more intense. Currently, ASEAN has an Agreement on the Movement of Natural Persons and Mutual Recognition Agreement on official practice certificates for eight professions, including audit, architect, engineer, dentist, doctor, nurse, investigator, and tour guide. The mutual recognition of vocational skills will be one of the vital conditions in implementing labor mobility between Vietnam and other countries in the region. It will also be a challenge for Vietnam because the number of our skilled workers is still limited. We have to accept the source of labor that migrates from other countries with higher qualifications. If the capabilities of our workers are not improved to meet the requirements, we will lose at home.

With the current situation of human capital, it is difficult to take advantage of the opportunities opening to our country. If the problem of improving the quality of staff cannot

²¹⁰ General Statistics Office of Vietnam (2021), *The report on labor and employment 2020*, Statistical Publishing House, p.12,15.

be solved in the future, Vietnam will be at the risk of a crisis in the quality of human resources. The result is a decrease in the economy's competitiveness, difficulty in escaping from the middle-income level, and loss of opportunities to participate in the international labor market.

3.3. Some solutions to improve the quality of human resources

The Resolution of the 5th plenum of the 12th Party Central Committee emphasized: "It is necessary to develop human resources, especially first-rate ones, to take advantage of the opportunities and achievements of the Fourth Industrial Revolution."²¹¹ It is crucial to have an overall and long-term strategy with a system of synchronous, practical, and feasible solutions. Thus, we can focus on researching and implementing the following primary duties.

Firstly, it is significant to focus on building and perfecting the overall strategy, the system of mechanisms, and policies for developing high-quality human resources. The system of mechanisms and policies has a principal role because it directly or indirectly creates a driving force to promote or hinder the growth of the economy and society in general and excellent staff in particular. Our country has had many new mechanisms and policies leaving a positive impact on the development of high-quality human resources. However, there were many limitations in the implementation process, and the achieved results were not commensurate. Therefore, to develop an excellent workforce, adjusting, supplementing, and perfecting the system of mechanisms and policies are essential, creating a legal framework and facilitating the development of high-quality workers in Industry 4.0.

Renovating and improving mechanisms and policies to motivate the development of a superior labor force must be carried out synchronously in many aspects, such as education and training, science and technology, working environment, employment policy, income, social security, insurance, social protection, health care, labor market policies, housing, living conditions, and settlement, etc. The State shall continue to renovate institutions and perfect the legal framework from central to local levels to create a favorable environment for human resource development. In addition, the development of high-quality labor markets and scientific and technological products should be encouraged toward integration. Building a legal environment for developing new business lines in Vietnam that are starting to emerge after Industry 4.0 is also an urgent task.

Secondly, it is necessary to focus on and improve the quality of short-, medium- and long-term forecasting of human resource demand, employment demand, and training demand in industries and professions affected by Industry 4.0. This content needs to be paid more attention to because the Fourth Industrial Revolution will significantly impact the economy's structure. The possibility of decline, even loss of many professions, as well as the emergence of new ones in the future, is possible, which will lead to considerable changes in the employment structure. We still lack the specific observations and assessments of each industry and their difference in the context of Industry 4.0. Therefore, it is necessary to

²¹¹<https://tulieuvankien.dangcongsan.vn/van-kien-tu-lieu-ve-dang/hoi-nghi-bch-trung-uong/khoa-xii/nghi-quyet-so-11-nqtw-ngay-362017-hoi-nghi-lan-thu-nam-ban-chap-hanh-trung-uong-dang-khoa-xii-ve-hoan-thien-the-che-kinh-561>.

forecast human resources associated with vocational training and education. In fact, in vocational education and training at colleges and universities, because there is no forecast of labor demand, as well as vocational training plans, schools often train based on their inherent capabilities and haven't linked to the actual needs of society and the market.

Thirdly, innovating and advancing the quality of education and training need to be associated with the mechanism of recruiting, using, and offering compensation to talent. It is necessary to transform the educational process from equipping knowledge to comprehensively developing learners' capabilities and qualities, from learning in the classroom to diverse forms of learning, such as online teaching and learning, social activities, extracurricular activities, and scientific research. It is required to train people to help them have ethics, discipline, awareness, social responsibility, life skills, job skills, foreign languages, creative thinking, and be familiar with information technology, digital technology, and international integration. The synchronous renovation of educational and training goals, contents, programs, and methods toward modernity, global integration, and comprehensive human development also plays an important role. Next, we shall develop high-quality technical and vocational education and training institutes, associate education and training with scientific and technological research, and form research centers and innovation groups. At the same time, improving the quality of education and training must be linked with the mechanism of recruiting, using, and giving compensation to talent. However, if there is a high-quality human resource, but there is no good recruitment, use plans, and compensation, we are not able to attract this force, leading to a "brain drain." Meanwhile, the talented are increasingly scarce because they must overcome a process of arduous learning and long training. Therefore, giving specific, practical recruitment plans and policies and creating a favorable environment to attract them are indispensable duties.

Lastly, it is compulsory to associate human resource development with promoting research, transfer, application, and development of science, technology, and innovation. To develop a workforce, especially a high-quality one, we need to link training tasks to scientific research, production, business, and the needs of the labor market. This requires us to "continue to implement the policy that is "science and technology are the top national policy and the key driving force for the development of a modern labor force, have a strategy for science and technology development in line with the general trend of the world and the country's conditions, and focus on synchronous development of natural sciences, technical and technological sciences, social sciences and humanities, and political theory."²¹² At the same time, connecting human resources development with the promotion of research, transfer, application, and development of science, technology, and innovation plays a vital part. It's significant to "strengthen the capacity of the national innovation system, restructure scientific and technological research programs towards business-centered, and consider serving the cause of national construction and defense the goal."²¹³ Moreover, domestic and foreign

²¹² The Communist Party of Vietnam (2021), *Documents of the 13th National Congress*, Volume I, Truth National Political Publishing House, p. 140.

²¹³ The Communist Party of Vietnam (2021), *Documents of the 13th National Congress*, Volume I, Truth National Political Publishing House, p. 141.

investors should be encouraged to establish prime universities and research institutes to meet development needs and promote human resources, especially an excellent workforce.

4. Discussion and Conclusion

In summary, when Vietnam is entering the Fourth Industrial Revolution with low socioeconomic status, the requirement to improve the quality of human capital is decisive for the success of the innovation career. The Vietnamese Party has determined that improving personnel quality must be the primary factor for rapid and sustainable development. Therefore, human resources shall be concerned and create favorable conditions for capacity improvement. It can be stated that high-quality human capital, rich in will and aspiration, with revolutionary ideals, in a reasonable quantity and structure, will be the driving force to turn our country into an industrialized one towards modernization and meet the requirements of Industry 4.0.

WHAT SKILLS ARE ESSENTIAL FOR STUDENTS IN HOTEL MANAGEMENT: THE REALITY AND REQUIREMENTS FOR TRAINING AT EDUCATION INSTITUTIONS

Dr. Hoang Van Hao

hao@dhcd.edu.vn

Faculty of Business Administration, Trade Union University, Hanoi, Vietnam

Dr. Nguyen Phuong Nga

nga.nguyenthiphuong@phenikaa-uni.edu.vn

Faculty of Tourism Studies - Phenikaa University, Hanoi, Vietnam

Abstract

The study identifies essential skill groups for Hotel Management students, including reasoning, analyzing and problem solving skills; knowledge discovery and research skills; system thinking skills; teamwork and communication skills; and occupational skills. The study surveys 161 people including: (i) officials and managers working in hotels; (ii) experts, scientists, lecturers and (iii) Hotel Management alumni. Observed variables have been tested in reliability using Cronbach's Alpha; analyzed for the differences among group means in the sample using one-way analysis of variance (ANOVA). The research results show that Skills of teamwork and communication and Occupational skills are highly appreciated in terms of necessity with average values of 4.6460/5.0 and 4.6071/5.0 respectively. Those results could be used to measure the world of work's demands for employees and to lay the groundwork for adjustments in training curriculum to meet society's needs.

Keywords: *skills, hotel management, higher education*

1. Introduction

Hotel activities are quite career-specific. For the hotel industry, workers' skills are identified as one of the most important factors determining the existence and development of a hotel. For Hotel Management students, skills taught in school are an important foundation in forming their ability to satisfy job requirements. Identifying the necessary skills that these students must possess through researching the needs of businesses, visions of training institutions and students' self-reflection provides the general desired skills output of Hotel Management training program.

In the world as well as in Vietnam, many studies have identified a set of skills expected from Hotel Management students, focusing on: communication skills, reasoning and problem solving skills, occupational skills, creative thinking skills. However, the necessity level or the required level of students for each skill has not yet been fully researched. This study used the Bloom scale to set the desired level of each skill group for Hotel Management students. Institutions could consider these findings while building their own competency scale, and from there make adjustments to their training programs.

2. Literature Review

Skills are an individual's ability or specialized ability in a certain field or aspect to meet the needs of life and work. Skills are expressed through an individual's actions in that individual's own environment. They are formed spontaneously or voluntarily, depending on the circumstances in which the skill is exercised. For the hospitality industry, employees' skills show their professionalism and act as part of the business's image to their customers. Research on essential skills in tourism and hospitality education has been done since the 1970s. James Buergermeister (1983) confirmed that students' skills and attitudes will affect the development of each business.

In Portugal, Daniela Wilks and Kevin Hemsworth (2011) analyzed and compared the needs of hotels to training institutions' ability to satisfy those needs regarding Hotel Management students. This study shows that most institutions paid very little attention to developing skills for students. Consequently, students' soft skills level did not meet the requirements of businesses. Kong Hai-yan and Tom Baum (2006) determined that, for hotel receptionists, communication skills and the ability to withstand work pressure are necessary, and proposed that these skills to be included in Chinese educational institutions' program. Ardel A. Nelson and Lea Dopson (2001) concluded that staff's knowledge and skills have been the vital factor of the hotel system in the United States since 2000. They believed that the success of institutions could be measured by the quality of its graduates and the ability to retain them of hospitality businesses. A good education system is to meet enterprises' requirements of employees' skills and attitudes.

Sousa et al (2019) analyzed leadership skills in hotel management in the context of The Fourth Industrial Revolution: adaptive ability, creative thinking skill, analytical ability, reasoning and problem-solving skill. Maria José Sousa (2019) argued that adaptive skills are a must for Hotel Management students in the context of Industry 4.0. The change of science and technology entails a change in the needs of guests, booking systems, and services in hotels. The global socio-economic scene requires hotel workers to adapt quickly. Maria José Sousa also said that skills of creative thinking, analyzing, and assessing problems are also essential for Hotel Management students. Specifically, Wang (2009) identified skills that are essential to students of Hotel Management in the context of Industry 4.0, grouped into: skills to use online platforms for hotel activities, communication skills, teamwork skills, skills to assess, analyze and solve problems. The research has also confirmed that using web platforms in hotel operations and management will enhance cooperation, improve knowledge and occupational skills, as well as other personal skills.

For the hospitality industry, employees working in the organization are not only trained workers at higher education institutions, but also workers with college and intermediate degrees due to the service industry's nature. However, Burns (1997) pointed out that hotels still need to have "unskilled labor" possessing basic requirements such as communication skills, appearance and foreign language skills and a positive working attitude. Employees' attitude, behavior, especially "the power of a smile" show their professionalism and conscientiousness. Therefore, training activities need to emphasize that

the professionalism of hotel staff is reflected from the way they communicate and behave. Samuel Adeyinka-Ojo (2018) pointed out employees' skills that were still lacking in hotels and tourism activities. The author said that human resources in hotels lack 14 basic skills and proposed a general skill framework for workers in the hotel industry. In addition to assessing the skills that are lacking in hotel workers, many studies have focused on finding skills differences between Hotel Management students and students of other majors working in the hospitality industry. The research results showed that formally trained employees have better skills in general (namely communication skills, teamwork skills, case analysis skills, information searching skills, critical thinking skills (Alhelalat, 2015)). Daniel Wood (2003) concluded that it is more effective to train and develop occupational skills in specialized education institutions than at hotel enterprises.

On the basis of analyzing the lacking skills of Hotel Management students and the needs of enterprises, comparing the need of different skills in specific hotel working environment, this research will identify skills that should be focused on in the training program of higher education institutions in Vietnam.

3. Method

3.1. Recommended measurement scale

From different researchs on learners' skills in higher education, the authors have synthesized and proposed skills to be surveyed. The proposed skill groups are shown in Table 1 below.

Table 1. Measurement variables used in the study

VARIABLES	Variables Name
<i>Skills of reasoning, analyzing and problem solving</i>	
Analyze and accurately evaluate the actual performance of each hotel department	SKILL1
Correctly detect problems in hotel management activities and propose solutions to those problem	SKILL2
<i>Skills of researching and discovering knowledge</i>	
Analyze information and data about hotel activities	SKILL3
Correctly apply scientific research methods to explain problems in hotel management activities	SKILL4
<i>Skills of system thinking</i>	
Analyze the hotel's objectives, strategies and operating policies	SKILL5
Analyze the relationship between hotel departments and between provided services in a hotel	SKILL6
Analyze the relationship between hotel resources	SKILL7
Determine the order of priorities in hotel management to ensure the goals of stakeholders	SKILL8

VARIABLES	Variables Name
<i>Skills of teamwork and communication</i>	
Build and manage an effective working group	SKILL9
Execute the assigned tasks properly	SKILL10
Smoothly share and coordinate work with team members	SKILL11
Demonstrate skills of effective listening, speaking and text composing	SKILL12
Demonstrate skills of presentation, negotiation, responding to complaints	SKILL13
Use English fluently and have basic use of another foreign language to handle work in hotel management activities	SKILL14
<i>Occupational skills</i>	
Demonstrate skills to complete basic hotel tasks	SKILL15
Demonstrate customer service skills	SKILL16
Use office software, hotel management software, applications and online tools in hotel administration	SKILL17
Demonstrate skills in planning, organizing, directing, coordinating and managing hotel activities	SKILL18

Source: Author's suggestions

3.2. Sample and survey method

This research was based on a survey research design method. It involved a self-designed questionnaire in collecting data, structured with a section about the professional context of the respondents and a set of questions about skills, focusing on assessing the important level of each skill. With respect to provided statements, a Likert scale from 1 (*Very unnecessary*) to 5 (*Very necessary*) was created, to allow respondents to indicate the level of importance of these competencies in their opinion. The study surveyed 161 people: (i) officials and managers working in hotels; (ii) experts, scientists, lecturers and (iii) Hotel Management alumni and the details are presented in Table 2.

Table 2. Descriptive statistics of survey sample

Sample characteristics	Number	Ratio (%)
Sex		
Male	81	50.3
Female	80	49.7
Age		
Under 30	84	52.2
From 30 to 60	69	42.8
Over 60	8	5.0
Academic level		

Sample characteristics	Number	Ratio (%)
Postgraduate	60	37.3
Undergraduate	97	60.2
Others	4	2.5
Respondents		
Officials and managers working in hotels	64	39.8
Experts, scientists, lecturers	35	21.7
Hotel Management alumni	62	38.5
Seniority in the field of hotel		
Under 5 years	85	52.8
From 5 to 10 years	30	18.6
Over 10 years	46	28.6
TOTAL	161	100

Source: Author's own elaboration

3.3. Data analysis method

Data from 161 questionnaires were imported then analyzed using SPSS (version 25). The implementation of descriptive statistics using SPSS software provided basic information about the survey sample (as described above in Table 1). Observed variables were tested in reliability using Cronbach's Alpha. In each scale, the Corrected Item - Total Correlation was tested to find the correlation between an observed variable with all other variables in the scale. After examining the reliability of the scale, descriptive statistics analyzed the assessments of respondents about the necessity of each Hotel Management students' skill. One-way analysis of variance (ANOVA) was used to see if there were differences in the assessment of each target group.

4. Data analysis

4.1. Reliability Analysis

The reliability analysis allows to analyze the internal consistency and Cronbach's Alpha is the best test to measure data reliability. Test results showed that Cronbach's Alpha values are all greater than 0.6. The highest Cronbach's Alpha coefficient is 0.835 for Skills of reasoning, analyzing and problem solving (2 observed variables). The lowest Cronbach's Alpha coefficient is 0.757 for Skills of researching and discovering knowledge. In addition, the relationship coefficients between observed variables and the total variable in each scale are all greater than 0.3. Thus, it could be concluded that the built scale system of five scales ensured a very good internal consistency with 18 observed variables. The research then could proceed with further analysis.

Table 3. Reliability Statistics

Variables	Cronbach's Alpha	Number of variables
Skills of reasoning, analyzing and problem solving	0.835	2
Skills of researching and discovering knowledge	0.757	2
Skills of system thinking	0.820	4
Skills of teamwork and communication	0.828	6
Occupational skills	0.813	4
TOTAL		18

Source: Author's own elaboration

4.2. Assessments on the need for each skill for Hotel Management students

To analyze the need of each skill groups, the authors performed descriptive statistics using the collected data to calculate the average value and determine the standard deviation of all five proposed scales (details in Table 4). Regarding the volatility, dispersion of the data, the deviation from the average value of all five variables are low (ranging from 0.3903 to 0.6710), showing that the mean is representative in statistics. Respondents considered initially proposed skills are all essential for Hotel Management students. Skills of teamwork and communication are arguably the most essential with an average score of 4.6460, followed by Occupational skills with an average value of 4.6071. Skills of system thinking and Skills of reasoning, analyzing and problem solving have average values of 4.4596 and 4.4720 respectively. Skills of researching and discovering knowledge have the lowest average value of 4.3292.

The results reflected the professional characteristics of working positions of Hotel Management students. Skills of teamwork and communication as well as Occupational skills are highly appreciated due to the nature of their working environment which consists of regular contact with guests. Employees meet a wide range of customers everyday thus are required to be able to adapt to all requirements in the most effective way. The Likert scale first is used to determine the desired level of each skill, then the Bloom scale is used to determine the required outcome after training at higher education institutions.

The difference in the necessity of skill groups is not significant. With 161 samples surveyed, Skills of teamwork and communication and Occupational skills have the highest average value (around 4.6), Skills of reasoning, analyzing and problem solving and Skills of system thinking have an average value of around 4.4; Skills of researching and discovering knowledge averages at 4.3. The value of standard deviation ranges from 0.3 to 0.6 which is still within the acceptable range. This showed that the necessary skill groups of Hotel Management students are quite comprehensive, requiring flexibility in thinking, career skills and the ability to adapt to changes in the context of the hotel industry.

Table 4. Mean and Standard Deviation Measures

Variables	Observations	Min value	Max value	Mean	St Dev
Skills of reasoning, analyzing and problem solving	161	2.00	5.00	4.4720	0.5949
Skills of researching and discovering knowledge	161	1.50	5.00	4.3292	0.6710
Skills of system thinking	161	2.75	5.00	4.4596	0.5324
Skills of teamwork and communication	161	3.33	5.00	4.6460	0.3903
Occupational skills	161	2.50	5.00	4.6071	0.4683

Source: Author's own elaboration, 2020

4.3. Analysis of the differences between groups of respondents

One-way ANOVA test was used to determine if there were differences of opinion between groups of respondents. The results are presented in Table 5. ANOVA (at 95% confidence interval) has shown that there is no statistically significant difference between surveyed groups. The assessment of the necessity of skill groups has a high uniformity of Officials and managers working in hotels, Experts, scientists, lecturers and Hotel Management alumni.

For Skills of reasoning, analyzing and problem solving, Officials and managers rated the importance of these skills at 4.5078, while Experts, scientists, lecturers and Alumni gave them the score of 4.4143 and 4.4677 respectively. There was not much difference but it showed how much businesses expect students to be well equipped in analyzing and solving problems. For Skills of researching and discovering knowledge, the level of desire and determination of the need does not differ, but there is a small difference between evaluation groups (0.1). For Skills of system thinking and Skills of teamwork and communication, there is almost no difference. Enterprises and experts and scientists shared the same view regarding Occupational skills while alumni responded with higher levels of desire and necessity (0.1).

Generally, the necessary level of skill groups for Hotel Management students are agreed between related parties: employers, training institutions and learners.

Table 5. Mean for the need of each skill of Hotel Management students divided by respondent groups

Variables	Mean	F value	Sig.
Skills of reasoning, analyzing and problem solving		0.280	0.756
Officials and managers working in hotels	4.5078		
Experts, scientists, lecturers	4.4143		
Hotel Management alumni	4.4677		

Variables	Mean	F value	Sig.
Skills of researching and discovering knowledge		0.259	0.772
Officials and managers working in hotels	4.3672		
Experts, scientists, lecturers	4.3429		
Hotel Management alumni	4.2823		
Skills of system thinking		0.153	0.859
Officials and managers working in hotels	4.4883		
Experts, scientists, lecturers	4.4429		
Hotel Management alumni	4.4395		
Skills of teamwork and communication		0.110	0.896
Officials and managers working in hotels	4.6328		
Experts, scientists, lecturers	4.6714		
Hotel Management alumni	4.6452		
Occupational skills		0.587	0.557
Officials and managers working in hotels	4.5703		
Experts, scientists, lecturers	4.5857		
Hotel Management alumni	4.6573		

Source: Author's own elaboration

5. Discussion and Conclusion

The need for each skill group of Hotel Management students has been confirmed through specific parameters based on assessments of related parties: Representatives of businesses, Researchers, and Alumni. All mentioned skills play important roles in building employees' ability to satisfy their job responsibilities.

On the basis of those research results, the authors propose some suggestions to institutions in developing their Hotel Management programs: i) With regard to characteristics of the hospitality industry, students need time to practice and actively participate in hotel activities while studying. Therefore, training programs need to *increase students' practice time*. Hotel Management programs should comply with Ministry of Education and Training's guidelines in setting a minimum practice time of 50% of total student learning time. Practical activities could be executed at institutions if their facilities for practice are similar to those of hotels; or operated in accommodation establishments as part of the cooperation between training institutions and enterprises. This helps students get exposed to the professional environment, practice occupational skills, communicate, work in groups and adapt to the ever changing business world. ii) Training programs should *clearly define the outcome standards for each skill*, the desired level of achievement of students based on the assessments of businesses. Prioritize specific skill groups students are expected to be proficient at: for Hotel Management students, the most important one is Skills of teamwork and communication, the second in line is Occupational skills. Additionally, the

skills to adapt to change and manage risk are also required in the hospitality industry. iii) Encourage students to participate in *scientific research*, form start-up ideas, focus on training skills related to digital technology (applied informatics, specialized informatics); social activities, soft skills clubs.

FACTORS AFFECTING JOB SATISFACTION OF TEACHERS OF HANOI COLLEGE OF INDUSTRIAL ECONOMICS

Doan Thi Ha Thanh

hathanh6683@gmail.com

Hanoi College of Industrial Economics, Hanoi, Vietnam

Abstract

The job satisfaction of lecturers is an important factor to contribute to improve the effectiveness of the education system. The number of research on job satisfaction in colleges is very limited in developing countries which include Vietnam. This article aims to identify several factors and their influences on job satisfaction of college lecturers. The study conducted a survey of 125 lecturers at Hanoi College of Industrial Economics. The results show that the satisfaction of lecturers is influenced by personal factors, co-worker relationships, working conditions and managers' attention.

Keywords: *Job satisfaction, influencing factors, lecturers.*

1. Introduction

Job satisfaction refers to an employee's emotional state which covers the complete range of emotions from positive to negative (Zhang, Yao, & Cheong, 2011). Thus, job satisfaction can also be defined as pleasantness or unpleasantness of employees during their work. Besides, job satisfaction can also be described as a positive feeling about a job or job experience (Tutuncu & Kozak, 2007). On the other hand, Fisher (2000) claimed that job satisfaction is a kind of attitude and attitudes generally contain two components which are affective components (feeling and emotional) and cognitive components (comparison, judgment and belief). Job satisfaction can be seen as the result of a chain reaction involving the motivation to satisfy a need. This chain combines several factors or motivators which will influence or induce an individual to perform (Marzuki, Permadi, & Sunaryo, 2012).

An important factor that determines the success of the college and university education system is the quality of lecturers who teach and research. Job satisfaction of lecturers is an important factor in improving the quality of researching and teaching as well as the quality of the education system. According to the theory of management science, employees' job satisfaction is based on the expectations of work results and these expectations depend on factors such as the nature of work, salary, benefits, promotion opportunities, management strategy (Duong Minh Quang, 2018). If employees perceive these factors as positive, employees have a tendency to do better work results. In addition, job satisfaction directly affects the productivity, attitude and working spirit of lecturers. When lecturers are satisfied with their work, they will be more engaged and devoted to their work (Spector, 1997).

The job satisfaction amongst the lectures is determined by the presence of job pleasure and absence of job dissatisfaction. Job dissatisfaction and job pleasure are regarded

to be important constituents of job satisfaction. The behavior of a lecturer is influenced by attitude and values. A lecturer, who is pleased and cheerful at the workplace, is always satisfied with work and this improves the quality of work. Job satisfaction benefits the organization in numerous ways. It results in the decline in complaints and grievances, absenteeism, turnover, and termination; it improves punctuality and employee morale. It is also a good sign of longevity; the individuals who are satisfied with their jobs, remain within the workplace for a long period of time (Grover, & Wahee, 2013).

This article aims to evaluate the factors to the job satisfaction of lecturers at Hanoi College of Industrial Economics.

2. Method

The study used survey questionnaires to collect data from 130 lecturers of Hanoi College of Industrial Economics. From 130 survey questionnaires, 125 valid answers were collected (accounting for 96.2%). This result shows that the percentage of questionnaires collected is acceptable to analyze the number of valid votes collected after being distributed from 30% to satisfy the condition (Malaney, 2002).

In this study, the results of factor analysis, extracted variance and Cronbach's alpha coefficient were performed to assess the reliability of 8 factors on job satisfaction of lecturers. According to Hair, the selection criteria to satisfy the requirements include: factor analysis values ≥ 0.5 ; extracted variance $\geq 60\%$, and Cronbach's alpha coefficient (Cronbach's α) ≥ 0.6 (Hair, 2009).

3. Results

3.1. Research models

According to Hoppock (1935), job satisfaction is a combination of psychology, physiological circumstances and working environment, affecting employees during job performance. Spector (1997), job satisfaction is demonstrated as employees feel like the work they are doing and they understand all aspects of their work. Job satisfaction is generally considered to be an emotional state caused by the employee's evaluation and attitude in the process of performing work or the returns from the job (Cantele, 2018).

Henry et al. (2013) investigated the relationship and impact of internal and external job satisfaction on the intention to quit their job as lecturers in three universities in Tanzania. Internal job satisfaction is measured by 12 variables including ability utilization, achievement, activities, authority, creativity, independence, moral values, responsibility, security, social services, social status and diversity. External job satisfaction is measured by 6 variables including: advancement, policies, compensation, recognition, supervision - human relations and supervision - technical. The results indicated that internal satisfaction is a determinant affecting the decision to quit the teaching. Mussie (2012) conducted a study to examine job satisfaction of university lecturers' and pointed out 5 factors affecting job satisfaction: salary and fringe benefits, supervisors, relationship with colleagues, working environment and job characteristics. In Particular, the working environment has the highest impact.

Facilities may greatly affect job satisfaction of lecturers in universities as good facilities allow lecturers to develop their capacity, creativity at work as well as avoiding occupational diseases, ensuring physical and mental health in the long term. Facilities examined by Smith (2007), Spector (1997), Locke (1969) include lecture halls, classrooms, libraries, laboratories, office, teaching and learning equipment; health care and insurance, fire system.

Work relationship is the relationship between the worker and his or her superiors, subordinates and peers. This includes both job related interactions and social interactions within the work environment. In order to build an effective working relationship, employees must be able to engage with others in a positive and productive way. Building the working relationship offers individuals a rich variety of tools and processes to prevent, manage and resolve work conflict and to build strong and lasting agreement (Barnes & Conti Associates, 2009). Having friendly and supportive colleagues lead to increased job satisfaction because working with a group serves as a source of support, comfort, advice and assistance to the individual worker. Individuals who perceive to have better interpersonal friendships with their co-workers and immediate supervisor lead higher levels of job satisfaction (Oshagbemi, 2001).

The criteria for measuring and assessing salary and fringe benefits are examined by Smith (2007), De Witte (2005), Spector (1997), Griffeth (2000), Henry et al. (2013), Sharma et al. (2009), Mussie (2012), Hughes (2006) including: policy regime, calculation method of salary, amount of salary received by employees, pay periods, pay rise policy, bonuses and other benefits that workers receive.

Development opportunities related to the working environment is a broad concept covering what is relevant and directly affecting the activities and capacity development of each lecturer. Lecturers who are given many development opportunities are more likely to commit to their universities. Therefore, it is an important factor affecting the development, quality and performance of a university. Research of Smith (2007), De Witte (2005), Locke (1969) Rounds et al. (1987), Henry et al. (2013), Mussie (2012).

In Vietnam, the topic of job satisfaction is also mentioned in researchers and conducted studies. Specifically, Tran Kim Dung (2005) uses the job description index (JDI) proposed by Smith et al. in 1969 to measure job satisfaction in Vietnamese conditions. The study points out factors affecting job satisfaction such as the nature of work, relationship with leaders, training and career path opportunities, relationships with colleagues, salary and benefits. In South Africa, George et al. (2012) also showed similar factors affecting the satisfaction of teachers such as working conditions, colleagues, salary and professional qualifications.

Based on the research objectives, the author proposes a research model that inherits the models of previous studies and adjusts the scales to suit the characteristics of the research location. Factors included in the research model: facilities, quality of lecturers, relationship with superiors, college reputation, career path opportunities, job stability, salary and bonus, organization culture.

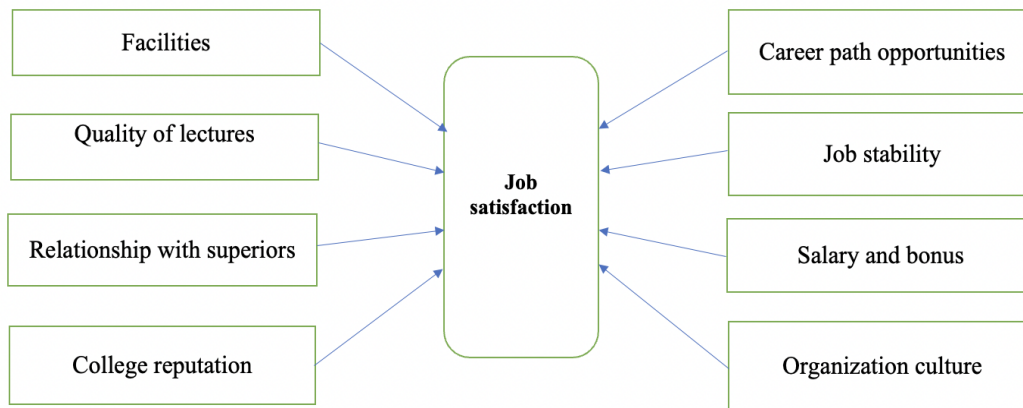

Figure 1. Job Satisfaction Model

Source: Compiled from the author's research

3.2. Research results

3.2.1. Level of job satisfaction of lecturers at Hanoi College of Industrial Economics

The results of descriptive statistics to answer the research question are shown in Table 1. This study used a 5-point Likert scale with 1 "strongly disagree" to 5 "strongly agree" respectively. Scale Likert 5 levels, we have a score of 3 as middle, if it's from 3 to 5 (3-5), it means that the respondents agree with the point of view of the given variable. Conversely, if the answer is from 1 to 3 (1-3), respondents disagree with the view of the variable.

Table 1. Results of factor analysis, mean and standard deviation on job satisfaction of lecturers

Factors	Mean	Standard deviation
1. Facilities	3.85	0.770
2. Quality of lectures	3.60	0.871
3. Relationship with superiors	3.75	0.870
4. College reputation	3.85	0.770
5. Career path opportunities	3.03	1.121
6. Job Stability	3.88	0.686
7. Salary and bonus	3.93	0.656
8. Organization culture	3.45	0.723

Source: Compiled from the author's research

As the table results, we can see that all variables have the mean value in the range 3-4, so the lecturers agree with the point of view of the given variable. This means that these factors all affect the job satisfaction of lecturers at Hanoi College of Industrial Economics.

3.2.2. Evaluation of the reliability of the scale and exploratory factor analysis (EFA)

After collecting the required number of answers, the author cleans up the survey with 125 answers included in the analysis, determining the reliability of the measures by using Cronbach's alpha.

Table 2. Evaluation of the reliability of the scale

Describe	Total variable correlation	Cronbach's alpha coefficient
1. Facilities	0.671	0.856
2. Quality of lectures	0.711	
3. Relationship with superiors	0.555	
4. College reputation	0.666	
5. Career path opportunities	0.677	
6. Job Stability	0.724	
7. Salary and bonus	0.645	
8. Organization culture	0.445	

Source: Compiled from the author's research

Table 2 shows that all observed variables have an appropriate correlation coefficient (≥ 0.3) and Cronbach's Alpha coefficient is $0.856 > 0.6$. Thus, the data meets the requirements of reliability.

** EFA Exploratory Factor Analysis*

The purpose of Exploratory Factor Analysis (EFA) is to test the convergence of the component variables on its concept by the convergence validity, and at the same time to measure the discriminant validity to help ensure differences and no correlation between factors used. In this process, observed variables that do not meet the load factor requirements (<0.5) will be removed. The analysis is used by SPSS software version 20 and here are results:

Table 3. KMO and Bartlett's Test Table

KMO and Bartlett's Test		
→	Kaiser-Meyer-Olkin Measure of Sampling Adequacy.	.853
	Bartlett's Test of Sphericity	180.454
	Approx. Chi-Square	df
	Sig.	.000

Source: Compiled from the author's research

Table 4. Total Variance Explained Table

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	4.562	57.028	57.028	4.562	57.028	57.028	4.313	53.911	53.911
2	1.148	14.356	71.384	1.148	14.356	71.384	1.398	17.473	71.384
3	.778	9.729	81.113						
4	.524	6.549	87.661						
5	.364	4.550	92.211						
6	.291	3.633	95.844						
7	.181	2.257	98.101						
8	.152	1.899	100.000						

Extraction Method: Principal Component Analysis.

Source: Compiled from the author's research

- Load coefficients of all variables are bigger than 0.5 which meet the requirement
- KMO coefficient reaches 0.853 and it is bigger than 0.5, so EFA is appropriate for the data.
- Bartlett's Test has a Sig significance level of 0.000. So, the observed variables are correlated.
- Eigenvalues is 1.1480 bigger than 1 which represents the variation explained by each factor, the results of factor analysis are appropriate.
- The result also shows that the cumulative variance is 71.384% (>50%), which explains 71.384% of the variation of the data.

3.2.3. *Testing the influence of factors to job satisfaction of lecturers at Hanoi College of Industrial Economics*

The author uses multiple linear regression analysis on SPSS to evaluate the influence of factors to job satisfaction of lecturers.

Table 5. Normalized regression coefficients table

Describe	Normalized regression coefficient
1. Facilities	0.370
2. Quality of lectures	0.368
3. Relationship with superiors	0.352
4. College reputation	0.327
5. Career path opportunities	0.372
6. Job stability	0.328
7. Salary and bonus	0.395
8. Organization culture	0.302

Source: Compiled from the author's research

From Table 5, we can perform the normalized regression equation as follows:

$$\text{Job satisfaction} = 0.395 \times \text{salary and bonus} + 0.372 \times \text{career path opportunities} + 0.37 \times \text{facilities} + 0.368 \times \text{quality of lectures} + 0.352 \times \text{relationship with superiors} + 0.328 \times \text{job stability} + 0.327 \times \text{college reputation} + 0.302 \times \text{organization culture} + e$$

It can be seen that the salary and bonus factors have the greatest influence on job satisfaction of lecturers. The next factors are career path opportunities and facilities. The organization culture has the least influence on job satisfaction. Specifically, when the variable salary and bonus increase by 1 unit (in the condition that the remaining variables do not change), the variable of job satisfaction increases by 0.395 units. Similarly, we can perform changes of remaining variables via job satisfaction.

The result shows similarities with previous studies. From a relationship with superiors and organization culture perspective, Záborská's group study (2014) shows that the job satisfaction of lecturers is influenced by the respect of lecturer's opinions. According

to this group, this is an important factor for managers to encourage lecturers to have necessary information in order to provide the appropriate policies. Other studies show that salary and bonus are positive factors that increase job satisfaction. In addition, the limited number of facilities has a negative influence on job satisfaction (Jiang, 2011).

4. Discussion and Conclusion

The job satisfaction of lecturers plays a very important role in improving the quality of the college and university education systems. The result shows that most of the lecturers have a high level of job satisfaction. However, each factor has a different influence on job satisfaction. The biggest influencing factor is salary and bonus, followed by career path opportunities. To better understand the factors which influence job satisfaction is very crucial for all organizations. Through the understanding of the factors, organizations can be aware of the symptoms beforehand and take precaution to support and increase the job satisfaction level of employees. In order for an organization to sustain and grow its business, job satisfaction is the long-term solution for talent retention and increased performance and productivity.

Managers need to pay more attention to policies on salary and bonus, creating conditions for lecturers to succeed in their work. In addition, managers need to develop factors that have a positive influence and overcome negative effects on job satisfaction when managing colleges.

Job satisfaction will motivate lecturers to improve the effectiveness of teaching and scientific research activities. The study on factors affecting lecturer job satisfaction helps college to develop appropriate policies to retain and develop employees, making them more satisfied.

This research was only conducted within one college. In the next step, the author will expand the research to colleges and universities in Hanoi city.

Abstract

Traffic safety violations caused by alcohol use are causing serious consequences to the social life and environment in Vietnam. In 2020 alone, 6,700 people died in traffic accidents, with alcohol use being the leading reason. The Government has issued Decree No. 100/2019/ND-CP stipulating the increase of penalties for traffic safety violations related to alcohol concentration, which has attracted public participation in discussion on online newspapers and social media. Applying the multistep flow theory and actor-network theory, the study aims to describe the role and influence of the public in shaping public opinion, as well as identify their position and influence in the network and their ability to activate information steps on online newspapers and social media. Through content analysis and in-depth interviews, the results show that public groups have actively used the media in their own ways to express their opinions, attitudes, and behaviours that influence discussion flows on traffic safety policies, contributing to the dissemination of regulations, creating positive effects on people's awareness, as well as advising on the socio-economic policy development towards the sustainable development of Vietnam's social environment.

Keywords: *public participation, policy communication, traffic environment, online newspapers, social media.*

1. Introduction

Technological development has changed human behaviour and interaction, making them more actively involved in the online discussion environment to occupy a central position in shaping public opinion. Using online accounts, users can call on other members to participate in movements and campaigns, as well as contribute influential policy-making ideas. Millions of people around the world today are spending a large part of their life in an online world called a “second life” (Tom Boellstorff, 2008). Besides the real life, there exists a virtual world built by the public, with its own online identity and culture. In this world, netizens form their own communities and participate in expressing their opinions and discussing issues of common interest, including socio-economic ones, contributing to shaping public opinion in the common space. The online space provides an opportunity for

public groups within the network to voice their views on socio-political discourse, and to discuss and share information on issues of common interest. Studying human behaviours in cyberspace is associated with the concept of participation. From the perspective of political science and media journalism, “Public participation” has been emphasized as a process by which the community’s concerns, needs, interests, etc. is communicated, and the public contributes openly to the government’s decision-making, based on dialogue, two-way communication and interaction with the common aim of better policy-making” (Creighton, 2005; Bleiker, 1994; Susskind, 1999). In addition, “participation” is a “public” process, in which the public uses various forms of communication to access information, express opinions, and participate in interactive discussions about socio-economic policies, thus shaping public opinion in the common space. The sharing relationship and human behaviour in cyberspace when participating in discussions have an active and positive position and influence in the network of public opinion, which has recreated a virtual social environment that shares many similarities with the real world. Also, people’s participation in the media has made positive impacts on policy changes, contributing to building a more democratic and civilized social environment.

The public participation in policy discussion on the Regulation on penalties for traffic safety violations related to alcohol use in Decree 100 is one of such cases. Owing to the fact that many serious accidents had involved drivers violating the regulations on alcohol concentration in road traffic, which caused much public anger in April 2019, on June 14, 2019, the National Assembly passed the Law on Prevention and Control of Harmful Effects of Alcoholic Beverages, which notably prohibits acts of driving vehicles in road traffic with alcohol content in the blood or breath. At the end of that year, the Government continued to issue Decree No. 100/2019/ND-CP stipulating the administrative sanctioning of violations in road and railway traffic, particularly raising the penalties for acts that violate the alcohol content regulation to a much higher level than those of other traffic violations. When Decree 100 officially took effect on January 1, 2021, public discussions became livelier with mixed opinions. Apart from favourable responses of many organisations and individuals who strictly comply and contribute their opinions, there were also questions, doubts, and arguments against the implementation of the Regulation, some of which involve the alcohol concentration level, alcohol advertising on the internet, and group interests, at the same time created many discussions among people. Public groups initiate discussion topics in the media to promote the responsibility of each citizen, creating a positive effect in shaping people’s views and behaviours to contribute to the common interest of society. By listening to people’s opinions, policy-promulgating agencies have made adjustments to policies accordingly and offered more practical solutions. By March 2020, the public discussion in the media had subsided, as the public had come to agree and support Decree 100, feeling its usefulness to life.

We find this to be a new and meaningful research direction when focusing on applying communication theories such as the multistep flow theory and the actor-network theory in understanding the role of public participation, how their opinions and behaviours affect flows of policy discussion on traffic safety in online newspapers and social media in

relation to major impacts on building a safe and civilized social environment. The study seeks to help advise media/policy makers to develop the best strategies to use new media to promote public participation in policy contributions.

2. Literature Review

2.1. The role and influence of the public on shaping public opinion from the perspective of the multistep flow theory

We applied the multistep flow theory to understand public participation in relation to the influence model of public groups in the network according to the multistep effect, as well as the opinion, the formation of discussion topics/contents, the characteristics and behaviours of public groups in cyberspace. While previous works mainly focus on one-way communication model, for example, Harold Laswell (1948) noted the direct influence of mass media on public perception, considering the public as easily led, recent studies have emphasized the public's initiative and assertiveness in the media environment. For example, the multistep flow theory considers the public as actors that interact, modify content, spread information, and shape public opinion, instead of being passive and socially isolated as described in previous theories. Moreover, the multistep flow theory does not assume that messages only start from a single source, which are then transferred through the mass media and have an equal impact on each individual.

The multistep flow theory is extended from the two-step flow theory originally developed by Paul Lazarsfeld, Berelson and Gaudet (1948) in the book "The people's choice: How the voter makes up his mind in a presidential campaign". Research by Lazarsfeld et al (1948) shows that personal relations have seemed to be more frequent and effective than the mass media in influencing participants' voting. According to the two-step flow theory, the effects of direct communication are hindered by social interactions and audience selectivity in exposing to, perceiving, and transforming messages. Instead of directly reaching the public, ideas broadcast by news agencies are conveyed through special actors known as key opinion leaders (KOLs). The research confirms the decisive importance of KOLs in the network to the shaping of personal opinion. Then, Katz and Lazarsfeld (1955) further studied the influence on the communication relationship between individuals and the mass media, especially the role of key individuals KOLs in receiving, interpreting and disseminating media messages to the general public.

However, after a few decades, the two-step flow theory had to be adapted to the context. Bennett & Manheim (2006) showed that the internet and mobile devices have made it easier for the public to directly access and disseminate media content. As a result, scholars pointed out that the top-down linear model proposed by Lazarsfeld and Katz is oversimplifying interpersonal influence, as well as underestimating the influence of the mass media. According to Weimann (1982), the flow of ideas from the mass media to individuals is found to be more complex than the theory predicts. Key drivers missing in the original model include the information exchange between KOLs and exchange between the "minority" public groups with less participation. Also, the influences do not disappear after two steps, as opinion leaders can communicate ideas to followers, who will spread these ideas to other individuals. Brosius

and Weimann (1996) also show new models that calculate complex patterns of the multi-step flow, which allow the audience to act from the bottom up, supporting the delivery of news topics and the dissemination of information for the media.

Based on previous studies, Ognyanova and Monge (2013) conducted a study on the relationship and influence between public groups in a multiperspective network using a multi-step communication approach. Then, Ognyanova (2017) described the position and influence of public groups on the media flow according to the multistep flow paradigm. The findings motivated us to focus on studying the participation and the influence of different public groups, including news editorial boards, administrators of social media pages/groups, KOLs, and the general public, on discussion flows, such as the formation of topic/discussion content, the shaping of public opinion, and opinions of other members in cyberspace.

2.2. The position and relationship between members in the social environment from the perspective of the actor-network theory

To understand the sharing relationships between actors in the public opinion network as well as to determine the strategic positions, relationships and influence of public groups, we applied the Actor-Network Theory (ANT) in the study of public participation. ANT was derived from the work of French scholar Bruno Latour (1987), then, a more complete theoretical framework applied in sociological and communication research was developed by researchers in the same field, typically Michel Callon (1986), John Law and John Hassard (1999). Teurlings (2013) explained the concept of Actor-network derives from the core idea that all existing phenomena are composed of actors operating in the network. These actors can be humans (individuals, groups, or communities) or non-humans (technology, knowledge, etc.) that have a dialectical relationship with each other. ANT has been applied in many communication studies such as the network centrality (Freeman, 1979) and media from an ANT perspective (Teurlings, 2013). Developing from this perspective, Freeman (1979) shows how to measure the influence of certain public groups (referred to as special actors) on other members of the network based on their favourable central position as well as their connection relationship in the network with respect to three factors: (1) Degree centrality; (2) Closeness centrality, and (3) Betweenness centrality. Also, Granovetter (1973), Freeman (1979) và Teurlings (2013) analyse the influence of actors in a network based not only on position but also on the relationship between actors according to the cohesion of the relationship, bond and power. It can be seen that stemming from public interests, recent approaches to communication research view the audience as active participants, promote active interaction of the public as actors that motivate and control the communication process, having a more equal role in the power position in relation to the media.

Based on the above-mentioned theoretical basis of communication, we chose to survey the public discussion on the Regulation on increasing penalties for traffic safety violations related to alcohol concentration in Decree No. 100/ 2019/ND-CP, taking place between April 23, 2019 and March 16, 2020 on a number of typical online newspapers and Facebook pages to examine the relationship and influence of some special public groups in promoting discussion flows, spreading information, and shaping public opinion and members' viewpoints in the social environment, thereby proposing solutions to improve the effectiveness of public participation in the media in socio-economic policy consultancy.

Based on the framework of the multistep flow theory and ANT, this study applies content analysis and in-depth interviews to understand the position, role, and influence of actors in shaping public opinion during the discussion. We identified three main actors, including: the media administrator (online news editors of VnExpress, Tuoi Tre Online, Vietnamnet, and their respective Facebook pages; admins of the Facebook group of Vietnam's automobile and motorcycle community (Otofun); Experts/KOLs (their personal pages that attract the most interaction and comments), and the general public actors (readers, social media users, and members of online pages/groups).

3. Method

Specifically, the study applies the in-depth interview method with online news editorial boards and Facebook page administrators, together with content analysis of news articles, posts, and comments about Decree 100 on the surveyed online newspapers and social media (including 303 new articles and 18,600 comments posted on VnExpress, Tuoi Tre Online, Vietnamnet and their respective pages, and 190 posts and 12,424 comments on Otofun social page), observed from April 23, 2019 to March 16, 2020, using framing criteria (Entman, 1991; Olasunkanmi Arowolo, 2017) to identify prominent topics discussed by the public and understand the role and influence of these public groups on the flow of discussion in the media network. We also inherit the results of content analysis published in our previous studies (Huyen & Anh, 2018) to classify the messages in 31,024 comments posted by online news readers and social media users in order to understand the contributions of the general public to shaping public opinion, using the constant comparative method (Glaser & Strauss, 1967). This method involves collecting comments, encoding each sentence, label themes to describe the encoded content and compare with other sentences, thus identifying themes that emerge from the text (Cho & De Moya, 2014). Specifically, we divided the samples into two separate parts and assigned the coding task to two programmers. They then encode the comments according to the topic list and determine their tone. After the encoding was completed, we analysed the collected comments, categorised them into a list of 11 topics, and grouped into seven types of message.

Finally, the study uses the method of observing the information spread by individuals/groups and in-depth interviews with seven people, including five managing editors in charge of readers of VnExpress, Tuoi Tre Online, and Vietnamnet, one administrator of 'Otofun', and one KOL who is a politician. In-depth interviews with these public groups with 8 questions were conducted to find out the following key issues: 1) The roles, attitudes, initiative, behaviours and influence of different public groups on discussion flows through the way they manage communication channels, organise discussion content for the public on online newspapers and social media to bring about policy changes to reach consensus from the people; 2) The reasons why they actively participate in calling on people to discuss traffic safety policies and respond to the "No drink driving" campaign, thereby supporting to answer questions and form opinions in discussions on online newspapers and social media. All these interviews are recorded in audio or written form.

4. Results

Applying the above communication theories, we have come to describe the position and influence of public groups on discussion flows in a multi-perspective network on online newspapers and social media, regarding the regulation on increasing the penalties for alcohol content violations in the Decree 100/2019/ND-CP. The results show that public groups have their own roles, views, active participation and influence levels, contributing to policy consultancy, creating positive effects on members' perception in the social environment as follows:

The position and influence of the online newspaper editorial board/ Facebook page administrator

In-depth interviews with the surveyed online newspaper editorial boards and Facebook page administrators show that this group is always interested in finding and methodically updating information flows about the anti-drink-driving movement from public opinion flows and people's opinions on the Regulation on penalties for traffic safety violations related to alcohol use to attract the public to participate in the discussion:

“Readers’ comments about the series of published articles on Decree 100 sent to the editorial office are collected and categorised into two versions per day. A portion of valuable readers’ opinions will be processed, edited and approved for publication in all online publications. Taking advantage of data sources from readers’ discussion and opinion flows, the editorial board enrich the content of news topics, initiate life-related discussion topics by selectively publishing hot issues of public concern, promoting public participation in discussion, thereby creating positive effects in policy communication”

(the representatives of the online Newspaper's managing editor)

Combining in-depth interviews and content analysis, encoding and categorising 303 news articles and 18,600 comments published on newspapers and their fanpages, 190 posts and 12,424 comments on the 'Otofun' page according to Entman's framing criteria (1991), the results show that these posts and comments are divided into five prominent topic groups in relation to the surveyed issue as follows:

Figure 1. The rate of readers' discussion initiated by administrators of VnExpress, Vietnamnet, Tuoi Tre Online, and their respective pages, and Otofun page between April 23, 2019 and March 16, 2020 (per cent)

Source: Author Field survey

Figure 1 shows that, in the surveyed online newspapers, the topic group “life-related issues” accounts for most of the discussion content (27%), illustrating aspects such as drinking culture, the penalty’s economical level, or people’s stories, such as the difficult background of a poor female worker who was fatally hit by a drunk driver on Lang Street, or an unfortunate victim killed by a Mercedes in Kim Lien tunnel (Hanoi). Next are controversial topics during the sanctioning of traffic safety violations related to alcohol use (23%), such as alcohol advertising on the internet, eating fruit or drinking syrups containing alcohol, or whether people walking drunk could be fined. Topics on the impact of Decree 100 on people’s lives attract public participation in discussion at the third position (21%). Articles on this topic show their effectiveness that follows the official implementation of Decree 100 and the Law on prevention and control of harmful effects of alcoholic beverages (focusing on issues of public concern such as the declining number of people hospitalized due to alcohol-related traffic accidents, a more peaceful Tet holiday thanks to alcohol concentration fines, deserted pubs with lost revenue following Decree 100, etc.). The online newspaper public is also interested in the topic of the government’s responsibility to find solutions (19%), in which the government and ministries coordinated with relevant parties to listen and exchange information through media channels, clarify and resolve people’s concerns, provide strong and timely measures and actions so that people trust, support and abide by the Regulation. Ethical issues also account for 10% of the public’s discussion on online newspapers, involving conflicts, violations of law and ethics while implementing the Regulation, for example, a driver with ‘blue’ license plate cursing and slapping a traffic police officer when being asked for an alcohol test, setting up groups revealing alcohol concentration measuring spots, “Head of the Traffic Police Department: Stopping drivers violating the alcohol concentration next to the beer pub is very offensive”, and many drivers calling for help when violating the alcohol concentration.

Regarding social media pages, the in-depth interview with the administrator of the automobile and motorcycle community “Otofun” shows that they have their own way of organising and leading the public’s discussion flows, with indirect, accessible messages close to the public interest:

“Instead of just informing the laws, Otofun focuses on indirect communication, giving factual information about accidents or penalties related to alcohol violations, helping readers see the consequences of traffic violations. This method is quite effective, as forum members participate more in discussions, thereby making the content more diverse and attractive, allowing the message of Decree 100 to be integrated naturally and practically to the community and helping them find the forum helpful.”

(Representative of Otofun forum administrator)

According to the results of the survey on news topics on the social media pages of the 91-94 high school group and the Otofun community, it can be seen that the administrators had initiated and published articles that attract and call on people to actively respond to the ‘No Drink Driving’ Movement, as well as to express contributive opinions to Decree 100. The topic group that social media users are most interested in are life-related issues (37%),

similar to the level of discussion among online newspaper readers. After Decree 100 officially took effect on January 1, 2019, common news topics related to the alcohol culture, levels of fines, post-drinking shuttle service, etc. were discussed more by Otofun members than other topic groups. Novel information and prominent discussion topics on this page were re-published by the press such as a driver receiving a 7 million VND fine for ‘drinking a cup of medicinal liquor’ on VnExpress, or the first wedding in Binh Phuoc serving 40 tables without a bottle of beer and alcohol on Vietnamnet. Controversial issues also attract discussion among social media users on Otofun (32%), similar to that of online newspapers. These issues include people’s questions about the absurdity of the regulation on fines of zero alcohol concentration, or whether those driving a bicycle could be fined for alcohol level. The next topics that interest users to discuss are the government’s responsibility (15%), the impact of Decree 100 on people’s lives (10%), and ethical issues (6%).

Upon comparing survey results on online newspapers and social networks, there are similarities in the news topics that attract the participation in discussion of readers and social media users. In particular, it can be seen that novel topics that are heavily discussed and shared by users on many social media pages/groups have been used by the news editorial board to expand the source of news topics on major online newspapers. Especially, the online news editorial board and social media administrators focus on exploiting the articles showing the conflict between the old and new beliefs, between the deeply rooted alcohol culture into Vietnamese people’s lives and safe traffic practices, in order to stimulate interaction and engage the public in discussion on the Regulation on penalties for traffic safety violations related to alcohol use. Therefore, topics showing the consequences caused by alcohol on the lives of innocent victims of accidents have caused discontent, sympathy and compassion among many people. The survey results also show that the online news editorial board and the social media administrators have demonstrated their role and influence on the public’s discussion flows about traffic safety policy by initiating topics, consulting experts and managers, participating in publishing and solving public problems, and receiving great support from the people.

The position and influence of KOLs

In communicating traffic safety policy, the participation of key opinion leaders (KOLs) plays an important role, influencing discussion flows of members in the social environment. Key opinion leaders are special actors located in a strategic position that acts as the necessary bridge in the process of transmitting information between online newspaper administrators, social media and the general public. They are influential individuals in a particular field, and because of their special positions, they are often separated to examine and decode messages and how ideas are disseminated and shared. The participation in discussions of KOLs who are politicians, national assembly deputies, journalists, lawyers, medical experts, etc., has the ability to initiate, lead, form opinions and direct public opinion.

For example, during the peak period of critique (June 1, 2019 - January 1, 2020), the draft regulation continuously encountered the public’s mixed opinions due to information insufficiently reported in online newspapers. Some controversial topics published in

newspapers, such as “206 deputies opposed the “no drink driving” regulation”, “businesses lobbying historians to lobby for alcohol businesses”, caused misunderstanding, creating a wave of fierce criticism from the public. On June 4, 2019, the press headline “The National Assembly does not agree with the “no drink driving” option” without a clear and thorough explanation, encountered strong criticisms from social media users. Many people suspected that the deputies had been bribed by group interests. On the same day, Assoc. Prof. Dr., and National Assembly deputy, Nguyen Lan Hieu, spoke up by posting the article “The National Assembly and alcohol” in the ‘Perspectives’ section of VnExpress, in which he explained that all delegates supported ‘no drink driving’, but they were still concerned about the permissible limit of alcohol concentration in a driver’s breath of 0 milligram per litre of air. Previously, lawyer Le Nguyen Duy Hau published an article that shared the same opinion with Mr. Nguyen Lan Hieu, titled “Not true – the National Assembly does not support drink driving”, which shows clear arguments about legislative activities, so that the people could understand and stay calm instead of criticising the National Assembly. These articles were shared and discussed enthusiastically, as well as became the prominent news topic of many major newspapers. Applying the multistep flow theory and the actor-network theory, it can be seen that National Assembly member Nguyen Lan Hieu and lawyer Le Nguyen Duy Hau promoted their influence in persuading and forming the public views because they are reputable and representative experts with in-depth medical and legal expertise. Because of their central position in the network, they become special actors with sufficient scientific and practical background to clear up the public’s doubts and misunderstandings, somewhat changing the public opinion at that time.

At the same time, on social media, many KOLs showed their influence on the public’s discussion flows about the Regulation by simultaneously speaking out and creating communication networks on online newspapers. In particular, content analysis results show that the representative of the National Traffic Safety Committee, is one of the KOLs who actively participated in the Otofun forum, shared views and answered questions, easing public controversy surrounding this new Decree. These posts on social media attracted discussion and support from a large number of people. For example, on January 23, 2020, the post with answers related to alcohol concentration violations attracted the highest interaction on the Otofun group (568 comments, 852 likes). The representative of the National Traffic Safety Committee’s post was shared and commented by many social media users, contributing to forming the right opinion in them, emphasizing that “Decree 100 neither penalizes the sober nor does the drunk! It only penalises the driver with “alcohol found in the breath or blood”.

Although many support that Decree 100 is “civilized”, “progressive”, “brings many benefits to society”, many argue that the current level of fines for alcohol concentration of zero is absurd, compared with the minimum applicable in many countries around the world.

On the “Otofun” social page, the representative of the National Traffic Safety Committee listened to opinions and explained to people clearly the purpose of the Regulation on penalties for traffic safety violations related to alcohol use, that “*the blood alcohol level*

of zero acts as a deterrent, a form of education. Decree 100 issued by the government is not only to fine people, but seeks to raise people's awareness of not using alcohol when participating in traffic, for the safety of themselves and the social community."

The results of our in-depth interview with the representative of the National Traffic Safety Committee, explain why the statements and discussion contents contributed to directing public opinion, created support, and spread strongly among the public. *"When speaking in the press and on social media, I do not think of myself as a person who directs public opinion or has great influence, rather I am just a civil servant working in the traffic field, a citizen who believes in correct regulations that benefits everyone. The statements I make are based on accuracy, accessibility, friendliness, and the message must be sufficient, not sensational or shock the public, so that anyone when reading my posts can properly understand the thoughts and goals I want to convey"*

(The representative of the National Traffic Safety Committee)

The results of in-depth interview also suggest that the representative of the National Traffic Safety Committee is selective in the contents of the messages this person shares on online newspapers and social media, making them accessible, focusing on protecting safety and lives for road users in particular and the whole society in general, which have a sufficiently strong warning effect, acting as a deterrent, while remaining humane, determined to help people adjust their behaviour and avoid violations, thereby gaining consensus and contributing to shaping the general public opinion, correctly comprehending the Regulations on penalties for traffic safety violations related to alcohol use.

Through analysing the aforementioned cases as well as analysing research findings, we find that KOLs, such as the representative of the National Traffic Safety Committee, lawyer Le Nguyen Duy Hau, and National Assembly deputy, Doctor Nguyen Lan Hieu, are special actors with the function of influencing and mediating in spreading powerful messages in the network. The reason is that they represent elite groups and relevant parties that have the ability to connect and mobilize a large network of participants to support. Also, these KOLs have the ability to interpret messages and opinions and have their own behavioural culture to shape public perception and opinion around them.

The position and influence of the general public

In the network structure, the general public is affected by messages from online newspaper editorial boards and social media administrators, but they themselves actively participate in discussions and play an important role, holding central positions in spreading information, promoting interaction, and shaping public opinion. The general public can actively participate in discussions in groups of topics, contribute ideas, and contribute to spreading information quickly and strongly to actors closely connected to them in the network.

Using content analysis of the posts and comments on Decree 100 by the surveyed online newspaper readers and social media users, we found seven common types of comments made by the general public as follows:

Table 2. The proportion of comments in relation to type among readers of three online newspaper, and “Otofun” social page from April 23, 2019 to March 16,2020 (Dimensions refer from Cho & De Moya, 2014; Huyen & Anh, 2018)

No	Comment type	Online newspapers (%)	Social media (%)
1	Advocacy	30	16
2	Advisory	14	13
3	Grievance	11	10
4	Inquiries	10	12
5	Call to action	9	5
6	Emotion	6	19
7	Information provision	5	23
8	Others	15	2

The survey results show that online newspaper readers expressing ‘advocacy’ comments account for the highest percentage (30%). However, quite a few comments discuss “other issues” (15%), apart from topics aimed by the press, such as food safety, environmental sanitation, or attacking and judgemental comments found in the discussion. ‘Advisory’ comments rank third at 14%, which share suggestions and advice, or propose solutions to managing alcohol use for the government. A considerable 11% of ‘grievance’ comments criticized the government’s actions, doubting their purpose and the authenticity of the information published by the press. ‘Inquiries’ comments make up 10%, asking for answers from the government. ‘Call to action’ comments constitute 9%, aiming at connecting other members to act together to reduce traffic accidents through behavior change, while 6% is for the ‘emotion’ category, which shows concern and painful feelings in tragic accidents, and care about community interests. Only 5% of comments ‘provide information’, which update information about other countries’ laws, and the pros and cons of alcohol use.

In contrast to online newspapers, comments of ‘information provision’ account for the largest proportion on social media (23%). Similarly, many ‘emotional’ comments are given by social media users (19%). At the same time, up to 16% of public comments express agreement with Decree 100 and acknowledge its practical benefits and impact on life. Next are ‘advisory’ (13%), ‘Inquiries’ (12%), ‘grievance’ ones (10%) which include personal attacks and questions about Decree 100, and ‘call to action’ (5%). There are few comments on ‘other issues’ (2%) which are not related to the contents aimed by the social media administrator.

The survey results also show that many opinions in discussions have become a source of news for the press, shaping public opinion, as well as advising the government how to implement Decree 100 seriously and effectively, for example, the articles “Is sweeping the road or dredging channels as the penalty for drunk drivers strong enough as a deterrent?” (May 11, 2019) on Tuoi Tre Online, “Considering alcohol and beer as a national cultural trait is a fallacy” published on VnExpress (June 4, 2019), or a summary of opinions showing “101 word-of-mouth ways to ‘dodge’ the alcohol concentration test” on Vietnamnet (January

5, 2020). In addition, some online newspaper reader groups and social media users always want to dissociate and discuss issues other than the topics the press directs them to. Readers/audience are easily dispersed and expand their network to other groups on social media. In private groups on social media, some social media users become bridges, easily transferring information from one group to another, from personal accounts to groups and vice versa, and from the fanpage to groups and vice versa. To find out which user actors have the ability to spread and promote other group members' participation, we conducted a survey on the posts that attracted the most discussion and interaction in the Otofun group.

One notable finding of the study is that some active social media users in the marginal group play the role of transferring “strange” information between groups. For example, the account N.T.V.A. - a member of the Otofun group who played the role of intermediary when transferring information from ‘Hóng Express’ to the Otofun group, with the content “Male student sobs over a 7 million dong fine: This Tet, I’ll come home with no money”, and a further commentary titled “That’s it for Tet”. The post attracted discussion of many group members, with 490 comments, 51 shares and 2,300 likes. This social media user also becomes a bridging point of information transfer between different independent network clusters. It can be seen that social media have created favourable conditions for actors to create their own networks, and also to be able to interpret and transfer information inside and outside the network.

From the results of content analysis, we also found that some social media users have the function of navigating information and forming opinions as special actors. For example, during the adjustment period (January 4, 2020 - February 15, 2020), after the Law on Prevention of the Harmful Effects of Alcohol and Decree 100 was put into effect, apart from the support of organizations and individuals who strictly abide by the law and spread good messages, there were acts of defiance, cynicism, and doubts about the implementation of the laws, and questions from the public about the penalty level, populists and group interests to increase budget revenue and income for traffic police officers. Some opposing groups set up their own closed groups and networks, for example, in Da Nang, some Facebook groups were created under the name “Updates on the alcohol concentration checkpoints in Da Nang”, which provide 24/7 updates on traffic police checkpoints sanctioning traffic safety violations, or “Da Nang alcohol concentration checkpoints”. Although these groups had only been established for two days, some already attracted more than 3,000 members. Updated schedules and locations of traffic police’s checkpoints were continuously informed in detail. Many “drinkers” even asked in advance where the checkpoints were before going to drink, and received enthusiastic responses from members. It can be seen that some traffic participants’ ways to solve the problem in Vietnam have become more creative, formed by the sharing of the online community. However, this is the act of abetting violations because pointing out checkpoints is similar to cheating the laws when drink-driving people avoid being checked. According to the ANT theory, when a series of “strange” information was transferred between groups and pages, account V.T.T. on Otofun immediately called for the need to immediately stop the act of avoiding alcohol concentration check and sharing how

to do it. V.T.T called for “*being civilized by not drink driving. In the city, take a taxi, motorbike taxi, or someone in the group accepts not to drink to drive others home.*” This is one of our findings showing that shows that the technological development has changed the general public’s interaction behaviours to be more proactive in the media environment. People can participate in online discussions and hold central positions that positively influencing the dissemination of information and the shaping of public opinion.

5. Discussion and Conclusion

5.1. Discussion

When assessing the role, opinion and active participation in discussion among public groups on online newspapers and social media presented in the findings, we find that each public group has its own position, role, participatory behaviour and level of influence level to make positive contributions to promoting members’ discussion flows on policy-making to build a better social environment. Of these groups, (1) *The online news editorial board and the social media administrator* hold a powerful central position in disseminating information, thus having the advantage in leading and organising the content and creating multi-perspective discussion topics that attract public interaction. The relationship between online newspapers and social media is a symbiotic relationship of cooperation and mutual complementarity. While social media administrators have the advantage of a large network of followers and the ability to spread information quickly, the online news editorial board, thanks to its legitimacy, has the advantage in leading public opinion through the opinions of experts, managers, and elected deputies. The results of in-depth interviews show that journalists and Otofun social media administrators realise the importance of policy communication, which requires attention to the discussion contents of the public. However, upon comparing the public’s comments on online newspapers and social media, it is shown that the public are easily dispersed when discussing many issues other than the topics aimed by the newspaper, and easily splits up to form their own network in other spaces such as closed groups on social media.. For this reason, journalists and social media administrators tend to focus on updating discussion threads and valuable opinions from the public and KOLs in gaining attention, creating discussion environments and directing public opinion in order to disseminate policies more clearly and accessibly, as well as gain public consensus. (2) *Key opinion leaders (KOLs)* hold a prominent central position, convenient in creating, disseminating, guiding information, answering questions, which has significant influence on shaping public opinion. Special actors such as the representative of the National Traffic Safety Committee, lawyer Le Nguyen Duy Hau, and National Assembly deputy - Doctor Nguyen Lan Hieu, play important roles in guiding and answering readers’ questions, and at the same time forming views and shaping public opinion in the networks they create. In particular, KOLs initiated discussion topics on social media that promote each citizen’s responsibility and a sense of belonging to a broader community, in which each person’s behaviour will contribute to the common interests of society. However, from the results of content analysis of topics that attract discussion published in the press, we realise that some state authority representatives made unclear and incomplete statements in the press and

social media, which created conflicting opinions from the public, causing controversy surrounding the policy. (3) *The general public* has an important position in providing information, especially influencing the formation of public opinion through sharing ideas, spreading information quickly and strongly to other members in the network.

Nevertheless, through the results of content analysis and observation of online discussion on online newspapers and social media, we find that sometimes, some discussions in online newspapers were led by the crowd psychology, ran after the trend under the pulling power of some public groups in the network. For example, “initiative” groups set up groups that locate alcohol concentration checkpoints; drinking people show how to “co-exist” with Decree 100, which attracted a portion of people with limited information and insufficient knowledge to participate. In addition, there existed personal attacks or sophistry, isolation and defeat of different opinions and views. At the climax when the press made headlines without clearly explaining the draft law on prevention and control of harmful effects of alcohol, the online community accused many National Assembly deputies of not supporting the plan to ban drink driving and of having “group interests”. In subsequent stages, such keywords as “alcohol enterprises lobbying for policies” or “traffic police not transparent in sanctioning” created mixed public opinions on traffic safety policy. Also, the general public and KOLs had not yet been effectively utilised by the online news editorial board.

Based on the analysed results, the study’s main findings show that media management agencies and newsrooms have not developed the most effective public engagement strategies. Therefore, to motivate members in the social environment to participate in contributing to better policy-making, media management agencies and online newspapers, *firstly*, need to create an environment that encourages them to participate in discussion on the newspapers’ pages and their social media channels. To be specific, the online newspaper and social media administrator needs to grasp hot issues of public concern to create articles and connect other actors such as KOLs and the general public to participate in discussions. Online newspapers also need to determine the position and influence of KOLs with good expertise, opinions, and communication capacity to hold a key position in expressing opinions in order to shape and lead discussion flows of the general public. *Secondly*, build a multi-channel, multi-relationship approach strategy to enhance information spread and promote interaction with the public. *Thirdly*, online newspapers can select and use quality posts and discussions of engaging readers or social media users to develop into multi-perspective discussion articles on online newspapers and social networks in order to expand the communication network through the set of followers of those whose comments are posted. At the same time, develop a strategy for selecting and sharing message contents on the media based on the issues of individual people associated with the interests of the community and society. *Fourthly*, online newspapers should build a culture of discussion in newspapers and publish these principles of participation based on criteria such as lawfulness, civility, openness, friendliness, equality, and respect. In particular, it is necessary to strengthen research on actors in the media network on online newspapers and social media in order to promote their advantages and influence in the discussion flows of policy and social issues.

5.2. Conclusion

The research findings show that using the multistep flow theory and actor-network flow theory has clarified public groups' discussion flows in the network regarding policies on online newspapers and social media, as well as existing problems in order to build a safer traffic environment. The highlight of this study shows the position, role, contribution and influence of different public groups on promoting discussion flows on online newspapers and social media, with the final result being the people's consensus in favour of Decree 100, as they feel that the traffic safety policy is really necessary and meaningful in life. This research direction suggests agencies and organizations to gain a deeper understanding of people's behaviour when participating in consulting and contributing to policy-making in the social environment, thereby proposing better media management strategies when promulgating policies and decisions that can affect the socio-economic development, gaining people's understanding and consensus. In addition, the findings suggest future research directions on human behaviour and interaction with the social environment through communication in cyberspace based on deep understanding of human behaviour and influence from the multistep flow theory approach according to the network effect. As for these factors, more extensive studies on participation are necessary to propose effective strategies to improve public participation, not only contributing to good social governance, building a more lawful, civilized, open and friendly social environment, but also enhancing the promotion of a culture of responsible behaviour and participation in cyberspace.

BUILDING A WEBSITE SUPPORTING THE DEVELOPMENT OF GEOGRAPHY STUDIES STUDENTS' SPECIALISED ENGLISH PROFICIENCY, GEOGRAPHY DEPARTMENT, HO CHI MINH CITY UNIVERSITY OF EDUCATION

BA. Tran Dinh Khang
khangtd00@gmail.com

Dr. Pham Thi Binh
binhpt@hcmue.edu.vn

MA. Nguyen Xuan Bac
bacnx@hcmue.edu.vn

Faculty of Geography, University of Education, Ho Chi Minh City, Vietnam

Abstract

In the era of globalisation, English proficiency is becoming more and more important to students in many aspects. To study and research in a major effectively, students should develop their own specialised English proficiency. In the Department of Geography, Ho Chi Minh City University of Education, Geography Studies students major in tourism. With survey methodology, the author collected primary data on students' specialised English proficiency. Furthermore, the author collected the opinions of students and experts on a suitable means to support. From the survey results, the author built a website supporting the development of students' specialised English proficiency. The website's data is specialised in tourism, includes vocabulary, sentences, news and videos in English. The survey results about usage effectiveness of the website show that the majority of students and experts agree with the website's ability to support the development of specialised English proficiency.

Keywords: *Geography Department, Geography Studies, specialised English, website.*

1. Introduction

In the era of globalisation, English proficiency is becoming more and more important in many aspects to students. English proficiency not only provides students with open study and research opportunities, helps students to read and understand foreign documents, but also gives students greater job opportunities after graduation. In the world, there are 204 countries, in which, the number of English-speaking countries is up to 101. It is the wide distribution of English in the world that has made it one of the main languages used in the United Nations, in the process of trade between countries, businesses, exchange of working experience, production technology, manufacturing, cultural exchange activities, translation, tourism, etc. Knowing and being able to use a foreign language (especially English) can raise an individual's income, therefore, it can be affirmed that in the era of integration, English ability is extremely important.

English includes general English (GE) and English for specific purposes (ESP). While GE serves the general and basic requirements in communication of any foreign

language learners, ESP serves the clear and specific purposes of learners in working and researching. In the Department of Geography, Ho Chi Minh City University of Education, Geography Studies students major in tourism.

In the new era, the development of technology has made online teaching and learning (E-learning) popular. This is a form of distance learning and training based on modern technological devices and Internet connection. The tools to support learning English today are also very diverse, including the accompanying dictionaries such as Cambridge, Oxford, Longman, etc; English-Vietnamese bilingual flashcard; English learning apps like Duolingo, Memrise, Cake, etc. and English learning websites like BBC learning English, Go4English, American Stories for English learners, etc.

However, the above tools only support GE learning, not ESP. As for the websites that only support learning English for tourism, it can be seen that the number of websites is quite a lot, such as Hospitality, Condé Nast Traveler, Tnooz, etc. However, the above websites are only written in English, which can cause difficulties for students who do not have enough English proficiency to be able to read and understand documents. On the other hand, the author found that the above websites are mainly divided into topics and news, but there are no specialised vocabulary and sentences used in tourism. As for the websites that support learning English for tourism written in Vietnamese, the number of these is modest. When the author searched with Google, the results only show GE teaching websites with articles on ESP. For example, we have "English vocabulary about geographical features and terms" (Website English4you, 2017). The learning materials in the above paper are general vocabulary, not vocabulary for specific purposes and they are not even complete.

From the above reasons, the author supposed that building an ESP website in tourism to support the development of specialised English proficiency of Geography Studies students in Geography Department is necessary. The website of this research will support students to develop specialised English proficiency with more sufficient information and materials.

2. Method

- Document analysis method

The analysis method of secondary documents is important and necessary for any scientific researches. When using this method, the author collected and synthesizes documents from many different sources such as textbooks, scientific journals, scientific research works, statistics of agencies, etc. about the specialised vocabulary and sentences used in tourism. The author also researched the training program of Geography Studies in University of Education in order to have a basis to build suitable vocabulary in tourism for the students. The main reference of this research is the textbook used to teach 2 modules of study about tourism for Geography Studies students. Its name is "English for International Tourism - Pre-intermediate".

PRE-INTERMEDIATE COURSEBOOK

ENGLISH FOR INTERNATIONAL TOURISM

NEW EDITION

Figure 1. "English for International Tourism - Pre-intermediate"
Textbook (Coursebook)

- Survey method

In this research, the author carried out two surveys. In the first survey, the author collected opinions of Geography Studies students about their own specialised English proficiency and the means of supporting they think is the most suitable. In the second survey, the author collected opinions of Geography Studies students about the look and the content of the website (the means which is chosen the most). Therefrom, the author can learn, collect and process data in a logical and scientific way, ensuring the objectivity of the survey results.

The author collected the number of Geography Studies students of the 43rd, 44th, 45th and 46th courses, respectively, 29, 46, 26 and 32 (excluding students who have dropped out or been forced to drop out). The total number of students as of the school year 2021-2022 is 133. After the survey, the number of students participating in the first survey reached 101. The second survey reached 95, accounting for more than 70% of the total number of students in the major. The number of students of the courses and the number of students participating in the survey are shown in the table below.

Table 1. The number of Geography Studies students joining the surveys

Course	Number of students	Number of students joining the 1st survey	Number of students joining the 2nd survey
43	29 (100%)	21 (72,4%)	19 (65,5%)
44	46 (100%)	31 (67,4%)	27 (58,7%)
45	26 (100%)	22 (84,6%)	24 (92,3%)
46	32 (100%)	27 (84,4%)	25 (78,1%)
Total	133 (100%)	101 (75,9%)	95 (71,4%)

Due to the complicated situation of the COVID-19 epidemic, the author sent a survey and collected the results online. Specifically, the author sent the Google Form link to university students through online communication applications such as Facebook, Zalo, etc.

The first survey form (The current situation of learning ESP of Geography Studies students) includes 2 main contents:

- ESP proficiency of students.
- Means of supporting the development of Geography Studies students' specialised English proficiency.

The second survey (Website usage effectiveness) includes 2 main contents:

- The look of the website.
- The content of the website.

- Expert interview method:

In order to find the correct source of information, increase the reliability of the topic, as well as have more orientation to build the website, the author applied the expert interview method by sending a survey to the teachers participating in training Geography Studies students. Besides, the author also sent survey questionnaires to a number of employers in tourism such as directors of travel companies, hotels, etc. The survey results will be a reference source and a direction for building as well as completing the website.

3. Results

- The first survey's results

Table 2. Geography Students' grades in the 2 modules of study about tourism (n=101)

Course	Number of students and their grades in 2 modules of study									
		A	B+	B	C+	C	D+	D	F	Not study yet
43	Module 1	1	6	10	1	1	-	-	-	2
	Module 2	2	6	9	2	-	-	-	-	2
		A	B+	B	C+	C	D+	D	F	Not study yet
44	Module 1	1	4	12	10	2	1	1	-	-
	Module 2	1	7	10	5	6	-	-	-	2
		A	B+	B	C+	C	D+	D	F	Not study yet
45	Module 1	2	3	3	9	1	-	2	-	2
	Module 2	1	-	1	-	2	-	-	-	18
		A	B+	B	C+	C	D+	D	F	Not study yet
46	Module 1	-	-	2	3	-	-	-	-	22
	Module 2	-	2	-	3	-	-	-	-	22
		A	B+	B	C+	C	D+	D	F	Not study yet

The grades of 2 modules of study of Geography Studies students range mainly from C to B+, in which, grades C + and B have the highest number of students achieved. It can be seen that the grades of the students are mostly average - good.

Table 3. Means of supporting chosen by Geography Studies students (n=101)

Means of supporting	Number of students choosing
Website	65 (64,4%)
Fanpage	25 (24,8%)
Blog	11 (10,9%)

The survey results show that 68.8% of the students participating in the survey think that the means of supporting should have various specialised vocabulary, specialised sentences with correct pronunciation. 71.4% of students think that the supporting means should have tourism knowledge videos and tourism news in English. To meet the above requirements, students think that "website" is the most suitable support with 64.4% of the students' votes, followed by "fanpage" and "blog" with 24.8% and 10.9% respectively.

- *The website supporting Geography Studies students' specialised English proficiency (<http://geoet.info/>)*

* Vocabulary

Based on the content of the textbook "English for International Tourism - Pre-intermediate", the author builds a specialised vocabulary section consisting of 15 subsections, of which the first 10 subsections have names corresponding to 10 lessons of the

curriculum. The remaining 5 subsections include extended tourism vocabulary words outside the textbook, respectively, on 5 topics:

- Transportation
- Sports (Sports)
- Festivals (Festivals)
- Currency (Currency)
- Countries & Nationalities

The specialised vocabulary is taken directly from the textbook by the author, and added from other websites and travel English books. Each word has a meaning explanation in Vietnamese and definition in English. The 15 subsections of specialised vocabulary with specific topics and number of words are shown in the table below.

Table 4. Specialised vocabulary of the website

No.	Subsection	Number of words
1	World tourism	34
2	Jobs in tourism	21
3	Visitor centres	56
4	Package tours	37
5	Hotels	90
6	Food & Beverage	214
7	Nature tourism	66
8	Air travel	23
9	Hotel operations	33
10	Marketing	35
11	Transportation	68
12	Sports	36
13	Festivals	50
14	Countries & Nationalities	113
15	Currency	18
Total		894

***Sentences**

In order to develop students' specialised sentences, the author built specialised sentences section with subsections corresponding to the skills of the textbook "English for International Tourism - Pre-intermediate". The content of the specialised sentences section is built by the author through the learning process and practical experience in the environment of restaurants, hotels, contact with customers, etc. Each sentence on the website has a sound file recorded by the author.

The subsections' names are:

- Checking and confirming details.
- Covering letters.

- Dealing with enquiries.
- Leading city tours.
- Dealing with complaints and difficult passengers.
- Meeting customers' needs.
- Structuring a presentation.
- Checking out.
- Negotiating.

The name of each subsection and the corresponding number of sentences are shown in the table below.

Table 5. Specialised sentences of the website

No	Subsection	Number of sentences
1	Checking and confirming details	5
2	Covering letters	14
3	Dealing with enquiries	7
4	City tours	7
5	Dealing with complaints and difficult passengers	7
6	Meeting customers' needs	8
7	Structuring a presentation	12
8	Checking out	14
9	Negotiating	6
Total		80

***News**

In news section, the author defines the following:

- Purpose: Increase students' ability to read and understand specialised English.
- Source material: Articles in Vietnamese are from the website of Vietnam National

Administration of Tourism <https://vietnamtourism.gov.vn/> (with citations for each article, the author is responsible for the content translated into English); Articles in English are from the UNWTO World Tourism Organisation website <https://www.unwto.org/> (with citations for each article).

Because the website was built in the last period of March 2022, the author selected the news from the first half of March 2022 to January 2022 to post. In the period from December 2021 and earlier due to the raging Covid-19 pandemic, there were almost no articles on tourism activities, the information mainly revolved around recovery solutions, post-pandemic situation forecasts, etc. Criteria for choosing news is that the number of words is about 400, not too short or too long, the content is easy to grasp and close to students. The news section includes 2 subsections: "News in the world" and "News in Vietnam". The author collected 13 articles. There are 5 articles in the "News in the world" subsection and 8 articles in the "News in Vietnam" subsection.

***Videos**

In videos section, the author designed 10 videos in the subsection "Tourism knowledge videos". These videos can help students learn specialised English and provide knowledge about tourism for students.

- The second survey's results

Table 6. Geography Studies students' opinions about the look of the website (n=95)

Statement	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree
Website's structure is appropriate	0 (0%)	0 (0%)	3 (3,2%)	64 (67,4%)	28 (29,5%)
Website's texts are easy to read	0 (0%)	1 (1,1%)	3 (3,2%)	63 (66,3%)	28 (29,5%)
Website's images are easy to watch	0 (0%)	0 (0%)	3 (3,2%)	66 (69,5%)	26 (27,4%)

As for the look of the website, at each statement about the structure, text and image, more than 95% of the students participating in the survey agree and strongly agree. Only a few students did not have opinions or disagree with the comments about the website's appearance. There were not any students strongly disagreed.

Table 7. Geography Studies students' opinions about the content of the website (n=95)

Statement	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree
Specialised Vocabulary section has a variety of words	0 (0%)	0 (0%)	3 (3,2%)	53 (55,8%)	39 (41,1%)
Specialised Vocabulary section is closely related to the textbook	0 (0%)	0 (0%)	3 (3,2%)	57 (60%)	35 (36,8%)
Specialised Sentences section has a variety of samples	0 (0%)	0 (0%)	4 (4,2%)	55 (57,9%)	36 (37,9%)
Specialised Sentences section is closely related to the textbook	0 (0%)	0 (0%)	3 (3,2%)	57 (60%)	35 (36,8%)
Specialised Sentences section has clear pronunciation	0 (0%)	1 (1,1%)	5 (5,3%)	45 (47,4%)	44 (46,3%)
News section is closely related to your major	0 (0%)	0 (0%)	2 (2,1%)	60 (63,2%)	33 (34,7%)
News section supports the development of reading-comprehension in ESP	0 (0%)	0 (0%)	5 (5,3%)	54 (56,8%)	36 (37,9%)
Videos section is closely related to your major	0 (0%)	0 (0%)	4 (4,2%)	60 (63,2%)	31 (32,6%)

Statement	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree
News section supports the development of listening-comprehension in ESP	0 (0%)	0 (0%)	4 (4,2%)	60 (63,2%)	31 (32,6%)
Website supports the development of your specialised vocabulary	0 (0%)	0 (0%)	4 (4,2%)	64 (67,4%)	27 (28,4%)
Website supports the development of your specialised sentences	0 (0%)	0 (0%)	4 (4,2%)	63 (66,3%)	28 (29,5%)
Website supports the development of your pronunciation to learn ESP	0 (0%)	1 (1,1%)	3 (3,2%)	62 (65,3%)	29 (30,5%)
Website supports the development of your specialised English proficiency	0 (0%)	0 (0%)	3 (3,2%)	50 (52,6%)	42 (44,2%)

As for the content of the website, more than 95% of the students participating in the survey agree and strongly agree that the specialised vocabulary section has a variety of words and they are closely related to the textbook "English for International Tourism - Pre-intermediate". More than 95% of the students participating in the survey agree and strongly agree that the specialised sentences section has a variety of sentence patterns and they are closely related to the textbook "English for International Tourism - Pre-intermediate", of which more than 93 % of students think that the specialised sentences section has clear pronunciation. About the news section, more than 92% of the students who participated in the survey agreed and strongly agreed that this section is closely related to their major, which can support the development of reading-comprehension in specialised English. In videos section, more than 94% of the students participating in the survey agree and strongly agree that this section is closely related to their major and can support the development of specialised English listening and comprehension skills.

In general, more than 95% of the students participating in the survey think that the website is capable of supporting the development of specialised vocabulary, specialised sentences and pronunciation when learning ESP. There are 52.6% of students participating in the survey agree and 44.2% strongly agree that the website supports students to develop specialised English proficiency.

4. Discussion and Conclusion

The topic "Building A Website Supporting the Development Of Geography Studies Students' Specialised English Proficiency, Geography Department, Ho Chi Minh City University Of Education" is the author's enthusiasm in supporting the development of specialised English proficiency of Geography Studies students. After the first survey, the topic has determined the type of support means should be the website because the rate of voting for the website next to the blog and fanpage reaches from 60-70%.

Website of the research is built with 5 main sections: specialised vocabulary, specialised sentences, news and videos. The specialised vocabulary section has 15 vocabulary topics corresponding to 10 lessons of the "English for International Tourism - Pre-intermediate" curriculum and 5 additional topics for students. The specialised sentences

section has 9 topics corresponding to 10 skills that students learn in the curriculum "English for International Tourism - Pre-intermediate" (there is 1 topic for the 2 skills included in the textbook because of their similarity). The section "News in the world and "News in Vietnam" aims to help students update information and increase their ability to read and understand ESP. The videos section is intended to help students review basic knowledge about tourism and increase their ability to listen and understand ESP.

The results of the second survey show that the majority of students participating in the survey agree and strongly agree with the ability to support the development of specialised English proficiency of the website in general and the sections of the website in particular.

Although the website has been built, to be able to support Geography Studies students in developing their specialised English proficiency, it must have efforts from the students themselves and the orientations from Geography Department teachers combined with the website, then the website will maximize its effectiveness. As for the students, they should be proactive in learning ESP with website through self-study, group study, full review before going to class and exams and exams. As for the teachers of Geography Department, they can orient and encourage the students to do exercises in a bilingual form. At the same time, they should design exercises to encourage students to look up the terms of tourism in English so that ESP becomes familiar and close to students.

In the future, another direction related to the topic that the author intends to research is the effectiveness of the website, which is reflected in the scores of the ESP modules. Thereby, it is possible to determine the ability of the website to support in practice, reflected in the learning results of students.

THE FOURTH INDUSTRIAL REVOLUTION AND THE GENDER GAP IN VIETNAM CONSIDERING EMPLOYMENT

Dr. Tran Thi Ngoc Thuy

tranngocthuy@tlu.edu.vn

Faculty of Political Theory, Thuyloi University, Hanoi, Vietnam

Abstract

Ensuring gender equality in the field of employment for employees in the process of accelerating industrialization and modernization of the country and international integration is one of the important goals contributing to the improvement of the position of the labor force individuals in the family and society, and at the same time contributing to social stability, gradual improvement of the quality of life. However, reality shows that, in countries around the world as well as in Vietnam, the gap in gender equality in the field of labor still exists. This issue greatly affects women's employment opportunities and the realization of gender equality. Especially, in the stand of the impacts of the fourth industrial revolution, the jobs for simple laborers like female workers, will be pushed at high risk of being replaced by machines and robots, which makes the gap between genders even larger. Therefore, analyzing the effects of the fourth industrial revolution, the issue of the gender gap, and from this proposing measures to promote gender equality to narrow the gender gap in employment is a meaningfully important issue, which ensures gender equality in such a substantive manner.

Keywords: *Employment, female workers, gender equality, the fourth industrial revolution.*

1. Introduction

According to the 2017 Global Gender Gap Report of the World Economic Forum: "Vietnam ranks 69th out of 144 countries in terms of gender equality, in which the criterion of economic participation and opportunity is ranked first 33/144" (Ngoc Tien Pham, 2022). Vietnamese women "account for nearly 50% of the workforce, and they operate and manage more than 60% among the total number of more than 4 million rural economic households and 28% among the total number of enterprises" (Ngoc Tien Pham, 2022). However, under the impact of the fourth industrial revolution, female workers will be pushed under high pressure as the employment trend will change from manual skills to thinking skills, from workers to machines and tools, or as robots will replace most of the simple jobs. Meanwhile, in Vietnam, female workers are most often concentrated in agriculture, textiles, footwear, and electrical and electronic assembly. These working fields are replaced by robots at the most.

In fact, despite the application of high technology and intelligent machines, especially the appearance of robots with artificial intelligence and robotics are and will create many new jobs, typically jobs relating to human-machine interaction, which creates new waves of business and new jobs. Besides, the fourth industrial revolution can also cause the

risk of disrupting the labor market, which makes the advantage of cheap labor fade away, and the risk of falling further behind is present. Many types of jobs, like those requiring precise manual labor, have been automated and continuously increased as computers have been continuously developed overhead. Most of the work of professionals such as lawyers, financial analysts, doctors, reporters, accountants, insurance, or librarian will likely be partially or fully automated. Many traditional production and business lines will also be at the risk of disappearing. According to research by the McKinsey Global Institute, “it is estimated that by 2030, between about 400 and 800 million jobs worldwide will be replaced by automation technologies. The birth of smart factories, in which machines play a leading role, can operate the entire production process by themselves, which gradually replaces previous production lines” (Nam Hai Nguyen, 2021)

Furthermore, developed countries having technological advantages and capital will invest back in their own countries based on applying "smart factory" technology, rather than investing in profitable country's labor force as before. According to the International Labor Organization (ILO), “about 56% of workers in five Southeast Asian countries are at risk of losing their jobs because of robots” (Central Institute for Economic Management Information - Document Center, 2019). Which, Vietnam is one of the countries most affected by the fourth industrial revolution. According to the forecast of the International Labor Organization (2019), “in the next 10 years, Vietnam will face the replacement of labor when applying digital technology, leading to a change in the production model, culture, etc. Up to 70% of jobs are at high risk (with a probability of being replaced over 70%), 18% have a medium risk (with a probability of being replaced from 30- 70%) and 12% are low risk (with less than 30% probability of being replaced)” (Nam Hai Nguyen, 2021).

Not only in the field of production but also the field of commerce, service, and entertainment, robots, there are jobs to be irreplaceable such as hotel receptionists, offices, restaurants, call centers, traffic, healthcare, education, and agriculture. Not only the risk of losing jobs due to being replaced by machines, female workers in developing countries, including Vietnam, also face a series of other problems such as: not having rights protected according to a change like the labor relationship between people and machines. They also are treated unequally between high-skilled workers and low-skilled workers, who are not equipped with sufficient expertise and techniques to adapt to the new requirements of modern machinery and equipment, leading to self-elimination from enterprises...

In addition, the impact of automation on the labor market is different as well as specific for each industry, each job, and also gender. In particular, workers in the textile and garment, and footwear industries will be most at risk of being replaced by machines because they are mostly low-skilled and unskilled workers, the majority being female workers. Meanwhile, industries such as automobile manufacturing, transportation, electricity – electronics, and infrastructure will have an increased job demand for skilled workers, which is usually for men.

All of the above factors have also had a strong impact on the gender gap, especially the role of women in employment in the digital, physical, technological, and biological

world. Men often dominate in computer science, math, engineering, manufacturing, construction, and installation, industries that are in high demand, which means more careers in which women are playing. Key roles such as switchboard operator, administrative work, retail... will face the risk of job loss.

Thus, the fourth industrial revolution has had a strong impact on the employment of many workers, in many occupations, for both male and female workers, especially female workers. This requires taking active measures to reduce the gender gap in receiving the achievements of the fourth industrial revolution in the field of employment, thereby creating favorable conditions for laborers. Women workers have more opportunities to choose and develop careers in this digital era.

2. Method

The article uses historical, logical, analytical, and synthetic methods to clarify the impacts of the fourth industrial revolution on the gender gap in terms of employment, thereby offering some solutions and measures to increase opportunities for female workers in adapting to the transformational requirements of the labor market 4.0, towards ensuring gender equality in all fields.

3. Results

3.1. The effects of the fourth industrial revolution on the gender gap in employment

3.1.1. Positive impact

Firstly, the fourth industrial revolution has brought many job opportunities for female workers to access new occupations and new jobs.

Although the fourth industrial revolution will make many professions at risk of disappearing because of the trend of automation, it is also an opportunity for other occupations to develop, especially in information technology and digital applications. The transformation will be an opportunity for the birth and development of new business models, new markets, and job opportunities, thereby creating more conditions for female workers to access new occupations and new jobs.

This favorable condition is firstly explained by the relatively high number of female workers, the proportion of female workers in age groups is always higher than that of male workers. “The total number of working employees is over 5.5 million, of which the percentage of female employees is over 50.30%. The majority of female employees are working in industries, accounting for 51.3%, and the proportion of female employees working in commercial services accounts for 40.7%” (Anh Tuan Tran, 2021).

Besides, the Party and the State of Vietnam also have many policies to support employment for female workers. That is the Law on Supporting Small and Medium Enterprises, which prioritizes the development of women-owned small and medium-sized enterprises, and was promulgated on June 12, 2017. Programs to support women entrepreneurs have also been implemented at all levels and sectors to raise women's awareness of the Party and State's guidelines and policies on entrepreneurship, contributing to the realization of the national goals on business development and the National Strategy for Gender Equality. In

particular, on June 30, 2017, the Prime Minister also issued a Decision approving the project "Supporting women to start a business for the period 2017-2025" to support 20,000 women to start businesses and start businesses, helping to realize creative ideas stemming from needs and solving current problems of women" (Ngoc Tien Pham, 2022).

Second, the fourth industrial revolution creates conditions for Vietnamese female workers to have more opportunities to access science and technology, thereby gradually improving their professional and technical qualifications and changing careers industry to adapt to the changes of this revolution.

When having access to high science and technology, and improving professional and technical qualifications, female workers have more opportunities to work in developed industry groups at enterprises or start-ups or create their own. jobs in many flexible forms including part-time jobs such as food processing technology, packaging paper, printing technology, information technology - electronics, mechanical automation, plastic technology, yarn, weaving, sewing, fashion design - prototyping, high-tech agricultural and aquatic product processing, seafood...

Besides, the combination with new professions, changing modern techniques such as building materials, food processing, ceramics, production of high-class sports equipment, high-class fine arts, cosmetics applied arts, travel services, catering, entertainment, cosmetology - beauty care, business administration, marketing - brand development, e-commerce, logistics, financial management - accounting, audit, etc will also attract more and more female workers and there will be almost no occupational boundaries between men and women in the labor market trend towards technology, science, and technology.

On the other hand, the fourth industrial revolution also makes an increasing number of creative women appear in the fields of science and technology, design, art, culture, entertainment, media, education, training construction, healthcare, law... These are also occupations where women will dominate over men.

Third, the fourth industrial revolution also created many new occupational groups that are more suitable for women than for men

One of the opportunities for women in the digital transformation labor market is the maintenance and necessity of women-specific occupations and jobs that machines cannot perform or replace. Those are jobs requiring natural human abilities, capacities, and qualities related to emotional and psychological issues. This often belongs to women such as psychologists, therapists, coaches, event planning, nursing, and other healthcare professionals. Therefore, it is necessary to seize and take advantage of the opportunities of the transforming economy to redesign labor policies and business practices to ensure that both men and women are fully empowered.

Fourth, contribution to increasing income for female workers

New technological breakthroughs in the fields of artificial intelligence, the Internet, 3D printing, nanotechnology, biotechnology, and the rapid and far-reaching change of the entire value chain from R&D to production, customer service, a significant reduction in

transaction costs, transportation, and 4th industrial revolution applications in agriculture, fisheries, medicine, food processing, environmental protection, energy Renewable energy, chemistry, have led to miracles in production and efficiency. As a result, labor productivity increases, and the income of female workers increases also, helping them to stabilize and increasingly improve their quality of life.

3.1.2. Negative impact

In addition to new opportunities opening up for workers in many fields and industries, it also increases gender inequality in the ability to access and apply new technologies.

Firstly, female workers have a higher risk of losing their jobs than men

One of the biggest impacts of this revolution on employment is unpredictable effects on the nature of traditional jobs, causing the risk of disrupting the labor market, redundant labor according to machines replacing people, and an increase of pressure due to the shift of labor resources. In particular, this challenge is even greater for developing countries and especially in occupations employing a lot of manual and unskilled labor where women reach a high rate. One of the main reasons is that they are under-represented for the jobs with the highest growth in the coming years in the STEM (science, technology, engineering, and math) industries. “According to UNESCO estimation, only 3 in 10 researchers in science, technology, and innovation globally are women” (Ngoc Tien Pham, 2022).

On the other hand, like in many other parts of the world, Vietnamese female workers are also under high pressure and face the risk of losing their jobs in labor-intensive industries. The following table shows that the rate of jobs being replaced by machines in the following sectors: agriculture, forestry, fishery, processing industry, manufacturing, wholesale and retail, textile and electronics industry is very high.

Table 1. Industries with a high rate of job displacement in Vietnam

Industry	Rate of substitution
Processing and manufacturing industry	74,4%
Textile industry	83%
Electronics industry	75%
Agriculture, forestry, and fishery	83,3%
Wholesale and retail	84,1%

Source: Forecast of the International Labor Organization, 2019

(Nam Hai Nguyen, 2022)

In the above occupational groups, female workers in Vietnam will face more risks and challenges than men because they often focus on fields that require low professional qualifications or jobs with sustainability and low stability. Specifically: “70% of female workers usually work in industries and fields such as services, textiles, leather, and footwear; 62.4% of female employees work in the family without pay and are self-employed; 41.1% of female workers do simple jobs; 43.6% of female employees work in the agricultural sector” (Ngoc Tien Pham, 2022). For example, in the textile industry, operations such as

cutting and sewing can be replaced by machines. Technology 4.0 can work continuously 24/24h, robots can replace for electronic assembly industry, and consulting, and customer care will be answered by automatic robots. This will have unpredictable consequences for the economy and other social security issues, including an increase in the gender gap.

At the APEC Women and Economic Forum held in Thua Thien Hue in September 2017, it was also pointed out that the fourth industrial revolution is having unpredictable effects on the nature of work in general and participation in the workforce empowering women in the economic field in particular. The majority of female-owned enterprises are small and micro enterprises; access to support programs and policies is limited. In addition, they also have more difficulty than men in realizing business ideas, and fewer opportunities to participate in trade promotion activities, or opportunities for training and learning...

The second is the imbalance in the industry structure

The fourth industrial revolution will increase the segregation of the roles of men and women at work. This is a negative consequence of this industrial revolution because it increases inequality in general and the gender gap in particular, making it more difficult for women to develop their capacity in the labor force's future motion.

In which, the majority of female workers are still concentrated in industries that use mainly labor, or jobs with specific and repetitive characteristics, which are easily changed by robots and automated production processes such as textile, garment, footwear, agricultural product processing, non-agricultural sectors... Moreover, many women in difficult circumstances can only do unstable jobs, precarious work, etc. low income, easy job loss or unimproved working conditions, long working hours, precarious jobs, and high risks.

Meanwhile, it is because men tend to dominate in computer science, math and engineering, it is likely that gender inequality will be exacerbated. At the top is the information technology industry, considered the core industry of this industrial revolution, which is immune to the economic crisis, followed by the electrical engineering, robotic,s and intelligence industries artificial - the focus of the fourth industrial revolution will also develop very strongly. In addition, the following industries: Biotechnology - creating high labor productivity and generating output for businesses; development of mobile Internet, cloud computing... and service industries also tend to increase strongly such as 3D printing development and construction, investment financial services, design, healthcare, auto repair, etc. refrigeration...

In addition, the process of automation, development of artificial intelligence, and the ability to digitize jobs in service industries also mean that many occupations that female workers are undertaking are also at risk of unemployment. Traditional occupations are often the source of livelihood for many young women, many of whom are the first women in their families to work, or occupations that are popular among low-skilled middle-class women such as staff, call center, administrative and retail jobs will also gradually disappear or be replaced. This "will hurt many families, especially will put their families with single income from low-skilled women in danger, reducing the total income of families with two workers." and widen the gender gap that already afflicts the world" (Klaus Schwab, 2016, p.78-79)

This can be seen very clearly when Vietnam as well as other countries in the world are directly affected by the Covid-19 epidemic, the service sector, as well as several industries and occupations in which female workers predominate, are under pressure great force from the consequences of the epidemic. Therefore, digital transformation plays an increasingly important role for all industries to adapt to life during the pandemic, leading to job loss, reduced income, and increased pressure on workers female.

Third, the difference in qualifications between male and female workers

While jobs in the fourth industrial revolution are highly intellectual, those hardest hit will be the medium- or low-skilled workforce because the rise of super-automation and hyper-connectivity, combined with artificial intelligence, will dramatically impact nature of all types of work. Any field of manual labor or profession with a repetitive nature can be replaced by robots. Even jobs that require skillful human hands can also be replaced by robots such as sewing the winding curves of clothes and shoes... According to a forecast by the World Economic Forum, “50% of jobs doing today will be replaced by robots in the next 30 years; 65% of children in primary school today who graduate from school will find a new job that has never existed before” (Thi Thu Lan Pham, 2021). Accordingly, a portion of the low-skilled workforce that was already heavily impacted by automation during the 3rd industrial revolution may now be further affected. An economy with a high degree of automation and creativity requires workers to quickly adapt to changes in production, otherwise, they will be redundant and unemployed.

Meanwhile, the current professional and technical qualifications of the majority of female workers are lower than that of men, especially in technical skills, digital skills, and information technology in the traditional direction (textile, sewing, service, sales...). Although vocational training and capacity building for female workers have been focused on, it has not yet met the actual needs, especially in the context that the fourth industrial revolution is having a profound impact on women employers’ recruitment requirements. “According to a report of the Ministry of Labor, War Invalids and Social Affairs, although the number of female workers participating in vocational training increases every year, it mainly only increases in primary training and under three months, focusing mainly in the fields of vocational training and education garment, footwear, electronic assembly, tourism, service, seafood processing, and agricultural production sectors; the percentage of female employees participating in vocational training does not meet the set target, the percentage of female workers who have undergone vocational training is still lower than that of men” (Thi Mung Bui, 2022). Therefore, when the fourth industrial revolution develops, the replacement of production lines with modern machines and equipment will increasingly require a highly-skilled workforce to control production lines with modern equipment and machines.

3.2. Some solutions

Firstly, regulate the percentage of men and women recruited to ensure the implementation of gender equality in the development and implementation of legal documents

The regulation of the percentage of men and women employed is one of the important measures to ensure equal employment opportunities for men or women to close the gender

gap and towards the realization of substantive gender equality. The 2006 Law on Gender Equality stipulates specific measures to promote gender equality in the field of labor, including regulations on the percentage of men and women who are recruited; training and retraining to improve the capacity of female employees and the employer to create occupational hygiene and safety conditions for female employees working in several heavy and dangerous industries or occupations or contact with toxic substances (Clause 3, Article 13). (Law on Gender Equality, 2006).

However, eliminating the large gap between men and women in terms of employment opportunities has not yet achieved the expected results, because in fact, discrimination against women is reflected in the Job advertisements that are still available. According to a report by the International Labor Organization (ILO) conducted in 2015: “Job advertisements from mid-November 2014 to mid-January 2015 showed that the majority of job advertisements mentioned gender requirements. Of the job postings with a gender factor, 70% require only men, while only 30% expect female candidates to apply” (Thi Mung Bui, 2022). Moreover, in the recruitment posting needs of many companies, agencies or businesses, gender requirements are often stated. For example, male recruitment is often preferred for jobs of a technical nature, advanced engineering, technology, or jobs that require more mobility such as architects, engineers, information technology ..., and women are often required for support and office jobs such as receptionists, secretaries and assistants, accountants, human resources and administration...

Moreover, stemming from gender stereotypes, employers do not want to hire female employees because women often have to give birth and take care of the family, so they will have to take more rest than men or other important employers think that men will do better than women for that job, so they will prioritize choosing men and ignore opportunities for women. As a result, women are still more disadvantaged than men in terms of employment opportunities. In particular, before the changes of many professions under the impact of the fourth industrial revolution, the jobs that women take on often tend to be replaced by robots and automation, or the jobs that women do with low or moderate-income. This also means that jobs with high incomes and opportunities for career advancement are still jobs that tend to go to male candidates more than women, thereby creating inequality in employment opportunities for female workers, leading to inequalities between men and women in many other areas of social and family life.

Therefore, besides ensuring job opportunities for female workers in general and female workers in particular with ethnic minorities, women with disabilities, etc., more policies are needed to work. Women workers are allowed to work in groups of occupations that apply modern technology and techniques to better solve the problem of gender inequality in employment opportunities.

Second, training and fostering to improve the knowledge and skills of female workers

Before the effects of the fourth industrial revolution, women are often more disadvantaged in accessing employment opportunities than men. Therefore, measures to promote gender equality in the labor sector should focus on training and capacity-building measures for female employees. This is the most urgent measure at present and is meant as

a leverage solution to ensure gender equality in the field of employment to realize the goal of the National Strategy on Equality Gender in the period 2021 - 2030. These are the goals: (1) Increase the proportion of female wage workers to 50% by 2025 and about 60% by 2030. (2) Reduce the proportion of female employees working in the agricultural sector in the total number of female employees with employment to less than 30% by 2025 and less than 25% by 2030. (3) The ratio of female directors/owners of businesses and cooperatives are at least 27% by 2025 and 30% by 2030” (Resolution No. 28/NQ-CP, 2021).

Prioritizing training and capacity building for female workers will create more conditions for women to have equal employment opportunities. Once they receive vocational training and have a solid professional qualification, they will have more opportunities to choose jobs, have stable jobs, better incomes, and therefore also have the opportunity to assert their position in the family and society. Practice shows that, in recent years, many projects on capacity building for female employees have been implemented, which has contributed to increasing job opportunities for many female workers. However, before the requirements of the fourth industrial revolution, female workers still face a lot of pressure in finding decent jobs as well as jobs with high income and good prospects in the profession Karma.

Therefore, the job training policy for female workers, if it stops at primary training and focuses on several occupations where female workers currently play the main role, will not solve the problem thoroughly the problem of creating equal employment opportunities for female workers. Therefore, female workers need to actively raise awareness about the fourth industrial revolution, and actively participate in training courses to improve their qualifications and skills in their occupations and jobs to meet the needs of the workforce meet the requirements of digital technology. Each female employee must be aware of the change, feel the pressure and challenges from this industry, actively learn the necessary information, make efforts, and overcome herself to respond appropriately fit herself.

Female workers also need to proactively equip skills, especially technology skills, develop soft skills, creativity, adaptability, flexibility in work and communication, and improve foreign language skills and information technology to be able to adapt and meet the requirements of high-quality jobs and labor mobility in the digital age. In addition, to overcome the unemployment of a part of female workers with low professional qualifications and skills, especially in occupational groups at high risk of being automated and replaced by robots, attention should be paid to retraining, and training to improve professional knowledge and skills in enterprises, production, business and service establishments to meet the requirements of technical, technological and service innovation, production, the ability to adapt to changes in technology and organization and management.

On the other hand, it is necessary to increase and promote access to information and communication technology and women's participation in the training of careers in high growth fields, new careers brought about by the digital age, are better paid like science, technology, engineering, art, and math. At the same time, promote creative entrepreneurship among young women and female entrepreneurs.

In addition, women need to focus on training and working in a group of professions that need creativity in the fields of design, art, culture, entertainment, media, education,

training, healthcare, law... or groups of professions that require ingenuity, sophistication, perseverance, jobs that cannot be performed by machines and or jobs that require natural human abilities and qualities such as problems emotional and psychological issues.

Third, strengthen support policies for female workers

In addition to preferential policies for start-up programs, production projects of female workers should focus on supporting technical research for women's associations, enterprises, and cooperatives led by women masters to have access to advanced scientific and technical achievements, step by step mastering technology.

In addition, businesses and employers also need to create occupational hygiene and safety conditions for female employees working in several heavy and dangerous industries or occupations or exposed to hazardous substances. This is one of the measures to show the progressive trend in approaching and solving the gender equality issue specified in Clause 3, Article 13 of the Law on Gender Equality in 2006 to ensure that female worker are not excluded from job opportunities. Because, if the priority is not to select women to work in a toxic and dangerous environment that priority will remove female workers from some job opportunities. Therefore, creating hygienic and safe conditions for female workers so that women can still work in some dangerous industries and occupations, and come into contact with toxic substances without affecting their health is the key to ensuring their health ensure substantive gender equality in employment opportunities for both men and women.

To do this well, it is necessary to promote the implementation of many solutions to create conditions for female workers to work in several dangerous industries or occupations or to be exposed to toxic substances, to which special attention must be paid: It is important to propagate for female workers to raise their awareness of preventing dangerous impacts from the working environment on their health and reproductive health. At the same time, the employer must strengthen additional measures to ensure the safety of female employees when they work in several dangerous industries and occupations and are exposed to hazardous substances. Because ensuring safety and hygiene for female workers must be done in all working environments. That is also the clearest expression of the nature of measures to promote gender equality.

4. Conclusion

Thus, the fourth industrial revolution has been opening up many opportunities for women to develop their capacities, and grasp the development trend of science and technology, but also poses many challenges in terms of employment for them. In particular, changes in the structure of the labor market, machines, and robots gradually replacing humans have impacted many industries, which will lead to a large number of female workers being affected. Therefore, female employees themselves need to be aware of the opportunities and challenges for their work and profession to innovate their working ways and thinking, learn and improve their capacity, and step by step adapt to the fourth industrial revolution. In addition, the State's policies also need to focus on vocational training for female workers according to the gender approach, improving professional qualifications, technology skills, and soft skills to meet the needs of female workers employed in the

enterprise or the labor market. This training is not only to serve the livelihood but also to increase the participation and contribution of women, create new impetus to promote sustainable, innovative, and inclusive growth, create a favorable environment benefits for women to promote their talents, to gradually narrow the gender gap, and to realize gender equality substantively and effectively.

THE RETURNEE OF MARRIAGE MIGRATION: A CASE STUDY IN MEKONG DELTA, VIETNAM

Dr. Pham Thi Binh

binhpt@hcmue.edu.vn

Geography Department, Ho Chi Minh City University of Education, HCMC, Vietnam

Abstract

This paper focuses on the adversity circumstances of Vietnamese marriage migrants who return to their hometowns. The paper starts with analyzing the context of marriage migration in Vietnam last three decades. Then, the returning of Vietnamese marriage migrants will be discussed. Finally, by examining specific returned cases in Mekong Delta, the paper demonstrates that the returnees face with lots of difficulties in their hometown; and their returning also creates many problems to the sending communities. Overall, it is hard for the returnees to re-settle down and continue their life in the hometown due to various reasons, including social constraints, institutional and legal structures. This urges many returnees jump into forced migration. Though, they are not recognized and documented as forced migration. Therefore, transnational framework for legal support is urgently needed to solve problems faced by many marriage returnees in their homeland.

Keywords: *marriage migration, returnee, Vietnam, Mekong Delta*

1. Introduction

The Marriage Migration Trend

In recent decades, marriage migration has become an important form of migration for women in many developing countries in contemporary Asia. Marriage migration has become an important form of mobility for women in many developing countries (Charsley, 2008). In 2007, 44.7% of the total number of migrants in Asia is female. Noteworthy, marriage migrants from developing to developed countries are predominantly female (Belanger et al. 2010). A great number of marriage migrants are from Southeast Asian countries. For instance, the Vietnamese women got married to Taiwanese men and Korean men. The Pakistan women moved to Britain. Thai women marry Germany, Filipina women to Germany [9], to the United States, Japan, Australia and Sweden, etc. The main reason Asian women migrate for marriage is to improve the economic situation. That is to find a better life as Vietnamese women in Taiwan and Korea (Kim, 2017; Kim, 2007; Lee, 2008), to obtain money as foreign brides in Korea (Kamiya & Lee, 2008) and Pakistani brides in Britain (Charsley, 2008), to help natal family by sending remittances; to escape from bad situations in the homeland as Thai women and Filipinas in Germany or Filipina in the US, Japan, Australia, and Sweden (Ishikawa, 2010).

Researches on marriage migration have been done in different fields. However, not many studies concern about the returnees in the sending sides. They seem to be neglected in

migration studies. In reality, the cause and effect of the returnees will create many problems to both sides, especially to sending countries. Although, the returning of these marriage migrants would not be as big wave as the out-migration, it needs to be placed in the marriage migration studies theory to fully understand the forced marriage or “*circular marriage migration phenomena*”.

After migration, the marriage migrant women might get along with the foreign husbands in the destination. Or their journey might end up with a divorce (worse cases are killed or died) and they need to make other choices: 1-continue to live in foreign countries legally in case they have acquired the resident alien; 2- return their home countries. The most miserable cases are the returnees with empty-handed, even without their personal documents. Some return with their small child who cannot speak the mother’s language. Facing with the difficulties in the sending sides, some will force to re-migrate for marriage.

Conceptually, this paper discusses three important points. Firstly, this article provides evidences on the difficulties that the returnees faced with. By analyzing specific interviewed cases in the sending communities, we clarify the dual stigma of failure on the returnees, that is, failed wives (aim for marriage) and failed migrants (aim for economic). Secondly, at macro level, our findings support the viewpoint on the legal precarity of the poor returned marriage migrants in their home countries. They are in complicated and ambiguous status due to social constraints, institutional barriers, and legal structures. These limit them from re-settling down in their hometowns. And, due to the difficulties to re-settle down, many returnees seek for another chance to migrate for international marriage. Thirdly, since the mixed child accompanied with the returnees has been increasing overtime and will soon be big problems to the sending communities, the support from countries of mother and father needs to be seriously considered and clarified.

The Context of Marriage Migration In Vietnam

According to the Ministry of Justice of Vietnam (MJOV), between 1995 and 2019, a total 393,570 Vietnamese women got married to foreigners, 90% of them were from rural areas, and 83% married via brokers. Their main destinations were Korea and Taiwan, the US, China, Singapore, Malaysia, etc. From 2010 to 2019, the number of Vietnamese women married to Korean men increase remarkably. Until 2018, Vietnamese brides in Korea is about 120,000, account for 38,16%, the largest foreign brides’ group in this country.

Before 1986, some Vietnamese women, especially those from Mekong delta region, got married to US nationals via relatives and friends. Most of them got married to the Vietnamese American men called Vietkieu. International marriage migration in Vietnam has become a great concern due to the increasing volume of women choosing marriage to improve their economic situation. This trend has started just after the Government of Vietnam adapted the “*open policy*” in 1986. The number of Vietnamese women got married to foreign husbands via brokers has increased remarkably. Their two main destinations are Taiwan (since 1987) and Korea (since 2000). The destination of migration for marriage of Vietnamese women changes from Taiwan to Korea in the last two decades due to social, economic and policy factors (see, Pham & Kamiya (2013).

In Vietnam, in comparison to labor migration, the migration for marriage of women is considered one way to reduce the poverty and unemployment rate in rural areas. Thus, the marriage migrants take dual roles as a wife and worker, with high economic expectations from natal families. Previous research showed that, the living standard of Vietnamese brides' families in Vietnam improved considerably after their migration. They assumed that even though, most of the Vietnamese brides move to the rural areas in Korea and Taiwan, their marriages are still hypergamy in economic condition (Pham & Kamiya, 2013). According to the Ministry of Gender Equality and Family of Korea, 59.7% multicultural families live on less than 2 million won per month. Most of them got married to the lowest socio-economic husbands (Park et al., 2012). Therefore, many Vietnamese brides face with economic difficulty in foreign countries. Moreover, the life of the Vietnamese brides in the destination become harder since they are also faced with other difficulties such as, language barrier, cultural differences, social exclusion, discrimination, and so on. And, the disappointed about the real economic condition in destination countries is the one of the main reason leading to breakup of such international marriages. These explain why the numbers of international divorces have been increasing overtime in Korea (Park et al., 2012).

After migrating to foreign countries for marriage, not all the Vietnamese women can settle down. Many of them must return their hometown with the feeling of failure. They failed to achieve their goal, that is, to bear children, to integrate, to settle down and assume lifelong in the destination countries. Divorce does happen due to different reasons. After getting divorce, some marriage migrant women continue to live in the destination countries, both legal and illegally, while many must return their hometown.

Kim (2017) mentioned that, according to Korean Center of United Nation Human Right Policy (KOCUN) survey on 100 Vietnamese marriage migrant women in 2014, 92 out of 100 women got divorce with official papers, 58 voluntarily returned Vietnam, 32 women became illegal aliens after divorce and were deported Vietnam, 5 were repatriated by the husbands. This means, nearly half of the returnees do not want to go back Vietnam. It is compatible with some interviewed cases in Mekong Delta that will be analyzed in the following section.

Some women returned alone, leaving their small children in the destinations. Some come back with their child who cannot speak Vietnamese, even without personal documents.

Though, the returning does happen, the returnees' data and information are not officially documented in Vietnam. Thus, the data in this paper is collected by making interviews through personal approaches. So, the sample size is so limited. Besides, since the returning of those women, still, is not a concerned topic in the marriage migration studies, we have limited secondary data for analysis and references, too.

2. Method

Research Methodology and Collected Data

The study aims to demonstrate that transnational framework for legal support between countries of origin and destination is urgently required to solve problems faced by the returned marriage migrant women. By documenting and clarifying the Vietnamese returnees' problems, including what they are suffered, faced with after returning; in their homeland to re-settle down; and, also what are the influences of their returning to the sending communities, etc.

Research place is Can Tho and An Giang provinces, in Mekong Delta, Vietnam. We collected the data in November 2019. Primary data collected by in-depth interview.

We chose these areas because a very large numbers of marriage migrants had left the regions last three decades. Of more than 50,000 international marriages that took place in the two provinces last three decades, a majority were to Taiwanese husband (50%), Korean (40%) and other countries (10%). Most of the Vietnamese marriage migrants are young, aged 18-25, low education level. Their husbands are often twenty-four years (even more) older.

After migration, some marriage migrants can help their parents to build new houses, to buy modern equipments. In sending communities, those marriage migrants are considered successful and embedded good image. In contrast, there are also many unsuccessful cases, returning with empty-handed. It is not the natal families' expectations. They are embedded failure cases, or bad images.

Actually, those women returned Vietnam for different reasons, such as getting divorce or escaping from the violent husbands, etc. Thus, the returnees' plight in Mekong Delta should be recognized and deeply sympathized.

The main methodology we used to collect data is in – depth interview. The total numbers of returnees we interviewed are only twenty-one. Actually, it is not easy for us to reach these returnees since they are not willing to join in the interview.

There is no official data about the returnees in the two provinces. As the commune officer said that the returnees do not want to present themselves due to the feeling of a shame (as failure), the stigma of useless women (as difficult or nearly unable to remarry a Vietnamese man). Besides, it is difficult for us to meet some returnees because they do not want to share anything. They thought that their stories are unsuccessful, or not worth mentioning. Since we could not reach the returnees, we also conducted interview with their relatives and some villagers to collect data. We present the research results in the next part.

3. Results

Table 1. General information of 21 cases

Indicator		Person/ (%)
Education	primary	2 (9.5%)
	junior	10 (47.6%)
	senior	8 (38.1%)
	tertiary	1 (4.8%)
Marriage age	17-19	6 (28.9%)
	20-24	8 (38.1%)
	25-29	5 (23.8%)
	30-34	2 (9.5%)
Occupations before migrating for marriage	maid servant	9 (42.9%)
	worker	3 (14.3%)

Indicator		Person/ (%)
	farmer	6 (28.6%)
	selling	3 (14.3%)
	others	1 (4.8%)
Occupations after returning	maid servant	7 (33.3%)
	Selling	14 (66.7%)
Number of children	one	10 (47.6%)
	two	2 (9.5)
	no	9 (43%)
Expect to re-migrate for marriage	yes	18 (86%)
	no	3 (14%)
Destination countries	Taiwan	11 (52%)
	China	1 (4.8%)
	Korea	7 (33%)
	Malaysia	2 (9.5%)

Source: Survey in 2019

Table 1 show that, all the returnees are young and have little education, just finish primary and secondary school. Eleven out of twenty-one returnees married to Taiwanese; seven returnees married to Korean, two to Malaysian, and one to Chinese. Most of them have children and expect to re-migrate for marriage.

Studying the 21 returned cases, we recognized that, the difficulties of the returnees accompanied with and without children are different. Thus, we classified them into two groups, *group 1*- returnees without children; *group 2*- returnees accompanied with children. Then, we selected three cases from the two groups for analysis in the next section.

Case Study Analysis

In this part, we will analyze three returned cases. Case A and B come back Vietnam, accompanied with children. Case C returned Vietnam without children. Besides, destinations countries of the three cases are Taiwan, Korea, and China. We documented their information in the following table.

Table 2. Information of the three cases

Information	A	B	C
Marriage age	19	21	23
Education	primary	high school	secondary
Language ability	poor	rather good	average
Occupation before migration	farmer	nothing	maid servant
Occupation after returning	selling	maid servant	maid servant
Length of stay	6 years	5 years	3 years
Number of children	2	1	0

Source: survey 2019

Note:

Language ability

Poor: know a few words, can't make conversation in the husband's language.

Average: can make basic/daily conversations, but with lots of errors.

Good: can make conversation properly, with less serious errors

The three cases above have similar motives of migration, seeking for higher economic betterment. All the three cases married via marriage brokers and do not know about the husband's job and income in the destination.

Case A

A's hometown is CanTho (Tan Loc island). A got married to a Taiwanese man at the age of 19 via brokers in 2008. She quickly migrated to Taiwan three months after a mass wedding in Ky Hoa park. Coming to Taiwan, she continued to work as a farmer, the job she used to do in Vietnam. Her husband is a farmer and must work hard, too. After one year, she gave birth to a daughter. Her husband was not very happy. He wanted a son, and so did his parents. Her husband often easily got angry with her. A had to do all the housework and taking care of the old parents-in law. Luckily, the third year in Taiwan, she delivered the second child, a son.

A said: "I had to work hard before going to Taiwan. And, it does not change when I came to Taiwan. I cannot speak Taiwanese. I have no friends. My husband did not allow me to meet others Vietnamese women. I worked as a machine. At first, I dare not tell my mom in Vietnam anything. I dare not (because my mom is also a single mom with two daughters. She is sad enough - crying). When my parents- in law got sick and died, my husband became a crazy man. He only wanted my son. He beat me any time. One time, my head was seriously hurt. The neighbors took me to hospital. Then, we got divorce. And I returned Vietnam with my daughter because my husband refused to raise up my daughter".

To A, visiting the son seems impossible for her. It is difficult for her to apply for visa to Taiwan again because she does not have money, and no one guarantees her. Also, she has not received any help or information from her ex-husband since she left Taiwan. After returning Vietnam, A cannot find a stable job. She sells lottery ticket and fruits in a small market.

Case B

B's hometown is An Giang province. B got married to a Korean man at the age of 21 via brokers in 2012. She migrated to Korea six months after the wedding in her hometown. Coming to Korea, she is a housewife. The couple lived with the parents-in law, over 80 years old. Her husband is a constructed worker. After one year and a half, she gave birth to a daughter. Six months after the daughter's birth, her husband got an accident. Then, he was unable to work again. B had to find a job outside the home to earn money. She worked for a cleaning company. Her job is washing the drape from the hotels or hospitals. Since she worked outside, her husband was unhappy and easily getting angry.

B said: "Now, I have no chance to go back Korea. I still cannot make the identification. Before coming back Vietnam, I had applied all the related documents to

acquire Korean citizenship. The process has not finished. At present, I also cannot remarry with anyone else because I am officially married”.

Case B shows that due to the lack of personal documents and the refusal of the Korean husband, she cannot go back Korea. Though, she does not want to be stuck in Vietnam. She does not know what to do. She is not acknowledged as single women in Vietnam.

Case C

C’s hometown is Can Tho, in Tan Loc island. C got married to a Chinese man at the age of 23 via brokers in 2013. She migrated to China one month after the wedding in her home. In China, she worked as a housewife. It is really a hard job since she had to do serve a big family, with twelve members. Her husband is a worker. After three years in China, she still did not have any children though her husband tried to find different ways. Then, C was considered as real maidservant in the family. She became the wife of other men in the big family, not only the wife of her husband. It was terrible to her. She tried to escape several times. Finally, she was lucky to go back Vietnam in a cold winter night, leaving all her personal papers in China.

Sadly, C said: “*It was terrible time in China. I was dying. I am not good at Chinese. I had no right. I even do not have to work hard like that in Vietnam. However, I never tell my parents about my terrible time in China. My parents encouraged me to marry a foreigner. I made a wrong choice. I hope to take other chances. I think, Korean men is better*”.

C suffered a terrible life in China. This case also shows that the Vietnamese women are very enduring. They dare gamble their life. They accept to bear any degree of misery such as economic difficulty, and hard-working condition. And, the game has not finished after they returned Vietnam.

Returning Vietnam, the three cases face with different difficulties, both objective and subjective. The reaction from the relatives and neighbors as well as their own problems are documented in the table 3.

Table 3. Problem faced by the returnees

Indicators	Case A	Case B	Case C
<i>Feeling after returning and re-settling down</i>	- Tangible: empty, failed, ashamed, faulty to parents, and lucky feelings	<i>Disappointed (Cannot stand the neighbor’s attitude)</i>	- happy (successfully escaped)
<i>Difficulties</i>	- Daughter (6 years old): cannot attend primary school, not good at Vietnamese, suffering from other kids (mixed-blood) - sufferings from relative and neighbors’ opinions/ attitudes.	- no money - no job	- no money for daily life - no job

Indicators	Case A	Case B	Case C
	- difficult to find a job (no degree, and no money).		
<i>Support from the local community</i>	- daughter is allowed to enter the primary school.	- <i>nothing</i>	- nothing
<i>Relatives/ neighbors' reaction</i>	- look down on me.	- look down on me.	- pity for me
<i>earning a living</i>	- selling lottery ticket and fruits at a small market.	- <i>working in a small restaurant in HCM City</i>	- working in HCM City as a cleaner
Expectation	- stay in Vietnam - get a stable job. - visit her son in Taiwan	- <i>go back Korea.</i> - <i>get divorce.</i> - <i>migrate for marriage again.</i>	- migrate for marriage again. (considering)

Source: In- depth interview, 2019

4. Discussion and Conclusion

4.1. Discussion

4.1.1. The problems in receiving sides

The differences of marriage law in the destination countries and countries of origin. The foreign wives do not have legal rights to live or to leave the destination. For example, the foreign wives need the husband's guarantee for entering the destination (in both Korea and Taiwan), for applying resident card, for submitting the documents to get divorce. This also means that, from the beginning of migration, the foreign wives are in imbalanced position.

Firstly, the foreign wives are easily accused as run away, or to be deported from the destination countries. Their husband has the power to abandon them, simply by reporting to the immigration office that they were suddenly disappeared, even when the foreign wives are still in Korea [8],[10]. That is why case B does not have the chance to come back Korea when her husband reported that she was disappeared without any reason. Thus, B was considered as run-away case in Korea. While in Vietnam, she cannot become full citizen since she did not get a legal divorce. Moreover, the foreign wives' have no right after getting marriage. Case C demonstrates that she loses her basic human rights. Her husband did not consider C as his wife. In the destination, C also did not get any support from the local government. Finally, she ran away to rescue herself.

These finding support the conclusion in Kim study [6] i.e., the foreign wives need more legal support in the destination, especially before getting divorce.

Secondly, the ideology of maintain bloodline to the father and the marriage Law in destination countries force the foreign wife in disadvantages condition, especially after divorce. In specific, even getting divorce legally, the foreign wives often do not have the

rights to custody their child because they are economic dependent; they have no job, no money. It is different from the Law on Marriage and Family stipulates of Vietnam. In Vietnam, the priority of child custody after divorce belongs to the wife, even when the wife does not have a stable job. The husband must take the duty to support the child until their children get to the age of eighteen. This difference makes most of Vietnamese wives in foreign countries dare not think of getting divorce because they want to take care of the children. They sacrifice for their children.

Among the three cases we analyze in this paper; case A is an example. A's ex-husband has no connection with his daughter and does not support anything after divorce. It is unfair to the foreign wives, and especially it is not compatible with the Vietnamese Law on marriage and Family. Case A certifies that after getting divorce officially and return the home countries legally, the returnees need more supports from the local government; and the support from the husbands' government to visit their children left behind in the receiving sides.

Thirdly, the husbands have the right to get divorce without the foreign wife's agreement while the wives do not. Thus, the foreign wife is in disadvantage position and their voice is weaker. For example, although case B does not economically depend on the husband. She found a job and earned money by herself in Korea. However, her husband still has the power to abandon her by reporting her disappearance. So, even B is economic independent, she cannot go back to Korea.

In sum, in the destination countries, the foreign wives are in disadvantage position. Especially, the laws of destination countries are impartial, unfair, inequitable, and unjust to the foreign wives. This makes the husbands have more power to control and dominate the wives. And the wives are in inferior positions. Thus, the imbalances in daily life and legal powers will lead to many problems in such multicultural families. Especially, in the some first few years of the marriage, the wives' language ability is not good enough to report the problem. From these findings, we completely agree and support the claim of Kim [6] that, a new transnational framework for legal assistance is urgently required to find solution for the problem faced by such international marriage as well as to protect the human right for these migrant women and their children.

4.1.2. The problem in sending sides

To the sending sides, primary data collected on the returning of these marriage migrant women also raises many problems.

Firstly, because the aim of these women is clearly to migrate for a better economic condition and to settle down in foreign countries [12]. Therefore, the viewpoint and reactions of their relatives/communities on their returning means a failure. This reinforce the returnees' ashamed and useless feelings

Secondly, the social constraints in the hometown heavily influence on the returnees' thinking. These constraints become the burden on the returnees and urge them to think of re-migrate for marriage, escaping from the impassable reality.

Thirdly, there is not much support from the local government, maybe no support except when the returnees ask for help. In fact, due to the social constraints and the thinking of failure, ashamed feelings; the returnees tend to solve their difficulties by themselves. Usually, they do not ask the local government for help. They find their way to re-migrate for marriage.

4.3. Conclusion

There have been many studies on marriage migration, focusing on the sending and receiving sides. However, research on the returnees is very limited. Especially, the push factors on forced migration of the marriage migrant women have not mentioned. The story of the returnees in Mekong Delta of Vietnam in this paper is just an example.

The paper makes a very starting glance at the life of the returnees to raise their voice for getting support not only for the returnees themselves but also for their mixed child. It is more important to give supports to the returnees' mixed child, both in the receiving and sending sides. Besides, more research needs to be done to clarify the returnees' difficulties in their hometowns in order to support them. The difficulties the returnees face with are also derived from what they suffer in the destinations, such as their disadvantage position in the husband's countries (lower and less powerful). So, before returning, they cannot get enough supported from both the destination and origin sides. Specifically, destination Governments need to give them more support and protection. Especially, the returnees and their child should have the rights to get enough personal documents to restart their life in the hometown.

We hope that this paper raises the voice for these miserable returnees, requiring transnational legal assistances before and after returning. Thus, it is necessary to collect more data and research on the returned marriage migrants viewing both from the sending and receiving sides.

Abstract

The article aims to find out the factors affecting security investment decision of students, measure the impact of those factors, and point out similarities or differences between economics and non-economics students. A survey of 178 students in both economic and non-economic sectors of universities in Hanoi showed that the factor "Available resources and decision-making bases" has the strongest influence on decision-making, the factors "The Crowd Effect" and "Self-Confidence" rank 2nd and 3rd. At the same time, the analysis results also show that there is no difference in the impact of these factors to the investment decisions of students of economics and non-economics majors.

Keywords: *stock investment, investment decision, economics student, non-economics student, available resources, decision-making basis, crowd effect, self-confidence.*

1. Introduction

Throughout more than 20 years of establishment and development, the Vietnam's stock market has truly become a medium and long-term capital mobilization channel for the economy. Together with the development of the market, Vietnam's economic structure is also being improved around 4 pillars: the organizational structure of the market, goods, investors, and security business operation. Relating to the investor factor, beside the solutions that have strongly and efficiently attracted their participation, Viet Nam would focus on strategies of investor development by expanding the scale of investment funds (State Securities Commission of Viet Nam, 2021). Nowadays, with the trend of global integration, the Vietnamese security market is becoming more and more opened with

international collaboration activities, and adds on modern, public, transparent mechanisms that protect investor's efficiency, contribute to increase credibility of the capital market and attract organizational and individual investors, both inside and outside.

Together with the development of 4.0 technology and the media like Youtube, Facebook, Tiktok..., most investors who have just joined the market are the young, since they can easily adapt to changes and update financial investment news as well. The investment scale of gen Z investors (who were born in 1996 - 2010) rose 200% from early 2010 till the end of 2021 (DBS Bank, 2021). In Viet Nam, securities companies have also recorded this trend. In the first month of deploying the "Young Investors" account package, VPS Securities Company had 15,000 new customers. At Pinetree Securities Company, in August 2021, the number of newly opened accounts increased four times, in which the group of customers born in 1996 or later accounts for the majority (VnExpress, 2021). This is a signal of more and more the Vietnamese young, especially students, interested in participating in stock investment based on approaching high technology soon. Stock investment brings a lot of benefits for student investors. For real, not only economic students but also non-economic students started to join the stock market. Student investors do not really have much experience in trading. They can choose to invest through the broker channel. The different investment methods, resources, and outside factors could lead to different investing results.

This article aims to answer the following questions: *i*, What are factors affecting students' decision to invest in securities and how much of such influence?; *ii*, Is there any difference of the factors affecting the investment decisions between economics and non-economics students?

2. Literature Review

Overconfidence is a bias that humans promote knowledge, ability and optimism about the accuracy of their information (Markus Glaser & Martin Weber, 2007). This is a psychological status of investors when they feel confident about having more knowledge, experiences... than others (Shiller, 2005). The research of Barka, S., & Y, A.N.C (2016) pointed out that investors' decisions are affected a lot by their confidence.

According to De Bondt, W. F. M & Thaler, R. (1985), investors are all influenced by the representativeness of stocks. They can also be over optimistic about the achievements and pessimistic about bad cases in the past.

Investors joining the stock market tends to follow the crowd effect (Abul, S. J., 2019). They are naturally interested in any trend on the market and believe that previous investors have a lot of reliable information.

Abhijeet Chandra (2008) explored psychological and behavioral factors of investors towards their decision making, and the relationship between the attitude when facing risk with their behavior. The result shows that individual investors do not always make rational decisions. They seek risks and avoid selling stocks in the faces of losses. They separate their investments for specific objectives. Investors' decision to allocate their portfolio is significantly affected by greed and fear. The research suggests that the emotion and behavior factors need to be collaborated in the investment strategies for individual investors. When

making decisions, investors are influenced by the risk relating to their portfolio. Specifically, their investment behavior are influenced by cognitive dissonance, greed and fear, sentiment and rationale. According to the research, these behavioral factors are considered as risk.

Chira, Adam and Thornton (2008) studied the late and emotional awareness that student investors encounter when making decisions, while clarifying the question “How are students influenced by these factors?”. In November 2007, the authors conducted a survey with a sample of 68 students at the University of Jacksonville in the US. The results of the study show that students were very optimistic and confident when being asked to rate their driving ability and work or school performance, but were less optimistic about athletic ability or investment ability. So, students are less likely to make the mistake of being overconfident and optimistic when there is more objectivity in their assessment. In other words, they are not cheated by controlling trends and emotional decisions.

Phan Thanh Hung (2012) studied the behavioral psychology such as herd mentality, fear of loss, pessimism, overconfidence, depression, cognitive inconsistency, regrets,... The results of the survey show that individual investors in Vietnam’s stock market were influenced by psychological factors which lead to irrational behavior, and this did not only happen to few individual investors. When being affected, investors will become the followers of the crowd, contributing to the overheating of the market as well as a subsequent decline, causing socio-economic impacts.

Nguyen Duc Hien (2012) focused on clarifying the theoretical framework of individual investor behavior based on the theory of financial behavior. The author indicates that the macroeconomic environment and the stock market have impact on the decision making of individual investors while inflation is not a real factor.

Pham Ngoc Toan and Pham Thanh Long (2018) conducted a survey of 192 individual investors in Ho Chi Minh City security market. The research results show that there are 5 determinants of individual investment decision, i.e. herding, overconfidence in financial capability, company’s image, consultants’ advice, and the quality of information in financial statements. Among these, the strongest factor is herding while the least influencing factor is the quality of information in financial statements.

Research hypothesis

[H1]: Overconfidence has a positive effect on students' investment decision.

[H2]: Available resources factor have a positive effect on students' investment decision.

[H3]: Representativeness has a positive influence on students' investment decision.

[H4]: Crowd effect directly affects students' stock investment decision.

[H5]: Decision-making bases factor has a positive influence on students' investment decision.

3. Method

Along with in-depth interviews with some students, 250 online survey questionnaires were sent to 1st - 4th year students in economic and non-economic sectors (Humanities, Social Sciences, Medicine, Engineering) who are living and studying in Hanoi. These students may intend or have invested in securities. The number of qualified answers is 178.

Building a scale

a. Overconfidence

Table 1. Overconfidence

Factor	Symbol	Observed variables	Reference source
Overconfidence	TT1	I am confident that my basic knowledge/broker is enough to invest in stocks	Phan Tran Trung Dung (2020), Philmore Alleyne and Tracey Broome (2011)
	TT2	I know exactly what I need to invest in stocks	
	TT3	I am confident in my ability to search and analyze information for stock investment	
	TT4	I have completed the stock investment courses, so it's easy to join this market	
	TT5	I believe in my luck to make effective investment decisions	The authors

b. Available resources

Table 2. Available resources

Factor	Symbol	Observed variables	Reference source
Available resources	NLSC1	I am able to access official information sources (textbooks, books, newspapers...) in stock investment.	Lai, Cheng-Po (2019)
	NLSC2	I am able to access unofficial information sources (friends, relatives...) in stock investment	Cao Minh Man et al. (2020)
	NLSC3	I have more access to domestic information than foreign sources	
	NLSC4	I have enough time for stock investment	Lai, Cheng-Po (2019)
	NLSC5	I have sufficient money for stock investment	

c. Representativeness

Table 3. Representativeness

Factor	Symbol	Observed variables	Reference source
Representativeness	TDD1	I analyze the trends of representative stocks as an investment basis for all stocks in the same industry that I invest in.	Cao Minh Man et al. (2020)
	TDD2	I buy stocks that are "hot" (stocks that perform well in the short term)	
	TDD3	I prefer to buy stocks of companies with high positions in the industry (in the medium and long term).	

d. Crowd Effect

Table 4. Crowd Effect

Factor	Symbol	Observed variables	Reference source
Crowd Effect	HUDD1	I decide to invest in stocks because my colleagues do.	Lai, Cheng-Po (2019)
	HUDD2	I decide to invest due to the media promotions.	
	HUDD3	I decide to invest in high capitalized stocks.	Luu Thi Bich Ngoc (2014)
	HUDD4	I am affected by other investors' portfolios.	

e. Decision-making bases

Table 5. Decision-making bases

Factor	Symbol	Observed variables	Reference source
Decision-making bases	CSQD1	I rely on the theories and rules of investment.	The authors
	CSQD2	I rely on my experience for the next investments.	Cao Minh Man et al. (2020)
	CSQS03	I rely on the experience of people who have made previous investment decisions.	Phan Tran Trung Dung (2020), Philmore Alleyne và Tracey Broome (2011)

Estimation methods

Quantitative analysis is employed in this research, using the SPSS software through the following steps: sample descriptive statistics, analysis and reliability testing of the scale by Cronbach's Alpha, ANOVA analysis, exploratory factor analysis (EFA), regression analysis, and recommendations.

4. Results

Among 178 students participating in the survey, 61 respondents did not intend to participate in stock trading, accounting for 25.5%. 52.7% of students intended to invest in stocks and the number of students who have been and are investing in stocks contribute to 21.8%.

According to gender, men account for 41%, women make up 59%. According to intake, 57.9% were in the group of 3rd year students, 18% were in the 2nd year, 11.8% in the 1st year, 8.4% in the 4th year, and 3.9% in other intakes. Refer to income, students who have income of less than 2 million VND/month account for 53.4%, followed by 2-5 million VND/month (32%), and over 10 million VND/month (5.1%). Most of the respondents are majoring in economics (73%). By the investment channel, the number of students choosing a self-investment channel accounts for 70.8%, the rest of 29.2% choose to invest through a broker.

The average value of the *overconfidence* factor ranges from 2.51 to 3.14. In which, the variable "I know exactly what I need to invest in stocks" has the highest value of 3.14.

The average value of the *available resources* factor ranges from 2.92 - 3.52. In which, the variable "I have the ability to access official information sources (textbooks, books, newspapers...) in stock investment" has the highest average value of 3.52.

The average value of the *representativeness* factor ranges from 2.82 - 3.24. In which, the variable “I prefer to buy stocks of companies with high positions in the industry (medium, long term)” has the highest average value of 3.24.

The average value of the *crowd effect* factor ranges from 2.67 to 2.91. In which, the variables “I decide to invest in stocks because my colleagues do” and “I am affected by other investors' portfolios” have the highest average value of agreement of 2.91.

The average value of the scales of the *decision-making bases* factor ranges from 3.20 to 3.34. In which, the variable “I rely on my experience for the next investments” has the highest average value of 3.34.

Sample linear regression equation showing the relationship of factors to students' investment decision-making is as follows:

$$Y = B_0 + B_1X_1 + B_2X_2 + B_3X_3 + U$$

In which:

Y: Investment decision.

X1: Overconfidence, X2: Available resources and decision-making bases, and X3: Crowd effect.

The tests show that: The regression model does not violate the hypothesis of multicollinearity, heterogeneity of variance, and autocorrelation. The model is statistically significant.

Table 6. Testing the significance of regression coefficients

Correlation coefficients								
Model		Unnormalized correlation coefficient		Normalized correlation coefficient	t	Sig.	Multicollinear Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	.888	.176		5.039	.000		
	HUDD	.187	.049	.238	3.786	.000	.700	1.428
	TT	.179	.060	.214	3.013	.003	.547	1.827
	NLSC_CSQD	.373	.068	.400	5.481	.000	.519	1.928

a. Dependent variable: QDDT (Investment decision)

The regression model on investment decision is determined as follows:

$$QDDT = 0.187 *HUDD + 0.179 *TT + 0.373 *NLSC_CSQD + 0.888$$

It can be seen that the Available Resources and Decision-Making Bases factors have the strongest impact on the dependent variable Stock Investment Intention (0.373), followed by the Crowd Effect factor (0.187) and Overconfidence (0.179).

Hence, after the analytical methods and the final empirical model have been carried out, the final survival factors include Overconfidence, Available Resources, Crowd Effect and Decision-Making Bases. Accordingly, the following hypotheses are accepted:

[H1]: Overconfidence has a positive effect on students' investment decision

The regression analysis results show that “Overconfidence” has a positive influence on students' investment decision. This result is different from the study of Luu Thi Bich Ngoc (2014) in which overconfidence has little influence on investment decisions of stock investors. This, however, is consistent with the research of Phan Tran Trung Dung (2020) which was concluded that potential investors are strongly influenced by their self-confidence. This result partly shows that student investors are confident in their ability to look for information, knowledge, and experience, both by themselves and through the broker.

[H2]: Available Resources factor has a positive effect on students' investment decision

According to the results of the regression analysis, there is a positive influence of the variable " Available Resources " on the student's decision to invest in securities. This result is consistent with the research results of Cao Minh Man (2020) and Lai Cheng Po (2019). Available Resources is an important factor, positively affecting students' decision to participate in stock investment. With enough knowledge, capital, and time, students will be more willing to participate in stock investment.

[H4]: The Crowd Effect directly affects students' stock investment decision

The results of the regression analysis show that the "Crowd Effect" has a positive impact on students' decisions to invest in securities. The impact of this variable is consistent with the research results of Luu Thi Bich Ngoc (2014) and Cao Minh Man (2020). The direct influence of this factor can be explained by the fact that students have access to a variety of sources of information: from friends, other investors, and the media.

[H5]: Decision-Making Bases has a positive influence on students' investment decisions

The obtained results show that the factor "Decision-Making Bases" positively affects the decision to invest in securities. This result has no difference with the research results of Cao Minh Man (2020), Phan Tran Trung Dung (2020), and Vo Thi Hieu, Bui Huu Phuoc, Bui Nhat Vuong (2020), contributing to demonstrate the importance of the decision-making bases for student investors. In particular, their own experiences and those of other investors have certain impacts, leading to reasonable investment decisions.

Implications

Based on the data collected, the authors found that a majority of students surveyed intend to invest in securities, accounting for 52.7% and 21.8% of the students who have been investing in stocks. This implies that securities investment has been gradually becoming popular to the young. However, a majority of students agree with the hypothesis that the intention to invest in securities comes from the crowd effect, meaning that since everyone around them invests, they decide to invest by themselves. The results through questionnaires and face-to-face interviews contain the following implications, and it is hopefully to contribute to the improvement of students' effectiveness in stock investment.

● ***Actively setting goals when making investment***

Before you want to do something, it is necessary to clearly define what your goals are. If the initial investment decision is made only based on the thought of following friends, it will never have results. According to T..., a third-year student majoring in Corporate

Finance: "I think students have much time but limited financial resources, so it would be better for them to study while participating in. Besides, you should have a plan of what is your own investment purpose". Setting goals for investment represents the student's vision of what and when they want to achieve. When you have clear goals and are able to clearly understand what you are about to do, students will put themselves in a position of being ready to face obstacles and difficulties. It takes time to fully understand the stock market and learn how to invest effectively, and students will certainly face many difficulties with specialized terminologies and language. However, investing or understanding and analyzing the stock market is very essential for students. Therefore, setting goals when intending to invest in securities will help students have more confidence in the journey of stock investment.

- ***Invest only in what you really understand***

According to Le Anh T..., a third-year student majoring in Mathematics-Informatics at Hanoi University of Science and Technology: "Sometimes, when I expect which industry is rising, I will buy hot codes of that industry". Students should broaden their views about the market, they need to do researches on industries and stocks that have not yet appeared in their portfolio. Investors should not buy new and even potential stocks if the shares are listed on the stock exchange by new companies that they themselves have not had time to learn carefully.

- ***Practice perseverance without fear of failure***

For an investment to be profitable, it takes long time. According to Nguyen Minh H., a fourth-year student majoring in Pharmacy, Hanoi University of Medicine and Pharmacy: "My advice for those who have just started investing in the stock market is that you should be patient. There are stocks that are long-term investments, they will not be profitable at the moment, and you have to wait for months or even longer". If students themselves cannot wait patiently, it will lead to wrong decisions. Moreover, if student investors can maintain calm attitude and perseverance, practice their observatory ability and sensitivity to market fluctuations, this will be an effective backup step in the risky investment process.

5. Conclusion

This study has contributed to confirming the factors affecting the decision to invest in securities of student investors in Hanoi, including demographic and other behavioral characteristics.

The research has added and diversified the factors affecting the students' intention to invest in securities, thereby showing the degree of influence of those factors on the investment decision. The investment intention has been mentioned in previous studies, however, student investors have not been deeply taken into account by other research groups. The results show the impact of 5 factors: Overconfidence, Available Resources, Representativeness, Crowd Effect, and Decision - Making Bases on stock investment decisions of economics and non-economics students. In conclusion, there are four factors affecting the student's decision to invest in securities, in which the Available Resources and Decision - Making Bases are the most influential factors, followed by the Crowd Effect and Overconfidence respectively. In addition, the study also shows that in general, there is no difference in the influence of the above factors on investment decisions between economic

students and non-economic students. On the basis of research results, some recommendations have been proposed to contribute to improving the investment efficiency of young investors in general and student investors in particular.

Abstract

Along with the development of science and technology as well as the need to connect and share information with people, social networking sites such as Facebook, Youtube and most recently, the TikTok app was launched. The development of information technology, especially the Internet, has had the impact of changing the way of thinking, even behavior of young people. This article presents the behavior of using TikTok by young people in Ha Noi city. Research results show the extent of usage and factors affecting the behavior of young people using TikTok - people in the age group from 15 to 24 in Ha Noi city, including Subjective norms, Technological development, Perceived usefulness, Perceived ease of use, COVID-19 and some other factors relating to risks such as Time, Information, Psychological and Functional risks.

Keywords: *TikTok, Social Media, Usage Behavior, Decision Tree*

1. Introduction

In the process of formation and development through various stages, social networks have become increasingly popular and have become an integral part of the general public and young people in particular. However, in addition to the benefits offered by social networks such as the speed of information transmission and remote connectivity, there are still major challenges in the process of content management as well as control of the form of communication faced by specialized agencies.

Social networks started to appear from platforms like Yahoo, Facebook, and Google to the growth of some apps with the advent of Youtube, Twitter, and Instagram. The appearance of TikTok has brought a new tendency to users around the world and Viet Nam

is no exception. The object that best represents the coverage of this platform is young people from the age of 14 to 16 and University students. It is undeniable that TikTok is having an impact on certain aspects of the thinking, cognition, and lifestyle of some parts of youth nowadays, whether directly or indirectly.

With an intuitive, easy-to-use interface and smartly constructed algorithms to recommend relevant content to viewers, TikTok has created a network of engaged users between viewers and content creators. This is also an intangible space created to connect, share information visually, and easily overcome time and space constraints. In addition to the above-mentioned characteristics, the content created on TikTok is extremely diverse when being spread through the areas of entertainment, learning, and news... Perhaps because of this, the number of users, especially adolescents, is increasing dramatically in the world and also in Vietnam.

However, the algorithm as well as the hashtag feature being built by TikTok can become a disturbing double-edged knife in response to malicious content. This situation has been continuing when there are young people with deviant ideas, uninformed behavior, and cognitive deficiencies when posting content that is not suitable to social norms as well as national customs.

Why do young people now have the tendency to choose TikTok as an efficient learning and entertainment tool for themselves? What was the impact on their psychology and behavior that led to this decision? Consequently, researchers hope to make suitable recommendations for the related subjects in the use of the TikTok social network.

Starting from the above-mentioned question, we decided to conduct research on the topic "TikTok usage behavior of young people in Ha Noi city".

2. Method

2.1. Study Overview

Behavioral research

Human behavior is deemed to be formed by eight factors: identity; willingness; awareness; skills; personal characteristics of the person performing the behavior; expression of the behavior including all body postures, movements, and processes relating to the behavior; the results and implications of performing the behavior.

Based on the concept of behavior, Michael T. Burn and Adrian D. Pearson studied the civilized behavior of young people and misbehavior in High School in 2003 and 2006, respectively. Besides foreign studies, in Vietnam, author Tran Van Thao (2014) also presented the thesis: "School civilization behavior of students in some universities in Ho Chi Minh City".

Focusing on research issues, the authors find some research articles on behavior relating to young people, students, and students as above. In addition, there are still several other research directions on behavior such as consumer behavior, organizational behavior, customer behavior, financial behavior, criminal behavior, etc., which are also of increasing interest.

Behavioral research using social protection

According to the results of territorial search and research, the proportion of social security users is up to 95% in developed countries such as France, Germany, Italy, etc. And this number continues to grow to 46 percent of the world's population and reach 3.5 billion people by 2020.

Under such a large number of users, there have been numerous articles on social issues in the relationship with social that the research team has conducted such as:

Education and social life:

Factors Affecting Social Network Use by Students in Indonesia (Budhi Kristiano, 2017)

Students' Attitude Towards the Use of Social Network for Learning the English Language (Elham Akbari, Soodeh Eghtesad, and Robert-Jan Simons, 2012)

Children's Facebook Usage: Parents Awareness, Attitudes and Behavior (Asnat Dor and Dana Weimann-Saks, 2012)

The Impact of Using Facebook Social Media on Students' Learning and Life Today (Nguyen Lan Nguyen, 2020)

Students and Social Media Facebook: An Analysis of Social Capital Evolution (Doan Thuy Duong, 2014)

Usage behavior:

Factors Affecting the Social Network Acceptance: An Empirical Study using PLS-SEM Approach (Muhammad Al Shurideh, Said A. Salloum, and Barween Al Kurdi, 2019)

Social media usage behavior of Hai Duong University students (Nguyen Thi Bac, 2018)

Business:

70+ Essential Social Media Statistics for 2022 (Werner Geyser, 2022)

The above studies not only elucidate the factors influencing the decision to use social networks but also provide additional research models to serve the research process in different aspects.

Behavioral studies using TikTok

Researching factors affecting TikTok usage behavior in China, Keira Shuyan Meng and Louis Leung (2021) showed that: friendliness, navigability, the interaction between users, and TikTok functions are strong predictors of the contribution and increase in TikTok usage.

The basic needs and perceived ease of use of TikTok functions are the two factors that most impact the behavior of TikTok users according to the research results of Xuedong, XianMing, and Yaqi (2021).

Bahiyah Omar and Wang Dequan (2020) in the article "Effects of Personality: Characteristics and Motivation of Users of TikTok Mobile Video" pointed out that users use TikTok to escape from reality, and social interaction and storage.

In Vietnam, TikTok only receives statistics on the number and frequency of uses.

TikTok estimates that users in Vietnam spend an average of 28 minutes per day (agency, 2022). In 2020, when the COVID-19 pandemic broke out, TikTok Vietnam recorded 16 million downloads with 160% growth on iOS, demonstrating TikTok's tremendous pull.

Considering the popular application rankings in the Vietnamese market, TikTok is also ranked in fourth place right after Facebook, Zalo, and Instagram (Appota, 2021).

In the article "The influence of video content on TikTok on the behavior and attitude of Ha Noi students", Pham Thuy Trinh et al. (2020) pointed out that: most students in both social and natural sciences tend to spend less than 1 hour per day using TikTok. In addition, the number of students using TikTok for more than 3 hours per day is only 5.3%.

Identification of Research Gaps

Although there has been in-depth research, and detailed analysis of factors affecting the behavior of some popular social organizations of young people such as Facebook, Youtube,... However, new social networking sites began to appear with many attractive features that have become increasingly popular such as TikTok, which has created a new wave in the community and had a certain impact on social life, especially among young people today. Moreover, in Vietnam, there are very few research works on TikTok Social Security. Therefore, research and in-depth analysis of the situation, and factors affecting the decision to use TikTok Social Security of users, especially young people is a topic worthy of attention.

2.2. Research Process

The research process of the research team can be divided into four basic stages: theoretical overview, development of the draft scale, preliminary study, and formal study. The contents of the four phases are described in the following model:

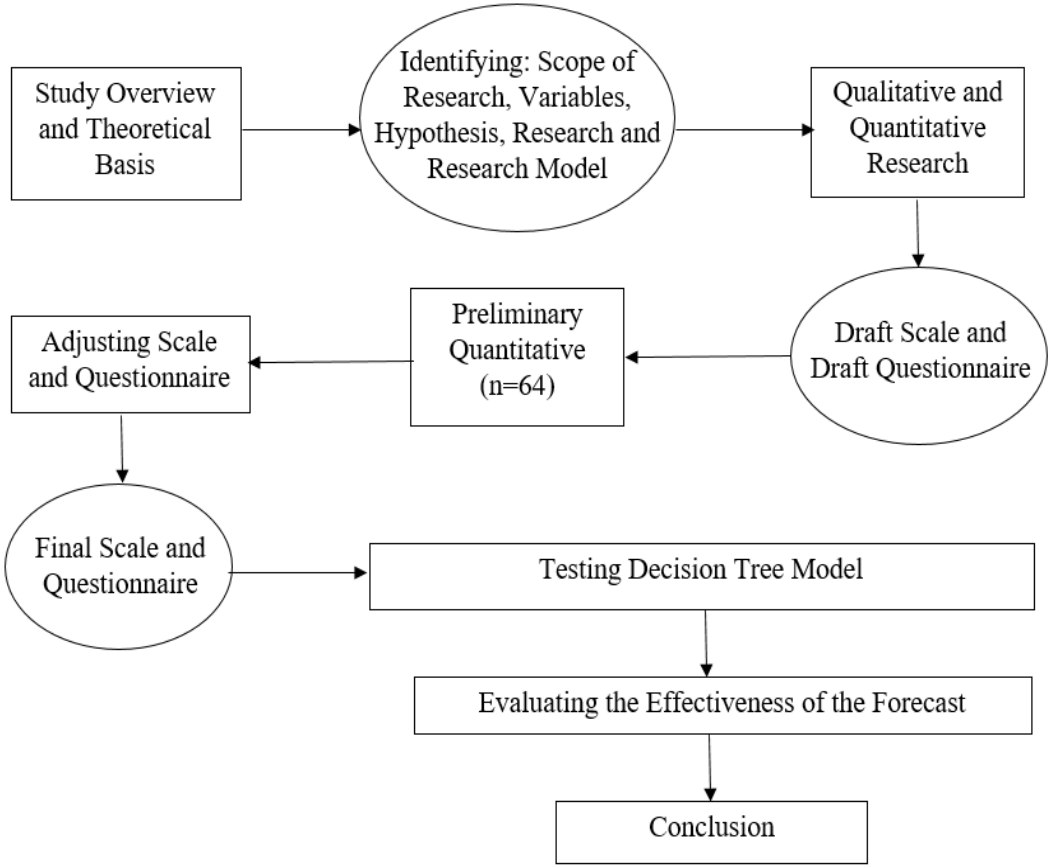

Figure 1. Research Process

2.3. Research Model

Theoretical basis

Fishbein and Ajzen (1975) proposed the Model of Reasoned Actions (TRA) which explains and predicts the intent to act in cases of acceptance of a technological product. According to the TRA, the most important factor determining human behavior is the intention to commit it. Behavioral intent is influenced by two factors: Usage Attitude and Subjective Norms relating to behavior.

Created in 1985 by Fred Davis, the Technology Acceptance Model (TAM) is a platform that is widely referenced and adopted for the purpose of assessing the impact on the behavior of choosing to use technology devices that serve primarily individual or even collective needs. In particular, two basic factors have a clear influence on the decision to accept the use of an information technology system: perceived usefulness and perceived ease of use.

The Theory of Perceived Risk (TPR) developed by Bauer in 1960, states that consumer behavior in information technology products has a risk perception, consisting of two elements: (1) Risk Perception relating to Products/Services (PRP) and (2) Risk Perception Relating to Online Trading (PRT). In the study “Components of Risk Perception” (Jacoby and Kaplan, 1974) as well as the study of Stone & Gronhaug in 1993, the scholars pointed out that there are 6 main risk perception factors that often occur in consumer thinking, including 6 factors: financial risk, functional risk, social risk, psychological risk, information risk, and time risk. This model is also recognized and used by many researchers when studying risk perception that greatly affects the intention to use a new product in the Internet environment.

Based on the above theoretical models, experimental studies have been used to test the acceptance behavior, and the intention to use a new product, service, or technology of consumers in many fields. In particular, the TAM model received a lot of consensus and wide applications. In this study, the combination of the three models of TRA, TAM, and TPR is used to forecast the intention to use one of the most prominent new products and technologies today - TikTok social network of young people in Ha Noi.

The proposed research model includes the following factors:

Subjective norms: Subjective norms are social attributes, in which the things that the individual considers whether or not to perform depend on the opinions and views of others, and the perception of social pressure acting to a certain extent on behavior. In a survey to find out the intention to use social media on mobile phones, Tan, Qin, Kim, and Hsu (2012) concluded that: “The extraneous factors of subjective norms affect people who use social media applications.”

Hypothesis H1: Subjective norms affect the intention of young people to use TikTok

Attitude toward using: Attitude toward using is defined by Davis (1989) in relation to emotions revealed by evaluating a particular object according to a tendency to be satisfied or dissatisfied. The three sides of attitudes to use include:

+ Perceived ease of use: Users will have the intention to use social media when they feel it is easy to use and has all the convenient conditions such as financial conditions, access conditions to services as it is very easy to have a social account as well as use social media anytime, anywhere,...

+ Technological development: enables applications to deliver content with a variety of modern features and modalities such as text, images, audio, and video.

+ Perceived usefulness: when a user perceives applications to be useful, they will have a positive attitude and will tend to use them more (Osama Isaac et al., 2016)

Hypothesis H2: Attitude toward using influences the intention of young people to use TikTok

Risk perception: Risk perception is subjective thinking about the determination of losses, with two implications, uncertainty and bad consequences. The proposed research model on risk perception impacts the intention to use TikTok social security: time risk, information risk, functional risk, psychological risk.

+ Time risk: the time risk of using social media is spending a lot of time using social media along with reducing the time to do other activities.

+ Information risk: is the risk that consumers' personal information is disclosed due to carelessness or illegal behavior of suppliers, third parties, or related persons.

+ Functional risk: is a type of risk when the expectations of the user at the initial time of the entertainment platform are not met due to the functional limitations of the platform.

+ Psychological risk: psychological risk refers to the ability of users to experience negative emotions such as fear, frustration, and pressure when using technological services.

Hypothesis H3: Risk perception affects the intention of young people to use TikTok

COVID-19: In October-2021, according to the report “The Change in Vietnamese User Routines During the Distance Due to the Disease” published by Q&Me, young people have increased their time using social media because they have more free time, they are spending more time watching online videos on YouTube and TikTok platforms. In particular, young people gradually tend to use TikTok more.

Hypothesis H4: COVID-19 affects the intention of young people to use TikTok

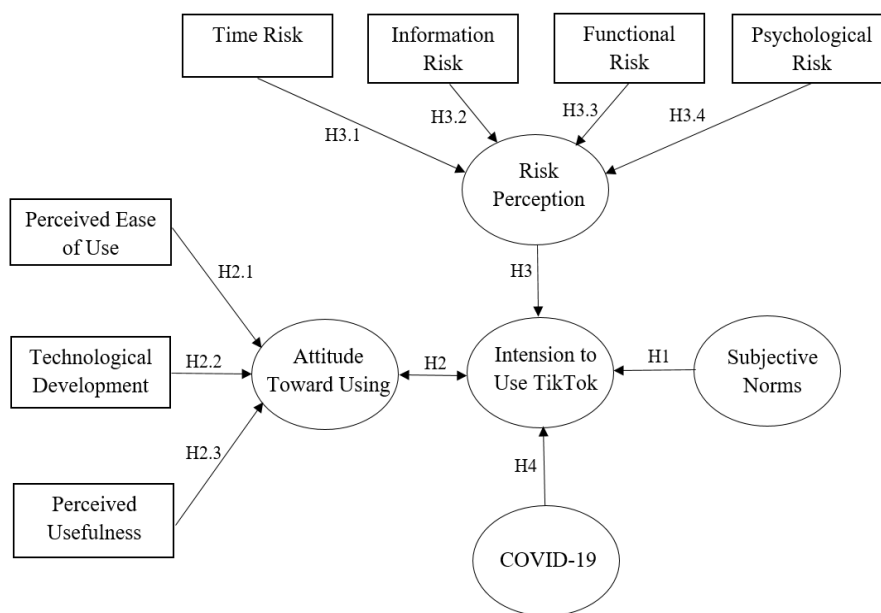

Figure 2. Proposed Research Model

2.4. Data Analytical Process

2.4.1 Methods of analysis and synthesis of secondary information

The research team collects secondary information by searching social networks, TikTok, social usage behavior, TikTok usage behavior; domestic and foreign studies relating to the topic to write a research overview. This information is analyzed and synthesized by the author group from the sources of books, newspapers, websites on the Internet, theses, as well as recent national and international scientific journals on the behavior of young people using TikTok and factors affecting their intention to use TikTok. In addition, the researcher team also considered theoretical models relating to the topic for reference and selection as the basis for the development of research models.

2.4.2 Qualitative analysis method.

The research team conducted in-depth interviews with 10 residents currently studying and working in Ha Noi who have experienced using or are using the TikTok app. Interviewers are diversified according to each criterion to provide multi-dimensional information to ensure the satisfaction of the research content. The interviews were conducted by the in-depth interview method, namely semi-structured interview, based on the list of questions mentioned. The team conducting the interview will stop until no other new factors can be found. The recorded views and opinions are combined with the evaluation of the original objectives as well as the theoretical basis to serve as a premise for the scale to develop the official survey questionnaire.

2.4.3 Quantitative analysis method.

Measurement scale building

After studying the works published nationally and internationally, the authors have developed a scale selectively.

Variables were observed in the study using the Likert scale from 1 (Completely Disagree) to 5 (Strongly Agree). This is a scale that is quite common in sociological behavior studies. In principle, the Likert 7 or 9 scale helps to measure more accurately, but with Vietnamese, using a scale that is too much of an evaluation level often confuses respondents.

Preliminary quantitative study

Adjustment of questionnaires

The authors conducted a preliminary quantitative study by interviewing online questionnaires with a small sample (64 people) to standardize the terminology and edit the questions in the questionnaires, ensuring that the respondents did not misinterpret the meaning of the questions before conducting the official survey. After completing the basic adjustment steps, the research team conducted the study sample collection to assess the reliability of the scale.

Data collection

To ensure a minimum sample of 300 observations, the research team surveyed young people from 15 to 24 years old living, studying, and working in Ha Noi city, who also have the most access to TikTok. Data is collected using a questionnaire method designed on

Google Docs tools and sent to the audience via social media sites. The time to submit the survey ran from January 31, 2022, to March 3, 2022. With this method, the research team obtained 300 responses.

Quantitative analytical procedures

After collecting, classifying, and selecting valid questionnaires, the authors conducted data encryption, updating, and processing data using the "Decision Tree" model, following the following steps:

Step 1: Encrypting research data

After identifying the factors to be used, the research team transformed the collected data into digital form (digitized data) so that the computer could process.

Step 2: Select a reasonable model

The survey's data serves to study human behavior, so the research team prioritized the use of the Decision Tree model.

Step 3: Training on the dataset

Step 4: Evaluate the effectiveness of the forecast

Step 5: Collect the ratio reflecting the influence of each factor on the model.

3. Results

Outstanding features of the research sample

Figure 3. Age information of the surveyed subjects

The research team conducted a survey and collected a sample of 300 people. In particular, the age group accounting for the vast majority is 19 to 21 years old (68.67%), the second most involved group is from 15 to 18 years old (taking up 19.33%), the last group of 22 to 24 years of age with a data of 12%.

Figure 4. Information on the average time of using TikTok/day

Based on the survey, 234 out of 300 people are using the TikTok app. The average time spent in the day accounts for the highest proportion of 1 to 3 hours with 134 people (56.27%), 86 people (36.75%) spending less than 1 hour and 14 people (5.98%) spending more than 3 hours on the TikTok app.

Figure 5. TikTok Intended Use Information

Of 234 users, the results of the survey showed that the majority of their TikTok use came from entertaining needs with 94.4%. Followed by are learning and updating information with 52.99% and 51.71% respectively. Work ranks last in the intended use with 24.79%.

Results of data analysis through Decision Tree algorithm

Of the 300 data samples collected, the team applied the model to 240 data samples to obtain a statistical model of influencing factors with the use of TikTok or not and used 60

samples to verify the accuracy of the model. Since the small sample of data did not meet the generalization, the group introduced a method of re-selection of samples 240 and 60 randomly (6 times) and then re-do the model application step, then averaging the results over 6 times to ensure that the model is not biased according to any subset of data. After selecting 6 times 240 samples and testing the model on 60 samples to evaluate the generalization of the statistical model, the research team collected the results on the test set and the valid set each time as follows:

Table 1. Results table on test set and valid set

Number of metric reselections	Results on the test set of 240 samples (%)	Results on the valid set of 60 samples (%)
1	92.4	88.1
2	96.3	91.0
3	98.0	90.2
4	93.6	88.7
5	94.2	91.3
6	94.9	90.5

The result on the set used to create the model has a very high average of 95% (equivalent to 228/240 samples) and the average result of the valid set is 90% (equivalent to 54/60 samples), which is quite good when the small data set that the model has generalized highly.

After completing the model testing, the research team collected the results of factors and the proportion of influence. Details are as follows:

Table 2. Results table of factors and proportion of influence

Hypotheses	Factors	Proportion of influence
H1: Subjective norms	Subjective norms	17.05
H2: Attitude toward using	Perceived ease of use	28.5
	Technological development	9.06
	Perceived usefulness	6.44
H3: Risk perception	Time risk	1.93
	Information risk	5.73
	Functional risk	4.75
	Psychological risk	5.48
H4: COVID-19	COVID-19	21.06

Hypothesis H1: Subjective norms affect the intention of young people to use TikTok

Through the testing process, the level of impact of subjective norms at 17.05%, expressed the certain influence of the surrounding people on the intention to use TikTok among young people.

Hypothesis H2: Attitude toward using influences the intention of young people to use TikTok

The obtained results show that the level of correlation between the two factors of attitude to use and intention to use is relatively large with a rate of 44%. This can be explained by the attitude of use that is also influenced by: Perceived usefulness, Perceived ease of use, and Technological development. However, these factors attract young people to use TikTok, so the attitude toward using it has a great influence and plays a key role in deciding the intention to use TikTok.

Hypothesis H3: Risk perception affects the intention of young people to use TikTok

Research results show that risk perception quite strongly affects 17.89% of young people's intention to use TikTok. As cyber criminals with increasingly sophisticated scams, users also gradually lose trust and feel frustrated about the product. Anxiety about the problem of wasting time using social security is also a cause of the intention to use social networks. When consumers become aware of this, they reduce their intent to use TikTok or regulate their usage behavior.

Hypothesis H4: COVID-19 affects the intention of young people to use TikTok

According to the results of the study, TikTok is a social media that can satisfy the needs of people in the pandemic. This factor affects 21.06 % of young people's intention to use TikTok.

4. Discussion and Conclusion

4.1. Measurement results

The proposed research model of the group includes 9 factors and 22 observation variables. During the process of launching and testing data through the algorithm of the Decision Tree model, the research team found that the variables given had a certain influence on the intention to use TikTok by young people in Ha Noi. Specifically, factors affecting the intention to use TikTok accounted for respectively: Attitude toward using (44%), Subjective norms (17.05%), Risk perception (17.89%), COVID-19 (21.06%). In which, the influence of Attitude toward using is the strongest impact and the weakest impact is Subjective norms.

4.2. Theoretical model results

The proposed research model is built based on combining the theory of reasoned action (Ajzen & Fishbein, 1980; Fishbein & Ajzen, 1975), the model of technology acceptance (Fred Davis, 1985, 1989), the theory of risk perception in the framework of marketing (Stone & Gronhaug, 1993). In addition, the research team also conducted reference and selection of variables consistent with the scope of research from the previous models. Although these studies exploit different topics, the results obtained from the survey still show significant similarity to the previous theoretical model. Based on the level of influence on the model, the hypotheses are:

Hypothesis H2: Attitude toward using influences the intention of young people to use TikTok

Hypothesis H4: COVID-19 affects the intention of young people to use TikTok

Hypothesis H3: Risk perception affects the intention of young people to use TikTok

Hypothesis H1: Subjective norms affect the intention of young people to use TikTok

4.3. Recommendations

4.3.1 Recommendations for TikTok users

For content creators

Firstly, content creators shouldn't let themselves get caught up in trends and post videos with malicious content. They must be aware of both positive and negative sides before publishing any videos on TikTok as these videos can affect the thinking and lifestyle of many viewers, especially adolescents.

In addition, content creators should screen the information in their videos before publishing, because at present unorthodox newspapers are writing articles with pervasive untruthful content, so sometimes content creators can inadvertently spread incorrect information and affect the reputation and image of others.

For TikTok viewers

The level of influence of attitude toward using is most clearly expressed through this group of subjects, especially with the factor of perceived usefulness. Therefore, TikTok viewers need to be selective, and aware of the benefits and harms of content transmitted through TikTok. Users should use the TikTok reporting function for videos with malicious content. Moreover, viewers can learn selectively from reputable creators such as doctors, teachers,... to expand their knowledge.

In terms of risk perception, risks related to time, psychology, or information will also directly affect young people's behavior in using TikTok. Therefore, each individual user needs to allocate reasonable time when using TikTok for personal purposes as well as refer to the TikTok usage limitation and automatic screen lock at the end of the usage period. In addition, psychological risk should also be considered to lead to usage behavior as it affects emotional correlation, namely negative emotions with agitated videos, which leads to cognitive and psychological adverse consequences for the viewer.

4.3.2 Recommendations for School

As the unit directly manages students in the learning process, the school needs to be aware of the opportunities and challenges in student management when TikTok Social Security is gaining the attention of young people.

Teachers and schools can be flexible and creative, using TikTok as a means to support teaching. In addition, the school can include TikTok in the content and form of programs, seminars, extracurricular activities... to develop soft skills and apply new technologies to students.

Subjective norms are a strong influence on the behavior of young people. Therefore, the school can completely contribute to regulating, changing awareness, and guiding the use behavior of students in a healthier and more rational way through propaganda sessions and competitions to learn about the benefits and harms of social protection. In addition, there must also be clear rules and regulations when students use mobile phones to work privately during school hours.

4.3.3 Recommendations for TikTok Application Managers

Firstly, TikTok needs to strengthen the management and security of user information on this platform. The research team suggests that TikTok application managers, in addition to requiring clear proof of identity, also pay great attention to the security of user information.

Secondly, making it easy for videos to get on-trend without being selective will result in easy exposure of viewers to malicious content. Therefore, the research team made a suggestion that TikTok needs to develop an analysis system, select videos with healthy and positive content and place limited orders, eliminate videos with malicious content from TikTok trends. Furthermore, application managers should also consider launching healthy programs and activities to raise people's awareness.

Thirdly, application managers should consider upgrading the look and features of TikTok to facilitate users' use of more utilities. In addition, upgrading the technology platform will also make it easier for managers to control the content and operation of TikTok. From there, it offers solutions to many micro-and macro-issues in particular.

Abstract

The article aims to assess the impact factors of the TikTok social network, and the way young people express themselves on this social network. The authors used research methods: Cronbach's Alpha testing and exploratory factor analysis EFA, Pearson's correlation coefficient, and linear regression models. The main findings are the level of impact of the factors on the way young people express themselves is ranked from the strongest to the weakest: (i) Negative content on the social network TikTok, (ii) The needs for self-expression, (iii) Self-expression motivation. Since then, the article offers several proposals to help raise the awareness of young people when using the social network TikTok.

Keywords: *Self-expression needs, Self-expression motivation, TikTok, Social network, Deviant behavior.*

1. Introduction

TikTok, a music video platform and social network, is currently the number one growing app in the digital technology platform despite its age far behind Facebook or Instagram. Among the most used social networking apps in Vietnam, TikTok ranked 6th with a rate of 47.6% (about 34.2 million users) but considering the download ranking in Vietnam, Tik Tok ranked No. 1. Thus, it can be clearly seen that Tik Tok has the strongest influence on young people in Vietnam today. TikTok offers free and open space, providing young people with an ideal environment to express themselves in a variety of forms. Especially with the “virtual” nature of social media has allowed them to use many accounts and interact with many objects to create an open, multidimensional space for building personal images or identities. However, many young people are prone to over-the-top use of methods/tricks that they think are “different” or “unique” to express their outstanding personal identity/ego

in the online community, to create popularity (based on followers, views, and clicking the “like” button) causing antagonism to the online community.

Therefore, the goal of this study is to clarify “TikTok and the consequences in the way young people express themselves today”.

2. Method

2.1. Theoretical basis

2.1.1. Social Network - TikTok

Tik Tok is known as a music video platform and social network, on which users do not post statuses like Facebook but post music videos 15 seconds long which attract a lot of users.

2.1.2. Young people's ways of expressing themselves

The needs for self-expression:

As early as 1943, psychologist Abraham Maslow produced Maslow's hierarchy of needs with five floors arranged in ascending order from "basic needs" to "higher needs", of which the fifth floor is self-actualization needs: want to create, to show their abilities, to express themselves, to perform, to have and be recognized as successful.

Thus, the need to express oneself is the need to be self-aware, want to be recognized by everyone, and be affirmed their ego, this is also the highest need of people because people always want to improve themselves. The need for self-awareness includes the need to be acknowledged and the need for self-affirmation. What is important for a personality is not just the ability to express itself. For the need to fully satisfy one person, it is also necessary to receive appreciation from others. That is, for a person to materialize on their own, it is important not only to get results from their activities but also to feel the reward from others.

Self-expression Motivation:

There are many different definitions of self-expression dynamics but in general, the authors agree that the inner state of the human being guides and directs human behavior towards satisfaction is a series of needs, tendencies, and desires, that stimulate, and get the person to perform a certain behavior.

Deviant behavior of young people:

Currently, there are many different definitions of deviant behavior, but in general, the authors agree with the view that deviant behavior is behavior that is inconsistent with ethical, cultural, legal norms, and general regulations and needs to be adjusted.

2.2. Research Methodology

2.2.1. Survey form

Based on the size and sectors mentioned specifically in the scope of the study, the group focused on most young people survey subjects (16-24 years old) in Hanoi. The survey subjects are students in economics and engineering because these are two important sectors, trained by many universities, and account for an enormous number in Hanoi.

Out of a total of 288 observations, males accounted for 23.3% (67 people), females accounted for 76.4% corresponding to 220 people, and one gay case accounted for 0.3%.

2.2.2. Scale

The study's scale was referenced from previous studies by authors at home and abroad such as Nguyen Thi Ngoc Mien and Tran Phuong Thao (2015), Olivia Mellan and

Sherry Christie (2014), Webley and Nyhus (2012), Jorgensen and Savla (2010), Cliff A Robb and Anh Woodyard (2012), and added observational variables in expert opinion.

The observed variables are measured using a 5-point Likert scale, which is prescribed from 1 (Completely disagreeable) to 5 (Totally agree).

2.2.3. Data analysis and model verification

- Check the reliability of the scale: In this study, the team used Cronbach's Alpha testing and exploratory factor analysis (EFA) to identify the components of each factor and the overall factors that impacted the needs of young people on TikTok social network.

- Assess the impact of independent variables, and dependent variables through linear regression models.

2.3. Actual situation

The qualities, ethics, lifestyle, and style, of a part of young people in our country, are trending to change day by day, through trends shared at a rapid pace on social networks. Among them, there is no shortage of uncultured and reprehensible tricks such as: revealing dress, profanity, swearing, ridicule, attacks in music (rap diss), deviating from the standard "idol" (Kha Binh, Huan Hoa Hong, ...), deviations in ethics and lifestyle. In the field of music, besides musicians and singers who are interested in the profession, creating products of artistic value, there have appeared several "musical products" bearing the "font" of Vietnamese culture but the variation insults others. These are negative trends because self-expression adversely affects the spiritual and cultural life of the online community.

Social networking sites apply increasingly modern technology, to meet TikTok with the high demand of users. This application aims to support users in learning, labor, and entertainment. However, a section of the youth has made the social network TikTok go wrong with its original purpose. Deviant behaviors on social networks show a lack of respect for others, which needs to be corrected promptly.

3. Results

3.1. Describe the study sample according to demographic characteristics

Through the statistical results described by the observed variables, it is possible to see statements on highly diverse scales, there are many opinions from disagreement to consent. After surveying 288 young people (mostly students) in Hanoi, the team studied and analyzed the need to express themselves leading to the misbehavior of young people on the TikTok social network today.

Table 4.1. Sample Research Structure

Criteria	Gender	Amount	Percentage (%)
			23.3
	Female	220	76.4
	Different	1	0.3
Age	16-under 18	18	6.3
	18-under 22	220	76.9
	22-24	48	16.8

Source: Research by the authors

Out of a total of 288 quality survey samples, the group that obtained the female vote was 76.4% (220 votes) and 23.3% of the votes were male (with 67 votes). Gays were interested in this study, but the authors received only one response from this group of subjects.

3.2. Approach quantitative method

3.2.1. Results describing observed variables

To measure the group's observed variables, a 5-point Likert scale is used. This scale shows opinions from 1- Completely disagree to 5- Totally agree.

Table 4.2. Cronbach's Alpha coefficient

No	Observed Variables	Symbol	Cronbach's alpha coefficient
1	TikTok usage behavior	HP	0.819
2	The needs for self-expression	NC	0.868
3	Self-expression Motivation	DL	0.864
4	TikTok Contents	ND	0.954
5	Deviant Behavior	LC	0.954

Source: The authors' research

According to the results of the analysis, the independent variable "Behavior" has observational variables with an appropriate total variable correlation coefficient (≥ 0.3). Cronbach's Alpha coefficient = $0.819 > 0.6$ usable.

"The needs for self-expression" has a Cronbach's Alpha coefficient of $0.868 > 0.6$, matching total variable correlation coefficients (≥ 0.3). It can be concluded that the scale is used well.

For the "Motivation" variable, the test showed the appropriate total variable correlation coefficients (≥ 0.3), Cronbach's Alpha coefficient was $0.864 \geq 0.6$, concluding the scale is good.

The test for the "Contents" variable shows that the observation plates all have a suitable total variable correlation coefficient (≥ 0.3), and Cronbach's Alpha coefficient is $0.954 > 0.6$ so it can be confirmed that the scale of use is relatively good.

The test for the "Deviant Behavior" variable shows that the observed variable variables all have a suitable total variable correlation coefficient (≥ 0.3), and Cronbach's Alpha coefficient is $0.954 > 0.6$ so it can be confirmed that the scale is an effective use.

From the above results, the Cronbach's Alpha coefficients of the factor groups are mostly greater than 0.6, and the total variable correlation coefficients are greater than 0.3. Therefore, it is possible to conclude that the scales ensure reliability and can be used in the next analytical steps.

3.2.2. EFA discovery factor analysis

✚ EFA discovery factor analysis for independent variables

Table 4.3. Rotating matrix of independent variables

	Component		
	1	2	3
ND4	.915		
ND1	.901

NC2		.758	
NC3		.732	
DL3		.699	
NC4			.845
NC5			.826
DL5			.660
NC1			.642

Source: The authors' research

As a result of the rotating matrix table, the observed variables in each element have converged and distinguished from each other. In addition, factor loading has a value greater than 0.5, the variance index is approximately 73.119%, and the Eigenvalues = 1,296. As such, the study completely satisfied the conditions for the factor analysis results to be accepted: the variance quoted $> 50\%$ and the value of the eigenvalues > 1 .

Thus, the model has 17 variables of 3 factors that explain 73,119% of the observed variables.

Model after removing inappropriate variables of 3 elements

Table 4.4. Observed variables after extraction

Factor	Observation variables
The needs for self-expression	NC1, NC2, NC3, NC4, NC5
Self-expression Motivation	DL1, DL2, DL3, DL4, DL5
Negative contents on TikTok	ND1, ND2, ND3, ND4, ND5, ND6, ND7

Source: Research by the authors

✚ EFA discovery factor analysis for intermediate variable

Based on previous studies, the team determined that the intermediate variable " Tik Tok usage behavior " impacts the dependent variable "Deviant Behavior of young people ". After conducting a Cronbach's Alpha reliability test for the intermediate variable, the authors performed an EFA exploratory factor analysis. KMO and Bartlett's inspection results for the intermediate variable show that the KMO value, in this case, reached $0.734 > 0.5$. This shows that the data is suitable for factor analysis. In addition, Sig. of Bartlett's test $= 0,000 < 0.05$ demonstrated that the observed variables were correlated. Therefore, the author group is eligible to perform EFA for intermediate variables. EFA results show that the observed variables are converging at one factor. At the same time, the variance $= 58.665\%$ and the Eigenvalues $= 2,933$ index ensure that the factor analysis results are accepted. Thus, the intermediate variable consists of 5 observed variables of 1 factor that explains 58.665% of the observed variables.

✚ EFA discovery factor analysis for dependent variables

After learning about studies related to the "Deviant Behavior" variable, the team identified five observed variables for the dependent sea. KMO and Bartlett's test results for the "Deviant Behavior" variable is $0.902 > 0.5$, so the data is perfectly suited for factor analysis. The Sig. value of Bartlett's test $= 0.000 < 0.05$ indicates that the observed variables are correlated with each other. The results of the EFA analysis showed that the observed variables converged on one factor with the variance $= 84.902\%$ and the Eigenvalues index $= 4.24 > 1$ ensuring the factor analysis results were accepted. Thus, the five observational variables of the "Deviant Behavior" factor explain 84,902% of the observed variables.

3.3. Regression analysis

3.3.1. Multiple regression analysis

The multiple regression analysis selected three independent variables: The needs for self-expression (NC), Self-expression Motivation (DL), and Negative Contents on the social network Tik Tok (ND). The value of the representative variables is selected from the average of the observed variables.

According to the results of the Anova analysis with the Sig. value of the F-Test is $0.000 < 0.05$ so that the multiple linear regression model is suitable for data files and can be used.

Table 4.5. Anova Analysis Table for Multiple Regression Analysis

Model	Sum of squares	df	Average squared	F	Sig
Multiple regression	65.403	3	21.801	25.050	0.000

Source: The authors' research

The model has an adjusted R-value of 0.201 so the independent variables in the model explain 20.1% of the fluctuations of the intermediate variable "TikTok usage behavior", the remaining 79.9% is the effect of random factors.

Table 4.6. Summary model of multiple regression analysis

R	R-squared	Adjusted R- squared	Standard errors	Durbin- Watson
0.457	0.209	0.201	0.93291	2.027

Source: The authors' research

Independent variables are significant to the model because the Sig value in T-Test the regression coefficient of each independent variable is less than 0.05, so each independent variable is meant to explain the independent variables.

Table 4.7. The effect of the above factors on the deviant behavior of young people

Model	Unstandardized Regression Coefficients		Standardized Regression Coefficients	t	Sig.	Cumulative frequency	
	Beta	Standard E	Beta			Tolerance	VIF
1 (Constant)	.589	,291		2.023	.044		
TB_ND	.091	,053	,090	1.697	.091	.988	1.013
TB_DL	.599	,079	,514	7.586	.000	.607	1.647
TB_NC	-.180	,088	-,138	-2.045	.042	.608	1.646

Source: The authors' research

The sig value of the T-Test with variables "Contents", "Motivation" and "Needs" is less than 0.1, which can be confirmed that these variables are meant to account for the change of the "Deviant Behavior" variable.

We have a standardized regression equation:

$$LC = 0.09 * ND + 0.514 * DL - 0.138 * NC + e$$

LC: Deviant behavior

ND: Negative contents on TikTok

DL: Self-expression motivation

NC: The needs for self-expression

Conclusion of research hypothesis

After performing a regression analysis of the factors affecting the deviant behavior of young people when using Tik Tok, we have the following conclusion:

- Accept the [H1] hypothesis: The needs for self-expression has a negative impact on the deviant behavior of young people on TikTok social network
- Accept the [H2] hypothesis: Self-expression motivation has a negative impact on standard behavior with children on the TikTok social network
- Accept the [H3] hypothesis: Negative contents on TikTok have a negative impact on the standard behavior of young people on TikTok social network

3.3.2. Single regression analysis

The single linear regression analysis is performed with an intermediate variable: The use of the social network TikTok (HV) and a variable that depends on the standard behavior of young people (LC) The value of the representative plates is selected equal to the average of the observed vats of the Anova analysis with the Sig value of the F test is $0.000 < 0.05$ so that the multiple linear regression model is suitable for data files and can be used.

Table 4.8. Anova Analysis Table for Multiple Regression Analysis

Model	Sum of squares	df	Mean square	F	Sig
Single regression	55.882	1	55.882	62.263	0.000

Source: The authors' research

The model has an adjusted R-value of 0.201 so the independent variables in the model explain 20.1% of the fluctuations of the intermediate variable “TikTok usage behavior”, the remaining 79.9% is the effect of random factors.

Table 4.9. Summary model of multiple regression analysis

R	R-squared	Adjusted R- squared	Standard errors	Durbin- Watson
0.423	0.179	0.176	0.94738	1.971

Source: The authors' research

Independent variables are significant to the model because the Sig value in T-Test the regression coefficient of each independent variable is less than 0.05, so each independent variable is meant to explain the independent variables.

Table 4.10. The effect of Tik Tok's use on the deviant behavior of young people

Model	Unstandardized Regression Coefficients		Standardized Regression Coefficients	t	Sig	Cumulative frequency	
	B	Std. Error	Beta			Tolerance	VIF
Constant	,590	,192		3,070	,002		
TB_HV	,497	,063	,423	7,891	,000	1,000	1,000

Source: Research by the authors

The independent standardized regression factor is greater than 0, so the HV variable acts in the same direction as the dependent variable. The magnitude of the standardized beta regression coefficient of the independent variable is 0.423.

We have a standardized regression equation:

$$LC = 0.423 * HV + e$$

Conclusion of research hypothesis

After performing a regression analysis between Tik Tok usage behavior and young people's deviant behavior, the team accepted the hypothesis.

[H4]: The use of TikTok social network has a negative effect on the deviant behavior of young people on TikTok.

4. Discussion and Conclusion

Some solutions and recommendations are made to raise awareness of young people about the need to express themselves on TikTok social network, namely:

First, families and society need to organize activities to connect young people, especially students at school age, and to avoid the risk of deviant behaviors on social networks.

Second, foster and educate young people on information security and behavior when using social networks in general and TikTok social networks.

Third, encourage and build talent-seeking programs so that young people can express themselves in front of everyone.

Abstract

Online training (E-learning) has been developing in countries, corresponding to the development of the Industrial Revolution 4.0 (4IR). Online training is gradually affirming its important role, having outstanding advantages over traditional forms of training in universities in Vietnam. However, the application of this form of training in addition to the basic advantages, there are still difficulties and obstacles in private universities in Vietnam. This article summarizes the trend of developing online training in Industry 4.0, universities have advantages and difficulties when applying this form of training. The author proposed a number of solutions to develop online training in universities in Vietnam in the coming time.

Keywords: *E-learning, industrial revolution 4.0, private university, technology.*

1. Introduction

The Industrial Revolution 4.0 (4IR) puts us on the verge of a revolution that will fundamentally change the way we live, work, and relate to each other (Klaus Schwab, 2018). It is possible to generalize the four main characteristics of the Industrial Revolution 4.0: First, based on the foundation of the combination of new sensor technology, big data analysis, cloud computing and internet of things connectivity will drive the development of automation machines and intelligent manufacturing systems. Secondly, using 3D printing technology to produce products in the most complete way by physicalizing production lines not through the assembly of auxiliary equipment – this technology also allows people to print new products using non-traditional methods, ignore intermediaries and reduce production costs as much as possible. Third, nanotechnology and new materials create new material structures that are widely applied in most fields. Fourth, artificial intelligence (A.I) and cybernetics allow humans to control remotely, without limits on space, time, faster and more accurate interaction.

The Industrial Revolution 4.0 has been having a profound and comprehensive impact on all aspects of economic, political, and social life of countries, including education. Industry 4.0 requires a change in the education system in general, higher education in countries. Accordingly, higher education must become "an ecosystem", so that students can study together anytime, anywhere with connected devices. The objectives and training methods of universities must shift from transmitting knowledge to the masses to unleashing their potential, while empowering everyone to create. The teacher will move into a new role as the designer, catalyst, mentor and creator of the learning environment (Phan Chi Thanh, 2018). With digitized learning content, learners will have their own learning roadmap, can choose content suitable to the training objectives. The digital learning system also provides feedback on learning performance along with suggestions for further learning content. Learners can actively study materials as well as interact with lecturers at all times using a computer or smartphone. The development of online forms of learning helps learners save time, effort and cost. Augmented reality/virtual reality (AR/VR) technology is widely used, helping learners experience and hone their skills. In Industry 4.0, the application of online training in universities in general, private universities (PU) in particular is an indispensable, helping the university improve the quality of training.

This article summarizes the trend of online training development in Industry 4.0, analyzes the advantages and difficulties of private universities when applying online training forms and proposes a number of solutions to develop online training in private universities in Vietnam in the coming time.

2. Method

Since the late 1990s, the U.S. government has supported and supported electronic teaching and learning. In 2000, nearly 47% of U.S. universities and colleges offered different forms of distance learning models, making up 54,000 online courses. The number of participants increased by 33% annually between 1999 and 2004. By the end of 2004, about 90% of American universities and colleges offered E-learning models (Bui Viet Phu, 2012).

E-learning is also being implemented in universities and in companies is also going strong. In businesses, employees are trained in business processes on E-learning and LMS (Learning Manage System). Thereby, the employees have all the necessary knowledge and skills to perform their work well. Technology has grown tremendously since 2010 has made online training have really spread all over the world. In 2015, the number of people in the world participating in E-learning systems of about 36 million people rose to 60 million in 2016 and reached nearly 70 million in 2017. The increase in the number of users has led to a constant increase in the revenue of this industry. Data at the 19th International Conference on "Application of Information Technology and Management - ITAM" held in 2018 said: In 2016, the revenue of the E-learning sector worldwide reached 51.5 billion USD. In 2017, the global online education market reached more than 100 billion USD (results of research by Global Industry Analysts).

As E-learning began to become a world trend, in the country, E-learning has become a learning model that attracts a large number of users, especially at universities. E-learning

opens up a new learning environment that allows learners to interact anytime, anywhere on mobile apps and social networks (Le Van Math and Truong Thi Diem, 2020).

3. Results

3.1. Advantages and difficulties in applying online training in private universities today

3.1.1. Advantages

Firstly, in Industry 4.0 universities in general, private universities (PU) in particular has favorable digital education infrastructure conditions to develop online training.

The infrastructure of digital education in the context of the application of tens of thousands of people on the Internet (IoT), big data , cloud computing has now brought many great opportunities and possibilities to help the regeneration, production of knowledge, information sharing, "leveling" barriers in access to knowledge (Phung Xuan Nha, In particular, along with the development of technology, digital education will gradually become a "new form of learning relationships" that will change the teaching model that has existed for a long time in the top-down or bottom-up system to the network, Social sharing in which learners will become the center of the social learning network (Tran Thi Van Hoa, 2018).

In Vietnam, the technology infrastructure is growing rapidly, the internet with increasing transmission speed and low fees. Vietnam has the 6th largest number of internet users in Asia and the 12th largest in the world with 64 million in 2018. Socially, Vietnam is also in the "golden population period", in which the number of people under the age of 30 accounts for over 50% of the population, who have easy access to information and communication technologies. Therefore, Vietnam is considered as a country with great potential for E-learning development. According to data from market research organization Ambient Insight, Vietnam is in the list of the top 10 countries in terms of e-learning development rate. Vietnam's e-learning market according to experts is not less than 2 billion USD and has a growth rate of 40% but the majority is focused on exam preparation, foreign language preparation and soft skills. These are favorable objective conditions for private universities to implement online teaching.

Secondly, the training activities in private universities are quite diverse and rich, with many contents that can be applied to online teaching.

Training activities at private universities basically meet the needs of the market. In the academic year 2019 - 2020, there were 16,142 lecturers from private universities out of a total of 73,132 lecturers nationwide, accounting for 22.07%. Out of a total of 21,977 lecturers with doctoral degrees, private universities have 3,660 lecturers accounting for 16.65% (Higher education statistics in the academic year 2019 - 2020). Young, dynamic lecturers give schools flexibility in online training activities.

According to the Department of Quality Management - Ministry of Education and Training, updated on April 30, 2022, 38 universities have completed self-assessment reports, accredited out of a total of 236 universities across the country accounting for 16.10%. This shows that the quality of training of universities is increasingly improved in line with the application of online teaching.

The percentage of students enrolled in the private university increases every year. The country had 1,672,881 students in the 2019-2020 year, of which students from private universities were 313,479, accounting for 18.74%, an increase of 1.04% (18.74% - 17.34%) compared to 2018 - 2019. In recent years, the number of graduates from private universities regularly accounts for 14% - 17% or more of the total number of annual graduates (Higher education statistics in the academic year 2019 - 2020). This is a favorable factor, indispensable to help private universities can implement online training at all levels of study and subjects, contributing to improving the quality of training of each school.

Table 1. Data on number of schools, and the scale of university education

No	Contents	2018 – 2019				2019 – 2020			
		Total	Divide into		%	Tổng số	Divide into		%
			Public Uni	Private Uni			Public Uni	Private Uni	
1	Number of schools	237	172	65	27,43	237	172	65	27,43
2	University student's scale	1.526.111	1.261.529	264.582	17,34	1.672.881	1.359.402	313.479	18,74
3	Number of students that graduate	311.599	266.970	44.629	14,32	263.172	218.251	44.921	17,07
4	Number of Managers, lecturers, staffs	83.587	64.772	18.815	22,51	85.091	65.948	19.143	22,50
5	Number of primary lecturers	73.312	56.985	16.327	22,27	73.132	56.990	16.142	22,07
6	Number of Dr	21.106	17.336	3.770	17,86	21.977	18.317	3.660	16,65

Source: Compilation Author

Thirdly, private universities have made great investments in facilities and sources of digital materials for online teaching. The number of private universities accounting for 27.43% (65/237) of the total number of universities in the country (Higher Education Statistics for the academic year 2019 - 2020) is shown in the following Chart 1.

Private universities have invested in building spacious and modern, there are schools that meet international standards. According to the list of universities recognized to meet the quality standards of education in the country, there are 29 private universities in 167 accredited universities meeting the quality standards of education (Department of Quality Management - Ministry of Education and Training, April 30, 2022).

Figure 1. The percentage of private and public universities across the country

Source: Higher education statistics for the academic year 2019 - 2020

Along with investing in facilities, private universities have been interested in developing sources of information data, digitized input educational knowledge content (design, production, publishing, storage) and transferred through digital tools to meet the increasing demand for "multi-sensorization" and strong interaction for learners. Developed on the platform, digital tools according to the principles of content richness, diversity, strong interaction, reuse, ease of access, lookup, share and contribute ... Digital learning has gradually become an effective goal and medium in online training of private universities. More than just "digitizing text" or "open learning" as before, gamification applications increase immersive opportunities and embed learners in virtual environments to solve problems; 3D simulation, animation, hologram, video creation, artificial intelligence lectures, interactive E-book... it has helped digital learning not only provide information and learning content, but also create the ability to interact strongly with those contents for learners.

3.1.2. Some difficulties, obstacles

The difficulties and obstacles of the application of E-learning in private universities include institutional, cultural, technological, educational and ethical aspects:

Firstly, Vietnam has had macro policies from the Party and the State on promoting the application of information technology in higher education (Phung Xuan Nha, 2018). However, the implementation of the policy in practice is not good, especially in the field of distance education. The legal framework is incomplete. There are provisions on the conditions for applying E-learning in general (Circular No. 12/2016/TT-BGDĐT) and the concept of E-learning in the Regulation on Distance Learning (Circular No. 10/2017/TT-BGDĐT). The application of E-learning to formal training, postgraduate training has no clear legal basis to apply. The psychology of underestimating degrees from remote and online training by employers and learners limits the ability to attract learners.

Secondly, private universities lack the funds to invest in development in the context of the State not funding. Projects usually proceed thanks to foreign funding. The lack of connectivity between universities, so the spillover impact of these meager investments is still low. The learning environment does not stimulate the initiative and creativity of students. The capacity of the teaching staff and the education management team has not met the requirements of E-learning development, both in terms of technology and content. Some older lecturers are not used to the use of the internet should increase the workload as well as the pressure on lecturers. It gives rise to issues related to cybersecurity as well as intellectual property issues.

Thirdly, the teaching staff is lacking compared to the needs, and a limited number of lecturers in terms of qualifications and capacity (Liu Van An, 2019). Most PRIVATE UNIVERSITIES are unable to accommodate enough organic lecturers, the number of visiting lecturers still accounts for a large proportion, most of them are organic lecturers who have retired from being invited back. There are private universities after 8-10 years of establishment with a very small number of highly qualified lecturers (Professor, Doctor of Science, Master). The investment to train, foster and improve the level of lecturers at private universities is still limited.

Fourth, teaching facilities and equipment are still difficult.

Most schools have a narrow area, most of which do not meet the standards of classroom and lecture hall area. Many private universities do not have their own facilities, lecture halls, working rooms must rent without space for cultural activities, sports, dormitories many schools do not have. The library system, including the e-libraries of schools is generally small, the number of books is poor. Laboratory equipment, practice in most schools is lacking, outdated (Summary report of monitoring results ...). Facilities are lacking but the rate of increase in enrollment targets is high. That leads to low quality of training, not creating a consensus on benefits, strong enough attention to quality among learners, teachers, investors for education, employers, and society.

Fifth, the content and teaching methods of many schools are still outdated. The training content of private universities is generally outdated. The development of the program, the compilation of the syllabus has not paid enough attention; the content of the program lacks updating, the import of programs and syllabuses has not been evaluated to fully assess the applicability and effectiveness for higher education in our country.

3.2. Some solutions to develop online training in Vietnamese private universities in the coming time

3.2.1. Raising awareness and responsibility for the development of online training in Vietnamese private universities

The propaganda to raise awareness about the position, role, and benefits of online training in private universities should be promoted, not only in the education sector but also in the whole society. Management subjects, lecturers and students at the schools need to be aware of the advantages, difficulties, and conditions for implementing online training. It is necessary to develop a roadmap, a plan to put online training into the subjects and the training program. Private universities need to coordinate effective marketing campaigns for E-learning programs. Marketing contributes to bringing E-learning to all walks of life, thereby encouraging the spirit of learning as well as shortening the barriers that traditional training brings. Strengthen business cooperation in building E-learning websites. Enhance training on methods and skills, using a combination of components to create E-learning lectures. At the same time, improving the effectiveness of online forums, affirming the role of interaction when evaluating courses and learners' results, assessing the roles and responsibilities of administrators and technicians as well as technical instructors.

3.2.2. The State should amend and supplement the system of legal documents on finance for education in general and private universities to create a synchronous legal framework to create the most favorable conditions for private universities to develop.

Financial difficulties are one of the obstacles of private universities to develop online training. Therefore, special attention should be paid to the issue of attracting investment capital to private universities. Re-regulate ownership of assets for established capital contributors. Make sure their investments are profitable, not merely a form of savings. All investment activities everyone wants to make a profit, although not yet confirmed but investing in private university is also a form of business towards profit, but not like

businesses doing business for pure profit, the profit share of the private university establishment will continue to reinvest development to improve the quality of mining. Investors only enjoy a fair share of the profits.

Adjust and supplement financial support policies for private universities. If there is only one source of revenue from tuition fees of students with the requirement to invest in quality assurance conditions such as building facilities, renovating modern equipment, investing in building a team of teachers, and paying taxes to the State, the financial resources of private universities will face a lot of difficulties, so it is necessary to be financial support from the State to develop the scale and quality of private university institutions. It is not recommended to tax non-profit private universities. Taxing private universities is the main tax on students, as the main source of revenue for private universities is tuition fees. If taxed, the schools will raise tuition fees, the "sufferer" will be students. It is not only the way in which the State fulfills its task of providing public services but also a way to perfect the public services provided to society.

3.2.3. Interested in developing teaching staff

The teaching staff has a particularly important role for each educational institution, being the guide for the student's learning, contributing to the formation of qualities, personality, qualifications, and professional skills for students. The teaching staff is an asset that ensures the survival and development of private universities. They have the role of creating the brand, the class of the training institution in the country as well as internationally. Nowadays, the teaching staff has an extremely important mission in training human resources that are both highly qualified and have good personality qualities – citizens who can meet the requirements of national renewal and development. The quality of the teaching staff is also an important criterion in the evaluation and accreditation of university quality. Therefore, the care to build and develop the teaching staff of private universities will create a great change in the quality of higher education, meeting the new requirements for the socio-economic development of the country.

To prepare a highly qualified human resource team to be ready for the Industrial Revolution 4.0, there should be a form of training of lecturers to meet the most modern teaching requirements, such as the ability to apply teaching information technology, capable of using modern teaching facilities and most importantly, self-learning capacity, Self-study of science.

3.2.4. Upgrading the infrastructure for E – Learning

Good infrastructure plays an important role, successfully determining the implementation of online teaching and learning, while the development of infrastructure to serve E-learning with reforms and upgrades cannot take place in the short term. Therefore, private universities need to allocate finances as well as arrange reasonable time to continue to simultaneously implement both teaching activities and upgrade infrastructure without affecting learners.

The Ministry of Education and Training needs to develop appropriate LMS and LCMS systems to support online training (LMS - manages online learning activities, LCMS

- manages learning content); develop multimedia lecture materials for online training. The Ministry also needs to have regulations on the basic standards of training in the form of E-learning is the inevitable trend of society, stipulating the minimum standards of E-learning training such as infrastructure, equipment, teachers, learners, academic outlines. Recognition of online learning results...

3.2.5. Strengthening cooperation between private universities and enterprises to improve the efficiency of online training

In the context of the Industrial Revolution 4.0, the core element of building the higher education system is that training is associated with practical requirements, training that better meets the needs of society. Developing a cohesive training model between educational institutions (schools) and businesses is considered an important requirement to be set. To strengthen the cooperation between private universities and businesses to improve the quality of online training, many measures should be taken.

1) Expand training links between enterprises and private universities. The business side will act as information providers for training institutions to understand the needs of the labor market. The training activities of universities and colleges are always geared towards the needs of businesses. The school ensures that the supply of workers that meet the needs of the business. Thus, the enterprise is cooperating with the training institution is also a practical need of the enterprise itself. Therefore, this link is both inevitable and highly feasible in meeting labor for businesses.

2) Private universities and businesses combine in research and technology transfer. The transfer of science and technology has two aspects. The first is research and transfer to improve research capacity in schools and promote enterprise production in the direction of improvement according to demand. When intellectual human resources are becoming a direct production force and a determinant of the competitiveness of enterprises, the implementation and close combination of schools and enterprises in scientific research is a trend, a positive measure of dynamic education, creative. Secondly, the school has a team of well-trained intellectuals, capable enough to receive the transfer of advanced new technologies, thereby applying to businesses. In this respect, the business benefits in terms of saving time and taking advantage of external resources. Also from this activity, the school is quickly approaching new technologies based on resources from businesses.

3) The Government orients and brings resources from foreign organizations to help promote the cohesion between private universities and businesses in Vietnam. For businesses, access to foreign organizations opens new opportunities for enterprises to access foreign markets and resources. On the school's side, relying on resources from foreign organizations to conduct contacts and engagement with businesses will enhance its position and prestige in that relationship.

4. Discussion and Conclusion

Along with the development of Industry 4.0, online training is no longer a strange form for private universities. Education experts said that, along with the development of technology and the increasing demand for lifelong learning, E-learning online learning is an inevitable trend that countries in the world as well as Vietnam aim for and promote. E-

learning online training offers many benefits such as simplicity and accessibility for learners; flexibility helps learners to be fully proactive about time, learning space, course selection, appropriate learning content; highly synchronized curriculum and materials... However, the application of this form of training in private universities, besides the basic advantages, still has many difficulties and obstacles. Therefore, to develop online training, private universities need to take drastic action, synchronously implement many solutions; at the same time, it is necessary to have timely support and orientation from the Government and state management agencies.

MSc. Tran Khanh Linh
linhtk@due.edu.vn

Faculty of Economics, University of Economics – University of Danang, Danang, Vietnam

Abstract

In recent years, population ageing has become a global phenomenon, taking place in almost all countries in the world. Similar to this trend, Vietnam has also been undergoing a rapid rise in the number and proportion of the elderly people in the population, which can imply many impacts on the nation's economic development. Therefore, this paper focuses on analyzing the current situation of population ageing in Vietnam, mainly from 1975 to 2020. The results show that the older-aged group has continuously and significantly increased during this period, accounting for 7.87% of the total population in 2020 and this number is predicted to continue to rise in the upcoming future. While Vietnam has officially entered the "ageing" stage since 2011, it is forecast that the country may reach another stage – "aged" in less than 2 decades. This can pose many challenges as well as present some opportunities for the economic development of Vietnam. Using a collection of past literatures on the relationship between population ageing and economic development in different nations, the authors then discuss more deeply about the challenges and opportunities Vietnam's economy may face, as well as recommend some policies for the Vietnamese government in their preparation for coping and adapting to the ageing population.

Keywords: *Economic development; Population ageing; Vietnam; Vietnam's economic development.*

1. Introduction

Population ageing can be defined as a transition in a country's demography characterized with a rise in the share of the old-aged people (United Nations (UN), 2015). This leads to an older structure in the nation's population. As for the thresholds in defining an ageing population, according to the United Nations Population Fund (UNFPA) (2011), when the share of the elderly group (who are aged 65 and over) reaches 7%, the country's population can then be called "ageing". If it exceeds 14% and 20%, the population becomes "aged" and "super-aged" respectively. 60-year-old can also be used as another threshold to indicate an ageing population, specifically when the share of people in this age or over amounts to over 10% of the population; whereas it is called "aged" and "super-aged" when reaching 20% and 30% respectively (UNFPA, 2011). The main reasons that cause this particular change in demography include declines in fertility and mortality rates as well as rise in life expectancies (Weil, 1997; Giang & Pfau, 2007).

In recent years, population ageing has become an increasing phenomenon and is happening in almost all nations across the world. Before, population ageing was mostly reported in developed countries such as Japan, Germany, Italy (Lee et al., 2011; Muto et al., 2016). However, this same phenomenon can now be seen happening in many more developing nations, including China, Singapore, Korea (Banister et al., 2012; World Bank, 2016). More notably, the rate at which developing countries are experiencing population ageing is much higher compared to developed nations in the past. Not outside of this trend, Vietnam is also one of the countries undergoing the same phenomenon, where the share of older group in the country's population has been experiencing a rapid rise in both numbers and percentages (Giang & Pfau, 2009), more rapid than any other age groups. What is more concerning is that the rate at which population ageing is occurring in Vietnam can be considered one of the fastest in Asian region, or even in the world (Tong, 2017).

This would no doubt pose many challenges for the economic development of Vietnam, especially for the government and policymakers. This can be even more challenging for Vietnam since the country's level of income has only reached lower-middle level, thus it can come across an additional problem of "getting old before getting rich" (World Bank, 2016; IMF, 2017). Therefore, if not prepared carefully with appropriate measures to deal with the challenges that come with the phenomenon of population ageing, Vietnam's economy and socio-economic development in the future could be negatively affected, especially in the long term. More interestingly, population ageing can also come with some opportunities. If managed well, the investment in human capital and contributions from the elders can in fact help promote economic growth (United Nations, 2015). Thus, the government can have a proactive approach to prepare and adapt to the ongoing change in population structure so as to mitigate the negative influences and even capture the possible benefits from population ageing in order to promote more development (World Bank, 2016).

Of course, to come up with such policies would require proper and insightful researches into the situation of population ageing in Vietnam, and what specific challenges (and maybe even opportunities) such phenomenon could bring about to the nation's economic development. With the current lack of formal papers about this topic, the needs for more researches regarding population ageing and its relationship with Vietnam's economic development are greater than ever. Therefore, this paper intends to fill the literature gap by providing a thorough analysis of the situation of population ageing in Vietnam. Additionally, using past literatures that studied about the effects of population ageing on different nations, economically and socially, this paper will then discuss possible challenges and opportunities that can come with population ageing for Vietnamese economy. From that, our paper will provide some policy recommendations for Vietnamese government to help them design appropriate measures to respond to the phenomenon of population ageing.

2. Method

Our paper collects secondary data on Vietnam's demography and the main sources of data are from World Bank database and the General Statistics Office (GSO) of Vietnam. Using data ranging from the years 1975 to 2020, we apply statistical data analysis method in order to

research the situation of population ageing that is happening in Vietnam and the possible reasons behind its occurrence. This paper also synthesizes and analyzes a collection of past literatures on the topic of population ageing and its effects on many nations' economy in order to discuss the possible challenges and potential opportunities that population ageing can bring about to Vietnam's economic development as well as the appropriate policies that can be used to deal with the phenomenon. The results of our study will be discussed in the following sections.

3. Results

3.1. Literature review on population ageing and economic development

It is widely accepted among economics literature that population and demography of a country plays a great role in its economic development. Therefore, a particular shift in demographic structure such as one that moves towards an older age structure will certainly have some effects on the nation's economy.

On one hand, population ageing can affect a country's savings. In the life-cycle theory, many economists believe that the savings patterns of a typical individual follows a hump-shaped age profile where they tend to save little in their early years as a child, then accumulate most of their savings during their working years to prepare for retirement and save very little again or even dissave (for example: draw down savings) after retirement (Bloom & Canning, 2008; Albuquerque & Lopes, 2010; Weil, 1997). Therefore, more elderly people in the population would imply a lower aggregate savings rate for the country (Weil, 1997; Cutler et al., 1990). The rising fraction of the elderly group also implies more needs for government transfer such as retirement pensions or social security to assure the life of the older-aged group (Bloom & Canning, 2008). In other words, population ageing can create a substantial burden on a country's government budget (Bloom et al., 2010; Otsu & Shibayama, 2016). Another adverse effect that comes with population ageing when more and more people in the population are moving toward an older age group while the fertility rate continues to decline is the possible shortage of labor supply in the upcoming future (Lee et al., 2011; Muto et al., 2016;). As this phenomenon means a larger proportion of the elderly who would mostly be in their retirement and thus often economically inactive (Lee et al., 2011) and a smaller group of the working age group who are the main sources of the labor force, there will most likely be a decrease in the labor participation rate (Otsu & Shibayama, 2016). Thus, population ageing can have negative effects on a country's economic development.

On the other hand, population ageing may not only come with negative impacts. The lower fertility rate associated with population ageing would imply fewer children per family, meaning less dependencies from the youth and less expenditure devoted for child rearing (Lee et al., 2011) which could result in greater opportunities for households to save more. Increased longevity can also induce people to have higher precautionary savings to account for longer retirement period (Borsch-Supan, 2008). Meanwhile, the decline in the labor force can be offset by generating a greater participation rate, especially from the elderly people (Bloom & Canning, 2008; Clark et al., 2008) since rise in life expectancy can allow older people to prolong their working lives (Bloom & Canning, 2008), especially since this increase in life expectancy can mostly be associated with better health of the population, including the elderly.

The older-aged people can also make contributions to the economy by transferring their knowledge and experience to their younger family members, thus help improving the human capital of the younger generations. What’s more, decrease in fertility rate can imply fewer children in the family which allows more resources and investments from the parents for their children, further improving the human capital of the younger workforce (Lee et al., 2011; Prettnner, 2013). Therefore, there are possibilities that if dealt with in the right way, this population ageing phenomenon can actually help promote economic development.

3.2. The situation of population ageing in Vietnam

Generally, the total of Vietnam’s population is considered relatively large. Data by the GSO of Vietnam showed that the average total population of the nation in 2020 is estimated to be 97.58 million people which accounts for around 1.24% of the population of the world. Looking more closely at the demographic structure of Vietnam, in 2020, the number of the working age population (aged 15-64 years old) is 67.11 million, equivalent to 68.94% of the total population. Meanwhile, the child group (aged 0-14 years old) accounts for approximately 22.58 million, making up 23.19% of the population whereas the number of elderly people who are 65 years old and over is around 7.65 million, which is 7.87% % of Vietnamese population.

In recent decades, Vietnam’s age structure has been undergoing significant changes and has been transitioning gradually towards an ageing society. Despite only accounting for more than 7% of the whole population, the elderly group has been shown to experience considerable increases in the past years. More importantly, the rises in the number and percentage of this particular group are much more rapid compared to other age groups.

The total number of population aged 65 and over in Vietnam between 1975 – 2020

Figure 1. Total number of population aged 65 and over in Vietnam between 1975 – 2020

Source: World Bank Database

As can be seen from the graph, during the period from 1975 to 2020, the number of elderly people in Vietnam increased continuously and significantly. More specifically, while the population aged 65 and over was only about 2.4 million people in 1975, in 2000, the number has more than doubled to over 5 million. And from this year 2000, the population aged 65 years and over in Vietnam has constantly risen from 5.1 million to reach 7.65 million in 2020, a figure that is more than three times of that in 1975.

However, some people may argue that these increases in the number of elderly people could come from a general increase in the whole population of the country. Therefore, we will now look at the proportion of this particular group as compared to the total population to see the change in the age structure more clearly:

Figure 2. Proportion of population aged 65 and over in Vietnam between 1975 - 2020

Source: World Bank Database

It can be seen clearly from the above figure that the proportion of elderly people in Vietnam itself has risen remarkably in recent decades. In fact, the percentage of people aged 65 and over in Vietnam has increased by nearly two times from 4.94% of the country's population in 1975 to 7.87 % in 2020. By using the 65-year-old as a threshold for measuring population ageing, we can conclude that Vietnam has entered the “ageing” stage since 2016 as nearly 7% of the country’s population are 65 years old and over by this year.

However, if we use 60-year-old as an ageing threshold instead, it may indicate that Vietnam has become an “ageing” country at an even earlier year. More specifically, when 60 years of age is used as a baseline to define the elderly group, the number of older-aged people in Vietnam has also risen continuously over the years.

Figure 3. Total number of population aged 60 and over in Vietnam between 2009 - 2020

Source: Authors' calculations based on the results of the Surveys on Population Change and Family Planning for the period of April 1, 2009 to 2020

During the period from 2009 to 2020, the population of people 60 years old and over has experienced a continuous rise from 7.6 million people in 2009 to around 12.7 million people in 2018, corresponding to an increase from 8.93% to 13.53% of the total population which again showed a nearly doubled figure. Even though the number of old-aged people slightly decreased in the year 2019, this number started to rise again in 2020 and still reached 12 million people, accounting for 12.34% of the total population in 2020. This shows that the share of old-age group in the country's population still generally experience an overall upward trend. More importantly, according to this measure, Vietnam has actually officially entered the "aging" stage in an earlier year: in 2011 with nearly 10% of the total population being 60 years old and over.

Figure 4. Proportion of population aged 60 and over in Vietnam between 2009 - 2020

Source: Authors' calculations based on the results of the Surveys on Population Change and Family Planning for the period of April 1, 2009 to 2020

Similar to other countries, the main reasons that have caused population ageing in Vietnam are most likely a combination of two factors: a decrease in the fertility and mortality rates along with an increase in the population's life expectancy. World Bank data shows that between the period from 1975 to 2020, the total fertility rate of Vietnam has decreased sharply from 6 children/mother in 1975 to about 2 children/ mother in 2015 – a 3-fold decrease in volume. This low birth rate continued to be maintained at around 2 children per mother until 2020. This decline in birth rates is believed to have largely been due to the introduction and successful implementation of the “Family Planning” Policy in Vietnam in the 1970s, with the typical example being the “One-or-Two-Child” policy. Meanwhile, the mortality rate in Vietnam has decreased from 5.18% in 1975 to around 1.67% in 2020. At the same time, the life expectancy at birth increased from 61.5 years to 75.5 years old in the same period. The reason behind this decrease in mortality and increase in life expectancy can be attributed to the rapid socio-economic transformation in Vietnam since the "Doi Moi" period, which in turn led to many advancements and improvements in the medical and healthcare systems in Vietnam, which helped reduce mortality rate and improve life expectancy.

In the past, Vietnam has benefited from the above factors as they contributed to an increase in the working-age population and the creation of young, healthy and well-trained workforce to drive economic growth. However, after some periods, Vietnam has been experiencing a decline in the proportion of the children population (aged 0-14 years) while the percentage of the elderly group has increased rapidly in both quantity and proportion.

Table 1. Forecast of Vietnam’s population structure in the period 2029 - 2049

Year	2029	2039	2049
Total population (million)	102.3	106.5	108.5
Proportion of child population (0-4 years old)	20.9%	18.1%	17.9%
Proportion of working age population (15-64 years old)	68.0%	67.0%	64.0%
Proportion of old-age population (65 years old and over)	11.1%	14.9%	18.1%
Old age index 60+	77.6	113.2	138.9

Source: Authors' calculations based on GSO's data

What's more, predictions indicate that this rise in the older-aged group would continue in the upcoming years, reaching approximately 15.9 million and account for nearly 15% of the total population by 2040. This implies that Vietnam is likely to enter the next stage of “ageing” by becoming an “aged” population by this time. And by 2050, the number of the elderly in the country will increase to 19.6 million, making up more than 18% of the population, meaning Vietnam will head to a further stage of ageing. In other words, in the future, Vietnam's population will continue to undergo a strong and rapid structural transformation, following the trend of more and more elderly people in Vietnamese society.

3.4. Population ageing and economic development in Vietnam: challenges and opportunities

The gradual ageing of Vietnamese population can be considered a notable issue in the current years. This would bring about a number of challenges for the development of the nation, especially in terms of economics.

As mentioned above, there are possible shortages of the labor force in the upcoming future. According to GSO, in 2020, there are approximately 54.8 million people in the labor force, accounting for 56.2% of the country's total population. This number showed a decline in the labor force of around 924.5 thousand people compared to the year before 2019. Newest estimation for 2021 even showed that the labor force has continued to decrease to 50.5 million people, equivalent to 52.7% of the country's total population. Moreover, the working age population is predicted to decline from 68% to 67% from 2029 to 2049; while the younger population (ages 0-14) will decrease from 20.9% to 18.1% in the same period. This shrinking in the future workforce can dampen the production and output of Vietnam in the near future

In addition, the aging index (measured by the number of people aged 60 and over divided by the population under 15 years old) is forecast to exceed 100 by 2039, implying that the older population in Vietnam will outnumber the younger population by this year. This suggests that there will be more burden from the elderly group on the economy, since smaller group of younger people will have to support a now larger older-aged group. Other concerns include healthcare and pension funding for the elderly; more burden of the government budget and sustainability of the fiscal policy. What should be taken into consideration is that the rapid rate of ageing in Vietnam while the income status is still at lower – average level suggests that Vietnam would face the problem of “getting old before getting rich”, bringing even more challenges than other developed nations. Therefore, if not prepared well, this phenomenon could have serious negative effects on Vietnam's long-term economic development.

However, population aging does not necessarily always hinder a country's economic development. Higher savings rates, investments in human capital and contributions from the elderly can help promote growth. With Vietnam's popular existence of traditional family where grandparents usually live with their children and grandchildren, the elderly can bring many contributions to the economy and society. For example: They can help with child caring and support for their children and grandchildren, transfer their knowledge and experience,... Higher participation from the elderly can also be made use to improve the labor force participation since in Asian countries in Vietnam, many older-aged people still work after retirement, especially in the countryside. More importantly, population ageing requires a proactive approach by the government through the development and improvement of the pension and health care system as well as the social security system to successfully prepare and adapt to the changes in population structure that are taking place. Only then can Vietnam minimize the negative consequences of ageing and maintain economic development. Moreover, if managed well, the demographic transition that Vietnam is currently experiencing could lead to a long and prosperous life for the Vietnamese people.

4. Discussion and Conclusion

4.1. Policy recommendations

From the analysis of the situation of population aging in Vietnam and the discussion on the potential impacts this phenomenon has on Vietnam's economic development, we suggest the following policies:

Firstly, since population ageing is mostly associated with a rise in the share of the elderly people in the population and since this particular group is inherently one of the most vulnerable groups in the society, the needs for welfare and health care for the elderly will increase significantly. As a result, it is important for the Vietnamese government to pay more attention to the development of healthcare and social security policies for the older-age group. The design of such policies should also take into consideration the differences between different specific groups to account for essential needs, especially since resources is limited. For example, more priorities should be given to more vulnerable groups of older people such as those aged 80 years and over, those living in rural areas, elderly women, ethnic minorities,...etc. This is especially important when in Vietnam, the life of the elderly still faces many difficulties. Many elderly people still belong to poor households; most still live in the countryside, are farmers or work in agriculture. The percentage of elderly people who can live on pensions or social benefits is still very low. Thus, the development of a high-quality health care system, with medical facilities specializing in geriatrics; as well as having well-trained human resource for the healthcare of the elderly are considered necessary.

Moreover, one of the main reasons that lead to the occurrence of population ageing in Vietnam is the decrease in the fertility rate. Therefore, it may be recommended to the Vietnamese government to develop policies and programs to counter this problem. For example, there could be improvement in the provision of information and better access and better quality to reproductive healthcare along with social service supports for people making reproductive decisions. More favorable policies for working mothers such as more flexible working hours; more support for childcare and maternity care can also encourage women's participation in the workforce while also help increase the birth rate in the population.

Meanwhile, regarding a way to compensate for the potential future labor shortage in Vietnam, it is suggested that the Vietnamese government should implement measures to encourage the continued participation of the older-aged people in the labor force. Policies should be designed so as to create more incentives for the elderly to continue working and help them work in accordance with their health, expertise and skills. For example, the government can develop a lifelong learning programs for the elderly, making it easier for this group to have access to and learn new knowledge and skills to continue in their jobs, to still make their contributions to the society and the economy. Additionally, the future generations of elderly people who have increased levels of education and skills can become an important force for economic development. Thus, policies should be made with more focus on promoting and making use of the participation and contributions of the elderly. With this, Vietnam can move towards a more active approach in ageing.

4.2. Conclusion

Population ageing is undeniably becoming a global phenomenon and occurs in many countries across the world. Not outside of that trend, Vietnam is also experiencing a shift in demographic structure with an increasing number of elderly people in the population, both in number and proportion. This paper takes a closer look into the situation of population ageing happening in Vietnam and discuss the potential challenges and opportunities that this

phenomenon may bring to Vietnam's economic development. Therefore, our research will help the Vietnamese government better understand and have more awareness about the issues of population ageing as well as how to prepare to deal with this phenomenon in the upcoming future. In addition, we also propose some policy recommendations which include: policies to develop better healthcare and social security systems to improve the quality of life for the elderly; policies to promote more births among the populations and policies that would help increase labor force participation, especially of the elderly group. The authors believe that these policy reforms can be useful for the Vietnamese government in designing and implementing appropriate measures to effectively and successfully adapt to the situation of ageing population in Vietnam. More importantly, with the rapid speed that population ageing is happening in Vietnam, it is recommended that the Vietnamese government should prepare and apply the appropriate measures as soon as possible to put Vietnam in a better position to cope with the possible challenges that come with population ageing while still capturing the potential benefits related to this phenomenon and maintain sustainable development in the short term and the long term.

DEVELOP SELF-LEADERSHIP SKILLS IN ENTREPRENEURSHIP FOR VIETNAM STUDENTS

MSc. Nguyen Quang Hung

hungnq@uel.edu.vn

University of Economics and Law, VNU-HCM, Ho Chi Minh City, Vietnam

Abstract

The Vietnam government has set a target to have about one million businesses operating effectively. Startup is one of the most important activities to achieve that goal. Entrepreneurship can be seen as an innovation, i.e., risk-taking, pursuing the new, and being ahead of others. Self-leadership is important for innovators and has many benefits for risk-taking entrepreneurs. The universities in Vietnam have many activities to encourage students to start a business, and there have been several entrepreneurship courses. However, no university has trained students in self-leadership skills. Developing self-leadership skills for students is an important factor in promoting entrepreneurship in Vietnam.

Keywords: *Startup, Entrepreneurship, Self-leadership*

1. Introduction

Vietnam is facing a situation of economic growth tend to decrease, unsustainable, low economic creativity capacity (Mai Viet Dung, 2015). It is accompanied by an ever-increasing unemployment problem, especially among people with tertiary education (VCCI, 2016). To address the above fundamental issues of macroeconomics, developing a group of enterprises based on science and technology - an innovative start-up or formerly called an innovation startup is the choice that is imperative for our country today (Nhat Nam, 2016).

With the efforts of the Government and the participation and response of the whole society, creative start-up activities in Vietnam tend to increase in both quantity and quality. According to the statistics of one of the leading magazines on startup in Southeast Asia Echelon, Vietnam currently has about 3,000 innovative startups. Statistics from Topica Founder Institute (TFI) show that in 2017, Vietnam received nearly double the number of innovative start-up deals and increased 50% in total investment capital compared to 2016 (Ministry of Science & Technology, 2018). Many creative start-up movements among young people took place wildly, such as the movement to bring startups into university lecture halls, the program of creative start-up students ...

In Vietnam, the Government has set a target to have about one million businesses operating effectively by 2020; and starting a youth business is one of the most important activities to achieve that goal. Many programs, policies and support funds have been implemented to promote business among young people in Vietnam. According to the Global Entrepreneur Report (GEM), the proportion of adults who are aware of the opportunity to start a new business in Vietnam increased from 39.4% in 2014 to 56.8% in 2015, higher than

in the whole Southeast Asia (Report, G. E., 2017). However, GEM also reported that the proportion of people planning to start a business in Vietnam is only 22.3%, much lower than other countries with similar economic development levels. Evidence of entrepreneurial intent among young people in Vietnam is available. Therefore, it is necessary to fight against barriers affecting the business intentions of young people, which can contribute to the development of policies to improve young entrepreneurs in Vietnam.

Leadership as an important feature for an entrepreneur

An entrepreneur's leadership has become apparently important due to challenges in a management setting. It is believed that entrepreneurs are people-dependent and need people's help. This could be both inside and outside the company. Therefore, entrepreneurial leadership emerges as something a businessman wants to run his company (Sklaveniti 2017 p. 204). Among others, Reid et al. (2018) argue that many of an entrepreneur's attributes or characteristics are the same as those needed to be a leader. Leadership and leadership research have collaborated in several ways (Reid et al. 2018). Some of the thematic areas that overlap entrepreneurship and leadership, such as vision, influence, creativity and innovation, planning, and cognitive and dispositional approaches (Reid et al. 2018, p. 152).

Thus, leadership remains an important part of entrepreneurship research (Simsek et al. 2015, quoted in Reid et al. 2018). One way to improve an entrepreneur's life and business are perhaps by pursuing "self-leadership to lead him or herself more effectively." It's argued that leading oneself can only lead others (Furtner, Baldegger & Rauthmann, 2013). Leading oneself is specifically related to the idea of self-leadership, and self-leadership can be taught and implemented through a combination of behavioral and cognitive techniques (D'Intino et al. 2007, p.105). Therefore, if leadership is important for entrepreneurship, an entrepreneur can use self-leadership as a starting point to develop their leadership skills.

Many scholars claim to support leadership as something that can be either thought or learned (Doh 2003). And for an entrepreneur, leadership has become a skill needed, and self-leadership is seen as necessary (e.g., Manz & Sims 1991; Pearce 2007; Reichard & Johnson 2011). Furthermore, leadership can be seen from various viewpoints and through different reference frames depending on a company's maturation. In startups, however, the leader usually learns how to lead through the entrepreneurial process. He or she may have a vague idea of whether to be a leader or how to become a leader at the outset of their business venture, but when it progresses, it always occurs during business venture growth (Leitch, McMullan & Harrison 2012, p.348). Thus, one who wishes to become a leader may build leadership through entrepreneurship. To cope with the lead role, an entrepreneur can deal with self-leadership as an important contribution (Furtner, Baldegger & Rauthmann 2013).

2. Literature Review

2.1. Self-leadership

Self-leadership is a term that emerged in the 1980s and is described as "a process in which a person influences himself in order to gain self-direction and self-motivation for success" (Houghton & Neck 2003, p.126). It can be applied by different behavioral and cognitive approaches, which can be used to affect personal effectiveness positively (Neck &

Houghton 2006, pp. 271). Since its creation, self-leadership has gained popularity among scholars and even executives who have used self-leadership concepts through training programs to increase workplace self-leadership (Neck & Houghton 2006, pp. 270-271). Different research revealed three central dimensions of self-leadership: (a) self-behavior; (b) self-reward / punishment; (c) positive thought (Prussia, Anderson & Manz 1998, and Houghton & Neck 2002). In this study, these aspects will be presented to the reader for a deeper understanding of the principle of self-leadership.

Figure 1. Self-leadership pattern, Houghton & Neck 2002

The idea of self-leadership is based on psychological theories, primarily related to cognitive and behavioral theories (Neck & Houghton 2006). Therefore, one can learn principles and strategies about how to apply self-leadership to achieve benefits such as individual strength, inspiration, and creativity (Yun, Cox & Sims Jr 2006, and DiLiello & Houghton 2006).

✚ *Providing self-leadership*

Self-leadership is a theory is a construction based on an individual's psychological aspects as a set of cognitive and behavioral strategies divided mainly into three major categories (a) behavior-focus strategies; (b) natural rewards; (c) constructive thinking (Prussia, Anderson & Manz 1998, and Houghton & Neck 2002) that can enhance one 's performance through self-efficacy.

✚ *Conduct-focused approaches*

One adopts behavior-focus approaches to "increase self-awareness, leading to behavior modification requiring required but sometimes difficult activities" (Houghton & Neck 2002, p. 673). Behavior emphasis may involve a series of techniques outlined, such as self-observation, target setting, reward, punishment, cueing, correction of feedback, and practice (Houghton & Neck 2002, and Neck & Houghton 2006). Such techniques are similar to tactics taken to form one's own actions by HR agencies or even business strategies, but

embraced and presented by one to oneself. Both approaches increase self-awareness and practice to contribute to real behavioral improvement, enhancement, or removal (Houghton & Neck 2002, pp. 673).

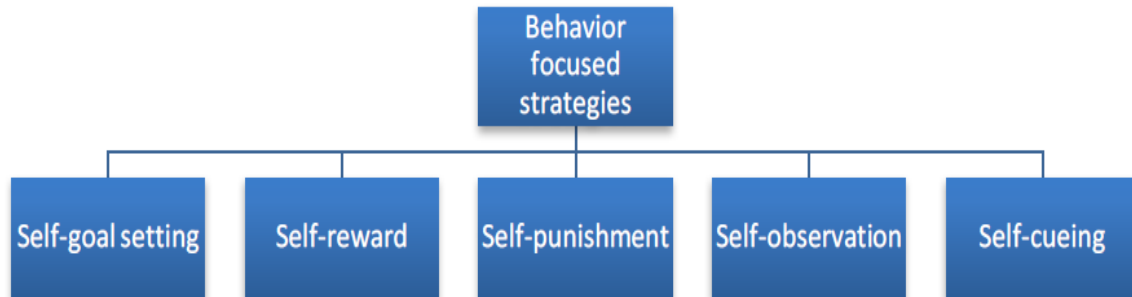

Figure 2. Behavior focused strategies, based on Houghton & Neck 2002

✚ Strategies for Natural Reward

Natural rewards are strategies designed by one to shift one's focus to the most pleasant aspects of a task or shape the work environment to a more pleasant place where one's enjoyment of doing a task is likely to be more natural (Houghton & Neck 2002, pp. 673-674). These techniques may include but are not limited to, outdoor work, using pictures on the workstation, conversing with others to make the work less mechanical and more normal, as shown in the figure below.

Figure 3. Natural reward approaches based on 2002

✚ Constructive learning techniques

Positive thought or positive thinking patterns are techniques aimed at challenging and removing unhealthy and irrational ideas to create a more constructive thinking pattern (Neck & Houghton 2006, p. 272). The way to enhance a constructive way of thinking is by increasing positive self-talking and replacing destructive self-talking, in this scenario, one should re-evaluate one's way of thinking about oneself and change one's way of internal dialogue, present in the figure how constructive pattern strategies are used;

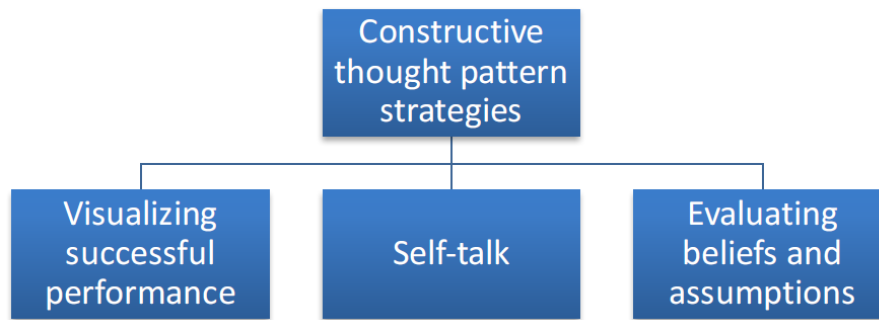

Figure 4. Building strategies based on Houghton & Neck 2002

✚ *Self-leadership is intrinsic to one's discipline and sensory making*

Sensing is the ability to understand what is happening, to understand the present and how the flow of events has led to the current situation rationalization (Weick, Sutcliffe, Obstfeld, 2005). As one must be careful to follow one or more strategies, the application of these strategies must make sense to oneself if one looks back. Leadership is the link between figure and ground, what leaders do, and actions and utterances from the action relationship of leaders, and it's about giving meaning to a context (Smircich & Morgan, 1982). Thus, self-leadership is related to a self-sensing process in which one must incorporate one's own actions by making sense.

✚ *Self-leading disputes and limitations*

Neck and Houghton (2006) draw attention to the fact that self-leadership is not easy to quantify. The concept of self-leadership overlaps with classic theories of self-motivation and self-influence, making self-leadership difficult to be a unique and distinguishable building separated from other motivational and personality constructions (Neck & Houghton 2006, pp. 274-275). While self-leadership is related to different psychological principles and theories, it is a specific structure that has to do with one's personality and behavior but also with actions, self-discipline, and self-sensing.

Because self-leadership is not easily measurable, RSLQ is one method for measuring self-leadership. However, it faces critics, particularly when used in non-western contexts (Neuber & Wu 2006, Alves et al . 2006). Nevertheless, construction is not annulled. It brings challenges to scholars and practitioners, and one has to be the best self-judge of self-leadership effectiveness, adapting the way it is evaluated when necessary.

Self-leadership concepts can be applied in practical ways and have proven to be tools that enhance the performance of those who receive instruction on the subject as shown by results (Neck & Manz 1996, Stewart, Carson & Cardy 1996). While hard to quantify (Houghton & Neck 2002 and Furtner, Baldegger & Rauthmann 2013), an individual's self-leadership training and growth is possible and can effectively improve efficiency (D'Intino et al . 2007 and Neck et al. 2013).

✚ *Self-leadership of others*

Self-leadership is not leadership, and one aspect of leadership and self-leadership is positively linked to certain leadership types rather than others. It's not clear how self-

management accounts for leadership itself, but its connection is empirically evident (Furtner, Baldegger & Rauthmann 2013).

Self-leadership is typically a concept used to control one's actions. When one thinks about leadership, the leader and follower must be taken into account. "Leadership is realized in the process by which one or more individuals may attempt to frame and describe others' reality" (Smircich & Morgan 1982, p. 258). Thus, self-leadership is the self-success in attempting to frame and describe one's own reality through a series of blended techniques that include self-behavior-focused strategies, natural reward techniques, and self-building thought (Prussia, Anderson & Manz 1998, and Houghton & Neck 2002). One must follow to lead.

Simultaneously, the following is a trend that goes hand-in-hand with leadership as leaders and followers have a normal relationship. Leaders and followers must share a common purpose. Followership is an active action as followers intend to participate in events (Baker 2007). Hence, followers willingly encourage leaders to lead while common interests motivate leaders and followers. Self-leadership, by example, can enhance leadership if followers can make sense of their leadership.

2.2. Entrepreneurship and Self-leadership

Entrepreneurship can be said to be a spirit of relentless challenge to build new values and possibilities through creativity, initiative, and risk-taking without being constrained by resources that can be managed in a rapidly evolving competitive environment and can also be said to be contributing attitude and competence. Furthermore, leadership can be identified as a concept that means influencing others rather than position or title. It can also be observed to be strong in terms of organizational management, influencing the exercising power process (Ha & Jung, 2011).

The characteristic study of entrepreneurship focuses primarily on identifying specific variables of personality, validating the level of achievement, control position, risk-taking, and ambiguity tolerance. On the other hand, people's characteristics addressed in terms of leadership can be seen as compassion, work motivation, emotional equilibrium, competence, ethical conduct, imagination, and bravery. This is, if the characteristics of the leader and leadership are analyzed in terms of the individual's various characteristics affecting success within the category of characteristics, the difference is that the dimension of entrepreneurship is emphasized in creating and running a new organization.

As such, there are many parallels between the philosophy of entrepreneurship and leadership in that they both have some ambiguity, but there is a significant gap in the study method and practical implementation. Accordingly, entrepreneurship is said to be part of leadership in a specific sense, but entrepreneurship can be viewed differently from leadership in terms of developing something new rather than handling the current.

Entrepreneurship can be seen as an innovation, i.e. risk-taking along with innovative pursuing the new and ahead of others (Yoo & Kim, 2015). This indicates that self-leadership may be much more important to innovation-oriented people (Pearce & Manz, 2005), and self-leadership may be even more beneficial to risk-taking entrepreneurs (D'Intino et al., 2007), and those with strong initiative have shown themselves to be comparatively stronger

in self-leadership compared to those with the less strong initiative (Yun & Sims, 2006). As such, entrepreneurship and self-leadership are closely linked to each other.

Self-leadership, consistent with recent trends, is emphasized by each member's efforts to exercise influences and lead to desirable thoughts and actions, unlike traditional leadership that focuses solely on the leader's influence to achieve organizational performance (Song, 2013). In previous self-leadership studies (Houghton & Neck, 2002; Neck & Manz, 2010), constituents' self-leadership is often required to fulfill creative positions that sustain entrepreneurship, affecting entrepreneurship. It can also be said to be a response mechanism used to cope with changes in an enterprise's climate or organization in an active reaction to a rapidly evolving entrepreneurial spirit world or organizational change.

Accordingly, a study claims that since self-leadership can determine self-regulation towards environmental changes and self-control level of intent, the relationship with entrepreneurship is likely to be close (Kim & Noh, 2012). It is also defined as an element of behavioral activities that approach college students' self-goal and passion without further dividing them into sub-elements such as behavior-centric strategy, natural compensation strategy, and constructive thinking strategy, which are sub-elements of self-leadership (Song, 2013).

Entrepreneurship creativity may mean a desire to generate new ideas required to produce new products or services that have not existed before. That is, innovation represents the entrepreneurial propensity to embrace and encourage innovative concepts, R&D, and creative processes leading to new goods, new services, and technological creation (Yoo, 2010). Examining previous studies related to innovation and entrepreneurship self-leadership, innovation has been empirically validated to have a positive relationship with self-leadership (Neck & Houghton, 2006).

The relationship between risk-taking and self-leadership of entrepreneurship implies a tendency to introduce risk-preferred decision-making, seeking opportunities despite risks in making business decisions where uncertainty exists, and in this regard, it has been claimed that it can exert influence (Kim, 2008). Moreover, the partnership between entrepreneurship initiative and self-management is an entrepreneurial mindset to predict new opportunities and protect existing markets by encouraging new opportunities (Lee, 2016).

3. Results

3.1. Application of the theory

Manz and Sims (1980) introduced self-management as an extension of self-management theory and is characterized as "the process of self-influencing" (Neck and Manz, 2010). It involves three major sub-faceted strategic areas (Neck and Houghton, 2006): behavior-focused strategies (self-goal setting, self-reward, self-punishment, self-observation, self-care); natural reward strategies; and positive pattern strategies (visualizing good results, self-talking, assessing values and assumptions).

Use this tri-partite model as it provides the most detailed and inclusive account of self-leadership strategies. Some scholars proposed discarding self-punishment from the

nine-factorial compendium of self-leadership techniques. Nonetheless, use all the original dimensions because decided to check the most inclusive self-leadership and not limit our study to a limited collection of dimensions. (Andressen et al. 2012) also presented empirical proof of the nine-factor model of self-leadership.

Self-regulatory strategies can be used to focus one's attention on one's own behaviors to reduce discrepancies between current and desired states. They foster successful behaviors and eradicate unfavorable behaviors (Neck and Houghton, 2006). Obtaining undesirable conduct (status quo) is assessed in the first step. In a second step, the self-goal setting sets a behavior-modifying goal (desired condition). Thus, self-observation serves constant monitoring of discrepancies between the present and desired condition during the pursuit of the goal. For a targeted, systematic behavioral change, self-reward, and self-punishment are used. Self-cueing is some form of a memory aid to promote target achievement (e.g. post-its, notes, etc.).

The central component of self-leadership is natural to reward strategies (Furtner et al., 2013; Manz, 1986; Neck and Houghton, 2006) that can directly influence people's task-related intrinsic motivation. By using natural reward strategies, pleasant aspects of a task are focused on (and de-focused negative aspects) or actively implemented (Neck and Manz, 2010) so that stronger intrinsic motivation, joy, and self-determination may arise. The task is then "naturally' rewarding,' as it has an intrinsic positive element. Therefore, on a conceptual level, natural reward strategies are strongly linked to emotional regulation, as different regulatory strategies can be subsumed in this dimension, such as situation selection (selecting an inherently rewarding task), situation modification (generating and implementing pleasant aspects into a task), careful deployment (focusing). Regulation of emotions and self-regulation are closely related (e.g., Furtner and Hiller, 2013), and as self-regulation is an integral part of self-leadership, self-leadership can be crucially guided by underlying emotion-regulating mechanisms, putting natural reward strategies at the core of self-leadership (Furtner et al., 2013).

Constructive thinking patterns refer to positive and explicit control of habitual thinking patterns (Neck and Manz, 1992). Mental imaging or simulation is used to predict potential positive results with the intention of improving actual performance (Driskell et al. , 1994; Neck and Manz, 2010). Pessimistic self-talk can be eliminated through self-reflective analysis and replaced by optimistic self-talk (Seligman, 1991). Furthermore, irrational or unstable thought patterns may be established and modulated by analyzing one's own beliefs and perceptions.

3.2. Recommendation

Currently, the universities in Vietnam have many activities to encourage students to start a business. However, although there have been several entrepreneurship courses, no university has trained students in self-leadership skills. Therefore, it is necessary to add self-leadership skills to teaching.

Based on the premise that self-leadership skills can hardly be developed simply through structured education (i.e. theoretical input) and learning is a process of direct

experience, analytical evaluation, abstract conceptualization and constructive exploration (Kolb's experiential learning theory, 1984), an creative approach to developing and improving selected self-leadership skills.

The learning process requires physical experience, perception and critical reflection. The course is planned for 30 hours, emphasizing primarily physical activity. Each unit includes a section with physical activities (i.e., bodywork) and an analytical reflection section. The ultimate aim is to build and improve the following skills in self-leadership.

Table 1. Overview of selected self-leadership skills

Competencies	Description
Concentration	Students train to be focused the moment they 're in
	Keeping the mind concentrated and listening diligently to the instructions increases the ability to concentrate under intense, complex circumstances
	A special breathing technique helps a deep concentrated mind
	Practicing the exercises requires focusing on body function
Self-awareness	Effective listening is a leader's most essential skill. Self-awareness means listening to one's inner self (i.e. self-focus)
	Students practice listening within their bodies to consider their own desires and feelings and acknowledge their own restrictions
	Increased self-confidence can help to trust one's own decisions
Self-discipline	Students must overcome their inner resistance because they don't learn that way
	Doing the exercises consistently takes discipline and diligence
	Students are encouraged to incorporate learning outcomes into their everyday lives
Creating positive thought pattern	Positive thinking during exercises enables students to transfer this ability to work and its achievement
	Positive self-discussion as internal communication helps decision-making and creates a "can-do" belief
	Students improve their capacity to creatively execute a task and visualize how to do it beforehand
Flexibility and balance	The learned exercises make students more versatile in body and mind
	In doing uncomfortable exercises, students must conquer inner temptations and thus abandon their comfort zone
	Flexibility means being open to new ways of thinking that may allow students to be better prepared for future challenges

Competencies	Description
	The course supports students' mental and physical strength and well-being and encourages better achieving and maintaining harmony between body and mind
Empathy	Better understanding of one's own needs, emotions and constraints may contribute to a better understanding of others' needs, emotions and restrictions
	People may be well qualified to listen to a conversation, but they also improve their ability to detect nonverbal communication
Communication	Due to the course structure, students practice both non-verbal body language communication and verbal communication
	Through exercises, students increase their exposure to non-verbal contact
	The verbal contact component assists the class initially with group composition and subsequently with group success
	It helps students to familiarize themselves and increase their community cohesiveness
Relaxation	No doubt a leader must be able to recover in order to obtain fresh strength for fresh challenges
	Therefore, students practice handling their limited resources to avoid burn-out
	They feel the difference between triggering and relaxing
	Breathing helps students to relax their mind and spirit

Participants gained hands-on training in self-leadership. Especially they should be able to:

- Be mindful of self-disciplinary problems in their everyday work
- Raise the ability to tackle internal constraints
- Keep centered (i.e. self-focused) under harsh conditions
- Know their own thoughts, desires, and limitations (i.e. self-awareness)
- Understanding others' feelings, desires, and limitations (i.e. empathy)
- Understand the sense of the entire mind and body
- Calm and calm consciously
- Apply selected self-management skills in their daily work to avoid stress and maintain a healthy work-life balance
- Understand the importance of non-verbal contact
- Build constructive thought habits
- Consider body and mind control

Practicing these self-leadership skills can contribute to the self-efficacy, inspiration, and success of participants.

4. Conclusion

Developing self-leadership skills for students is an important factor in promoting entrepreneurship in Vietnam. However, there is no program to train self-leadership skills in universities. This study proposed a program to guide self-leadership skills for Vietnam students. In the future, if this course is to be taken, it is necessary to have an evaluation analysis of student growth after study. As such, this program will meet the desired outcome standards and increase the success rate when students start their careers.

BUILDING THE TEACHING STAFF OF DEFENSE AND SECURITY EDUCATION AT UNIVERSITIES IN THE MEKONG DELTA

PhD student. MA. Nguyen Ho Thanh

nhothanh@agu.edu.vn

An Giang University, Vietnam National University Ho Chi Minh City, An Giang, Vietnam

Abstract

The article analyzes and clarifies the actual situation of building a contingent of lecturers in defense and security education at universities in the Mekong Delta. In the face of the requirements of the fundamental and comprehensive renovation of education and training, the strong impact of the industrial revolution 4.0, and the international and domestic context, many complicated developments are posing high demands for national defense and security work and the teaching staff of defense and security education. The Mekong Delta is not an exception to this development, so the research to clarify the actual situation of building a contingent of defense and security education lecturers at universities will help orient and find appropriate solutions, effective and feasible for this management.

Keywords: *Mekong Delta, teaching staff, defense and security education.*

1. Introduction

In universities, the teaching staff holds positions and plays a very important role in improving the quality and effectiveness of education. Therefore, the work of developing lecturers at universities is of great interest to our Party and State. In the Decision "Approving the project to improve the capacity of lecturers and managers of higher education institutions to meet the requirements of a fundamental and comprehensive renovation of education and training in the period of 2019 - 2030" of the Decision No. The Prime Minister has clearly stated the point of view, "The training and retraining to improve the capacity of lecturers and managers of higher education institutions should be given importance because this is a decisive factor in the quality of education higher education" (Prime Minister, 2019, pp.2).

Currently, the Mekong Delta has about 20 universities, in response to the renovation requirements of Vietnam's higher education and the implementation of the industrial revolution 4.0, universities must be able to train quality human resources increasing amount. This is a central and urgent task for the teaching staff in general and building the teaching staff of defense and security education at universities in particular. Over the years, the teaching staff of defense and security education at universities in the Mekong Delta have been interested in building and developing both quantity and quality, with a sense of responsibility and dedication. He is passionate about his profession, has good political and moral qualities, and has professional qualifications. However, currently, in universities in the Mekong Delta, the teaching staff of defense and security education is both short in quantity and has certain limitations in quality. Therefore, assessing the current situation and finding measures to develop the teaching staff of defense and security education in the Mekong Delta is a necessary and urgent issue today.

In Vietnam, the development of the teaching staff of national defense and security education at universities is understood as the standardization and integration of knowledge, skills, and attitudes to form a system of professional competence standards defense and security education lecturer. To implement the method of managing and developing the teaching staff of national defense and security education at universities, it is necessary to define a framework of professional qualifications; The next step is to "standardize" the content of management and development activities of the teaching staff of defense and security education according to the process from planning, development planning, recruitment, assignment, use, evaluation, training, fostering lecturers, reward and treatment policies, motivating staff ..., all are based on the professional competency standards of national defense and security education lecturers.

The competency model of national defense and security educators is a general and honest picture reflecting the activities of national defense and security educators. In addition to teaching capacity, there are many other competencies to participate in many different activities. National defense and security education lecturers are both capable of teaching as a pedagogue, with qualifications, the ability to organize and manage daily teaching and educational activities, in addition, they have professional competence of necessary military skills. The capacity model shows that in order to organize training and retraining for national defense and security education instructors, it is necessary to first identify the standards of the specific competencies mentioned above, and at the same time, need to develop those competencies in an appropriate manner synchronized. Among the above competencies, professional competence is dominant, directly affecting the development of lecturers. In addition, the identification of activities of national defense and security education lecturers also plays an important role in training and fostering the teaching staff.

On the basis of the studies, in this study, the author gives a model of the competencies that need to be built and developed for the teaching staff of defense and security education according to the figure below:

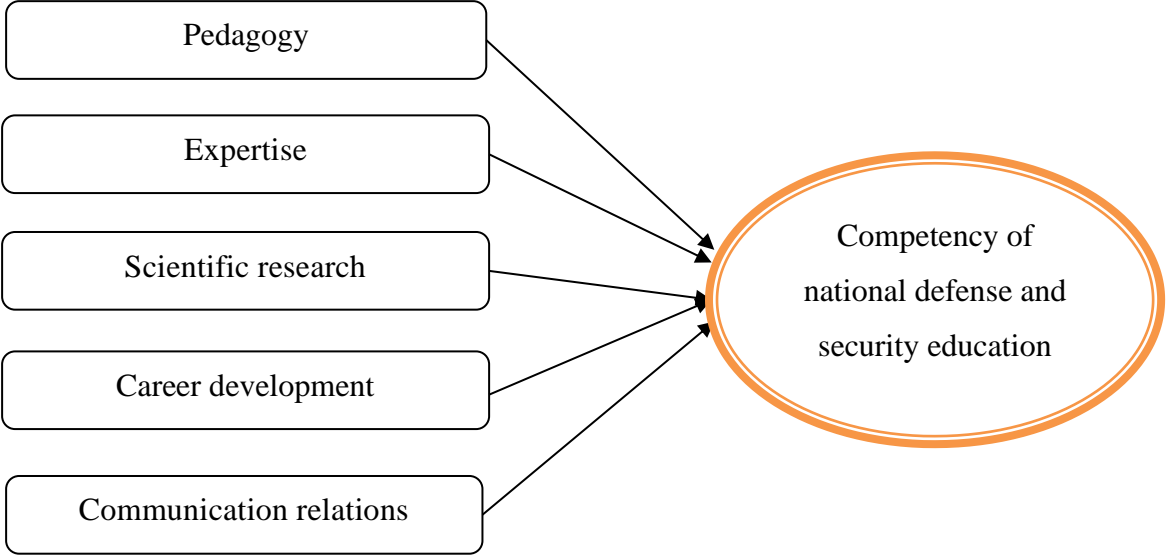

Figure 1. Competency model of national defense and security educators

2. Method

2.1. Overview of the survey organization

2.1.1. Survey purpose

Practical surveys and surveys aim to collect data to assess the reality of the development of national defense and security education lecturers at universities in the Mekong Delta in an objective manner. This is the basis of analyzing the strengths, weaknesses, opportunities and challenges in developing the teaching staff of defense and security education at universities in the Mekong Delta. From there, draw objective, scientific and accurate conclusions as a basis for proposing solutions to develop the teaching staff of defense and security education at universities in the Mekong Delta, contributing to improving the quality of life high quality of the teaching staff of defense and security education at universities in the Mekong Delta.

2.1.2. Survey content

Survey on the actual situation of building the teaching staff of national defense and security education at regional universities with specific contents such as:

Assess the current status of the teaching staff;

Review and assess the current capacity of the teaching staff of national defense and security education at universities in the Mekong Delta;

Assessing the current situation of building a contingent of lecturers in defense and security education at universities in the Mekong Delta.

2.1.3. Survey audience

Survey of 50 managers; 135 lecturers in 08 universities in the Mekong Delta with Centers, Faculty, Department of National Defense and Security Education (An Giang University, Can Tho University, Cuu Long University, Dong Thap University, Tien Giang University, Tra Vinh University, Vo Truong Toan University, and Kien Giang University) in March 2022.

2.2. Survey method

2.2.1. Questionnaire survey

Design a questionnaire with the content of asking administrators and lecturers to evaluate the results of developing the teaching staff of defense and security education at universities in the Mekong Delta. The values determined according to the assessment levels, are calculated as percentages, average points and on a scale as follows:

The results of calculating the average score are calculated on a scale from 0 points to 4 points such as: From 0 points - under 1,75 points: Weak; From 1,75 points - under 2,5 points: Average; From 2,5 points - under 3,25 points: Good; From 3,25 points - 4 points: Good; (approximately 0,75).

Use the formulas in mathematical statistics to calculate the average score for the indexes of the survey contents. Based on these results, the author analyzes the current situation of developing the teaching staff of defense and security education of 08 universities in the Mekong Delta.

2.2.2. In-depth interview

Using interview questions from 50 specialists of functional departments, managers, and lecturers of 08/20 universities in the Mekong Delta has Centers, Faculty, Department of National Defense and Security Education. Direct interviews with the subjects to clarify the difficulties to propose orientations for building a contingent of defense and security education lecturers.

2.2.3. Information processing method

Using SPSS software to enter and process descriptive statistics.

3. Results

3.1. Assessment of the current status of lecturers in defense and security education at universities in the Mekong Delta

Firstly, the characteristics of the teaching staff

The teaching staff of national defense and security education at universities in the Mekong Delta are trained from various sources, mainly seconded officers in the army and short-term trained lecturers (6 months), combining defense education with physical education, national defense education with political education, a team with formal training and expertise in defense and security education is very limited. Due to the diversity of training sources, there are unequal professional qualifications, pedagogical skills, scientific research capacity, etc., among lecturers. The teaching staff of the schools is not guaranteed in terms of quantity and structure, some schools still lack highly qualified lecturers.

With these characteristics, when considering aspects to develop the teaching staff of defense and security education in universities in the Mekong Delta, it is necessary to analyze and study specifically the current state of capacity of the teaching staff and the current situation of management of the construction and development of the teaching staff to find an effective solution to manage this development.

Secondly, quantity, gender, and age

Through the process of construction, development, and growth, the teaching staff of defense and security education at universities in the Mekong Delta has changed, and the number of lecturers is increasing day by day. The rate of increase in favor of high-quality and highly qualified lecturers has also been increased, but the average annual rate of increase has not met the task of teaching and educating national defense and security of the school.

The teaching staff of defense and security education at universities in the Mekong Delta have a relatively reasonable age structure, with 62.2% of the lecturers aged 35-50. This is not a young age, has a relatively high professional level, and has accumulated a lot of teaching experience. In particular, this is the enthusiastic and enthusiastic age group, not afraid to face advanced and modern technology; able to adapt to new things, and quickly absorb new technologies. However, at this age, usually lecturers do not have academic titles, high degrees and practical experience are still at a certain level. Regarding gender, the more balanced the ratio of men to women, the more favorable it will be for the development of teaching staff. However, due to the peculiarities, the proportion of female lecturers is very

small compared to that of male lecturers. The survey results show that the structure is 88,9% male and 11,1% female.

Thirdly, the structure of training qualifications and professional expertise

Table 1. Statistics of training qualifications of lecturers

No.	Names of Universities	Total	Number of organic lecturers							
			Prof/Assoc.		Doctor		Master		Bachelor	
			Amount	%	Amount	%	Amount	%	Amount	%
1.	An Giang Universities	15	0	0	1	6,7	12	80	2	13,3
2.	Can Tho Universities	48	0	0	1	2,1	27	56,2	20	58,3
3.	MeKong Universities	10	0	0	0	0	6	60	4	40
4.	Dong Thap Universities	14	0	0	1	7,1	10	71,4	3	28,6
5.	Kien Giang Universities	7	0	0	0	0	4	57,1	3	42,9
6.	Tien Giang Universities	12	0	0	0	0	8	66,7	4	33,3
7.	Tra Vinh Universities	24	0	0	0	0	18	75	6	25
8.	Vo Truong Toan Universities	5	0	0	0	0	3	60	2	40
Total		135	0	0	3	2,2	88	65,2	44	32,6

Source: Statistics up to March 2022 of 08 universities in the Mekong Delta

The survey results show that the structure of qualifications of the teaching staff of defense and security education at universities in the Mekong Delta is relatively reasonable, with the proportion of lecturers holding a master's degree accounting for the majority (65,2%), have a doctorate or higher, accounting for 2,2% and up to 32,6% of the lecturers have a university degree. Therefore, it is required that universities in the Mekong Delta need to continue to strive to increase the percentage of defense and security education teachers with high academic titles and degrees, striving for 100% of lecturers to achieve high academic standards master's degree. In training and teaching, several universities in the Mekong Delta have mechanisms and policies to invite visiting lecturers who are military officers of local military units to participate in teaching work, exchange professional knowledge and technical skills, and participate in scientific research to help young lecturers have the opportunity to study and improve their qualifications.

Fourthly, the structure of professional qualifications in pedagogy, informatics, and foreign languages

About pedagogy: Survey results show that about 90% have certificates of pedagogy in university teaching and certificates of teaching in defense and security education. Regarding foreign language proficiency: The survey results show that the number of national defense and security education lecturers with foreign language qualifications reaching university, postgraduate or international standards is very small (1,3% have IELTS 500/TOEFT 550 certificates; 3,6% have a university degree in foreign languages). However, the number of lecturers in defense and security education with B1 certificates accounts for 53,7% because the majority of teachers have master's degrees. Besides, teachers with foreign language certificate A, B, C (from 2015 and earlier) and other certificates account for 28,5%. About informatics: Survey results show that the vast majority of defense and security education lecturers have certificates of information technology application (accounting for 70,7%). The computer literacy of the teaching staff of defense and security education at universities in the Mekong Delta is still limited compared to the requirements for using and implementing information technology-related teaching aids. This requires universities to strengthen training and fostering in pedagogy, foreign languages, and informatics for this team.

Fifthly, the capacity of the teaching staff

Table 2. Current status of capacity of the teaching staff (Percentage unit)

No.	Capacity	Degree evaluation				Medium score	Standard deviation	Places
		Good	Fair	Average	Poor			
1.	Specialize	22,1	38,7	33,8	5,4	2,78	0,87	1
2.	Scientific research	20,7	25,9	37,1	16,3	2,48	0,88	3
3.	Career Development	23,4	32,2	28,8	15,6	2,70	0,85	2

The survey results show that the professional capacity of the teaching staff of defense and security education at universities in the Mekong Delta is quite good with an average score of 2.78. According to the results of in-depth interviews on this issue, administrators of universities in the Mekong Delta all believe that the teaching staff of defense and security education has specialized knowledge and skills. The subject is quite good, however, the weakness is the ability to apply professional knowledge to solve practical problems, and the ability to access new information technology to put into teaching and scientific research.

Regarding the scientific research capacity of the teaching staff of defense and security education at universities in the Mekong Delta, it is only assessed at the average level, with a mean score of 2,48, the standard deviation is quite high, showing that the evaluation opinions are not concentrated and scattered. This shows that the scientific research capacity of the teaching staff of defense and security education at universities in the Mekong Delta has not been highly appreciated. The professional development capacity of the teaching staff of defense and security education is quite good, with an average score of 2,70. However, there is a weak criterion that is the ability to use foreign languages for

professional development activities. Therefore, schools need to focus on developing the foreign language skills of their teaching staff.

3.2. The actual situation of building and developing the teaching staff of defense and security education at universities in the Mekong Delta

Firstly, the perception of management levels on the development of teaching staff of defense and security education

Figure 2. Awareness status of managers

The survey results on the perception of managers about the importance of developing the teaching staff of defense and security education at universities are as follows: Very important: 62,3%; less important: 27,3%; unimportant: 10,4%. According to the interview results, some managers believe that it is very necessary and important to build and develop the teaching staff of defense and security education at universities in the Mekong Delta because this development is in line with the current practice in the face of the impact of the domestic and international context, especially the impact of the Industrial Revolution 4.0. However, some others believe that defense and security education is a conditional subject, so universities need to focus on building and developing a contingent of lecturers in other subjects and majors developing the teaching staff of defense and security education in universities in the Mekong Delta is less necessary and unimportant.

Secondly, planning and recruiting teaching staff

The survey results show that at present, the staff and lecturers all realize the necessity of implementing the contents of the teaching staff planning. Which, managers and lecturers think that researching and analyzing the current status of the teaching staff is the most necessary because it is necessary to know the current situation and needs to be able to implement the development of a management plan and organize the implementation of the plan and evaluate the construction management plan, develop the teaching staff of defense and security education at universities. However, administrators and lecturers have not paid much attention to disseminating the plan to the entire teaching staff, civil servants, and public employees in the school, and at the same time forecasting the resource needs of the teaching staff defense and security education. These are also two very necessary contents in planning

the teaching staff of defense and security education. In the process of developing the teaching staff planning, it is necessary to expand democracy, to attract the broad participation of the school's administrators, civil servants, officials, and lecturers, so that they can overview, more complete and mobilize the participation of all cadres, civil servants, public employees and lecturers in the implementation of the plan to build and develop the teaching staff of defense and security education.

In terms of recruitment, all criteria are assessed at a good level, with the average score from 2,49 to 2,77. Thereby, it can be clearly seen the difficulties that need to be solved at universities in the Mekong Delta in recruiting lecturers in defense and security education.

Thirdly, arrange and use the teaching staff

According to the survey results of 08 universities in the Mekong Delta on the actual arrangement and use of teaching staff in defense and security education. The results of the evaluation are shown in table 3 below:

Table 3. Actual situation of arrangement and use of teaching staff (Percentage unit)

No.	Content	Degree evaluation				Medium score	Standard deviation	Places
		Good	Fair	Average	Poor			
1.	Formulate and promulgate regulations on assignment and arrangement at job positions	17,1	24,1	44,2	14,6	2,44	0,78	3
2.	Organize the assignment, arrange use at the job positions	27,4	28,4	41,1	3,1	2,8	0,77	1
3.	Rotation, appointment	17,7	41,2	28,5	12,6	2,64	0,80	2
4.	Evaluate and monitor usage	13,2	24,4	45,2	17,2	2,34	0,82	4

The survey results show that the arrangement and use of defense and security education lecturers at universities in the Mekong Delta is relatively well done. The school's leaders have directed the units to manage and use the teaching staff to meet training requirements and promote their capacity in teaching, scientific research, and application of information technology in lessons preach. However, through interviews, some opinions said that: The arrangement and use of national defense and security education lecturers in some universities are still not really appropriate, there is still a shortage of teachers, spare lessons. This is also an issue that universities in the Mekong Delta need to pay attention to in recruitment and planning.

Fourthly, training and fostering teaching staff

The survey results on training and fostering the teaching staff of defense and security education at universities in the Mekong Delta are evaluated as good and good, with an average score of 2,10 to 3,07 with high evaluation criteria: training and fostering political and

administrative theory; fostering knowledge about education; cultivating pedagogical skills. Some criteria are assessed at a low level such as training and fostering to improve professional standards, informatics, foreign languages; capacity building for professional development.

The results show that the schools are interested in training and fostering political and administrative theories in accordance with the regulations of the Party and State on the management and standardization of cadres. At the same time, it is also necessary to develop a plan and content for a training and retraining program in order to develop the capabilities of the teaching staff of defense and security education. However, the reality shows that universities in the Mekong Delta have not paid due attention to the training and retraining of high-level national defense and security education lecturers, improving the quality of life high level of professional development capabilities... These are important competencies, universities should have specific plans and promote training and retraining.

Fifthly, the examination and evaluation of the teaching staff

According to the survey results, the assessment of the teaching staff of defense and security education is done at a fairly good level, with the average score of the criteria from 2,55 to 3,10. In general, the examination and evaluation of universities in the Mekong Delta are carried out through the following contents: 1) Implement the examination and evaluation plan and the examination schedule of the university and the application periodically for teachers to know and implement. The plan has clearly defined purposes, requirements, time, methods of testing, and evaluation; 2) The Board of Directors directs the training room; testing, and quality control room; The People's Inspection Committee, Trade Union, and Youth Union shall coordinate in inspecting and evaluating professional qualifications, professional records, and lecturers' books; 3) Synthesize opinions on the evaluation of teaching activities, which is the basis for assessing the quality and qualifications of the teaching staff in general, the teaching staff of defense and security education in particular, and propose training courses for the students training and fostering each teacher of national defense and security education to improve professional capacity. At the same time, the test and evaluation results are also shown in the school year emulation review.

Sixthly, the organization of conditions to support the development of the teaching staff

The implementation of remuneration regimes and policies for lecturers is very important, both a requirement and a solution for schools today. The survey results show that the criteria are evaluated at a fairly good level, which shows that managers and lecturers both realize that the implementation of the regime, remuneration policy, and working environment are very important. In fact, the development and promulgation of mechanisms and policies to attract lecturers, especially lecturers in defense and security education, is one of the first important tasks for universities in the Mekong Delta.

4. Discussion and Conclusion

4.1. Discussion

In general, the current situation of developing the teaching staff of defense and security education in universities in the Mekong Delta is relatively reasonable. However, there are still shortcomings and limitations that need to be overcome such as the percentage

of lecturers with academic degrees is not high; foreign language and computer skills are still limited, and the number of visiting lecturers who are military officers of local military units in universities in the Mekong Delta is still high.

Many teachers of national defense and security education have not been able to access modern teaching methods, lack practical knowledge, and the capacity of some national defense and security educators has not yet met the requirements; the number of lecturers with formal university-level pedagogical training is very limited, most of the lecturers are trained through pedagogical training courses to grant certificates in pedagogy; the scientific research capacity shown in the scientific research activities of the teaching staff of national defense and security education is still weak compared to the requirements set forth, very few large-scale and capable scientific works are available high practical applicability, the number of scientific research works published in prestigious domestic and international scientific journals is not much; the planning of the teaching staff of national defense and security education has not yet been unified, and the professional competency standards associated with the duties of the lecturer's title are not clear. The recruitment of lecturers according to the administrative process is still temporary, there is little decentralization for faculties and subjects, not according to the requirements of the task description of the competency framework, and the capacity of the candidates has not been assessed pellets.

The arrangement and use of defense and security education lecturers in universities in the Mekong Delta is not appropriate, many units still have a shortage of lecturers and excess teaching hours. Several defense and security education lecturers have not been properly assigned, and there is a shortage of highly qualified lecturers; the training and development of national defense and security education lecturers is still a formality, with a large number of themed subjects, not focusing on developing the capacity of national defense education lecturers and security. Most schools do not have long-term training plans, lack initiative, and have not taken advantage of opportunities.

The above situation shows that a comprehensive picture of the capacity of the teaching staff of national defense and security education in universities in the Mekong Delta is still limited. The development of this team still has many shortcomings, slows innovation, and does not meet the training needs of the locality in particular, and the whole region in general. Therefore, there is a need for a direction to solve this problem.

4.2. Conclusions and recommendations

4.2.1. Conclusions

The research, assessment of the current capacity, and development of the teaching staff of national defense and security education in the Mekong Delta show that there have been significant advances in improving the capacity of the national defense and security education team in recent years. this five. However, in the current new situation, the capacity of the teaching staff of defense and security education in all aspects has not yet met the demand for human resource training. The reality shows that the teaching staff of national defense and security education at universities in the Mekong Delta still have limitations that

need to be overcome in terms of the Number and percentage of lecturers with academic titles and degrees. ; Foreign language and computer skills; Managing and developing a teaching staff from planning, training, recruiting, employing to testing and evaluating. In particular, there is no capacity framework to serve as the basis for recruitment, use, and capacity assessment of national defense and security education lecturers in accordance with changes in the new context.

4.2.2. Recommendations

The results of the above situation study show that there should be effective solutions to help managers do well in developing the teaching staff of defense and security education at universities in the Mekong Delta today.

Firstly, to raise awareness for managers and lecturers of universities in the Mekong Delta about the importance of developing teaching staff in defense and security education.

Secondly, building a capacity framework for national defense and security educators.

Thirdly, to improve planning and development plans for teaching staff of defense and security education.

Fourthly, develop, organize and implement the process of recruiting and employing national defense and security education lecturers.

Fifthly, organize training and fostering to improve the capacity of the teaching staff of national defense and security education.

Sixthly, to ensure the implementation of policies and regimes on developing the teaching staff of defense and security education.

lequanghieu@hdu.edu.vn

Hong Duc University, Thanh Hoa Province, Vietnam

Abstract

The enrollment issue toward regional institutions is particularly critical in the reformation context of the university enrollment process recently and the complicated scenario of the Covid-19 pandemic. What important factors affect students' decision to choose public universities in the North Central region is a question that most of universities must care about. Therefore, the purpose of this article is to study the influence of factors on students' decision to choose a university there. The study uses secondary data to describe the characteristics of universities in the North Central region and primary data through a student survey of 8 public universities to test the effect of proposed factors to the decision to choose a university according to the research model. Through a survey from 500 students with the support of data analysis tools (SPSS and AMOS 24), factor belonging to students, training activities, facilities, costs, promotion and local factor have a positive relationship with intention to choose a university; on the other hand, the factor of intention is an intermediate variable that has a great impact on the final university choice decision of students. The result also shows the moderating role of the factor of graduation exam score to the relationship between intention and final decision. These have important implications in contributing to the consolidation of theory and practice in the current difficult university enrollment situation in Vietnam these days.

Key words: *students, decision, university, the North Central, regional*

1. Introduction

Stemming from the importance of higher education and the Government's policy of educational socialization, the number of universities in our country has increased rapidly, including public universities in the North Central Region. Also from 2015, when the Ministry of Education and Training innovated the methods of university and college enrollment and allowed universities across the country to be autonomous in developing enrollment plans, universities in general and public universities in the North Central region in particular face many difficulties when the number of enrollment is not enough, leading to the shortage of funds, while the state budget is limited. Whether public universities in the North Central region can survive and develop depends a lot on improving the efficiency of annual enrollment. In addition, the world and Vietnam are experiencing unprecedented

negative impacts of the Covid-19 pandemic that started in Wuhan city, China from the beginning of January 2020²¹⁴. In 2021, Vietnam has 1,714,742 infections, ranking 31/224 countries and territories, while with the rate of infections per 1 million people, Vietnam ranks 138/224 countries and territories. On average, there are 17,383 infections for every 1 million people²¹⁵. Although Vietnam is well under control of the pandemic, most universities have just re-opened; learning and teaching activities have not returned to normal. Therefore, the recruitment task of universities with the goal of attracting enough students, which was not convenient, is now even more difficult.

In terms of science, while studies on the role of higher education, university development, higher education service quality and student satisfaction in the world and in Vietnam are very diverse, studies on groups of public universities in the regional area, especially in the North Central region, are not available (Maringe, 2006; Le, 2015). Moreover, the results of previous studies have not studied the two types of decisions in the university selection process uniquely in Vietnam, including: the decision to register for a university before the High School Graduation Examination and the decision to enroll after the student's admission. Meanwhile, the choice of a university to register and/or to attend by learners takes place over a long period of time from the registration until the announcement of the student's admission. With the aim to contribute suggestion and recommendation to the above situation for both students and universities, this study has identified and evaluated the main factors affecting students' decision to choose a public university in the North Central region, as a basis for high school students and especially universities to make the effective decisions and attraction strategies in the future periods.

2. Literature review and Research model

2.1. Universities in regional areas

In Vietnam, a university located in a regional area is a type of training institution under the higher education system, usually training multi-level, multi-disciplinary, multi-field and implementing both short-term and long-term training programs from intermediate to university and postgraduate to meet all needs of the labor market and lifelong learning needs of local residents (Le, 2015). Regional universities in the provinces were born thanks to the determination of the government and local authorities, are expected to bring quality university opportunities to everyone, realize the dream of local community is to go to university in the place where they live without moving to big and crowded cities (Duong, 2011). Higher education is easily accessible and available to people across the regions with the foundation of regional universities.

2.2. Determinants of students' decision

There have been many research studies on students' choice or decision to choose a university. The earliest is the work of Chapman (1981) which shows that there are two main

²¹⁴ <https://www.worldometers.info/coronavirus/>

²¹⁵ <https://vncdc.gov.vn/>

groups of factors affecting the decision to choose a university, namely (1) the characteristics of individual students (socio-economic conditions, academic aspirations, aptitudes, academic results) and (2) external factors (influential individuals and fixed characteristics of the university such as cost, location, curriculum and the university's communication efforts with students). In economics, students must choose the university with the highest utility in terms of expected net benefits (DesJardins and Toutkoushian, 2005). The human capital theory view holds that college enrollment rates are expected to be higher for individuals with better academic preparation and achievement, as they are more likely to complete their education and get a high-paying job in the future (Catsiapis, 1987). Sociological approaches to university choice again emphasize the ways in which socioeconomic background characteristics influence student decision making (Terenzini et al., 2001). However, studies have widely confirmed that the decision to choose a university is influenced by the characteristics of the student or/and the attributes of that university (Perna, 2006; Migin et al., 2015; Ming, 2010; Tran et al., 2018; Tran & Bui, 2020; Le, 2015; Tran & Cao, 2009).

(1) Individual characteristics of students

A research by Mehboob et al. (2012) showed that self-assessment of an individual's interests and abilities before choosing a university to apply to has a positive influence on the rate of students applying and entering. Preference for a university over other options also includes factors related to an individual's career preferences and employment prospects for a good career. Young people's career explorations and choices actually influence their choice of university (Sezgin & Binatl, 2011). In addition, the socioeconomic background of the student's family, especially the financial source, was concluded to be an important factor in university choice (Wargner & Fard, 2009).

(2) Characteristics and advertisement effort of the university

Many studies have shown that the decision to choose a university is influenced by the characteristics of that university itself. The attributes considered have an impact such as whether the school is public or private, the quality of the teachers, the availability of training programs, the quality and reputation, the facilities (such as library, computer equipment, and classrooms, campus size,...), tuition & financial aid from the university and its' advertisement efforts (Ming, 2010; Shamsudin et al., 2018; Tran & Bui, 2020; Le & Khuc, 2020,...). Atarah and Peprah (2014) studied the impact of advertising on students' college choice, thereby concluding that advertising activities provide information to students, thus having a direct impact on enrollment decisions to enter a university.

2.3. Decision to choose a regional university

The geographical location of an organization is the place where its' tangible assets yield higher value in case its location is placed not only near the central areas of the city, province, or district but also in the area where transportation has been developed (Le, 2020). The decision to choose a university in a local area is also influenced by local factors (Le & Khuc, 2000; Le et al, 2022). Rumbley (2016) argues that educational tradition, teaching knowledge and practice are the antecedents of elements of local education. Le (2014)

emphasizes the advantage of studying in local areas, which are considered favorable in the way that low cost of study (including tuition and living expenses) motivates students to choose a university in their province. Some high schools take students on college tours or participate in career counseling sessions from local universities. Most students in a locality with a university can know some information about that one or can have a chance to visit the university in their province. This is a distinct advantage of regional universities that the others in big cities can hardly have.

This study was carried out to solve the new problem arise that is to examine the process of choosing a university from the stage of registration to application and final decision to choose a university in order to contribute to building a scientific basis in accordance with the current condition of university enrollment in Vietnam according to the new regulations of the Ministry of Education and Training from 2015. On the other hand, this study focuses on public universities in the North Central region, where characteristics, geographical conditions, mechanisms and policies on university enrollment and training are unique and quite different from those of universities concentrated in major economic and educational centers in the country. From those, the proposed research model is as shown on Figure 1.

In this model, there are three factors that are considered newer than the previous studies: the first is the “local elements”. This is because the research focuses on regional objects, this factor can show the specificity of the research object; the second is the intermediate variable “Intention” to a university is assumed to be affected by 2 groups of factors belonging to students and group of factors belonging to the university (such as training activities, facilities, costs, promotion and local elements); the third is the “graduation exam result” (modifying variable) which is assumed to be able to moderate the influence of the registration factor on the student's decision to choose a university due to the new characteristics of the university admission regulation in Vietnam.

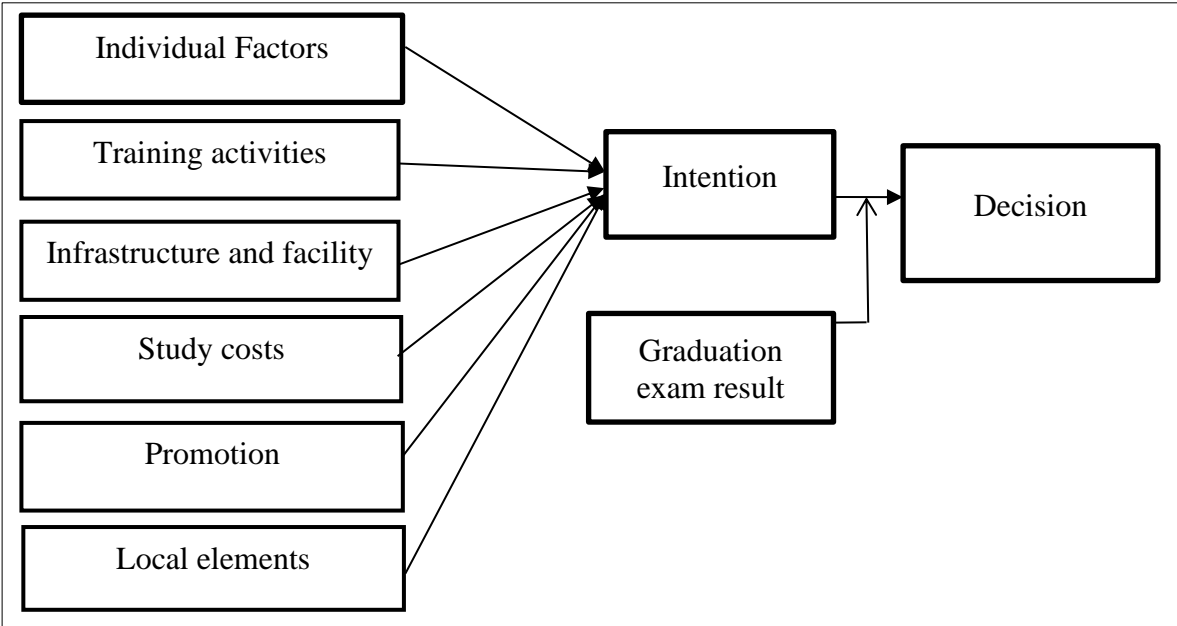

Figure 1. Research model

3. Method

The basic principle to build the scale is based on related theories and research. When the scales do not fully represent the measurement of the concept, this study continues to consider and put some observed variables developed by the qualitative research through in-depth interviews with experts, educators, and students into the scale. The results of the qualitative research have been adjusted and supplemented by observed variables to develop measurement concepts of local factors, registration, and graduation exam results in the model (Table 1).

Table 1. Scale development source

No	Code	Factor	References
1	STUD	Individual factors	Tran et al. (2018), Le and Khuc (2020)
2	TRAIN	Training activities	Tran and Cao (2009); Tran et al. (2018)
3	INFRU	Infrastructure and facilities	Chapman (1981); Tran and Cao (2009), Le and Khuc (2020)
4	COST	Study costs	Tran et al. (2018); Tran and Cao (2009)
5	PRO	Promotion	Kim and Gasman, (2011), Le (2015)

7	INTEN	Intention	Qualitative research results, author
8	RESUL	Graduation exam result	Qualitative research results, author
9	DECI	Decision	Tran and Cao (2009), Le (2015); Tran et al. (2018)

The study used a combination of primary and secondary data analysis. Secondary data are collected from the “3 public report” to describe the characteristics of regional universities. The primary data were collected through surveying student cases of 8 universities in the North Central region to test the factors affecting the decision to choose proposed according to the research model. The research scale consists of 33 observed variables measuring 9 independent and dependent factors of the model according to the Likert scale of 5 levels from strongly agree to strongly disagree. Research sample information was collected by quota technique from 8 schools with enrollment data in the last 3 years with 500 non-probability random samples and the number of valid votes included in the analysis is 488 samples, characterized on Table 2. After collected, data is coded and processed with the support of SPSS and AMOS 24 software to analyze the impact of the proposed factors in the model.

Table 2. Information of the respondents

4. Results

4.1. Description of characteristics of universities in the North Central region

North Central is the northern region of Central Vietnam, is one of seven economic regions under the government's socio-economic zoning plan. Administratively, the North Central region currently includes 6 provinces with an area of about 5.15 million hectares, including: Thanh Hoa, Nghe An, Ha Tinh, Quang Binh, Quang Tri, and Thua Thien Hue. Currently, there are 8 public universities in the North Central region, which were established and developed mainly from pedagogical, elementary and intermediate schools, and developed into colleges, thereby forming a university with a variety of training disciplines.

Students of universities in the North Central region are very diverse, from full-time to part-time students. Their students almost come from local regions or mainly from neighboring areas, ensuring the goal of opening up opportunities to access higher education for everyone in the local community and area. The training programs of the universities have also developed in the direction of diversification to meet most of the needs of learners and society, becoming centers of training and retraining of human resources.

Table 3. Characteristics of the universities in the North Centre of Vietnam

No	University	Province	Year of establi-	Training majors	No of lecturer	Square (m2)	Tuition fee (mil/year)
1.	Hong Duc University	Thanh Hoa	1997	59	411	478.000	6,2 - 7,3
2.	University of Culture, Sports and Tourism	Thanh Hoa	2011	18	189	73.380	6,8 - 8,2
3.	Quang Binh	Quang Binh	2006	23	207	125.596	9,46

6.	Nghe An College of Economic	Nghe An	2014	7	170	20.175	9,3
7.	Vinh University	Nghe An	2001	113	662	140.000	11,9-12,9
8.	Hue University (including 13 member units)	Thua Thien Hue	1957	288	3632		9,8 - 11,7

Source: synthesized from “3 public reports” and websites of 8 universities

In terms of management method, the eight universities within the scope of the study are all public universities managed by the Ministry of Education and Training, of which five are funded by the local governments of the provinces for educational and training activities (Hong Duc University, University of Culture, Sports and Tourism, Nghe An College of Economic, Ha Tinh University, Quang Binh University). For training majors, 04 universities have at least 40 majors such as Hong Duc University, Vinh university of Technology Education. Notably, Vinh University and Hue University are big and key universities of the region with over 100 training programs. However, there are still many issues that need to be improved such as the limited training scale of some schools, the quality of training activities (objectives, training program content) not really close to the actual requirements of the locality, teaching methods have not been radically reformed as current requirement (Table 3).

In terms of study costs, they are all public, so state or local government sponsor educational and training activities. Therefore, the cost of studying is lower than that of other universities; tuition fees fluctuate on the average from about 7 million to 10 million Vietnam dong a year (Table 3).

In term of human resource, the number of lecturers with master's and university degrees still accounts for a large proportion in the structure of professional qualifications of universities. The number of scientific works and international publications by lecturers at universities has increased, but overall, it is still very small (Table 3).

Spacious, modern facilities, fully equipped are one of the advantages of these schools to register and attend.

Promotion activities: diversified on many information channels (on the website, different information channels via the Internet) and continuously updated and shared faster with more attractive effects to interested audiences and society as a whole.

4.2. Research results on factors affecting the decision to choose a university

4.2.1 Reliability of the Scale

The result of reliability test of the scale shows that the scales both have a reasonably strong Cronbach's Alpha coefficient and the Corrected item - Total correlation of items are all more than 0.3, except for 02 observations STUD3 and TRAIN5 (Cronbach's Alpha coefficient is better if remove the 02 variables from the scales). Second-testing of the reliability coefficients gives the results on Table 4. The proposed items measure the same concepts and the scales are reliable for using in the next steps.

Table 4. Results of Cronbach's Alpha Test

No	Factors	Number of variables	Cronbach's Alpha
1	Individual factors	3	0.804
2	Training activities	4	0.803
3	Infrastructure and facilities	4	0.839
4	Study costs	3	0.808
5	Promotion	3	0.804
6	Local elements	4	0.802
7	Intention	3	0.793
8	Graduation exam result	3	0.767
9	Decision	4	0.827
	Total	31	

4.2.2 Exploratory factor analysis (EFA) and Confirmatory factor analysis (CFA)

The results of KMO and Barlett's test for the remaining 31 observed variables after the reliability test show that the KMO index is high (0.871) with the value Sig = 0. Thus, the large KMO index shows the suitable application of the analysis. The factor of exploring the scale set in this is appropriate. The use of factors analysis can explain 57.9% of the

explanatory power of all the influencing factors after removing the 02 variables TRAIN4 and LOCA4 from the model due to insufficient load factor.

The results of the CFA analysis for 29 variables show that the Chi-squared index / df = 1,048 (df <3); TLI = 0.9996; CFI = 0.996 (TLI, CFI > 0.9); GFI = 0.941 > 0.8 and RMSEA = 0.011 < 0.08. PCLOSE = 1,000 > 0.05 are in good range. Therefore, the model is compatible with real data.

4.2.3 Structural Equation Modeling

To measure the fit between the theoretical model and the actual data, Structural Equation Model continued to be used. The results showed that Chi-squared / df = 1,093 (df <3); TLI = 0.993; CFI = 0.994 (TLI, CFI > 0.9); GFI = 0.944 > 0.8 and RMSEA = 0.015 < 0.08. Therefore, it can be concluded that the model is compatible with the actual data (Figure 2).

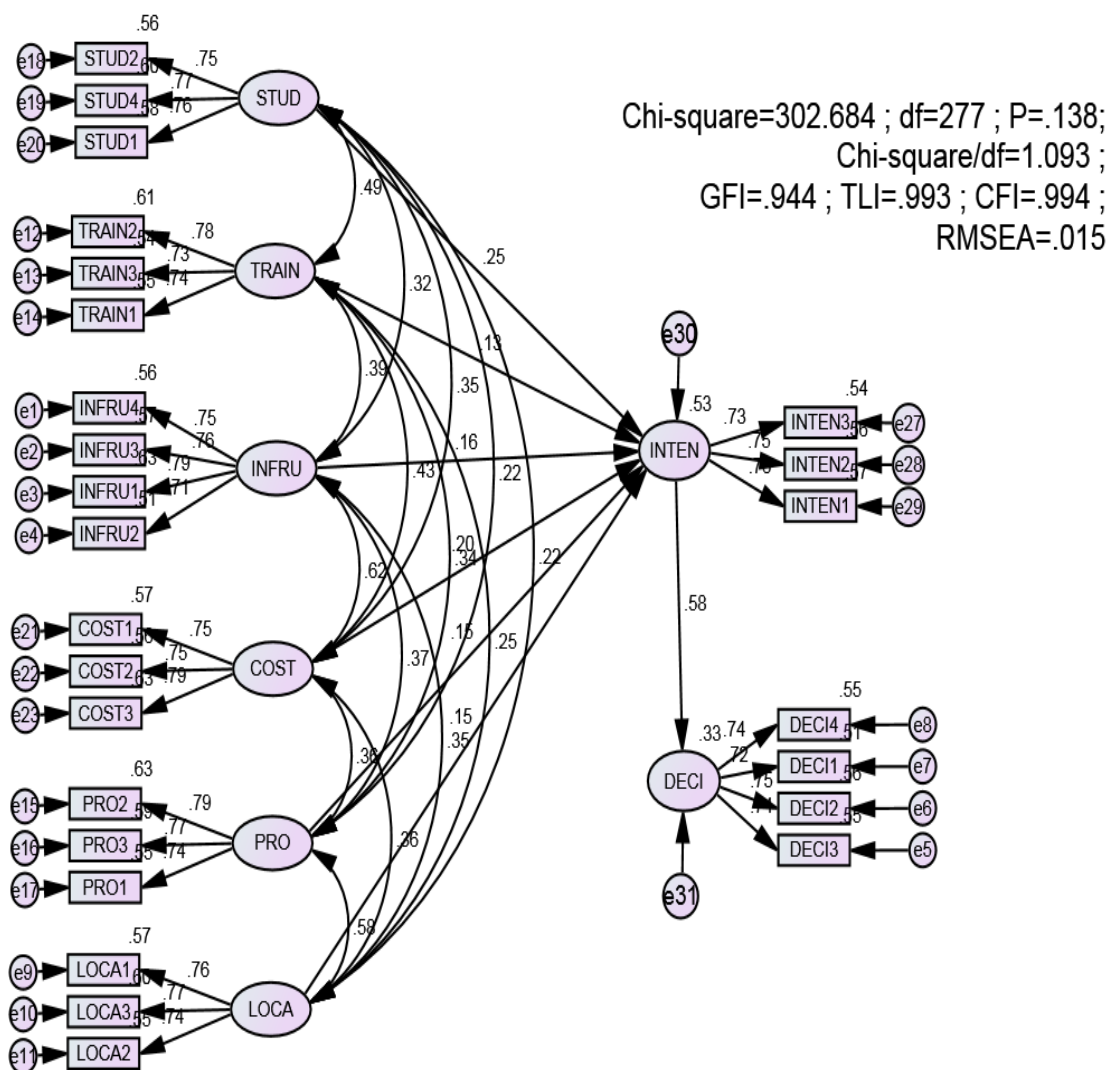

Figure 2. Structural equation modeling

The relationships between Individual factors, Training activities, Infrastructure and facilities, Study costs, Promotion, Local elements and Intention are all accepted ($p < 0.05$). Thus, the effects of the independent variable on the dependent variable in the model are

positive. On the other hand, there exists a positive relationship between Intention and Decision ($p < 0.05$) (Table 5). The hypothesis testing results also show that the order of impact of the independent variable on the dependent variable is: Individual factors, Studying costs, Promotion, Infrastructure and facilities, Local elements and finally, Training activities.

Table 5. Results of testing hypotheses at final SEM

			Estimate	S.E.	C.R.	P	Hypothes-es Result	Levels of impact
INTEN	<---	STUD	.178	.045	3.925	***	Accepted	First
INTEN	<---	TRAIN	.105	.052	2.011	.044	Accepted	Fifth
INTEN	<---	INFRU	.128	.056	2.303	.021	Accepted	Fourth
INTEN	<---	COST	.144	.053	2.718	.007	Accepted	Second
INTEN	<---	PRO	.130	.061	2.146	.032	Accepted	Third
INTEN	<---	LOCA	.128	.058	2.210	.027	Accepted	Fourth
DECI	<---	INTEN	.618	.073	8.457	***	Accepted	Strong

The results of evaluating the regulatory relationship by Bootstrapping technique through the PROCESS 3.5 macro on SPSS software also showed that the higher DECI is (the higher the results of the high school exam confirm the ability and the closer to the prediction and student's expectations), the higher the Decision increases.

5. Discussion and Conclusion

5.1. Discussion

The research results are consistent with the views of previous researchers on the decision-making behavior of students to choose a university and continue to affirm the role of factors belonging to learners and belonging to universities in the decision-making process according to the research model (Ming, 2010; Tran & Cao, 2009, Vu et al, 2017).

The results of the influence of local elements also show that local universities have the advantage of having a variety of majors and levels of training that allow them to meet the diverse needs of learners, and also ensure socio-economic development goals in many fields of that locality. Universities in the local area should continue to diversify training disciplines in the direction that are suitable with regional and local development practices, create identities and differences, and associate training with future employment. Diversify the training majors and at the same time improve the training quality and the quality of the lecturers so that the factor of training activities contributes more in the student's university selection process.

The cost factor has a strong influence on the decision to choose a university. On the other hand, universities in the North Central region have low tuition and living costs compared to other regions, which is a great advantage that those in this region should take advantage of to have propaganda orientations for suitable enrollment strategies. Especially

in this study, the new factor Intention and graduation exam result both confirmed a great influence on the decision to choose a university, so enrollment propaganda should be carried out regularly before and after the exam so that potential students as well as other individuals in the whole society know and choose universities.

5.2. Conclusion

The study has solved the main objective of finding out the affecting factors and its levels of impact on the decision to choose a university in the North Central region in the new condition with the participation of the intermediary factors namely Intention and Graduation Exam Result; learning about the advantages and disadvantages of regional universities, thereby orienting solutions to improve efficiency for those ones. In addition, research continues to confirm the role of internal and external factors in students' decision to choose a university; this implies oriented solutions in line with local development practices. Universities in the North Central region need to make more efforts to take advantage of their local advantages, enhance training quality, connecting activities, and promote training programs and brand images to be more effective in the process of attracting students, ensuring competitiveness of regional universities in the current difficult enrollment conditions.

Abstract

Over the past decades, our country's education has made remarkable achievements and development steps, making an important contribution to the mission of raising people's knowledge, training human resources, fostering talents and achieving some important results in the construction, protection and development of the country. Vietnam's education continues on the path of development, in which selective research on advanced teaching methods and theories embarks motivation for discovering, learning, and researching to the modern scientific world.

The theory of multiple intelligences is an optimal theory that creates a belief that helps to source potential talents hidden deep in each person, creating and directing the resources to achieve desired goals. Success begins with belief, and belief comes from a statement or an idea that we come up with ourselves. The theory of multiple intelligences is an example.

Keywords: *Multiple intelligence theory, capacity, education, training and response.*

1. Introduction

Studies on intelligence before Howard Gardner

In 1905, Alfred Binet (1857 - 1911), a French psychologist, first invented the first practical IQ test, making a measure of intelligence for the purpose of classifying students into intellectually equivalent groups to facilitate training.

In 1912, William Stern (1871 - 1938), a German philosopher and psychologist coined the term IQ (intelligence quotient). He used the quotient between Mental Age (which reflects

a person's level of intellectual development) and Biological Age (the person's actual age) to calculate an individual's intellectual development. He believes that individual differences, such as intelligence, are complex in nature and that there is no easy way to qualitatively compare individuals with one another. Concepts such as mental frailty cannot be identified with a single intelligence test, because there are many factors that the test does not test, such as behavioral and emotional variables.

In 1916, Lewis M. Terman (1877 - 1956), a psychologist at Stanford University and the President of the American Psychological Association credited as a pioneer in the field of educational psychology in the early 20th century, improved this calculation, by multiplying the above quotient by 100 to remove the odd number after the decimal point [6] and [11].

His formula for calculating intelligence, $IQ = \frac{\text{Intellectual age}}{\text{Biological age}} \times 100$, has been widely recognized and used. He also improved from Binet's test table to create the Stanford-Binet test which is considered the original for many IQ tests today.

The basis for Howard Gardner's theory of multiple intelligences

Howard Earl Gardner (born July 11, 1943) is an American developmental psychologist and professor of cognitive and educational studies. He is the father of multiple intelligences. According to Gardner's Theory of Multiple Intelligences, people have many different ways of processing information, and these ways are relatively independent of each other. This theory is a critique of standard intelligence theory, which emphasizes the correlation between abilities, as well as of traditional measures such as IQ tests that often only take into account language, logical and spatial abilities [11].

Howard rejects the traditional concept of intelligence, which is often identified and assessed based on IQ tests. He believes that this concept does not fully reflect the diverse intellectual abilities of people.

According to him, at school, a student who easily solves a complex math problem is not necessarily smarter than another student who can't finish the problem. The second student will most likely be better at other "types" of intelligence.

His theory of multiple intelligences says that each individual can reach some levels in each "category" in the system of intelligences. Whether this level is low or high, it represents an individual's limitations or advantages in this area. In particular, this level is not "constant" throughout their life but will change (increase or decrease) depending on cultivation conditions.

Howard Gardner's theory of multiple intelligences is based on the work of psychoanalyst Eric Erikson, sociologist David Riesman, and psychologist and cognitive scientist Jerome Bruner. He took a course on human instincts, specifically how humans think.

In the theory of multiple intelligences, Gardner established the specific necessary requirements that each type of intelligence must meet to qualify as an effective intelligence.

2. Results

The theory of multiple intelligences, published in 1983 by Dr. Howard Gardner - Harvard University, initially included 7 intelligences. In 1996, he continued to add the 8th

intelligence, which is Intelligence about nature, after a period of research and possible experimental planning [6], [11] and [13].

In 1999, he officially announced to the world that he would continue to research, supplement and develop the theory of the 9th type of intelligence, which is existential intelligence. "Existential intelligence is a special intelligence, a useful structure to evaluate one of the outstanding human capacities", said Dr. Howard Gardner after more than 20 years of research (July 8, 2020). Howard Gardner announced that existential intelligence is still in the researching stage to prove its existence.

Existential intelligence has not officially become a type of intelligence in the theory of multiple intelligences because there is still not enough evidence related to brain parameters. The biometric analysis shows that the brain parameters do not have enough bases to show the existence of this type of intelligence.

The human world possesses different types of intelligence such as: Verbal/ Linguistic, Logical/ Mathematical, Visual/ Spatial, Bodily/ Kinaesthetic, Musical/ Rhythmic, Interpersonal/ Introspective, Intrapersonal/Social, and Naturalist, etc. The above-mentioned types of intelligence are generally called the theory of multiple intelligences.

Human intelligence is not only measured by IQ but also depends on eight intelligence indexes in the theory of multiple intelligences.

Figure 1. The eight types of intelligence in Howard Gardner's theory

According to Professor Gardner, intelligence is defined as "the ability to give solutions or create products which have value in one or more cultural settings" and intelligence cannot be measured solely through mathematical logic or the ability to quickly process a math problem.

Multiple intelligences depend on each individual; they are not constants but nonlinear mathematical functions, capable of varying to infinity in the specified domain depending on the knowledge acquisition conditions of each learner.

2.1. Multiple Intelligences

Individual's learning ability and intelligence are the capability that each person can express through 8 different types of intelligence:

1. Linguistic intelligence

Linguistic intelligence is speech expressed in words, expressions, or letters. This intelligence includes the ability to use language effectively for self-expression and to understand language including written, spoken, and body language.

People who are prone to linguistic intelligence are often good at reading, writing, speaking and listening to memorize; like to discuss debate, explain, or persuade. People with this intelligence often use the power of language to speak eloquently. In particular, people with linguistic intelligence will learn foreign languages well thanks to their vocabulary memory.

2. Social intelligence

Social intelligence represents the ability to interact socially, extrovert, cooperate, influence, and persuade others. People with social intelligence are often sensitive, empathetic, friendly, approachable, psychological, responsible, charismatic, understanding and compassionate. They have the ability to understand and work with others; to feel and share with the moods, personalities, feelings, temperaments, intentions and desires of others easily; and to see the world through the others' eyes.

3. Musical intelligence

Musical intelligence favours the skills of recognizing and composing tone, pitch, and rhythm; feeling, enjoying and performing music. This ability is capable of creating rhythms, memorizing melodies and songs. People having this intelligence are usually very sensitive to sounds, rhythms, and pitches.

Musical intelligence is in everyone's subconscious as long as they have good listening ability, have spare time for music, know how to sing to the tune, and hear various musical repertoires with precision and discernment of the senses.

Musical intelligence goes hand in hand with linguistic intelligence. From a musical perspective, musically intelligent people will convey content in the language of music.

4. Kinesthetic intelligence

Kinesthetic intelligence, also known as bodily intelligence, is the ability to use the body or part of the human body to solve problems, signal or express emotions, as well as the ability of the brain to control these activities for small muscle movements and whole-body muscle coordination.

People with kinesthetic intelligence often want to move their bodies, have "instinctive responses" to situations and things, and show the ability to master body movements.

5. Spatial intelligence

Spatial intelligence, also known as visual intelligence, is a category related to visual thinking methods and the ability to perceive, transform, and reproduce different angles of the world.

People with visual-spatial intelligence have the ability to draw or sketch their ideas in the form of images and graphics, as well as the ability to orient themselves in 3D space easily. This intelligence is reflected in the ability to perceive and visualize the world / space under many angles. In addition, this type of person also has wonderful ability to remember pictures and videos.

6. Naturalist intelligence

Naturalist intelligence is the ability to recognize and appreciate man's relationship with the natural world. The theory of naturalist intelligence helps people perceive, classify, and derive features of the environment. Naturalist intelligence includes keen observation of the natural surroundings and the ability to sort out different things well. It can be done by exploring nature, making collections for species, studying them, and grouping them together.

7. Intrapersonal Intelligence

People with intrapersonal intelligence can easily access and clearly see their own emotions; distinguish many emotional states inside and apply their own understanding to enrich and plan their life; often like to meditate to perceive and evaluate the strengths and weaknesses of themselves.

They always think in a quiet state; have strong independence, high frankness and extreme self-discipline, and high self-reliance; prefer working independently rather than working with others or groups; are introvert with the ability to think internally, plan and manage arguments, understand inner language. They have a high sense of self-awareness and are able to understand their own feelings, goals, and motivations.

People with inner intelligence can easily access and clearly see their own emotions, distinguish their inner emotional states, and use their own insights to highlight their own life paths.

8. Logical-mathematical intelligence

Logical-mathematical intelligence is the ability to reason, analyze, synthesize and find out the nature and laws of arithmetic-related problems; infer sequences and chain events; and think in the direction of cause-and-effect; understand abstract problems; and have good logical thinking.

This intelligence is closely related to scientific and mathematical ideas, the ability to generate hypotheses, find numerical patterns or rules based on theoretical concepts.

People with this intelligence often excel with abstract operations or numbers. This is also the area for abstract pattern recognition, scientific and investigative thinking, and the ability to perform complex calculations.

Sir Ken Robinson once said: *“Human potential, like natural resources, is buried very deeply. You have to make an effort to find it since it's not right on the surface. You even have to create the circumstances so that it can manifest.”*

Each of us has all of the above eight intelligences, but at different levels depending on each person's temperament. Some types in multiple intelligences are more or less developed, however these are not permanent, and they can vary depending on how much practice, motivation and development is required.

2.2. Current status of Vietnamese education

Education is considered the leading national policy which determines the success or failure of the whole nation, because the result of education and training is people who decide the prosperity of the nation. Nelson Mandela - the first President of the Republic of South Africa used to say *"To destroy any country it is not necessary to use atomic bombs or long-range missiles but just downplaying the quality of education and allowing cheating in students' exams. As the result of that education, patients would die at the hands of doctors; buildings would collapse at the hands of the engineers; money would be lost at the hands of the economists and accountants; justice is vibrated at the hands of the judges. The fall of education is the fall of a nation."*

In fact, Vietnamese education is cumbersome with old thinking that will be outdated and lead to many consequences and deadlocks. Perhaps never before has the society given such special attention to this issue. Where is education in Vietnam in comparison with that of the world? Why can't the quality of training ever improve? And how can solutions to this important problem be found?

Traditional, contemporary and modern schools often evaluate a student through memorization and re-enactment of a certain unit of knowledge no matter which teaching methods are applied: traditional methods or competency approaches. According to Gardner, teachers evaluate learners through one or two types of intelligence only: linguistic intelligence and logical/mathematical intelligence; this assessment does not guarantee the accuracy and scientificity [1].

Students with some optimal learning inclinations seem to be left out at schools, because in addition to linguistic and logical/mathematical intelligence, learners also have a tendency to learn through music, movement, vision, and communication. ...

On the other hand, all learners seem to be equated by a common method for an assessment and judgment; meanwhile, learners can learn better if they can acquire knowledge with their own strengths of diversity, temperament, passion and interest.

Intellectual diversity of each student has it yet been appreciated though each type of intelligence is very important and each learner has many abilities to follow many different trends to promote their ability to study and research in a unique way. Archimedes once said, "Give me a place to lean on, and I will lift the earth." The school should be a place to arouse passion, nurture potential, and facilitate learning in different directions for future owners of the society. Be a lever for learners to develop comprehensively.

Teaching methods applying multiple intelligences have not been widely developed in Vietnamese education; educators and education experts are looking for the optimal solution to this problem. Experiments show it is possible to apply the theory of multiple intelligences in teaching by applying and synthesizing classical, contemporary and modern teaching methods to activate learners, but certain necessary and sufficient conditions are required for the implementation to be successful.

The environment for implementing teaching and learning activities under the theory of multiple intelligences has not met the requirements for there are no legal provisions. The new method just comes from the modern approach of some teachers, administrators and some schools.

In the assessment of learners, teachers almost exclusively rely on the scores of each subject to assess the intelligence of each person. This is the main reason why students are unknowingly labeled as weak by their relatives or teachers because they have not achieved good grades [2].

Schools, families and society have not paid much attention to the development of intelligences other than language and logic/mathematics in 08 theories of multiple intelligences, especially existentialism, which has not yet been recognized.

The theory of multiple intelligences has brought a humane and necessary view to call on schools and teachers to appreciate the diversity of intelligence in each student. To solve the above situation, it is necessary to have a solution along with a teaching method that combines the theory of multiple intelligences to explicitly deploy in education and training.

2.3. Applying Howard Gardner's theory of multiple intelligences in Vietnamese education

According to Howard Gardner, individuals are creative in certain areas only. For example, Albert Einstein is the greatest physicist of all time, a genius in mathematics and science, but we see no outstanding signs of kinesthetic or social intelligences. Consequently, most individuals can only succeed brilliantly with some forms of intelligence they possess.

Currently, the curriculum gives too much importance to the development of language and logic - math abilities, which reduces the ability to develop other types of intelligence. As a result, learners who are not good at the above subjects will lose confidence in themselves. Their other abilities are well developed and profound, but due to not being fully exploited and nurtured in a timely manner, their talents will be lost, which is a disadvantage for the individual learner and a great loss to society.

Compulsory basic knowledge and skills such as languages, math, history, and science subjects should not be taught in the same way to different learners. Frustration and poor results will be greatly reduced if teachers provide knowledge in different ways, suitable for each student. It is the teacher's duty and responsibility to find that possible path, establishing a "multi-modal" approach so that each learner has the opportunity to explore his or her interests, talents, and creativity in certain areas. Educational programs need to be designed with a certain degree of "openness, softness and inheritance", taking into account the richness of natural inclinations and interests of each individual.

Thomas Armstrong sends a message to parents and educators: *“My work, as an educator and a psychologist in the field of diverse intelligences and natural talents of learners, is guided by the belief that all people are destined to be human beings. Every human being born into this world has unique potentials that, if properly nurtured, can contribute to making the world a better place. The biggest challenge for parents and teachers is to clear the barriers for gifted talents to be recognized, honored and nurtured.”*

Education and training play a core role for each country; educational development must take the lead in all fields. Teachers need to appreciate the diversity of intelligence in each student, each type of intelligence is important and each learner has more or less abilities in different tendencies. Schools, teachers and parents must support and arouse potential, facilitate learning and passion in different directions for children to be the future owners of society [6] and [8].

The theory of multiple intelligences has a profound influence on teaching and learning methods. In fact, when affected by many intelligent areas, learners have the opportunity to promote their own strengths and weaknesses with a learning environment that can meet the basic requirements of learning and research.

With the philosophy of comprehensive education for learners, it is necessary for teachers to apply the theory of multiple intelligences in teaching. Thereby, the teacher arouses passion, capacity and aspiration for learners; Learners with sufficient conditions, and skills could arm themselves with modern knowledge for comprehensive development of competence [5].

Applying the theory of multiple intelligences in education is successful only when the teacher respects the intellectual diversity in each student. Each type of intelligence has its own characteristics, and each learner occupies more or fewer different intelligences and dispositions. Family and school responsibilities help learners develop naturally according to their inclinations.

The theory of multiple intelligences helps teachers to put themselves in the right frame of modern education. Before teaching, teachers build a "thinking diagram", consider, and choose teaching methods based on "brain attack" strategy so that the lecture time is the most appropriate. And teachers should clearly understand why that method is effective or only works for one student but not for another. Therefore, during a lecture period, teachers change their teaching methods regularly to meet the interests, diversity and temperament of learners [1].

Teachers put themselves in the position of learners to understand them well, let students understand the learning content that the teacher teaches in their own way; Learners will have confidence and interest in learning and remembering the lesson. Teachers should create regular and sustainable relationships with learners, so that personal interaction always appears to satisfy curiosity during teaching and learning hours.

Sometimes teachers can use introspection to enlighten learners by assigning exercises to challenge them on how to make a connection between their own experience and the research content of the subjects or asking them to write essays on related topics. This method encourages students to think about their own learning styles and processes.

It is also advisable to let learners study naturally to attract their attention to incorporating the outside world into the lesson; One ideal method is project-based learning

which creates opportunities for students to interact with the outside environment and keeps them interested in the subject while stimulating creativity.

It is recommended to do research and apply complex methods to integrate the theory of multiple intelligences with other subjects. At first, teachers can apply intelligences about introspection, personal interaction and nature as the basic methods to start the lesson, which is one of the methods of opening the theory of multiple intelligences easily and most intuitive for learners.

There are many ways of learning and understanding when we approach a problem: Each of us has different personalities, interests, tastes and learning styles. Through actual observation, teachers need to understand and properly appreciate these differences and know what type of students excel in which area based on the theory of multiple intelligences and from there teachers can develop teaching activities suitable for learners' capacity. Every learner has special abilities that need to be discovered, fostered and measured to satisfy their intellectual range.

Learning style: To meet the learning style of learners, educators, educational managers should invest in equipment, facilities and teaching staff; especially, continuously improve the training program to meet learners' capacity in the most effective way. Knowing that learners always possess all types of intelligence, it is advisable to find and propose a learning style can help learners develop their all kinds of intelligence, while emphasizing the method to promote intellectual potential according to learners' capacity to help them succeed in life [7] and [8].

Orientation and career development for learners according to the theory of multiple intelligences: In education, career orientation is one of the important components. Taking multi-intelligent theory as the standard system; the ability of each learner would determine criteria in each standard guiding them to develop future career goals. The orientation of teachers is extremely important; Thereby, learners determine for themselves the possible domain and will put all their abilities and wisdom, time and effort into studying and researching to succeed.

3. Conclusion

In order to develop and optimally apply the theory of multiple intelligences in our education today, teachers must apply and help learners according to the strengths of each individual and consider the teaching method help students to learn in the most effective way.

From the experimental planning in education, we have the necessary and sufficient conditions to apply the theory of multiple intelligences in education as following ways: Building a diverse and practical learning environment, creating a comfortable psychology for students; Taking the perspective of learners when applying the criteria of multiple intelligence theory with the belief that all learners would be liberated by the theory of multiple intelligences; Accepting all characteristics of the learner's temperament, respecting and listening to all feedback even if it is unusual opinions of learners; Developing communication skills and creative thinking, encouraging teamwork but favoring independent work [12].

Abstract

The e-textbooks is a new resource in addition to the printed, which has been put into practice at universities in Vietnam including National Economics University. This requires a comprehensive study to determine which factors influence the intention to use them. The purpose of this research is to find out there are factors influencing the intention to use e-textbooks on the NEU Reader app of students of the National Economics University. This study formed a sample of 226 students by using convenience sampling. In addition, drawing upon previous theories namely UTAUT model. The results of the analysis indicate five groups of factors that influence students' intention to use the e-textbooks: Facilitating conditions, Perceived benefit, Performance expectancy, Perceived environment, Effort expectancy and while experience serves as a control variable. The impact of these factors, coupled with efforts to improve the intention to use the e-Textbooks on the NEU Reader app of students of the National Economics University, will be further outlined in this study. Theoretical and practical implications of this research are also discussed.

Keywords: *e-textbooks, NEU Reader, use intention, UTAUT, National Economics University.*

1. Introduction

Developments in computer technology have changed the nature of digital content and its accessibility to consumers. Furthermore, the internet has caused an evolution in the book publishing industry with the emergence of electronic books (e-books). Thanks to the development of e-books, learners can easily close the gap with the knowledge which is taught in class (Larson và Marsh, 2005). Rozel and Gardner (2000) also argue that the use of e-books directly affects the learning process of students. When using e-books more,

students will make more progress in learning. The benefits of e-books are also factors that make e-books more popular in learning and play an increasingly important role. Students can use keywords to search for the desired topic more easily and quickly than in traditional books (Shelburne, 2009). Besides, other advantages of e-books such as flexibility, data saving in the hard drive or the ability to make notes (Gibson and Gibb, 2011) or easy access, highly referenced (Letchumanan and Tarmizi, 2011),...

In addition to e- books, the rise of electronic textbooks (e- textbooks) provides a new channel for students to learn. An electronic textbook is a document used by teachers and learners in the teaching and learning process, with content equivalent to printed textbooks, used on electronic devices and integrated interactive tools with learners. With many advantages, electronic textbooks are gradually becoming the favorite choice of students.

Universities in Vietnam have applied the development of information technology, digital, improving the quality of teaching and learning and the National Economics University is no exception. As part of the educational digitization program, the school has put the majority of the entire textbooks on the NEU Reader digital learning system to replace the traditional paper one.

E-textbook of National Economics University is a textbook integrated in the electronic format of the printed books, used on the e-reader application which is called NEU Reader. According to the Digital Resources Portal (NEU): "NEU Reader works on all kinds of digital devices such as tablets, smartphones, laptops, desktops (PCs)", which demonstrates the portability and convenience of mobile phones. In addition, users are allowed to use it completely free of charge and ensure the same content as the printed books. The e-textbooks NEU Reader system has a PDF format in the form of a reading file, divided into 35 specialties with 264 general textbooks.

Based on that, this study was conducted to clarify the following objectives: (1) To understand e-textbooks and the factors that influence the intent to use e-textbooks; (2) Clarify the current situation of using e-textbooks on NEU reader app; (3) Determine the extent of influence of factors on the intention to use e-textbooks; (4) Proposed solutions and recommendations.

2. Literature Review

Accordingly, research topics on users' acceptance of e-textbooks have garnered attention. For example, Nelson and Webb (2007) used the Technology Acceptance Model - TAM and web usability to show that perceived ease of use and perceived usefulness are important predictors of students' intent to use e-textbooks. Lai and Ulhas (2012) integrated TAM and Innovation Diffusion Theory (IDT) to investigate e-textbook applications, where perceived enjoyment is the factor that has the greatest direct influence on intent to use. Hsiao and Tang (2014) assessed five theoretical models of technology acceptance to investigate students' adoption intentions for e-textbooks and showed that the UTAUT model is the best model for measuring the degree of influence of factors. With the tendency to use mobile devices and computers for learning, students have a high positive awareness and identity about e-books but the acceptance and use of e-textbooks is quite low (Wang and Bai, 2016).

E-books are predicted to be popular in the future because students believe that e-books will increase their academic performance and productivity, this finding was presented in Lawson and Body's study (2018).

In Vietnam, e-textbooks are still a new topic. Moreover, domestic studies are still only focused on the field of e-books. Research by Truong Thanh Tri et al. (2010) adopted regression analysis to conclude that there was no difference in students' approach to e-books, and that the social impact did not affect their intention to use ebooks much. Research by Bao Ba Quyet and Hoang Cao Cuong (2018) has shown that the attitude of e-books is likely to replace printed books accounting for a high proportion. Favorable conditions that have a strong impact on students' behavioral intentions to use e-books were mentioned in the study by Le Thi Tu et al. (2020).

Theoretical Background and hypothesis development

The UTAUT model and usage intention

Unified Theory of Acceptance and Use of Technology (UTAUT) was built and developed in 2003 by Venkatesh et al. to explain intention and use behavior of individuals. As a result of the combination of eight previous models, UTAUT was found to be 70% accurate at predicting behavioral intention. Therefore, UTAUT is more comprehensive in its assessment of the likelihood of technology success and understanding the drivers of acceptance (Lu et al., 2009). UTAUT posits four key constructs as direct determinants of information technology acceptance (behavioral intention) and use (behavior), namely performance expectancy (PE), effort expectancy (EE), social influence (SI), and facilitating conditions (FC). Moreover, the theory postulates that the effect of these four variables is moderated by gender, age, experience, and voluntariness of use.

Performance expectancy indicates that college students use e- textbooks as they believe that the e- textbooks will increase effectiveness for tasks and improve learning outcomes. Furthermore, according to previous studies on e-books, the easier it is for an individual to use an e-book, the greater the perceived ease of use is, and the greater the usage intention (Hsu, 2017; Yoo và Roh, 2019). In addition, individuals will be affected by social influence. That is, suggestions from teachers and friends to use e-textbooks can increase the willingness of an individual to use them. With regard to facilitating conditions, these can reduce uncomfortable levels of uncertainty or ambiguity toward new technology (Al-Gahtani et al., 2007). In accordance with UTAUT structure and previous evidence, this study sets out the following hypotheses:

H1. Performance expectancy has a positive influence on the intention to use e-textbooks on the NEU Reader app of students of the National Economics University.

H2. Effort expectancy has a positive influence on the intention to use e-textbooks on the NEU Reader app of students of the National Economics University.

H3. Social influence has a positive influence on the intention to use e-textbooks on the NEU Reader app of students of the National Economics University.

H4. Facilitating conditions has a positive influence on the intention to use e-textbooks on the NEU Reader app of students of the National Economics University.

Environmental consciousness (EC) and usage intention

Users' concerns about the environment increase the number of green products they are willing to buy (Lee, 2009). Using e-books can reduce carbon emissions in printed works, so those interested in the environment intend to use e-books higher (Hsu et al., 2017). The hypothesis is given:

H5: Environmental consciousness has a positive influence on the intention to use e-textbooks on the NEU Reader app of students of the National Economics University.

Perceived risk (PR) and usage intention

According to Bauer (1960): "Perceived risk is a combination of uncertainty accompanied by the severity of the outcome." Lawson-Body et al. (2018) showed that the greater the perceived risk, the lower the likelihood of accepting e-books. The hypothesis is given:

H6: Perceived risk has a negative influence on the intention to use e-textbooks on the NEU Reader app of students of the National Economics University.

Habit of using printed books (HP) and usage intention

"Habits are the extent to which an individual behaves in an automatic way, obviously, as a result of the unconscious learning process" (Venkatesh et al., 2012). Although students take a positive approach to e-books, in the context that the culture of printed reading has become all too familiar, the majority of students still tend to use books with prints over electronic copies (Ashley Melinis, 2011). The hypothesis is given:

H7: The Habit of using printed books has a negative influence on the intention to use e-textbooks on the NEU Reader app of students of the National Economics University.

Perceived benefit (PB) and usage intention

The change in the form of learning due to COVID-19 pandemic has resulted in all support sources and support tools being unavailable (Piramanayagam and Seal, 2021). At that time, the e-textbooks on the NEU Reader app with the availability was a suitable alternative to the traditional printing textbooks. The hypothesis is given:

H8: Perceived benefit has a positive influence on the intention to use e-textbooks on the NEU Reader app of students of the National Economics University in the context of COVID-19 pandemic.

In addition, because NEU students have age characteristics that are not too different, gender is also said to have no predictor of the intention to use (Yoo và Roh, 2019) and the purchase of the NEU Reader e-textbooks is a regulation, therefore, the hypothesis of the experiential demographic variable is given:

H9: There is a difference in the intention to use the NEU Reader e-textbooks at different experience levels.

Taken together, this research presents the research framework shown in Figure 1.

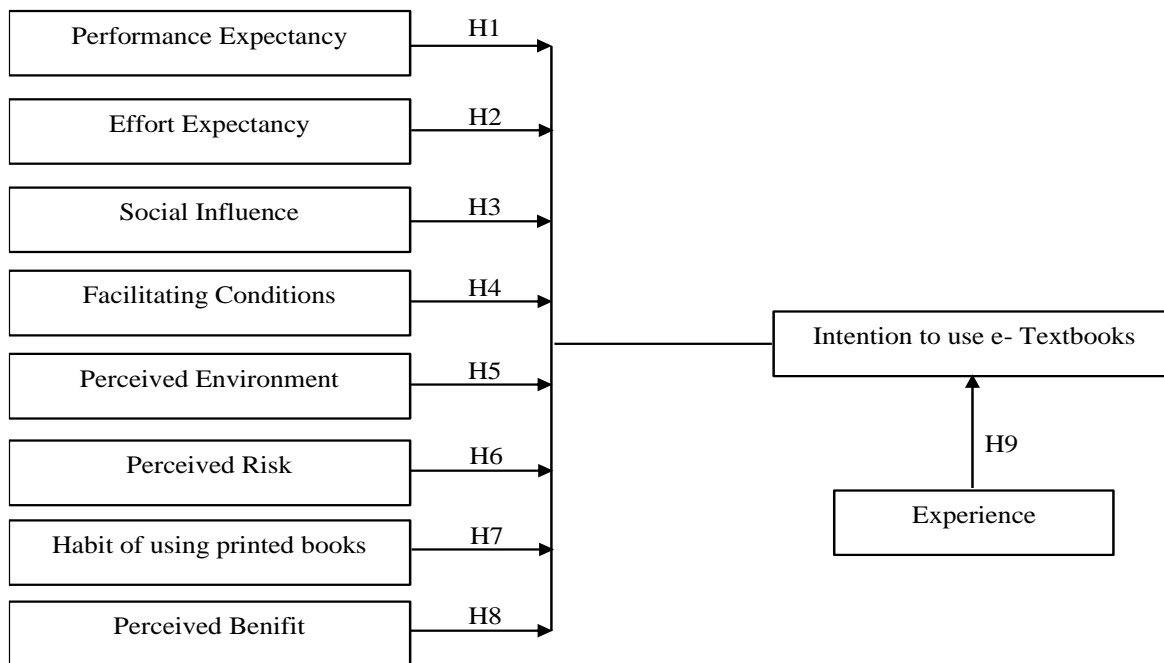

Figure 1. Research Model

3. Method

This study uses two main research methods, qualitative research and quantitative research. Qualitative research helps to find out the factors affecting the intention to use the NEU Reader e- textbooks of the students of the National Economics University. Next, quantitative research can test and draw the most accurate conclusions about the research problem.

Data collection methods

- Primary data: In-depth interviews were used to collect data that helps the research team adjust and perfect the survey, followed by an online questionnaire.

- Secondary data: Collecting, systematizing and analyzing secondary information from domestic and foreign books and newspapers, available documents, research work that has been carried out related to the topic and highly reliable websites.

Data samples

- Qualitative research sample includes 9 in-depth interview answers, helping the team discover new factors.

- Quantitative research sample: Bollen (1989) introduced a regulation on the number of samples and explained that the sample-to-variable ratio observed must ensure a minimum of 5:1. Furthermore, according to Gorsuch (1983), factor analysis requires at least 200 observations. Thus, to ensure and enhance the reliability factor as well as accuracy and objectivity, the team issued 243 survey tables, resulting in 226 valid observation samples.

Data analysis method

- Methods of secondary data analysis: The research team applied methods of analyzing, synthesizing and comparing data.

- Methods of primary data analysis: After collecting the questionnaire, the research team began to select the questionnaire, clean the data, encode the necessary information in the questionnaire, enter the data and analyzed using SPSS software version 20.0 with a 5-point Likert scale from “Strongly disagree” to “Strongly agree”.

4. Results

Sample Characteristics

It can be seen that the majority of students have used e- textbooks on the NEU Reader app provided by the school, accounting for 90.69%, while the percentage of students who have not used it is only 9.31%. The survey results conducted by the research team show that reading e - textbooks on the Neu Reader app is the plurality, depending on the different frequency levels of students and the percentage of students who do not use it. The relatively minor rate is 9.31% and the largest proportion is from 3 to 5 times/week, accounting for 22.88%. Therefore, it is undeniable that e - textbooks have impacted students' intention to use and accept it as an important source of learning materials in their learning and research process.

Table 1. Current use of e- textbooks on NEU reader app

Demographic Profile		Frequency	Percent (%)
Gender	Female	158	69.9
	Male	68	31.1
Educational level	First- year	15	6.64
	Second - year	52	23.01
	Third - year	140	61.95
	Fourth - year	18	8.4
Use of e - textbook	Yes	205	90.69
	No	21	9.31
Frequency of e- textbook usage among users	More than once/day	8	3.54
	Daily	10	4.42
	3 - 5 times/week	63	22.88
	One time / week	32	14.16
	2 - 3 times/ month	44	19.47
	One time/ month	12	5.31
	One time/ month	36	15.93
	No use	21	9.31

Reability Test

Cronbach’s alpha was used to test the internal consistency reliability of each of the composite constructs.

Table 2. Result of reliability test

Construct	Number of items	Cronbach's Alpha
Performance expectancy	4	0.879
Effort expectancy	4	0.787
Social influence	2	0.688
Facilitating conditions	4	0.646
Environmental consciousness	3	0.766
Perceived risk	4	0.719
Habit of using printed books	4	0.854
Perceived benefit	2	0.716
Intention to use e- Textbooks	4	0.852

Cronbach's alpha values for all constructs ranging from 0.646 to 0.879 indicate the existence of reliability (Nunnally 1978).

Exploratory factor analysis method

After analyzing the EFA factor, it was revealed Sig is $0.000 < 0.05$, KMO coefficient is $0.864 > 0.5$. This indicates how much significance the data set put into exploratory analysis is quite good, proving the appropriate factor analysis model. Factor Loading coefficients are both greater than 0.5 and Eigenvalue = $1.181 > 1$ that demonstrates the scales have practical significance.

Table 3. Result of KMO test of independent variables

Kaiser-Meyer-Olkin Measure of Sampling Adequacy		0.864
Barlett's Test of Sphericity	Approx. Chi- Square	2859.237
	df	351
	Sig.	.000

For the dependent variable Intention to use (IU), the data of the test coefficient KMO = $0.789 > 0.5$; Sig=000; Eigenvalues = $2.772 > 1$ and extracted variance is 69.301% (greater than 50%) illustrates the ability to converge well the variables in the scale.

Table 4. Result of EFA analysis of dependent variable

Kaiser-Meyer-Olkin Measure of Sampling Adequacy		0.789
Bartlett's Test of Sphericity	Approx. Chi-Square	396.412
	df	6
	Sig.	.000
% of Variance	69.301%	
Eigenvalues	2.772	

With the results of the EFA analysis of the independent variables, it demonstrates that the observed variables converge together in the same concept and are represented by the research team as following: Performance expectancy (from PE1 to PE4); Facilitating conditions (from FC1 to FC4); Social influence (from SI1 to SI2); Habits of using printed books (from HP1 to HP4); Effort expectancy (from EE1 to EE3); Perceived benefit (from PB1 to PB2); Perceived risk (from PR1 to PR4); Environmental consciousness (from EC1 to EC3).

Table 5. Result of rotation matrix of independent variables

	Component							
	1	2	3	4	5	6	7	8
PE3	.834							
PE4	.784							
PE1	.781							
PE2	.743							
FC4		.739						
FC2		.659						
FC1		.640						
FC3		.611						
SI2			.640					
SI1			.604					
HP3				.863				
HP2				.862				
HP4				.768				
HP1				.753				
EE2					.724			
EE1					.612			
EE3					.539			
PB2						.539		
PB1						.537		
PR2							.760	
PR3							.656	
PR4							.654	
PR1							.591	
EC3								.825
EC2								.822
EC1								.713

Extraction Method: Principal Component Analysis.

Correlation analysis

Pearson correlation was used to test the hypothetical relationships between the constructs. The results show that a significant positive linear correlation exists between intention to use e- textbooks and the independent variables including performance expectancy, effort expectancy, social influence, facilitating conditions, environmental consciousness, habit of using printed books and perceived risk (Sig. of all factors is less than 0.05). Although the habit of using printed books is confirmed to have no linear correlation with intention to use (Sig.=.121>0.05), the research team suspects that this factor has an impact on the use intention, so we decided to keep it for Multiple Linear Regression Analysis.

Table 6. Correlation matrix

	PE	EE	SI	FC	EC	PR	HP	PB	IU
PE	1.00								
EE	.621**	1.00							
SI	.611**	.558**	1.00						
FC	.639**	.651**	.543**	1.00

Multiple linear regression analysis and hypothesis testing

Table 7. Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.731 ^a	.535	.517	.54835	1.748

Adjusted R Square value equals 0.517, this means that the independent variables in the model included in the regression analysis affect 51.7% of the variability of dependent variables "Intention to use e- textbooks on the NEU Reader app of students of the National Economics University", the remaining 48.3% is caused by the impact of random errors.

Durbin-Watson value (DW) = 1,748, the model does not violate any similar assumptions related to the first-order sequence (Yahua Qiao, 2011).

Table 8. Regression Results

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics		
	B	Std. Error	Beta			Tolerance	VIF	
1	(Constant)	-.162	.297		-.545	.586		
	PE	.175	.062	.192	2.819	.005	.460	2.173
	EE	.146	.072	.141	2.028	.044	.443	2.259
	SI	.022	.059	.023	.368	.713	.527	1.896
	FC	.270	.081	.227	3.317	.001	.458	2.182
	EC	.170	.048	.178	3.522	.001	.839	1.192
	PR	.090	.065	.078	1.377	.170	.671	1.490
	HP	-.072	.050	-.073	-1.444	.150	.848	1.179
	PB	.222	.061	.206	3.638	.000	.667	1.500

The model does not have multilinear phenomena (VIF coefficients in the range of 1 - 2.5).

Social influence (SI), perceived risk (PR) and habits of using printed books (HP) with a Sig coefficient are all greater than 0.05, so it should be removed from the model, the corresponding hypotheses of H3, H6, H7 are all refused.

The Sig coefficient of the remaining five variables is performance expectancy (PE), effort expectancy (EE), facilitating conditions (FC), perceived benefit (PB), environmental consciousness (EC) are all less than 0.05 so the H1, H2, H4, H5 and H8 hypothesis are accepted.

This demonstrates that these factors are significant in the model that means that the increase or decrease of the coefficient of each factor will affect the intention to use the e- textbooks on the NEU Reader application of students of the National Economics University. Particularly facilitating conditions (FC) has the strongest impact, followed by perceived benefit (PB), performance expectancy (PE), environmental consciousness (EC) and effort expectancy (EE).

Control variable

One-way ANOVA test results show that there is a difference in intention to use NEU Reader e- textbooks at different experience levels.

	Hypothesis	Sig. (Levene test)	Sig. (ANOVA test)	Conclusions
H9	<i>There are differences in intention to use NEU Reader e- textbooks at different experience levels.</i>	0.412 > 0.05	0.012 < 0.05	Accepted

5. Discussion and Conclusion

5.1. Discussion

The research results show that there are five factors affecting the intention to use e- textbooks on the NEU Reader app of National Economics University students. First, facilitating conditions are the factors that have the greatest impact on students' intention to use e-textbooks, this result is consistent with the findings of Rana et al., 2013; Oh et al.,

2014. Students' intention to adopt e-textbooks can be increased through enhanced provision of necessary guidance and support during use (Al-Gahtani et al., 2007). Second, perceived benefit has a significant influence on usage intention. Especially in the context of online learning due to the COVID-19 pandemic, e-textbooks with easy access and low cost have become an appropriate alternative to printed textbooks. Performance expectancy is the third predictor of intention to use e-textbooks. In particular, students with higher performance expectancy have higher intention to use e-textbooks, so they tend to perceive e-textbooks as less complicated (Hsu et al., 2017). Fourth, environmental consciousness has a positive effect on the intention to use e-textbooks. When the students are concerned about environmental issues, they will tend to choose to use environmentally friendly products. Effort expectancy is the last factor found to have a positive influence on intention to use e-textbooks, this result is consistent with previous empirical studies such as Alam et al., 2014 and Bankole et al., 2011. From the student's point of view, they believe that the easier it is to use e-textbooks, the more they intend to use them.

In addition, three factors: social influence, perceived risk and habit of using printed books did not affect students' intention to use e-textbooks. In the evolving technology landscape, individuals make choices based on their own instead of being influenced by others' decisions or opinions. With the outstanding benefits of e-textbooks, students will still choose to use them without being too affected by the risks and habits of using printed books that have existed before.

Moreover, the test results show that there is a difference between the intention to use e-textbooks at different experience levels. The more experienced the students, the greater the intention to use. This is completely consistent with the reason that the more experienced, the higher the problem of access and proficiency in using it, so they tend to use more than students who have no experience and are afraid to approach new ways and methods in learning.

Conclusions and recommendations

For digital Publishing app provider NEU Reader: (1) Troubleshoot login errors, data download errors, app programming errors; (2) Solve the problem of connection errors with the server and fix the data error lost during use; (3) Software upgrades such as the addition of features, utilities such as notes, bookmark, tools to highlight important content, search content with keywords further is diverse access across different types of devices and platforms.

For the National Economics University

Firstly, develop the NEU Reader e-textbooks system: (1) Provide adequate e-textbooks of all disciplines; (2) Update e-Textbooks regularly to keep up with the training program, especially the newly released or modified textbooks.

Secondly, promote the management and development of the NEU Reader e-textbooks: (1) The school needs to direct the Faculties/Institutes to actively compile new textbooks and republish long-published textbooks; (2) Regularly have programs and courses to introduce NEU Reader e-textbooks to students; (3) A team of technicians is needed to solve students' questions in the process of using NEU Reader e-textbooks.

Contribution of research: The proposed recommendations can help improve the quality of the NEU Reader e-textbooks system and create the best learning conditions for students. At the same time, contributing to providing a theoretical basis for the current status of students' intention to use e-textbooks at National Economics University in particular and universities in Vietnam in general for research in the field of science and technology in the future. However, a limitation of the study is that the data sample collected by the group is still modest and not really representative because the sample is mostly junior, so the group proposes future studies to expand sample size range and further clarify the influence of factors.

Abstract

Nowadays, healthy eating is an important issue, especially for the young generation between the ages of 16 and 30. Therefore, the study aims to find out factors that affect the intention to eat healthily of young people in Ha Noi. This study applies quantitative methods with a sociological investigation with 308 observed samples. The results indicate 6 factors including: health consciousness, healthy food knowledge, perceived behavioral control, subjective norm, eating habits and attitude toward healthy eating affect intention to eat healthily of young people in Ha Noi. In which, perceived behavioral control plays an important role and has a strong impact on the intention to eat healthily. From the results, this study implies that the government should propagate through mass media about the importance and practical benefits of healthy eating; Enterprises need to diversify products to meet the needs of consumers; Businesses should consider opening more offline stores to access more customers. In addition, this study clarifies and broadens the scope of influencing factors in the context of intention to eat healthily in Ha Noi, which has not been done by previous studies in Viet Nam.

Keywords: *Intention toward healthy eating, TPB, young people.*

1. Introduction

The development of media and the influence of the Covid-19 pandemic have changed young people's food consumption habits and behavior towards healthy eating. "Eat clean" is gradually becoming a trend among young people these days. It is not difficult to come across articles sharing and discussing healthy eating on social networking platforms such as Facebook, Instagram, Tiktok... from celebrities, housewives, students, employees and office staff. However, many consumers still choose food based on convenience and inexpensive prices such as fast food, processed food, poor quality food... instead of healthy products. The authors have conducted a research in Hanoi, where the population density is high and the level of internet use is frequent, with the research objectives below:

- Synthesizing the theoretical basis and factors affecting the intention toward healthy eating
- Determining the factors affecting the intention toward healthy eating of young people in Hanoi.
- Analyzing the impact of factors affecting the healthy eating intention of young people in Hanoi.
- Make suggestions and recommendations to promote healthy eating intentions of young people in Hanoi.

2. Literature Review

One of the theories developed and widely applied to social psychology is the Theory of Reasoned Action (TRA) of Ajzen & Fishbein (1977). This theory is designed to account for human behavior in general. TRA extends the relationship between people's attitude and behavior to behavioral intention before an action is performed. Besides, behavioral intention is influenced not only by attitude but also by subjective norms. Subjective norms are governed by normative beliefs and compliance motivations. The theory of planned behavior (TPB) proposed by Ajzen (1991) is an extended version of the Theory of Reasoned Action (TRA) whose main purpose is to predict planned and intentional behaviors. Specifically, TPB predicts behavior based on 3 main factors: attitude, subjective norm, and perceived behavioral control.

TRA and TPB theories are considered as fundamental behavioral theories for researchers to apply in studies of healthy eating intentions: Findings of the current study on the account of traditional TPB corroborates previous studies on eating behavior in which perceived behavioral control and attitude are the strongest determinants of intention, while subjective norm has less impact (Armitage and Conner, 1998; Dennison and Shepherd, 1995; Raats, Shepherd and Sparks, 1995; Astram and Rise, 1996). Healthy eating intentions are predicted by attitudes, perceived behavioral control, cognitive barriers, and self-efficacy in Hong Kong (Chan et al., 2014).

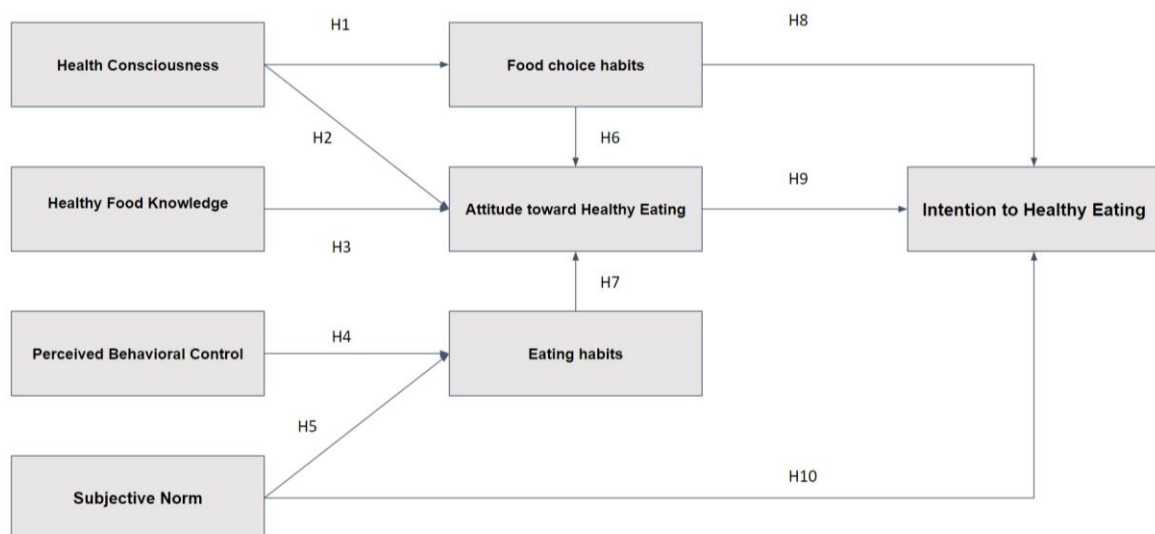

Figure 1. Proposed research model

Hypothesis

Health Consciousness (HC):

Health consciousness is the awareness of the importance of an individual's health (Mamun et al., 2020). Nguyen et al (2019) suggest that health consciousness reflects an individual's willingness to adopt a healthy eating habit.

Health and nutritional values include factors related to the avoidance or control of disease (eg, heart disease, cancer, or hypertension), weight control (health- or cosmetic-promoted) and physical well-being (optimal energy and health). Furst et al (1996) have suggested that the sense of health value has a significant and positive influence on food choice habits.

H1: Health consciousness has a positive influence on food choice habits

Many researches have shown a significant influence of health consciousness on consumers' attitudes towards healthy food consumption (Smith & Paladino, 2010; Yadav & Pathak, 2016). Francesco Testa et al. (2018) also confirmed that healthy eating attitudes are positively influenced by consumers' health consciousness. Based on the above, the research team hypothesized:

H2: Health consciousness has a positive effect on attitude toward healthy eating

Healthy Food Knowledge (HK):

Consumers must have some knowledge about foods, healthy products, and the ingredients of a meal in order to eat healthily. Although many college students are aware of the importance of meeting nutritional values, their knowledge and attitudes can prevent them from changing their behavior (Abraham et al., 2018). However, there is a gap between having knowledge and actually putting it into action. Therefore, information on promotion and activities about healthy eating should be focused to improve awareness and knowledge and attitude towards healthy food (Mamun et al., 2020).

H3: Healthy knowledge positively influences attitudes on healthy eating.

Perceived Behavioral Control (PBC):

Perceived Behavioral Control is an individual's understanding of how easy or difficult it is to perform a behavior (Ajzen, 2002). The assessment of the underlying belief structures of attitudes and cognitive behavioral control (Ajzen, 1991) provides the possibility to identify important barriers to and to facilitate dietary change. (Raats et al., 1995) Based on the above, the research team proposes the following hypothesis:

H4: Perceived behavioral control has a positive effect on eating habits

Subjective Norm (SN):

It can be asserted that the role of habit significantly influences intention prediction, more than the influence of attitude and subjective norm on behavioral prediction (Brinberg & Durand, 1983; Shepherd & Sparks, 1994).

H5: Subjective norm has a negative effect on eating habits.

Rezai et al. (2017) recognized that subjective norms have a positive and significant influence ($\beta = 0.198$, $p = 0.000$) on people's intention to buy healthy food in terms of Malaysian consumers. Furthermore, Menozzi et al. (2015) recognized that the subjective norm ($\beta = 0.56$, $p = 0.000$) significantly affects intention to use green food among Italian students.

H10: Subjective norm has a positive effect on intention to eat healthily

Food choice habits (HF)

Identifying the key factors in consumers' food choices will make it easier to understand their concerns and attitudes about healthy eating (Carrillo et al., 2011). The results of Sun's study (2008) also strongly support the assertion that food choice habits have an independent and moderating influence on healthy eating attitudes.

H6: Food choice habits have a positive effect on attitudes toward healthy eating

Assessing the importance of food to health is strongly associated with healthy eating intentions (Lim and van Dam, 2020). Beside that, understanding the underpinnings of food choices in life is important for planning dietary changes (Gedrich, 2003). Food choice habits have been confirmed to influence organic food purchase decisions by Lockie et al. in 2004, this factor is predicted to have an impact on intention to healthy eating.

H8: Food choice habits has a positive effect on intention to eat healthily

Eating habits (EB)

Unhealthy eating habits have a close relationship with psychological factors such as attitude (Hoque et al., 2018). Habit formation has been proposed as a means to promote the maintenance of healthy eating behaviors and attitudes. People who have a positive attitude towards healthy eating are often those who have had healthy eating habits in the past.

H7: Eating habits influence attitudes toward healthy eating positively

Attitude toward Healthy Eating (AE)

Attitude is a favorable or unfavorable assessment of a particular behavior (Ajzen, 1991). Attitude affects intention to be performed and the more favorable the attitude, the higher the intention to perform the behavior (Tarkiainen and Sundqvist, 2005). Attitude is the most important contributing factor to healthy food consumption intentions (Mamun et al., 2020). Many respondents appreciate the value of healthy eating.

H9: Attitudes toward healthy eating have a positive effect on intention to eat healthily

3. Method

Sample design: This research used convenience sampling method and the sample size formula of Bollen (1989): $n=5*m$ (m: number of variables). There are a total of 32 variables divided into 7 factors so the minimum sample size required is $32*5 = 160$ observations. Although the minimum required size of the study was 160 observations, the authors built an initial sample of 500 observations due to the fact that there were incomplete respondents leading to the invalid results that need to be rejected. To ensure the high reliability of the study, the research team chose a large number of samples. After the rejection process, the number of observations still ensures the minimum sample size with 308 observations.

Data collection method: (1) – Secondary data are studies, scholarly books, scientific articles, and journals related to the research area of healthy eating and healthy eating intentions that were obtained by the research team. (2) – Primary data is collected by conducting a sociological survey in Hanoi city. The survey subjects are young people living and working in Hanoi, the survey was carried out from October 27, 2021 to November 10,

2021. Due to the complicated situation of the Covid-19 pandemic, the questionnaire was designed and sent by the team entirely online, specifically on the Google Form platform, and then sent to the respondents through different channels: Email, Facebook Messenger, Instagram (the research team used a number of practical gifts for the survey subjects such as online English courses, Office, graphic design...). Sample size concludes 500 observations, the results of the number of used questionnaires are 308.

Data analytical method: To conduct the quantitative analysis, the research team used descriptive statistical analysis techniques through SPSS.20 software. Testing the reliability of the variables by Cronbach's Alpha coefficient (Hair et al., 1998) and using exploratory factor analysis (EFA) to identify groups of factors in the model and analytical techniques ANOVA with mean of intention to compare with demographic variables. Structural Equation Modeling (SEM) was used to analyze the model structure.

4. Results

Exploratory Factor Analysis (EFA): The first and second EFA results (PAF extraction method, Promax rotation) rejected HF3, BC4, EB5, SN1, HK3, HK4, AE4, HF1, HC1 have factor loading less than 0.5, HF2 is converted into a variable of Attitude. Observations belonging to the HF factor group were all removed. The 3rd EFA results on 23 observed variables resulted in 6 groups of factors, the total variance extracted was 59,148 which explained over 59% of the variation of the variables. After conducting the Cronbach's Alpha test, the results show that all 6 groups of factors in the model have Cronbach's Alpha coefficients greater than 0.7, showing that all factor groups are reliable. The correlation coefficients of all observed variables are at the confidence level above 0.6 except for HF2. The observed variable HF2 is a statistically significant new finding with a variable correlation coefficient of 0.531 and belongs to the group of factors AE. The specific EFA analysis results are presented in the table below:

Table 1. Analysis results (N = 308)

Items	Variables						
	AE	IN	EB	BC	HC	SN	HK
Attitude towards healthy eating (Alpha = 0,818)							
AE2 - Eating healthily is good	0,861						
AE1 - Eating healthily is beneficial	0,844						
AE3 - Eating healthily is worthy	0,774						
HF2 - I choose food according to taste preference	0,531						
Intention to eat healthily (Alpha = 0,826)							
IN2 - I intend to eat healthily in near future		0,916					
IN3 - I will try to eat healthily in a period of time		0,738					
IN1 - I would consider eating healthily		0,626					

Items	Variables						
	AE	IN	EB	BC	HC	SN	HK
IN4 - I am definitely going to eat healthily		0,612					
Eating habits (Alpha = 0,783)							
EB2 - How often do you eat processed food per month?			0,787				
EB3 - How often do you eat fast food per month?			0,755				
EB4 - How often do you eat out per month?			0,674				
EB1 - How often do you take snacks apart from regular meals per month?			0,622				
Perceived behavioral control (Alpha = 0,813)							
BC1 - . I have resources, time and chances to buy healthy food				0,856			
BC3 - I am confident that if I want, I can buy healthy food.				0,718			
BC2 - To buy or not to buy healthy food is entirely up to me				0,638			
Health consciousness (Alpha = 0,777)							
HC2 - I often dwell on my health					0,761		
HC3 - I choose food carefully to ensure good health					0,740		
HC4 - I think that I take health into account a lot in my life					0,687		
Subjective norm (Alpha = 0,776)							
SN4 - The newspapers and magazines that I read suggest that I should eat healthy						0,874	
SN3 - The TV programs that I watch suggest that I should eat healthy						0,805	
SN2 - The information on Internet that I read suggest that I should eat healthy						0,516	
Healthy food knowledge (Alpha = 0,702)							
HK2 - I am knowledgeable about the impact of unhealthy foods							0,802
HK1 - I am familiar with healthy foods							0,675

The results of the analysis of the linear structural model (SEM) when compared with the conditions show that the study's model is suitable for analysis.

Factor affecting the intention toward healthy eating of young people in Hanoi

Figure 4. Impact model of factors on intention to eat healthily

Source: Research data 2021

After testing the data with the structural linear model - SEM, the research team used the analysis of variance (ANOVA) for the modified variables to test the mean difference in the intention to eat healthily for groups of the moderator variables. After conducting the Levene test, the results show that the modified variables groups of age, occupation, and income all have Sig. values greater than 0.05, showing that the variance of the groups of values are homogeneous, for the gender variable and education, Sig. values respectively are 0.040 and 0.024, less than 0.05, indicating that the variance of the groups of values are not uniform. After conducting the analysis of variance of the moderating variables age, occupation, income Sig. values are all greater than 0.05, showing that there are no statistically significant differences in the intention to eat healthy of the respondents belonging to different groups of regulatory variables by age, occupation, and income.

For two groups of variables that regulate sex, education, we conducted Welch test (Samuel et al., 2005; Andy, 2009) to determine the difference in healthy eating intentions between groups of modified variables. The test results show the Sig. values are all greater than 0.05 (0.424 for sex and 0.566 for education). This shows that there is no statistically significant difference in the intention to eat healthily of the respondents belonging to different control variable groups by gender, education.

5. Discussion and Conclusion

In terms of influencing factors, the impact model of factors on intention to eat healthily shows the direct influence of 4 groups of factors on the intention to eat healthily including subjective norm, perceived behavioral control, eating habits and attitudes toward healthy eating. This result has similarities in some influencing factors compared with some previous research papers: Subjective norm (Abdullah Al Mamun, 2020; Smith and Paladino, 2010); perceived behavioral control (Francesco Testa et al., 2018; Abdullah Al Mamun, 2020); attitudes toward healthy eating (Singh and Verma, 2017; Francesco Testa et al., 2018). The direct effect of eating habits on healthy eating intentions is new compared to previous studies which is believed to result from the difference in study location, Hanoi (Vietnam). Changing habits that have been deeply ingrained in people's lives in Vietnam, specifically Hanoi. Making people change their habits is still quite difficult due to the influence of traditions, concepts of previous generations.

In terms of scale, all 4 original scales: IN1, IN2, IN3 and IN4 are kept. In which, the scale IN2 (I intend to eat healthily in near future) is the factor that has the greatest influence on the observed variable of intention to eat healthy with a loading coefficient of 0.916; the scale IN3 (I will try to eat healthily in a period of time) is the least influential factor with a loading factor of 0.612. So it indicates that for young people in Hanoi, having an eating plan in the future is clearly a decisive factor in their intention to eat healthily.

In conclusion, the intention to eat healthily of young people in Hanoi is directly or indirectly affected by 6 factors including: health consciousness, healthy food knowledge, perceived behavioral control, subjective norm, eating habits and attitude toward healthy eating. In which, perceived behavioral control plays an important role and has a strong impact on the intention to eat healthily. At the same time, the study also found a relation

between eating habits and healthy eating intentions. The study results also showed that there was no difference between groups of demographic modifiers on intention to eat healthily.

In terms of recommendations, the government should focus on strengthening education in schools, highlighting the importance of healthy eating through information channels such as the Internet, TV, and radio. Implement strict food safety control. Food processing businesses and restaurants need to pay more attention to the healthy food segment.

Limitations: respondents may be inclined to give desirable answers to questions as healthy eating is increasingly seen as a socially desirable behavior in the epidemic situation. Because of limitations in data collection, the research sample is not representative. In addition, due to the Covid-19 pandemic, the survey was totally conducted online.

Further studies should build a larger sample of observations to ensure representativeness. Future research should also focus more on how young people manage their time and what interventions would be most effective.

Abstract

The article aims to find out the intention to use O2O purchase form of Hanoi consumers through model analysis of influencing factors. This study clarifies and broadens the scope of influencing factors in the context of modern shopping channels in Hanoi, which has not been done by previous studies. The article uses in-depth interviews to build and complete the research model. Preliminary quantitative research was conducted through a pilot survey with 44 consumers to standardize questionnaires, formal quantitative research with a sample of 389 observations. Collected data and hypotheses were tested using SPSS 26.0 and AMOS 24.0 software. The article shows that consumers' intention to use O2O purchasing pattern at supermarkets in Hanoi is influenced by 6 factors, including: physical experience, perceived risk, perceived usefulness, perceived ease of use, perceived value, and attitude to use. In which, physical experience plays an important role, strongly influencing consumers' decision to participate in the O2O commerce process. Because of the research approach chosen, the observed behaviors can be influenced by culture, customs, and economics. Therefore, future studies can further exploit these factors. The study includes implications for retailers: should create opportunities for consumers to experience the goods and services provided at physical stores; Ensure consistency between the products described online and in the physical store; Optimize entire supply chain through applying automation technologies.

Keywords: *Supermarkets, O2O commerce, Physical experience, Intention to use.*

1. Introduction

With the rapid development of the Internet in the 4.0 technology era, together with the impact of the covid-19 pandemic, consumers' buying behaviors have changed a lot. Currently, offline shopping activities are gradually being transferred to the online environment through online purchasing apps on technology device platforms. However,

many consumers still affirm that the offline shopping experience at stores and supermarkets is still something that e-commerce platforms cannot replace. Therefore, the online to offline (O2O) purchase method has appeared in recent years with the desire to combine the advantages of both online shopping and offline transactions. The form of O2O purchase has been put into operation in Vietnamese supermarkets but has not received a high response and acceptance from Vietnamese consumers. The authors have carried out research in Hanoi, where there is a dense population, large shopping demand and high internet usage, with the research objectives as:

- Identify, analyze and evaluate the factors affecting the consumer's intention to use O2O purchasing method in supermarkets in Hanoi, through studying the models of previous related studies.

- Thereby making suggestions and recommendations for retail businesses to develop/enhance new forms of shopping.

2. Literature Review and Theoretical Foundation

The theory of reasoned action (TRA) is one of the theories developed and widely applied to social psychology by Fishbein and Ajzen (1975). TRA extended the relationship between attitudes and subjective norms to behavioral intentions before an action is performed. Technology Acceptance Model (TAM) was proposed and developed by Davis (1985, 1989) to assess the acceptability of the audience for information technology. The model is applied by two classical constructs: perceived usefulness and perceived ease of use. Perceived value theory (PVT) is proposed to predict consumer purchasing decisions in the context of innovation, combining the variables of expected benefits and expected costs incurred (Wood and Scheer, 1996). Due to TAM's limitations in explaining individual cell phone use, some studies build on PVT theory to highlight the role of consumers rather than technology adopters. (Kim, Gupta and Chan, 2007; Kleijnen, Wetzels and Ruyter, 2007).

To avoid the limitations of any single theory, studies often integrate several theories into the model to explore the complexity of applying innovation more holistically. Three theories TRA, TAM and PVT were combined by Yang et al (2019) to study consumer behavior with O2O purchasing patterns. Most of the studies on O2O commerce acceptance are based on TAM and combined with some other predictors such as convenience, feasibility and subjective norm (Rob and Park, 2019); service characteristics based on location (Cho, An and Hao, 2018). Wu, Zhao, and Tzeng (2015) combined mobile anxiety and user experience assessment as moderators into TAM to investigate mobile O2O commercial adoption of customers serving offline.

Research on consumer behavior with O2O purchases has exploded in recent years. Kang and Namkung (2018), conducted a study on Korean consumers' O2O food purchasing behavior, the results shows that the majority of customers believe that if O2O food commerce is built on a useful and convenient system then it is capable enough to make a successful transaction. In addition, research indicates that consumer's trust is a key determinant for the formation of attitudes and behavioral intentions. Consumers participating in O2O food commerce feel psychologically stable and continue to trade, then intend to use the service and

make a purchase. Chiang (2018) said that consumers buying goods through the form of O2O are attracted by the store's design and service quality. Xiao et al (2017), show that consumers' use of O2O purchases in China is influenced by three factors: relationship; trust of consumers with O2O purchasing method and trust in sellers. Along with research related to consumers' behavior on O2O commerce, the study conducted in Greater Jakarta city in Indonesia, Savila et al (2019) showed that trust about products and online stores greatly influence consumer's loyalty to offline stores, especially consumers' intention to repurchase products.

3. Method

3.1. Methodology of the study

The research was carried out through 2 phases, which are: Qualitative research and quantitative research.

Qualitative Research: conducted through group discussions and interviews to build and complete the research model and scale for measuring 7 factors in the model. The research team conducted in-depth interviews with 03 groups: Group 1: Included 5 Hanoi consumers with age evenly distributed among 5 groups from under 18 years old to over 40 years old. Group 2: Included 2 cashiers working at a hypermarket and supermarket in Hanoi. Group 3: 1 lecturer working at National Economics University. The questions in the in-depth interview focused on two issues: (1) Determining the factors affecting the intention to use O2O, (2) Clarifying the specific content of the observed variable, the scale, and the words used in the questionnaire. Through group discussions and interviews, the research team summarizes the comments as follows: Change the term "Shopping experience" to "Physical experience"; PR2 from "Privacy information leaking" to "Privacy information easily exposed"; "Test the offline offerings with the online description in a real store" to "Check the offline offerings with the online description in a real store"; PEU4 from "The operation processes of O2O commerce are understandable and simple" to "The operation processes of O2O commerce are understandable and clear"; "physical effort" in PV2 to "effort" and add the term "I can" to the variable PE4.

Quantitative Research: Preliminary quantitative research was carried out through a pilot survey with 44 consumers to standardize the questionnaire and be ready for the official survey. Through the pilot survey, it showed positive feedback from the respondents, the scales have good reliability.

The formal study was carried out using a quantitative method. The scales for measuring the questionnaires are adopted from previous studies (Yang et al., 2019; Ko et al., 2017; Kim et al., 2007; Jeong and Song, 2016; Kang and Namkung, 2018; Lee, 2018) and mostly (except for the questions about demographics) were measured using a 5-point Likert scale, ranging from 1, "Extremely disagree", to 5, "Extremely agree". Data was collected through an online survey, sent to respondents via social networking platforms including Messenger, Zalo and Email. Collected data and hypotheses were tested using SPSS 26.0 and AMOS 24.0 softwares.

To generalize the result across the population, the sample size was determined based on the formula of Cochran (1963), which is:

$$n_0 = \frac{Z^2 pq}{e^2}$$

Due to the property $p + q = 1$, so $p \cdot q$ will be maximum when $p = q = 0.5$ so $p \cdot q = 0.25$. If it is assumed that the change is maximum, then p will equal to 0.5. Therefore, we calculate the sample size with a confidence level of 95% and with an error of at least $e = \pm 5\%$. At 95% confidence level, the z value is 1.96 in the table of values, then the sample we need to choose will have the minimum sample size: $N = ((1,96)^2 \cdot (0,5) \cdot (0,5) \cdot (1 - 0,5)) / (0,05)^2 = 385$

Thus, the minimum sample size of the study is 385 observations to ensure that the sample size is large enough when conducting analyzes and tests to solve the research objectives. However, the research team built an initial expected sample of 500 observations because of the fact that there were people who answered incorrectly and incompletely, leading to invalid questionnaires and forced to remove. To ensure the high reliability of the study, the research team chose a large sample so that the number of questionnaires after rejection still ensures the minimum sample size.

A total of 475 fully answered online questionnaires were collected. After checking for inappropriate answers, 86 invalid answers were removed, therefore bringing the total number of valid responses down to 389. The descriptive analysis of respondents is shown in the table below:

Table 1. Descriptions of Samples

Variables	Frequency	Percentage	Variables	Frequency	Percentage
Age			Occupations		
< 18	78	20.05	Student	78	20.05
18-24	81	20.82	Employee	186	47.81

3.2. Research Model and Hypotheses Development

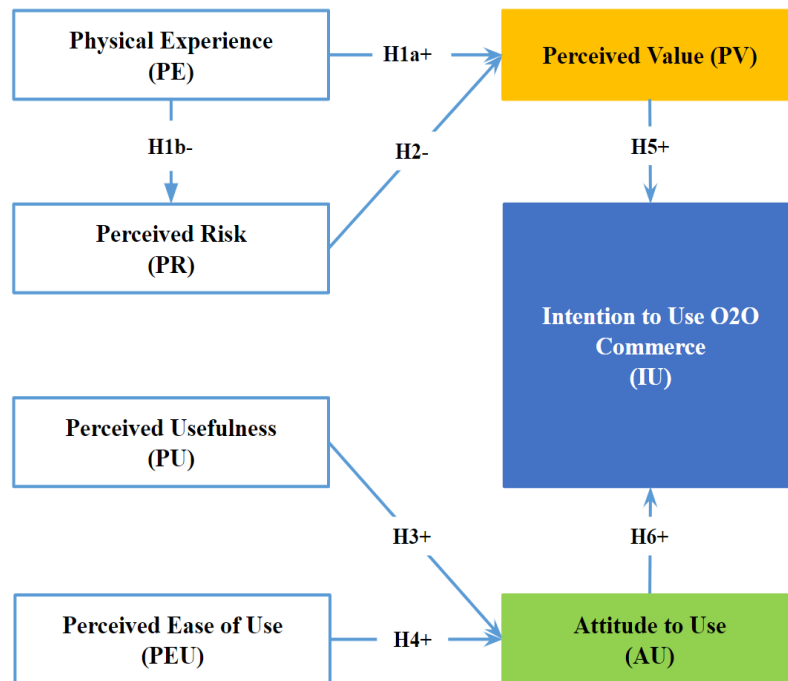

Figure 1. Research Model

Source: Authors design

Physical Experience

Pine and Gilmore (1998) introduced the concept of customer experience as one of the most important economic attributes in the consumption process. Experience refers to a memorable event created by a product or service through the individual customer's shopping process. In O2O commerce, this factor is considered to have the strongest impact on consumers' purchasing decisions (Huang et al., 2017). In 2019, research conducted by Yang et al confirmed that consumers' physical experience is an important factor affecting the decision to choose the form of O2O purchase. This factor has a significant influence on users' perceived value as well as perceived risk. In addition, the physical experience is a unique feature of O2O commerce compared to other patterns of shopping, which can create a direct interaction between the buyer and the seller, which can help create more value to consumers (Vargo and Lusch, 2004). Based on these findings above, the following hypothesis has been developed:

H1a: *Physical experience has a positive effect on the perceived value of O2O.*

A notable shortcoming of online sale platforms is that consumers do not have opportunities to experience the product directly before making a buying decision (Elven, 2019). Moreover, since the goods delivered may not be as described in the online store, it is understandable that customers may be dissatisfied or disappointed about their online purchases (Liao, 2017; Yang, Liu, Li, & Yu, 2015). However, for O2O commerce, in physical stores, consumers can feel the quality, experience the service, and confirm whether

the product meets their expectations or not. As a result, consumers' perceived risk is reduced (Yang et al., 2019; Huang et al., 2017). Therefore, we propose the following hypothesis:

H1b: *Physical experience has a negative effect on the perceived risk in O2O.*

Perceived Risk

Bauer (1960) was the first to introduce the concept of risk perception, defined perceived risk as the combination of uncertainty and severity of relevant outcomes. Perceived risk is also defined by Dowling & Staelin (1994) to describe "people's perception of uncertainty and adverse consequences of purchasing or using a product (or service)". In O2O commerce, as mentioned in hypothesis H1b, the physical shopping experience can reduce consumers' perceived risk. However, users are still worried about the risk of personal information disclosure, privacy, payment errors or product risks. Therefore, risk perception still has an impact on users' perception of value, in other words, risk perception reduces the beneficial value that users perceive when using O2O purchase method. (Yang et al., 2016; Liu et al., 2019). Therefore, the following hypothesis is proposed:

H2: *Perceived risk has a negative effect on the perceived value of O2O.*

Perceived Usefulness

According to Davis et al (1992), perceived usefulness refers to the consumer's perception of the outcome of the experience. In 1993, Davis defined perceived usefulness as an individual's perception that using new technology will enhance or improve their performance at work. Thus, it can be seen that users tend to accept new technologies when they find them useful. In particular, the influence of perceived usefulness on the attitude to use was first tested in the TAM model (Davis, 1989). In 2006, when studying the role of technology in explaining the influence of visual interaction technology on consumers, Lee et al. Confirmed that new technology will be considered useful in online shopping and it has a direct impact on consumers' attitudes towards purchasing decisions, usefulness is increased when sellers provide specific and rich information about the product (e.g., quality, price,...). In 2015, Wu et al. Determined the influence of perceived usefulness on the attitude of using O2O mobile commerce with the coefficient $\beta = 0.290$, $p < 0.001$. Studies conducted by Letchumanan and Muniandy (2013), Elkaseh et al. (2016), Ko et al. (2017), Yang et al (2019), Chung and Nam (2020) also confirm that perceived usefulness has a positive effect on the attitude to usage intention of consumers to O2O commerce. Based on the findings above, this article suggests:

H3: *Perceived usefulness has a positive effect on the attitude toward using O2O.*

Perceived Ease of Use

Rogers (1962) stated that perceived ease of use is a term that describes the extent to which an innovation is perceived as not difficult to understand, learn or operate. Similarly, when explaining that users' use of the system is influenced by the intention to use the system, Davis (1989) defines perceived ease of use as the degree to which potential users expect that the Using a particular system will require no physical and mental effort. With the perceived ease of use factor, many researchers have shown a positive influence of perceived ease of use on the attitude towards using O2O (Lee et al., 2006; Letchumanan and Muniandy, 2006).

2013; Ko et al., 2017; Riantini et al., 2018; Roh & Park, 2019). In addition to the impact on the attitude to use, perceived ease of use also shows a positive effect on the user's perceived usefulness. In the study of Yang et al (2019), this relationship is verified through quantitative research on 416 customers in China. Perceived ease of use showed a positive effect on perceived usefulness with an impact coefficient $\beta=0.118$ ($p\text{-value}<0.01$). Recently, a study by Chung & Nam (2020) on users' acceptance of O2O services also shows a positive influence of perceived ease of use on user attitudes with $\beta=0.288$ and $t\text{-value}= 3.57$. Based on the findings above, this article suggests:

H4: *Perceived ease of use has a positive effect on the attitude toward using O2O.*

Perceived Value

Kim et al (2007) defined perceived value as "Consumers' subjective evaluation of benefits and sacrifices". This study validated the strong impact of perceived value on customer's intention to use mobile Internet in Singapore with coefficient $\beta=0.539$ ($p<0.001$). In O2O commerce, many studies have shown that each value has a decisive influence on human behavior and motivates them to buy (Li et al, 2015; Hsu and Lin, 2018; Chang et al, 2018; Zhou, 2020). Chunxiang (2014) also confirmed that the development process of trade, integrated with the resources of the technology industry chain and the business model can meet the needs of consumers. According to research by Jeong and Song (2016), consumers feel that using the O2O form has many values in updating promotion information. They can use coupons easily, conveniently and have many benefits in purchasing products. This has motivated them to buy through O2O. When researching on the topic of factors affecting product repurchase intention by O2O service (2018), Che et al. Confirmed that perceived value can arouse consumers' intention to repurchase products over time with coefficient $\beta=0.43$. Based on the findings above, we propose the following hypothesis:

H5: *Perceived value has a positive effect on consumers' intention to use the O2O purchasing method.*

Attitude to Use

When building the TRA model, Fishbein and Ajzen (1975) introduced the concept of attitude as a positive or negative feeling of individuals about the system, which has a strong impact on the formation of intention to perform certain human behaviors. In O2O commerce, the attitudinal factor has a positive influence on the purchase intention of consumers (Moon and Armstrong, 2019) with the coefficient $\beta = 0.765$, $p < 0.001$. They feel satisfied when using O2O services at large shopping malls, motivating them to intend to continue the service in the future. A year earlier, Kang and Namkung (2018) also affirmed the importance of consumer attitudes towards the positive intention to use O2O food commerce. In addition, this factor has been concluded by Wu et al. (2015) about its positive impact on consumers' intention to switch purchasing methods. Based on the above, the following hypothesis has been developed:

H6: *Attitude to use has a positive effect on consumers' intention to use the O2O purchasing method.*

4. Results

Reliability Tests

The Exploratory Factor Analysis (EFA) was conducted to test the data reliability, using the Promax rotation method. Considering the KMO table and Bartlett test EFA for the first time, it shows that the factor analysis is appropriate with the KMO coefficient = 0.852 (satisfying the condition > 0.5) and Bartlett test for P-value (Sig.) = 0.000 should be statistically significant. The results of the first EFA exploratory factor analysis (PAF extraction method, Promax rotation, Criterion eigenvalue > 0.1) on 30 observed variables showed 7 different groups of factors, in which 4 observed variables, including: PEU1, IU1, PU5 and PE3 with factor loading less than 0.6. Therefore, the research team removed the above 4 observed variables. The second EFA test was conducted on 26 remaining variables with the same conditions as the first test. The results of the second KMO and Bartlett Test, the KMO coefficient is 0.854, still satisfying the conditions, suitable for factor analysis. The result showed that 26 variables were divided in 7 groups of factors with factor loading coefficients most greater than 0.6 except 2 variables PR4 and PR5, which the coefficients less than 0.6 would be removed. The third EFA test was conducted on 24 remaining variables with the same condition as the first and the second tests. The results indicated that all 24 variables have coefficients greater than 0.6 and the total variance extracted was 72.065, which explains over 72% of the real effect in real life. Specific results are indicated in the table below:

Table 2. Reliability Test Results: EFA Approach

	1st Test	2nd Test	3rd Test
KMO Coefficient	0,852	0,854	0,852
Sig.	0,000	0,000	0,000
Total Variance Extracted	65,023%	69,672%	72,065%
Number of Origin Factors	7	7	7
Number of Remaining Factors	7	7	7
Number of Origin Variables	30	26	24
Number of Remaining Variables	26	24	24

Source: Data analysis results compiled by authors

Confirmatory Factor Analysis – CFA

Conducting confirmatory factor analysis – CFA and comparing the model fit indicators obtained with the conditions provided by Hu & Bentler (1999), indicates the following results: The Chi-square test index $CMIN/df = 1.477 < 3$ means that it is at a good level, the GFI index = $0.931 > 0.9$, the CFI index = $0.982 > 0.95$ is at a very good level, the index is very good. $RMSEA = 0.035 < 0.08$ and $PCLOSE = 1.000 > 0.05$ are at a good level. Carrying out testing of convergence, discriminant and reliability shows that: the composite reliability indexes (CR) are all greater than 0.7, reliability is guaranteed; The AVE is all greater

than 0.5, convergence is guaranteed; The MSV is all smaller than AVE, the SQRTAVE values are larger than all the factor structure correlations, the discriminant is guaranteed.

Table 3. Results of Reliability and Validity Test of Research Model

	CR	AVE	MSV	MaxR(H)	AU	PU	PV	PE	PR	PEU	IU

Structural Model Test – SEM

The results of the analysis when compared with the conditions of confirmatory factor test (CFA) show that the research model is suitable for analysis. As follows: with a CMIN/df = 1.484 < 3, the Chi-square test index is acceptable; The GFI index = 0.928 > 0.9 is at a good level. Besides, the CFI index = 0.981 > 0.950 is at a very good level. RMSEA index = 0.035 < 0.08, therefore qualifies. Finally, the PCLOSE index = 1.000 > 0.05, which is at a good level. The above results are suitable to use for testing the research hypothesis. The model used in this study is shown below:

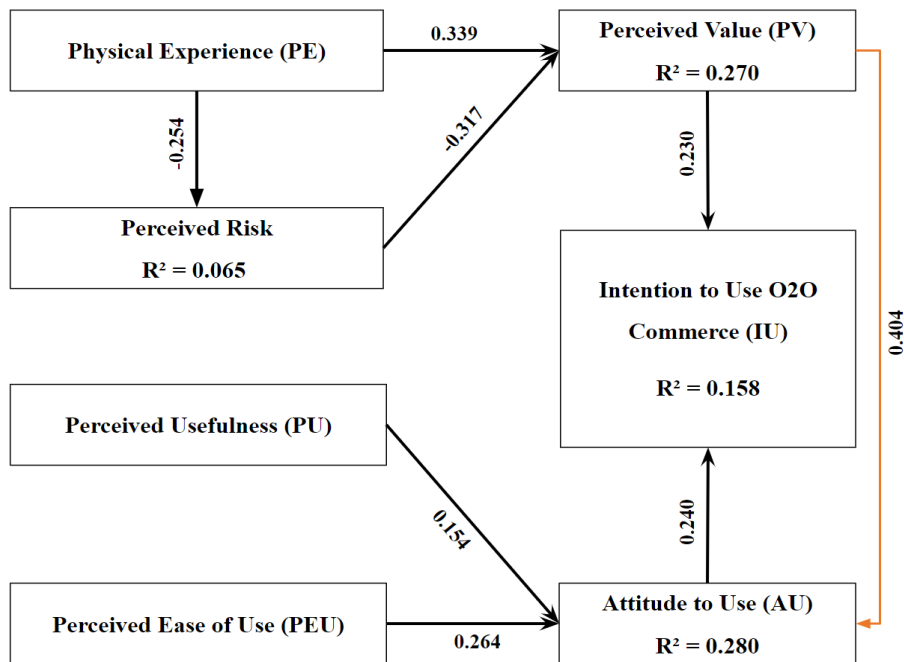

Figure 2. Theoretical Model Analysis: SEM Approach

Source: Data analysis results compiled by authors

Hypothesis Testing

The results of hypothesis testing in the research model show that, compared with initial expectations, hypothesis H1a shows the opposite effect, physical experience has a positive effect on perceived risk with the coefficient $\beta = 0.263$ (p-value < 0.001). Besides, there is a newly discovered relationship, perceived value shows a positive impact on attitude toward using O2O. The remaining hypotheses are accepted. As follows:

Table 4. Hypothesis Test Results and Coefficients of Impacts

	β	Standard Error	P	Hypotheses
PE → PV	0.339	0.047	***	H1a: Accepted
PE → PR	-0.254	0.052	***	H1b: Accepted

Note: *** indicates $p < 0.001$ significance level

Source: Data analysis results compiled by authors

Hypothesis H1a: Physical experience has a positive effect on consumers' perceived value ($\beta = 0.339$, p-value < 0.001), this result is consistent with the initial expectation. One of the weaknesses of online shopping is that consumers do not have the opportunity to experience the product before placing an order (Elven, 2019). Therefore, experiencing the actual product at the supermarket helps to increase the perception of value for consumers, in other words, they feel that buying in the form of O2O brings more value to them when they experience the product offline. Thus, it can be seen that the physical experience is an advantage of O2O commerce compared to other electronic commerce patterns.

Hypothesis H1b: Physical experience has a positive effect on perceived risk ($\beta = -0.254$, p-value < 0.001), which is consistent with the initial expectations and many previous studies. It can be seen that consumers' anxiety about products when shopping in the form of O2O at supermarkets can be reduced significantly if they have the opportunity to experience the products directly. Many products at supermarkets such as vegetables, fresh foods or seafood have great risks in terms of quality, size and color if users buy in the form of O2O because they are not sure about the products, whether the product they choose is correctly packaged and delivered or not. Experiencing the products directly at physical stores can eliminate the level of risk perception for customers. Therefore, improving service quality and ensuring accuracy in packaging and shipping are important factors in reducing the perceived risks of consumers.

Hypothesis H2: Perceived risk has shown a negative impact on perceived value ($\beta = -0.317$, p-value < 0.001), this result is consistent with initial expectations. Consumers'

perceived risk when using O2O purchasing patterns drastically reduces their perceived value. They still worry about the risk of personal information disclosure, privacy, payment errors or product risks. Therefore, perceived risk reduces the beneficial value that users perceive when using O2O purchasing patterns.

Hypothesis H3, H4: Among the effects on attitude to use, perceived ease of use shows the strongest impact with $\beta = 0.264$, $p\text{-value} < 0.001$. When consumers feel that O2O is easy to use and the operations are simple, they will tend to use more and have a more positive attitude towards O2O commerce. Perceived usefulness also shows a positive impact on consumer's attitudes ($\beta = 0.154$, $p\text{-value} < 0.001$). Buying goods by using O2O pattern brings consumers a lot of benefits, which help increase their positive attitude towards using this form of purchasing.

Hypothesis H5, H6: Both perceived value and attitudes to use show a positive impact on the intention to use O2O purchasing pattern with the coefficients of 0.230 and 0.240, respectively. This result is in line with initial expectations and is consistent with the results of many previous studies (Chung & Nam, 2020; Yang et al., 2019; Ko et al., 2017). Consumers tend to use the O2O purchasing method when they clearly see the benefits and value that this form of buying brings to them.

New effects: Besides the impact of perceived usefulness and perceived ease of use, consumer's attitude to use is also strongly affected by perceived value ($\beta = 0.404$, $p\text{-value} < 0.001$), which is a new finding of the study compared with the original expectations and hypotheses. Perceived value shows a positive impact on the attitude to use, which is reasonable and logical with consumer psychology. As they get more value from their O2O purchases compared to their costs and efforts, positive attitudes towards O2O purchases will increase (Yang et al., 2019).

5. Discussion and Conclusion

This study explores consumer's intention to use O2O commerce at supermarkets based on theory of reasoned action, perceived value theory and the technology acceptance model. Besides, it examines the role of the unique features of O2O commerce in consumer's behavioral intentions.

By integrating technological and economical attributes into the research model to explain users' behavior, we found that consumers' intention to use O2O at supermarkets in Hanoi is directly or indirectly affected by 6 factors, including: physical experience, perceived risk, perceived usefulness, perceived ease of use, perceived value, and attitude to use. In which, physical experience is found to be a crucial factor and plays an important and essential role that strongly influences the consumer's decision to participate in the process of O2O commerce. At supermarkets, consumers have the opportunity to experience the service and directly feel the quality of the product, thereby increasing the value and benefits of purchasing. Physical experience is also considered as a unique feature, which differentiates O2O from other pure forms of e-commerce. In this study, the results show that the level of consumer's risk perception will be reduced when they have chances to experience the products in physical stores, which requires retail businesses to come up with strategies to help reduce risks for consumers.

Recommendations

In O2O commerce, retail businesses and merchants are encouraged to create opportunities for consumers to experience the goods and services provided at physical stores. This is also an opportunity to help businesses make first impressions on their customers. For tangible products, O2O retailers can provide pre-sales services such as trial, consulting and after-sales services such as technology support, maintenance, delivery, distribution, and easy-return. In addition, the services or goods which consumers experience in real stores should be in line with their online specification. In other words, retailers need to ensure consistency between the products and services described online and in the physical store, which greatly reduces information asymmetry in O2O commerce. In terms of technology, businesses need to build a solid online platform and update marketing trends regularly to drive consumers to buy at physical stores. At the supermarket, retailers should introduce and promote new technology and automation, such as the application of artificial intelligence technology to create new experiences for users, thereby promoting customers' intention to use O2O purchasing patterns.

Limitations and Future Research Directions

Although our research has discovered factors that affect consumer's intention to use O2O commerce in supermarkets, we only used the data from Hanoi consumers, then observed behaviors can be influenced by culture, customs, and economy. Besides, since the Covid-19 pandemic, this study had to conduct a survey entirely on the Internet. This limitation possibly has minimized our sampling technique and sample size to ensure the generalizability of the results. Future research can expand the sample size and apply more data collecting methods, which includes both online and offline methods.

Based on our findings, future research may additionally investigate the effects of physical experience on merchant's operation and performance. Although physical experience is validated as a compelling predictor of O2O consumer behavior, its effects may vary within the different phases involved in purchasing activities. According to Yang et al (2019), how physical experience exerts influence within the different stages of future O2O commerce might be another future direction. Therefore, physical experience may play different roles in consumer behavior, which is additionally another future research topic for tangible goods and intangible services. Because there are many characteristics of O2O purchasing pattern, investigating the effects of other unique characteristics, such as Integration of Online and Offline Information (Yang et al, 2019), on consumer's intention to use this purchasing method can also be another future research topic.

Abstract

As the importance of learning culture, innovation and trust is rising these days, this study seeks to provide empirical evidence of relationships among these three variables at the firm level in Vietnamese context. It aims to hypothesize a mediational model implying that organizational trust is related to the relationship between learning culture and innovation. The data were collected using online and offline survey from a cross-section of industries. A total of 170 surveys were carried out among Vietnamese companies. Hypotheses were tested using mediation analysis with multiple regression and bootstrap method. The results indicate that: trust partially mediates the relationship between learning culture and innovation. One of the limitations is cross-sectional data were collected only in Vietnam, so that it would be highly valuable to consider replicating this study in different settings using longitudinal designs and explore the effects of each dimensions in each variable. For practical implications, the findings accentuate to managers that Trust require Learning culture, which taken together result in innovations. Besides, this paper is the first attempt to find empirical support for the role of Learning culture in trust creation. Further, analyzing how organizational trust, learning culture and innovation are related to each other is also an important contribution.

Keywords: *Learning culture, Organizational trust, Trust, Innovation*

1. Introduction

Technological disruption and VUCA conditions fueled by the ongoing pandemic and evolving organizational architectures are just a few of the major challenges businesses face

today. As a leader, the main role is to equip the workforce with the capabilities needed to stay competitive amidst these changes. In other words, managers must build a transformation-ready organization. Being transformation-ready does not mean adopting the latest technology or rewriting the mission statement to keep up with current trends. Instead, it is about developing a learning culture that positions the entire organization to adapt to the inevitable unknowns the future will bring. In an extended discussion between Gary Hamel and Lowell Bryan, facilitated by Barsh (2008) (see also Barsh et al., 2008), the point is made that in order to transform outmoded competitive orientations and adopt new strategies based, in particular, on innovation, organizational leaders need to become much more concerned with the encouragement of organizational learning and the facilitation of greater autonomy for knowledge workers, than with control.

Unless the firm is willing to take on this risk, its innovation investment will bring only incremental results. Nonetheless taking the risk of innovation is not an irrational decision, but is based on the rationale of trust. It has to be made clear that an innovative organization has to create a trusting environment within the company, in order to foster collaboration, the generation of new ideas, creativity, and finally innovation. Fukuyama (1995) asserts that trust in organizations and communities is determined by culture, and organizational trust is one of the results of learning organizational culture. In the knowledge economy, trust has an important influence on the culture of sharing knowledge (Bakker et al., 2006) because an employee needs trust to respond to and exchange knowledge (Gruenfeld et al., 1996). Trust is needed to encourage the development and application of knowledge in organizations and build a learning culture.

Recently, economists have increasingly paid attention to the role trust plays in economic activity. From economic growth (Knack and Keefer, 1997) to the size of firms (Bloom et al., 2009), from financial development (Guiso et al., 2008) to international trade and investments (Guiso et al., 2009), many economic phenomena have been related to the level of trust. The concept of trust has been used in relationship with learning culture and innovation. Nevertheless, none of them mention its mediating role. This paper will fill the research gap by examining the mediating role of trust in cultural learning and innovation relationship.

2. Literature Review

Trust

The literature on trust depicts an understanding of trust from three perspectives namely; trust as a personality trait (Gabarro, 1978), trust as a behavioral intention (Rousseau et al., 1998), and trust as characteristic based (Butler, 1991). The early definition of trust (Deutsch, 1958) highlighted trust as a decision based on an expectation of a positive motivational consequence if a person is trusted as against a negative consequence if the person is not trusted. Rotter (1967) explains trust as a personality trait that accounts for people high on the trait are more likely to trust other individuals than people low on the trait. This personality-based factor of trust was later labeled as propensity to trust by Mayer et al. (1995). Propensity to trust is the same as trust as a personality trait and has been defined by Mayer et al. (1995) as “a stable individual difference that affects the likelihood that a person will trust”. Mayer et al. (1995) have

highlighted the importance of propensity to trust in a situation when the characteristics of the trustee (the person to be trusted) are unknown. However, the personality-based definition of trust was insufficient to explain why people trusted another.

For the purpose of our study, we will adopt Mayer et al. (1995) definition of trust which is as follows “the willingness of a party to be vulnerable to the actions of another party, based on the expectation that the other will perform a particular action important to the trustor, irrespective of the ability to monitor or control that other party”. We adopt this definition of trust mainly because the objective of our study is not to focus on the individual determinant of trust or on interpersonal trust in social relationships but to understand the role of trust in an organizational perspective or what is called, organizational trust, and factors in the organization that enhance trust.

Innovation

Innovation is often characterized as a kind of “capital” for the organization and has been broadly defined as “an idea, a product, or process, system or device that is perceived to be new to an individual, a group of people or firms, and industrial sector or a society as a whole” (Rogers, 1995, p. 276). Organizations strongly oriented toward innovation develop innovative products and services thereby increasing firms’ innovative capabilities and offerings in the market (Heimonen, 2012; Rosenbusch et al., 2011). Firms may go for process, technology, product, and market innovations in order to create new opportunities (Wiklund and Shepherd, 2005), which require innovative capability (Tidd et al., 1997). Moreover, innovation firms can better facilitate entry into new arenas as well as renew their position in the current situation (Cho and Pucik, 2005). Thus, innovation becomes an essential tool for firms’ long-term success and survival (Deshpande et al., 1993). Innovation is a ‘multi-stage process whereby organizations transform ideas into new/improved products, services, or processes to advance, compete and differentiate themselves successfully in their marketplace’ (Baregheg et al., 2009).

Learning culture

The concept of learning culture is a combination of organizational learning and organizational culture. Nowakowski and Conlon (2005) state that organizational learning cultures are organizational phenomena that support the acquisition of information, the sharing of knowledge acquisition, and the consolidation and support of continuous learning and application to organizational improvement. Organizational learning culture can be defined as a set of norms and values about an organization's operations (Schein, 1985) that support in-depth, systematic approaches to the level of achievement of higher levels of learning and organizational research (Witrock, 1992). In the study by Garvin et al., 2008, a learning culture that emphasizes values, beliefs, and assumptions toward creating a collective learning process within an organization.

Trust – Innovation – Learning culture relationship

Developments in the organizational sciences have highlighted the crucial role of trust-based relationships in sustaining individual and organizational effectiveness (McAllister, 1995).

According to Alsharo et al. (2017), trust among individuals plays a crucial role in building and maintaining social relationships and promoting cooperative relationships and effective teamwork. Indeed, trust plays a crucial role in social relations it improves the quality of information exchanges, supports core capacity building, promotes mutual learning, and creates motivation for innovation (Murphy, 2002). Trust creates openness and sincerity in the interpersonal relationships which will foster a collaborative atmosphere and learning culture for flourishing the creativity and innovation capabilities (Barczak et al., 2010).

Individuals will not be able to share and manage knowledge effectively if they do not trust their colleagues. In contrast, they will have greater motivation to actively participate in the knowledge-sharing process and share more useful knowledge with others (Holste and Fields, 2010). In the same vein, Rutten et al. (2016) suggested that trust is the driving force of learning culture. It may seriously hinder the sharing of key information and knowledge, even damaging the effectiveness of business processes if employees lack trust in each other. Jain et al. (2015) believed that a higher level of trust among individuals creates a greater intention to willingly engage in learning. Trust contributes to the willingness to share knowledge and the successful implementation of the knowledge management processes (Koohang et al., 2017). Meanwhile, a learning culture encourages employees and organizations to develop knowledge and competence and that systems influence each other to trust their colleagues (Tala A., 2015).

An organizational learning culture becomes important in the consideration of innovation to the extent that the culture enables an organization to anticipate and adapt to the dynamics of a changing environment. For example, Bass and Avolio (1990) emphasize the value of innovative and adaptive cultures in their distinction between transformational and transactional cultures. The former support change and innovation while the latter tend toward the maintenance of the status quo. Both innovation and organizational learning are seen as emphasizing the free exchange of information and ideas in ways that facilitate learning and its application. Both focus heavily on the role of culture as a facilitator of creativity. The common threads that emerge from this and other literature underscore the importance of culture in promoting and supporting inquiry, risk-taking, and experimentation. In the same vein, Tidd et al. (2020) just argue that culture is the composition of what people believe and how they behave and, if appropriate, it activates and reinforces innovative behavior. On the basis of theory and previous empirical studies, the team expects that through a learning-oriented organizational culture framework, organizational and interpersonal trust can be strengthened so that innovative ideas in the business. The following hypotheses are suggested:

H1: Learning culture is positively related to innovation

H2: Learning culture is positively related to trust

H3: Trust mediates the relationship between the learning culture and innovation in Vietnamese enterprises.

3. Method

3.1. Sample and data collection

In this paper, data were collected from employees working at companies in Hanoi and Ho Chi Minh City with the convenience sampling method, with a maximum number of 3 - 5 employees per enterprise. The time of sampling is between September 1, 2021, and January 20, 2022.

The sample was conducted by the method of direct questionnaire distribution and distributed the questionnaire online via the online questionnaire on Google Form. After conducting a survey, data were filtered by eliminating the invalid reports that may affect research results.

Table 1. Demographic profile of sample

Demographic variables	Frequency	%
<i>Gender</i>		
Male	82	48.2
Female	88	51.8
<i>Education</i>		
High school	2	1.2
Graduates	155	91.2
Postgraduate	13	7.6
<i>Work seniority</i>		
Under 5 years	143	84.1
5 - 10 years	12	7.1
11 - 20 years	13	7.6
Over 20 years	2	1.2
<i>Work position</i>		
Staff	124	72.9
Team leader	27	15.9
Manager	18	10.6
Senior manager	1	0.6

Source: Data analysis results of the research team

Questionnaires were sent to employees with positions from staff to senior manager and education from High school to Postgraduate. The number of respondents is 350 and after eliminating the invalid, 170 responses are qualified to process.

Table 1 shows the characteristics of the sample, it shows that there are 88 employees taking the questionnaires is female, accounting for 51.8%. As can be seen from the table, most of the respondents' educational levels are graduate. The majority of the participants were under 5 years of work experience (84.1%). The results of descriptive analysis showed that 72.9% of the respondents are staff.

3.2. Measurement development

5-point Likert scale was utilized in the present study. The scale items were taken from English literature. Therefore, language validity was checked. The items were translated into Vietnamese via the back-to-translation method (Brislin, 1976).

The three trust variables, including organizational trust, affective trust, and cognitive trust, were measured using scales developed by Nyhan and Malowe (1997) and McAllister (1995). The scale includes 13 items. Learning culture was measured using the scale developed by Yang et al. (2004) and Garvin et al. (2008) with 5 items. Innovation was measured by a scale developed by López et al. (2004) and Jiménez-Jiménez, Sanz-Valle (2011). The scale is composed of 2 dimensions and 14 items.

These items were scaled by the Likert scale, from 1 – strongly disagree to 5 – strongly agree.

3.3. Data analysis

In this present paper, simple linear regression is used to test the relationship between the variables and bootstrapping is conducted to examine the mediating role of trust. Bootstrapping is a technique that involves repeated sampling from a sample data set and estimating the indirect effect in each resampled data set. By repeating this process, the distribution of the product $a*b$ is formed and creates a confidence interval of the indirect effects relationship (Preacher and Hayes, 2004).

Many studies have demonstrated that Bootstrapping is better than the Sobel Test and other techniques when it comes to evaluating intermediate relationships (Williams & MacKinnon, 2008; Zhao, Lynch & Chen, 2010). While Sobel Test requires a large sample size and normally distributed data, Bootstrapping overcomes these limitations (Hayes, 2009). Therefore, currently, the technique of handling intermediate variables with Bootstrap is more commonly used than Sobel Test.

4. Results

4.1. The Reliability and Validity Testing of Measurements

Cronbach's Alpha test showed that all variables have the corrected item-total correlation greater than 0.3 and Cronbach's Alpha coefficient greater than 0.8. Reliability testing results show that all measures and variables are qualified. The detailed results are as follows:

Table 2. Reliability Statistics of Variables in The Research Model

Variables	Sub-variables	Code	Cronbach's Alpha
Trust	Organizational Trust	ORGTRUST	0.842
	Affective Trust	AFFTRUST	0.897
	Cognitive Trust	COGTRUST	0.874
Learning Culture		LEARCULT	0.930
Innovation	Exploratory Innovation	EXPLORINN	0.938
	Exploitative Innovation	EXPLOIINN	0.959

Source: Data analysis results of the research team

The exploratory factor analysis method (EFA) was applied to test the validity of the measurements.

The analysis results by EFA indicated that trust, learning culture, and innovation scale are appropriate for the research data. Kaiser-Meyer-Olkin (KMO) coefficient is greater than 0.5, Bartlett's test has sig < 0.05, the factor loadings of observed items are all greater than 0.5, Total Variance Explained (TVE) is greater than 50%.

4.2. Results

To examine the impact of Learning Culture on Trust and Innovation, simple linear regression was conducted. The regression results are shown in the table below:

Table 3. Regression Analysis Between Trust, Learning Culture and Innovation

Variable	Model 1	Model 2
	Beta (β)	Beta (β)
Independent Variable		
Learning Culture	0.748***	0.665***
Adjusted R Square	0.583	0.653
F	237.490***	318.751***
Dependent Variable	Innovation	Trust
*: **, ***: Correlation is significant at the 0,5; 0,01; 0.001 level (2-tailed).		

Source: Data analysis results of the research team

The regression results show that learning culture has a positive impact on innovation (Adjusted R Square = 0.583, F = 237.490, sig<0.001). Learning culture explains 58.3% of innovation volatility in Vietnamese enterprises. Similarly, learning culture explains 65.3% of trust volatility in Vietnamese enterprises (Adjusted R Square = 0.653, F = 318.751, sig<0.001). Therefore, hypotheses 1 and 2 are accepted.

To examine the mediating role of Trust in the relationship between Learning Culture and Innovation, Process macro version 4.0 in SPSS developed by Hayes (2022) was used to analyze the mediating variable of the research model. Model 4 was chosen to analyze the direct impact of Learning Culture (MLEARCUL) on Innovation (MINNO) and the mediating role of Trust (MTRUST) with 95% confidence interval. Besides, the data is processed by the Bootstrap method with a sample number of 50000. The research results are as follows:

Table 4. Coefficients for Mediating Effect

Antecedent	Consequent											
	M (MTRUST)					Y (MINNO)						
	Unstandardized Coefficient		Bootstrapping			Unstandardized Coefficient		Bootstrapping				
	Coeff.	SE	Sig	LLCI	ULCI	Coeff.	SE	Sig	LLCI	ULCI		
X (MLEARCUL)	a	0.665	0.037	0.000	0.591	0.738	c'	0.448	0.078	0.000	0.295	0.602
M (MTRUST)							b	0.451	0.095	0.000	0.264	0.638
Constant	i _M	1.163	0.156	0.000	0.855	1.470	i _Y	0.214	0.221	0.333	-0.221	0.649
R ² = 0.6549						R ² = 0.6352						
F (1,168) = 318.751, p = 0.000						F (2,167) = 145.414, p = 0.000						
MTRUST = 1.163 + 0.665. MLEARCUL + e _M						MINNO = 0.214 + 0.448. MLEARCUL + 0.451. MTRUST + e _Y (4)						
(3)						(4)						

Source: Data analysis results of the research team

According to the regression results, model 3 is appropriate for analysis ($F = 318.751$; $R^2 = 0.655$; $p < 0.001$). Considering the results of linear regression analysis with the significance level of 5, it can be seen that Learning Culture (MLEARCUL) has a positive impact on Trust (MTRUST) and this effect is statistically significant ($\beta = 0.635$, $p < 0.001$). Similarly, model 4 was appropriate for analysis ($F = 145.414$; $R^2 = 0.635$; $p < 0.001$). The results show that Learning Culture (MLEARCUL) and Trust (MTRUST) have a positive impact on Innovation (MINNO) ($\beta = 0.448$; 0.451 , $p < 0.001$).

Table 5. Summary of Direct and Indirect Effects Between Variables

	Effect	SE	P	LLCI	ULCI
Total effect of MLEARCUL on MINNO	0.748	0.048	0.000	0.652	0.844
Direct effect of MLEARCUL on MINNO	0.448	0.778	0.000	0.295	0.602
Indirect effect through MTRUST	Effect	BootSE		BootLLCI	BootULCI
	0.300	0.085		0.138	0.473

Source: Data analysis results of the research team

In terms of direct and indirect effects through intermediate variables, BootLLCI (Lower-Level Confidence Interval) = 0.295 and BootULCI (Upper-Level Confidence Interval) = 0.602 does not contain the value 0. Similar to the indirect effect through the intermediate variable MTRUST when the confidence interval is [0.138;0.473] also does not contain the value 0.

From the above analysis, it can be concluded that Trust plays a partial mediator in the relationship between Learning Culture and Innovation. Therefore, hypothesis 3 is supported.

5. Discussion and Conclusion

5.1. Discussion

The present study has achieved its initial goal that is examining the relationship between Trust, Learning Culture and Innovation in the context of Vietnamese enterprises. The results of correlation and regression analysis supported and clarified that relationship.

Firstly, based on the theoretical background that has been synthesized and the results of model analysis, it shows that Trust, Learning Culture and Innovation are interrelated. In which, Trust plays a partial mediator in the relationship between Learning Culture and Innovation, the hypothesis that the study raises is supported.

In the knowledge base that we have synthesized, previous studies have shown a positive relationship between two out of three variables: Trust, Learning Culture and Innovation. With Trust acting as a partial mediator between Learning Culture and Innovation, the obtained results somewhat clarify the relationship between the three variables and complement previous studies. More specifically, the results of the above study have similar findings to the study of Lei et al (2019), the authors have shown that knowledge sharing plays a mediating role in the relationship between trust and confidence, interpersonal and organizational innovation. Therefore, with the motivating role of Trust, Learning Culture will

have a stronger impact on Innovation. This shows that, when employees have trust in the organization, they tend to learn more, thereby stimulating and developing innovation.

Secondly, due to the above findings, we make some recommendations for managers and organizations/enterprises in Vietnam. For managers, as a person who directly works and guide employees, it is necessary to improve employees' trust in the organization. Specifically, managers can communicate more with employees, then learn and assess the trust level of employees in the organization and the manager himself. Thereby, in case the level of trust is low or does not manifest specifically, managers can take appropriate measures to increase trust. When trust is strengthened, it would promote learning within the organization, which in turn increases innovation. In addition to fostering trust, an organization can enhance learning and establish a learning culture through activities such as periodic knowledge checks and organization-wide knowledge exchanges, rewards for individuals who have achievements in learning and contribute useful ideas for innovation, etc.

The research also has a number of limitations leading us to possible further studies. At first, the most significant limitation is associated with its data collection from Vietnamese enterprises only which makes it difficult to conclude the relations. The second limitation is causality cannot be established because all constructs were measured at a certain point in time. Third, the study focused only on the whole variable and did not explore the effects of each dimension in each variable.

With these above limitations, there are several areas for possible future research. The result of this study suggests future replications and extensions in different countries circumscribe the generalizability and applicability of the findings reported here. Finally, further study should investigate the influence of each dimension of the variable to get more specific results.

5.2. Conclusion

This study has examined the relationship between Trust, Learning Culture and Innovation for the first time in Vietnam. The results uncover that Trust plays a partial mediator in the relationship between Learning Culture and Innovation. These results help to increase understanding of organizational learning theory, especially how Learning Culture and Trust affect Innovation in organizations. The implications of the study outcomes for both managers and researchers are also mentioned in the paper.

Abstract

This paper aims to review the main challenges which are facing quality application in higher education institutions and universities in Vietnam. These challenges became as obstacles, in ensuring the quality of the output of the educational process, to achieve the objectives of sustainable development, and meet the needs and requirements of labor market, locally and internationally. Therefore, the paper has stated the constraints and challenges in these institutions and provided some suggestions to deal with them.

Keywords: *Education; Higher education; Quality; Vietnamese universities; Quality challenges.*

1. Introduction

There is a quick quantitative and qualitative development going on, in the field of higher education. The numbers of higher education institutions are increasing, including various programs and specialties, with developed techniques and educational patterns. Knowledge is growing necessary in life and essential for the progress of contemporary societies. It is considered as an economical free standing. So, there is a great need for developing knowledge and working hard to make good spending on it. Despite the current situation of knowledge society and the great development happening around, and its impact on higher education especially with regard to consolidate the concepts of competitiveness in the open market. And the phenomenon of standards for the quality of institutions and programmes not only at national level but also at the regional and global.

The lack of attention to the quality of programmes and institutions at the national level may lead to the failure of these institutions by civilization and progress, which in turn leads to perish completely and replaced by cross-border education institutions. This will necessitate the need to reformulate the curricula, teaching methods, the quality of management and financing. Also, to revitalize the role of the state in the provision of these services and work for appropriate change to suit the global context and its requirements. The fact is that the graduates from higher education institutions are not competing for jobs with

local Vietnamese market specifications, but with world markets (MOET, 2015). This requires a radical change in the content of curricula, teaching methods, and training in higher education institutions to ensure high quality and characteristic of the teaching programs, according to international standards. Which may lead to output that can meet the requirements of sustainable development.

2. Method

The process of measuring the quality of higher education institutions can be carried out through several actions, beginning with a study of self-assessment in accordance with the adopted quality assurance standards. Then setting up a committee of experts whose task is to study the self-evaluation of educational institution. This is considered as a main step in measuring quality been achieved in the educational institution. The committee of experts will ensure that the educational institution provides proofs, evidence, and all the necessary information for issuing judgments on the degree of achievement of the institution's quality assurance standards. Through descriptive gradients with several levels of performance, on the subject of item so gradually. These levels have been reached, depending on dimensions of the design, implementation and effectiveness of the item of interest and the degree of its indicators on the enterprise position in term of evaluation and attention (Paunder, 2006). Accurate estimates of the degree of availability of items of quality assurance standards can be provided according to these narrative gradients. And each item will have its own degrees. At the end of this step the form of recording the scores deserved by the enterprise to the various items of quality assurance standards should be filled. After that each degree of these scores should be put independently on a graphic page (profile), showing the degrees of the quality been achieved by the Enterprise. And then write the final report and submit it to the authority or related entity. After getting the estimates obtained by the enterprise on the items included in the quality assurance standards, extract the degree that is deserved by the enterprise about every quality assurance standard, that is through finding the sum of the scores been obtained by the enterprise on each item of that standard. These estimates are used to determine the quality grade achieved and interpreted according to each item of quality assurance standards and each criterion, in addition to the possibility of translating these estimates in the form of graphs illustrating quality achieved by the enterprise. Thus, one can find out the weaknesses and strengths in the degrees of quality standards been achieved and the appropriate decisions, to determine the degree of its quality and building plans for quality assurance and improvement.

3. Results

3.1. Quality and higher education

Quality has received considerable attention in most countries of the world as one of the fundamental pillars of education systems that must keep pace with global changes and adaptation. It is also considered as the starting point of human resources scientifically qualified to participate in the development of different dimensions, and confront the negative impact caused by the engines of change down to practical solutions that will benefit the communities. In order to achieve this, the quality assurance process should work to apply

advanced methods so as to improve the higher education, activation of existing practices with its development, and achieve the highest possible level at the output of higher education institutions to satisfy the local, regional, and global needs (Paunder, 2006). The application of the quality assurance standards can help in achieving the following benefits:

a) The continuous development of the educational institution message and its objectives

The application of quality assurance standards causes the higher education institutions to review their messages and objectives which will enable them keep pace with the rapid changes in the globalization and the knowledge economies and meet the requirements of comprehensive development. Particularly that the quality assurance standards are not a specific ceiling but are constantly evolving, which makes educational institutions pursue this development and seeks to achieve all its levels.

b) Optimal investment of financial and human resources

The higher education institutions suffer from wasting of manpower. And the financial resources are either incapable of achieving the requirements and implementing the programmes or they are drained in areas not serving the educational process directly. Therefore, the applications of quality assurance standards are considered as best method for using the human and financial resources optimally.

c) Achieve community involvement of higher education institutions

The message of institutions is not only concerned with educational goals, but goes beyond that to include the broader surroundings. Which is called the community and humanitarian role. Thus, the quality of education will influence directly through its outputs (students). These students are considered as inputs for other operations and roles such as scientific researches, practical advices, help decision-makers, contributing to propose solutions to social problems, economic, political, environmental, technological, industrial and others. This would limit the effects of global change engines.

d) Develop skills in higher education

The quality assurance standards required of workers in educational institutions: High levels of professionalism, continuous training, better use of modern technology, and provision of leadership skills, reflected on the performance and work productivity and contribute to development in various dimensions.

3.2. Challenges facing the quality in higher education institutions

There are many challenges facing the quality in higher education institutions in Vietnam, these challenges can be grouped as follows:

a) Massive expansion in higher education

There is a huge and significant expansion in universities in Vietnam and an increasing number of students enrolled. In addition to the approach of the private sector investment and its involvement in higher education, and the emergence of new patterns of education, such as open learning and distance education. The educational institutions have been over the past few years relying on sufficient quantity of outputs without much interest in the adequacy of quality, which plunged the Vietnamese labour market with large numbers

of output that have caused an imbalance in the balance of supply and demand for labour (MOET, 2015). The steady growth in student numbers in higher education institutions has not been accompanied by a parallel growth in buildings and equipment, devices and techniques, as well as the preparation and qualifications of faculty members and also in student services, which entail adverse consequences in terms of the quality of graduates.

b) Weak demand for technical education

Vietnamese labor market faces a clear inflation in the numbers of university graduates from different programs, significant shortages of professionals and technicians which led to the emergence of social and economic problems. The educational decision makers should reconsider the admission policies so that there will be a wider share in technical education.

c) The output of higher education not adapting the labour market needs

There is no harmony between national needs and requirements for licensing academic programmes. The absence of correlation between academic and practical learning outcomes skills. And the lack of institutional coordination methodology between the output of higher education and the requirements of the local and regional market.

d) The curriculums

The current curriculums have the lack of courses that help develop intellectual skills, such as analytical thinking, communication, leadership, and institutional initiatives, therefore, there should be a modernization by providing curriculum that stimulates the mind and illuminate the leading thinking and stimulate creativity.

e) Financial challenges

This aspect can be summarized with the following dimensions:

- Low budgets of universities and low spending on tertiary education and the difficulty of securing adequate and stable funding sources to maintain the educational level.
- Lack of financing the activities that aim to develop a comprehensive strategic plan for higher education outputs which prompted universities to rely on their own limited resources and so dented its output.

Table 1. Major reasons of challenges facing the quality in higher education institutions

Admission policies	<ul style="list-style-type: none"> - Weak alignment between student performance in high school and their choice of specialization, where the rate of high school is the only factor taken into consideration for admission to academic programs, thereby restricting institutions in providing inputs to the programs, regardless of quality achieved. - Ignoring the quality factor in admission policies in universities, private colleges and admission programs. - Customizing special admission policies for some social groups has led to a lack of uniformity in the criteria for admission.
--------------------	--

Teaching staff members	<ul style="list-style-type: none"> - Difficulties to provide faculty members with specialties and expertise. - The absence of a clear policy of human resources capacity-building, such as training of faculty members, support for new members, and the lack of transparent and fair assessment system. - Brain drain, as are many minds working in Vietnamese universities working in neighboring States with higher salaries and incentives.
Scientific research	<ul style="list-style-type: none"> - Focusing on theoretical research rather than focusing on applied research which investigating the payoff. - Weak spending on scientific research. - Most researches that provided by faculty members at universities were with the aim to upgrade and not with the aim to offer a research product that can be applied and provide a practical benefit. - The actual research activity of faculty member at universities does not exceed (5%) of his/or her academic duties, because of the weight of the teaching burden. - The absence of clear regulations and stimulating career scholar dedicated to research and development, may cause many researchers prefer to stay in universities, or go to other occupations for earning a higher return, or joining a convoy brain drain abroad. - Weak collaboration between the sectors of agriculture, industry and higher education institutions that might contribute to putting unrealistic researches which do not include value for the development of the national economy.
Management Challenges in management	<ul style="list-style-type: none"> - The lack of harmony between the style of university management and the requirements of the development of modern higher education institutions, and the lack of strategic planning. - Low balancing scholarship. - Increased competition due to the entry of foreign universities and colleges on the local and regional levels. - Complicated procedures faced by foreign students - The weak guidance and counseling for students in universities and colleges. Fifth: Perception of quality importance It is as follows: - Lack of vision, mission and clear objectives to direct the work of Vietnamese higher education institutions. And to translate into strategic plans, academic approaches and syllabus contributing to desired learning outcomes for each specialty area. - Failure to allocate sufficient budgets for investment in the field of quality assurance. - No development of quality assurance systems at universities and colleges. - The absence of a classification system for universities and academic programs. - Some private higher education institutions increase attention towards profitability, while the norm is the discrepancy between quality standards and maximum profit.

Source: Author's summarization

3.3. Mechanisms and working methods for the proposed solution

- Institutional and community awareness of the importance of quality in the field of higher education.
- For the State to attract private investment and to encourage them to invest in the field of quality.
- Commitment to strategic planning method which focuses on the development of future concepts, to prepare for anticipated problems and develop capacity to address and find solutions to them. And predict the effects of the resulting repercussions with attention to the effective implementation of the strategic plans, and follow-up its implementation and progress.
- The National Council (upper council) should exercise its oversight role and to follow the work of the self-evaluation units and centers, quality assurance and accreditation of universities while providing incentives for public and private institutions that are committed to quality assurance standards recognized internationally and disseminating national experiences in the area of quality assurance to all higher education institutions.
- To activate the mechanisms of student participation in assessment of academic programs and the application of quality systems at universities and take their opinions seriously, the literature of accreditation indicates that the views and perspectives of students is considered as one of the sources of evidence that the provisions are issued on its basis.
- Activation and application of decisions and regulations concerning the selection and appointment of faculty members and university staff with strict standards of efficiency and excellence in the selection processes without taking into account any other effects.
- Formation of quality committees in all departments and develop guidelines and follow up work periodically.
- Keeping up with the rapid changes in techniques and methods of teaching and the development of knowledge and skills with attention to quality in submission.
- Raise the level of scientific research and the development of knowledge outside the framework of the promotion of science.

4. Conclusion

The higher education quality assurance has an effective role in sustainability and meeting the global challenges by providing communities with efficient outputs that can meet the needs and requirements of the labor market, which requires clear mechanisms to link the change occurring in the fallout of the higher education sector in line with the requirements of the knowledge society (Mukhopachyay, 2010). The process of development and quality assurance in higher education institutions in our country will only be achieved with the availability of supportive infrastructure for change and development of qualified human resources, material, technical infrastructures, and renewable resources for education and learning that commensurate with the capacity of these institutions. The success in achieving the objectives of the upgraded performance and quality assurance is dependent on the presence of active units for self-evaluation by institutions of higher education. All educational institutions and its components should have a sincere desire to work and implement the standards that can represent a permanent strategy.

Abstract

Religion in Vietnam is not only an element of culture but also an important resource contributing to the development of the country. In particular, exploiting the cultural values of religions with the sustainable development of the country in the current period is of great importance. The article focuses on clearly identifying the roles and cultural values of religions; current status of promoting cultural values of religions. On that basis, the author proposes some solutions to effectively promote the cultural values of religions in our country in the coming time.

Keywords: *Cultural values; religion; role.*

1. Introduction

Religion is an important part of Vietnamese culture contributing to Vietnam's cultural identity. Religion not only contributes to satisfy the spiritual, spiritual, belief and religious life of the majority of people and society, but also to develop the country. This is a view that has been acknowledged and confirmed by the Party. Vietnam has many religions, with 43 organizations belonging to 16 religions recognized or registered by the state. Among them, there are religions that were introduced to Vietnam for hundreds of years and blended with the nation, and endogenous religions imbued with regional cultural imprints. Therefore, culture, religious ethics also have a long history, not only directly affecting a part of the people but also contributing to the process of building morality and culture in Vietnam. Resolution No. 24-NQ/TW dated October 16, 1990 of the Politburo on strengthening religious work in the new situation confirmed the suitability of religious morality to the construction of a new society; Directive No. 37-CT/TW of July 2, 1998 affirmed the need to promote the moral and cultural values of religions; The Resolution of the 5th Party Central Committee, term VIII on building and developing an advanced Vietnamese culture imbued

with national identity, continues to affirm the viewpoint of respecting and promoting cultural and ethical values of beliefs and religions. Religion "encourages ideas, justice, charity, and goodwill... in religion, and at the same time propagates and educates to overcome superstition, to oppose the abuse of religion and belief to carry out political intentions bad treatment"²¹⁶. Most recently, the Document of the 12th National Party Congress of the Party once again affirms that "Promote good cultural and moral values and resources of religions for the country's development"²¹⁷. It can be affirmed that our Party has recognized and appreciated the great contributions and resources of religion in country's development.

Besides, in order to successfully implement the national construction and development in the new situation, the Party directs to mobilize all resources. Religion is culture; Religion is a resource, so the resources of religions are also "cultural resources". The 13th Party Congress also affirmed: "Increasing the investment, exploitation and maximum promotion of cultural resources" (Communist Party of Vietnam, 2021a, page 146). The systematic approach to those viewpoints shows that our Party recognizes clearly the important role of religion more clearly - religion (organizations, dignitaries, followers, facilities, religious activities) religion...) has been gradually becoming one of the important constituents of the overall resources for national construction and development, including the development of spiritual tourism.

Although religious culture has contributed to the development of the country, in reality, the contribution of religious culture depends a lot on specific policies, mechanisms and regulations. Therefore, it can be said that at present, we have not fully promoted the role and values of religious culture for the development of the country, which makes us waste valuable "resources". On the other hand, to be able to promote the role of culture in general and culture of religions in particular, we need to build a healthy culture, prevent and remove negative aspects, limitations, even the counterculture that is taking place like the spirit of the Resolution of the 5th Plenum of the Party Central Committee (8th tenure). The issues and contents are mentioned in this essay with the desire to bring a more thorough awareness of the cultures of religions, values, roles and contributions to the development of the country. We point out the limitations, inadequacies and problems facing the current religious culture. Because of the broad topic, the article only focuses on presenting the heritage value of religious cultures.

2. Method

The content of the article uses the following specific research methods:

- Method of data research: The authors have researched and collected documents and articles related to the content of the article.

- Method of analysis and synthesis: On the basis of documents, texts and articles on current culture, beliefs and religions, the authors have summarized the theory and practice to supplement and complete the article.

²¹⁶ Communist Party of Vietnam: Document of the Fifth Conference of the Central Committee, term VIII, Publishing House. National politics, Hanoi, 1998, pp.66-67.

²¹⁷ Communist Party of Vietnam: Document of the 13th National Congress of Deputies, Publishing House. National politics, Hanoi, 2021, t.I, p.171.

- Method of summarizing practice: Assessing and summarizing practice to clarify the achieved results, limitations and point out the causes. At the same time, make forecasts and suggestions to help promote efficiency in the coming time.

- Expert method: Discuss with leaders, officials directly doing religious work, who know the situation, understand the fact that this is a real person, true to the actual content of the article. write.

3.1. Cultural values of religions in the development of different fields

Firstly, the cultural values of religions are hidden in architectural works

Talking about the culture of religions, we often refer to two basic aspects: tangible culture and intangible culture. In terms of tangible culture, religion has created many works that are national and world cultural heritages. Since its formation, introduction and development in Vietnam, religious architectures have always been an important criterion to evaluate the growth of a religion. Today, when society is increasingly changing, developing strongly and rising up in the era of the industrial revolution, religious architecture has many continuous changes, but still carries specific cultural values. Cultural values represent the philosophy of the world, the religious outlook on life. These works have existed for hundreds, even thousands of years, spread across localities and regions in the country. For example, relics of One Pillar Pagoda, Tran Quoc Pagoda, Perfume Pagoda, Thay Pagoda, Quan Thanh Temple, Kim Lien Temple, Phu Tay Ho, Phat Tich Pagoda, Dau Pagoda, Vinh Nghiem Pagoda, Hung Temple Relics (Phu Tho).), Phat Diem stone church, Thien Mu pagoda, Hon Chen temple (Hue), Di Da Thap pagoda (Binh Dinh), Chuc Thanh pagoda (Quang Nam), Indochina Buddhist academy relic (Quang Nam), the area My Son relic, Hanoi Cathedral, Sapa stone church, La Vang church (Quang Tri), Notre-Dame Cathedral Basilica of Saigon, Temple of Ba Chua Xu Nui Sam, Cao Dai Temple in Tay Ninh, Mosque of Islam Mubarak (An Giang), Cham temples in the central provinces²¹⁸, etc. Currently, in Vietnam, there are about 30,000 places of worship of different religions, and thousands of belief establishments across the country²¹⁹.

It is worth noting that religious monuments not only exist independently but also create a cultural space, a cultural complex as extensive as the Yen Tu landscape relic complex (including Quang Ninh, Hai Duong, Bac Giang). This kind of relic complex bears the strongest religious beliefs and contains many historical and cultural values of the nation. This complex also attracts a large number of visitors and tourists.

Not just famous monuments, religion also created and left many valuable relics such as inscriptions, ancient statues, bells, ancient days, woodblocks, horizontal paintings, couplets, reliefs, carved plaques, valuable ancient works and scriptures... For example, Thanh Mai stele (Thanh Mai temple), Sung Thien Dien Linh stele, Buddha statue of Phat

²¹⁸ Po Klaong Garai Tower, Ponagar Tower, Banh It Tower, Hoa Lai Tower, etc..

²¹⁹ Chu Van Tuan, Nguyen Thanh Trung: "Building tourism products associated with exploiting religious and belief heritage in the context of industry 4.0 in Vietnam today", Vietnam Science and Technology Magazine, no. 11-2018, p.61.

Tich temple, Buddha statue of thousands Eyes of a thousand hands (But Thap pagoda), Woodblocks of Vinh Nghiem pagoda, Bo Da pagoda, Indochina Buddha statue, etc., many of these relics have become national treasures, recognized by the world as Woodblocks of Vinh pagoda Nghiem, Bo Da, which have been recognized by UNESCO as a memory heritage of mankind.

Secondly, the cultural values of religions are expressed through festivals

In addition to tangible culture, religion also contributes to the creation of intangible culture, which is moral and humanistic values, philosophies in dealing with people, nature and society, art, festivals, and religious ceremonies. It can be mentioned that many religious festivals have existed for a long time, preserved and developed from generation to generation such as Huong Pagoda festival, Yen Tu festival, Phu Day festival, Kate Festival, La Vang Festival, etc. According to statistics of the Cultural Industry, the country has about 8,000 festivals, of which 600 are religious festivals. The rest are mostly associated with beliefs.

Religious festivals themselves have created cultural values including: sacredness, community and self-governance. To form a religious festival, it is always necessary to find a certain “sacred” reason, the value of balancing the spiritual life emphasized in the festival. Through festivals, people can satisfy their needs for spiritual life. In addition, community characteristic in religious festivals is also highly appreciated. This value is reflected in the nature of all activities taking place during the process of organizing, operating and managing the festivals. Community strength associated with specific communities, whether large or small, still demonstrates the cultural strength to create great cohesion among individuals in the community. In today's society, this value has even greater significance and important status. In addition, other values of religious festivals such as self-governance, democratic spirit in creativity and cultural enjoyment are also highly promoted. Religious festivals of believers, which are acquired by believers and returned to serve the practical needs of believers' cultural and religious life. Believers self-organize, self-administer and arrange for festivals to take place smoothly, well and joyfully for many people in the community.

Thirdly, cultural values of religions are expressed through literature, music, and cuisine.

Those are literary and musical values imbued with humanity. Buddhist literature has a long history and has become familiar to the Vietnamese people. In particular, the combination of Buddhist thought with the art of language - national literature has produced a kind of literature that honors the impermanent beauty and imbued with the humane spirit of the Vietnamese nation; Catholic literary heritage includes works whose content is taken from the Bible, rituals, and deeds of saints and is composed in a poetic style (A Life of Consecration, New Earth, Companion, Journey to Heaven...); Hoa Hao Buddhist teachings are expressed mainly in the form of rhymes so that believers can easily memorize and remember, in order to cultivate themselves and study Buddhism, both with Buddhist characteristics and with folklore. Besides, the heritage of religious music in our country is very unique, in which “Buddhist music”, “Christian music”, “Cao Dai music”... contribute to enriching the national music scene.

In addition, religious cuisine is also a typical cultural feature that attracts a large number of tourists in spiritual tours. Among them, the most prominent is Buddhist cuisine. When it comes to Buddhist “food”, many people think that Buddhist cuisine is just “vegetarianism”, even just a matter of eating and drinking of “Buddhist monks”. So there is nothing special with that. In fact, Buddhist culinary culture is very meaningful, and nowadays, the culinary needs of many people are interested in each of their meals. Vegetarian dishes present in luxurious banquets of businessmen are not entirely religious and are increasingly known to international diners thanks to luxurious vegetarian buffets in the middle of Saigon (Venerable Giac Toan, 2018).

It can be said that thousands of religious relics and festivals are extremely valuable tangible and intangible cultural heritages. These heritages are clear evidences of the national culture and history reflecting the tradition of productive labor as well as the richness and diversity in the cultural and spiritual life of the people as well as the creation of many generations in history. This is an invaluable resource for us to exploit and serve the socio-economic development of the country in general, localities and regions in particular.

In short, the cultural values of religions are the synthesis, the crystallization of the tangible and intangible elements as described above, which are the product of the process of formation, development of the national history. The culture of religions contributes to the richness and diversity of the national culture. It not only satisfies the cultural life of society at each historical period, but also has many meanings for the development of the country in the current period.

3.2. Cultural values of religions with the development of the country in the current period

There was a time when the culture of religions was not considered as a contributing factor to the development, but a factor that hindered social development, or had a negative impact on social life. In this period, religions were considered superstitious; religious activities were restricted and prevented and many religious buildings were demolished. However, that has changed along with the renewal process of the country. According to our Party, culture is the spiritual foundation of society, both a goal and a driving force for socio-economic development. Without this spiritual foundation, there will be no sustainable socio-economic development. So, what does religious culture contribute to the development of social life? Does religion only contribute in the field of morality and spirituality? Does religion contribute to socio-economic development?

To be able to answer this question, we need to look at the culture of religions as a resource. To develop the country, we need a lot of resources, a total of resources such as natural resources (resources, minerals, land, sea...), human resources (labor force, intellectuals, talents...), human resources (thoughts, philosophies, experiences, ethics, solidarity, patriotism...). In other words, to develop the country, we need material resources and spiritual resources. Culture in general and the culture of religions in particular contribute not only to material resources but also to spiritual resources for social development.

Therefore, religion contributes to the creation of cultural relics, relics are national treasures, relics and scenic spots contain many historical, cultural and artistic values. .. This

is a valuable “resource” for the development of the country. Notably, this “resource” can be both conserved and exploited in a sustainable way without worrying about “running out” like natural resources. The core of sustainable development is the need to exploit more cultural, human, and human resources, rather than natural resources. The reasonable structure of sustainable development should probably be: exploitation of natural resources from 20-30%, exploitation of cultural, human and human resources: from 70-80%. If we look at this structure and ratio in Vietnam today, we can see that we are exploiting too much natural resources, but are exploiting little (or inefficiently exploiting) cultural resources, human resources.

Currently, the values of religious culture have also been initially exploited for tourism purposes. As we all know, Resolution No. 08NQ/TW of the Politburo on developing tourism into a spearhead economic sector has shown the importance of tourism in the development of the country. In recent years, spiritual tourism has become a trend that attracts a large number of domestic and foreign tourists. Famous tourist sites and festivals such as Huong Pagoda, Yen Tu, Temple of Ba Chua Xu Nui Sam, Nui Ba Den Tay Ninh, Kate Festival in Ninh Thuan, Binh Thuan, La Vang Sanctuary (Quang Tri), Di. My Son area (Quang Nam), etc., attracts millions of tourists every year. Many localities have exploited belief and religious heritages (tangible and intangible) to build attractions and tourism in order to attract domestic and foreign tourists. Many localities not only exploit and develop from existing heritages, but also build new works of belief and religion. Before the success and effectiveness of a number of spiritual tourism models, encouraged many localities to propose plans to develop this form, even had plans to invest and build spiritual tourism projects on a very large scale. A few years ago, the press reported on a number of “terrible” spiritual tourism projects such as the Perfume Pagoda Spiritual Project, the Nui Coc Lake eco-tourism area in Thai Nguyen with an expected investment capital of tens of thousands of dollars. thousand billion dong.

Localities interested in developing spiritual tourism not only because of the annual budget revenue, but also expect spiritual tourism to bring other positive impacts to the local socio-economic development. direction. Through the development of spiritual tourism, a large local workforce can get jobs by participating in many accompanying services such as goods, products for tourists, services. transportation, food service, rest and entertainment. Through tourism development, when the number of domestic and foreign tourists come to visit and tourism is large, other economic sectors of the locality are also stimulated to develop such as agriculture, handicrafts (such as the agricultural and handicraft industries). traditional crafts: bamboo and rattan knitting, weaving, ceramics, carpentry, etc.). Products of local industries have the opportunity to promote more widely, consume more, have the opportunity to sign and cooperate in production, business, and product consumption with domestic and foreign partners. Thus, if localities know how to exploit religious and belief heritages to develop tourism in a strategic way, with clear goals and towards sustainable development in the locality. can stimulate local socio-economic development very effectively. Not only tourism-related industries are newly developed, but all other industries and fields are also stimulated to develop. Through that, the local infrastructure is also built and developed, the investment opportunities of domestic and foreign enterprises for the locality are also expanded.

3.3. Problems posed to the culture of religions in the development of the country in the current period

Firstly, a part of the religious culture that shows signs of degradation

The decline of culture in general is a concern, but the culture of religions is even more worrisome because this is a sacred, precious and deep aspect of human spiritual life. Religions' cultures have degraded manifestations, which are reflected in: deviations in perception, in beliefs, excessive and blind behaviors and practices. The space of belief and religion is a place for people to awaken their conscience, repent of wrongdoing, a place to evoke the good seeds in each person, a place to spread noble human values, is a place for people to find serenity and purity in their souls... But a lot of people come here to pray for fame and fortune, for promotion, for wealth, for trading and trading. expensive, praying for others to be harmed so that they can benefit, even those who do illegal and sinful businesses also come to pray for their work luck. Many people realize that just by making a ceremony to offer the stars to release the term, they can neutralize all bad luck, there are people who believe in the “wrong home of the bondholder” and believe that just spending some money and asking a master will help them. help solve...

According to the actual survey, there are ceremonies where people burn hundreds of millions into votive coins. It is the distorted perceptions and practices of such a large number of people that have degraded religious culture. Unfortunately, this problem is “assisted” by a part of monks who lack virtue, have a pragmatic lifestyle, contrary to the spirit and principles of religions. Among the monks today, there are some who are not real monks but those who consider this a profession for a living. Therefore, they always have to rely on the ignorance of the people and believers to profit.

Secondly, the inadequacies in exploiting and promoting the values of culture, belief and religion in socio-economic development.

The culture of religions plays a significant role in socio-economic development, and many localities have also promoted this well. However, the methodical approach does not pay attention to sustainable development. To promote the culture of religions for the sustainable development of the country, we need to preserve and well preserve the culture of beliefs and religions. To promote well, we must have a scientific way of doing things, must have a sustainable purpose, cannot promote culture but turn into cultural destruction. In fact, there are many worrying issues surrounding this story.

One of the worrisome issues is that the space of belief and religion is being encroached on by “follow-up” services. Because of profits and the weak management of the government, services crowded around the space of relics, festivals, even services and products that are not suitable for the space of culture, beliefs, and religions. like selling wild game meat (like at Huong Pagoda), making the space here no different from a market. The number of visitors to the cave, the lack of strict management, the lack of tourist awareness, the lack of infrastructure, etc., have caused problems such as littering, environmental destruction, etc. ruins were destroyed, objectionable actions such as looting, fighting for fortune, activities such as divination, worshipping, and superstitious rituals also developed.

These problems have caused the space of belief and religion to become chaotic and chaotic, losing the beauty of sacred space and traditional cultural space.

In addition, for reasons of profit and only interested in profit, many localities have turned monuments as tools to make money, in other words, taking advantage of religious relics to collect money from people. They attach great importance to the issue of benefits without paying commensurate attention to the preservation and preservation of the values of culture, belief and religion. This is an issue that needs much attention from the Culture sector, and needs attention from governments at all levels in the socio-economic development of their respective localities. It is also a fact that, in some localities, the benefits from exploiting religious and religious values are falling into businesses. The State allocates land to mining enterprises to invest in the construction of infrastructure, but the budget revenue is insignificant. This is a phenomenon that needs to be fully evaluated and considered in order to avoid wasting state resources and wasting cultural resources in general, culture of religions in particular.

3.4. Solutions to promote the cultural values of religions in the sustainable development of the country in the current period

Firstly, raising awareness for Party committees and local authorities at all levels; departments, branches and unions; people about the cultural values of religions in sustainable development. The document of the 13th Congress of the Communist Party of Vietnam affirms: “Promoting good cultural and moral values and the resources of religions for the cause of national development” (Communist Party of Vietnam, 2021a, page 171). This is an important basis for deeply understanding the resources of religions in the development of the country. On that basis, party committees and local governments at all levels need to develop programs, plans and master plans. This program and plan must be based on the natural and religious characteristics of each locality and must be agreed upon by the departments and agencies together with the people in order to promote the cultural values of religions in the region. develop.

Secondly, preserving cultural values at religious institutions and festivals contributes to promoting the values of religions in sustainable development. Currently, due to the economic development of the country, the spiritual life of the people has been improved, so they have the conditions to repair and remodel architectural works, special cultural festivals of the religion. religion, contributing to honoring precious spiritual and cultural values. But for that process to be implemented effectively, the authorities need to have a clear direction so that the renovation and embellishment both retain the traditional values and bring the direction of the times. In addition, it is necessary to promote the role of religious organizations in preserving and promoting the cultural values of religion. In particular, especially the role of dignitaries and monks, it is necessary to regularly meet, contact, grasp needs and aspirations, create close, friendly and open relationships. Develop regulations on coordination between agencies, departments and branches and religious churches in the implementation of patriotic emulation movements and cultural movements, in order to promote the values of religions.

Thirdly, focus on exploiting cultural values of religions into community spiritual tourism activities, such as: Pilgrimage to spiritual places, temples, holy buildings, temples, radios, mausoleums, and mausoleums. , palace, memorial area, conducting worship activities... Activities of worshiping, praying, chanting, meditation, yoga, Dharma talk, tea meditation, consultation, Dharma talk, meditation song, relaxation meditation... ; sightseeing, sightseeing, enjoying landscape space and architectural space, sculpture associated with spiritual points; learn about culture associated with religious history and indigenous way of life, cultural heritage values associated with spiritual points; participate in traditional religious and folk festivals.

Fourthly, invest and attract investment capital for infrastructure to serve the exploitation of cultural values of religions in sustainable development of the country. Concentrating investment from the State budget in a synchronous direction, with focus and focus; prioritize investment in infrastructure development in key areas. Besides, implementing socialization and development of religious establishments with tourism elements, encouraging economic sectors to participate in investing in spiritual tourism activities in different forms.

Fifthly, promote training and human resource development, contributing to promoting the cultural values of religions. The force of spiritual tour guides is still lacking in number and weak in professional expertise. Guide human resources to understand religion; must understand deeply the meaning of each religious architecture and festival. Therefore, in the coming time, it is necessary to promote training, develop human resources, increase the effectiveness and efficiency of human resource management, renew training programs, study religious cultural characteristics, especially points, economic and social strengths, development potential.

4. Conclusion

Cultures of religions need to be realized more fully and properly so that they can promote positive values in the cause of national development. Through this article, we also hope that the manifestations of degradation in the culture of belief and religion in Vietnam today need to be fully identified and remedied. At the same time, inadequacies in promoting cultural values of religions for socio-economic development in many localities also need to be fully recognized and evaluated in order to have solutions to overcome.

Religions culture for socio-economic development in a sustainable way because this is a valuable resource of the country. In the future, it is necessary to change the rate of exploitation of natural resources to avoid the current rate of natural resource exploitation being too large. It is necessary to develop strategies, programs and plans in a scientific way to be able to promote this resource in a sustainable way. Promoting the role and values of beliefs and religions for the development of the country, in our opinion, is also preserving and preserving the values of beliefs and religions.

Promoting the role and values of culture, belief and religion for the development of the country, in our opinion, this is not only the story of the State, but also the story of localities and organizations. religion and of the whole community and society.

CHANGE OF PRODUCTIVE FORCES IN DIGITAL ECONOMY AND RECOMMENDATIONS TO VIETNAM

Assoc. Prof. Dr. Nguyen Thi Thanh Hieu

hieunt@neu.edu.vn

Faculty of Political Theory, National Economics University, Vietnam

Abstract

On the basis of an overview of the digital economy, the author of this article identifies the change of the productive force factors in the digital economy in Vietnam to propose recommendations for the development of the productive forces in the context of the industrial revolution 4.0 developing rapidly and our country's deeper and broader integration into the world economy.

Keywords: *Industrial revolution 4.0, digital economy, productive forces, employees, relations of production, means of labor, Vietnam.*

1. Introduction

Karl Marx discovered the compatibility between the relations of production and the level and character of the development of productive forces – the objective and fundamental rule of movement and development of human society. It can be seen that the productive forces and the relations of production in Vietnam have all changed as a result of the implementation of the Party's Renovation (Doi Moi) Policy and Vietnam's deeper and broader integration into the world economy as well as the impact of the modern scientific and technological revolution.

In Vietnam, there have been quite a lot of studies on the productive forces or the digital economy, but there are not many studies on this topic. This article analyzes the change of factors of the productive forces in the digital economy model in Vietnam and recommends science-based solutions to boost the development of the productive forces in the coming time.

2. Method

The authors have collected the data and information on the transformation of productive forces and the digital economy in Vietnam, then have used statistical analysis methods combined with data analysis and processing to propose solutions and recommendations to develop productive forces.

3. Results

3.1. Overview of digital economy

The digital economy is a broad concept and difficult to measure. There has not been a unified and official definition of "digital economy" in the world so far. In Vietnam, at the "Vietnam Private Economic Forum 2019", digital economy is understood as all economic activities based on a digital platform, and the development of digital economy is the use of digital technology and data to create new business models. Digital economy includes all

sectors and economies (industry, agriculture, services; production, distribution, circulation of goods, transportation, logistics, finance and banking...) in which the digital technology is applied. The typical feature of digital economy is that the operation of all economic activities is mainly based on the digital technology. Economic and social activities are operated mainly on the basis of the use of information and communication technologies. Digital knowledge is the key element to conduct electronic transactions through the Internet, mobile networks and sensor networks, whose speeds and performance that are far superior to previous economies. The digital economy makes traditional production tools more powerful, promoting areas of innovation and saving the cost. The backbone of the digital economy is hyper-connectivity, which is the foundation of cooperation to create new ways for knowledge production. Information systems, especially the Internet of Things (IoT) are capable of generating powerful, high-speed direct streams of information. Information at the time of creation is more valuable than any old knowledge. Artificial intelligence (AI) and other advanced analytic technologies rapidly reduce the cost of information processing. All knowledge only has real competitive value at the moment it is created and rapidly decays into legacy knowledge. The only way to find a competitive advantage in the digital economy is to directly learn how to use available information to make decisions that are responsive to market demand. The digital economy plays an important role in all areas of economic, political and social life. It not only strongly supports economic activities of enterprises to maximize profits, but also strongly supports State management to find solutions to maximize social benefits faster and more effective. It not only helps to improve the life quality of consumers, but also to create a platform for people to access new knowledge faster, more accurately and more effectively, meeting the needs of learning and scientific research better.

Southeast Asia is the region which has the most internet users in the world. Google, Temasek and Bain & Company announced that Singapore's digital economy decreased by 24% from 12 billion USD in 2019 to 9 billion USD in 2020 while Vietnam and Indonesia have still maintained double-digit growth. Vietnam leads Southeast Asia in growth, with its digital economy expanding 16% from 12 billion USD in 2019 to 14 billion USD in 2020. The digital economy of Indonesia, the most populous country in the region, grew 11% from 40 billion USD in 2019 to 44 billion USD in 2020.

According to the Southeast Asia’s Digital Economy 2021 Report – Roaring 20’s: The SEA Digital Decade by Google, Temasek and Bain & Company, Vietnam's digital economy was forecasted to reach 220 billion USD in gross merchandise value (GMV) by 2030, becoming the second largest one in Southeast Asia behind Indonesia. In 2021, Vietnam's digital economy was expected to grow by 31% to 21 billion USD compared to 2020 and was expected to continue to reach 57 billion USD in 2025.

3.2. The transformation of the productive force factors in the digital economy in Vietnam

Entering the twenty-first century, the productive forces of the world have moved to a new development level with the occurrence and development of the Fourth Industrial Revolution with the new digital technology as a decisive role, in which artificial intelligence (AI) and big data lead the way. The two key technologies are followed by the third evolution of the Internet, Internet of Things (IoT), Blockchain, the sharing economy, 3D and 4D printing, and cloud services. Nowadays, modern productive forces are based on new technologies, which are characterized by high productivity, high efficiency, cause less damage to the ecological environment, and consume less energy and materials for production, as well as create more the knowledge proportion in each product.

3.2.1. Employees in the digital economy

Human capital is an important source of capital in the modern productive forces. Human capital includes not only the folk knowledge accumulated by each person in their life (knacks, skills, techniques, long experience, skillful workmanship...) but also scientific knowledge also known as knowledge that can be codified, encrypted, and disseminated over computer networks. Employees are becoming the most important and decisive factor in the modern productive forces. They create modern working tools, new objects of labor, increasingly advanced means of production, and constantly improve their qualifications, skills and knowledge.

When science became a direct productive force, scientific knowledge drastically changed the level of modern productive forces. Modern productive forces not only occur in new manufacturing sectors; but also influence, renovate and renew old manufacturing sectors of the economy. The more efficient and faster the promotion and exploitation of the available knowledge and the generation of new knowledge are, the higher the economic growth is.

As the scientific knowledge is global, the modern productive forces based on scientific knowledge are also globalized. Because the strong development of the internet and science in particular, and knowledge in general are spread rapidly, almost instantaneously all over the world; the knowledge flow, the technology flow, as well as the capital flows are circulating at unprecedented speeds.

In the manufacturing process, there are not only blue-collar workers, but also an increasing number of direct production managers, engineers and technologists creating scientific and technological products. At present, it is the high development of the productive forces at the high level of intellectualization in the manufacturing process making the distance between workers and managers closer. Corresponding to different levels of production tools, the experience and skills of Vietnamese employees are also very different from manual and simple workers, mechanical workers to workers with modern machines and automation. Since then, the level of labor organization, and the level of application of science and technology to production in different manufacturing facilities are also very various.

According to the latest figures from the United Nations, the current population of Vietnam is 98,788,357 people (as of April 15, 2022). Vietnam's population currently accounts for 1.24% of the world's population. Vietnam is ranked 15th in the list of countries and territories by population. The average age in Vietnam is 33.3 years old. (<https://danso.org/viet-nam/>)

Although the proportion of trained, skilled and qualified workers has increased significantly in recent times; it is still quite low, so cannot meet the current demand of the economy. According to the assessment of the World Bank (WB) 2019, Vietnam is 11th out of 12 Asian countries in the ranking of quality of *human resources* with 3.79 points out of 10 because of the deficiency in highly qualified experts and skilled workers. Besides, the knowledge economy index (KEI) of our country is still low with only 3.51 points, ranking 106 out of 133 classified countries. Most rural workers have not received vocational training, causing low labor productivity. These issues are making huge challenges for Vietnam in the process of developing a modern productive force.

The comparison of the population pyramids in 2009 and 2019 shows that in 2019, the group aged 70-74 and above tends to increase, which confirms the trend of aging population growing rapidly in Vietnam. The change in age structure with the proportion of children under 15 years old decreasing and the proportion of people aged 60 and over increasing has made the aging index of Vietnam tend to grow rapidly in the past two decades. The aging index in 2019 is 48.8%, going up 13.3 percentage points compared to 2009 and more than twice as large as in 1999. The aging index is forecasted to continue to increase in the coming years (Nguyen Thuy Quynh, 2021).

In addition, the human resource development, especially high-quality human resources, is still limited and has not met the requirements. The proportion of untrained workers is still large, and the quality of training is low. The industry structure is not reasonable. There is also a shortage of qualified, capable and skilled workers...

3.2.2. Means of production in the digital economy

If workers are the most important factor of the productive forces, the tools of production are the most dynamic factor. The fundamental change in the tools of production contributes to the change of economic eras. Nowadays, the object of labor has also changed a lot. If in the agricultural civilization, the main object of labor is land; the labor object of the mechanical civilization is expanded. In addition to land, there are raw materials (coal, fuel, oil and gas, fossil materials, mines,...) and raw materials required for such industries as

iron, steel, yarn, textile, automobile, mechanical engineering, ... The object of labor in this modern era is mainly information.

At present, science and technology have become a direct productive force, which is the direct cause of many changes in production. It has been widely applied in production and has become an indispensable element of the production process. It has penetrated the factors of the productive forces; and has brought a qualitative change in the productive forces. Besides, it has made the main production process become a process of science and technology application, which is quite vital to many manufacturing processes.

In general, labor tools in Vietnam are various with many levels, which include manual labor, mechanization, modernization, and automation. The current levels of science and technology in our country are also very diverse and uneven. Most of its levels are low and have a slow development; however, there are also elements of modernity going ahead and taking the lead.

The real situation of applying modern science and technology achievements to the development of productive forces in Vietnam:

The survey results on processing and manufacturing enterprises in 2015 showed that about 57% of these enterprises had low technology; 31% of these enterprises had medium technology, but only 12% of these enterprises had high technology. While the regional countries had a high proportion of science and technology investment in production, Vietnam's investment level was still low. In the 2006-2016 period, the proportion of Vietnam's GDP invested in science and technology was about 0.6%. Within 10 years, this rate only increased from 0.48% to 0.51%. Therefore, after 35 years of renovation, Vietnam's industry still only stops at the processing level.

In 2021, Vietnam's expenditure on science and technology reached 7,732 billion VND, accounting for only 0.934% of the total expenditure of the Central Budget which was 827,550 billion VND (Hong Linh, 2022).

The real situation of Vietnam's infrastructure for the development of productive forces:

In recent years, the application of modern science and technology achievements in production, improvement of production tools and in expansion of the labor force and means of labor in our country have also made significant progress. Although great achievements have been made, the construction of infrastructure for manufacture in our country still reveals many weaknesses such as the significantly asynchronous and unbalanced infrastructure system across regions. The infrastructure system in big cities such as Hanoi and Ho Chi Minh City is quite modern while in rural, mountainous and island areas, it is still backward, weak, and has limited quality. Besides, there are many shortcomings in the management, exploitation and use of infrastructure services.

4. Discussion and Conclusion

Proposals and recommendations for the growth of the productive forces to develop the digital economy in Vietnam

Firstly, it is necessary to improve the quality of human resources - the most important factor of the productive forces in order to meet the requirements of industrialization and modernization of the country and international integration, with an emphasis on the rapid

development of human resources for the digital economy, especially human resources for artificial intelligence. The advantage of the "golden population" period needs to be turned into the advantage of digital capabilities in global integration and division of labor. Besides, it is important to focus on training qualified human resources of international technology. Employees must be equipped with diverse skills to easily adapt to the 4.0 era and the market needs.

Secondly, the government needs to raise the awareness and responsibility of cadres, party members and people on science and technology development, actively seizing opportunities and taking full advantage of the industry 4.0 to develop the social economics of Vietnam. The first necessary thing is to thoroughly study the contents, operation methods and impacts of the Industrial Revolution 4.0, task orientation and specific solutions in several industries, fields and localities to integrate and blend into the flow of this industrial revolution. The next things are to promote creativity in scientific and technological innovation; to develop mechanisms and policies to create a favorable environment to increase the level of operation and the number of science and technology service organizations and technology application units; and to increase the investment in building a number of research and development organizations to reach modern and advanced levels to promote the integration process. Besides, creating close links between science and technology organizations, universities and enterprises; linking scientific research, training activities with production – business is also very important.

Thirdly, the government should continue to amend, supplement and complete mechanisms, policies and laws to liberate, maximize and improve the efficiency of using existing resources, and to promote socio-economic development according to the market principle; ensuring the socialist orientation publicity and transparency in the management, exploitation and use of the country's resources. It is also essential to review and urgently reduce business conditions that are barriers to the operation of enterprises and individual business establishments. In addition, appropriate policies and solutions should be made to encourage individual business establishments to turn into enterprises; to create favorable business conditions for individual establishments to do stable, long-term business and comply with the law.

Fourthly, it is important to drastically restructure the economy in association with renovating the growth model, improving productivity, efficiency and competitiveness of the economy; to renovate the economic structure of sectors, regions and product structure in the direction of modernity, promoting comparative advantages and deeply participating in the global value chain, in which focusing on restructuring the agriculture and fishery industries in the direction of improving the quality of plant and animal products on the basis of applying modern technology, biotechnology and bringing high economic efficiency; to focus on developing the processing and manufacturing industries, especially the deep processing industry, the processing of agricultural products, the supporting industries, the production of consumer goods and export goods; to improve the quality and efficiency of service industries, to put the emphasis on the development of service industries with high labor productivity, high value-added services, and modern tourism services. Besides, it is also

necessary to concentrate resources on developing products with comparative advantage, competitiveness, high added value and consumption market.

Fifthly, it is essential to renovate the socio-economic development model from mainly relying on the exploitation of resources, investment capital and labor to the integrated and efficient usage of the economy's resources and using science and technology, innovation for sustainable development. Focusing on synchronously implementing solutions to improve labor productivity, considering this as the most important content in improving competitiveness and sustainable development of the economy is also crucial.

Sixthly, it is vital to increase the exploitation of growth opportunities through deeper economic integration, including the promotion of free trade agreements with ASEAN countries and other major partners in Asia such as Japan, Korea and China. Besides giving the opportunity of market access, the integration process also supports Vietnam's institutional reforms, putting it on the right track to create a more competitive and innovative economy. The government needs to promote enterprises to be more proactive in exploring FTAs to build innovative business plans, overcome challenges and take advantage of most of the opportunities from international economic integration. They should also focus on supporting associations and businesses to actively respond to the new wave of protectionism in major economies around the world.

DEVELOPMENT OF LECTURER RESOURCES TO MEET THE REQUIREMENTS OF TRANSFORMING INTO INNOVATION-ORIENTED UNIVERSITY MODEL IN VIETNAM TODAY

MA. Nguyen Minh Hung

nmhung2325@gmail.com

Graduate Academy of Social Sciences, Hanoi, Vietnam

Abstract

It is inevitable that Vietnamese universities are to transform into an innovation oriented model in the context of increasingly drastical globalization and the Fourth Industrial Revolution. It is the lecturer resources that plays an important and decisive role in, and as a result, the development of this resource is the key step of the transforming process. The development of teaching staff work force must meet the requirements of transforming the university model towards innovation. Over the years, despite positive changes in teaching staff work force in Vietnam, there are still shortcomings, taking into account the requirements of innovation. Therefore, in order to develop the teaching staff work force on a par with the new period, it is necessary to implement synchronous solutions, of which the second solution is most important.

Keywords: *Lecturer resources, university model, innovation.*

1. Introduction

Presently, Vietnam is “strengthening the renewal of the economic growth model, strongly transforming the economy to a growth model based on productivity, scientific and technological progress, innovation, high-quality human resources, economical and efficient use of resources to improve the quality, efficiency and competitiveness of the economy. Improve the investment and business environment, promote creative start-ups, develop industries, sectors and enterprises on the basis of strong application of scientific and technological achievements, especially from the fourth industrial revolution; develop products with competitive advantages, high-tech products, high value-added products, environmental-friendly products with effective engagement in the global production network and value chain” (Vietnamese Communist Party, 2021, pp.120-121). Renovating the growth model, restructuring the economy; accelerate industrialization, modernization, and developing nations in such a rapid and sustainable manner are placing new demands for universities in Vietnam nowadays.

Education, therefore, ought to adapt to the context of socio-economic development. Accordingly, transforming into the innovation oriented university model is an inevitable trend in the context of drastical development of the Fourth Industrial Revolution that has been creating breakthroughs in many fields, brings both opportunities and challenges to every university.

The lecturer resource is decisive factor in the success of transforming into the innovation oriented university model. After all, any transformation of the universities are rooted in the teaching and research activities of the lecturers. Innovation is a core feature of lecturer resources. The development of lecturer resources to meet the requirements of transforming into an innovation-oriented university model in Vietnam today, is the key step.

2. Method

In order to conduct the study, the structural system method, the statistical method, the socio-economic analysis and synthesis method are employed based on the specific conditions of Vietnam.

3. Results

3.1. Transforming into an innovation-oriented university model is an inevitable trend to improve the quality of human resource training in Vietnam today

Innovation is a prerequisite for improving competitiveness, for survival and development. Innovation is application of new knowledge into practice to create added value, through practical activities to realize the power of knowledge and commercialize it. For this purpose, it should also be further defined that the concepts of “innovation”, “creation” and “creative innovation” are closely related, but not identical.

Innovation is to leave behind the existing way of thinking and doing, and to come up with a new way of thinking and doing in accordance with the new situation. Therefore, innovation is deemed as the trend of development. Creativity is coming up with new ideas but not necessarily bringing value. To get value, those new ideas must be applied into practice, realized and accepted by the market.

Creative innovation is the creation of new knowledge in a creative way, associated with the application of such knowledge in practice in a creative way and accepted by the market. The creation of new knowledge may not be immediately put into practice. Therefore, compared to the creative innovation, it often takes a time lag for the creation to apply creative ideas into practice. Late application will result in loss of opportunity, loss of advantages, loss of room for development, and the consequences of stagnation and lagging behind.

In the context of increasingly drastical globalization and the Fourth Industrial Revolution, universities are to innovate their models to adapt for survival and development. Transforming into an innovation-oriented university model is an inevitable trend, a vital requirement, and a prerequisite for them to catch up fast and sustainable development in the digital era.

In Vietnam, “based on capacity and requirements for socio-economic development, higher education institutions determine development goals and operation orientations as follows:

- a) Research-oriented higher education institutions;
- b) Application-oriented higher education institutions” (National Assembly of the Socialist Republic of Vietnam, 2019, p.15).

Both models have made positive contributions in training high-quality human resources serving the cause of industrialization and modernization of the country. However, in the face of the requirements to strongly shift the economy to a growth model based on

scientific, technological and innovation progress, the models of the aforementioned higher education institutions revealed many shortcomings. Therefore, education and training have not really become a key driving force for socio-economic development; higher education institutions have not commercialized knowledge; knowledge assets have not been capitalized and contributed to the increase of value in the market economy; the university autonomy mechanism has many shortcomings; the quality and effectiveness of education and training is not high; “The contents and curriculum of education and training show a huge gap between theory and practice. The link between training and scientific research, production and business and the needs of the labor market is limited” (Vietnamese Communist Party, 2021, p.82). The inadequacy of higher education shows the need to transform the university model into an innovation-oriented model.

In light of the industrial revolution 4.0 in Vietnam today, it is essential to renovate the university model to match the new economic growth model which is based on science and technology advancements, innovation, creativity and high-quality human resources. The fourth industrial revolution leads to a smart economy known as a digital economy (a digital economy operating on a digital technology platform is a specific form of a knowledge economy) and a smart higher education system. Accordingly, the university model 4.0 - an innovation-oriented university model is developed.

Higher education ought to meet the requirements of socio-economic development and it is the socio-economic development that facilitates the innovation of higher education. Reforming the growth model and restructuring the economy to ensure fast and sustainable growth is Vietnam's socio-economic development strategy at present, which is posing urgent requirements for innovation of the university model. It is a reform of the innovation-oriented university model that can “meet the new requirements of socio-economic, scientific and technological development. Adapt to the Fourth Industrial Revolution” (Vietnamese Communist Party, 2021, p.136). Not only that, reform of the innovation-oriented university model is also a solid foundation for universities to promote fundamental and comprehensive innovation and improve the quality of education and training, modernize and change the mode of education and training.

Contents of innovation-oriented university model reform in Vietnam, including: synchronously reforming goals, contents, programs, approaches and methods of education and training in the direction of modernity, international integration; synchronously reforming, improving of the effectiveness and efficiency of state management, professional management and administration, expertise in education and training, step by step effectively implementing the autonomy mechanism associated with the accountability of universities; promoting innovation, transfer, application and strongly developing science, technology and digital transformation to create breakthroughs in quality, efficiency and competitiveness; reforming and strengthening cooperation and international integration in education - training, linking international cooperation in education - training with all fields of socio-economic life. “Effectively developing and implementing a strategy for international cooperation and integration in education and training; Striving to make our country a strong

country in education and training in the region, catching up with the advanced level of the world, participating in the international human resource training market” (Vietnamese Communist Party, 2021, p.140).

In the context of increasingly extensive globalization and international integration; the industrial revolution 4.0, especially the strong development of digital technology, Vietnam's higher education, in that context, only by reforming the universities' model in innovation-oriented direction will support for the adaptation to social requirements and make a positive contribution to: improve innovative and creative competency, modern management; promote the transfer, application and development of science and technology in line with the general trend of the world and the conditions of Vietnam; improve the quality of human resources, develop an innovative startup ecosystem; effectively implement the policy of integration education and training together with science and technology as top policy, a key driving force for the development and enhancement of the economy's competitiveness.

3.2. Lecturer resources - that plays an important and decisive role in the transforming into an innovation-oriented university model creative

Higher education plays an important role in the national education system of Vietnam. It is where to train high-qualified human resources with university, master and doctoral degrees - who are able to work independently, creatively and have the ability to detect and solve problems posed by practice. At universities, the lecturer resources plays a decisive role in improving the quality of education and training high-qualified human resources; and this is also the core force to carry out fundamental and comprehensive reform of higher education in Vietnam.

The objectives of higher education in Vietnam today are: “a) Training human resources, raising people's knowledge, fostering talents; performing scientific and technological research, creating new knowledge and products, serving the requirements of socio-economic development, ensuring national defense and security and international integration; b) Training learners with political and moral qualities being equipped with knowledge and skills for professional practice, having the capacity to research and develop science and technology applications commensurate with the training level; having a healthy body; having creative ability and professional responsibility, adapting to the working environment; consciously serving the people” (National Assembly of the Socialist Republic of Vietnam, 2019, p.12).

To achieve these objectives, higher education must use many resources such as financial resources, physical resources, scientific and technological resources and lecturer resources. In which, the lecturer resources is the decisive, the most important one to exploit and effectively use other resources. Therefore, the development of lecturer resources is a key step that determines the success of transforming into an innovation-oriented university model. The Fourth Industrial Revolution has created many unprecedented changes compared to before and has a strong impact on the entire education and training process. Under that impact, it is required that universities must fundamentally reform the contents, programs,

approaches and methods of teaching and learning in the direction of modernity and international integration.

The wave of industrial revolution 4.0 and the current process of globalization are promoting Vietnam's deeper international integration to develop higher education; at the same time, higher education must meet the requirements of globalization and international integration to develop the country. However, the challenges and difficulties that are posed for higher education in Vietnam are resources, including financial resources and lecturer resources, which are still inadequate and limited. According to current regulations, for a university to become a research-oriented higher education institution, the ratio of lecturers with doctoral degrees over total number of lecturers must reach 50% or more. According to statistics of the Ministry of Education and Training in 2020, there are 56,990 full-time lecturers, including 436 professors; 3,795 associate professors; 18,317 doctorates; 34,054 masters and 4,433 staff with university degrees out of total number of higher education institutions in Vietnam. The above figures indicate that the ratio of lecturers with a doctorate degree out of total number of lecturers is $18317/56,990$ (32%). Thus, in order to actively and positively integrate into the world to promote the reform of higher education in Vietnam, first of all, it is necessary to focus on developing lecturer resources. Development of lecturer resources is the golden key to open the door for Vietnamese higher education to firmly step into the digital era.

The reform of curriculum needs to embrace the educational philosophy of “provide learners with what they need, not what the school is able to do”. Providing learners with what the school is able to do but unnecessary for the learners also means no education or training at all. At universities, only lecturer resources play a decisive role in researching, selecting the courses that are really necessary for learners and putting them into the training program in the direction of streamlining, modernity and practicality. The lecturers are the persons who directly instruct the learner's knowledge acquisition process, so it requires the lecturers to have the capacity to develop the training program. The current reality has shown us that, due to the limited lecturer resources, especially the capacity to develop training programs, the training programs of many Vietnamese universities have not updated to keep up with the requirements of the times; are under the situation of heavy theory, light practice; lack of connection with scientific research, production, business and labor market needs. The training programs and content are subjective, imposed, formal, coping, invalidated, not drawn through research not as an isolated case. The situation that some universities still provide learners with unnecessary knowledge for the learners that are unable to practically apply is still ongoing. This is one of the reasons why some universities' outcomes have not been accepted by the market; The adaptability of human resources and the capacity of the innovation ecosystem at all levels from central to grassroots levels are still inadequate.

The real innovation should be performed through activities to create added value. The value is the standard, the measure of innovation. Learning is to practice, getting knowledge is to do - the educational philosophy of “knowledge and practice go hand in hand” has not been fully mastered by universities and lecturers. It is responsibility of the

lecturers, first of all, to reform the curriculum and training contents. It is defined that the transformation into innovation-oriented university model is to be rooted from the lecturers. Development of lecturer resources is the key step to realize the innovative university model.

Robusting innovation is the university's mission for which to be accomplished, the prerequisite is to develop lecturer resources. The the lecturers' innovation result in the learners' innovation; Only those who approach with creativity will have creative learners; the lecturers with capacity of developing new knowledge with help the learner be able to develop new knowledge; the teacher with capacity of effectively solving the problems posed by practice, will equip their learner with the same ability - like lecturers, like students. Good teaching and good learning are inextricably linked. Never before has the educational philosophy of good teaching and good learning has been as profound as it is today. In the flat world, the amount of human knowledge increases very rapidly and also quickly becomes obsolete, the new replaces the old, but then this new will be replaced by the newer, so on forever and in progress. The process is getting shorter and shorter in terms of time unpredictably. Therefore, it is important for the lecturers to give learners the ability to innovate, to find new things and apply them to practice to achieve the highest efficiency without being constrained or stereotyped according to the existing ones; Lecturers must focus on teaching how to learn, how to think, create a basis for learners to update and renew their knowledge, skills, and capacity development. This is also the requirement, content and mission of the innovation-oriented university model. To accomplish this task, first of all, there must be lecturer resources of lecturer on par with the requirements of the new period.

According to the announcement of the World Intellectual Property Organization (WIPO), in 2021, Vietnam was ranked the 44th out of 132 countries/economies on the Global Innovation Index (GII). This index to some extents reflects the current state of innovation capacity of teaching staff work force. Over the years, the Global Innovation Index in Vietnam has continuously improved. However, in consideration of the development goal by 2030 when Vietnam becomes “a developing country with modern industry and high average income” (Vietnamese Communist Party, 2021, p.112), the Global Innovation Index is still inadequate. Therefore, it is necessary to continue to focus on improving innovation capacity in human resource development, especially lecturers in higher education institutions to a new development level; contribute to making a breakthrough in improving productivity, quality, efficiency and competitiveness of the economy.

3.3. Approaches to develop lecturer resources to meet the requirements of transforming into innovation-oriented university model

The first, creating a strong change in people's awareness about developing lecturer resources as the top task of transforming into an innovation-oriented university model. Lecturers are a key factor determining the success of developing an innovation-oriented university model. The development of lecturer resources in innovation activities is a breakthrough solution. High-qualified lecturer resources are both a requirement and a prerequisite to ensure that universities transform into an innovative university model with development in depth.

The second, is training and fostering teaching staff work force according to the requirements of transforming the university model into innovation-oriented universities. Professional capacity and expertise of lecturers should be improved, especially the training program development capacity, teaching capacity according to modern methods, scientific research capacity, foreign language proficiency and information technology competency. Organizational forms and methods of training and fostering lecturers should be renovated and diversified. Training and fostering in the form of traditional education (conventional education) should be combined with the modern form of education (online education). The application of information technology to training, scientific research, management and administration activities should be enhanced according to the model of innovation-oriented and smart university; digital transformation should be realized in all university activities.

The third, strengthening international cooperation and integration in education, training and scientific research. Giving a policy of cooperation in exploiting common infrastructure such as laboratories and modern equipment; giving policies to support lecturers in international academic exchanges and activities; Prioritizing investment in lecturers' research and innovation. The integration of Vietnamese higher education into the world higher education system should be enhanced to keep up with the times. "Improve the capacity of the national innovation system, restructure scientific and technological research programs in enterprise-centric direction with the goal of effectively serving the cause of national construction and defense" (Vietnamese Communist Party, 2021, p.141).

The fourth, is forecasting and developing strategies for developing teaching staff work force satisfying new requirements of socio-economic development, science, technology and adaptation to digital transformation. In the higher education development strategy, it is necessary to associate the goal of transforming the university model into an innovation-oriented university model with the goal of lecturers' personal development. University autonomy should be promoted. First of all, higher education institutions exercise autonomy in recruiting, employed, planning, training, evaluating, appointing, rewarding, disciplining, and compensations for lecturers. "Synchronous innovation is promoted to improve the effectiveness and efficiency of state management, professional and expertise management and administration in education and training, gradually and effectively implementing the autonomy mechanism associated with accountability of education and training institutions. Build a healthy educational environment, rectify uncompromisingly the achievement diseases, prevent and strictly handle negatives in education and training. Complete and stably implement methods of assessment and accreditation of quality of education and training" (Vietnamese Communist Party, 2021, p.139). Policies should be issued to support the commercialization of scientific and technological research findings of lecturers.

The fifth, creating an environment and conditions to promote innovation. Encouraging lecturers to perform scientific research, transfer and apply scientific and technological advances; dare to think, dare to do, dare to breakthrough, dare to take responsibility for improving the quality of training, in order to meet the requirements of high-quality human resources of the Fourth Industrial Revolution and international

integration. Building a healthy educational environment, overcoming achievement ideology and taking the quality and efficiency of output as a standard. Harmoniously developing between public and non-public education. “Improving mechanisms and policies for the development of non-public training institutions in accordance with the trend of the world and Vietnam's conditions on the basis of ensuring social justice and the basic values of socialist orientation” (Vietnamese Communist Party, 2021, p.138). “Push up the socialization of education and training, firstly for higher education. Encourage healthy competition in education and training, encourage enterprises to participate in activities to support training activities; encourage links with prestigious foreign higher education institutions in training, research, application and transfer of science and technology. Promote international cultural and academic exchanges. Create conditions for international experts and overseas Vietnamese to participate in lecturing and research at domestic educational and training institutions” (Vietnamese Communist Party, 2013, p.138). Prioritize resources, have special mechanisms and policies to develop lecturers human resources to meet the requirements of reforming the university model towards innovation-oriented directions.

4. Discussion and Conclusion

In the current context, education and training, together with science and technology, are becoming the most important driving forces for socio-economic development and enhancing Vietnam’s position. Actively and actively engaging in the fourth industrial revolution is an indispensable and objective requirement, an urgent and long-term task of special strategic importance of the university setting in Vietnam, which is closely associated with the intensive international integration process.

Transforming into an innovation-oriented university model is inevitable for universities in the digital era. It is a lecturer resources that plays an important and decisive role in such a process. Lecturers are the most advanced sections in the high-quality human resources – they are the pattern of high-quality human resources.

Therefore, developing lecturer resources with sufficient quantity, high quality and suitable structure must be given priority ahead of other resources. In order to have lecturer resources on a par with the innovative university model, it is necessary to synchronously implement the above approaches. Develop the lecturers’ resources to meet the requirements of reforming the university model towards innovation-oriented directions, which is considered as a breakthrough in the fundamental and comprehensive innovation of higher education in Vietnam nowadays.

Abstract

Vietnam's traditional environmental ethics are built on the smooth connection between human philosophy and are deeply influenced by Eastern philosophy along with the practical way of life in labor close to nature. Vietnam's traditional environmental ethics are all the ideas, feelings, customs, habits, and behaviors of Vietnamese people toward the natural environment that are relatively stable and deeply ingrained in psychology and social practices, having a positive impact on the community, passed down from one to another generation and followed by everyone. Traditional environmental ethics are clearly expressed in the life of the ancient Vietnamese and have meaning in building environmental ethics today, contributing to the country's sustainable development.

Keywords: *Construction, Environmental ethics, Traditional, Vietnam.*

1. Introduction

Today, the strong development of the modern scientific and technological revolution has led to great changes in many fields, especially the economic field. However, the miraculous successes in economics, science, and technology lead to the negative side of environmental pollution. For a long time, when discussing environmental issues, people usually only pay attention to, technological, economic, medical, and legal aspects, while other aspects such as cultural and traditional factors of the nation, and lifestyle ethics have not been paid much attention to, although they are basic and very important factors in regulating human behavior in the process of exploiting and using natural resources and environmental protection.

The Vietnamese have traditionally had a very significant sense of environmental protection. This consciousness is expressed in the conventions, customary laws, proverbs, and folk songs, but even higher is found in some laws of the Vietnamese feudal dynasties. Human behavior with the natural environment is expressed by each community through conventions

and customary laws to regulate each individual in the community they live and follow, and these are environmental ethical factors highest in the history of the Vietnamese community.

Currently, the environment in Vietnam is at an alarming level because of the heavy destruction of the natural environment by humans. Large environmental cases are increasing day by day with serious consequences affecting the economy. Faced with that situation, Vietnam has come up with many solutions to solve environmental problems and sustainable economic development but has not yet solved the root of the problem. Because for the protection of the environment, people in addition to the awareness of the importance of the environment in their lives also need more attitudes, emotions, and behaviors to implement it. The sustainable and long-term environmental solution is to improve environmental ethics. In that process, it is required that we know how to promote traditional environmental ethical values and contribute to improving environmental ethics for everyone to protect the ecological environment in Vietnam today.

1.1. Environmental Ethics concept

Discussing the concept of environmental ethics has many different conceptions depending on the approaches of researchers from the perspective of philosophy, sociology, and psychology, especially there are many studies on environmental ethics come from philosophers.

In both the East and the West, there have existed many different views on environmental ethics, reflecting different worldviews and human views, as well as showing different levels of awareness of human society through each historical period. Environmental ethics is also known as environmental ethics or ecological ethics. From the perspective of ecological ethics, the term "ecology" in Greek is "Oikos" which means housing, residence, and living place of living beings from inorganic to organic, from small to big, from plants, animals to humans. From another perspective, ecology can be expressed as the interrelationship between living organisms and the environment, including the interaction between human society and the entire biosphere. The term environmental ethics appeared in the 60s of the twentieth century, so far around the term "environmental ethics" there is much controversy about its definition as well as its connotations and characteristics.

In the framework of the article, the author's concept: *of environmental ethics includes perspectives, concepts, principles, standards of work adjustment, assessment, guidance, and impaired control of the behavior of all voluntary and voluntary social action toward the environment toward sustainable development (sustainability for humans and sustainability for the natural environment).*

Firstly, environmental ethics is the whole set of rules and standards to regulate and evaluate human behavior and behavior with the environment to bring benefits, and happiness for present and future generations. Not only that, but environmental ethics also contribute to sustainable development. Second, through these rules and standards, people adjust their behavior to the environment voluntarily and voluntarily. Third, environmental ethics represents the harmonious relationship between humans and nature. This is a relationship that shows respect and responsibility of people towards the environment. After all, environmental ethics is the expression of people's very high self-consciousness towards the

environment, which reflects the conscience, responsibility, goodness, and obligations of people towards the environment. Environmental ethics consists of environmental ethical awareness and environmental ethical behavior.

Environmental ethics is expressed in the consciousness and behavior of people toward the environment, which is both mandatory and voluntary. It is mandatory because these standards and rules reflect the demands and requirements of society. These requirements and requirements are not legal, but the scope of impact and adjustment is inevitable and regular through public opinion to evaluate, so any move related to the environment one must also adopt the rules of environmental ethics to act. On the other hand, the environment is not the property of anyone alone, it involves many people, is community and human. Therefore, implementing environmental ethical standards is the responsibility, obligation, and conscience of all individuals, organizations, and social subjects. It is voluntary because individuals and communities implement rules and standards for the environment motivated by conscience, self-consciousness, and goodwill towards the environment, not because of a commitment. legally required. They are aware of the need to protect the environment for their own life, for their benefit, so they act, and even feel happy and happy when performing environmentally ethical behaviors.

Thus, environmental ethics consists of environmental ethical consciousness (including environmental ethical standards, environmental ethical knowledge, and environmental ethical sentiments) and environmental ethical behavior.

Environmental ethics has some basic characteristics such as:

Environmental ethics of self-discipline, and voluntary are very high in humans. In environmental ethics, people voluntarily set forth principles and rules of environmental ethical standards to adjust their behavior within the framework of that principle; that shows compliance with environmental ethics due to the urge of conscience, self-consciousness and they see their responsibility and obligation in environmental protection, and they feel happy when protecting the environment.

Environmental ethics is the expression of human social responsibility towards the environment (environmental responsibility). Because humans are playing a leading role in the process of exploiting and transforming nature, people have soon become aware of their responsibility in improving nature and protecting the natural environment. Human environmental responsibility toward nature is formed on the basis that people have a sense of environmental ethics and have a sense of environmental rule of law. Human social responsibility towards nature is expressed by people being aware of the consequences caused by their actions to nature and taking responsibility for those consequences.

Thus, there are many forms to protect the environment, however, protecting the environment by ethical means creates the ability to restrain and prevent evil acts, harming nature and society. It also has the ability and motivation to motivate people to fight against acts of destroying resources and polluting the environment.

1.2. Literature Review

Currently, there have been many research works on traditional Vietnamese environmental ethics, some typical works such as:

Ecological issues have now received a lot of research, both from a theoretical and a practical perspective, both from a single-disciplinary to an interdisciplinary perspective. However, from the perspective of humanities and social sciences, it can be seen that there have been the following basic works:

Pham Thi Ngoc Tram, “*Ethical ethics: From theory to practice*” (1999); Pham Thi Ngoc Tram (Editor), *State management of natural resources and environment for sustainable development from a socio-humanistic perspective* (2006); Ho Sy Quy, “*On Environmental Ethics*” (2005); Nguyen Van Phuc, “*Environmental protection from an ethical perspective*” (2010); Basic investigation project “*Ethical assessment of the environment in our country today*”, implemented by the Vietnam Academy of Social Sciences (2009-2010); National Workshop “*Environmental Education in Schools*”, Center for Research on Natural Resources and Environment and Hanoi National University in collaboration to implement; Nguyen Van Phuc, “*Environmental Ethics*” (2013); Nguyen Thi Lan Huong, *Environmental Ethics and Utilitarianism* (2016); Le Van Khoa, *Environmental ethics - from thinking to action* (2016) ... In the above works, the need to improve the environmental ethics has been argued. Accordingly, environmental ethics is a factor contributing to overcoming the situation of over-exploitation of nature and is one of the solutions to preserve the harmonious relationship between humans and nature, ensuring sustainable development. Innovation is expressed in all aspects and fields of activities of the society and people from production, tourism, and entertainment to daily life. That requires raising the environmental ethics for everyone, regardless of social status and age. Degradation in environmental ethics manifests itself not only in cities and industrial zones but also in rural areas and schools. Therefore, in the above works, the proposed solutions to improve the environmental ethics include national-level solutions related to laws and policies, socio-economic development projects, and programs. national education program; At the same time, it also includes direct and specific solutions for regions, areas of activity, or specific subjects such as industrial parks, craft villages, rural areas, and schools.

More focused and more systematic research on biodiversity in our country is currently carried out by the following works: Basic investigation project “*Ethical assessment of the environment in our country today*”, by the Institute of Science and Technology. social studies in Vietnam (2009 - 2010); Vu Dung, “*Environmental ethics in our country: theory and practice*”, (2010); Hoang Thi Thanh, *Building environmental ethics in Vietnam today* (2019), Tran Thi Thuy Ha, *Culture of behavior with the natural environment in Vietnam today* (2018)... In these works, the regulation rationally and harmoniously adjusts the relationships of interests between people at all levels in exploiting and protecting the environment for sustainable development, which is recognized as the essence of environmental ethics. The authors also analyze the basic standards of innovation, such as Respect and protecting the harmony of human (society) and natural systems; use of resources economically and

effectively; voluntarily and voluntarily elevating legal requirements on environmental protection to ethical requirements; fairness in exploitation and environmental protection; improve the spirit of mutual assistance and coordinated action to solve environmental incidents; maintain a green, clean and beautiful living environment in daily life.

The article *The problem of building ecological ethics in the market economy conditions* by the author Pham Thi Ngoc Tram (2002). Through the analysis of traditional ecological ethical values of Vietnam such as the goodness of the Vietnamese, the love of people for nature, the love of labor, and the love of people are always expressed in nature. community, solidarity, a way of life of gratitude, and kindness. The author has given some ways of behavior of the Vietnamese toward the ecological environment. Under the influence of the current market economy, which has gradually changed the way people behave in the past, the relationship between people living in harmony with nature (the union between God and Man) is now not more, but gradually turning into the ideal (Human intends to overcome God). The author also offers a solution that we must build, which is environmental ethics suitable for a market economy. This new environmental ethics must be based on Vietnam's traditional environmental ethics, but with changes to suit.

Customary law of environmental protection of some ethnic minorities in Vietnam by authors Pham Quang Tien, and Nguyen Thi Hoi (2010) analyzed the role of custom and customary law in the development and implementation of the law. The authors have analyzed the customs and customary laws of some ethnic minorities on environmental protection such as customary laws on environmental protection of the Ede, the M'ngong in the Central Highlands, and the Thais in the central highlands of Son La, Lai Chau, Hoa Binh provinces... In the customary law of these ethnic minorities, there are things that the community cares about to protect the environment, that is: protecting forests, birds, animals, land, and water sources. In the customary law, there are also forms of propaganda and dissemination of environmental protection factors in the community and especially in the family through generations.

Author Nguyen Hieu Tin (2010) in the article *Dealing with the natural environment requires ecological ethics*. The article has analyzed the conceptions of ecological ethics in the world with a human-centered or anthropocentric perspective derived from modern science in the seventeenth and eighteenth centuries. The author also analyzes that in the Western during this period the human-centered view was very popular because at that time it was a mechanized worldview and metaphysical mechanical thinking. The author gives this is how humans treat nature from an ethical perspective. The historical fact also proves that, after many decades after humans exploited nature indiscriminately, despite all the laws and their existence, nature has "revenge" on humans. Humans have exhausted natural resources, polluted the living environment, and exploited them indiscriminately, making natural resources unable to recover in time. Until now, when people are aware of the serious problem of environmental pollution in their own lives, people have taken measures to overcome them. The author also analyzes the previous Vietnamese concept of nature, which is the relationship "Heaven-Earth-Human unity", this is a very beautiful concept in the Vietnamese

way of life toward the environment, but nowadays that is being gradually disappeared due to the pressure of the market economy, due to population growth leading to behaviors that are harmful to the environment.

There are many papers on environmental ethics. Some typical papers such as "*Some theoretical issues about environmental ethics*" by Vu Dung, and "*On environmental ethics*" by Ho Si Quy, are directly related to ecological ethics. The Japanese researcher Tomnobi Imamichi has the article "*The concept of ecological ethics and the development of ethics ideology*", the translator Nguyen Thi Lan Huong. That papers have focused on clarifying the concept of environmental ethics, the constituent elements of environmental ethics, and the factors affecting environmental ethics in general. Although there are still different notions about the concept of environmental ethics, these works are generally united in the assumption that environmental ethics is formed in the process of human impact on nature, it is a system of views, concepts, thoughts, feelings, principles, rules, norms... regulating and adjusting human behavior in the process of natural gender transformation to serve the human life, ensuring the development of both human beings and the natural world.

2. Method

The article is based on the theoretical basis of Marxism-Leninism, Ho Chi Minh's thoughts, viewpoints, and lines of the Communist Party of Vietnam, policies, and laws of the State of Vietnam on environmental ethics, construction environmental ethics, and related issues. Selectively acquire research results published by scientists on traditional environmental ethics, and construction environmental ethics. To study the topic, the authors base themselves on the actual achievements and limitations, and inadequacies in implementing environmental ethics, and construction environmental ethics in Vietnam through 35 years of renovation.

The research is based on the methodology of Marxism-Leninism and Ho Chi Minh's thought to deploy research tasks. Focus on using interdisciplinary methods of social sciences and humanities. Using a combination of methods: History, logic, combining history with logic, analysis, synthesis, comparison, forecasting... These specific research methods are used flexibly and appropriately to have an analysis, comments, and assessments on the issue that the Communist Party of Vietnam continues to promote environmental ethics on constructing environmental ethics on sustainable national development.

3. Results

3.1. The concept of traditional environmental ethics in Vietnam

Over thousands of years of building and defending the country, the Vietnamese have created their own culture rich in identity. Inhabitants living in different geographical areas have different rules and ways of dealing with people, and people with the natural world. The rules of behavior between people and the environment also come from the standards and ethical regulations between people in society. Therefore, ethics towards the natural environment is also part of the ethics of people in society. In Vietnam in the past, there was no system of doctrine or a separate law stipulating the rules and standards of human behavior

towards the natural environment. The customs and customary laws of the ancient Vietnamese village conventions, over time, were elevated to the law. Through conventions and customary laws, the laws of dynasties in Vietnamese history have shaped environmental ethics. "Vietnam's traditional ecological ethics are formed based on conceptions and folk philosophies, reflecting on different levels of the relationship between humans and nature" (Vu Trong Dung, 2009, p.105).

The basis for the formation of traditional environmental ethics in Vietnamese

The culture of the Vietnamese is built on a smooth connection between the philosophy of life and is deeply influenced by Eastern philosophies such as Confucianism, Buddhism, and Taoism, along with a practical lifestyle of close labor. The closeness to nature has been reflected in different degrees in the relationship between man and nature. These theories all associate humans with nature and have greatly influenced the behavior of traditional Vietnamese. That also helps to protect the ecosystem of the Vietnamese people and has become a part of the Vietnamese culture. That culture of dealing with the natural environment is expressed through some basic concepts as follows:

First is the concept of harmony between nature and humans. This is the earliest concept of the relationship between humans and nature. Humans and nature are a solid, integral part. With this concept, the Vietnamese have gone through many difficulties, arduous still living in harmony with nature, relying on and following nature. This concept is consistent with agricultural life, low-level rice cultivation, dependent on nature.

Second is the concept of "Man proposes, God, disposes". In an underdeveloped society, especially with the too outdated productive forces, humans do not have the capacity and conditions to exploit nature enough to earn full-living. This concept makes humans worship nature: "thank god for sunshine and raining enough," and "please rain down". The name of the gods such as "Land has the land gods, rivers have river gods ", mountain, forest, sea, sun, thunder, and fire also have gods showing that not only Vietnamese love but also gratitude, respect, even depend on natural forces blindly. According to folklore, worshipping the gods is worshipping nature, protecting nature. And customary law - which may be the human law of natural environment protection has appeared based on worshipping the gods, worshipping that nature.

The third is the concept of "The human wins the nature". Different from the previous two concepts, this concept gives humans certain dynamics with nature, not waiting for natural gifts, but in a certain way, they can overcome natural disasters by themselves power. Humans fight natural disasters and win against natural calamities to live in harmony with nature rather than away or opposite to it. That is the logical conquest of nature, within its limits of it and such conduct demonstrates an open love of nature.

Vietnamese love nature, and live in harmony with nature because they understand the values and the great benefits that nature brings to them. Comparing nature to gold, as silver shows not only means rich nature but also proves that nature in the Vietnamese's heart is extremely precious, the source of life, the source of material things that humans need to respect and protect.

When studying the traditional concept of environmental ethics of the Vietnamese, an important data is the customary laws and village conventions in the community in the past. Because these are authentic evidence that still exists, they are still applied by some localities in parallel with the current law. However, the role of customary law and village conventions is still noticed when combined with the law, together with the law to better play its role, especially in environmental protection. Because before the law, each community had its regulations, and those regulations were put into writing in the customary law. Therefore, when studying environmental ethics, it is necessary to find out the concepts of the ancient Vietnamese through these documents.

The village conventions and customary laws of the ancient Vietnamese have reflected the rules and standards of people in villages, hamlets, and ethnic groups in preserving the natural environment or ethical issues of people in dealing with the environment. Village conventions are usually rules set out in villages in North and Central Vietnam, typically: in the village convention of Minh Duc, Minh Hoa commune, Yen Lap district (Phu Tho), regulations on protection are provided. historical and cultural relics, revolutionary culture in the area. Or, the convention of Hung Nhi village, Cu Thang commune, Thanh Son district stipulates that 50-year-old stilt houses cannot be sold out of the village to prevent "bleeding on stilt houses", regulations on Tet holidays, people in the village wear traditional costumes of their people... In the village convention of Lang village, Xuan Son commune, Tan Son district, there are clear regulations not to cut trees or collect firewood in Xuan Son primeval forest. Do not cut down or exploit stalactites in caves and caves. Protect water flows and waterfalls in local forests. The convention of several villages in Dong Think commune, Huong Long commune, and Yen Lap district clearly states that the Muong people must preserve and restore the "mõi" dance, swing drum dance of the Muong.

But for localities in highlands such as the Northern mountainous region or the Central Highlands, these rules and regulations are made by customary laws, such as The customary law of human communities such as Ede, M'ngong Thai, and Muong, have certain rules in the protection of the natural environment which are expressed in the daily life of their ethnic groups.

In the things prescribed by customary law and village conventions, there are rules to protect the environment and towards long-term and sustainable natural exploitation for future generations. Thereby, we can see that our ancestors were aware of the importance of the natural environment in their lives. More importantly, turning those perceptions into actions, the highest manifestation is the written regulations in the customary law and village conventions.

In addition to the customary law and village conventions, in Vietnam, there have been studies on the protection of the natural environment through surveys on geography, geology, biology, medicine, economy, and society of our country, such as the research works of Tue Tinh in the 14th century, Le Quy Don and Hai Thuong Lan Ong in the 18th century. The above works have recorded natural products and previous experiences of Vietnamese people in grasping the laws of nature, how Vietnamese live with nature and rely on nature to survive and develop. Through research and surveys, previous researchers have also given

vivid examples of different natural regions where people have different production methods and are suitable for the natural conditions of each region.

In particular, the issue of environmental protection in our country has existed since 1483, when King Le Thanh Tong brought environmental issues into the law of the country. The Hong Duc Law was promulgated in the feudal period, but there were regulations on environmental protection such as: keeping the environment in place of residence, protecting wild animals, etc. This law consists of 13 chapters with 722 articles. In the Hong Duc Law, article 580 provides for the protection of traction mainly for agriculture such as prohibiting the arbitrary killing of buffaloes and cows. In Gia Long Law, book 21, article 7 regulates the repair and protection of dykes and field banks. During the Nguyen Dynasty, the king and mandarins had the custom of planting pine trees in the Nam Giao herd (Hue) to encourage the custom of planting trees and causing forests. The trees planted by the king and the mandarins were all taken care of by them.

The relationship between man and nature is governed by moral codes and norms of behavior, which are most commonly endorsed by each dynasty's code of law. This demonstrates that the ancient Vietnamese had rules governing human behavior about the natural environment, or environmental ethics as we know it today. This approach to coping with the natural environment has a long history in the Vietnamese culture of natural behavior, which we study now as traditional environmental ethics.

As a result, *traditional environmental ethics in Vietnam can be defined as the sum of Vietnamese attitudes, feelings, customs, habits, and behaviors regarding the natural environment that are relatively stable and stable. It's profoundly embedded in psychology and social norms.*

3.2. Some traditional Vietnamese environmental ethics standards

In the course of the nation's life and growth, the Vietnamese have developed traditional environmental ethical principles. The Vietnamese productive forces, in particular, are responsible for the behavior of people and nature. People's attitudes regarding the environment used to be very different from what they are now. Because Vietnamese society has changed so much throughout the centuries, socioeconomic developments have also influenced people's ethics, particularly how they treat the natural environment. course. The most basic traditional Vietnamese environmental ethical criteria in the production style characterized by wet-rice agriculture are: Vietnamese love nature, live in harmony with nature

This is the Vietnamese philosophy of life, which is influenced by Confucianism, Buddhism, and Taoism and is smoothly combined with Eastern philosophy. Vietnamese rely on the natural environment to labor and produce in order to survive and flourish. A lifestyle in harmony with nature is mentioned and practiced by Vietnamese people in daily life, such as in production, in the method of eating and dressing, and living.

First and foremost, in constructive labor.

Man's love for animals, as expressed in folk songs and proverbs, reflects the link between man and nature. For farmers, the buffalo is both an asset ("the buffalo is an investment") and a buddy who works alongside them and shares the benefits of their effort.

This bond is also emphasized when people recognize the importance of nature in the production process, as in "one inch of golden land," "golden forest, silver sea," and so on. Vietnamese people adore nature and are committed to it. Recognize the significance and benefits that nature provides.

Traditional proverbs in folk songs have compared the richness and beauty of nature to what people consider the most valuable, such as gold, silver, and other precious metals. People in Vietnam live off the land and gather basic minerals. They appreciate the worth of natural resources better than anyone else, which contributes to the ancient Vietnamese's love of nature and happy lifestyle.

Second, in daily life.

Geographical considerations and living environments have created a lifestyle in harmony with nature for the Vietnamese people throughout their history. This way of life is reflected in the way people live and dress in the workplace and in everyday life.

Vietnamese homes are made up of bamboo and wooden stilt structures that are well-suited to the country's hot and humid climate. The banyan tree, the water wharf, and the common home yard have all contributed to the cultural characteristics of the wet rice culture village. Due to the hot and humid tropical climate, the Vietnamese house combines the elements of Land, Water, and People. Vietnamese people construct their residences to fit their self-sufficient way of life. Depending on the family's economic situation, Vietnamese houses are often built from locally available materials such as leaves, thatch, bamboo, hewn wood, stone for column foundations, baked or unbaked clay, mud combined with straw, and so on. The residences of the Vietnamese people reflect their environmentally conscious lifestyle.

The agricultural aspect of Vietnamese clothes, which is most obvious in the fabric, is a distinguishing feature of their dressing style. As one of the cradles of agricultural civilization, the Vietnamese prioritize the usage of plant-based garment textiles. Those are farm-related things.

Cultural events are used to express Vietnamese culture. Harvest festivals, plowing ceremonies, the Long Tong festival, the new rice festival, or the new rice festival, all have the symbolism of being full and hoping for a bountiful crop and are related to Vietnam's wet-rice cultivation. The celebration honors buffalo and other farm animals. Gods of nature such as Thunder, Lightning, and the Sun are revered.

When it comes to dealing with nature, the Vietnamese know how to exploit it intelligently and flexibly

Vietnamese people utilize nature to support their survival and progress in life, stemming from a love of nature. Discover natural laws and the influence interaction between nature and humanity, which is dialectics: "Knowledge, experience, and sentiments are derived from an ethical attitude of loving nature. The calculations have been accumulated and passed down through generations, and Vietnamese people have gradually learned to grasp nature, which, while not comprehensive or detailed, has a high degree of generalization and, in particular, reason (Vu Trong Dung, 2009, p.114).

The flexibility of the ancient Vietnamese people's lives is represented in their eating habits and utensils, such as chopsticks made of natural materials (bamboo is a close relative of the Vietnamese people). everyone in the Northern Delta Vietnamese The use of everyday food as medication reflects human flexibility in relations with the natural world. To employ these plants as preventive and curative medicines, Vietnamese people must be very knowledgeable about them, study them attentively, and comprehend their properties. On the other hand, adapt to "variable changes" in natural elements with sensitivity and flexibility. This is evident in all human activities, from the way people work, eat, stay, and travel to the way they create buildings and seek treatment..." (Vu Trong Dung, p.115, 2009). The yin-yang equilibrium between humans and the natural world reflects this dialectic. Because Vietnam has a hot (yang) temperature, most of the food is cold (yin), and people consume a lot of plants (yin) in their meals, contributing to the yin-yang balance between humans and animals, as well as the environment, as shown in seasonal foods in nature.

Nature rationally exploited: People must be aware of the laws of nature to serve their products, which stems from the ancient Vietnamese people's production method of wet rice farming as the major force. output and longevity The Vietnamese realized and utilized the laws of nature in living in that situation. Recognizing plant and animal growth rules, and so exploiting nature while also caring for and recreating it, exploiting and safeguarding natural goods, and establishing circumstances for them to grow and thrive. Because the Vietnamese recognize the importance of nature in the survival and prosperity of their country, they rationally utilize it. This is mirrored in ethnic communities' environmental agreements and customary laws.

The ancient Vietnamese's thrift, industrious disposition, and love of labor show their reasonable approach toward nature.

Environmental ethics, as well as thrift, industriousness, and work love, are moral values in general. Material creation is the most important activity in practical human activities.

The ancient Vietnamese's passion for labor stems from material-producing producing activities. People establish relationships between people and nature, as well as relationships between people in society while working. Vietnamese individuals must work hard and diligently in order to improve their lives. Vietnamese people value the benefits of their labor even more since they work hard to produce finished products to feed themselves and their families. As a result, the Vietnamese hold rice grains in high regard, considering them "genuine pearls" that are also derived from the wet-rice agricultural production system, which has given rise to a traditional culture: "Traditional cultural values". This is the Vietnamese people's greatest defining virtue. After all, this value is derived from and conditioned by the relationship between humans and nature" (Vu Trong Dung, 2009, p.124).

The ancient Vietnamese were industrious and economical because they worked hard to create items. Vietnamese people constantly remind themselves and their communities to live frugally in their daily lives. Any ethnic group must work hard to obtain financial wealth, and they can be proud of their accomplishments, but the Vietnamese people are an exception. Wet rice is the main production industry in Vietnam due to the country's geographical

factors, which include a hot and humid environment, tropical monsoon, and agricultural production method, therefore making rice grain requires a lot of effort.

3.3. The role of traditional environmental ethics in the development of contemporary environmental ethics in Vietnam

Traditional environmental ethical principles must be considered in the formation of Vietnam's guidelines and policies for socio-economic development and environmental protection.

We currently need to consider environmental protection factors while developing guidelines and policies, so we inherit traditional environmental ethics that are still applicable in today's modern society. Because traditional Vietnamese environmental ethics are based on excellent ideals, this is how individuals and the Vietnamese community as a whole treat the natural environment.

Resolution 41 of the Politburo on environmental protection in Vietnam in the process of industrialization and modernization states: "Environmental protection is the rights and obligations of all organizations, every family and of each person, which is the expression of cultural lifestyle, morality, which is an important criterion of civilized society and a continuation of his father's tradition of loving nature, living in harmony with nature" (Politburo, 2004). Many historic ethical ideals are still true today, and they have provided the theoretical foundation for the Party and State to inherit, implement, and promote in order to establish environmental rules and policies. Protect the environment in light of the country's new circumstances while being compatible with Vietnamese culture and lifestyle. Furthermore, there are old and long-standing beliefs that have become firmly established in our thinking and habits of living, but which are no longer consistent with modern environmental ethics, and which we must gradually eradicate.

Currently, Vietnam is gradually improving its environmental regulations, however, the laws are prescribed with consequences that are insufficiently effective and deterrent for violators. As a result, conventional ethical standards must be applied as one of the primary strategies for adjusting human behavior; this is a wholly voluntary, non-self-interest adjustment within a limited scope (a region, a nation). Using conventional environmental ethics to safeguard the environment also helps people live better lives and contribute more to society.

Inheriting and fostering the rational aspects in the Vietnamese ethnic groups' customary laws and regulations, as well as the law, to build the current rules of human behavior toward the environment.

Traditional environmental ethical principles can be promoted through the promotion of customary conventions and laws, with the law serving as the foundation for promoting and inheriting the good of traditional environmental ethics. Vietnam's best option for environmental conservation. The Party and the State have also grasped that the environment and the economy are inextricably linked: the natural environment is a precondition for economic development, and economic development is the foundation for economic growth. As a result of changes in the natural environment, economic development laws and policies must go hand in hand with environmental protection. The state has enacted laws and sub-

law papers to guide environmental protection, but the outcomes are still insufficient, and the number of environmental cases is increasing, with grave repercussions. As a result, the law's provisions will be more effective when combined with the customs and behaviors established in village conventions and customary laws.

Traditional environmental ethics education helps people, particularly the young generation, pupils, and students - the country's future owners - develop environmental ethics

Environmental ethics education is one of the most significant ways to create knowledge about environmental conservation and activate all societal forces to help improve the environment. to overcome past pollution impacts by making the ecological environment cleaner, better, and more carefully maintained, so that the ecological environment is better and more beneficial to humans, and to bring people and the natural world into harmony, rather than "hostile" as it is today. Current environmental ethics will be shaped in part by traditional environmental ethics.

Students are a powerful force in society and the masters of tomorrow. Moral education, including environmental ethics education, is therefore required in addition to the transmission, creation, and improvement of creative thinking capacity and professional qualifications. It is especially significant for students. Because: first, environmental ethics is an integral part of ethics and social moral education; second, environmental ethics education for students contributes to the development of student personality - the subject of the country's industrialization and modernization process; and third, environmental ethics education for students is important for the long-term development of people and the natural world.

4. Discussion and Conclusion

Traditional Vietnamese environmental ethical standards are established on the basis of human notions and philosophies and are influenced by Confucianism, Buddhism, and Taoism ethical ideas. It is vital to inherit and develop traditional moral principles to suit the country's conditions, as well as to construct environmental ethical values in the direction of combining tradition with modernity, the nation with modernity, international, individual to society, and human to nature.

Previously, man's behavior in relation to the natural world was only demonstrated at a low level, in a passive method of exploiting and using nature-based on experience and the concept of "Heaven - Earth - Human harmony," "A plan formed by people, but how it is carried out will be determined by God." People lose their energy and innovation as a result, stifling societal progress. This is no longer relevant in today's culture, and a new ecological ethical standard is needed to govern human ecological ethical behavior.

Traditional environmental ethical standards are chosen, inherited, and developed in light of present development conditions. The contemporary idea of living in harmony with nature is still viable, but its content needs revision. People nowadays live in peace with the environment, relying on natural resources to support their lifestyles and the country's development. That is, people are not only aware of how to exploit the use-values of nature with modern instruments and procedures, but also how to do it efficiently. People must also recreate, maintain, and safeguard the natural world in order to meet their requirements, as

well as their own lives. To put it another way, people must be able to compensate for nature, comprehend its tolerance level, and ensure nature's ability to regenerate and heal. Furthermore, living in harmony with the environment must adhere to the principle of sustainable development, which is what we strive for in the growth of science and technology and the construction of a socialist-oriented market economy.

THE ROLE OF VIETNAMESE FATHERLAND FRONT IN ENCOURAGING THE RELIGIOUS UNITY IN THE GREAT NATIONAL UNION TO MEET THE COUNTRY'S SUSTAINABLE DEVELOPMENT REQUIREMENTS

MA. Nguyen Viet Duc

vietduc.napa93@gmail.com

Postgraduate Student in Politics of Graduate Academy of Social Sciences, Vietnam

Abstract

The great national unity is a precious tradition of the Vietnamese people, considered a fundamental, long-term and cross-cutting strategy that determines every success of the Vietnamese revolution. Religious unity is one of the contents of the religious policies of the Party and Vietnamese government. It is also a strategic content in the Vietnamese great national unity. Encouraging for religious unity in the great national union is both a right and a responsibility of the Vietnamese Fatherland Front and demonstrates its role in hereto. Beside the presentation of the religious unity and the great national unity issues in Vietnam, this article outlines the role of the Vietnamese Fatherland Front before the requirements of sustainable development of the country, especially analyzes and elucidates the role of the Vietnamese Fatherland Front in encouraging the religious unity in the great national union.

Keywords: *Vietnamese Fatherland Front; religious unity; great national unity; sustainable development*

1. Introduction

This study is based on Marxist-Leninist dialectical materialism; Ho Chi Minh's Ideology, the Communist Party of Vietnam's views on the religious unity, the great national unity and the position and role of the Vietnamese Fatherland Front in the country's development. This study aims to clarify the role of the Vietnamese Fatherland Front in encouraging the religious unity in the great national union to meet the requirements of sustainable development of the country. Researches on the religious unity, the great national unity and the Vietnamese Fatherland Front's position and role are quite diverse. Those are valuable references to help the author complete this study.

2. Method

This study aims to answer the following questions:

Questions 1: What is the religious unity and great national unity in Vietnam?

Questions 2: What is the role of the Vietnamese Fatherland Front in meeting the country's sustainable development requirements?

Questions 3: What role does the Vietnamese Fatherland Front play in encouraging the religious unity in the great national union to meet the requirements of the country's sustainable development?

In the scientific research methods, this study uses the scientific inheritance method from previous studies, the method of synthesizing and analyzing information and data from scientific journals and newspapers and magazines to bring an objective assessment of the concerned issues.

3. Results

3.1. The religious unity and the great national unity in Vietnam

Great national unity is a precious tradition of the Vietnamese people, forged through thousands of historical years of building and defending the country. Since ancient times, for survival, Vietnamese people have often had to struggle to overcome nature and fight with many invading enemies. That has made members in community stick together, soon forming the will, spirit, and unity strength. Thanks to the strength of great solidarity, the Vietnamese people have conquered nature, taken measures to adapt and lived in harmony with the harshness of nature. Based on the strength of great unity, the Vietnamese people have defeated many brutal invaders and had many glorious victories in the national and the human history. The national arduous struggle has helped foster love for the homeland, country and solidarity in every Vietnamese citizen. Currently, taking advantage of the process of integration and globalization, hostile forces enhance the “Non-violent action” strategy; inciting to divide among nations and religions; inciting people to riot, causing socio-political instability; spreading fabricated information to defame the Party, State and High-ranking cadres in order to reduce trust and sow division of the close relationship between the Party, State, cadres and people. Promoting the great national unity tradition and strength will help us defeat all the evil plots of hostile forces, ensuring the sustainable victory of the Vietnam’s revolution.

Great national unity is considered an fundamental, long-term and cross-cutting strategic content, determining the success of the Vietnamese revolution. This was determined early on by President Ho Chi Minh and the Communist Party of Vietnam. President Ho Chi Minh affirmed: “Without unity, we lose and lose. If there is unity, then there will be prosperity and survival. We must rely on unity as our destiny, preserve the nation and defend the country” [5]. According to President Ho Chi Minh, in order to the revolution get success, it is necessary to gather all possible forces to build a great national union in a sustainable way. Over the revolutionary periods, the Communist Party of Vietnam's viewpoint on building the great national union has been increasingly improved and developed. The Party has always identified "solidarity" as the core value, "great national unity" as the strategic line, the strength source and the main driving force of the Vietnamese revolution. It determines all the victories of the Vietnamese revolution in the cause of building and defending the socialist of the nation. History has proven: President Ho Chi Minh and the Communist Party of Vietnam and the Vietnamese people have been successfully building a great national union, leading the Vietnamese revolution to continuously gain many great achievements. The 13th Congress of the Communist Party of Vietnam continued to express the guiding viewpoint: "Strongly awake the patriotism, the will to strengthen, the strength of the great national unity and the aspiration for developing the national prosperity and happiness” [3].

Great national unity is a decisive factor for in the renewal process and in the promoting industrialization, modernization and international integration of Vietnam. Commenting on the 35-year process of conducting national renewal, industrialization, modernization and international integration, General Secretary, Nguyen Phu Trong, has made many speeches and the Communist Party of Vietnam has also affirmed in the proceedings of the 13th Congress: "We have achieved great achievements of historical significance, stronger and more comprehensive development compared to the previous years of renovation. Our country has never had the opportunity, potential, position and international prestige as it does today. These achievements are the product of crystallized creativity, the result of a whole process of persistent and continuous efforts over many terms of the entire Party, people and army" [3]. This shows the solidarity, consensus and agree of the entire Party, army and Vietnam people in the pursuit of the goal of "rich people, strong country, democracy, justice and civilization".

Overall assessment of 35 years of innovation and 20 years of implementation *The building the country credo in the transition to socialism* in Vietnam, forecasting the situation of the world and the country in the coming time, the 13th Congress of the Communist Party of Vietnam proposed five guiding directions [3] and development goals [3]. Accordingly, many contents in the guiding directions are common denominators and similarities in benefits for the creation, implementation and promotion of the great national union, such as: "consistent application and creative developing of Marxism-Leninism and Ho Chi Minh's Ideology"; "consistent with the goal of national independence and socialism"; "ensuring the highest interests of the nation and country"; "having aspiration to develop a prosperous and happy country"; "promoting the socialist democracy"; "making the most inner strength, especilally, human resources are the most important". Moreover, from the general goal to the middle of the 21st century, our country have become to a developed country with socialist-oriented". The 13th Congress of the Party has identified specific goals associated with each milestone. This is the basis for creating social consensus and national unity, contributing to promote production development, improving people's material and spiritual life, step by step towards socialism.

The Vietnamese great national unity is a great solidarity union between classes, segments, ethnic groups, religions, patriotic organizations and individuals in domestic and abroad. Each class, segment, ethnic group, religion and different social sections, whether living in Vietnam or living abroad, have a certain role to play in creating the common strength of the great national union. President Ho Chi Minh stated many times: "Our solidarity is not only broad, but also enduring...We unite to fight for reunification and defense of the nation; We also must unite to build our country. Those who are talented, virtuous, strong, have the heart to serve the nation and serve the people, we stand in solidarity with them" [6]. The Party and State of Vietnam always respect and praise organizations and individuals that have contributed to building the great national union. The 13th National Congress of the Communist Party of Vietnam affirms the irreplaceable importance of all classes, social sections but does not identify the "foundational" role of the great national union for any class or segment. That does not reduce the solidity, invincible strength of the

great national union, as well as affecting the orientation and goals of building the great national union but on the contrary also makes the great national union is more and more solid, constantly expanding and bringing into full play its strength [7].

Religious unity is a strategic content in the great national unity in Vietnam. Religion is an entity, part of society. The Vietnamese great national union includes the unity of religions, and the implementation of religious unity must work towards the common goal of the Vietnamese great national union. The vast majority of religious compatriots in Vietnam are labor force and patriotic people. They are always nurtured by the good traditions and qualities of the nation. Therefore, they not only have faith in their religion, but they always stick with, unite, accompany and make many positive contributions to the national construction and defense. Right at the first meeting of the Provisional Government of the Democratic Republic of Vietnam (September 3, 1945), President Ho Chi Minh has given six urgent tasks, including the one on religious unity: “The colonialists and feudalists implemented the policy of dividing the religious and non-religious people for easy domination. I ask our Government to declare: Freedom of Faith and the Unity of Religion” [4]. President Ho Chi Minh said that being a Vietnamese, whether religious or non-religious, regardless of religion, they all share the same ethnic group, the same Lac - Hong lineage. Therefore, religious unity in the great national union is an inevitable issue and a decisive factor for the success of the Vietnamese revolution.

Religious unity and freedom of faith and religion are the basic viewpoint and main content of the policy towards religion of the Party and State of Vietnam. In order to unite religions, there must be religious freedom within the legal framework and freedom and equality among religions is the basis for religious unity, towards the Vietnamese great national union. Some contents of Vietnam's religious policy today clearly show the spirit of religious unity in the great national union, such as: First, ensuring the rights and protection of all religious freedoms. Second, equality before the law between religious and non-religious people. Third, people of all religions are an important part of the great national union. Uniting religious compatriots with non-religious compatriots to build and defend the nation. Fourth, fight with hostile forces that take advantage of religion to divide the great national union and oppose the Party and State of Vietnam.

3.2. The role of the Vietnamese Fatherland Front in the face of the country's sustainable development requirements

From early time, President Ho Chi Minh paid attention to bringing the masses of the people into patriotic organizations suitable for each class, segment, age, gender, profession, religion, etc. It were Friendship Associations, Unions, Farmers' Associations, Women's Associations, Elders' Associations, Youth Unions, Children's Youth Team, Catholic Patriotic Associations, and Buddhist Associations for National Salvation, etc. But the most overarching was the National United Front. After the Communist Party of Vietnam was born on November 18, 1930, the Standing Committee of the Party Central Committee issued a Directive Notice on the establishment of the Allied Anti-Imperial Association – the predecessor organization of the Vietnamese Fatherland Front, the first form of the

Vietnamese National United Front with the desire to rally the masses to realize the revolutionary goal. Over the past 90 years, under the leadership of the Communist Party of Vietnam, the Vietnamese National United Front has operated with many forms and measures, aroused patriotism and brought into play the great national union, combined with the strength of the times, contributed to bringing the Vietnam gaining from one victory to another.

During the revolutionary period, the Vietnamese Fatherland Front encouraged, gathered and united widely all classes, segments, parties, ethnic groups, religions, patriotic and progressive intellectuals people to successfully carry out the revolutionary goals and tasks. In the renewal process and in the face of the current sustainable development requirements of the country, the Vietnamese Fatherland Front continues to promote its role, which is reflected in the following:

First, the Vietnamese Fatherland Front gathers, builds and firmly consolidates the great national union, promotes democracy and strengthens social consensus. At the central level, the Vietnamese Fatherland Front has 47 member organizations, which are socio-political organizations, religious organizations, professional associations and hobby associations, etc. Thereby gathering and collecting a large number of people to promote democracy and strengthen social consensus. The Vietnamese Fatherland Front Committees at all levels are increasingly expanded in structure and composition in the direction of increasing representatives of all classes, segments, ethnic groups, religions, outside Party members and Vietnamese living abroad. The Vietnamese Fatherland Front gathers the strength of great national unity in various forms, such as: Held a conference praising "Promoting the role of prominent people representing ethnic minorities in the movement of the entire people to participate in the protection of territorial sovereignty and national border security in the new situation"; organizing the program "Spring in Hometown " to meet and capture the thoughts and aspirations of overseas Vietnamese returning home to celebrate Tet holiday and to encourage overseas Vietnamese to contribute to the country; organizing the Great National Unity Day [8] (on 18th November every year - This is the founding day of the Vietnamese National United Front). According to the author's knowledge, in the world, there is no country in the world that has a day that is considered the Great National Unity Day, organized from the central government to each residential village and hamlet like in Vietnam.

Second, the Vietnamese Fatherland Front promotes propaganda and encouraging the people to exercise their right to mastery and implement the Party's guidelines and the State's policies and laws. The Vietnamese Fatherland Front always encourages people of all walks of life to promote their mastery, through people's conferences as well as through contact with organizations and individuals so that they can contribute ideas and participate in building, amending and supplementing the Constitution, legal documents and sub-law documents. The exercise of the people's mastery right is closely linked with the implementation of the Party's guidelines and the State's policies and laws. The Vietnamese Fatherland Front at all levels has always actively propagated and mobilized the people to be well aware of the Party's guidelines, policies and resolutions. The Vietnamese Fatherland Front Committees at all levels organizes for the people to study and research the Party's

policies and resolutions as well as to disseminate the laws so that the majority of the people can understand, implement and strictly abide by the laws of the State. Along with propaganda and dissemination, the Committees at all levels coordinate with the authorities and mass organizations to call the people to well implement the guidelines, policies and laws of the Party and State [9].

Third, the Vietnamese Fatherland Front is increasingly promoting its role as a representative organization, protecting the legitimate and justifiable rights and interests of the people. At the regular meetings of the Government, the Chairman of the Vietnamese Fatherland Front Central Committee was invited to attend and give comments reflecting on the thoughts and aspirations of the people of all classes and other issues regard to the national people's livelihood. The coordination with state agencies in settling complaints and denunciations of citizens is also of interest to this organization. Complaints, denunciations, reflections and petitions from citizens are received, studied by the Front at all levels and promptly transferred to competent agencies for consideration and settlement in accordance with regulations. In addition, the Vietnamese Fatherland Front Committees at all levels perform the task of promoting democracy at the grassroots through the activities of the People's Inspection Committee and the Public Investment Supervision Board [8].

Fourth, the Vietnamese Fatherland Front actively participates in the construction of the Party and State. Recently, the Vietnamese Fatherland Front Central Committee has issued an action plan to implement the Resolution of the 4th Central Conference (XII Term) of the Party on “Strengthening the building and rectification of the Party; preventing and reversing the deterioration of political ideology, morality, lifestyle and expressions “self-evolving”, “self-transform” in internal; launching and awarding the National Press Award with the topic “Journalism with the fight against corruption and wastefulness”. Thereby contributing to building an increasingly pure and strong Party. The Vietnamese Fatherland Front at all levels shall make regular, irregular and periodic comments on the activities of agencies and organizations of the Party and the administration and give suggestions to officials and Party members. The role of the Vietnamese Fatherland Front in the election of deputies to the National Assembly and People's Councils at all levels has been increasingly confirmed. The Vietnamese Fatherland Front participates from the formulation and issuance of regulations and guiding documents on the election to the stage of election organization, closely supervises the elected organization activities of agencies and organizations to promptly discover and minimize errors in the implementation process. Vietnamese Fatherland Front participates as a member of the National Judges Selection Council and the Procurator Selection Council of the People's Procuracy at all levels in accordance with law. Over the past time, many contributions of the Front in this field have been highly appreciated by the Selection Council and Office of the President [8].

Fifth, the Vietnamese Fatherland Front has increasingly strengthened its supervision and social criticism. Over the past time, surveillance has become a regular and main activity of the Front. The Standing Committee of the Vietnamese Fatherland Front Central Committee and the Central Agencies of Socio-Political organizations have presided over or

coordinated with member organizations and agencies and organizations of the Party and State to implement monitoring programs. A number of monitoring programs have been implemented over the past time, focusing on the implementation of the Party's guidelines and the State's policies and laws in various fields: supervising the settlement of complaints and denunciations at the grassroots level; administrative reform; complying with the law of medical facilities; Health Insurance; Social Insurance; ensuring food safety; tax and customs, etc. The Vietnamese Fatherland Front Committees at local levels have presided over and joined agencies and organizations to supervise many contents related to the people's legitimate rights and interests such as: the implementation of the regime, land compensation policy, site clearance when the State recovers land; the arrangement of resettlement and temporary residence for people whose houses and land have been recovered [8]. In addition, the Vietnamese Fatherland Front at all levels actively social criticism for legal regulation before they are promulgated. Thanks to those criticisms and suggestions, the quality of the law has been improved and the role of the Front has also been confirmed.

Sixth, the Vietnamese Fatherland Front gathers, synthesizes the opinions and recommendations of voters and the people to reflect and propose to the Party and State. The collection of opinions and recommendations of voters and people by the Presidium of the Vietnamese Fatherland Front Central Committee over the past time, honestly and objectively reflects the thoughts and aspirations of voters and the people that sent to the National Assembly, the Government, ministries and central branches. The Standing Committee of the Vietnamese Fatherland Front Central Committee has a periodical report every 3 months once to the leaders of the Party, the State and relevant agencies on the situation of the people of all classes. At meetings of the People's Council, the Vietnamese Fatherland Front Committee at the same level actively gathers opinions and recommendations of voters and the people to send to the People's Council and State agencies in the locality to solve it [8]. Through the opinions and recommendations of the people, the Vietnamese Fatherland Front promptly proposes difficulties and problems so that the Party and State can take timely solutions to improve the efficiency in practical results in people's lives and learn from experience in making specific decisions [9].

Seventh, the Vietnamese Fatherland Front strengthens the implementation of people-to-people diplomacy. The Vietnamese Fatherland Front Central Committee and its member organizations have well performed their role of connecting, providing information, coordinating in organizing Vietnamese delegations to visit and work abroad and vice versa; exchanging with international friends at the celebrations of the countries or important International Conferences, etc. Thereby contributing to strengthening solidarity, friendship and cooperation with the people of neighboring countries, expanding international relations. Through people-to-people diplomacy activities, mass organizations and people's organizations call and take advantage of valuable resources for socio-economic development, hunger eradication and poverty reduction, towards sustainable development. With the motto "proactive, flexible, creative and effective", the people's foreign affairs activities of the Vietnamese Fatherland Front have been increasingly enhanced and renewed, contributing to the realization of the policy and guidelines for the Vietnamese Fatherland

Front in independence, self-reliance, peace diplomacy activities, cooperation for mutual development of the Party and State, facilitating the process of national renewal, enhancing the prestige and position of Vietnam in the international arena.

Eighth, bringing into play the great strength of the people of all classes and member organizations in the national construction and defense mission meeting the requirements of sustainable development. The Vietnamese Fatherland Front is increasingly promoting its role "as an organization of political alliances, voluntary unions of political organizations, socio-political organizations, social organizations and typical individuals of all classes, social classes, ethnic groups, religions, overseas Vietnamese; is the political basis of the people's government" [10] ; is "common house" to promote the great national union. The Front gathers the entire people through campaigns: "The whole people unite to build a new countryside and a civilized city"; "Day for the poor"; Emulation Movement "Unity and creativity to improve productivity, quality, efficiency, international integration", etc. When the Covid-19 pandemic occurred, spread and broke out in Vietnam, the Vietnamese Fatherland Front and its member organizations were proactive and creative to promote the core role and coordinate with other State agencies making appeals, propagates, mobilizes and promoting the strength of the great national unity and of the entire people and encouraging the strength, wealth and material supports to the front lines of anti-epidemic, supplementing the Government's funds to buy vaccines, prevent and control the increase and repelling the Covid-19 pandemic.

At the 13th National Congress, the Communist Party of Vietnam determined that the goal of our country's revolution was to: "Promoting the will and strength of great national unity in combination with the strength of the times; comprehensively and synchronously promote the renovation, industrialization and modernization; firmly defending the Fatherland, maintaining a peaceful and stable environment; striving to make our country to become a developed, socialist-oriented country by the middle of the twenty-first century". That goal is also the destination, the convergence of the strength of the great national union. To accomplish this goal, the position and role of the Vietnamese Fatherland Front should be enhanced more than ever.

3.3. The role of the Vietnamese Fatherland Front in encouraging the religious unity in the great national union to meet the requirements of sustainable development of the country

Religion is the spiritual need of a part of the people, which is and will exist with the nation in the process of building socialism in Vietnam [1]. Vietnam is a multi-religious country. Religions in Vietnam are constantly developing in terms of the number of followers, dignitaries, positions and activities becoming more and more diversified. According to the Government Committee for Religion, by the end of December 2020, the Vietnamese Government recognized 36 religious organizations of 16 religions and 04 organizations and 01 branch of religion were granted Certificates of registration of religious activities [2]. Incomplete statistics show that the whole country has nearly 27 million followers of religions, accounting for about 27% of the population; more than 55,000 dignitaries, 145,000 positions and 29,000 places of worship.

Religion plays an important role in the sustainable development of the country. As an important part of the ethnic community, people of all religions always stick with, unite and accompany the compatriots across the country, striving for the common interests of the nation and the Vietnamese revolution. The Vietnam's Party and State has identified that religion as an important resource, making contributions in many fields. In recent years, activities of social security, socialization of health care, education (especially preschool education), social protection, vocational training, charity and humanitarianism activities of religions have been promoted and contributed together with the Party and State and Vietnamese Fatherland Front taking care of the poor, people with meritorious services to the country, lonely old people, orphans and disabled children, building charitable house and great unity house; taking care of and helping people infected and affected by HIV/AIDS, providing relief to people in areas affected by natural disasters and floods, protecting the environment and responding to climate change, etc. People-religious foreign affairs of organizations and dignitaries, positions are increasingly being expanded with fellow believers in countries, in the region and the world, actively supporting the Party's foreign affairs and the State's diplomatic activities. Religious activities of overseas Vietnamese play an important role in connecting the community and preserving the national cultural identity. Many religious organizations and dignitaries have promoted their roles and responsibilities in fighting the plots of religious division and undermining the great national union of hostile forces.

With its functions and tasks, over the past years, the Vietnamese Fatherland Front has really promoted its role in encouraging the religious unity in the great national union to meet the requirements of sustainable development of the country, reflected in some of the following contents:

First, the Vietnamese Fatherland Front makes an important contribution to the task of mobilizing, rallying and uniting religious and non-religious compatriots, uniting religions to build great national unity and building the country. The Vietnamese Fatherland Front at all levels acts as a bridge for dialogue between religious and non-religious people and between religions and between religious people living abroad and people in the domestic country. Thereby, the Vietnamese Fatherland Front mobilizes and gathers all people in the great national union, regardless of class, status, gender, age, ethnicity, religion, in domestic or abroad. Currently, the Vietnamese Buddhist Church and the Vietnamese Protestant Church are participating as members of the Vietnamese Fatherland Front. In many fields and for many religions, the Front has shown its role as a bridge between religion and the Party, State and people of all classes. Along with that, the Vietnamese Fatherland Front at all levels always focuses on mobilizing religions to actively participate in the social-economic development process, promoting good cultural and moral values and natural resources of religion to contribute to building cultural life in residential areas and at religious establishments, thereby contributing to the process of building and developing the country in a sustainable way. In 2019, Prime Minister, Nguyen Xuan Phuc and high-ranking officials of the Party and State met to commend dignitaries and religious positions for their contributions to the national defense and construction mission. Organizing such programs is an effective way to call, gather and unite religions in the Vietnamese great national union.

Second, the Vietnamese Fatherland Front has stepped up propaganda and mobilization of dignitaries, positions, priests, believers, religious followers, religious organizations and the people to implement the guidelines and policies of the Party, policies and laws of the State, including guidelines, policies and laws on religions. Every year, the Vietnamese Fatherland Front at all levels coordinate with relevant agencies to organize propaganda for the Party and State's guidelines, policies and laws and mobilize officials, people to follow the true religion. The purpose of propagating and mobilizing people to implement the guidelines, policies and laws is for the people to clearly see the benefits of solidarity, the rights and interests associated with the obligations and interests of individuals must be in accordance with the law. Accompany with the interests of the community, religion must be consistent with the common interests of the nation and country. This is also the core point to mobilize the unity of religions in the great national union. At the same time, the Vietnamese Fatherland Front at all levels has continuously promoted the propaganda, explanation and enlightenment for believers, dignitaries and officials of religions to understand their responsibilities towards the country, contributing to strengthening the consensus between religious compatriots and non-religious compatriots as well as between followers of different religions. Since then, the people have clearly understood and well implemented the Party's guidelines and resolutions, the State's policies and laws on religion. This is the basis for the people to realize illegal religious activities and clearly understand acts of taking advantage of religion to incite division of the people and devastate the great national union.

Third, the Vietnamese Fatherland Front is increasingly promoting its role as an organization that takes care of and protects the legitimate and justifiable rights and interests of people of all religions in accordance with the common interests of society. Coordinating with Party and Government agencies, over the past time, Vietnamese Fatherland Front Committees at all levels have always taken care of the material and spiritual life of people of all religions. Thereby contributing to consolidating and promoting the strength of the great national union, successfully implementing political tasks and developing socio-economic in the locality. In order to take care of the material and spiritual life of the people in general and the religious people in particular, the Party, Government, Front and mass organizations always pay attention to direction and promoting the work of hunger eradication and poverty alleviation, investing in the construction of infrastructure in the locality and creating all favorable conditions for religious compatriots to improve their lives; facilitating people and religious compatriots to actively transform economic structure, developing trade and services; create conditions for them to access loans for production and business development. Along with that, the Front at all levels cares about protecting the legitimate and justifiable rights and interests of people of all religions. The Front receives and studies letters, feedback, recommendations, complaints and denunciations from religious compatriots and promptly transfers them to competent agencies for consideration and settlement in accordance with regulations.

Fourth, the Vietnamese Fatherland Front mobilizes, encourages and promotes the role of prominent and prestigious people in religions and coordinates with the State to have

a mechanism for them to participate in State power agencies and Socio-political organizations. Over the years, the Vietnamese Fatherland Front at all levels has presided over and coordinated with functional agencies of the Party, State and Socio-political organizations in mobilizing and gathering people of different religion and promoting the role of a representative and reputable person in religions. Prestigious people in religions have a great role and influence on the community, collective and family line. They promptly capture people's thoughts, feelings and aspirations and send them to the Party and State; It is a connector tool of the Party and the people. They are trusted by people, shared all aspects of social life, kept contact with, are the center of solidarity between Party, authorities and religious compatriots. Along with that, the Front at all levels mobilizes, selects and creates favorable conditions for dignitaries, monks and typical followers of different religions to participate as a Members of the National Assembly and members of the People's Councils of at all levels, the Vietnamese Fatherland Front Committees at all levels and its member organizations such as the Red Cross Society, the Elderly Association, the Study Promotion Association, the Association for the Protection of the Disabled and Orphans, etc. Therefrom, dignitaries, priests and typical followers of religions can speak out and express their personal and religious views on economic, political, cultural and social issues and can participate in building the Party and the State, making a significant contribution to the solid construction of the Vietnamese great national union.

Fifth, the Vietnamese Fatherland Front actively mobilizes the people to participate in the process of monitoring and social criticism of the Front, thereby strengthening social consensus and religious unity in the great national union. The Vietnamese Fatherland Front at all levels mobilizes the people to supervise the activities of agencies, organizations, elect representatives and officials, public servants and public employees in the implementation of policies and regulation on religion. People in general and religious people in particular, in the process of carrying out supervision, if they have detected the agencies, organizations and individuals fail to strictly follow the guidelines, resolutions, policies and laws on religion, they can reflect it to the Vietnamese Fatherland Front Committees at all levels, from which the Committee will receive the feedback and settle it according to its functions, tasks and powers. In addition, the Vietnamese Fatherland Front at all levels always mobilizes the people to actively participate in the process of commenting on policies draft and laws of the State related to religion. Contributions of the people will help the State increasingly improve policies and laws on religion; it is the basis for the Front to strengthen social consensus, mobilize and unite religions in the great national union.

Sixth, through policy advocacy, the Vietnamese Fatherland Front gathers, synthesizes the people's opinions, recommendations and aspirations on issues related to religion and promptly reflects and proposes to the Party and Government. The Front has performed the task of grasping the people's situation, "the Front listens to the people's opinions" and regularly, irregularly and periodically reflecting and proposing to the Party and State. Periodically and on National holidays and religious holidays, the Front at all levels coordinates with relevant agencies to organize visits and meetings with typical religious dignitaries, positions and priests. Leaders of the Front Committees at all levels regularly visit

and congratulate religious organizations in Vietnam on important occasions such as the Buddha's Birthday Celebration and the Catholic Christmas. Notable recent events can be mentioned that in 2019, Prime Minister Nguyen Xuan Phuc and high-ranking officials of the Party and State met to commend religious dignitaries and positions for their contributions to the Fatherland defense and construction. Through these meetings, the Front gathered and grasped the legitimate thoughts and aspirations of religious dignitaries and religious compatriots in the region to have appropriate solutions. This is also an effective way to mobilize, gather and unite religions in the Vietnamese great national union.

Seventh, the Vietnamese Fatherland Front has increased mobilizing religions to carry out people-religious foreign affairs to contribute to implement the Vietnam's foreign policy and demonstrate the spirit and strength of great national unity. Over the past time, religious organizations in many localities have increased their religious foreign affairs associated with people diplomacy activities through the Vietnamese Fatherland Front Committees at all levels, especially the Central and Provincial levels and has achieved certain achievements. People diplomacy activities are most clearly demonstrated by religions in specific things such as: organizing delegations for dignitaries and religious followers to study abroad, attending conferences and seminars for dialogue on beliefs, religion; organizing charity activities such as free medical examination and providing medicine, giving gifts to the poor in some countries (for example: Laos, Cambodia..); welcoming and working with foreign delegations and religious organizations to coordinate the implementation of projects in Vietnam sponsored by non-governmental organizations.

Eighth, the Vietnamese Fatherland Front actively and effectively participates in the implementation of religious policies and contributes to the realization of religious unity in the great national union. The Vietnamese Fatherland Front propagates and mobilizes religions to respond and actively participate in patriotic emulation movements, emulation movements in religious areas, campaigns to strive for homeland construction getting richer and more beautiful. The Vietnamese Fatherland Front Committees in all localities across the country regularly mobilize and unite religious organizations, dignitaries and believers to "live a good life and a good religion"; organize religious activities in accordance with the provisions of law; build and replicate self-governing models for environmental protection, security and social order and building the "Bright-Green-Clean-Beautiful" residential areas, sophisticated and civilized worship establishments. During the campaign of advocacy, the Vietnamese Fatherland Front at all levels always ensures to respect the religious freedom right of the people and to equality between religions. In order to improve the effectiveness of the implementation of the religious policy and the strategy of the great national unity, the Presidium of the Vietnamese Fatherland Front Central Committee had a special program on: Renovating contents and modes of operation of the Vietnamese Fatherland Front in ethnic and religious affairs. It can be seen that the effective implementation of religious policy is thanks to the important contributions of the Vietnamese Fatherland Front at all levels. Since then, religious unity has been raised and the great national union has become more and more solid.

4. Conclusion and Recommendations

From the study results, the author of the article makes the following observations for discussion:

First, each religion in our country, although having a different history of formation and characteristics, exists in the hearts of the whole people; The interests of each religion are also associated with the interests of the nation and country. It is proved that religions have made many contributions to the national construction and defense. It is necessary to further promote the resources and values of religions, thereby contributing to improving the synergy of the great national union to meet the goal of sustainable development.

Second, promoting the great national union is one of the main, consistent and throughout the entire Vietnamese revolutionary process. In specific situations and circumstances, the promotion of the great national union must always ensure the harmonious settlement of issues of interests, create a common denominator and building and forming similarities with each other for each class, segment, ethnic group, religion, as well as for each specific region and area towards realizing the revolutionary goal that the Communist Party of Vietnam and the people have chosen.

Third, religious unity in the great national union is an important content in the Vietnamese great national unity strategy. Solidarity between religions and between religious people and non-religious people, resolutely fighting and strictly handling those who abuse religion to oppose the Party, State and socialist regime. This will contribute to strengthening and promoting the strength of the great national union in the current of national construction and defense.

Fourth, the Vietnamese Fatherland Front has always had an indispensable position and role in each revolutionary period. Promoting the strength of the great national unity is the responsibility of both the political system and the Vietnamese people, in which the Vietnamese Fatherland Front plays a very important role. The Vietnamese Fatherland Front is a "common house" that gathers and unites the entire Vietnamese people, including the unity of religions. Ensuring the right to religious freedom, equality between religions, uniting religions in the great national union, contributing to the promotion of democracy, strengthening social consensus, towards building an increasingly democracy, justice, civilization society.

Some recommendations to further promote the role of the Vietnamese Fatherland Front in mobilizing the religious unity in the great national union to meet the requirements of sustainable development of the country in the coming time:

First, it is necessary to continue strengthening the leadership role of the Party in promoting the great national union, the State's management of religion and religious work; strengthen coordination between Party and State agencies, Vietnamese Fatherland Front and socio-political organizations for the mobilization of religious unity in the great national union.

Second, it is necessary to strengthen cooperation in participating in theoretical research on religious work. Continuing to participate in developing, supplementing and perfecting the Party's guidelines and resolutions, the State's policies and legal regulation on religion and religious work, serving as a basis for strengthening the mobilization and religious unity in the great national union.

Third, need to be proactive, creative and innovative in content and forms of religious unity. Strengthening the mobilization of religions, religious compatriots to respond and participate in programs and campaigns in a substantive manner, avoiding formality. Regularly review, summarize and evaluate to increasingly improve the quality of religious unity mobilization tasks in the great national union.

Fourth, it is necessary to strengthen the collection of recognized religious organizations participating as members of the Front; attracting typical individuals of religious organizations to join the Vietnamese Fatherland Front Committee, the Executive Committee of Socio-political organizations, Social organizations and elected office at all levels with a suitable number of quantity and structure.

Abstract

Vocational training for ethnic minorities women in general and local ethnic minority women in particular in the province of the Dak Nong is one of the top priorities in the field of vocational training and socio-economic development policies of the Dak Nong province. Currently, local ethnic minority women still face many difficulties in life, economy, culture and society. Organizing research and properly assessing the reality of vocational training for local ethnic minority women in district-level vocational education and continuing education centers of the Dak Nong province is a very important and urgent job.

The authors of the article conducted a survey on the current situation of flexible and effective vocational training models for local ethnic minorities women in the Dak Nong province in the period 2017-2021, analyzing the strengths, weaknesses, causes and problems for effective management and development of vocational training models for local ethnic minorities women in the Dak Nong province in the coming time. Since then, the research team has proposed a system of effective management solutions to develop flexible and effective vocational training models for local women of ethnic minorities in vocational education and continuing education centers at district level in the current digital transformation context.

Keywords: *Building vocational training models; Local ethnic minority women; Vocational education - Continuing Education Centers at district level; Dak Nong province.*

1. Introduction

The State increases investment to develop vocational training for rural workers, adopts policies to ensure the implementation of social justice in terms of vocational training

opportunities for all rural workers, encourages, mobilizes and creates favorable conditions for rural workers, conditions for the whole society to participate in vocational training for rural workers. In fact, after more than twelve years, the Dak Nong province have provided vocational training for many agricultural workers. Besides the achievements, vocational training for ethnic minorities in the Dak Nong province still has certain limitations. Vocational training and job creation for rural workers in general and ethnic minorities in particular, especially ethnic minority women living in extremely difficult communes, still face many difficulties. After vocational training, laborers are able to find jobs and earn a small amount of income. There is no appropriate policy to encourage vocational training institutions to expand enrollment. Many localities in remote, isolated and extremely difficult areas do not yet have a vocational training model suitable for each target group, especially ethnic minority women in the Dak Nong province. Education socialization has not been promoted and resources have not been mobilized from businesses and people. There are places where vocational training does not match the actual local needs. The quality of vocational training is not high because the education level of workers, especially the quality of workers in remote and mountainous areas, is uneven, so the number of rural workers participating in vocational training is not high. The main occupation is learning simple trades, or fostering knowledge for a few days. In particular, there is a lack of preferential mechanisms and policies for ethnic minority apprentices. A number of regulations and norms on vocational training support for rural workers and ethnic minority workers are not appropriate and do not meet the needs of vocational training in the locality, specifically: regulations on expenditure levels compared with the place of residence of the compatriots. High-tech occupations have not yet developed. The qualifications of workers do not meet the requirements of the labor market. Labor export is still limited. Many training institutions still have difficulties in terms of facilities and lack of places to practice. Vocational training program is still heavy on theory, not really suitable with the cognitive level of rural workers, especially ethnic minority workers. Most of the rural apprentices receive only elementary level training and are less than 3 months old. Most of the workers after receiving vocational training still do their old jobs. The percentage of ethnic minority workers receiving vocational training is very low (less than 6% compared to ethnic minority workers in the age group). Ethnic minority workers still have few opportunities to receive formal vocational training, often only in classes of less than 3 months. Also due to the customs left behind, most of the ethnic minority women in the Dak Nong province rarely go to school, the time to study is too short, and there are few opportunities to participate in rural vocational training programs. Besides, the issue of vocational training, especially vocational training for women, is a matter of concern for ethnic minorities in extremely difficult communes in particular and in the Dak Nong province in general. In this province, women are the main laborers in the family, playing the main role in taking care of the family economy and shouldering the burden of raising children, but in reality, the percentage of female workers is employed, is low and youth unemployment is still very high. Life support, policy settlement by the allocation of production land is not guaranteed, because the government has no land fund, that's why the implementation of policies on job change, vocational

training and vocational guidance for farmers for ethnic minority youth has been implemented by the Party and State for many years. However, at present, vocational training for ethnic minority women has been paid attention, but is not really effective. On the other hand, local ethnic minority women still have to bear many inequalities in life as well as in access to cultural, social and educational services, while gender equality is an issue, has received special attention from the whole society. Vocational training and career development are the rights and obligations of female employees. Women actively participate in vocational training to meet the needs of the labor market, contribute to increasing the competitiveness of human resources, economic growth and social development. Increase opportunities for vocational training and job creation for women; especially women in rural areas, middle-aged women, local ethnic minority women, particularly disadvantaged areas, displaced and cleared areas are the wishes of the whole society. The State increases investment in vocational training development and job creation for women; adopt policies to mobilize all resources in society, pay attention to vocational training and create jobs for women; focus on investing in the development of vocational training institutions that attract many female workers. Currently, we still have many limitations that need to be overcome in the issue of gender equality, especially in terms of ideology and views of people in society, especially towards ethnic minorities. Ethnic minority men are not aware or have attitudes that do not accept the roles and positions of women, which even many ethnic minority women themselves have vague understanding of, thereby having deviant attitudes and unable behaviors to have a correct solution to problems arising in life related to their gender roles and positions. Gender inequality is still one of the main causes of poverty and one of the obstacles to sustainable development, especially in extremely disadvantaged communes in mountainous areas, research program on capacity development and creating opportunities for women. Education is the key to development. Education development is to create a solid foundation for socio-economic development in regions of the country in general, especially vocational training in extremely difficult communes of the Dak Nong province in particular. In education, research to address the issue of vocational training for ethnic minority women in the locality has become increasingly significant. Therefore, the implementation of the Project: *"Building vocational training models for local ethnic minorities women at district-level continuing education and vocational education centers in the Dak Nong province"* is an urgent requirement to help ethnic minority women in the Dak Nong province have the opportunity to improve their professional capacity as well as labor productivity to develop the household economy.

2. Method

The study is carried out based on the following main approaches: Logical-historical approach; System approach in the direction of interdisciplinary, inter-regional and inter-level; Access to school education; Access to sociology; Access to value; Access to market; Access to psychology; Cultural access; Approach to case study; Access through expert opinion.

The study implements the following research methods: Methods of collecting information: Methods of researching secondary documents, methods of collecting information, primary data; Data analysis methods; Deployment method to replicate the model.

3. Results

3.1. Actual situation of building vocational training models for local ethnic minority women in extremely difficult communes in the Dak Nong province

Supporting women in self-employment is the strength of the Women's Union in the Dak Nong province. Credit and loan programs for self-employment creation of the Women's Union at all levels always attract a large number of participants, especially untrained, underemployed, low-income women, women lost productive land,... Annually, vocational training institutions have coordinated to support from 1,000 to over 1,600 women to create self-employment in various forms, reaching the rate of approximately 29%. to over 35% of the total number of women apprentices at vocational training institutions every year. About a third of vocational training institutions have relationships with programs and projects to coordinate and support women in self-employment after vocational training.

In extremely difficult communes in Dak Nong province, a model has emerged recently: Supporting women to work abroad for a limited time under contract (labor export) after vocational training. Women's Unions at all levels have actively joined the government in providing vocational training for women. The Women's Unions in these localities shall appoint staff to join the Labor Export Support Committee, or participate as collaborators of labor export enterprises. From there, there are conditions to connect and support to send women to work abroad after vocational training. The results of the survey sample within the scope of the research show that there are 5 vocational training institutions that have supported from 360 to 520 women to work abroad.

Forms of job support for specific groups of women, poor women are similar to other groups of women, including job counseling, job placement, self-employment support, export support, labor export. Besides the vocational training model: The Women's Union participating in supporting women to export labor after vocational training is a model of vocational training with the participation and support of all levels of government for women and girls, girls in joint training in the system of vocational training institutions of the Women's Union and the general vocational training system of the state and locality. Along with the form of long-term vocational training (over 3 months, inter-training) are other forms of vocational training such as short-term training, address-based training, vocational training at vocational training institutions, and vocational training institutions, itinerant occupations, seasonal training (when farming at home), training associated with job creation. All of the above training models have the participation and combination of subjects and the models are increasingly aiming for perfection. In general, there are models that have worked well in practice, have been deployed and are continuing to be replicated in the near future for local ethnic minority women in extremely difficult communes in the Dak Nong province such as:

Model 1. Linking "houses" in providing information, vocational training and job counseling for women in line with market needs

Steering Committee for programs/projects/projects (Project 295- Project training and employment support for women; Project 1956 - Vocational training for rural workers...) on vocational training and support employment assistance, state management agencies, vocational training institutions under the Women's Union, general vocational training

institutions in the system, job placement establishments, employers, organizations socio-political organizations, mass organizations, especially the Women's Union at all levels, share information on the labor market and the demand for female workers with vocational training (quantity and structure). In addition to the vocational training counseling system, the professional employment of vocational training and job placement institutions can use the grassroots staff network or the grassroots Women's Union (commune/ward) to play a role. collaborators, conducting propaganda and counseling on vocational training and employment at the grassroots (commune/village) for women.

Model 2. Vocational training institutions of the Women's Union shall coordinate with vocational training institutions of the general system to organize intermediate and primary vocational training courses and short-term vocational training courses of less than 3 months for students

Women in general in extremely difficult communes and specific women's groups in particular have diversified training occupations, suitable to market demands. In fact, vocational training institutions, vocational training centers in the general vocational training system, or vocational training institutions of the Women's Union in extremely difficult communes in the Central Highlands have organized counseling sessions. vocational training and vocational enrollment for women on training occupations suitable to market demand; At the same time, there are regular links between institutions, exchange, transfer/send students to other vocational training institutions in the locality to train a number of occupations that the vocational training institution itself is not capable of training. Women can choose to study many different professions according to their needs; Save investment costs in facilities and ensure conditions for vocational training for vocational training institutions, while ensuring that many jobs can be taught to employees.

Model 3. Connecting vocational training at vocational intermediate and college levels with and between the system of vocational training institutions and vocational training centers

Students graduating from primary vocational schools at vocational training institutions can receive training to transfer to vocational intermediate schools and colleges at vocational training institutions of the common system; Women have the opportunity to continue their vocational training at a higher level (vocational secondary school, vocational college) in the general vocational training system. This possibility increases the attractiveness of the system of vocational training institutions in general and vocational training institutions of the Women's Union at all levels in particular. There are differences in teaching quality and program content among vocational training institutions, which may cause certain difficulties for students to connect. It is necessary to test and supplement knowledge before entering a joint school to ensure entry requirements.

Model 4. Linkage between vocational training institutions and enterprises employing many women

This model has been implemented and replicated in the Dak Nong province, including especially disadvantaged communes, in order to attach vocational training and job support to women. Vocational training institutions associate with enterprises that use a lot

of female workers for training. Vocational training institutions grasp the labor demand of enterprises/production, business and service establishments to develop appropriate training plans. Vocational training institutions recruit, train in theory and send vocational students to practice and practice at enterprises. After completing the course, the enterprise will immediately recruit students who meet the requirements. The most suitable form is a vocational training institution that provides “order-based” training for businesses/production, business and service establishments that employ a lot of female employees. Supporting businesses on input and output markets.

Model 5. Vocational training establishments belonging to the Women's Union at all levels or joint vocational training institutions coordinate vocational training and support on-the-spot employment in the models of women's groups and groups cooperating in production and business and for traditional craft villages that employ many women

In order for this vocational training model to be effective, in recent times, the Women's Unions at all levels in extremely difficult localities, or local authorities, have developed vocational training programs and curricula with the participation of participants. The objective is that the content of the training program is lean, using traditional techniques of the craft village in combination with the use of new and modern technical technologies. The program not only ensures legal regulations, but also has a flexible and flexible structure that is highly practical and practical with the traditional production process in the craft village. Specifically, the elective program in the framework program has been loosened from 30% to 40-50%; increasing internship time in craft villages, accounting for 1/5 of the course time (previously 1/10). Teaching basic theory and practice at vocational training institutions, advanced practice, organizing internship in craft villages, using equipment of craft villages. Mobilize a team of artisans and skilled workers of the craft village to participate in advanced practice teaching and internship guidance. The teaching staff of the vocational training institution cooperated with the artisans of the craft village in the training process. Laborers in craft villages receive vocational training, receive formal degrees/certificates and are officially recognized. Craft villages are allowed to receive and use a team of workers who have undergone formal vocational training. Students learn jobs conveniently and easily because they don't have to go far. Saving on teaching costs because vocational institutions do not have to make large investments in equipment for practical teaching. Students can practice, practice the profession right at the actual production site, helping them get acquainted with the job right from the time they are learning the profession. The entire program and curriculum are compiled separately for each traditional profession, difficult to widely apply, so it is quite expensive in terms of time and money.

Model 6. Vocational training institutions cooperate with labor export enterprises or foreign employers

Vocational training institutions have consulted and recruited women to participate in vocational training courses according to orders for labor export enterprises or foreign employers. Women who complete vocational training courses will be examined by labor

export enterprises or foreign workers and sent to work abroad under contracts. Labor export enterprises have quality labor resources due to vocational training, education and necessary knowledge and skills before going to work abroad. Women who receive vocational training and have professional and technical qualifications will increase their chances of working abroad with jobs with better income and working conditions. Few labor export enterprises "order to train" women for labor export. Although some initial results have been achieved, vocational training in general and building a vocational training model for ethnic minority women in the locality in particular still have many limitations and shortcomings. The investigation and survey of vocational training needs, counseling orientation, and job placement have not been given due attention; many places have not yet identified the occupations that need training in accordance with the requirements of local socio-economic development; have not properly oriented job creation for employees after receiving vocational training. Therefore, some post-training classes have very low employment settlement rates. Some districts assign vocational training quotas to communes, wards and townships, but not on the basis of local vocational training needs. To achieve the target, many localities have mobilized both people with vocational training needs and those without vocational training needs to attend classes, thereby greatly affecting the quality and effectiveness of training. Although the quality of vocational training has been improved, it still cannot meet the increasing requirements of the labor market. Many female workers have received vocational training, but still work in the old farming profession or consider the training time as a waste because the products made from the profession have no market for consumption, or the market is unstable.

3.2. System of solutions to build vocational training models for local ethnic minority women in extremely difficult communes in the Dak Nong province

3.2.1. Group of solutions to improve the effectiveness of vocational training for female employees of ethnic minorities in the Dak Nong province

✚ Solution to raise awareness

Perception plays a very important role in all practical activities of people. The reality of vocational training has proved that one of the reasons for success or failure in the organization and implementation of vocational training is awareness. It is necessary to make people understand the true nature of vocational training and the need to participate in this work, thereby gradually increasing self-awareness and actively participating. Therefore, it is necessary to raise awareness of all levels, sectors, enterprises and society about vocational training; must be properly aware of the position and role of vocational training in job creation, in ensuring the structure of human resources, of the decisive factor for sustainable socio-economic development; To properly perceive the value scale of vocational training to change behavior, to attract the majority of young women and women to vocational training. Raising awareness of entrepreneurs about the benefits of vocational training for the sustainable development of enterprises, thereby actively participating, making major and active contributions to vocational training. If you want to raise awareness, you have to do a

good job of propaganda. The purpose of propaganda is to mobilize and provide adequate information about the Party's guidelines and guidelines, the State's policies and laws, the advantages and disadvantages of vocational training, from which change the perception of Party committees, local authorities, social organizations and the masses in a positive direction about the position of vocational training for female workers in the cause of industrialization and modernization.

 *Solution on mechanisms and policies*

Renovating mechanisms and policies on vocational education and streamlining students after lower secondary school. Strengthen the work of socialization of vocational education, strengthen the physical facilities for vocational education institutions. Continue to renovate the financial mechanism for vocational education in order to mobilize, allocate and use more efficiently the resources of the State and society invested in vocational education; improving the autonomy of vocational education institutions, ensuring transparency and accountability to the State, learners and society.

Implement the program of coordination between the Ethnic Minorities Committees and the Women's Unions of the provinces in the Central Highlands on the mobilization of ethnic minority women in the period of 2020 - 2025. In order to attract ethnic minorities to actively participate in vocational training, especially ethnic minority women in extremely difficult communes, vocational training must go hand in hand with creating jobs on the spot after vocational training, to help them have a stable income. On the other hand, vocational training must be appropriate to their cognitive level and to the requirements of local industries, production and employment requirements. There are mechanisms and policies to regulate the responsibility of enterprises in investing in vocational training for employees, especially in training high-quality human resources and human resources in key industries. Regulations on the responsibilities of industries, socio-political organizations, communities and families in contributing resources and participating in vocational education activities, creating lifelong learning opportunities for everyone, gradually contribute to building a learning society.

 *Solution for capital support and production conditions, infrastructure*

Expanding and diversifying funding sources to support ethnic minorities, especially ethnic minority women, linking the Bank for Social Policies' credit activities with credit channels and other resources. other funds such as: National Employment Support Fund, Farmers Support Fund, ... continue to implement the policy of supporting residential and productive land for ethnic minorities; supporting agricultural, forestry, fishery and industrial extension activities; support plant and animal varieties, production materials,....Continue to invest in essential infrastructure for production and people's livelihood, giving priority to works in service of production that have direct practical effects on production and economic exchanges, such as irrigation, roads and roads. rural areas, electricity for production and daily life, rural markets,... Priority is given to investment in infrastructure works according to the New Rural criteria.

+ Solution for innovating training content, programs, methods and capacity building of training institutions

The content of the vocational training program must be consistent with the requirements of the labor market, specified in the occupational skill standards or determined through vocational analysis, and regularly updated with new techniques and technologies in production. Increase the amount of time to practice practical skills; reduce the theoretical time. Strengthening vocational training activities on mass media channels and online training on Vietnam Agricultural Extension Website; distance learning program. To guide establishments conducting agricultural vocational training for female workers to uniformly train according to the framework program and curriculum promulgated by the Ministry of Agriculture and Rural Development. Pursuant to the framework program of the Ministry of Labor - Invalids and Social Affairs; The Ministry of Agriculture and Rural Development has directed the vocational training institutes to develop programs for each training level from Beginner Vocational to Vocational College to ensure the vocational training objectives for each level and the connectivity between qualifications for each profession, meeting the requirements of enterprises. On that basis, training institutions develop specific training programs for each profession. The modules included in the training program of each profession need to ensure the practicality, ensuring the balance of the theoretical and practical training time of that module. Vocational training institutions need to organize delegations of cadres and teachers to conduct field surveys at agencies and units of all economic sectors, thereby developing detailed training programs while taking into account the weight of each module, in each training profession so that the subject can be adjusted accordingly. After each course, the school should have a process to collect information from learners to evaluate the quality of the training program.

+ Solution to strengthen coordination between ministries, branches, agencies and levels of the Women's Union in formulating and proposing laws and policies and monitoring the implementation of laws and policies on vocational training and create jobs for women from ethnic minorities

Central Vietnam Women's Union:

- To assume the prime responsibility for, and coordinate with concerned ministries, branches and localities in, organizing and implementing vocational training; report to the Prime Minister and issues arising in the implementation process; make recommendations on necessary changes and adjustments, in line with the specific realities of the region;

- Directing the Vietnam Women's Union at all levels to coordinate with relevant departments and agencies in implementing vocational training in the locality;

- Coordinate with ministries, branches and functional agencies in inspecting and supervising the implementation of vocational training; periodically report to the Prime Minister on implementation results; evaluate and summarize the implementation of vocational training.

Ministry of Labor, War Invalids and Social Affairs:

- To assume the prime responsibility for, and coordinate with the Vietnam Women's Union in, guiding the planning of the network of schools and centers for vocational training and job placement under the Vietnam Women's Union;

- Coordinate with the Vietnam Women's Union in researching and supplementing the activities of the Scheme on supporting women in vocational training and job creation, integrating them into the national target programs on employment, the target program on employment and the national target program on employment, national goal of education - training and other related projects and schemes;

- Guide vocational training units and establishments to conduct vocational training.

- To assume the prime responsibility for, and coordinate with the Vietnam Women's Union in, monitoring and evaluating the implementation and implementation of vocational training.

Ministry of Finance, Ministry of Planning and Investment:

- Ensuring annual state budget allocation for vocational training in accordance with the Law on State Budget;

- To assume the prime responsibility for and coordinate with relevant agencies in, guiding the financial management mechanism for vocational training; coordinate and supervise the implementation of vocational training.

Ministry of Education and Training:

- Review and add relevant activities of vocational training to the National Target Program on Education and Training;

- Directing affiliated units to coordinate in implementing the Scheme to support women in vocational training and job creation; Coordinate and supervise the implementation of the Project.

Ministry of Home Affairs:

- Coordinate the implementation of related activities in the Scheme, especially on the model of organization and operation of vocational training institutions at all levels of the Vietnam Women's Union;

- Review and add relevant activities of the Scheme into the staff retraining program.

The Ministry of Agriculture and Rural Development:

- Coordinate in implementing and supplementing relevant activities of the Scheme into the programs of agricultural extension, forestry extension, fishery extension, and vocational training for rural workers.

The Ministry of Industry and Trade:

- Coordinate in implementing and adding relevant activities of the Scheme to the trade promotion program and agricultural extension program.

The People's Committees of the provinces and centrally-run cities:

- Approve and organize the implementation of the Scheme on support for vocational training and job creation for women in their respective localities on the basis of the Scheme and the Economic Development Strategy.

- Provincial society by 2030 or integrated with other projects being implemented in the area; create conditions on land and other conditions for the implementation of the Scheme.

Linking vocational training with employment, labor export and poverty reduction is a very important policy to link vocational training activities with the labor market. This policy will be one of the main foundations to ensure the effectiveness of vocational training, vocational training and the use of learned professions. Policies should be developed to promote vocational training institutions, production and business establishments to cooperate in order to create favorable conditions for the labor market to operate. There should be more policies to promote the development of an intermediary network to act as a bridge between the vocational training unit and the employer to ensure the balance between supply and demand in the labor market in general and generate income. sustainable poverty reduction.

 *Solution to strengthen the inspection and monitoring of the implementation process*

Strengthening inspection and guidance on the implementation of legal provisions, policies and vocational training for female workers is a very important solution to ensure that vocational training is properly accomplished, regulations set forth. In order for the inspection and supervision to be objective and effective, local governments at all levels must post up on targets, publicize relevant regulations, regimes, training programs, policies, etc. all localities in terms of mass medi. Officers in charge of vocational training must receive regular training in their respective specialties, must understand the Law on Vocational Education, all regulations and regulations related to the Law on Vocational Education. Contents of inspection and control must be included in the examination of training content, training programs, training quality, registration for entry, training time, examination regulations, standards for granting diplomas and certificates, the conditions of facilities, teaching equipment, etc. Violations must be handled seriously in order to maintain order and discipline. Develop criteria for writing an overall female labor management program according to age, ability, vocational training needs and employment status. In order to avoid duplication in the training enrollment stage, the solution to be implemented is to avoid duplicating 01 training supporter many times. To do this, it is necessary to develop a program to manage all relevant information about female workers of working age belonging to poor, near-poor households, policy areas, disadvantaged communes, needs and information. employment status of female workers after vocational training and networking through the job exchange floor of the Southwest region for unified management.

3.3. Group of solutions on vocational training, building vocational training models for local ethnic minority women in extremely difficult communes in the Dak Nong province

3.3.1. Solution for raising awareness

Through community activities, through meetings, women's associations at all levels propagate and raise awareness for women about the position and role of women in the family,

in society, about equality gender equality, women's right to education and stable employment. Thereby mobilizing women to participate in vocational classes held in the locality, and at the same time advising them to choose the appropriate career.

3.3.2. Solution to promote activities to support vocational training and create jobs for local ethnic minority women in extremely difficult communes in the Dak Nong province

Increase the scale and develop teaching new professions to meet the needs of the labor market. Expand training in new occupations that appear on the market to attract many female workers. Diversifying training methods: expanding training in occupations suitable to the characteristics of female workers, occupations capable of attracting middle-aged female workers; link and coordinate in organizing vocational training for female workers in enterprises, cooperatives and cooperative groups; associate with businesses for vocational training and practice. In order to create outputs for vocational training for ethnic minority women on the spot, it is necessary to strengthen counseling, job introduction and job creation activities before, during and after vocational training. Diversify forms of vocational training counseling, job placement counseling suitable for each target group at the grassroots level. Actively and in coordination with businesses, production and business establishments, etc., especially the network of Associations, Associations, Women Entrepreneurs Clubs to create new jobs for women and organizations providing female labor ; support women to access credit to create new jobs, develop production and business, create jobs for female workers; support women in promoting trade for products from craft villages, production and business establishments owned by local ethnic minority women.

3.3.3. Regularly survey and survey labor market information, forecast demand and pilot vocational training models for employees

Investigate and survey the vocational training needs of workers and forecast the demand for laborers through vocational training of production, business and service establishments and the capacity of business establishments for employees, very important activities, which are the basis for effective implementation of vocational training for workers. Provide guidance, support and training in surveying skills for districts in the Dak Nong province, at the same time design information input software for localities, build output form systems and demand forecasting models. Vocational training for female workers of ethnic minorities on the spot in extremely difficult communes in the Dak Nong province, pilot training models for workers.

Coordinate with the Vietnam Association of Crafts Villages to develop vocational training projects such as: vocational training and job organization associated with the development of new craft villages; vocational training with the combination of raw material areas, job organization and product consumption; vocational training in association with maintaining and developing traditional craft villages.

Coordinate with a number of corporations, corporations, industrial parks, production and business establishments and a number of training schools in the field of processing industry, services...to deploy orders for vocational training for employees move to industry and service in the countryside or work in industrial zones and local businesses.

3.3.4. Implement the national target program on job creation and vocational training through stages, vocational training, building a model of vocational training for ethnic minority workers in the Dak Nong province

Ethnic minority women in extremely difficult communes in the Dak Nong province have obtained very positive results. The number of employees receiving vocational training and getting jobs after vocational training has increased significantly over the years. Local ethnic minority women have suitable conditions for vocational training, most of them have found jobs and have income. But in reality, local ethnic minority women in extremely difficult communes still face many difficulties in accessing vocational guidance, choosing a training career and benefiting from a suitable vocational training model. The barriers that prevent women from effectively accessing the profession are due to backward factors in the cultural practices of the people, factors that prevent them from having a stable job after vocational training... Wanting to solve these difficulties With the above difficulties and inadequacies, the acquisition of suitable occupations and effective vocational training models along with the active participation of all levels of government, mass organizations and society.

4. Discussion and Conclusion

On the basis of research results, in order to renew and improve the effectiveness of vocational training for local ethnic minority women in Dak Nong province in general and local ethnic minority women in special communes. To distinguish the difficulties of Dak Nong province in particular, the research team raised the following issues that need to be further discussed:

- Continue to promote propaganda to raise awareness for ethnic minority women on the spot about participating in vocational training to have stable jobs, develop livelihoods, create more incomes to rise out of poverty sustainably. steady.

- Increase capital support for production and business development for local ethnic minority women after vocational training.

- Proposing to increase the level of support for ethnic minority women on the job training site. Vocational training projects need to expand the beneficiaries of vocational training support money in order to ensure life during the study period and should have an investment policy to encourage post-apprenticeship.

- Vocational training projects need to focus on investing in the model of job creation after vocational training, in order to help local ethnic minority women in extremely difficult communes after vocational training to actively develop production in the world. their own profession, with the knowledge they have learned, apply to develop production, increase income, improve life to get rich.

- There should be vocational training programs suitable to the receptive ability and participation conditions of ethnic minority women in the locality.

- Implement the coordination program between the Provincial Committee for Ethnic Minority Affairs and the Women's Union of Dak Nong Province on the mobilization of ethnic minority women in general and ethnic minority women in place in the period of 2020 - 2025.

- Coordinate the implementation of the point model on sustainable poverty reduction and effective vocational training model suitable to the natural, economic and social conditions of each locality. It is necessary to research and select vocational training models suitable for local ethnic minority women living in extremely difficult areas, and vocational models that can be performed at home in association with product consumption.

-Strengthening activities to support ethnic minority women on the spot in vocational training and job creation: Only teaching occupations according to the needs of the labor market; organize vocational training classes in hamlets, at times suitable to the participation conditions of local ethnic minority female workers.

- Actively coordinate with businesses, production and business establishments... especially Business Associations and Women Entrepreneurs Clubs to create new jobs for local ethnic minority women in association with labor supply organizations. ethnic minority women on the spot. Building a network of collaborators in hamlets and credit institutions to support local ethnic minority women to access credit, develop production and business, and create jobs for ethnic minority women workers. spot number. Organize and support ethnic minority women to participate in trade promotion activities for products from craft villages, production and business establishments owned by local ethnic minority women.

On the basis of research and analysis of vocational training performance results; practical implementation of models of vocational training, job change for ethnic minority women on the spot in extremely difficult communes, the topic has proposed views and orientations on building a vocational training model; provide the bases for building models such as needs, ethnicity, locality and gender. Proposing some models of vocational training for ethnic minority women in extremely difficult communes, the study proposed two groups of solutions:

(1) Group of solutions to improve the effectiveness of vocational training for female employees of ethnic minorities in the Dak Nong province and

(2) Group of solutions on vocational training, building a vocational training model for local ethnic minorities women in extremely difficult communes in the Dak Nong province.

In the system of solutions and recommendations, along with clearly defining the responsibilities of each level of government of the political system in vocational training for ethnic minority women on the spot in extremely difficult communes, Contributing to raising the status of local ethnic minority women in the family and in society is to create conditions for poor ethnic minority women in the Dak Nong province to rise out of poverty and have stable jobs.

Abstract

Building school culture for university is to bring values of cohesion among members and improve training effectiveness as well as the school's brand. Universities have paid attention to building school culture and satisfying their customers (students) with training services. The aim of this study is to determine factors influencing university culture of universities in Hochiminh City. A sample of 425 respondents was collected via both online and offline surveys and data were analyzed by multiple regression model. The research findings indicated that 04 factors affecting university culture including (1) service quality, (2) extracurricular activities, (3) trademark identification, and (4) connection. From these, some suggestions are proposed to build a school culture of universities in Vietnam, to enhance the brand name as well as contribute to the sustainable development of them.

Key words: *culture, corporate culture, university culture, school university.*

1. Introduction

Organizational culture is a collection of values and norms that are shared by people in an organization which governs members' behaviours and actions in pursuit of organizational goals. In addition, school culture reflects the development level of the university because paying attention to building organizational culture will help the organization reach a higher level. School culture also shows the school's own characteristics that each member is proud of. Building school culture should be considered from the perspective of training service management, with the customers that are students.

Scholars have indicated that organizational performance depends on how broad and strong the values of the culture shared in the organization (Denison 1990).

Universities are increasingly focusing on this in order to make a difference as well as increase operational efficiency and the satisfaction of partners involved such as students, students' families and businesses.

It is understood that fundamental changes in the organizational culture are needed to improve an organization's performance (Cameron & Quinn, 2006). Therefore, the purpose of this study to identify and examine factors affecting university culture in Vietnam.

The authors approach school culture from the perspective of students - the object of the training process. To achieve this aim, we applied the quantitative approach along with deployed the survey of students at some universities in Hochiminh City with the structured-questionnaires. The independent variables regarding factors affecting to university culture. From the findings, we present the implications and recommendations for managerial aspects.

2. Literature Review

School culture has been studied since the 1930s in the United States, until the 1990s it was strongly developed in developed countries. In English, it is called school culture. The concept of school culture in Vietnam has a broader meaning, not only focuses on teaching and learning activities and the interactions between target groups including managers, lecturers, staff, students, parents and businesses, but also in terms of management (the provider of school activities). So, organizational culture of universities is called school culture or university culture.

Despite the existence of numerous studies in the field of organizational culture (OC), there is no agreement about one definition of it, as there are different viewpoints of this concept. OC is considered as a unique set of the highest values, standards, basic beliefs and behavioural norms held by the majority of organizational members (Fanxing et al. 2016). Harry (2014) defined organizational culture as the "personality of an organization, a pattern of shared basic assumptions-values, beliefs and codes of practice that emerged in an organization to achieve its mission and to solve its problems". Another definition was highlighted: "OC is reflected in the values, the dominant leadership styles, language and symbols, procedures and routines, and the definitions of success that make an organization unique" (Cameron and Quinn, 1999). The notion of organizational culture implies a set of shared goals and values held in common by organizational members which inspire and motivate consistent behaviours. Policies and initiatives have expressive significance: they help define desired modes of behaviour (Richard Adams et al, 2018)

School organizational culture is defined as the result of expressing school-specific values and beliefs, ideologies, attitudes, norms, goals, etc., which influence its members' way of thinking and behavior (Kim, 2008; Owens, 2001).

Nguyen Vu Bich Hien et al (2017) said that school culture "is a set of standards, values, beliefs and behaviours", "is the distinctive features that create a the school's difference from others and the difference between one school and another", "are the good values formed by a collective and accepted by each individual in the school". Nguyen Ngoc Tho (2020) has defined school culture as a system of standard values that is created and improved constantly through the processes of interaction and behavior among educational administrators, lecturers, and students in teaching and learning activities and behaving with the outside world in order to build a wholesome and humanistic school environment, meet the needs of human resources with full "talent – will – morality".

In addition, many scientific studies presented a positive relationship between organizational effectiveness and some dimensions of organizational culture. Authors such as Denison (1990), Berson et al. (2007), Ahmed and Shafiq (2014), Serpa (2015) and Ludolf

et al. (2017) indicated that culture could affect some organizational characteristics such as performance, productivity, quality, commitment and behaviour. On the other hand, a school's positive organizational culture creates conditions for teachers to provide effective instruction to students (Firestone & Wilson, 1984; Goldring, 2002) and improves the relationship between teachers and students, ultimately contributing to school development (Kritek, 1986).

Therefore, it is crucial to pay attention to organizational culture to provide quality education services (Choi, 2010). School organizational culture is influenced externally by politics, economy, and society, and internally by principals, teachers, students, parents, and residents; therefore, organizational culture is formed differently at each school (Park, 2014)

Components of school culture

Schein (1997) indicated that the organizational culture could be divided into three levels: assumptions, artefacts and values. This is because it has a huge effect on different aspects of organizational behaviour.

Shen và Tian (2012) divided campus culture into three aspects, namely, material culture, institutional culture and spiritual culture. Material culture, commonly taken on in the form of environment and facility, is the general name of external form of materialization in the development of university. Institutional culture includes the system shared in common and the distinctive system, which mainly refers to rule and regulation system, management and operation rule and restriction mechanism. Spiritual culture refers to how campus person take part in cultural activities and what results are achieved, thus reflecting the ideology, values, psychological quality and aesthetic consciousness, etc. It includes written culture, behavior culture and mental culture. Material culture is the external symbol of campus culture. Institutional culture guarantees the orderly development of campus culture. In which, spiritual culture is the core and spirit of campus culture.

In general, school culture is a system of values, material and spiritual standards accumulated through the development of the school. Those values affect the perceptions, attitudes and behaviors of members in order to create a standard cultural environment, suitable for training purposes and to create a unique identity for each school (Tung Lam, 2017).

It can be seen that school culture is a system with elements that interact with each other. Regarding the subject, according to Deal and Peterson (2010), the factors leading to the success of school culture lie in three main target groups: managers, lecturers and students. In these, the factor that plays the leading role is managers. A successful school environment must have a team of people who can approach, embrace and actively reinforce traditions and core values, and administrators must have a leading style that helps maintain and promote student learning as well as the teaching and research of lecturers.

3. Method

Inheriting previous research results, from the perspective of university culture management, the authors proposes a research model with 6 independent factors affecting university culture, including: (1) Trademark Identification (TI), (2) Perceived Values (PV), (3) Training Service (TS), (4)Academic Environment (AE), (5) Extracurricular (EX), (6) Connection (CO).

Proposed hypotheses are:

H1: Trademark Identification (TI) has a positive effect on University Culture

H2: Perceived Values (PV) has a positive effect on University Culture

H3: Training Service (TS) has a positive effect on University Culture

H4: Academic Environment (AE) has a positive effect on University Culture

H5: Extracurricular Activities (EX) has a positive effect on University Culture

H6: Connection (CO) has a positive effect on University Culture

Table 1. Scales of the study

No	Variables	Contents	Sources
<i>Trademark Identification</i>			
1	TI1	The image of the school is easily recognized through the logo, slogan, motto	Lê Văn Hào (2018)
2	TI2	The school's brand image is displayed in many activities inside and outside the school	Lê Văn Hào (2018)
3	TI3	The school's brand image has its own characteristics	Authors
4	TI4	The school's brand image is always paid attention and improved	Authors
<i>Perceived Values</i>			
5	PV1	The school's input score is getting higher and higher	Authors
6	PV2	I am proud to be a student of the school	Authors
7	PV3	I believe in choosing to study at the school	Authors
8	PV4	The school's reputation is increasing day by day	Authors
<i>Training Service</i>			
9	TS1	The staff and lecturers are polite and enthusiastic to support students	Tùng Lâm (2017)
10	TS2	Support services for students are implemented quickly and conveniently	Authors
11	TS3	The necessary information for students is provided fully and clearly	Lê Văn Hào (2018)
12	TS4	I consciously comply with the regulations and contribute to build the school culture	Authors
<i>Academic Environment</i>			
13	AE1	The infrastructure are continuously being improved for studying	Authors
14	AE2	Teachers have appropriate teaching methods and support students well	Tùng Lâm (2017)
15	AE3	Evaluating methods are fairly and objectively	Authors

No	Variables	Contents	Sources
16	AE4	I learned a lot from the teachers	Tùng Lâm (2017)
<i>Extracurricular Activities</i>			
17	EX1	The school has many interesting clubs	Tùng Lâm (2017)
18	EX2	Joining extracurricular activities help me contribute to the community	Tùng Lâm (2017)
19	EX3	Joining extracurricular activities helps me develop personalities, practice skills and improve abilities	Authors
20	EX4	Joining in groups makes my youth more dynamic and meaningful	Authors
<i>Connection</i>			
21	CO1	The School gets on with parents and students	Tùng Lâm (2017)
22	CO2	Communication channels between the school and students are always straightforward	Tùng Lâm (2017)
23	CO3	The School's Website is really helpful for students	Authors
24	CO4	Behavior Rules are reasonable	Lê Văn Hào (2018)
25	CO5	The connection between the school and enterprises is beneficial to students	Lê Văn Hào (2018)
<i>University Culture</i>			
26	UC1	School's leaders focus on building school culture	Authors
27	UC2	School culture affects my attitude and learning	Authors
28	UC3	School culture helps the school strengthen its popularity	Authors
29	UC4	Building the school culture requires the cooperation of all lecturers, staff and students.	Authors

To answer the research questions, survey data were collected from some universities in Hochiminh City, Vietnam. The questionnaire which was sent via both online and offline approaches. The respondents were asked to state how they agree by using a 5-point Likert scale (1 = highly disagree, 5 = highly agree) with agreement with components of university culture in their university. From 2021 November to 2022 March, 425 responses in total were received and all were qualified.

In this study, a questionnaire comprising 29 determinants was designed to measure university culture. The Statistical Package for Social Science (SPSS 26.0) is used for data analysis.

4. Results

Of the 425 valid samples, there were 30.4% of the respondents were male compared to 69.6% of the total students who were female. In order to test the reliability of each factor, Cronbach's alpha of each factor was computed as below:

Table 2. Cronbach's alpha scores

Factor	Observed variables	Mean	Std. Deviation	Cronbach's Alpha
Trademark Identification (TI)	TI1	4.36	.589	.736
	TI2	3.87	.615	.722
	TI3	4.28	.659	.701
	TI4	3.72	.518	.775
	Cronbach's alpha of TI factor: 0.786			
Perceived Values (PV)	PV1	4.15	.507	.852
	PV2	4.09	.737	.753
	PV3	3.96	.765	.740
	PV4	3.93	.646	.795
	Cronbach's alpha of PV factor: 0.832			
Training Service (TS)	TS1	4.10	.611	.746
	TS2	3.62	.558	.774
	TS3	3.89	.692	.701
	TS4	4.34	.583	.757
	Cronbach's alpha of TS factor: 0.796			
Academic Environment (AE)	AE1	3.55	.480	.805
	AE2	3.98	.683	.697
	AE3	3.95	.609	.729
	AE4	4.14	.642	.711
	Cronbach's alpha of AE factor: 0.787			
Extracurricular Activities (EA)	EX1	3.98	.692	.910
	EX2	3.79	.810	.867
	EX3	3.97	.840	.856
	EX4	3.96	.801	.869
	Cronbach's alpha of EX factor: 0.904			
Connection (CO)	CO1	3.54	.622	.814
	CO2	3.85	.699	.793
	CO3	4.04	.661	.803
	CO4	3.97	.656	.805
	CO5	3.73	.587	.824
	Cronbach's alpha of CO factor: 0.840			
University Culture (UC)	UC1	3.94	.687	.856
	UC2	4.09	.732	.838
	UC3	4.10	.762	.827
	UC4	4.25	.743	.835
	Cronbach's alpha of EX factor: 0.874			

The table indicates that Cronbach's alpha scores of 6 independent variables and independent variable ranged from 0.786 to 0.904. Since 0.50 is the minimum value for accepting the reliability test (Nunnally, 1967), the results of factor analysis in this study are considered reliable.

Exploratory Factor Analysis (EFA)

The exploratory factor analysis (EFA) was conducted to test the validity of the measurement of six independent variables that met the requirements of Cronbach's Alpha reliability testing. By using SPSS ver 26.0, the exploratory factor analysis produced the results as presented in Table 3 below. The results of EFA satisfied four elements: (1) Sig value. Bartlett's test = 0.000 <0.05; (2) 0.5 <KMO coefficient = 0.948 <1; Fraction of deductible = 61,516% > 50%.

Prior to multiple regression analysis, the 25 determinants were factor analyzed using principal component analyses with varimax rotation in order to identify the structure of determinants related to university culture. The EFA analysis verified the four factors as predetermined in the questionnaire development as the table below:

Table 3. Factor rotation matrix result of independent variables

Variables	Component			
	1	2	3	4
AE4	.715			
AE2	.679			
AE3	.668			
TS1	.668			
TS4	.663			
PV3	.635			
PV2	.628			
PV1	.610			
PV4				
TS2		.687		
CO1		.686		
CO2		.635		

Variables	Component			
	1	2	3	4
TI4		.617		
CO5		.578		
CO3		.572		
TS3		.569		
AE1		.526		
CO4				
EX3			.844	
EX4			.829	
EX2			.823	
EX1			.682	
TI3				.736
TI1				.702
TI2				.650

The number of factors was determined by retaining only the factors with an eigenvalue of 1 or higher. After removing the PV4 and CO4 determinants, the first factor, Service Quality (*SQ*), comprised eight items: PV1, PV2, PV3, AE2, AE3, AE4, TS1 and TS4. The second factor, Connection (*CO*), consisted of eight items: CO1, CO2, CO3, CO5, TI4, TS2, TS3, and AE1. The third factor, Extracurricular Activities (*EX*) consisted of four items: EX1, EX2, EX3, and EX4. The fourth factor was related to Trademark Identification (*TI*), including TI1, TI2, TI3, and TI4.

With dependent variable, $KMO = .833$, $Chi\text{-square} = 840.436$ và the only one component extracted, accounted for 72.711% of the variation.

In order to investigate whether the independent variables (four factors) had significant impacts on the dependent variables (UC), Pearson correlation and regression analyses were conducted

Table 4. Pearson Correlation analysis

		SQ	CO	EX	TI	UC
SQ	Pearson Correlation	1	.724**	.594**	.632**	.785**
	Sig. (2-tailed)		.000	.000	.000	.000
	N	425	424	425	425	425
CO	Pearson Correlation	.724**	1	.617**	.626**	.668**
	Sig. (2-tailed)	.000		.000	.000	.000
	N	424	424	424	424	424
EX	Pearson Correlation	.594**	.617**	1	.503**	.577**
	Sig. (2-tailed)	.000	.000		.000	.000
	N	425	424	425	425	425
TI	Pearson Correlation	.632**	.626**	.503**	1	.627**
	Sig. (2-tailed)	.000	.000	.000		.000
	N	425	424	425	425	425
UC	Pearson Correlation	.785**	.668**	.577**	.627**	1
	Sig. (2-tailed)	.000	.000	.000	.000	
	N	425	424	425	425	425

** . Correlation is significant at the 0.01 level (2-tailed).

Based on the results of Pearson Correlation analysis in table 4, the Sig. of all factors (SQ, CO, EX, TI) > 0.05; therefore, there are correlations between them and the dependent variable (UC).

Multiple regression analysis

To determine the importance of each factor to online reservation intention, a multiple regression analysis was conducted. University culture was the dependent variable, while the four determinant factors were the independent variables. All variables were entered at the same time. Table 5 reports the results of the multiple regression analysis.

Table 5. Multiple regression analysis

	Std. β	Sig.	VIF
SQ	.540	.000	2.485
CO	.108	.018	2.552
EX	.108	.005	1.763
TI	.164	.000	1.872
R ² = 0.661			
Adjusted R ² = 0.658			
ANOVA (F = 204.587), Sig = 0.000 ^b < 0.05			

The result showed an adjusted R² of 0.661, suggesting that about 66.1% of the variation in overall satisfaction was explained by the regression equation, and there is no multi-collinear phenomenon because the VIF of all factors < 10.

Based on the coefficient of each independent variable, it is possible to assess the impact of each variable on the dependent variable. The findings reveal that Service Quality (SQ) was the most important factor in explaining University Culture. Trademark Identification (TI) followed in importance. Besides, Extracurricular Activities (EX) and Connection (CO) have the same positive impacts on the dependent variable (UC).

5. Discussion and Conclusion

Overall, this study basically meets the original objectives, the findings showed that university culture is influenced by four factors in descending order: Service Quality, Trademark Identification, Extracurricular Activities and Connection.

According to the results of the study, from the practical perspective of management, if universities would like to improve training quality by enhancing university culture, they should pay enough attention to the following elements:

Service Quality, each university constantly improves service quality through strengthening infrastructure and modern learning equipment, investing in human resource concluding lecturers and staff. Besides, the university should enhance cultural confidence and cultural consciousness for all members.

Connection, it is necessary to consider the connection of the university with partner involved. First of all, building a convenient and effective information channel with students and their families. Expanding cooperation with businesses will create chances for students to practice what they study and get good job after graduation.

Extracurricular activities, each university needs to build and maintain regularly specific-major clubs and social clubs. This is a useful playground for students to carry out research and practice necessary abilities and skills.

Trademark Identification, each university needs to clearly define its vision, build its own unique brand identity and implement it continuously. Therefore, the building of school culture needs to be done for a long time to get sustainable results.

Limitations and suggestions for future research

This research basically achieved the research objectives that stated above. However, the research still has certain limitations which are expected to be improved in the future research. First, due to the constraints of time, the sample is chosen by applying non-probability convenience method with a limited number of samples of respondents in some universities in Hochiminh City, not the whole nation. Secondly, students from universities which are not separated in fields such as economics, technologies, and social sciences with own characteristics.

The findings of our study indicated the necessity for universities to build and maintain their university culture in the long-term period. We do expect that our study will stimulate more and more additional studies on this domain as well as on this promising and interesting group.

THE BEHAVIOR OF WORKERS IN PRODUCTION IN BAC THANG LONG INDUSTRIAL PARK IN HANOI

MA. Do Minh Hoang

hoangdm.yri@gmail.com

Youth Research Institute, Hanoi, Vietnam

Abstract

The study aims to evaluate the standard deviation behavior of workers in enterprises today. The study was approved by the scientific council of the University of Social Sciences and Humanities - Hanoi National University under Decision No. 993/QĐ-XHNV-ĐT dated May 10, 2021. Survey data of 189 employees in Bac Thang Long industrial park about the expression and attitude and reaction of employees about the current deviant behaviors of workers based on survey results by polls and in-depth interviews. The results show that the serious deviant behaviors have a low rate, and the less serious behaviors have a higher rate, and the employees tend to oppose the deviant behaviors when related. directly related to their individuality.

Key word: *Deviant behavior, Laborer, Bac Thang Long Industrial Park - Hanoi*

1. Introduction

Deviant behavior is behavior that deviates markedly from social norms (Lance, 2003; Liu and Hsu, 2013) or in a way that is morally unacceptable, however, the degree of its transgression. not to the extent that it violates the IPDB (Lance, 2003). Deviant behavior in the working environment is the act that violates the rules, regulations, and IPDBs of the organization and harms the interests of individuals or groups to varying degrees (Robinson and Bennett, 1995). In the lifestyle of young people, there are manifestations of deviant behavior (Luu Song Ha, 2004; Pham Hong Tung, 2011). In enterprises, there are always two extremes of social solidarity and social conflict between individuals and social groups (Do Thi Van Anh, 2014).

From the summary, it can be concluded: A group of less serious acts of deviating from the standard include: (1) Acts of destruction of property (destroying or intentionally damaging property) is an act of destruction that causes damage to property. property has lost its use value or significantly reduces its use value, which is demonstrated through improper operation, intentional damage to items; production items that can still be used but are replaced, or know that the items are damaged but do not repair... This offender has acts of damaging, intentionally damaging other people's property, the act mentioned above It is expressed in many different ways, such as this person actively smashing, or burning, or bringing other people's property into the water, intentionally leaving the property damaged... resulting in this property. damaged, depreciated, or destroyed. (2) The act of stealing

property is the act of stealthily appropriating another person's property; taking advantage of the loopholes, caught off guard of the owner, the property manager, or taking advantage of the situation without the knowledge of the property manager. There are consequences that the property is appropriated in one of the following cases: (i) With large and bulky assets, the offender must be able to move that property out of the scope of storage; (ii) With property without a separate place to store it, the offender must take that property out of the area (the crime scene) to complete it; (iii) In exceptional cases: assets from 2 million VND or more, if the value is very large such as cars, motorbikes, computers, etc., even if the offender has not yet appropriated the property, it is still considered a crime. (3) Causing harm to the health and dignity of others is expressed in the following forms: quarrels, fights, insults, cursing at others, sexual harassment...

Groups of acts of a less serious nature, but also greatly affect the business, such as: (4) Working separately during working hours; (5) Leaving late / leaving eaERY; (6) Prolong working time; (7) Distraction from work.... The problem of labor workers violating rules, regulations and internal labor regulations still exists in the working environment at enterprises, factories and enterprises; causing damage to enterprises and factories, and even damage to properties and materials of those units. From the problems arising in the industrial park, especially in the working environment of labor workers, the article delves into whether worker tend to violate regulations and rules of enterprises. pose and the causes that influence their course of action.

2. Method

The study was approved by the scientific council of the University of Social Sciences and Humanities - Hanoi National University under Decision No. 993/QĐ-XHNV-ĐT dated May 10, 2021. Survey on deviant behavior. According to the standards of workers in Bac Thang Long industrial park, the author has built a scale of standard deviation in labor behavior including 02 large groups with 7 groups of behaviors in the working environment. The influencing factors include: (i) Perception of deviant behavior; (ii) Employees' reactions to deviant behaviors; (iii) The acquisition of situations on social networks.

The study conducted a survey with 189 workers at Bac Thang Long industrial park. The male group has 41.8%, the female group has 58.2%; in terms of age from 18 to 25 years old is 77.8%, from 26 to 30 years old 12.1%, over 30 years old is 10.1%; High school education level accounts for 74.6% and above high school level is 25.4%

Survey data were processed by SPSS software with descriptive statistics such as percentage, mean score, standard deviation, reliability of scale, factor analysis and regression analysis. linearity for the purpose of evaluating the standard deviation behaviors in the working environment, and the factors affecting the deviant behavior of workers in the Bac Thang Long industrial park.

3. Results

3.1. Evaluated reliability

Table 1. Descriptive statistics and evaluation of scale reliability

	Descriptive statistics		Item-Total Statistics			
	Mean	Std	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
Property destruction (PD): Cronbach's Alpha=0.809						
PD1. Improper operation of the procedure	0.875	.175	12.52	2.692	.562	.792
PD2. Intentionally damaging items	0.16	.244	12.48	2.457	.736	.708
PD3. Production equipment is still usable but has been replaced	1.51	30.2	12.53	2.376	.759	.695
PD4. Know damaged items but do not fix	1.245	.493	12.47	2.909	.468	.832
Theft of property (TP): Cronbach's Alpha=0.720						
TP1. Taking business supplies for personal use home/sell/give/gift to others	1.245	.621	8.13	1.597	.607	.552
TP2. Bringing business items	1.35	.486	8.16	1.579	.553	.616
TP3. Combine/associate with others to use/take the business's belongings for private purposes	0.95	.484	8.10	1.741	.466	.719
Acts that harm the health and dignity of others (HHD): Cronbach's Alpha=0.907						
HHD1. Inflicting injury, fighting	0.74	.486	16.43	9.501	.760	.888
HHD2. Insults, curses at others	0.95	.376	16.44	9.496	.763	.887
HHD3. Sexual harassment of others in the business	0.875	.481	16.42	9.471	.798	.880
HHD4. Threatening/bullying others in the business	0.425	.356	16.53	9.568	.731	.894
HHD5. Slander, discredit others	1.475	.381	16.41	9.704	.780	.884
Deviant behaviors of a less serious nature (DBL): Cronbach's Alpha=0.823						
DBL1. Working separately for hours	1.58	.501	12.65	3.700	.709	.770
DBL2. Go late/ leave eaERy	1.325	.500	12.90	3.790	.567	.830
DBL3. Deliberately prolonging working hours	1.295	.486	12.67	3.717	.676	.782
DBL4. Distractions at work	2.515	.308	12.89	3.242	.709	.767
Perception of deviant behavior (PDB): Cronbach's Alpha= 0.908						
PDB1. I see the assets of the business have nothing to do with me	3.34	.402	12.16	3.827	.778	.885

	Descriptive statistics		Item-Total Statistics			
	Mean	Std	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
PDB2. I find it normal to use business assets for my own purposes	3.60	.413	12.20	3.532	.807	.875
PDB3. I find it normal to work alone during working hours	3.96	.484	12.32	3.640	.755	.894
PDB4. Swearing, swearing/slandering, insulting others is very normal and is a common phenomenon in businesses.	4.12	.488	12.26	3.673	.831	.867
(ER) Employees' reactions to deviant behaviors: Cronbach's Alpha= 0.941						
ER1. I don't see other people commenting on my deviant behavior	3.76	.752	17.30	6.830	.847	.926
ER2. Others find struggle can be dangerous to themselves	3.95	.493	17.29	7.002	.850	.926
ER3. They only object when the matter concerns themselves	4.5	.484	17.38	7.245	.740	.945
ER4. Other people often ignore it because they have done it too	3.86	.495	17.33	6.682	.882	.920
ER5. People do not report because they see that the feedback is not recognized and handled by their superiors	3.69	.406	17.33	6.730	.888	.919
Social network: Cronbach's Alpha= 0.899						
SN1. Violent clips/images	3.56	.481	32.66	20.155	.745	.870
SN2. Sexy, erotic clips/images	3.01	.495	32.73	20.047	.722	.871
SN3. Theft clip/image	3.12	.326	32.72	20.328	.738	.871
SN4. Clip/image of hiding from work	2.96	.464	32.67	20.038	.759	.869
SN5. Protest clip/image	3.15	.498	33.21	20.488	.641	.904
SN6. Clip/image smashing factory machinery	2.76	.348	33.13	19.961	.683	.896
SN7. Clip/image of swearing	3.78	.412	32.69	20.644	.698	.874
SN8. Clips/images of others	3.89	.498	32.82	20.236	.677	.874
SN9. Clips/images of bad content	3.02	.344	32.73	19.724	.824	.864

Evaluation of the reliability of the scale with the reliability coefficient of most of the scales is Cronbach's Alpha > 0.6, and all the criteria have the total variable correlation coefficient > 0.3, which is satisfactory to include and factor analysis.

3.2. Factor analysis

Table 2. Pattern Matrix

	Factor						
	1	2	3	4	5	6	7

DP1					.525		
DBL1						.845	

	Factor						
	1	2	3	4	5	6	7
DBL4						.807	
DBL3						.763	
DBL2						.573	
TP1							.839
TP2							.679
TP3							.528
Extraction Method: Principal Axis Factoring. Rotation Method: Promax with Kaiser Normalization; Total Variance Explained: 63.063 KMO =0.860; Bartlett's Test=0.000							

The factor analysis results show that most of the coefficients KMO=0.860, Total Variance Explained: 63,063, observed variables have factor loading>0.5. After factor analysis, the criteria will automatically be determined. Reductive extraction forms a new way of factoring into regression analysis.

Table 3. Regression results of factors affecting worker's standard deviation behavior

	Unstandardized Coefficients		Standardized Coefficients	t	Sig	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
(Constant)	.663	.238		6.996	.000		
(ER) Employees' reactions to deviant behaviors	.246	.032	.351	7.623	.000	.957	1.045
(PDB) Perception of deviant behavior	.215	.041	.241	5.208	.000	.946	1.057
(SN) Acquiring situations on social networks	.197	.042	.217	4.711	.000	.957	1.035
R=0.546, R ² =0.298, Adjusted R ² =0.292, F=48.961, Sig=0.000, Durbin-Watson= 1,955							

Regression results shown with three factors were included in the statistical model $F = 48,961$ with $\text{sig} = 0.000$, showing that the regression model is suitable for the data set. Durbin-Watson is $1,955 < 3$ with no correlation between variables in the model. The VIF coefficients of all variables are < 10 , showing that there is no multicollinearity phenomenon. Adjusted $R^2 = 0.292$ shows that 29.2% of the variation of the dependent variable is explained by the independent variables. Unnormalized regression equation: $\text{HVLC} = 0.663 + 0.246 \text{ PHU} + 0.215(\text{NT}) + 0.197(\text{MXH})$.

4. Discussion and Conclusion

4.1. Situation of standard deviation behavior of workers in Bac Thang Long industrial park

* Standard deviant behavior

The survey results show that serious deviant behaviors are deviant behaviors that affect the relationship between workers and workers or between workers and employers. The deviations in the behavior of property destruction, property theft or harm to the health/dignity of others in the enterprise analyzed below also affect the atmosphere in the working environment because it has a lot to do with interpersonal behavior.

The act of destroying property in the business is one of the violations of the law and has a great influence on the business. The acts of worker intentionally damaging (mean=0.16), operating improperly (mean=0.87) occur at a very rare level because these are behaviors with very serious consequences to enterprises, if employees are discovered they may be disciplined, even fired. The behaviors that the item can be used but can still be replaced (mean=1.51) or known that the item is damaged and cannot be repaired (mean=1.25) do occur in the business, but to a lesser extent these behaviors. There are two trends when they replace new equipment to get old equipment that can still be used for personal purposes, or the level of damage is not really too serious and they want to push the responsibility. repair for the next shift.

Property theft, shows that workers labor has committed property theft in the enterprise with a degree (mean from 0.95 to 1.45). Thus, it can be seen that the level of property theft is low, but it is worth noting that these acts still occur in many companies and businesses. even employees have a combination/association with other people to use/take the company's belongings for their own purposes, proving that there is a connection between individuals in deviant behaviors for their own benefit. As such, there is a relatively small degree of organized theft of property in workers' businesses.

Behaviors that damage the health/dignity of others surveyed tend to be lower than the two groups of acts of destruction of property and theft of property in the basic enterprise with mean<1.0. However, the act of defaming and discrediting others has a higher level than mean=1.45. These behaviors significantly affect the labor relations in the enterprise, the relationships between individuals and individuals, and the relationship between individuals and the collective.

*Standard deviant behavior of a less serious nature

Besides the group of behaviors with serious manifestations such as: property destruction, property theft, damage to the health/dignity of others, the group of behaviors about positivity at work workers belong to the group of non-serious behaviors.

The survey data show that the group of non-serious behaviors about being positive at work is higher than the group of behaviors causing serious consequences. In which, the group of behaviors that assessed distraction at work had a higher level than the group

of behaviors about hours and working habits of agencies and enterprises. Working separately during the hour (mean=1.58), Leaving late/ leaving early (mean=1.35), Deliberately prolonging working time (mean=1.29), Distracting at work (mean=2.51). Distraction at work is a latent form of labor consciousness, workers still complete their work, but with inactivity, resulting in products that will not be perfect when finished. It is the latent of the form that one behavior tends to be superior to others. The group of behaviors that deviate from the standard in terms of working hours, labor intensity, and accuracy of working time have below average performance levels. These behaviors belong to the group of behaviors related to individuals, or in other words, the use of individuals to spend the least amount of labor. Therefore, workers tend to accept and even violate these behaviors more. The behaviors of this group often fall into the issue of awareness and responsibility of individuals in observing the rules and standards of the agency or unit where they are operating.

4.2. Factors affecting worker's deviant behavior

The action process of individuals depends on many factors. In this study, the author evaluates the impact of perception, action environment and the acquisition of social situations from the mass media. In the analytical model, the regression coefficients all have positive signs (+), indicating that the independent variables have a positive relationship with the dependent variable.

Perception of deviant behavior (PDB) has the strongest influence ($\beta_1 = 0.351$) on individuals' standard deviant behavior. The social environment, the context in which the action takes place has a strong influence on the behavior of individuals. If the majority of employees do not reflect and reflect on the deviant behaviors, it will create more conditions for the deviant behaviors of individuals to take place. The research results show that workers' reactions when detecting/seeing the above-mentioned deviant behaviors are usually not strongly opposed. They often ignore, or ignore as if. *I am very limited or I can say that I do not comment / frankly mention the shortcomings of others. I do not want to "bring disaster", bring trouble to myself, my family. At the company not long ago, there was a situation where Mr. A commented to Mr. B about being distracted at work, leading to the two brothers raising their voices and fighting, so everyone refrained from commenting. each other's shortcomings". (Female, 27 years old, worker). "At the company, there has also been a situation where workers have quarreled and fought recently, the reason being only that Mr. A commented on Mr. B's recent distraction at work, so usually everyone in the company do not openly point out each other's shortcomings"* (Female, 25 years old, worker). The people in the enterprise do not have any opinions about the deviant behavior of the individuals (mean=3.76); Workers who report deviant behavior can be hated by everyone and put themselves in danger (mean= 3.95), sometimes people do not report it because they see that the feedback is not recognized by their superiors. and handle (mean=3.69) and others do not react, preventing deviant behaviors because they have done so in the past

(mean=3.86) and others only react when the problem is present. related to themselves (mean=4.5) Because they are afraid to point out each other's shortcomings, employees in the company are often less likely to prevent deviant behaviors. In fact, most workers in the company are often "afraid" to point out the shortcomings of others, even more do they not want to "get into trouble" when preventing negative manifestations, especially when it is not related. nothing to do with them.

Employees' reactions to deviant behaviors (ER) behavior has a second network effect ($\beta_2 = 0.215$), which shows that employees find that their standard deviant behaviors are completely acceptable, the more they tend to do so. their deviant behaviors in the business. Employees believe that the assets of the enterprise have nothing to do with them (mean=3.34), so they can completely use the assets of the enterprise for their own purposes (mean=3.60), and the use of Working time to work alone is also completely acceptable (mean=3.96) so they may not consider the business as a place of attachment during their work. The survey data show that workers in the industrial park were partly aware that the above behaviors are standard deviations that not only represent a violation of the enterprise's internal regulations, but also shows the ethical violation of the workers in the enterprise.

Acquiring situations on social networks (SN) has the third effect ($\beta_3 = 0.197$) on deviant behavior. The influence of the mass media on young people and workers shows that the more situations workers absorb situations, the more deviant behavior online, the more likely they are to deviate from action. The Internet is increasingly developed, with the means of smartphones and 3G, 4G, 5G technologies making it easier to produce and share images, sounds, clips on social networks more and more easily: clips, videos related to deviant behaviors in general or related to workers, have the power to spread quickly on social networks... Frequency of exposure to images, sounds, Deviant clips and videos increase the likelihood of workers performing deviant behavior. In fact, workers often watch violent clips/images (mean = 3.56), sexy and erotic clips/images (mean=3.01); Clip/image of swearing (mean=3.78), clip/image of contempt for others (mean=3.89), clip/image of theft (mean=3.12), clip/image of avoiding work (mean) =2.96), Clips/pictures of demonstrations (mean=3.15), Clips/images of smashing factory machinery (mean=2.76), clips/images of instructions for bad content (mean=3.02). It is from exposure to deviant images, sounds, and clips that workers tend to follow such as theft, swearing, swearing, violence, even smashing factories and machines. of business owners.

Through analysis and evaluation of standard deviation behaviors of workers in Bac Thang Long industrial park, it was found that: workers showed signs of violating regulations and rules of the organization to a normal extent, more often than serious violations. Among the influencing factors, the unresponsiveness of others has the strongest effect on the worker's standard deviation behavior.

SOME FACTORS AFFECTING TO WORKING MOTIVATION OF LECTURERS AT MANAGEMENT LEVEL IN SOME PUBLIC UNIVERSITIES IN HANOI

Pham Thi Thanh Thuy

thuyptt@neu.edu.vn

Faculty of Foreign Languages, National Economics University, Hanoi, Vietnam

Abstract

From the previous research on "Employees' job satisfaction", and consulting, interviewing 10 knowledgeable experts majoring in human resources, the author offers a research model with factors affecting to job satisfaction, associated with operational practice as follows: (1) Regulation, (2) Leadership, (3) Work Nature, (4) Working environment, (5) Income, salary, (6) Training for advancement, and (7) General satisfaction. These factors will be assessed the reliability scale, exploratory factor analysis (EFA) to test the hypothesis. In the study, there are 7 scales with 28 observed variables of 5 independent factors and 5 observed variables of 1 dependent factor that meet the requirements of reliability for exploratory factor analysis. The result obtained after running that the model again with 27 observed variables representing 6 independent factors affecting job satisfaction is the best model to explain and analyze. The author uses a regression model to test the reliability of the factors affecting the satisfaction of management-level lecturers at some universities in Hanoi. Through the tests, it can be confirmed that factors affecting to labour satisfaction in order of importance are: (1) Training and advancement is the factor that has the strongest influence on satisfaction; (2) Leadership is the second strongest factor affecting to satisfaction; (3) Working environment is the third strongest factor affecting satisfaction; (4) Salary and income ranks the fourth; (5) Regulation is the fifth strongest factor affecting to satisfaction; (6) The job nature is the last strong influencing factor on job satisfaction. From the analysis results, the author proposes some solutions to improve the job satisfaction of lecturers at management level in some public universities in Hanoi.

Keywords: *Working Motivation, Public Universities, Management Level*

1. Introduction

Job satisfaction of employees in each organization determines the success or failure of each organization at present and in the future. The growth of the economy has created a "war to attract and keep talented people", forcing businesses to create new welfare regimes to attract and retain good staff. However, when the economy suffer from difficulty, many companies have to cut their employees' benefits, and at the same time maintaining human resources is always a difficult problem for enterprises. Practice shows that a satisfied employee is a person who not only is attached to the company but also represents the business, for the brand of the business in the market places, so the satisfaction of employees in the company. Job satisfaction is one of the key goals of human resource workers and business leaders.

In the public university environment, it becomes even more difficult to motivate lecturers because the process of increasing their benefits often takes place in a rather lengthy process. Wilhelm von Humboldt, who founded the University of Berlin in 1810, put forward the view that the teacher has a great capacity for self-improvement. They have a high sense of the process of improving their knowledge and ability to work, both in terms of ideas, knowledge and actions. They actively engage in systematic and continuous self-improvement, building their self-confidence and understanding, and creating academic careers. Motivation for self-improvement keeps teachers engaged in the learning and research process. However, some higher education institutions focus only on teaching as their core mission (Kriengsak Chareonwongsak, 2002) and often forget to motivate lecturers; thus, teaching staffs are generally invisible and suffer from a lack of motivation to promote academic productivity (Sarawut Seedee, 2004). In addition, the stability of work and job positions in state agencies easily leads to stagnation in the thoughts and actions of employees, leading to difficulties in motivating their employees.

This writing is the result of studying the work motivations of lecturers at management level in a number of universities in Hanoi, from which the author gives some suggestions to help create work motivation, motivate the main workforce - lecturers - in public universities to become more effective. The paper focuses on answering questions (1) What factors affect job satisfaction of lecturers at management level in some public universities in Hanoi? (2) How do the factors affect the job satisfaction of this faculty? (3) What needs to be done to improve job satisfaction for these incumbents?

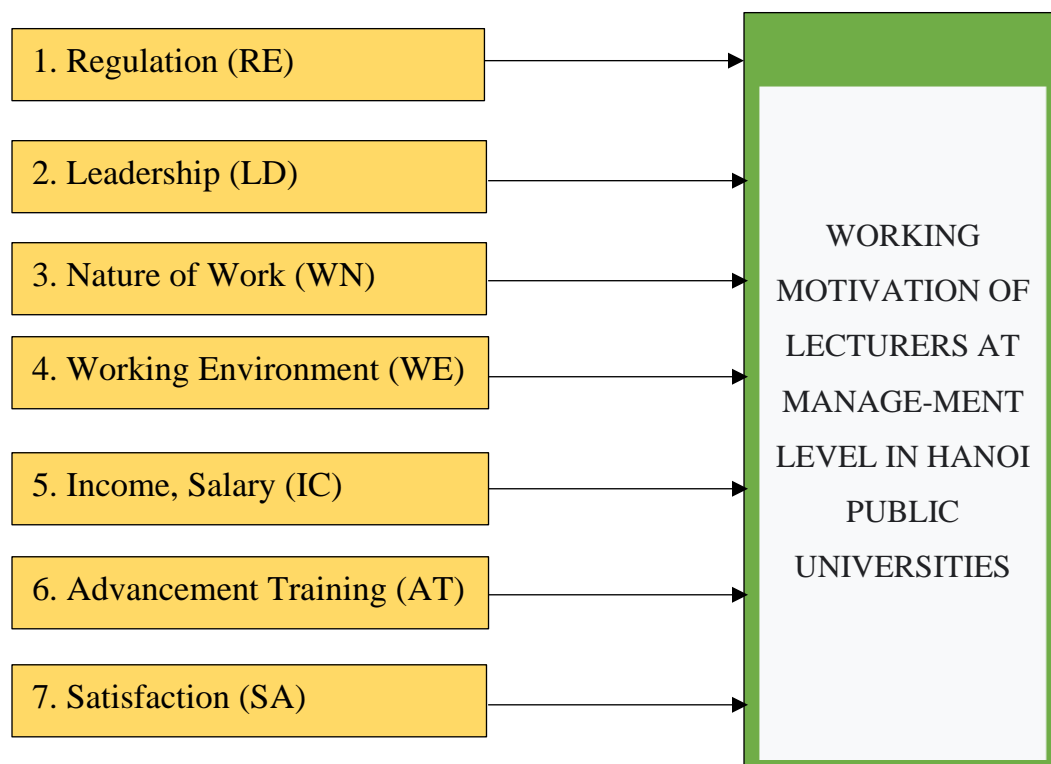

2. Literature Review

Practice shows that a happy employee is more loyal to the business, they can go far to achieve common goals, and feel proud of their work, their team and their own achievements. According to Michael Page's report, "Professional recruitment service company" on job prospects in 2020 asked survey questions related to factors affecting employee satisfaction in Vietnam. Nearly 50% of Vietnamese workers think their potential status has not been optimized; Five important factors affecting their labor motivation are: (1) The company's commitment to employees; (2) Clear personnel training and development plan; (3) There is a plan to increase salary; (4) Have a promotion plan; (5) Have a flexible working plan; The three main reasons workers quit their jobs are because: (1) There are better opportunities elsewhere waiting for them; (2) Their capacity is not being used properly; (3) Does not match the leadership style of superiors; and five important factors that make them switch to a new job because they are: (1) Working in a new industry or with a new challenge; (2) Optimizing skills and capabilities; (3) Seeing the right work culture; (4) Have better labor rights; (5) Better leadership and guidance style of superiors.

In their research, Smith and colleagues (1969) designed a JDI model with 72 different questions and concluded that there are five main factors to measure employee satisfaction at work: (1) Nature of work; (2) Income; (3) Opportunities for advancement training; (4) Leadership and (5) Colleagues.

Tran Kim Dung (2005) tested the job description index scale according to the JDI model of Smith et al. (1969) in the working conditions of Vietnam and concluded that there are 6 variables affecting the job performance. job satisfaction includes: (1) Nature of work; (2) Leadership; (3) Opportunities for training – promotion; (4) Colleagues; (5) Salary and (6) Benefits.

After synthesizing previous studies and consulting with experts, preliminary surveying incumbent lecturers selected by job position, the author proposes a research model including 7 influencing factors. affecting the job satisfaction of lecturers at management level in a number of public universities in Hanoi including: (1) Regulations, (2) Leadership, (3) Nature of work, (4) Working environment, (5) Income, salary and income, (6) Training for advancement, and (7) General satisfaction. These factors will be included in the assessment of the reliability of the scale, the EFA exploratory factor analysis.

3. Results

3.1. Factors affecting job satisfaction of lecturers at management level in a number of universities in Hanoi

In this paper, there are many factors affecting to job satisfaction of lecturers at management level in some public universities in Hanoi; therefore, the author decided to carry out exploratory research with the aim of (1) Narrowing and identifying factors affecting job satisfaction of incumbent lecturers in some public universities in Hanoi, (2) Seeking advice from experts understand the HR field of research author questions for timely adjustment before conducting formal research.

3.1.1. Testing the scale by Cronbach's Alpha reliability coefficient

The measurement scale system is evaluated and tested for reliability coefficient Cronbach's Alpha to check the correlation coefficient and relationship between variables, through exploratory factor analysis EFA to test the interaction between variable, measure in each factor.

The results of Cronbach's alpha of the scales on the components of regulation, leadership, job characteristics, working environment, salary, income, training, promotion, and satisfaction are shown in the table below. The scales are represented by observed variables. These scales all have satisfactory Cronbach's alpha reliability coefficient (>0.6).

Table 1. Testing the reliability of the scales by coefficient

Observed Variables	Cronbach's alpha
Regulation (RE)	0.815
Leadership (LD)	0.833
Nature of work (WN)	0.807
Working environment (WE)	0.825
Income and Salary (IC)	0.890
Advancement training (AT)	0.857
Job Satisfaction (JS)	0.812

Thus, after assessing the reliability of the scale, the model includes 7 factors regulation, leadership, nature of work, working environment, salary and income, training and promotion, and job satisfaction. heart. These factors will be included in the EFA exploratory factor analysis.

The author gives 28 observed variables representing 6 independent factors affecting to satisfaction, and they are reliable enough to conduct factor analysis. As a result, all the observed variables satisfy the condition that Factor loading coefficient > 0.5, in which the observed value of LD5 loading is in the same 2 factors, so remove the variable LD5 and run the model again. The result obtained after running again is that the model with 27 observed variables representing 6 independent factors affecting to satisfaction has the best ability to explain and analyze.

✚ The appropriate test of the EFA factor analysis model (KMO) and the correlation test between the observed variables (Barlett's Test)

Table 2. KMO coefficients and Bartlett's test

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy		0.796
Bartlett's Test of Sphericity	Approx. Chi-Square	2214.366
	df	351
	Sig.	.000

Source: SPSS result

The results of the EFA analysis for the independent variables of the above mentioned factor rotation matrix show that all factor loading coefficients of the observed variables satisfy the condition when factoring is that the factor loading coefficient ≥ 0.5 and the multiplier. The factor generated when factor analysis is 6 factors with 27 observed variables.

The results of EFA analysis for the above dependent variables show that all the factor loading coefficients of the observed variables satisfy the conditions when factor analysis is Factor loading coefficient ≥ 0.5 and the number of factors generated when analyzing factor is 1 factor, no observed variables are excluded.

Thus, the research model and scales after conducting EFA exploratory factor analysis include 6 independent factors affecting job satisfaction.

✚ Hypothesis testing on the significance of regression coefficients:

From the results of Table 2, it shows that the significance level of RE, LD, WN, WE, IC, AT has sig significance level < 0.05 , so it is accepted with 95% confidence level.

The independent variables are correlated with the dependent variable, suitable to include in the explanatory model for the dependent variable satisfaction.

Table 3. Regression coefficient results

Coefficients^a

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
1 (Constant)	-.077	.236		-.326	.745		
RE	.116	.043	.148	2.720	.007	.700	1.428
LD	.173	.055	.186	3.157	.002	.595	1.680
WN	.109	.050	.120	2.175	.031	.686	1.457
WE	.164	.052	.177	3.174	.002	.668	1.496
IC	.252	.036	.349	7.057	.000	.846	1.182
AT	.205	.051	.231	4.021	.000	.631	1.585

a. Dependent Variable: HL

Source: SPSS Result

The present summary results show that the model with the independent variables: RE, LD, WN, WE, IC, AT has a sig significance level ≤ 0.05 with the dependent variable; therefore, 6 independent variables are correlated and significant with dependent variable (JS) satisfaction with over 95% confidence.

Through Table 3 above, the regression coefficient results, the regression equation shows the relationship between the factors that form the satisfaction as follows (with unnormalized beta coefficient):

$$\text{Job Satisfaction (JS)} = -0.77 + 0.116*\text{RE} + 0.173*\text{WE} + 0.109*\text{WN} + 0.164*\text{IC} + 0.252*\text{AT} + 0.205*\text{LD}$$

From the regression results, we can conclude in the following table:

Table 4: Hypothesis testing of the research model

Hypothesis		Results
Hypothesis H1	Regulation has a positive correlation with satisfaction	Accepted
Hypothesis H2	Leadership has a positive correlation with satisfaction	Accepted
Hypothesis H3	Job characteristics are positively correlated with job satisfaction	Accepted
Hypothesis H4	Working environment has a positive correlation with satisfaction	Accepted
Hypothesis H5	Wages and earnings have a positive relationship with job satisfaction	Accepted
Hypothesis H6	Training for advancement has a positive relationship with satisfaction	Accepted

Source: SPSS Result

Through the tests, it can be confirmed that the factors affecting to job satisfaction ranked in order of importance are:

- + Training and advancement is the first factor that has the strongest influence on job satisfaction
- + Leadership is the second strongest factor affecting to job satisfaction.
- + Working environment is the third strongest factor affecting to job satisfaction.
- + Salary and income is the fourth strongest factor affecting job satisfaction.
